Test Validity Criteria:

The test is invalid if:

- 1) for the control solutions, the combined and cumulative incidence of any mortalities, or fish showing loss of equilibrium or other signs of atypical swimming behavior, is >20%
- 2) the average dry weight of the surviving control fish does not attain 250 ug when the fish are dried and weighed.

WQ Ranges:

T (°C) = 25 ± 1; DO (mg/L) = 3.3 to 8.4; pH = 6.5 to 8.5

Test Organism Information:

Batch No.: 082214
Source: Aquatic Biosystems, CO
Age: 24hr

APPENDIX C - *Lemna Minor* Toxicity Test Data

Lemna minor Summary Sheet

Client: Mount Polley
Work Order No.: 14564

Start Date: AUG 22 / 14
Set up by: KLP

Sample Information:

Sample ID: HAD - 1
Sample Date: AUG 20 / 14
Date Received: AUG 21 / 14
Sample Volume: 3 x 20L

Test Organism Information:

Culture Date: 08/31/14
Age of culture (Day 0): 9 days
>8X growth in APHA?: Y (24 fronds)

KCI Reference Toxicant Results:

Reference Toxicant ID: LM 108
Date Initiated: Sept 5/14

7-d No. of Fronds IC50 (95% CL): 3.8 (3.4 - 4.2)

7-d No. Fronds IC50 Reference Toxicant Mean (2 SD Range): 4.2 (3.1 - 5.7) CV (%): 16

APPENDIX D - *Pseudokirchneriella subcapitata* Toxicity Test Data

Pseudokirchneriella subcapitata Summary Sheet

Client: Mount Polley
Work Order No.: 14563

Start Date: Aug 22, 2014
Set up by: EMM

Sample Information:

Sample ID: HAD-1
Sample Date: Aug 20, 2014
Date Received: Aug 21, 2014
Sample Volume: 3 x 20L

Test Organism Information:

Culture Date: Aug 15, 2014
Age of culture (Day 0): 7d

Zinc Reference Toxicant Results:

Reference Toxicant ID: SC117
Stock Solution ID: 14Zn01
Date Initiated: Aug 14, 2014

72-h IC50 (95% CL): 28.9 (21.2 - 33.7) µg/L Zn

72-h IC50 Reference Toxicant Mean and Range: 25.1 (14.8 - 42.7) µg/L Zn CV (%): 30

Test Results:	Algal Growth
IC25 %(v/v) (95% CL)	<u>795.2</u>
IC50 %(v/v) (95% CL)	<u>795.2</u>

Reviewed by: JGlu

Date reviewed: Sept. 23/14

72-h Algal Growth Inhibition Toxicity Test Water Quality Measurements

Client: Mr. Polley Setup by: EMM
 Sample ID: HAD-1 Test Date/Time: Aug 22/14 @ 1600
 Work Order No.: 14563 Test Species: Pseudokirchneriella subcapitata

Culture Date: aug 15/14 Age of Culture: 7d Culture Health: Good
 Culture Count: 15892508 Average: 548.5 Culture Cell Density (c1): 548.5 x 10⁴ cells/ml

$$v1 = \frac{220,000 \text{ cells/ml} \times 100 \text{ ml}}{(c1) 548.5 \times 10^4 \text{ cells/ml}} = 4 \text{ mL}$$

Time Zero Counts: 124 219 Average: 21.5

No. of Cells/mL: 21.5 x 10⁴ Initial Density: # cells/mL ÷ 220 µL x 10 µL = 9772 cells/mL
emm 9773 cells/mL

This report has been prepared by Nautilus Environmental Company Inc. based on data and/or samples provided by our client and the results of this study are for their sole benefit. Any reliance on the data by a third party is at the sole and exclusive risk of that party. The results presented here relate only to the samples tested.

1.0 INTRODUCTION

Nautilus Environmental Company Inc. conducted toxicity tests for Mount Polley Mining Corporation on a sample identified as QUL66-40m. The sample was collected on August 21, 2014 and delivered to the laboratory in Burnaby, BC on August 22, 2014. The sample was transported in three 20-L plastic carboys and coolers. The sample was received at a temperature of 4.9°C and was stored in the dark at $4 \pm 2^\circ\text{C}$ prior to testing. The following sub-lethal toxicity tests were performed on the sample:

- *Ceriodaphnia dubia* survival and reproduction
- 7-d fathead minnow (*Pimephales promelas*) survival and growth
- 7-d duckweed (*Lemna minor*) growth inhibition
- 72-h algal (*Pseudokirchneriella subcapitata*) growth inhibition

This report describes the results of these toxicity tests. Copies of laboratory data sheets and printouts of statistical analyses for each test are provided in Appendices A to D. The chain-of-custody form is provided in Appendix E. This report was revised from an earlier version to incorporate data for dry weight of fathead minnows, in addition to biomass.

2.0 METHODS

Methods for the toxicity tests are summarized in Tables 1 to 4. Testing was conducted according to procedures described by the Environment Canada protocols (2007a, 2007b, 2007c and 2011). Statistical analyses for all tests were performed using CETIS (Tidepool Scientific Software, 2013).

Table 1. Summary of test conditions: *Ceriodaphnia dubia* survival and reproduction test.

Test organism	<i>Ceriodaphnia dubia</i>
Test organism source	In-house culture
Test organism age	<24 h old neonates produced within 12 h
Test type	Static-renewal
Test duration	7 ± 1 day
Test vessel	20 mL test tube
Test volume	15 mL
Test replicates	10 test replicates per treatment
Number of organisms	1 per replicate
Control water	20% Perrier water
Test solution renewal	Daily
Test temperature	25 ± 1°C
Feeding	<i>Pseudokirchneriella subcapitata</i> and YCT
Light intensity	100 to 600 lux at water surface
Photoperiod	16 hours light/8 hours dark
Aeration	None
Test protocol	Environment Canada, (2007a) EPS 1/RM/21
Statistical software	CETIS (2013)
Test endpoint	Survival and reproduction
Test acceptability criteria for controls	≥80% survival; ≥15 young per surviving control producing three broods; ≥60% of controls producing three or more broods
Reference toxicant	Sodium chloride

Table 2. Summary of test conditions: fathead minnow (*Pimephales promelas*) survival and growth test.

Test organism	<i>Pimephales promelas</i>
Test organism source	Aquatic BioSystems, Fort Collins, CO
Test organism age	<24 hours
Test type	Static renewal
Test duration	7 days
Test vessel	375-mL glass containers
Test volume	250 mL
Test replicates	3 per treatment
Number of organisms	10 per replicate
Control water	Moderately-hard water (hardness 80-100 mg/L CaCO ₃)
Test solution renewal	Daily
Test temperature	25 ± 1°C
Feeding	Twice a day with newly hatched brine shrimp (<i>Artemia nauplii</i>)
Light intensity	100 – 500 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	None
Test protocol	Environment Canada (2011), EPS 1/RM/22
Statistical software	CETIS (2013)
Test endpoint	Survival and biomass
Test acceptability criteria for controls	≥80% survival, ≥250 µg mean dry weight
Reference toxicant	Sodium Chloride

Table 3. Summary of test conditions: *Lemna minor* growth inhibition test.

Test organism	<i>Lemna minor</i>
Test organism source	In-house culture, obtained from Canadian Phycological Culture Centre, and originally isolated from Wainfleet, Stinking Barn, Niagara Peninsula, Ontario, Canada
Test organism age	7-to 10-day old
Test type	Static
Test duration	7 days
Test vessel	250 mL glass containers
Test volume	100 mL
Test replicates	4 test replicates per treatment
No. of organisms	Two 3-frond plants per replicate
Control water	Deionized water with nutrients added
Test solution renewal	None
Test temperature	25 ± 2°C
Feeding	None
Light intensity	4000 to 5600 lux full spectrum light
Photoperiod	24 hours light
Aeration	None
Test protocol	Environment Canada (2007b), EPS 1/RM/37
Statistical software	CETIS (2013)
Test endpoint	Number of fronds and dry weight
Test acceptability criteria for controls	≥ 8-fold increase in number of fronds
Reference toxicant	Potassium chloride

Table 4. Summary of test conditions: *Pseudokirchneriella subcapitata* growth inhibition test.

Test organism	<i>Pseudokirchneriella subcapitata</i> , strain UTCC #37
Test organism source	In-house culture, obtained from Canadian Phycological Culture Center, and originally isolated from Nitelva River, Norway.
Test organism age	3- to 7-day old culture in logarithmic growth phase
Test type	Static
Test duration	72 hours
Test vessel	Microplate
Test volume	220 µL
Test replicates	4 replicates per treatment; 8 replicates for control
Number of organisms	10,000 cells/mL
Control water	Deionized water with supplemented nutrients
Test solution renewal	None
Test temperature	24 ± 2°C
Feeding	None
Light intensity	3600 to 4400 lux
Photoperiod	24 hours light
Aeration	None
Test protocol	Environment Canada (2007c), EPS1/RM/25
Statistical software	CETIS (2013)
Test endpoint	Algal cell growth inhibition
Test acceptability criteria for controls	≥ 16-fold increase in number of algal cells; CV ≤ 20%; no trend when analyzed using Mann-Kendall test
Reference toxicant	Zinc

3.0 RESULTS

Adverse effects were observed only on *C. dubia* reproduction (Table 5). The IC25 and IC50 values were 3.9 and 9.8%, respectively. There were no adverse effects observed on survival of *C. dubia*, survival and growth of fathead minnow (Table 6), frond count and dry weight of *L. minor* (Table 7) or cell yield of *P. subcapitata* (Table 8). The LC and IC values were therefore greater than the highest concentration tested for each of these endpoints in these toxicity tests. In addition, a stimulatory effect was observed for *P. subcapitata* cell yield; percent stimulation ranged from 6.4 to 175.4%.

Table 5. Results: *Ceriodaphnia dubia* survival and reproduction test.

Concentration (% v/v)	Survival (%)	Reproduction (mean ± SD)
Control	90	16.7 ± 7.5
1.56	100	18.7 ± 4.3
3.12	100	14.2 ± 5.7
6.25	100	11.1 ± 1.2
12.5	100	7.6 ± 2.8

IC50	>97	>97

SD = Standard Deviation, IC = Inhibition Concentration.

Table 8. Results: *Pseudokirchneriella subcapitata* growth inhibition test.

Concentration (% v/v)	Cell Density (x 10 ⁴ cells/mL) (Mean ± SD)	Stimulation (%)
Control	42.8 ± 5.3	--
1.5	45.5 ± 2.6	6.4
3.0	50.2 ± 2.2	17.5
6.0	55.8 ± 7.9*	30.4
11.9	71.5 ± 3.7*	67.2
23.8	94.5 ± 6.0*	121.1
47.6	117.8 ± 10.7*	175.4
95.2	97.5 ± 11.9*	128.1
Test endpoint (% v/v)		
IC25	>95.2	--
IC50	>95.2	--

SD = Standard Deviation, IC = Inhibition Concentration.

*Indicates cell yield that were significantly greater than the control.

4.0 QA/QC

The health history of the test organisms used in the exposures was acceptable and met the requirements of the Environment Canada protocols. The tests met all control acceptability criteria and water quality parameters remained within ranges specified in the protocols throughout the tests. There were no deviations from the test methodologies. Uncertainty associated with these tests is best described by the standard deviation around the mean and/or the confidence limits around the point estimates.

In the fathead minnow test two of the three control replicates had 100% survival while the third replicate had 0% survival. The concurrent reference toxicant test conducted had a mean control survival of 96.7%, indicating that the organisms used were healthy. Thus the low survival in the one control replicate was an anomalous result, given that five of the six control replicates tested with this batch of organisms had 90 to 100% survival. A statistical analysis was conducted that identified the one control replicate with low survival as being a statistically significant outlier. Therefore, the control survival and biomass, and the statistical endpoints of the sample were calculated based on two replicates and the data presented in the report are considered valid.

Results of the reference toxicant tests conducted during the testing program are summarized in Table 9. Results for these tests fell within the range for organism performance of mean and two standard deviation range, based on historical results obtained by the laboratory with these tests. Thus, the sensitivity of the organisms used in these tests was appropriate.

Table 9. Reference toxicant results.

Test Species	Endpoint	Historical Mean (2 SD Range)	CV (%)	Test Date
<i>C. dubia</i>	Survival (LC50): 1.8 g/L NaCl	1.8 (1.2 - 2.7)	22	August 26 , 2014
	Reproduction (IC50): 1.3 g/L NaCl	1.4 (1.0 - 1.9)	19	
<i>P. promelas</i>	Survival (LC50): 5.2 g/L NaCl	4.5 (3.4 - 6.1)	16	August 22, 2014
	Biomass (IC50): 3.9 g/L NaCl	4.1 (3.0 - 5.6)	17	
<i>L. minor</i>	No. Fronds (IC50) 3.8 g/L KCl	4.2 (3.1 - 5.7)	16	September 5, 2014
<i>P. subcapitata</i>	Growth (IC50) 28.9 µg/L Zn	25.1 (14.8 - 42.7)	30	August 14, 2014

SD = Standard Deviation, CV = Coefficient of Variation, IC = Inhibition Concentration, LC = Lethal Concentration.

APPENDIX A - *Ceriodaphnia dubia* Toxicity Test Data

Ceriodaphnia dubia Summary Sheet

Client: Mount Polley
 Work Order No.: 14569

Start Date/Time: Aug 22/14 @ 1100h
 Set up by: EMM

Sample Information:

Sample ID: QUL66-40m
 Sample Date: Aug 21/14
 Date Received: Aug 22/14
 Sample Volume: 3x20L

Test Validity Criteria:

- 1) Mean survival of first generation controls is >80 %
- 2) At least 60% of controls have produced three broods within 8 days
- 3) An average of >15 live young produced per surviving female in the control solutions during the first three broods.
- 4) Invalid if ephippia observed in any control solution at any time.

WQ Ranges:

T (°C) = 25 ± 1; DO (mg/L) = 3.3 to 8.4 ; pH = 6.0 to 8.5

Test Organism Information:

Broodstock No.: 081514A
 Age of young (Day 0): <24-h (within 12-h)
 Avg No. young in first 3 broods of previous 7 d: 19
 Mortality (%) in previous 7 d: 0
 Individual female # used ≥8 young on test day: 1, 2, 8, 11, 12, 13, 14, 16, 18

NaCl Reference Toxicant Results:

Reference Toxicant ID: CD117
 Stock Solution ID: 14N402
 Date Initiated: Aug 20/14

7-d LC50 (95% CL): 1.8 (1.5-2.2) g/L NaCl

APPENDIX B - Fathead Minnow (*Pimephales promelas*) Toxicity Test Data

Fathead Minnow Test Summary Sheet

(7-d *Pimephales promelas* Survival and Growth Test)

Client: Mant Polley
 Work Order No.: 14520

Start Date/Time: Aug 22/14 @ 1500h
 Test Species: P. promelas

Sample Information:

Sample ID: QUL66-40M
 Sample Date: Aug 21/14
 Date Received: Aug 22/14
 Sample Volume: 3820L

Dilution Water (initial water quality):

Type: 24.0^{NSC} Moderately hard
 Temperature (°C): 24.0
 pH: 8.0
 Dissolved Oxygen (mg/L): 8.1
 Hardness (mg/L CaCO₃): 92
 Alkalinity (mg/L CaCO₃): 58

Test Validity Criteria:

The test is invalid if:

- 1) for the control solutions, the combined and cumulative incidence of any mortalities, or fish showing loss of equilibrium or other signs of atypical swimming behavior, is >20%
- 2) the average dry weight of the surviving control fish does not attain 250 ug when the fish are dried and weighed.

WQ Ranges:
 T (°C) = 25 ± 1; DO (mg/L) = 3.3 to 8.4; pH = 6.5 to 8.5

Test Organism Information:

Batch No.: 082214
 Source: Aquatic Biosystems, CO
 Age: 224hr

NaCl Reference Toxicant Results:

Reference Toxicant ID: PP90
 Stock Solution ID: n/a
 Date Initiated: Aug 22/14
 7-d EC50 (95% CL): 5.2 (4.4-6.2)
 7-d IC50 (95% CL): 3.4 (3.3-4.6)

Survival:
 Reference Toxicant Mean and Historical Range: 4.5 (3.4-6.1) CV (%): 16

Biomass:
 Reference Toxicant Mean and Historical Range: 4.1 (3.0-5.6) CV (%): 17

Test Results:

	Survival	Biomass
LC25 % (v/v) (95% CL)	>100	
LC50 % (v/v) (95% CL)	>100	
IC25 % (v/v) (95% CL)		7100
IC50 % (v/v) (95% CL)		>100

APPENDIX C - *Lemna Minor* Toxicity Test Data

Lemna minor Summary Sheet

Client: Mount Polley
Work Order No.: 14572

Start Date: AUG 22 / 14
Set up by: KLP

Sample Information:

Sample ID: QUL - 66 - 40m
Sample Date: AUG 21 / 14
Date Received: AUG 22 / 14
Sample Volume: 3 x 20L

Test Organism Information:

Culture Date: 081314
Age of culture (Day 0): 9 days
>8X growth in APHA?: Y (24 fronds)

KCI Reference Toxicant Results:

Reference Toxicant ID: Lm 108
Date Initiated: SEPT 5 / 14

7-d No. of Fronds IC50 (95% CL): 3.8 (3.4 - 4.2)

7-d No. Fronds IC50 Reference Toxicant Mean (2 SD Range): 4.2 (3.1 - 5.7) CV (%): 16

This report has been prepared by Nautilus Environmental Company Inc. based on data and/or samples provided by our client and the results of this study are for their sole benefit. Any reliance on the data by a third party is at the sole and exclusive risk of that party. The results presented here relate only to the samples tested.

1.0 INTRODUCTION

Nautilus Environmental Company Inc. conducted toxicity tests for Mount Polley Mining Corporation on a sample identified as QUR-1. The sample was collected on August 22, 2014 and delivered to the laboratory in Burnaby, BC on August 23, 2014. The sample was transported in three 20-L plastic carboys and coolers. The sample was received at a temperature of 7.5°C and was stored in the dark at $4 \pm 2^\circ\text{C}$ prior to testing. The following sub-lethal toxicity tests were performed on the sample:

- *Ceriodaphnia dubia* survival and reproduction
- 7-d fathead minnow (*Pimephales promelas*) survival and growth
- 7-d duckweed (*Lemna minor*) growth inhibition
- 72-h algal (*Pseudokirchneriella subcapitata*) growth inhibition

This report describes the results of these toxicity tests. Copies of laboratory data sheets and printouts of statistical analyses for each test are provided in Appendices A to D. The chain-of-custody form is provided in Appendix E. This report was revised from an earlier version to incorporate data for dry weight of fathead minnows, in addition to biomass.

2.0 METHODS

Methods for the toxicity tests are summarized in Tables 1 to 4. Testing was conducted according to procedures described by the Environment Canada protocols (2007a, 2007b, 2007c and 2011). Statistical analyses for all tests were performed using CETIS (Tidepool Scientific Software, 2013).

Table 1. Summary of test conditions: *Ceriodaphnia dubia* survival and reproduction test.

Test organism	<i>Ceriodaphnia dubia</i>
Test organism source	In-house culture
Test organism age	<24 h old neonates produced within 12 h
Test type	Static-renewal
Test duration	7 ± 1 day
Test vessel	20 mL test tube
Test volume	15 mL
Test replicates	10 test replicates per treatment
Number of organisms	1 per replicate
Control water	20% Perrier water
Test solution renewal	Daily
Test temperature	25 ± 1°C
Feeding	<i>Pseudokirchneriella subcapitata</i> and YCT
Light intensity	100 to 600 lux at water surface
Photoperiod	16 hours light/8 hours dark
Aeration	None
Test protocol	Environment Canada, (2007a) EPS 1/RM/21
Statistical software	CETIS (2013)
Test endpoint	Survival and reproduction
Test acceptability criteria for controls	≥80% survival; ≥15 young per surviving control producing three broods; ≥60% of controls producing three or more broods
Reference toxicant	Sodium chloride

Table 2. Summary of test conditions: fathead minnow (*Pimephales promelas*) survival and growth test.

Test organism	<i>Pimephales promelas</i>
Test organism source	Aquatic BioSystems, Fort Collins, CO
Test organism age	<24 hours
Test type	Static renewal
Test duration	7 days
Test vessel	375-mL glass containers
Test volume	250 mL
Test replicates	3 per treatment
Number of organisms	10 per replicate
Control water	Moderately-hard water (hardness 80-100 mg/L CaCO ₃)
Test solution renewal	Daily
Test temperature	25 ± 1°C
Feeding	Twice a day with newly hatched brine shrimp (<i>Artemia nauplii</i>)
Light intensity	100 – 500 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	None
Test protocol	Environment Canada (2011), EPS 1/RM/22
Statistical software	CETIS (2013)
Test endpoint	Survival and biomass
Test acceptability criteria for controls	≥80% survival, ≥250 µg mean dry weight
Reference toxicant	Sodium Chloride

Table 3. Summary of test conditions: *Lemna minor* growth inhibition test.

Test organism	<i>Lemna minor</i>
Test organism source	In-house culture, obtained from Canadian Phycological Culture Centre, and originally isolated from Wainfleet, Stinking Barn, Niagara Peninsula, Ontario, Canada
Test organism age	7- to 10-day old
Test type	Static
Test duration	7 days
Test vessel	250 mL glass containers
Test volume	100 mL
Test replicates	4 test replicates per treatment
No. of organisms	Two 3-frond plants per replicate
Control water	Deionized water with nutrients added
Test solution renewal	None
Test temperature	25 ± 2°C
Feeding	None
Light intensity	4000 to 5600 lux full spectrum light
Photoperiod	24 hours light
Aeration	None
Test protocol	Environment Canada (2007b), EPS 1/RM/37
Statistical software	CETIS (2013)
Test endpoint	Number of fronds and dry weight
Test acceptability criteria for controls	≥ 8-fold increase in number of fronds
Reference toxicant	Potassium chloride

Table 4. Summary of test conditions: *Pseudokirchneriella subcapitata* growth inhibition test.

Test organism	<i>Pseudokirchneriella subcapitata</i> , strain UTCC #37
Test organism source	In-house culture, obtained from Canadian Phycological Culture Center, and originally isolated from Nitelva River, Norway.
Test organism age	3- to 7-day old culture in logarithmic growth phase
Test type	Static
Test duration	72 hours
Test vessel	Microplate
Test volume	220 µL
Test replicates	4 replicates per treatment; 8 replicates for control
Number of organisms	10,000 cells/mL
Control water	Deionized water with supplemented nutrients
Test solution renewal	None
Test temperature	24 ± 2°C
Feeding	None
Light intensity	3600 to 4400 lux
Photoperiod	24 hours light
Aeration	None
Test protocol	Environment Canada (2007c), EPS1/RM/25
Statistical software	CETIS (2013)
Test endpoint	Algal cell growth inhibition
Test acceptability criteria for controls	≥ 16-fold increase in number of algal cells; CV ≤ 20%; no trend when analyzed using Mann-Kendall test
Reference toxicant	Zinc

3.0 RESULTS

Adverse effects were observed on fathead minnow biomass (Table 6); the IC25 for biomass was 75.9%. There were no adverse effects observed on survival and reproduction of *C. dubia* (Table 5), frond count and dry weight of *L. minor* (Table 7) or cell yield of *P. subcapitata* (Table 8). The LC and IC values were therefore greater than the highest concentration tested for each of these endpoints in these toxicity tests. In addition, a stimulatory effect was observed for *P. subcapitata* cell yield; percent stimulation ranged from 38.9 to 320.4%.

Table 5. Results: *Ceriodaphnia dubia* survival and reproduction test.

Concentration (% v/v)	Survival (%)	Reproduction (mean ± SD)
Control	100	20.1 ± 5.2
1.56	100	20.5 ± 4.0
3.12	100	21.4 ± 3.4

IC50	>97	>97

SD = Standard Deviation, IC = Inhibition Concentration.

Table 8. Results: *Pseudokirchneriella subcapitata* growth inhibition test.

Concentration (% v/v)	Cell Density (x 10 ⁴ cells/mL) (Mean ± SD)	Stimulation (%)
Control	41.8 ± 3.8	--
1.5	58.0 ± 4.8*	38.9
3.0	72.0 ± 4.1*	72.5
6.0	70.5 ± 4.2*	68.9
11.9	82.0 ± 7.3*	96.4
23.8	119.8 ± 8.7*	186.8
47.6	138.8 ± 10.2*	232.3
95.2	175.5 ± 16.1*	320.4
Test endpoint (% v/v)		
IC25	>95.2	--
IC50	>95.2	--

SD = Standard Deviation, IC = Inhibition Concentration.

*Indicates cell yield that were significantly greater than the control.

4.0 QA/QC

The health history of the test organisms used in the exposures was acceptable and met the requirements of the Environment Canada protocols. The tests met all control acceptability criteria and water quality parameters remained within ranges specified in the protocols throughout the tests. Uncertainty associated with these tests is best described by the standard deviation around the mean and/or the confidence limits around the point estimates.

As per the client's request the fathead minnow test was initiated one day after the sample holding time expired due to a lack of available organisms. There were no other deviations from the test methodologies.

Results of the reference toxicant tests conducted during the testing program are summarized in Table 9. Results for these tests fell within the range for organism performance of mean and two standard deviation range, based on historical results obtained by the laboratory with these tests. Thus, the sensitivity of the organisms used in these tests was appropriate.

Table 9. Reference toxicant results.

Test Species	Endpoint	Historical Mean (2 SD Range)	CV (%)	Test Date
<i>C. dubia</i>	Survival (LC50): 1.8 g/L NaCl	1.8 (1.2 - 2.7)	22	August 26 , 2014
	Reproduction (IC50): 1.3 g/L NaCl	1.4 (1.0 - 1.9)	19	
<i>P. promelas</i>	Survival (LC50): 4.2 g/L NaCl	4.5 (3.5 - 5.9)	14	August 26, 2014
	Biomass (IC50): 3.3 g/L NaCl	4.1 (3.0 - 5.6)	17	
<i>L. minor</i>	No. Fronds (IC50) 3.8 g/L KCl	4.2 (3.1 - 5.7)	16	September 5, 2014
<i>P. subcapitata</i>	Growth (IC50) 28.9 µg/L Zn	25.1 (14.8 - 42.7)	30	August 14, 2014

SD = Standard Deviation, CV = Coefficient of Variation, IC = Inhibition Concentration, LC = Lethal Concentration.

APPENDIX A - *Ceriodaphnia dubia* Toxicity Test Data

Ceriodaphnia dubia Summary Sheet

Client: Mant Polley
 Work Order No.: 14577

Start Date/Time: Aug 23/14 @ 1425h
 Set up by: AWD

Sample Information:

Sample ID: QUR-1
 Sample Date: Aug 22/14
 Date Received: Aug 23/14
 Sample Volume: 3x200 = 3x20L

Test Validity Criteria:

- 1) Mean survival of first generation controls is $\geq 80\%$
- 2) At least 60% of controls have produced three broods within 8 days
- 3) An average of ≥ 15 live young produced per surviving female in the control solutions during the first three broods.
- 4) Invalid if ephippia observed in any control solution at any time.

WQ Ranges:

T ($^{\circ}$ C) = 25 ± 1 ; DO (mg/L) = 3.3 to 8.4; pH = 6.0 to 8.5

Test Organism Information:

Broodstock No.: 081514A
 Age of young (Day 0): <24-h (within 12-h)
 Avg No. young in first 3 broods of previous 7 d: 19
 Mortality (%) in previous 7 d: 0
 Individual female # used ≥ 8 young on test day: 7, 2, 8, 11, 12, 14, 16, 18

NaCl Reference Toxicant Results:

Reference Toxicant ID: cd117
 Stock Solution ID: 14NaO2
 Date Initiated: Aug 26/14

7-d LC50 (95% CL): 1.8 (1.5-2.2) g/L NaCl
 7-d IC50 (95% CL): 1.3 (1.1-1.5) g/L NaCl

7-d LC50 Reference Toxicant Mean and Historical Range: 1.8 (1.2-2.7) g/L NaCl CV (%): 22
 7-d IC50 Reference Toxicant Mean and Historical Range: 1.4 (1.0-1.9) g/L NaCl CV (%): 19

Test Results:

	Survival	Reproduction
LC50 % (v/v) (95% CL)	7100	
IC25 % (v/v) (95% CL)		7100
IC50 % (v/v) (95% CL)		7100

APPENDIX B - Fathead Minnow (*Pimephales promelas*) Toxicity Test Data

Fathead Minnow Test Summary Sheet
(7-d *Pimephales promelas* Survival and Growth Test)

Client: Mount Polley
Work Order No.: 14578

Start Date/Time: Aug 26/14 @ 1215h
Test Species: P. promelas

Sample Information:

Sample ID: OUR-1
Sample Date: Aug 22/14
Date Received: Aug 23/14
Sample Volume: 3020L

Dilution Water (initial water quality):

Type: Moderately hard water
Temperature (°C): 26.0
pH: 8.1
Dissolved Oxygen (mg/L): 7.7
Hardness (mg/L CaCO₃): ~~100~~ 100
Alkalinity (mg/L CaCO₃): 64

Test Validity Criteria:

The test is invalid if:

- 1) for the control solutions, the combined and cumulative incidence of any mortalities, or fish showing loss of equilibrium or other signs of atypical swimming behavior, is >20%
- 2) the average dry weight of the surviving control fish does not attain 250 ug when the fish are dried and weighed.

WQ Ranges:

T (°C) = 25 ± 1; DO (mg/L) = 3.3 to 8.4; pH = 6.5 to 8.5

Test Organism Information:

Batch No.: 082614
Source: Aquatic Biosystems, CO
Age: 224 hrs

NaCl Reference Toxicant Results:

Reference Toxicant ID: pp91
Stock Solution ID: n/a
Date Initiated: Aug 26/14
7-d EC50 (95% CL): 4.2 (3.7-4.7)
7-d IC50 (95% CL): ~~3.3 (2.9-4.7)~~ 3.3 (2.7-4.8)

Survival:

Reference Toxicant Mean and Historical Range: 4.5 (3.5-5.9) CV (%): 14

Biomass:

Reference Toxicant Mean and Historical Range: 4.1 (3.0-5.6) CV (%): 17

Test Results:

	Survival	Biomass
LC25 % (v/v) (95% CL)	10.4 (n/a-n/a)	
LC50 % (v/v) (95% CL)	<u>7100</u>	
IC25 % (v/v) (95% CL)		68.5 (n/a) <u>75.9 (24.9-102)</u>
IC50 % (v/v) (95% CL)		<u>7100</u>

This report has been prepared by Nautilus Environmental Company Inc. based on data and/or samples provided by our client and the results of this study are for their sole benefit. Any reliance on the data by a third party is at the sole and exclusive risk of that party. The results presented here relate only to the samples tested.

1.0 INTRODUCTION

Nautilus Environmental Company Inc. conducted toxicity tests for Mount Polley Mining Corporation on a sample identified as HAD-1-140827. The sample was collected on August 27, 2014 and delivered to the laboratory in Burnaby, BC on August 28, 2014. The sample was transported in two 20-L plastic carboys and coolers. The sample was received at a temperature of 14.1°C and was stored in the dark at $4 \pm 2^\circ\text{C}$ prior to testing. The following sub-lethal toxicity tests were performed on the sample:

- *Ceriodaphnia dubia* survival and reproduction
- 7-d fathead minnow (*Pimephales promelas*) survival and growth

This report describes the results of these toxicity tests. Copies of laboratory data sheets and printouts of statistical analyses for each test are provided in Appendices A and B. The chain-of-custody form is provided in Appendix C. This report was revised from an earlier version to incorporate data for dry weight of fathead minnows, in addition to biomass.

2.0 METHODS

Methods for the toxicity tests are summarized in Tables 1 and 2. Testing was conducted according to procedures described by the Environment Canada protocols (2007 and 2011). Statistical analyses for all tests were performed using CETIS (Tidepool Scientific Software, 2013).

Table 1. Summary of test conditions: *Ceriodaphnia dubia* survival and reproduction test.

Test organism	<i>Ceriodaphnia dubia</i>
Test organism source	In-house culture
Test organism age	<24 h old neonates produced within 12 h
Test type	Static-renewal
Test duration	7 ± 1 day
Test vessel	20 mL test tube
Test volume	15 mL
Test replicates	10 test replicates per treatment
Number of organisms	1 per replicate
Control water	20% Perrier water
Test solution renewal	Daily
Test temperature	25 ± 1°C
Feeding	<i>Pseudokirchneriella subcapitata</i> and YCT
Light intensity	100 to 600 lux at water surface
Photoperiod	16 hours light/8 hours dark
Aeration	None
Test protocol	Environment Canada, (2007) EPS 1/RM/21
Statistical software	CETIS (2013)
Test endpoint	Survival and reproduction
Test acceptability criteria for controls	≥80% survival; ≥15 young per surviving control producing three broods; ≥60% of controls producing three or more broods
Reference toxicant	Sodium chloride

Table 2. Summary of test conditions: fathead minnow (*Pimephales promelas*) survival and growth test.

Test organism	<i>Pimephales promelas</i>
Test organism source	Aquatic BioSystems, Fort Collins, CO
Test organism age	<24 hours
Test type	Static renewal
Test duration	7 days
Test vessel	375-mL glass containers
Test volume	250 mL
Test replicates	3 per treatment
Number of organisms	10 per replicate
Control water	Moderately-hard water (hardness 80-100 mg/L CaCO ₃)
Test solution renewal	Daily
Test temperature	25 ± 1°C
Feeding	Twice a day with newly hatched brine shrimp (<i>Artemia nauplii</i>)
Light intensity	100 – 500 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	None
Test protocol	Environment Canada (2011), EPS 1/RM/22
Statistical software	CETIS (2013)
Test endpoint	Survival and biomass
Test acceptability criteria for controls	≥80% survival, ≥250 µg mean dry weight
Reference toxicant	Sodium Chloride

3.0 RESULTS

There were no adverse effects observed on survival or reproduction of *C. dubia* (Table 3). The LC50, IC25 and IC50 were >100%. Adverse effects were observed on fathead minnow and biomass (Table 4); the IC25 and IC50 were 71.6 and >100%, respectively.

Table 3. Results: *Ceriodaphnia dubia* survival and reproduction test.

Concentration (% v/v)	Survival (%)	Reproduction (mean ± SD)
Control	90	16.1 ± 7.5
1.56	100	21.1 ± 2.3
3.12	100	22.7 ± 2.1
6.25	90	20.4 ± 7.7
12.5	100	23.7 ± 3.9
25	100	24.0 ± 2.9
50	70	20.3 ± 11.7
100	90	21.6 ± 10.9
Test endpoint (% v/v)		
LC50	>100	--
IC25	--	>100
IC50	--	>100

SD = Standard Deviation, LC = Lethal Concentration, IC = Inhibition Concentration.

Table 4. Results: fathead minnow (*Pimephales promelas*) survival and growth test.

Concentration (% v/v)	Mean ± SD		
	Survival (%)	Biomass (µg)	Dry Weight (µg)
Control	96.7 ± 5.8	788.3 ± 118.6	813.4 ± 87.0
1.56	86.7 ± 15.3	662.0 ± 29.6	778.2 ± 123.6
3.1	100.0 ± 0.0	792.0 ± 21.0	792.0 ± 21.0
6.25	90.0 ± 10.0	818.0 ± 76.6	910.8 ± 44.5
12.5	83.3 ± 11.6	719.0 ± 66.2	867.7 ± 61.5
25	100.0 ± 0.0	792.0 ± 26.6	792.0 ± 26.6
50	66.7 ± 15.3	571.0 ± 138.4	854.4 ± 19.5
100	60.0 ± 10.0	521.0 ± 55.2	876.6 ± 93.0
Test endpoint (% v/v)			
LC50	>100	--	--
IC25 (95% CL)	--	71.6 (47.0 - 98.8)	>100
IC50	--	>100	>100

SD = Standard Deviation, LC = Lethal Concentration, IC = Inhibition Concentration, CL = Confidence Limits.

4.0 QA/QC

The health history of the test organisms used in the exposures was acceptable and met the requirements of the Environment Canada protocols. The tests met all control acceptability criteria and water quality parameters remained within ranges specified in the protocols throughout the tests. There were no deviations from the test methodologies. Uncertainty associated with these tests is best described by the standard deviation around the mean and/or the confidence limits around the point estimates.

Results of the reference toxicant tests conducted during the testing program are summarized in Table 5. Results for these tests fell within the range for organism performance of mean and two standard deviation range, based on historical results obtained by the laboratory with these tests. Thus, the sensitivity of the organisms used in these tests was appropriate.

Table 5. Reference toxicant results.

Test Species	Endpoint	Historical Mean (2 SD Range)	CV (%)	Test Date
<i>C. dubia</i>	Survival (LC50): 1.8 g/L NaCl	1.8 (1.2 - 2.7)	22	August 26 , 2014
	Reproduction (IC50): 1.3 g/L NaCl	1.4 (1.0 - 1.9)	19	
<i>P. promelas</i>	Survival (LC50): 4.1 g/L NaCl	4.5 (3.4 - 5.9)	14	August 28, 2014
	Biomass (IC50): 3.4 g/L NaCl	4.0 (2.9 - 5.5)	17	

SD = Standard Deviation, CV = Coefficient of Variation, IC = Inhibition Concentration, LC = Lethal Concentration.

APPENDIX A - *Ceriodaphnia dubia* Toxicity Test Data

Ceriodaphnia dubia Summary Sheet

Client: Mount Polley
 Work Order No.: 14597

Start Date/Time: Aug 28/14 @ 1320h
 Set up by: EMM

Sample Information:

Sample ID: HAO-1-140827
 Sample Date: Aug 27/14
 Date Received: Aug 28/14
 Sample Volume: 2 x 20L

Test Validity Criteria:

- 1) Mean survival of first generation controls is $\geq 80\%$
- 2) At least 60% of controls have produced three broods within 8 days
- 3) An average of ≥ 15 live young produced per surviving female in the control solutions during the first three broods.
- 4) Invalid if ephippia observed in any control solution at any time.

WQ Ranges:

T ($^{\circ}$ C) = 25 ± 1 ; DO (mg/L) = 3.3 to 8.4 ; pH = 6.0 to 8.5

Test Organism Information:

Broodstock No.: 081514A
 Age of young (Day 0): <24-h (within 12-h)
 Avg No. young in first 3 broods of previous 7 d: 34
 Mortality (%) in previous 7 d: 5
 Individual female # used ≥ 8 young on test day: 11, 12, 13, 17, 19, 20

NaCl Reference Toxicant Results:

Reference Toxicant ID: cd117
 Stock Solution ID: 14Na02
 Date Initiated: Aug 26/14

APPENDIX B - Fathead Minnow (*Pimephales promelas*) Toxicity Test Data

Fathead Minnow Test Summary Sheet
(7-d *Pimephales promelas* Survival and Growth Test)

Client: Mount Polley
Work Order No.: 14598

Start Date/Time: Aug 28/14 @ 1330h
Test Species: *P. promelas*

Sample Information:

Sample ID: HAD-1-140827
Sample Date: Aug 29/14
Date Received: Aug 28/14
Sample Volume: 2x vol

Dilution Water (initial water quality):

Type: Moderately Hard Water
Temperature (°C): 25.0
pH: 8.2
Dissolved Oxygen (mg/L): 8.0
Hardness (mg/L CaCO₃): 100
Alkalinity (mg/L CaCO₃): 60

Test Validity Criteria:

The test is invalid if:

- 1) for the control solutions, the combined and cumulative incidence of any mortalities, or fish showing loss of equilibrium or other signs of atypical swimming behavior, is >20%
- 2) the average dry weight of the surviving control fish does not attain 250 ug when the fish are dried and weighed.

WQ Ranges:

T (°C) = 25 ± 1; DO (mg/L) = 3.3 to 8.4; pH = 6.5 to 8.5

Test Organism Information:

Batch No.: 082814
Source: Aquatic Biosystems, CO
Age: 224 hrs

NaCl Reference Toxicant Results:

Reference Toxicant ID: PP92
Stock Solution ID: n/a
Date Initiated: Aug 28/14
7-d EC50 (95% CL): 4.9 (3.5 - 6.8) g/L NaCl
7-d IC50 (95% CL): 3.7 (3.1 - 3.8) g/L NaCl

Survival:

Reference Toxicant Mean and Historical Range: 4.5 (3.4 - 5.9) g/L NaCl CV (%): 14

Biomass:

Reference Toxicant Mean and Historical Range: 4.0 (2.9 - 5.5) g/L NaCl CV (%): 17

Test Results:

	Survival	Biomass
LC25 % (v/v) (95% CL)	42.4 (24.6 - 92.0)	
LC50 % (v/v) (95% CL)	7100	
IC25 % (v/v) (95% CL)		71.6 (47.0 - 98.8)
IC50 % (v/v) (95% CL)		7100

Test Species: Oncorhynchus mykiss

Sample Information:

Sample ID: CUL-66-40m-140828
Sample Date: August 28/14 @ 1005
Date Received: August 29/14 @ 0950
Sample Volume: 3 x 20L
Other: N/A

Test Validity Criteria:

≥ 90% control survival

WQ Ranges:

T (°C) = 15 ± 1; DO (mg/L) = 7.0 to 10.3; pH = 5.5 to 8.5

Dilution Water:

Type: Dechlorinated Municipal Tap Water
Hardness (mg/L CaCO₃): 11
Alkalinity (mg/L CaCO₃): 9

Test Organism Information:

Batch No.: 080614
Source: Miracle Springs
No. Fish/Volume (L): 10/10
Loading Density (g/L): 0.33
Mean Length ± SD (mm): 34 ± 2 Range: 30 - 38
Mean Weight ± SD (g): 0.33 ± 0.07 Range: 0.21 - 0.43

NaNO₂ Reference Toxicant Results:

Reference Toxicant ID: RTN166
Stock Solution ID: 14NE01
Date Initiated: August 20/14
96-h LC50 (95% CL): 10.9 (8.1 - 14.7) mg/L NaNO₂

Reference Toxicant Mean and Historical Range: 4.9 (2.0 - 12.0) mg/L NaNO₂
Reference Toxicant CV (%): 56

Test Results: The 96-h LC50 is >100% (N/A).

This report has been prepared by Nautilus Environmental Company Inc. based on data and/or samples provided by our client and the results of this study are for their sole benefit. Any reliance on the data by a third party is at the sole and exclusive risk of that party. The results presented here relate only to the samples tested.

1.0 INTRODUCTION

Nautilus Environmental Company Inc. conducted toxicity tests for Mount Polley Mining Corporation on a sample identified as QUL66-40m-140828. The sample was collected on August 28, 2014 and delivered to the laboratory in Burnaby, BC on August 29, 2014. The sample was transported in three 20-L plastic carboys and coolers. The sample was received at a temperature of 7.2°C and was stored in the dark at $4 \pm 2^\circ\text{C}$ prior to testing. The following sub-lethal toxicity tests were performed on the sample:

- *Ceriodaphnia dubia* survival and reproduction
- 7-d fathead minnow (*Pimephales promelas*) survival and growth
- 7-d duckweed (*Lemna minor*) growth inhibition
- 72-h algal (*Pseudokirchneriella subcapitata*) growth inhibition

This report describes the results of these toxicity tests. Copies of laboratory data sheets and printouts of statistical analyses for each test are provided in Appendices A to D. The chain-of-custody form is provided in Appendix E. This report was revised from an earlier version to incorporate data for dry weight of fathead minnows, in addition to biomass.

2.0 METHODS

Methods for the toxicity tests are summarized in Tables 1 to 4. Testing was conducted according to procedures described by the Environment Canada protocols (2007a, 2007b, 2007c and 2011). Statistical analyses for all tests were performed using CETIS (Tidepool Scientific Software, 2013).

Table 1. Summary of test conditions: *Ceriodaphnia dubia* survival and reproduction test.

Test organism	<i>Ceriodaphnia dubia</i>
Test organism source	In-house culture
Test organism age	<24 h old neonates produced within 12 h
Test type	Static-renewal
Test duration	7 ± 1 day
Test vessel	20 mL test tube
Test volume	15 mL
Test replicates	10 test replicates per treatment
Number of organisms	1 per replicate
Control water	20% Perrier water
Test solution renewal	Daily
Test temperature	25 ± 1°C
Feeding	<i>Pseudokirchneriella subcapitata</i> and YCT
Light intensity	100 to 600 lux at water surface
Photoperiod	16 hours light/8 hours dark
Aeration	None
Test protocol	Environment Canada, (2007a) EPS 1/RM/21
Statistical software	CETIS (2013)
Test endpoint	Survival and reproduction
Test acceptability criteria for controls	≥80% survival; ≥15 young per surviving control producing three broods; ≥60% of controls producing three or more broods
Reference toxicant	Sodium chloride

Table 2. Summary of test conditions: fathead minnow (*Pimephales promelas*) survival and growth test.

Test organism	<i>Pimephales promelas</i>
Test organism source	Aquatic BioSystems, Fort Collins, CO
Test organism age	<24 hours
Test type	Static renewal
Test duration	7 days
Test vessel	375-mL glass containers
Test volume	250 mL
Test replicates	3 per treatment
Number of organisms	10 per replicate
Control water	Moderately-hard water (hardness 80-100 mg/L CaCO ₃)
Test solution renewal	Daily
Test temperature	25 ± 1°C
Feeding	Twice a day with newly hatched brine shrimp (<i>Artemia nauplii</i>)
Light intensity	100 – 500 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	None
Test protocol	Environment Canada (2011), EPS 1/RM/22
Statistical software	CETIS (2013)
Test endpoint	Survival and biomass
Test acceptability criteria for controls	≥80% survival, ≥250 µg mean dry weight
Reference toxicant	Sodium Chloride

Table 3. Summary of test conditions: *Lemna minor* growth inhibition test.

Test organism	<i>Lemna minor</i>
Test organism source	In-house culture, obtained from Canadian Phycological Culture Centre, and originally isolated from Wainfleet, Stinking Barn, Niagara Peninsula, Ontario, Canada
Test organism age	7-to 10-day old
Test type	Static
Test duration	7 days
Test vessel	250 mL glass containers
Test volume	100 mL
Test replicates	4 test replicates per treatment
No. of organisms	Two 3-frond plants per replicate
Control water	Deionized water with nutrients added
Test solution renewal	None
Test temperature	25 ± 2°C
Feeding	None
Light intensity	4000 to 5600 lux full spectrum light
Photoperiod	24 hours light
Aeration	None
Test protocol	Environment Canada (2007b), EPS 1/RM/37
Statistical software	CETIS (2013)
Test endpoint	Number of fronds and dry weight
Test acceptability criteria for controls	≥ 8-fold increase in number of fronds
Reference toxicant	Potassium chloride

Table 4. Summary of test conditions: *Pseudokirchneriella subcapitata* growth inhibition test.

Test organism	<i>Pseudokirchneriella subcapitata</i> , strain UTCC #37
Test organism source	In-house culture, obtained from Canadian Phycological Culture Center, and originally isolated from Nitelva River, Norway.
Test organism age	3- to 7-day old culture in logarithmic growth phase
Test type	Static
Test duration	72 hours
Test vessel	Microplate
Test volume	220 µL
Test replicates	4 replicates per treatment; 8 replicates for control
Number of organisms	10,000 cells/mL
Control water	Deionized water with supplemented nutrients
Test solution renewal	None
Test temperature	24 ± 2°C
Feeding	None
Light intensity	3600 to 4400 lux
Photoperiod	24 hours light
Aeration	None
Test protocol	Environment Canada (2007c), EPS1/RM/25
Statistical software	CETIS (2013)
Test endpoint	Algal cell growth inhibition
Test acceptability criteria for controls	≥ 16-fold increase in number of algal cells; CV ≤ 20%; no trend when analyzed using Mann-Kendall test
Reference toxicant	Zinc

3.0 RESULTS

Adverse effects were observed only on *C. dubia* reproduction (Table 5). The IC25 and IC50 values were 3.0 and 5.3%, respectively. There were no adverse effects observed on survival of *C. dubia*, survival and growth of fathead minnow (Table 6), frond count and dry weight of *L. minor* (Table 7) or cell yield of *P. subcapitata* (Table 8). The LC and IC values were therefore greater than the highest concentration tested for each of these endpoints in these toxicity tests. In addition, a stimulatory effect was observed for *P. subcapitata* cell yield; percent stimulation ranged from 9.6 to 198.7%.

Table 5. Results: *Ceriodaphnia dubia* survival and reproduction test.

Concentration (% v/v)	Survival (%)	Reproduction (mean ± SD)
Control	100	18.8 ± 4.0
1.56	100	16.2 ± 3.6
3.12	100	13.9 ± 3.5

95.2	56.2 ± 7.6*	44.2
Test endpoint (% v/v)		
IC25	>95.2	--
IC50	>95.2	--

SD = Standard Deviation, IC = Inhibition Concentration.

*Indicates cell yield that were significantly greater than the control.

4.0 QA/QC

The health history of the test organisms used in the exposures was acceptable and met the requirements of the Environment Canada protocols. The tests met all control acceptability criteria and water quality parameters remained within ranges specified in the protocols throughout the tests. Uncertainty associated with these tests is best described by the standard deviation around the mean and/or the confidence limits around the point estimates.

The *L. minor* test was initiated using fronds from a culture dish that had visible contamination. The client was notified and requested to proceed with testing. All test acceptability criteria were satisfied, indicating that the fronds used in the test were healthy and the data presented in this report are valid. There were no other deviations from the test methodologies.

Results of the reference toxicant tests conducted during the testing program are summarized in Table 9. Results for these tests fell within the range for organism performance of mean and two standard deviation range, based on historical results obtained by the laboratory with these tests. Thus, the sensitivity of the organisms used in these tests was appropriate.

Table 9. Reference toxicant results.

Test Species	Endpoint	Historical Mean (2 SD Range)	CV (%)	Test Date
<i>C. dubia</i>	Survival (LC50): 1.8 g/L NaCl	1.8 (1.2 - 2.7)	22	August 26 , 2014
	Reproduction (IC50): 1.3 g/L NaCl	1.4 (1.0 - 1.9)	19	
<i>P. promelas</i>	Survival (LC50): 4.2 g/L NaCl	4.5 (3.4 - 5.9)	14	August 29, 2014
	Biomass (IC50): 3.2 g/L NaCl	4.0 (2.9 - 5.5)	18	
<i>L. minor</i>	No. Fronds (IC50) 3.8 g/L KCl	4.2 (3.1 - 5.7)	16	September 5, 2014
<i>P. subcapitata</i>	Growth (IC50) 29.2 µg/L Zn	25.2 (14.8 - 42.8)	30	September 5, 2014

SD = Standard Deviation, CV = Coefficient of Variation, IC = Inhibition Concentration, LC = Lethal Concentration.

APPENDIX A - *Ceriodaphnia dubia* Toxicity Test Data

Ceriodaphnia dubia Summary Sheet

Client: Mount Pottery
 Work Order No.: 14602

Start Date/Time: Aug 29/14 @ 1100h
 Set up by: EMM

Sample Information:

Sample ID: QUL-6640m-140828
 Sample Date: Aug 28/14
 Date Received: Aug 29/14
 Sample Volume: 3x20L

Test Validity Criteria:

- 1) Mean survival of first generation controls is $\geq 80\%$
- 2) At least 60% of controls have produced three broods within 8 days
- 3) An average of ≥ 15 live young produced per surviving female in the control solutions during the first three broods.
- 4) Invalid if ephippia observed in any control solution at any time.

WQ Ranges:

T ($^{\circ}$ C) = 25 ± 1 ; DO (mg/L) = 3.3 to 8.4 ; pH = 6.0 to 8.5

Test Organism Information:

Broodstock No.: 082114
 Age of young (Day 0): <24-h (within 12-h)
 Avg No. young in first 3 broods of previous 7 d: 20
 Mortality (%) in previous 7 d: 0
 Individual female # used ≥ 8 young on test day: 21, 23, 25, 26, 28, 29, 30

NaCl Reference Toxicant Results:

Reference Toxicant ID: cd117
 Stock Solution ID: 14Na02

APPENDIX B - Fathead Minnow (*Pimephales promelas*) Toxicity Test Data

Fathead Minnow Test Summary Sheet

(7-d *Pimephales promelas* Survival and Growth Test)

Client: Mount Pooley
 Work Order No.: 14603

Start Date/Time: Aug 29/14 @ 1250h
 Test Species: P. promelas

Sample Information:

Sample ID: 011-66-40m-140625
 Sample Date: Aug 28/14
 Date Received: Aug 29/14
 Sample Volume: 3 x 20L

Dilution Water (initial water quality):

Type: Moderately hard water
 Temperature (°C): 25.0
 pH: 8.1
 Dissolved Oxygen (mg/L): 8.0
 Hardness (mg/L CaCO₃): 100
 Alkalinity (mg/L CaCO₃): 60

Test Validity Criteria:

The test is invalid if:

- 1) for the control solutions, the combined and cumulative incidence of any mortalities, or fish showing loss of equilibrium or other signs of atypical swimming behavior, is >20%
- 2) the average dry weight of the surviving control fish does not attain 250 ug when the fish are dried and weighed.

WQ Ranges:
 T (°C) = 25 ± 1; DO (mg/L) = 3.3 to 8.4; pH = 6.5 to 8.5

Test Organism Information:

Batch No.: 082914
 Source: Aquatic Biosystems
 Age: 27d 224hr

APPENDIX C - *Lemna Minor* Toxicity Test Data

Lemna minor Summary Sheet

Client: Mount Polley
Work Order No.: 14605

Start Date: AUGUST 29 / 14
Set up by: KLP

Sample Information:

Sample ID: GUL-66-40M-140828
Sample Date: AUG 28 / 14
Date Received: AUG 29 / 14
Sample Volume: 3 x 20L

Test Organism Information:

Culture Date: 082014
Age of culture (Day 0): 9 days
>8X growth in APHA?: Y (31 fronds)

KCI Reference Toxicant Results:

Reference Toxicant ID: Lm 108
Date Initiated: Sept 5/14

7-d No. of Fronds IC50 (95% CL): 3.8 (3.4 - 4.2)

7-d No. Fronds IC50 Reference Toxicant Mean (2 SD Range): 4.2 (3.1-5.7) CV (%): 16

	Number of Fronds	Dry Weight
Test Results: IC25 %(v/v) (95% CL)	> 97	> 97

This report has been prepared by Nautilus Environmental Company Inc. based on data and/or samples provided by our client and the results of this study are for their sole benefit. Any reliance on the data by a third party is at the sole and exclusive risk of that party. The results presented here relate only to the samples tested.

1.0 INTRODUCTION

Nautilus Environmental Company Inc. conducted toxicity tests for Mount Polley Mining Corporation on samples identified as HAD-2-140903 and QUL-66-45m-140903. The samples were collected on September 3, 2014 and delivered to the laboratory in Burnaby, BC on September 4, 2014. The samples were each transported in two 20-L plastic carboys and coolers. HAD-2-140903 and QUL-66-45m-140903 were received at temperatures of 10.9 and 7.3°C, respectively, and were stored in the dark at $4 \pm 2^\circ\text{C}$ prior to testing. The following sub-lethal toxicity tests were performed on the samples:

- *Ceriodaphnia dubia* survival and reproduction
- 7-d fathead minnow (*Pimephales promelas*) survival and growth

This report describes the results of these toxicity tests. Copies of laboratory data sheets and printouts of statistical analyses for each test are provided in Appendices A and B. The chain-of-custody form is provided in Appendix C. This report was revised from an earlier version to incorporate data for dry weight of fathead minnows, in addition to biomass.

2.0 METHODS

Methods for the toxicity tests are summarized in Tables 1 and 2. Testing was conducted according to procedures described by the Environment Canada protocols (2007 and 2011). Statistical analyses for all tests were performed using CETIS (Tidepool Scientific Software, 2013).

Table 1. Summary of test conditions: *Ceriodaphnia dubia* survival and reproduction test.

Test organism	<i>Ceriodaphnia dubia</i>
Test organism source	In-house culture
Test organism age	<24 h old neonates produced within 12 h
Test type	Static-renewal
Test duration	7 ± 1 day
Test vessel	20 mL test tube
Test volume	15 mL
Test replicates	10 test replicates per treatment
Number of organisms	1 per replicate
Control water	20% Perrier water
Test solution renewal	Daily
Test temperature	25 ± 1°C
Feeding	<i>Pseudokirchneriella subcapitata</i> and YCT
Light intensity	100 to 600 lux at water surface
Photoperiod	16 hours light/8 hours dark
Aeration	None
Test protocol	Environment Canada, (2007) EPS 1/RM/21
Statistical software	CETIS (2013)
Test endpoint	Survival and reproduction
Test acceptability criteria for controls	≥80% survival; ≥15 young per surviving control producing three broods; ≥60% of controls producing three or more broods
Reference toxicant	Sodium chloride

Table 2. Summary of test conditions: fathead minnow (*Pimephales promelas*) survival and growth test.

Test organism	<i>Pimephales promelas</i>
Test organism source	Aquatic BioSystems, Fort Collins, CO
Test organism age	<24 hours
Test type	Static renewal
Test duration	7 days
Test vessel	375-mL glass containers
Test volume	250 mL
Test replicates	3 per treatment
Number of organisms	10 per replicate
Control water	Moderately-hard water (hardness 80-100 mg/L CaCO ₃)
Test solution renewal	Daily
Test temperature	25 ± 1°C
Feeding	Twice a day with newly hatched brine shrimp (<i>Artemia nauplii</i>)
Light intensity	100 – 500 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	None
Test protocol	Environment Canada (2011), EPS 1/RM/22
Statistical software	CETIS (2013)
Test endpoint	Survival and biomass
Test acceptability criteria for controls	≥80% survival, ≥250 µg mean dry weight
Reference toxicant	Sodium Chloride

3.0 RESULTS

Results of the *C. dubia* test are provided in Table 3. No adverse effects were observed on survival or reproduction in HAD-2-140903; the LC50, IC25 and IC50 were >100%. No adverse effects on survival were observed in QUL-66-45m-140903; the LC50 was >100%. Reproduction was inhibited in QUL-66-45m-140903 resulting in an IC25 of 1.8% and an IC50 of 13.6%.

Results of the fathead minnow test are provided in Table 4. Adverse effects on survival and biomass were observed in HAD-2-140903. The LC50 was 84.1% and the IC25 was 24.2%. No adverse effects on survival or biomass were observed in QUL-66-45m-140903; the LC50, IC25 and IC50 were >100%.

Table 3. Results: *Ceriodaphnia dubia* survival and reproduction test.

Concentration (% v/v)	HAD-2-140903		QUL-66-45m-140903

SD = Standard Deviation, LC = Lethal Concentration, IC = Inhibition Concentration, CL = Confidence Limits, NA = Not Applicable.

4.0 QA/QC

The health history of the test organisms used in the exposures was acceptable and met the requirements of the Environment Canada protocols. The tests met all control acceptability criteria specified in the protocols throughout the tests. Uncertainty associated with these tests is best described by the standard deviation around the mean and/or the confidence limits around the point estimates.

On day 5 of the fathead minnow test with HAD-2-140903 the temperature in the 100% concentration was measured as 22.0 °C, which is below the range of $25 \pm 1^\circ\text{C}$ for this test, but well within the range of tolerance for this species. The temperature of the water bath was readjusted and the temperature increased to within the required range. All other water quality parameters measured during the toxicity tests were within the acceptable ranges. There were no other deviations from the test methodologies.

Results of the reference toxicant tests conducted during the testing program are summarized in Table 5. Results for the *C. dubia* test fell within the range for organism performance of mean and two standard deviation range, based on historical results obtained by the laboratory with these tests. Thus, the sensitivity of the organisms used in this test was appropriate.

In the fathead minnow reference toxicant test, mean control survival was 73.3% which was below the acceptability criterion of $\geq 80\%$. One control replicate had 30% survival while the other two control replicates had 90 and 100% survival. Mean control survival in the test with HAD-2-140903 and QUL-66-45m-140903 were 96.7% and 83.3%, respectively, indicating that the organisms used were healthy. Thus, the low survival in the one control replicate for the reference toxicant test was likely an anomalous result. Endpoints, historical means and coefficient of variations were not calculated or reported for the fathead minnow reference toxicant test due to the control failure.

Table 5. Reference toxicant results.

Test Species	Endpoint	Historical Mean (2 SD Range)	CV (%)	Test Date
<i>C. dubia</i>	Survival (LC50): 1.8 g/L NaCl	1.8 (1.2 - 2.7)	22	August 26 , 2014
	Reproduction (IC50): 1.3 g/L NaCl	1.4 (1.0 - 1.9)	19	
<i>P. promelas</i> *	Survival (LC50): N/A	N/A	N/A	September 5, 2014
	Biomass (IC50): N/A	N/A	N/A	

SD = Standard Deviation, CV = Coefficient of Variation, IC = Inhibition Concentration, LC = Lethal Concentration, N/A = Not Applicable.

*Results not available for the fathead minnow reference toxicant test. See QA/QC section for further details.

APPENDIX A - *Ceriodaphnia dubia* Toxicity Test Data

Ceriodaphnia dubia Summary Sheet

Client: Mount Polley
 Work Order No.: 14614

Start Date/Time: Sept 4/14 @ 1200h
 Set up by: EMM

Sample Information:

Sample ID: HAD-2-140903
 Sample Date: Sept 3/14
 Date Received: Sept 4/14
 Sample Volume: 2X20L

Test Validity Criteria:

- 1) Mean survival of first generation controls is $\geq 80\%$
- 2) At least 60% of controls have produced three broods within 8 days
- 3) An average of ≥ 15 live young produced per surviving female in the control solutions during the first three broods.
- 4) Invalid if ephippia observed in any control solution at any time.

WQ Ranges:

T ($^{\circ}$ C) = 25 ± 1 ; DO (mg/L) = 3.3 to 8.4 ; pH = 6.0 to 8.5

Test Organism Information:

Broodstock No.: 082114
 Age of young (Day 0): <24-h (within 12-h)
 Avg No. young in first 3 broods of previous 7 d: 43
 Mortality (%) in previous 7 d: 10
 Individual female # used ≥ 8 young on test day: 21, 22, 23, 26, 27, 30, 31, 33, 35, 36, 39

NaCl Reference Toxicant Results:

Reference Toxicant ID: cd117
 Stock Solution ID: 14NaO2
 Date Initiated: Aug 20/14

7-d LC50 (95% CL): 1.8 (1.5-2.2) g/L NaCl
 7-d IC50 (95% CL): 1.3 (1.1-1.5) g/L NaCl

7-d LC50 Reference Toxicant Mean and Historical Range: 1.8 (1.2-2.7) g/L NaCl CV (%): 22
 7-d IC50 Reference Toxicant Mean and Historical Range: 1.4 (1.0-1.9) g/L NaCl CV (%): 19

Test Results:

	Survival	Reproduction
LC50 % (v/v) (95% CL)	7100	
IC25 % (v/v) (95% CL)		7100
IC50 % (v/v) (95% CL)		7100

Ceriodaphnia dubia Summary Sheet

Client: Mount Polley
 Work Order No.: 14624

Start Date/Time: Sept 4/14 @ 1130h
 Set up by: EMM

Sample Information:

Sample ID: QUL-66-45m-140903
 Sample Date: Sept 3/14
 Date Received: Sept 4/14
 Sample Volume: 2X20L

Test Validity Criteria:

- 1) Mean survival of first generation controls is $\geq 80\%$
- 2) At least 60% of controls have produced three broods within 8 days
- 3) An average of ≥ 15 live young produced per surviving female in the control solutions during the first three broods.
- 4) Invalid if ephippia observed in any control solution at any time.

WQ Ranges:

T ($^{\circ}$ C) = 25 ± 1 ; DO (mg/L) = 3.3 to 8.4 ; pH = 6.0 to 8.5

Test Organism Information:

Broodstock No.: 082114
 Age of young (Day 0): <24-h (within 12-h)
 Avg No. young in first 3 broods of previous 7 d: 43
 Mortality (%) in previous 7 d: 10
 Individual female # used ≥ 8 young on test day: 21, 22, 23, 26, 27, 30, 31, 33, 35, 36, 39

NaCl Reference Toxicant Results:

Reference Toxicant ID: Cd117
 Stock Solution ID: 14Na02
 Date Initiated: Aug 26/14

7-d LC50 (95% CL): 1.8 (1.5-2.2) g/L NaCl
 7-d IC50 (95% CL): 1.3 (1.1-1.5) g/L NaCl

7-d LC50 Reference Toxicant Mean and Historical Range: 1.8 (1.2-2.7) g/L NaCl CV (%): 22
 7-d IC50 Reference Toxicant Mean and Historical Range: 1.4 (1.0-1.9) g/L NaCl CV (%): 19

Test Results:

	Survival	Reproduction
LC50 % (v/v) (95% CL)	7100	09.0
IC25 % (v/v) (95% CL)		1.8 (1.56-6.4)
IC50 % (v/v) (95% CL)		13.6 (9.0-53.8)

Fathead Minnow Test Summary Sheet
(7-d *Pimephales promelas* Survival and Growth Test)

Client: Mulent Polley
Work Order No.: 14615

Start Date/Time: Sept 5/14 @ 1500h
Test Species: P. promelas

Sample Information:

Sample ID: QUL-66-4SM-140903
Sample Date: Sept 3/14
Date Received: Sept 4/14
Sample Volume: 2x 400 L

Dilution Water (initial water quality):

Type: Moderately hard
Temperature (°C): 24.0
pH: 7.9
Dissolved Oxygen (mg/L): 7.4
Hardness (mg/L CaCO₃): 104
Alkalinity (mg/L CaCO₃): 64

Test Validity Criteria:

The test is invalid if:

- 1) for the control solutions, the combined and cumulative incidence of any mortalities, or fish showing loss of equilibrium or other signs of atypical swimming behavior, is >20%
- 2) the average dry weight of the surviving control fish does not attain 250 ug when the fish are dried and weighed.

WQ Ranges:

T (°C) = 25 ± 1; DO (mg/L) = 3.3 to 8.4; pH = 6.5 to 8.5

Test Organism Information:

Batch No.: 090514
Source: Aquatic Biosystems, CO
Age: 224 hrs

NaCl Reference Toxicant Results:

Reference Toxicant ID: PP95
Stock Solution ID: n/a
Date Initiated: Sept 5/14
7-d EC50 (95% CL): n/a } control failure
7-d IC50 (95% CL): n/a }

Survival:

This report has been prepared by Nautilus Environmental Company Inc. based on data and/or samples provided by our client and the results of this study are for their sole benefit. Any reliance on the data by a third party is at the sole and exclusive risk of that party. The results presented here relate only to the samples tested.

1.0 INTRODUCTION

Nautilus Environmental Company Inc. conducted toxicity tests for Mount Polley Mining Corporation on samples identified as HAD-1-140910 and QUL-66-48m-140910. The samples were collected on September 10, 2014 and delivered to the laboratory in Burnaby, BC on September 11, 2014. The samples were each transported in two 20-L plastic carboys and coolers. HAD-1-140910 and QUL-66-48m-140910 were received at temperatures of 10.5 and 8.5°C, respectively, and were stored in the dark at $4 \pm 2^\circ\text{C}$ prior to testing. The following sub-lethal toxicity tests were performed on the samples:

- *Ceriodaphnia dubia* survival and reproduction
- 7-d fathead minnow (*Pimephales promelas*) survival and growth

This report describes the results of these toxicity tests. Copies of laboratory data sheets and printouts of statistical analyses for each test are provided in Appendices A and B. The chain-of-custody form is provided in Appendix C. This report was revised from an earlier version to incorporate data for dry weight of fathead minnows, in addition to biomass.

2.0 METHODS

Methods for the toxicity tests are summarized in Tables 1 and 2. Testing was conducted according to procedures described by the Environment Canada protocols (2007 and 2011). Statistical analyses for all tests were performed using CETIS (Tidepool Scientific Software, 2013).

Table 1. Summary of test conditions: *Ceriodaphnia dubia* survival and reproduction test.

Test organism	<i>Ceriodaphnia dubia</i>
Test organism source	In-house culture
Test organism age	<24 h old neonates produced within 12 h
Test type	Static-renewal
Test duration	7 ± 1 day
Test vessel	20 mL test tube
Test volume	15 mL
Test replicates	10 test replicates per treatment
Number of organisms	1 per replicate
Control water	20% Perrier water
Test solution renewal	Daily
Test temperature	25 ± 1°C
Feeding	<i>Pseudokirchneriella subcapitata</i> and YCT
Light intensity	100 to 600 lux at water surface
Photoperiod	16 hours light/8 hours dark
Aeration	None
Test protocol	Environment Canada, (2007) EPS 1/RM/21
Statistical software	CETIS (2013)
Test endpoint	Survival and reproduction
Test acceptability criteria for controls	≥80% survival; ≥15 young per surviving control producing three broods; ≥60% of controls producing three or more broods
Reference toxicant	Sodium chloride

Table 2. Summary of test conditions: fathead minnow (*Pimephales promelas*) survival and growth test.

Test organism	<i>Pimephales promelas</i>
Test organism source	Aquatic BioSystems, Fort Collins, CO
Test organism age	<24 hours
Test type	Static renewal
Test duration	7 days
Test vessel	375-mL glass containers
Test volume	250 mL
Test replicates	3 per treatment
Number of organisms	10 per replicate
Control water	Moderately-hard water (hardness 80-100 mg/L CaCO ₃)
Test solution renewal	Daily
Test temperature	25 ± 1°C
Feeding	Twice a day with newly hatched brine shrimp (<i>Artemia nauplii</i>)
Light intensity	100 – 500 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	None
Test protocol	Environment Canada (2011), EPS 1/RM/22
Statistical software	CETIS (2013)
Test endpoint	Survival and biomass
Test acceptability criteria for controls	≥80% survival, ≥250 µg mean dry weight
Reference toxicant	Sodium Chloride

3.0 RESULTS

Results of the *C. dubia* test are provided in Table 3. No adverse effects were observed on survival or reproduction in HAD-1-140910; the LC50, IC25 and IC50 were >100%. No adverse effects on survival were observed in QUL-66-48m-140910; the LC50 was >100%. Reproduction was inhibited in QUL-66-48m-140910 resulting in IC25 and IC50 values of <1.56 and 2.5%, respectively.

Results of the fathead minnow test are provided in Table 4. No adverse effects were observed on survival or biomass in HAD-1-140910 or QUL-66-48m-140910. The LC50, IC25 and IC50 were all >100% for both samples.

Table 3. Results: *Ceriodaphnia dubia* survival and reproduction test.

4.0 QA/QC

The health history of the test organisms used in the exposures was acceptable and met the requirements of the Environment Canada protocols. The tests met all control acceptability criteria and water quality parameters remained within ranges specified in the protocols throughout the tests. There were no deviations from the test methodologies. Uncertainty associated with these tests is best described by the standard deviation around the mean and/or the confidence limits around the point estimates.

Results of the reference toxicant tests conducted during the testing program are summarized in Table 5. Results for these tests fell within the range for organism performance of mean and two standard deviation range, based on historical results obtained by the laboratory with these tests. Thus, the sensitivity of the organisms used in these tests was appropriate.

Table 5. Reference toxicant results.

Test Species	Endpoint	Historical Mean (2 SD Range)	CV (%)	Test Date
<i>C. dubia</i>	Survival (LC50): 2.1 g/L NaCl	1.8 (1.4 - 2.5)	16	September 23 , 2014
	Reproduction (IC50): 1.9 g/L NaCl	1.4 (1.0 - 1.9)	17	
<i>P. promelas</i>	Survival (LC50): 4.2 g/L NaCl	4.5 (3.5 - 5.7)	13	September 12, 2014
	Biomass (IC50): 3.8 g/L NaCl	3.9 (2.9 - 5.4)	17	

SD = Standard Deviation, CV = Coefficient of Variation, IC = Inhibition Concentration, LC = Lethal Concentration.

APPENDIX A - *Ceriodaphnia dubia* Toxicity Test Data

Ceriodaphnia dubia Summary Sheet

Client: Mount Polley
 Work Order No.: 14631

Start Date/Time: Sept 11/14 @ 1340h
 Set up by: EMM

Sample Information:

Sample ID: HAD-1-140910
 Sample Date: Sept 10/14
 Date Received: Sept 11/14
 Sample Volume: 2 x 20L

Test Validity Criteria:

- 1) Mean survival of first generation controls is $\geq 80\%$
- 2) At least 60% of controls have produced three broods within 8 days
- 3) An average of ≥ 15 live young produced per surviving female in the control solutions during the first three broods.
- 4) Invalid if ephippia observed in any control solution at any time.

WQ Ranges:
 T ($^{\circ}\text{C}$) = 25 ± 1 ; DO (mg/L) = 3.3 to 8.4 ; pH = 6.0 to 8.5

Test Organism Information:

Broodstock No.: 082914A
 Age of young (Day 0): <24-h (within 12-h)
 Avg No. young in first 3 broods of previous 7 d: 30
 Mortality (%) in previous 7 d: 0
 Individual female # used ≥ 8 young on test day: 4,5,6,7,9,10,11,12,14

NaCl Reference Toxicant Results:

Reference Toxicant ID: Cd118
 Stock Solution ID: 14Na02
 Date Initiated: Sept 23/14

7-d LC50 (95% CL): 2.1 (1.5-3.0) g/L NaCl
 7-d IC50 (95% CL): 1.9 (1.1-2.9) g/L NaCl

7-d LC50 Reference Toxicant Mean and Historical Range: 1.8 (1.4-2.5) g/L NaCl CV (%): 16
 7-d IC50 Reference Toxicant Mean and Historical Range: 1.4 (1.0-1.9) g/L NaCl CV (%): 17

Test Results:

	Survival	Reproduction
LC50 % (v/v) (95% CL)	7100	
IC25 % (v/v) (95% CL)		7100
IC50 % (v/v) (95% CL)		7100

- 1) Mean survival of first generation controls is $\geq 80\%$
- 2) At least 60% of controls have produced three broods within 8 days
- 3) An average of ≥ 15 live young produced per surviving female in the control solutions during the first three broods.
- 4) Invalid if ephippia observed in any control solution at any time.

WQ Ranges:

T ($^{\circ}$ C) = 25 ± 1 ; DO (mg/L) = 3.3 to 8.4 ; pH = 6.0 to 8.5

Test Organism Information:

Broodstock No.: 082914A
 Age of young (Day 0): <24-h (within 12-h)
 Avg No. young in first 3 broods of previous 7 d: 30
 Mortality (%) in previous 7 d: 0
 Individual female # used ≥ 8 young on test day: 4,5,6,7,9,10,11,12,14

NaCl Reference Toxicant Results:

Reference Toxicant ID: cd118
 Stock Solution ID: 14NaCl
 Date Initiated: Sept 23/14

7-d LC50 (95% CL): 2.1 (1.5-3.0) g/L NaCl
 7-d IC50 (95% CL): 1.9 (1.1-2.9) g/L NaCl

7-d LC50 Reference Toxicant Mean and Historical Range: 1.8(1.4-2.5) g/L NaCl CV (%): 16
 7-d IC50 Reference Toxicant Mean and Historical Range: 1.4(1.0-1.9) g/L NaCl CV (%): 17

Test Results:

	Survival	Reproduction
LC50 % (v/v) (95% CL)	7100	
IC25 % (v/v) (95% CL)		<1.56 ^{13.4}
IC50 % (v/v) (95% CL)		2.5 (1.3 to 4.5)

APPENDIX B - Fathead Minnow (*Pimephales promelas*) Toxicity Test Data

Fathead Minnow Test Summary Sheet
(7-d *Pimephales promelas* Survival and Growth Test)

Client: Mount Polley
Work Order No.: 14632

Start Date/Time: Sept 12/14 @ 1630L
Test Species: *P. promelas*

Sample Information:

Sample ID: HAD-1-140910
Sample Date: Sept 10/14
Date Received: Sept 11/14
Sample Volume: 2x20L

Dilution Water (initial water quality):

Type: Moderately Hard Water
Temperature (°C): 24.0
pH: 7.9
Dissolved Oxygen (mg/L): 8.2
Hardness (mg/L CaCO₃): 98
Alkalinity (mg/L CaCO₃): 62.62

Test Validity Criteria:

The test is invalid if:

- 1) for the control solutions, the combined and cumulative incidence of any mortalities, or fish showing loss of equilibrium or other signs of atypical swimming behavior, is >20%
- 2) the average dry weight of the surviving control fish does not attain 250 ug when the fish are dried and weighed.

WQ Ranges:

T (°C) = 25 ± 1; DO (mg/L) = 3.3 to 8.4; pH = 6.5 to 8.5

Test Organism Information:

Batch No.: 091214
Source: Aquatic Biosystems, Co
Age: 24hr

NaCl Reference Toxicant Results:

Reference Toxicant ID: PP96
Stock Solution ID: n/a
Date Initiated: Sept 12/14
7-d EC50 (95% CL): 4.2 (3.2-4.9) 4.2 (3.5-4.9)
7-d IC50 (95% CL): 3.3 (2.4-6.3) 3.8 (2.3-6.3)

Survival:

Reference Toxicant Mean and Historical Range: 4.5 (3.5-5.7) CV (%): 13

Biomass:

Reference Toxicant Mean and Historical Range: 3.9 (2.9-5.4) CV (%): 7

Test Results:

	Survival	Biomass
LC25 % (v/v) (95% CL)	>100	
LC50 % (v/v) (95% CL)	>100	
IC25 % (v/v) (95% CL)		>100
IC50 % (v/v) (95% CL)		>100

Fathead Minnow Test Summary Sheet
(7-d *Pimephales promelas* Survival and Growth Test)

Client: Mount Pooley
Work Order No.: 14632

Start Date/Time: Sept 12/14 @ 1630h
Test Species: *P. promelas*

Sample Information:

Sample ID: QUL-66-48M-140910
Sample Date: SEP 10/14
Date Received: SEP 11/14
Sample Volume: 2L 20L

Dilution Water (initial water quality):

Type: Moderately Hard Water
Temperature (°C): 21.0
pH: 7.9
Dissolved Oxygen (mg/L): 8.4
Hardness (mg/L CaCO₃): 98
Alkalinity (mg/L CaCO₃): 68.62
kn

Test Validity Criteria:

The test is invalid if:

- 1) for the control solutions, the combined and cumulative incidence of any mortalities, or fish showing loss of equilibrium or other signs of atypical swimming behavior, is >20%
- 2) the average dry weight of the surviving control fish does not attain 250 ug when the fish are dried and weighed.

WQ Ranges:

T (°C) = 25 ± 1; DO (mg/L) = 3.3 to 8.4; pH = 6.5 to 8.5

Test Organism Information:

Batch No.: 091214
Source: Aquatic Biosystems, CO
Age: 224hr

NaCl Reference Toxicant Results:

Reference Toxicant ID: PP96

This report has been prepared by Nautilus Environmental Company Inc. based on data and/or samples provided by our client and the results of this study are for their sole benefit. Any reliance on the data by a third party is at the sole and exclusive risk of that party. The results presented here relate only to the samples tested.

1.0 INTRODUCTION

Nautilus Environmental Company Inc. conducted toxicity tests for Mount Polley Mining Corporation on a sample identified as QUL-66-40m-140916. The sample was collected on September 16, 2014 and delivered to the laboratory in Burnaby, BC on September 17, 2014. The sample was transported in two 20-L plastic carboys and coolers. The sample was received at a temperature of 9.1°C and was stored in the dark at $4 \pm 2^\circ\text{C}$ prior to testing. The following sub-lethal toxicity tests were performed on the sample:

- *Ceriodaphnia dubia* survival and reproduction
- 7-d fathead minnow (*Pimephales promelas*) survival and growth

This report describes the results of these toxicity tests. Copies of laboratory data sheets and printouts of statistical analyses for each test are provided in Appendices A and B. The chain-of-custody form is provided in Appendix C.

2.0 METHODS

Methods for the toxicity tests are summarized in Tables 1 and 2. Testing was conducted according to procedures described by the Environment Canada protocols (2007 and 2011). Statistical analyses for all tests were performed using CETIS (Tidepool Scientific Software, 2013).

Table 1. Summary of test conditions: *Ceriodaphnia dubia* survival and reproduction test.

Test organism	<i>Ceriodaphnia dubia</i>
Test organism source	In-house culture
Test organism age	<24 h old neonates produced within 12 h
Test type	Static-renewal
Test duration	7 ± 1 day
Test vessel	20 mL test tube
Test volume	15 mL
Test replicates	10 test replicates per treatment
Number of organisms	1 per replicate
Control water	20% Perrier water
Test solution renewal	Daily
Test temperature	25 ± 1°C
Feeding	<i>Pseudokirchneriella subcapitata</i> and YCT
Light intensity	100 to 600 lux at water surface
Photoperiod	16 hours light/8 hours dark
Aeration	None
Test protocol	Environment Canada, (2007) EPS 1/RM/21
Statistical software	CETIS (2013)
Test endpoint	Survival and reproduction
Test acceptability criteria for controls	≥80% survival; ≥15 young per surviving control producing three broods; ≥60% of controls producing three or more broods
Reference toxicant	Sodium chloride

Table 2. Summary of test conditions: fathead minnow (*Pimephales promelas*) survival and growth test.

Test organism	<i>Pimephales promelas</i>
Test organism source	Aquatic BioSystems, Fort Collins, CO
Test organism age	<24 hours
Test type	Static renewal
Test duration	7 days
Test vessel	375-mL glass containers
Test volume	250 mL
Test replicates	3 per treatment
Number of organisms	10 per replicate
Control water	Moderately-hard water (hardness 80-100 mg/L CaCO ₃)
Test solution renewal	Daily
Test temperature	25 ± 1°C
Feeding	Twice a day with newly hatched brine shrimp (<i>Artemia nauplii</i>)
Light intensity	100 – 500 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	None
Test protocol	Environment Canada (2011), EPS 1/RM/22
Statistical software	CETIS (2013)
Test endpoint	Survival and biomass
Test acceptability criteria for controls	≥80% survival, ≥250 µg mean dry weight
Reference toxicant	Sodium Chloride

3.0 RESULTS

No adverse effects were observed on survival of *C. dubia* (Table 3); the LC50 was >100%. Adverse effects were observed on *C. dubia* reproduction. The IC25 and IC50 were <1.56 and 7.3%, respectively. There were no adverse effects observed on fathead minnow survival or biomass (Table 4); the LC50, IC25 and IC50 were >100%.

Table 3. Results: *Ceriodaphnia dubia* survival and reproduction test.

Concentration (% v/v)	Survival (%)	Reproduction (mean ± SD)
Control	100	20.3 ± 3.3
1.56	90	14.2 ± 6.7
3.12	100	14.0 ± 3.4
6.25	100	10.4 ± 4.4
12.5	100	8.2 ± 2.9
25	100	5.7 ± 2.1
50	100	5.1 ± 1.9
100	100	3.0 ± 2.5
Test endpoint (% v/v)		
LC50	>100	--
IC25	--	<1.56
IC50 (95% CL)	--	7.3 (5.3 - 10.0)

SD = Standard Deviation, LC = Lethal Concentration, IC = Inhibition Concentration, CL = Confidence Limits.

Table 4. Results: fathead minnow (*Pimephales promelas*) survival and growth test.

Concentration (% v/v)	Mean ± SD	
	Survival (%)	Biomass (µg)
Control	83.3 ± 5.8	700.7 ± 46.9
1.56	73.3 ± 30.6	598.0 ± 189.5
3.1	56.7 ± 5.8	485.3 ± 52.5
6.25	90.0 ± 10.0	717.0 ± 104.5
12.5	80.0 ± 0.0	680.3 ± 65.6
25	83.3 ± 5.8	679.3 ± 28.4
50	66.7 ± 25.2	516.3 ± 118.6
100	93.3 ± 5.8	746.0 ± 24.9
Test endpoint (% v/v)		
LC25	>100	--
LC50	>100	--
IC25	--	>100
IC50	--	>100

SD = Standard Deviation, LC = Lethal Concentration, IC = Inhibition Concentration.

4.0 QA/QC

The health history of the test organisms used in the exposures was acceptable and met the requirements of the Environment Canada protocols. The tests met all control acceptability criteria and water quality parameters remained within ranges specified in the protocols throughout the tests. There were no deviations from the test methodologies. Uncertainty associated with these tests is best described by the standard deviation around the mean and/or the confidence limits around the point estimates.

Results of the reference toxicant tests conducted during the testing program are summarized in Table 5. Results for these tests fell within the range for organism performance of mean and two standard deviation range, based on historical results obtained by the laboratory with these tests. Thus, the sensitivity of the organisms used in these tests was appropriate.

Table 5. Reference toxicant results.

Test Species	Endpoint	Historical Mean (2 SD Range)	CV (%)	Test Date
<i>C. dubia</i>	Survival (LC50): 2.1 g/L NaCl	1.8 (1.4 - 2.5)	16	September 23 , 2014
	Reproduction (IC50): 1.9 g/L NaCl	1.4 (1.0 - 1.9)	17	
<i>P. promelas</i>	Survival (LC50): 5.5 g/L NaCl	4.4 (3.5 - 5.7)	13	September 17, 2014
	Biomass (IC50): 4.4 g/L NaCl	3.9 (2.8 - 5.4)	17	

SD = Standard Deviation, CV = Coefficient of Variation, IC = Inhibition Concentration, LC = Lethal Concentration.

APPENDIX A - *Ceriodaphnia dubia* Toxicity Test Data

Ceriodaphnia dubia Summary Sheet

Client: Mt. Palley
 Work Order No.: 14651

Start Date/Time: Sept 17/14 @ 1145h
 Set up by: EMM

Sample Information:

Sample ID: 046640-140916
 Sample Date: Sept 16/14
 Date Received: Sept 17/14
 Sample Volume: 2x20L

Test Validity Criteria:

- 1) Mean survival of first generation controls is $\geq 80\%$
- 2) At least 60% of controls have produced three broods within 8 days
- 3) An average of ≥ 15 live young produced per surviving female in the control solutions during the first three broods.
- 4) Invalid if ephippia observed in any control solution at any time.

WQ Ranges:

T ($^{\circ}$ C) = 25 ± 1 ; DO (mg/L) = 3.3 to 8.4 ; pH = 6.0 to 8.5

Test Organism Information:

Broodstock No.: 090314 A+B
 Age of young (Day 0): <24-h (within 12-h)
 Avg No. young in first 3 broods of previous 7 d: 37
 Mortality (%) in previous 7 d: 3
 Individual female # used ≥ 8 young on test day: 1, 9, 11, 12, 13, 16, 17, 18, 19, 25, 26, 27

NaCl Reference Toxicant Results:

Reference Toxicant ID: cd 118
 Stock Solution ID: 14N402
 Date Initiated: Sept 23/14

7-d LC50 (95% CL): 2.1 (1.5-3.0) g/L NaCl
 7-d IC50 (95% CL): 1.9 (1.1-2.9) g/L NaCl

7-d LC50 Reference Toxicant Mean and Historical Range: 1.8 (1.4-2.5) g/L NaCl CV (%): 17/16
 7-d IC50 Reference Toxicant Mean and Historical Range: 1.4 (1.0-1.9) g/L NaCl CV (%): 16/17

Test Results:

	Survival	Reproduction
LC50 % (v/v) (95% CL)	7100	
IC25 % (v/v) (95% CL)		1.56 (1.1-2.1) <u>1.56 (1.0-2.4)</u>
IC50 % (v/v) (95% CL)		7.3 (5.3-10.0)

APPENDIX B - Fathead Minnow (*Pimephales promelas*) Toxicity Test Data

Fathead Minnow Test Summary Sheet

(7-d *Pimephales promelas* Survival and Growth Test)

Client: Mount Polley
 Work Order No.: 14652

Start Date/Time: Sept 17/14 @ 1350h
 Test Species: P. promelas

Sample Information:

Sample ID: QUL-66-40M-140916
 Sample Date: Sept 16/14
 Date Received: Sept 17/14
 Sample Volume: 3x 20L

Test Validity Criteria:

The test is invalid if:

- 1) for the control solutions, the combined and cumulative incidence of any mortalities, or fish showing loss of equilibrium or other signs of atypical swimming behavior, is >20%
- 2) the average dry weight of the surviving control fish does not attain 250 ug when the fish are dried and weighed.

WQ Ranges:

T (°C) = 25 ± 1; DO (mg/L) = 3.3 to 8.4; pH = 6.5 to 8.5

Dilution Water (initial water quality):

Type: Moderately Hard Water
 Temperature (°C): 26.0
 pH: 7.9
 Dissolved Oxygen (mg/L): 7.9
 Hardness (mg/L CaCO₃): 98
 Alkalinity (mg/L CaCO₃): 68

Test Organism Information:

Batch No.: 091714
 Source: Aquatic Biosystems, CO
 Age: 224 hrs

NaCl Reference Toxicant Results:

Reference Toxicant ID: pp97
 Stock Solution ID: n/a
 Date Initiated: Sept 17/14
 7-d EC50 (95% CL): 5.5 (4.7-6.4)
 7-d IC50 (95% CL): 4.4 (3.8-5.4)

Survival:

Reference Toxicant Mean and Historical Range: 4.4 (3.5-5.7) g/L NaCl CV (%): 13

Biomass:

Reference Toxicant Mean and Historical Range: 3.9 (2.8-5.4) g/L NaCl CV (%): 17

Test Results:

	Survival	Biomass
LC25 % (v/v) (95% CL)	7100	
LC50 % (v/v) (95% CL)	7100	
IC25 % (v/v) (95% CL)		7100

This report has been prepared by Nautilus Environmental Company Inc. based on data and/or samples provided by our client and the results of this study are for their sole benefit. Any reliance on the data by a third party is at the sole and exclusive risk of that party. The results presented here relate only to the samples tested.

1.0 INTRODUCTION

Nautilus Environmental Company Inc. conducted toxicity tests for Mount Polley Mining Corporation on a sample identified as POL-6-14m-140916. The sample was collected on September 16, 2014 and delivered to the laboratory in Burnaby, BC on September 18, 2014. The sample was transported in two 20-L plastic carboys and coolers. The sample was received at a temperature of 9.5°C and was stored in the dark at $4 \pm 2^\circ\text{C}$ prior to testing. The following sub-lethal toxicity tests were performed on the sample:

- *Ceriodaphnia dubia* survival and reproduction
- 7-d fathead minnow (*Pimephales promelas*) survival and growth
- 7-d duckweed (*Lemna minor*) growth inhibition
- 72-h algal (*Pseudokirchneriella subcapitata*) growth inhibition

This report describes the results of these toxicity tests. Copies of laboratory data sheets and printouts of statistical analyses for each test are provided in Appendices A to D. The chain-of-custody form is provided in Appendix E.

2.0 METHODS

Methods for the toxicity tests are summarized in Tables 1 to 4. Testing was conducted according to procedures described by the Environment Canada protocols (2007a, 2007b, 2007c and 2011). Statistical analyses for all tests were performed using CETIS (Tidepool Scientific Software, 2013).

Table 1. Summary of test conditions: *Ceriodaphnia dubia* survival and reproduction test.

Test organism	<i>Ceriodaphnia dubia</i>
Test organism source	In-house culture
Test organism age	<24 h old neonates produced within 12 h
Test type	Static-renewal
Test duration	7 ± 1 day
Test vessel	20 mL test tube
Test volume	15 mL
Test replicates	10 test replicates per treatment
Number of organisms	1 per replicate
Control water	20% Perrier water
Test solution renewal	Daily
Test temperature	25 ± 1°C
Feeding	<i>Pseudokirchneriella subcapitata</i> and YCT
Light intensity	100 to 600 lux at water surface
Photoperiod	16 hours light/8 hours dark
Aeration	None
Test protocol	Environment Canada, (2007a) EPS 1/RM/21
Statistical software	CETIS (2013)
Test endpoint	Survival and reproduction
Test acceptability criteria for controls	≥80% survival; ≥15 young per surviving control producing three broods; ≥60% of controls producing three or more broods
Reference toxicant	Sodium chloride

Table 2. Summary of test conditions: fathead minnow (*Pimephales promelas*) survival and growth test.

Test organism	<i>Pimephales promelas</i>
Test organism source	Aquatic BioSystems, Fort Collins, CO
Test organism age	<24 hours
Test type	Static renewal
Test duration	7 days
Test vessel	375-mL glass containers
Test volume	250 mL
Test replicates	3 per treatment
Number of organisms	10 per replicate
Control water	Moderately-hard water (hardness 80-100 mg/L CaCO ₃)
Test solution renewal	Daily
Test temperature	25 ± 1°C
Feeding	Twice a day with newly hatched brine shrimp (<i>Artemia nauplii</i>)
Light intensity	100 – 500 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	None
Test protocol	Environment Canada (2011), EPS 1/RM/22
Statistical software	CETIS (2013)
Test endpoint	Survival and biomass
Test acceptability criteria for controls	≥80% survival, ≥250 µg mean dry weight
Reference toxicant	Sodium Chloride

Table 3. Summary of test conditions: *Lemna minor* growth inhibition test.

Test organism	<i>Lemna minor</i>
Test organism source	In-house culture, obtained from Canadian Phycological Culture Centre, and originally isolated from Wainfleet, Stinking Barn, Niagara Peninsula, Ontario, Canada
Test organism age	7-to 10-day old
Test type	Static
Test duration	7 days
Test vessel	250 mL glass containers
Test volume	100 mL
Test replicates	4 test replicates per treatment
No. of organisms	Two 3-frond plants per replicate
Control water	Deionized water with nutrients added
Test solution renewal	None
Test temperature	25 ± 2°C
Feeding	None
Light intensity	4000 to 5600 lux full spectrum light
Photoperiod	24 hours light
Aeration	None
Test protocol	Environment Canada (2007b), EPS 1/RM/37
Statistical software	CETIS (2013)
Test endpoint	Number of fronds and dry weight
Test acceptability criteria for controls	≥ 8-fold increase in number of fronds
Reference toxicant	Potassium chloride

Table 4. Summary of test conditions: *Pseudokirchneriella subcapitata* growth inhibition test.

Test organism	<i>Pseudokirchneriella subcapitata</i> , strain UTCC #37
Test organism source	In-house culture, obtained from Canadian Phycological Culture Center, and originally isolated from Nitelva River, Norway.
Test organism age	3- to 7-day old culture in logarithmic growth phase
Test type	Static
Test duration	72 hours
Test vessel	Microplate
Test volume	220 µL
Test replicates	4 replicates per treatment; 8 replicates for control
Number of organisms	10,000 cells/mL
Control water	Deionized water with supplemented nutrients
Test solution renewal	None
Test temperature	24 ± 2°C
Feeding	None
Light intensity	3600 to 4400 lux
Photoperiod	24 hours light
Aeration	None
Test protocol	Environment Canada (2007c), EPS1/RM/25
Statistical software	CETIS (2013)
Test endpoint	Algal cell growth inhibition
Test acceptability criteria for controls	≥ 16-fold increase in number of algal cells; CV ≤ 20%; no trend when analyzed using Mann-Kendall test
Reference toxicant	Zinc

3.0 RESULTS

Adverse effects were observed only on *C. dubia* reproduction (Table 5). The IC25 and IC50 values were 3.8 and 5.3%, respectively. There were no adverse effects observed on survival of *C. dubia*, survival and growth of fathead minnow (Table 6), frond count and dry weight of *L. minor* (Table 7) or cell yield of *P. subcapitata* (Table 8). The LC and IC values were therefore greater than the highest concentration tested for each of these endpoints in these toxicity tests. In addition, a stimulatory effect was observed for *P. subcapitata* cell yield; percent stimulation ranged from 43.6 to 330.3%.

Table 5. Results: *Ceriodaphnia dubia* survival and reproduction test.

Concentration (% v/v)	Survival (%)	Reproduction (mean ± SD)
Control	100	21.5 ± 2.6
1.56	100	21.8 ± 4.6
3.12	100	19.8 ± 4.9
6.25	100	16.0 ± 4.3
12.5	100	11.3 ± 3.4
25	100	13.9 ± 4.7
50	100	13.2 ± 5.7

IC50	>95.2	--

SD = Standard Deviation, IC = Inhibition Concentration.

*Indicates cell yield that were significantly greater than the control.

4.0 QA/QC

The health history of the test organisms used in the exposures was acceptable and met the requirements of the Environment Canada protocols. The tests met all control acceptability criteria and water quality parameters remained within ranges specified in the protocols throughout the tests. There were no deviations from the test methodologies. Uncertainty associated with these tests is best described by the standard deviation around the mean and/or the confidence limits around the point estimates.

Results of the reference toxicant tests conducted during the testing program are summarized in Table 9. Results for these tests fell within the range for organism performance of mean and two standard deviation range, based on historical results obtained by the laboratory with these tests. Thus, the sensitivity of the organisms used in these tests was appropriate.

Table 9. Reference toxicant results.

Test Species	Endpoint	Historical Mean (2 SD Range)	CV (%)	Test Date
<i>C. dubia</i>	Survival (LC50): 2.1 g/L NaCl	1.8 (1.4 - 2.5)	16	September 23 , 2014
	Reproduction (IC50): 1.9 g/L NaCl	1.4 (1.0 - 1.9)	17	
<i>P. promelas</i>	Survival (LC50): 4.0 g/L NaCl	4.4 (3.4 - 5.8)	14	September 19, 2014
	Biomass (IC50): 3.2 g/L NaCl	3.9 (2.9 - 5.3)	17	
<i>L. minor</i>	No. Fronds (IC50) 5.3 g/L KCl	4.2 (3.1 - 5.7)	16	October 3, 2014
<i>P. subcapitata</i>	Growth (IC50) 29.2 µg/L Zn	25.2 (14.8 - 42.8)	30	September 5, 2014

SD = Standard Deviation, CV = Coefficient of Variation, IC = Inhibition Concentration, LC = Lethal Concentration.

APPENDIX A - *Ceriodaphnia dubia* Toxicity Test Data

Ceriodaphnia dubia Summary Sheet

Client: Mt. Palley
 Work Order No.: 14662

Start Date/Time: Sept 18/14 @ 1023h
 Set up by: EMM/EC

Sample Information:

Sample ID: POL-6-14M-140916
 Sample Date: Sept 16/14
 Date Received: Sept 18/14
 Sample Volume: 2 x 20L

Test Validity Criteria:

- 1) Mean survival of first generation controls is $\geq 80\%$
- 2) At least 60% of controls have produced three broods within 8 days
- 3) An average of ≥ 15 live young produced per surviving female in the control solutions during the first three broods.
- 4) Invalid if ephippia observed in any control solution at any time.

WQ Ranges:

T ($^{\circ}$ C) = 25 ± 1 ; DO (mg/L) = 3.3 to 8.4 ; pH = 6.0 to 8.5

Test Organism Information:

Broodstock No.: 091014B
 Age of young (Day 0): <24-h (within 12-h)
 Avg No. young in first 3 broods of previous 7 d: 21
 Mortality (%) in previous 7 d: 0
 Individual female # used ≥ 8 young on test day: 24, 25, 27, 29, 30, 31, 32

NaCl Reference Toxicant Results:

Reference Toxicant ID: cd 118
 Stock Solution ID: 14NaO2
 Date Initiated: Sept 23/14

7-d LC50 (95% CL): 2.1 (1.5-3.0) g/L NaCl
 7-d IC50 (95% CL): 1.9 (1.1-2.9) g/L NaCl

7-d LC50 Reference Toxicant Mean and Historical Range: 1.8 (1.4-2.5) g/L NaCl CV (%): 16
 7-d IC50 Reference Toxicant Mean and Historical Range: 1.4 (1.0-1.9) g/L NaCl CV (%): 17

Test Results:

	Survival	Reproduction
LC50 % (v/v) (95% CL)	>100	
IC25 % (v/v) (95% CL)		3.8 (n/a - 5.6)
IC50 % (v/v) (95% CL)		5.3 (3.7 - 7.5)

APPENDIX B - Fathead Minnow (*Pimephales promelas*) Toxicity Test Data

Fathead Minnow Test Summary Sheet
(7-d *Pimephales promelas* Survival and Growth Test)

Client: Mowat Polley
Work Order No.: 14663

Start Date/Time: Sept 19/14 @ 1200h
Test Species: P. promelas

Sample Information:

Sample ID: POL-6-14M-140916
Sample Date: Sept 16/14
Date Received: Sept 16/14
Sample Volume: 2x20L

Dilution Water (initial water quality):

Type: Moderately Hard Water
Temperature (°C): 25.0
pH: 7.4
Dissolved Oxygen (mg/L): 6.0
Hardness (mg/L CaCO₃): 88
Alkalinity (mg/L CaCO₃): 64

Test Validity Criteria:

The test is invalid if:

- 1) for the control solutions, the combined and cumulative incidence of any mortalities, or fish showing loss of equilibrium or other signs of atypical swimming behavior, is >20%
- 2) the average dry weight of the surviving control fish does not attain 250 ug when the fish are dried and weighed.

WQ Ranges:

T (°C) = 25 ± 1; DO (mg/L) = 3.3 to 8.4; pH = 6.5 to 8.5

Test Organism Information:

Batch No.: 091914
Source: Aquatic Biosystems, CO
Age: <24hrs

NaCl Reference Toxicant Results:

Reference Toxicant ID: PP98
Stock Solution ID: n/a
Date Initiated: Sept 19/14
7-d EC50 (95% CL): 4.0 (3.4 - 4.7)
7-d IC50 (95% CL): 3.2 (2.9 - 3.6)

Survival:

Reference Toxicant Mean and Historical Range: 4.4 (3.4 - 5.8) CV (%): 14

Biomass:

Reference Toxicant Mean and Historical Range: 3.9 (2.9 - 5.3) CV (%): 17

Test Results:

	Survival	Biomass

Pseudokirchneriella subcapitata Summary Sheet

Client: Mt. Palley
Work Order No.: 14664

Start Date: Sept 19, 2014
Set up by: EMM

Sample Information:

Sample ID: POL-6-14m-140916
Sample Date: Sept 16, 2014
Date Received: Sept 18, 2014
Sample Volume: 2 x 20L

Test Organism Information:

Culture Date: Sept 12, 2014
Age of culture (Day 0): 7d

Zinc Reference Toxicant Results:

Reference Toxicant ID: SC118
Stock Solution ID: 14ZnO
Date Initiated: Sept 5, 2014

72-h IC50 (95% CL): 29.2 (25.6 - 32.4) µg/L Zn

72-h IC50 Reference Toxicant Mean and Range: ^{emm} 25.2 (14.8 - 42.8) µg/L Zn CV (%): ^{emm} 25.30

**Toxicity testing on a sample identified as POL-6-12m: Samples collected
September 30, 2014 (Report date October 17, 2014)**

Mount Polley Mining Corporation
ATTN: Colleen Hughes
Box 12
Likely, BC
VOL 1N0

Report Date: October 17, 2014
Work Order: 14697

Data Report

Species: Rainbow trout (*Oncorhynchus mykiss*)
Protocol: EPS 1/RM/13 (Second Ed. with 2007 amendments)

Table 1. Results for the 96-h rainbow trout acute toxicity test.

Sample ID	Collection Date and Time	96-h LC50 (%v/v)
POL-6-12M	September 30, 2014 @ 1350h	>100

Test met performance criteria and there were no deviations from the test method. The results relate only to the sample tested.

Rainbow Trout Summary Sheet

Client: Mount Polley Mining Corp.

Start Date/Time: October 3/14 @ 1000

Work Order No.: 14697

Test Species: Oncorhynchus mykiss

Sample Information:

Sample ID: POL-6-12M
Sample Date: September 30/14 @ 1350
Date Received: October 1/14 @ 0830
Sample Volume: 1 x 20L
Other: _____

Test Validity Criteria:

≥ 90% control survival

WQ Ranges:

T (°C) = 15 ± 1; DO (mg/L) = 7.0 to 10.3; pH = 5.5 to 8.5

Dilution Water:

Type: Dechlorinated Municipal Tap Water
Hardness (mg/L CaCO₃): 10
Alkalinity (mg/L CaCO₃): 10

Test Organism Information:

Batch No.: 073114
Source: Trout Lodge
No. Fish/Volume (L): 10/10
Loading Density (g/L): 0.36
Mean Length ± SD (mm): 35 ± 3
Mean Weight ± SD (g): 0.36 ± 0.10

Range: 30 - 39
Range: 0.21 - 0.54

NaNO₂ Reference Toxicant Results:

Reference Toxicant ID: RTN667
Stock Solution ID: 14NE01
Date Initiated: September 26/14
96-h LC50 (95% CL): 7.6 (6.6 - 8.6) mg/L NaNO₂

Reference Toxicant Mean and Historical Range: 4.9 (2.0 - 12.0) mg/L NaNO₂
Reference Toxicant CV (%): 56

Test Results: The 96-h LC50 is >100% (W/N).

Memorandum

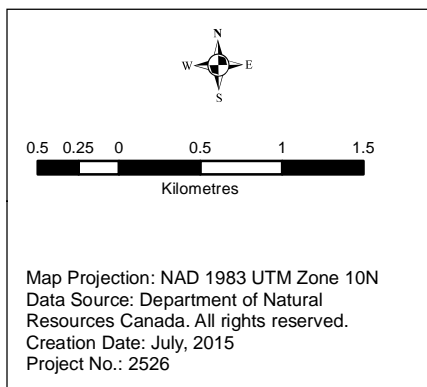

Date: July 10, 2015
To: Dale Reimer, Mount Polley Mining Corporation
From: Pierre Stecko, Minnow Environmental Inc.
Cc: Colleen Hughes, Katie McMahan, Mount Polley Mining Corporation
Lee Nikl, Golder Associates

Re: Summary and Interpretation of Water Toxicity Tests (Nov 2014 to Apr 2015)

This memorandum provides a brief summary and interpretation of toxicity test results associated with water samples collected between November 2014 and April 2015 as part of continued monitoring following the Mount Polley Mine tailings dam failure (August 4, 2014). This memo provides an update relative to an initial memorandum of toxicity test results from August and September 2014 (Minnow 2015). The water toxicity testing discussed within this memorandum was conducted on samples collected from Polley Lake, Quesnel Lake, and the Quesnel River (Figure 1). Based on the results and interpretation of these tests, recommendations for future toxicity testing are also provided.

Methods

Toxicity testing included sub-lethal tests recommended under the federal Metal Mining Effluent Regulations (MMER; Government of Canada 2015). No acute lethality was reported in association with water samples collected during the initial response to the dam failure (Minnow 2015), therefore toxicity testing conducted between November 2014 and April 2015 was limited to sub-lethal testing. All tests were conducted by a laboratory (Nautilus Environmental) accredited by the Canadian Association for Laboratory Accreditation (CALA), and were conducted under standard protocols. The sublethal tests conducted included the 30-day test of early life stages (embryo/alevin) of rainbow trout (*Oncorhynchus mykiss*) (Environment Canada 1998), the 7-day test of rainbow trout swim-up fry survival and growth (Lazorchak and Smith 2007), the 7-day test of fathead minnow (*Pimephales promelas*) larval survival and growth (Environment Canada 2011), and the 7-day test of *Ceriodaphnia dubia* (invertebrate) survival and reproduction (Environment Canada 2007). Samples were collected using grab techniques in accordance with provincial and federal guidance (BCWLAP 2003; BCMOE 2012; Environment Canada 2012) and were supported by field meter measurements and

concurrent water samples, which were submitted to a CALA accredited analytical laboratory (ALS Environmental) for chemical analysis. To investigate potential causes of responses observed in August and September 2014 (Minnow 2015), the sublethal test of *Ceriodaphnia dubia* (invertebrate) survival and reproduction (Environment Canada 2007) conducted on samples collected from Quesnel Lake and Quesnel River were run on both unfiltered and filtered samples (0.45 µm pore diameter filter). Filtration of the samples was performed by Nautilus Environmental prior to testing.

Results

A total of 46 toxicity tests were conducted on water samples collected by the Mount Polley Mining Corporation (MPMC) between November 25th 2014 and April 14th 2015 (Table 1; Appendix A). Ten of the tests did not meet validity requirements due to poor control survival or growth and not discussed herein. No effects were observed on the survival and development of rainbow trout at the embryo/alevin stages, or on the survival and growth of rainbow trout swim-up fry. No effects to the survival of fathead minnow or *C. dubia* were observed; however some reduced growth or reproduction (respectively) was observed in these test organisms. All toxicity test results are discussed below, by test type, including an examination of the reported responses in relation to concurrent water quality (Table 2).

Survival and Development – Rainbow trout embryo and alevin stages

Tests of the survival and development of rainbow trout early life stages (embryo and alevin stages) indicated no effects on either the survival of these sensitive life stages, nor to their normal development in any of the Quesnel River waters tested (Table 1).

Survival and Growth – Rainbow trout swim-up fry

Tests of the survival and growth of rainbow trout swim-up fry (3 to 6 day post-swim-up) indicated no effects to either survival or growth in any of the waters tested (Table 1).

Survival and Growth - Fathead minnow

Tests of the survival and growth of fathead minnow (*Pimephales promelas*) indicated no effects on survival, and all 50% inhibitory concentrations (IC50s - growth) were greater than 100% (Table 1). However, growth inhibition was observed in 25% inhibitory concentrations (IC25s, as evaluated using total biomass) in two water samples from Quesnel Lake collected from the surface and from 85 m depth on January 15th 2015, with 25% inhibitory concentrations (IC25s) of 83.2 and 95.6% v/v, respectively (Table 1). The

^a British Columbia Water Quality Guidelines (BCMOE 2015a, 2015b); W=Working guideline; A=Approved guideline. See Appendix Table B.1 for derivation of condition-specific guidelines.

^b guidelines for turbidity and TSS are for induced values above reference or background (background of 1.0 NTU turbidity and 3.0 mg/L TSS used for screening).

^c The BCWQG guideline for phosphorus is based on non-toxic endpoints associated with phosphorus. The phosphorus guideline was not applied to the grab samples in this table because the presented samples were collected in support of water toxicity test samples.

^d guideline for dissolved cadmium is displayed and applied to total cadmium concentrations.

^e applies to chromium as Cr (IV); guideline for Cr(III) is 9 µg/L.

total biomass endpoint integrates effects on both survival and growth by measuring dry weight of surviving fish per test chamber (Environment Canada 2011). Examination of the toxicity test data (Appendix A) indicated that the effects on biomass observed for these Quesnel Lake samples were associated with low level mortality (fewer organisms result in lower total biomass per test chamber) and the consideration of individual dry weight data (i.e., average weight of surviving fish only) indicated no inhibition of individual biomass (Table 1) ¹.

Examination of concurrent water quality data associated with the tests (i.e., from samples collected at the same location and time as the test water) indicated that turbidity and total copper concentrations exceeded the applicable chronic British Columbia Water Quality Guidelines (BCWQG) for the protection of aquatic life (BCMoE 2015a,b) in waters where effects to fathead minnow total biomass were observed (QUL-66; January 15, 2015), as well as in waters where no effects were observed (Table 2; see Appendix B for reference values supporting applicable BCWQG). Total metals do not effectively represent bioavailable metals (Allen 1993; Bergman et al 1997; Markich et al. 2001; ICMM and Eurometaux 2005), and dissolved copper (which is better characterized as “filtered” [$<0.45 \mu\text{m}$] copper) is a better representation of bioavailable copper. In all samples tested, dissolved copper concentrations were below corresponding total copper guideline levels. Dissolved copper may remain an overestimate of bioavailable copper due to the presence of small particles, colloids and complexation with dissolved ligands such as dissolved organic carbon (e.g., Morel 1983; Pagenkopf 1983; Markich et al. 2001; Grosell 2012). Therefore, biotic ligand modeling (BLM) was employed (using supporting water quality characteristics) to model the median lethal concentration [LC50] of dissolved copper for the waters tested for fathead minnow survival and growth, as well as the lowest dissolved copper concentration associated with chronic effects (Appendix C). These BLM modeled values indicated that lowest chronic effects associated with dissolved copper (i.e., effects to the most sensitive species and life stage) would not be expected at concentrations below $7.2 \mu\text{g/L}$ in Quesnel Lake (see Appendix C). Therefore, the observed effects to the growth of fathead appear not to be related to dissolved copper.

Turbidity greater than the applicable chronic BCWQG was observed in the Quesnel Lake water samples that were associated with effects to fathead minnow biomass, however

¹ Total biomass and individual biomass (dry weight) can be influenced by low level test mortality resulting in fewer test organisms per chamber. Total biomass is generally lower in tests with fewer surviving organisms, although individual biomass can be higher due to density dependent growth of surviving test organisms. The latter does not appear to have occurred for the QUL-66 samples (surface and 85m depth) collected on January 15, 2015.

elevated turbidity above BCWQG was also observed in a Quesnel River water sample which exhibited no effects to biomass (January 7, 2015; Table 2). Due to a lack of concordance between the toxicity test results and water chemistry, there is no apparent cause of the effects observed in the fathead minnow tests. This was previously noted based on data collected in August and September 2014 (Minnow 2015), and the initiation of rainbow trout survival and growth testing was recommended to augment the existing fathead minnow testing. The limited effects observed to fathead minnow were not supported by the rainbow trout testing results reported for the same samples (i.e. collected at the same time and location), which indicated no effects (Table 1). Fathead minnows are susceptible to disease, are of less relevance to the water bodies being evaluated than rainbow trout, and have not demonstrated toxicity effects in concordance with water quality results. Therefore, it is recommended that fathead minnow survival and growth testing be discontinued and that it is replaced with testing of rainbow trout survival and growth.

Survival and Reproduction - Ceriodaphnia dubia

Tests of the survival and reproduction of *C. dubia* (a copper-sensitive cladoceran; USEPA 2007) indicated no lethality in any of the waters tested, and no reproductive impairment associated with Polley Lake water. All 50% inhibitory concentrations (IC50s - reproduction) were greater than 100% (Table 1). However, reproductive inhibition was observed in 25% inhibitory concentrations (IC25s) in a number of water samples from Quesnel Lake and the Quesnel River (Table 1). In the previous memorandum, testing of concurrent filtered (0.45 µm pore diameter filter) and unfiltered water samples from Quesnel Lake and Quesnel River was recommended in order to investigate the influence of suspended solids on *C. dubia* reproduction (Minnow 2015). All unfiltered samples from Quesnel Lake (surface and deep; n=6) and 3 of 5 unfiltered samples from the Quesnel River were associated with impaired *C. dubia* reproduction (IC25 <100%), resulting in a total of 9 of the 11 unfiltered samples tested between November 2014 and April 2015 exhibiting effects on reproduction (Table 1). Turbidity and total copper concentrations exceeded the applicable chronic BCWQG in 7 of these 9 samples (3.11-6.37 NTU and 4.27-7.51 µg/L), but were below guidelines in the remaining 2 samples (approximately 1 NTU and <2.5 µg/L; Table 2). As previously indicated, total metals do not effectively represent bioavailable metals, and concentrations of dissolved copper were lower than the total copper guideline in all samples associated with reproductive effects. Reproductive impairment was not associated with any of the filtered Quesnel Lake and Quesnel River

waters tested, with the exception of one filtered sample collected from Quesnel Lake (November 25, 2014) which had a reported IC25 of 92.5% (v/v). Dissolved copper concentrations present in all the filtered samples tested for toxicity were below the total copper BCWQG. Given the matching dissolved copper concentrations in the concurrent filtered and unfiltered toxicity samples, the differing effects on reproduction observed in filtered versus unfiltered toxicity samples indicate that suspended solids may be responsible for the observed reproductive impairment rather than copper concentrations. This is supported by the relationship observed between suspended solid concentrations in unfiltered water samples (as measured by turbidity or total suspended solids) and reproductive impairment of *C. dubia* (Appendix D), with lower IC25 concentrations (and therefore greater reproductive impairment) associated with greater suspended solid concentrations. This relationship also explains the occurrence of low IC25 concentrations associated with samples containing low concentrations of dissolved copper, which was also noted previously (Minnow 2015). The suspended solid-related responses observed for *C. dubia* are in contrast to the apparent lack of concordance between fathead minnow growth (total biomass) effects and water quality results, further corroborating the recommendation to discontinue fathead minnow testing.

Summary

Overall, toxicity testing conducted between November 2014 and April 2015 indicated limited adverse effects. No effects to the survival or development of rainbow trout early life stages or to rainbow trout swim-up fry were observed, and no effects were observed in any of the test organisms exposed to Polley Lake water. However, some biological responses were associated with Quesnel Lake and Quesnel River waters, with effects observed to fathead minnow growth and *C. dubia* reproduction.

Reported effects to fathead minnow did not corroborate well with water chemistry results (as previously observed), nor with the reported rainbow trout toxicity results (no reported effects). Impaired reproduction of *C. dubia* was only associated with unfiltered water samples, despite matching dissolved copper concentrations present in each paired filtered and unfiltered sample. This indicates that suspended solids, not copper, were likely responsible for the observed reproductive impairment associated with unfiltered samples. The majority of Quesnel Lake and Quesnel River samples associated with reproductive impairment in *C. dubia* had elevated turbidity, although the turbidity was lower than reported for toxicity samples collected in August and September 2014 (Minnow 2015) indicating improved water

quality. Continued testing at a lower frequency is recommended to monitor potential toxicity associated with changing conditions within Quesnel Lake, Quesnel River and Polley Lake.

Recommendations for Toxicity Testing

Based on the toxicity data collected between November 2014 and April 2015, the following recommendations are provided for toxicity testing within the waterbodies affected by the tailings dam failure (Table 3).

- Discontinue the rainbow trout embryo-alevin testing which was applied in the Quesnel River, and which reported no effects.
- Discontinue the 7-day fathead minnow survival and growth test (Environment Canada 2011) due to the apparent lack of concordance with water quality.
- Continue the 7-day rainbow trout survival and growth test (Lazorchak and Smith 2007) at all proposed surveillance monitoring locations (Table 3) when high quality rainbow trout of an appropriate life stage are available.
- Continue the 7-day *Ceriodaphnia dubia* survival and reproduction test (Environment Canada 2007) at all proposed surveillance monitoring locations (Table 3).

Table 3: Recommended Surveillance Monitoring Water Toxicity Testing Program for Mount Polley, Summer and Fall 2015.

Location	Tests	Frequency ¹
Polley Lake	7-d rainbow trout survival and growth	quarterly ^{2, 3}
	7-d <i>Ceriodaphnia dubia</i> survival and reproduction	quarterly ^{2, 3}
Quesnel Lake	7-d rainbow trout survival and growth	quarterly ^{2, 3}
	7-d <i>Ceriodaphnia dubia</i> survival and reproduction	quarterly ^{2, 3, 4}
Quesnel River	7-d rainbow trout survival and growth	quarterly ²
	7-d <i>Ceriodaphnia dubia</i> survival and reproduction	quarterly ^{2, 4}

¹ frequency to be re-evaluated in fall of 2015 following receipt and interpretation of results from May 2015 to October 2015

² four times per year, not less than one month apart

³ one of the quarterly sampling events in lakes (summer) should include two samples - one above the thermocline and one near bottom

⁴ if field turbidity exceeds 3 NTU, collect a second sample to be filtered in the laboratory prior to testing

This report has been prepared by Nautilus Environmental Company Inc. based on data and/or samples provided by our client and the results of this study are for their sole benefit. Any reliance on the data by a third party is at the sole and exclusive risk of that party. The results presented here relate only to the samples tested.

1.0 INTRODUCTION

Nautilus Environmental Company Inc. conducted a toxicity test for Mount Polley Mining Corporation on samples identified as QUR-1-141125, QUL-66-0M-141125, QUL-66-20M-141125 and QUL-66-45M-141125. The samples were collected on November 25, 2014 and delivered to the laboratory in Burnaby, BC on November 26, 2014. The samples were transported in 1-L plastic bottles and 20-L plastic carboys inside coolers. Samples were received at temperatures ranging from 3.3 to 4.5°C and were stored in the dark at $4 \pm 2^\circ\text{C}$ prior to testing.

Samples QUL-66-0M-141125, QUL-66-20M-141125 and QUL-66-45M-141125 were vacuum filtered through 0.45µm filter paper and tested in addition to unfiltered sample testing. Sample QUR-1-141125 was tested unfiltered.

This report describes the results of the toxicity test conducted on the samples using *Ceriodaphnia dubia*. Copies of laboratory data sheets and printouts of statistical analyses for the test are provided in Appendix A. The chain of custody form is provided in Appendix B.

2.0 METHODS

Methods for the toxicity test using *C. dubia* are summarized in Table 1. Testing was conducted according to procedures described by Environment Canada (2007). Statistical analyses for the test were performed using CETIS (Tidepool Scientific Software, 2013).

Table 1. Summary of test conditions: *Ceriodaphnia dubia* survival and reproduction test.

Test organism	<i>Ceriodaphnia dubia</i>
Test organism source	In-house culture
Test organism age	<24 h old neonates produced within 12 h
Test type	Static-renewal
Test duration	7 ± 1 day
Test vessel	20 mL test tube
Test volume	15 mL
Test replicates	10 test replicates per treatment
Number of organisms	1 per replicate
Control water	20% Perrier water
Test solution renewal	Daily
Test temperature	25 ± 1°C
Feeding	<i>Pseudokirchneriella subcapitata</i> and YCT
Light intensity	100 to 600 lux at water surface
Photoperiod	16 hours light/8 hours dark
Aeration	None
Test protocol	Environment Canada, (2007) EPS 1/RM/21
Statistical software	CETIS (2013)
Test endpoint	Survival and reproduction
Test acceptability criteria for controls	≥80% survival; ≥15 young per surviving control producing three broods; ≥60% of controls producing three or more broods
Reference toxicant	Sodium chloride

3.0 RESULTS

Results of the toxicity test conducted on samples QUR-1-141125, QUL-66-0M-141125, QUL-66-20M-141125 and QUL-66-45M-141125 using *C. dubia* are provided in Tables 2 to 5. No adverse effects on survival were observed, resulting in LC50 values of >100% for all samples.

There were adverse effects on reproduction in sample QUR-1-141125; the IC25 was 8.2% and the IC50 was >100%. Adverse effects on reproduction were observed on the unfiltered samples QUL-66-0M-141125, QUL-66-20M-141125 and QUL-66-45M-141125; the IC25 values were 29.3, 6.2 and 22.1%, respectively. The corresponding filtered samples exhibited reduced toxicity with IC25 values of >100% in QUL-66-0M-141125 and QUL-66-20M-141125, and 92.5% in QUL-66-45M-141125. IC50 values in the filtered and unfiltered samples were all >100%.

Table 2. Results: *Ceriodaphnia dubia* survival and reproduction test with sample QUR-1-141125.

Concentration (% v/v)	Survival (%)	Reproduction (Mean ± SD)

IC50	--	>100	--	>100

SD = Standard Deviation, LC = Lethal Concentration, IC = Inhibition Concentration, CL = Confidence Limits, N/A = Not Applicable.

4.0 QA/QC

The health history of the test organisms used in the exposure was acceptable and met the requirements of the Environment Canada protocol. The test met all control acceptability criteria and water quality parameters remained within ranges specified in the protocol throughout the test. There were no deviations from the test methodology. Uncertainty associated with this test is best described by the standard deviation around the mean and/or the confidence limits around the point estimates.

Results of the reference toxicant test conducted during the testing program are summarized in Table 6. Results for this test fell within the range for organism performance of mean and two standard deviation range, based on historical results obtained by the laboratory with this test. Thus, the sensitivity of the organisms used in this test was appropriate.

Table 6. Reference toxicant test results.

Test Species	Endpoint	Historical Mean (2 SD Range)	CV (%)	Test Date
<i>C. dubia</i>	Survival (LC50): 1.8 g/L NaCl	1.9 (1.5 - 2.4) g/L NaCl	12	November 19, 2014
	Reproduction (IC25): 1.2 g/L NaCl	1.4 (1.0 - 2.0) g/L NaCl	19	

SD = Standard Deviation, CV = Coefficient of Variation, LC = Lethal Concentration, IC = Inhibition Concentration.

APPENDIX A - Toxicity Test Data

Ceriodaphnia dubia Summary Sheet

Client: Mount Polley
 Work Order No.: 14927

Start Date/Time: Nov 26/14 @ 1330h
 Set up by: EMM

Sample Information:

Sample ID: QUR-1-141125
 Sample Date: Nov 25/14
 Date Received: Nov 26/14
 Sample Volume: 6 x 20L

Test Validity Criteria:

- 1) Mean survival of first generation controls is $\geq 80\%$
- 2) At least 60% of controls have produced three broods within 8 days
- 3) An average of ≥ 15 live young produced per surviving female in the control solutions during the first three broods.
- 4) Invalid if ephippia observed in any control solution at any time.

WQ Ranges:

T ($^{\circ}$ C) = 25 ± 1 ; DO (mg/L) = 3.3 to 8.4; pH = 6.0 to 8.5

Test Organism Information:

Broodstock No.: 111214B
 Age of young (Day 0): <24-h (within 12-h)
 Avg No. young in first 3 broods of previous 7 d: 36
 Mortality (%) in previous 7 d: 5
 Individual female # used ≥ 8 young on test day: 21 \rightarrow 26, 28 \rightarrow 39

NaCl Reference Toxicant Results:

Reference Toxicant ID: cd120
 Stock Solution ID: 14NaO2
 Date Initiated: Nov 19/14

7-d LC50 (95% CL): 1.8 (1.6-2.2) g/L NaCl
 7-d IC50 (95% CL): 1.2 (0.9-1.5) g/L NaCl

7-d LC50 Reference Toxicant Mean and Historical Range: 1.9 (1.5-2.4) g/L NaCl CV (%): 12
 7-d IC50 Reference Toxicant Mean and Historical Range: 1.4 (1.0-2.0) g/L NaCl CV (%): 19

Test Results:

	Survival	Reproduction
LC50 % (v/v) (95% CL)	7100	
IC25 % (v/v) (95% CL)		8.2 (2.4-34.4)
IC50 % (v/v) (95% CL)		7100

Ceriodaphnia dubia Summary Sheet

Client: Mount Polley
 Work Order No.: 14927

Start Date/Time: Nov 26 114 @ 1200h
 Set up by: EMM

Sample Information:

Sample ID: QUL-66-0m-141125
 Sample Date: Nov 25 14
 Date Received: Nov 26 14
 Sample Volume: 15 x 12

Test Validity Criteria:

- 1) Mean survival of first generation controls is ≥80 %
- 2) At least 60% of controls have produced three broods within 8 days
- 3) An average of ≥15 live young produced per surviving female in the control solutions during the first three broods.
- 4) Invalid if ephippia observed in any control solution at any time.

WQ Ranges:

T (°C) = 25 ± 1; DO (mg/L) = 3.3 to 8.4 ; pH = 6.0 to 8.5

Test Organism Information:

Broodstock No.: 111214B
 Age of young (Day 0): <24-h (within 12-h)
 Avg No. young in first 3 broods of previous 7 d: 36
 Mortality (%) in previous 7 d: 5
 Individual female # used ≥8 young on test day: 21→26, 28-39

NaCl Reference Toxicant Results:

Reference Toxicant ID: cd120
 Stock Solution ID: 14Na02
 Date Initiated: Nov 19 14

7-d LC50 (95% CL): 1.8 (1.6-2.2) g/L NaCl
 7-d IC50 (95% CL): 1.2 (0.9-1.5) g/L NaCl

7-d LC50 Reference Toxicant Mean and Historical Range: 1.9 (1.5-2.4) g/L NaCl CV (%): 12
 7-d IC50 Reference Toxicant Mean and Historical Range: 1.4 (1.0-2.0) g/L NaCl CV (%): 19

Test Results:

	Survival	Reproduction
LC50 % (v/v) (95% CL)	7100	
IC25 % (v/v) (95% CL)		29.3 (10.9-40.2)
IC50 % (v/v) (95% CL)		7100

Ceriodaphnia dubia Summary Sheet

Client: Mount Polley
 Work Order No.: 14927

Start Date/Time: Nov 26/14 @ 1200h
 Set up by: EMM

Sample Information:

Sample ID: QUL-66-0m-141125 (Filtered)
 Sample Date: Nov 25/14
 Date Received: Nov 26/14
 Sample Volume: 15 x 1 L

Test Validity Criteria:

- 1) Mean survival of first generation controls is $\geq 80\%$
- 2) At least 60% of controls have produced three broods within 8 days
- 3) An average of ≥ 15 live young produced per surviving female in the control solutions during the first three broods.
- 4) Invalid if ephippia observed in any control solution at any time.

WQ Ranges:

T ($^{\circ}$ C) = 25 ± 1 ; DO (mg/L) = 3.3 to 8.4; pH = 6.0 to 8.5

Test Organism Information:

Broodstock No.: 11214B
 Age of young (Day 0): <24-h (within 12-h)
 Avg No. young in first 3 broods of previous 7 d: 36
 Mortality (%) in previous 7 d: 5
 Individual female # used ≥ 8 young on test day: 21-26, 28-39

NaCl Reference Toxicant Results:

Reference Toxicant ID: cd120
 Stock Solution ID: 14Na02
 Date Initiated: Nov 19/14

7-d LC50 (95% CL): 1.8 (1.6-2.2) g/L NaCl
 7-d IC50 (95% CL): 1.2 (0.9-1.5) g/L NaCl

7-d LC50 Reference Toxicant Mean and Historical Range: 1.9 (1.5-2.4) g/L NaCl CV (%): 12
 7-d IC50 Reference Toxicant Mean and Historical Range: 1.4 (1.0-2.0) g/L NaCl CV (%): 19

Test Results:

	Survival	Reproduction
LC50 % (v/v) (95% CL)	7100	
IC25 % (v/v) (95% CL)		7100
IC50 % (v/v) (95% CL)		7100

Ceriodaphnia dubia Summary Sheet

Client: Mount Polley
 Work Order No.: 14927

Start Date/Time: Nov 26/14 @ 1230h
 Set up by: EMM

Sample Information:

Sample ID: QUL-66-20m-141125
 Sample Date: Nov 25/14
 Date Received: Nov 26/14
 Sample Volume: 1x 20L

Test Validity Criteria:

- 1) Mean survival of first generation controls is $\geq 80\%$
- 2) At least 60% of controls have produced three broods within 8 days
- 3) An average of ≥ 15 live young produced per surviving female in the control solutions during the first three broods.
- 4) Invalid if ephippia observed in any control solution at any time.

WQ Ranges:

T ($^{\circ}$ C) = 25 ± 1 ; DO (mg/L) = 3.3 to 8.4; pH = 6.0 to 8.5

Test Organism Information:

Broodstock No.: 111814
 Age of young (Day 0): <24-h (within 12-h)
 Avg No. young in first 3 broods of previous 7 d: 21
 Mortality (%) in previous 7 d: 0
 Individual female # used ≥ 8 young on test day: 1-10

NaCl Reference Toxicant Results:

Reference Toxicant ID: cd120
 Stock Solution ID: 14Na02
 Date Initiated: Nov 19/14

7-d LC50 (95% CL): 1.8 (1.6-2.2) g/L NaCl
 7-d IC50 (95% CL): 1.2 (0.9-1.5) g/L NaCl

7-d LC50 Reference Toxicant Mean and Historical Range: 1.9 (1.5-2.4) g/L NaCl CV (%): 12
 7-d IC50 Reference Toxicant Mean and Historical Range: 1.4 (1.0-2.0) g/L NaCl CV (%): 19

Test Results:

	Survival	Reproduction
LC50 % (v/v) (95% CL)	7100	
IC25 % (v/v) (95% CL)		6.2 (3.0-32.5)
IC50 % (v/v) (95% CL)		7100

Ceriodaphnia dubia Summary Sheet

Client: Mount Polley
 Work Order No.: 14927

Start Date/Time: Nov 26/14 @ 1230h
 Set up by: EMM

Sample Information:

Sample ID: QUL-66-20m-141125 (Filtered)
 Sample Date: Nov 25/14
 Date Received: Nov 26/14
 Sample Volume: 1x20L

Test Validity Criteria:

- 1) Mean survival of first generation controls is $\geq 80\%$
- 2) At least 60% of controls have produced three broods within 8 days
- 3) An average of ≥ 15 live young produced per surviving female in the control solutions during the first three broods.
- 4) Invalid if ephippia observed in any control solution at any time.

WQ Ranges:

T ($^{\circ}$ C) = 25 ± 1 ; DO (mg/L) = 3.3 to 8.4 ; pH = 6.0 to 8.5

Test Organism Information:

Broodstock No.: 111814
 Age of young (Day 0): <24-h (within 12-h)
 Avg No. young in first 3 broods of previous 7 d: 21
 Mortality (%) in previous 7 d: 0
 Individual female # used ≥ 8 young on test day: 1-710

NaCl Reference Toxicant Results:

Reference Toxicant ID: cd120
 Stock Solution ID: 14Na02
 Date Initiated: Nov 19/14

7-d LC50 (95% CL): 1.8 (1.16-2.2) g/L NaCl
 7-d IC50 (95% CL): 1.2 (0.9-1.5) g/L NaCl

7-d LC50 Reference Toxicant Mean and Historical Range: 1.9 (1.5-2.4) g/L NaCl CV (%): 12
 7-d IC50 Reference Toxicant Mean and Historical Range: 1.4 (1.0-2.0) g/L NaCl CV (%): 19

Test Results:

	Survival	Reproduction
LC50 % (v/v) (95% CL)	7100	
IC25 % (v/v) (95% CL)		7100
IC50 % (v/v) (95% CL)		7100

Ceriodaphnia dubia Summary Sheet

Client: Mount Pooley
 Work Order No.: 14927

Start Date/Time: Nov 26 11/4 @ 1300h
 Set up by: EMM

Sample Information:

Sample ID: QUL-166-45m-141125
 Sample Date: Nov 25/14
 Date Received: Nov 26/14
 Sample Volume: 1 x 20L

Test Validity Criteria:

- 1) Mean survival of first generation controls is $\geq 80\%$
- 2) At least 60% of controls have produced three broods within 8 days
- 3) An average of ≥ 15 live young produced per surviving female in the control solutions during the first three broods.
- 4) Invalid if ephippia observed in any control solution at any time.

WQ Ranges:

T ($^{\circ}$ C) = 25 ± 1 ; DO (mg/L) = 3.3 to 8.4 ; pH = 6.0 to 8.5

Test Organism Information:

Broodstock No.: 111214A
 Age of young (Day 0): <24-h (within 12-h)
 Avg No. young in first 3 broods of previous 7 d: 35
 Mortality (%) in previous 7 d: EMM 5 10
 Individual female # used ≥ 8 young on test day: 1-8, 10, 11, 13-17, 20

NaCl Reference Toxicant Results:

Reference Toxicant ID: cd120
 Stock Solution ID: 14NaO2
 Date Initiated: Nov 19/14

7-d LC50 (95% CL): 1.8 (1.6-2.2) g/L NaCl
 7-d IC50 (95% CL): 1.2 (0.9-1.5) g/L NaCl

7-d LC50 Reference Toxicant Mean and Historical Range: 1.4 (1.5-2.4) g/L NaCl CV (%): 12
 7-d IC50 Reference Toxicant Mean and Historical Range: 1.4 (1.0-2.0) g/L NaCl CV (%): 19

Test Results:

	Survival	Reproduction
LC50 % (v/v) (95% CL)	7100	
IC25 % (v/v) (95% CL)		22.1 (5.4-57.7)
IC50 % (v/v) (95% CL)		7100

Ceriodaphnia dubia Summary Sheet

Client: Mount Polley
 Work Order No.: 14927

Start Date/Time: Nov 26/14 @ 1300h
 Set up by: EMM

Sample Information:

Sample ID: QUL-66-45m-141125 (Filtered)
 Sample Date: Nov 25/14
 Date Received: Nov 26/14
 Sample Volume: 1x20L

Test Validity Criteria:

- 1) Mean survival of first generation controls is $\geq 80\%$
- 2) At least 60% of controls have produced three broods within 8 days
- 3) An average of ≥ 15 live young produced per surviving female in the control solutions during the first three broods.
- 4) Invalid if ephippia observed in any control solution at any time.

WQ Ranges:

T ($^{\circ}$ C) = 25 ± 1 ; DO (mg/L) = 3.3 to 8.4 ; pH = 6.0 to 8.5

Test Organism Information:

Broodstock No.: 111214A
 Age of young (Day 0): <24-h (within 12-h)
 Avg No. young in first 3 broods of previous 7 d: 35
 Mortality (%) in previous 7 d: EMM
 Individual female # used ≥ 8 young on test day: 1-8, 10, 11, 13-17, 20

NaCl Reference Toxicant Results:

Reference Toxicant ID: cd120
 Stock Solution ID: 14NaO2
 Date initiated: Nov 19/14

7-d LC50 (95% CL): 1.8 (1.6-2.2) g/L NaCl
 7-d IC50 (95% CL): 1.2 (0.9-1.5) g/L NaCl

7-d LC50 Reference Toxicant Mean and Historical Range: 1.9 (1.5-2.4) g/L NaCl CV (%): 12
 7-d IC50 Reference Toxicant Mean and Historical Range: 1.4 (1.0-2.0) g/L NaCl CV (%): 19

Test Results:

	Survival	Reproduction
LC50 % (v/v) (95% CL)	7100	
IC25 % (v/v) (95% CL)		92.5 (43.4 - N/A)
IC50 % (v/v) (95% CL)		7100

This report has been prepared by Nautilus Environmental Company Inc. based on data and/or samples provided by our client and the results of this study are for their sole benefit. Any reliance on the data by a third party is at the sole and exclusive risk of that party. The results presented here relate only to the samples tested.

1.0 INTRODUCTION

Nautilus Environmental conducted a rainbow trout (*Oncorhynchus mykiss*) embryo-alevin toxicity test for Mount Polley Mining on a sample identified as QUR-1. The initial and refresh samples were collected between November 25 to December 22, 2014 and delivered on a weekly basis to the Nautilus Environmental laboratory in Burnaby, BC. The samples were collected in 20-L plastic containers. The samples were received at temperatures ranging from 3.0 to 6.9°C and were stored at $4 \pm 2^\circ\text{C}$ in the dark prior to and during testing.

This report describes the results of the toxicity test. Copies of laboratory data sheets and printouts of statistical analyses are provided in Appendix A. The chain-of-custody forms are provided in Appendix B.

2.0 METHODS

The methodology for the early life stage embryo-alevin test is summarized in Table 1. Testing was conducted according to procedures described by Environment Canada (1998) and Canaria et al. (1999). Statistical analyses were performed using CETIS (Tidepool Scientific Software, 2013).

Table 1. Summary of test conditions: rainbow trout embryo-alevin test.

Test organism	<i>Oncorhynchus mykiss</i>
Test organism source	Vancouver Island Trout Hatchery, Duncan, BC
Test organism age	<30 min post fertilization, <24 h old gametes
Test type	Static-renewal
Test duration	30 days
Test vessel	2-L plastic containers
Test solution volume	2L
Test treatments	Laboratory control, 6.25, 12.5, 25, 50, and 100% sample
Test replicates	4 test replicates per treatment
No. of organisms	30 eggs per container
Control water	Dechlorinated water (hardness 9-12 mg/L CaCO ₃)
Test solution renewal	Daily
Test temperature	14 ± 1°C
Feeding	None
Light intensity	Dark (low light during solution renewals)
Photoperiod	24-h dark
Aeration	6.5 ± 1 mL/min/L
Test protocol	Environment Canada (1998), EPS 1/RM/28; Canaria et al. (1999)
Statistical software	CETIS (2013)
Test endpoint	Survival, normal alevins
Test acceptability criteria for controls	≥65% normal alevins
Reference toxicant	Sodium Dodecyl Sulphate (SDS)

3.0 RESULTS

Results of the embryo-alevin test with sample QUR-1 are provided below in Table 2. There were no adverse effects exhibited for either test endpoint, with embryo survival and normal hatched alevins in all the test treatments at >87% and >85%, respectively. Consequently, the EC25 and EC50 values for both survival and normality were >100% (v/v).

Table 2. Results: rainbow trout embryo-alevin test.

Concentration (% v/v)	Survival (%) [Mean ± SD]	Normal Alevins (%) [Mean ± SD]
Control	87.5 ± 16.2	85.0 ± 19.2
6.25	92.5 ± 7.4	92.5 ± 7.4
12.5	92.5 ± 6.9	88.3 ± 4.3
25	90.8 ± 5.7	87.5 ± 5.0
50	94.8 ± 4.6	93.2 ± 4.1
100	92.5 ± 6.3	92.5 ± 6.3
Test Endpoint	Survival (%)	Normal Alevins (%)
EC25	>100	>100
EC50	>100	>100

v/v = volume per volume, SD = Standard Deviation, EC = Effective Concentration.

4.0 QA/QC

The tests met control passing criterion of $\geq 65\%$ normal hatched alevins specified in the Environment Canada protocol (1998). Water quality parameters remained within ranges specified in the protocol and there were no deviations from the test methodology. Uncertainty associated with these tests is best described by the standard deviation around the mean and/or where applicable, the confidence interval for point estimates.

Results of the reference toxicant test conducted during the testing program are summarized in Table 3. Results for this test fell within the range for organism performance of mean and range, based on historical results obtained by the laboratory with this test. Thus, the sensitivity of the embryos used in the toxicity test and evaluated with the concurrent SDS reference toxicant test was appropriate.

Table 3. Reference toxicant result.

Test Species	Endpoint	Historical Mean (2 SD Range)	CV (%)	Test Date
<i>O.mykiss</i> (embryo)	Viability (EC50): 2.7 mg/L SDS	3.9 (2.0 – 7.3)	37	November 26, 2014

SD = Standard Deviation, CV = Coefficient of Variation, EC = Effective Concentration.

This report has been prepared by Nautilus Environmental Company Inc, based on data and/or samples provided by our client and the results of this study are for their sole benefit. Any reliance on the data by a third party is at the sole and exclusive risk of that party. The results presented here relate only to the samples tested.

1.0 INTRODUCTION

Nautilus Environmental conducted a rainbow trout (*Oncorhynchus mykiss*) embryo-alevin toxicity test for Mount Polley Mining on a sample identified as QUR-1. The initial and refresh samples were collected between December 10, 2014 to January 7, 2015 and delivered on a weekly basis to the Nautilus Environmental laboratory in Burnaby, BC. The samples were collected in 20-L plastic containers. The samples were received at temperatures ranging from 2.0 to 6.9°C and were stored at $4 \pm 2^\circ\text{C}$ in the dark prior to testing.

This report describes the results of the toxicity test. Copies of laboratory data sheets and printouts of statistical analyses are provided in Appendix A. The chain-of-custody forms are provided in Appendix B.

2.0 METHODS

The methodology for the early life stage embryo-alevin test is summarized in Table 1. Testing was conducted according to procedures described by Environment Canada (1998) and Canaria et al. (1999). Statistical analyses were performed using CETIS (Tidepool Scientific Software, 2013).

Table 1. Summary of test conditions: rainbow trout embryo-alevin test.

Test organism	<i>Oncorhynchus mykiss</i>
Test organism source	Vancouver Island Trout Hatchery, Duncan, BC
Test organism age	<30 min post fertilization, <24 h old gametes
Test type	Static-renewal
Test duration	30 days
Test vessel	2-L plastic containers
Test solution volume	2-L
Test treatments	Laboratory control, 6.25, 12.5, 25, 50, and 100% sample
Test replicates	4 test replicates per treatment
No. of organisms	30 eggs per container
Control water	Dechlorinated water (hardness 9-11 mg/L CaCO ₃)
Test solution renewal	Daily
Test temperature	14 ± 1°C
Feeding	None
Light intensity	Dark (low light during solution renewals)
Photoperiod	24-h dark
Aeration	6.5 ± 1 mL/min/L
Test protocol	Environment Canada (1998), EPS 1/RM/28; Canaria et al. (1999)
Statistical software	CETIS (2013)
Test endpoint	Survival, normal alevins
Test acceptability criteria for controls	≥65% normal live alevins
Reference toxicant	Sodium Dodecyl Sulphate (SDS)

3.0 RESULTS

Results of the embryo-alevin test with sample QUR-1 are provided below in Table 2. There were no adverse effects exhibited for either test endpoint, with survival and normal hatched alevins in all the test treatments at $\geq 80\%$ and $>61\%$, respectively. Consequently, the EC25 and EC50 values for both survival and normal hatched alevins were $>100\%$ (v/v).

Table 2. Results: rainbow trout embryo-alevin test.

Concentration (% v/v)	Survival (%) [Mean \pm SD]	Normal Alevins (%) [Mean \pm SD]
Control	89.2 \pm 9.2	75.0 \pm 11.1
6.25	86.7 \pm 2.7	71.7 \pm 5.8
12.5	80.0 \pm 8.2	61.7 \pm 7.9
25	84.2 \pm 15.0	71.7 \pm 15.5
50	87.5 \pm 8.3	66.7 \pm 9.4
100	80.8 \pm 18.1	62.5 \pm 16.4
Test endpoint	Survival (%)	Normal (%)
EC25	>100	>100
EC50	>100	>100

v/v = volume per volume, SD = Standard Deviation, EC = Effective Concentration.

4.0 QA/QC

The tests met control passing criterion of $\geq 65\%$ normal hatched alevins specified in the Environment Canada protocol (1998). Water quality parameters remained within ranges specified in the protocol and there were no deviations from the test methodology. Uncertainty associated with these tests is best described by the standard deviation around the mean and/or where applicable, the confidence interval for point estimates.

Results of the reference toxicant test conducted during the testing program are summarized in Table 3. Results for this test fell within the range for organism performance of mean and range, based on historical results obtained by the laboratory with this test. Thus, the sensitivity of the embryos used in the toxicity tests and evaluated with the concurrent SDS reference toxicant test was appropriate.

Table 3. Reference toxicant result.

Test Species	Endpoint	Historical Mean (2 SD Range)	CV (%)	Test Date
<i>O.mykiss</i> (embryo)	Viability (EC50): 5.6 mg/L SDS	3.9 (2.1 - 7.1)	35	December 11, 2014

SD = Standard Deviation, CV = Coefficient of Variation, EC = Effective Concentration.

This report has been prepared by Nautilus Environmental Company Inc. based on data and/or samples provided by our client and the results of this study are for their sole benefit. Any reliance on the data by a third party is at the sole and exclusive risk of that party. The results presented here relate only to the samples tested.

1.0 INTRODUCTION

Nautilus Environmental Company Inc. conducted toxicity tests for Mount Polley Mining Corporation on samples identified as QUR-1 and POL-4. The samples were collected on December 16, 2014 and delivered to the laboratory in Burnaby, BC on December 17, 2014. Samples QUR-1 and POL-4 were transported in 20-L plastic carboys and were received at temperatures of 4.5 and 3.9°C, respectively. Samples were stored in the dark at $4 \pm 2^\circ\text{C}$ prior to testing.

This report describes the results of the toxicity tests conducted on samples QUR-1 and POL-4 using *Ceriodaphnia dubia*. Tests with fathead minnow and rainbow trout were invalid and therefore, excluded from this report. Samples were re-collected for testing at a later date and a separate report will be prepared for these two species. Copies of laboratory data sheets and printouts of statistical analyses for the test are provided in Appendix A. The chain of custody form is provided in Appendix B.

2.0 METHODS

Methods for the toxicity tests using *C. dubia* are summarized in Table 1. Testing was conducted according to procedures described by Environment Canada (2007). Statistical analyses for the test were performed using CETIS (Tidepool Scientific Software, 2013).

Table 1. Summary of test conditions: *Ceriodaphnia dubia* survival and reproduction test.

Test organism	<i>Ceriodaphnia dubia</i>
Test organism source	In-house culture
Test organism age	<24 h old neonates produced within 12 h
Test type	Static-renewal
Test duration	7 ± 1 day
Test vessel	20 mL test tube
Test volume	15 mL
Test replicates	10 test replicates per treatment
Number of organisms	1 per replicate
Control water	20% Perrier water
Test solution renewal	Daily
Test temperature	25 ± 1°C
Feeding	<i>Pseudokirchneriella subcapitata</i> and YCT
Light intensity	100 to 600 lux at water surface
Photoperiod	16 hours light/8 hours dark
Aeration	None
Test protocol	Environment Canada, (2007) EPS 1/RM/21
Statistical software	CETIS (2013)
Test endpoint	Survival and reproduction
Test acceptability criteria for controls	≥80% survival; ≥15 young per surviving control producing three broods; ≥60% of controls producing three or more broods
Reference toxicant	Sodium chloride

3.0 RESULTS

Results of the toxicity tests conducted on samples QUR-1 and POL-4 using *C. dubia* are provided in Table 2. There were no adverse effects on survival for either sample, resulting in LC50 values of >100%. There were also no adverse effects on reproduction for sample POL-4. However, reproduction was adversely affected for sample QUR-1, resulting in an IC25 value of 50.6%.

Table 2. Results: *Ceriodaphnia dubia* survival and reproduction test.

Concentration (% v/v)	QUR-1		POL-4	
	Survival (%)	Reproduction (Mean ± SD)	Survival (%)	Reproduction (Mean ± SD)
Control	100	20.3 ± 3.3	90	18.8 ± 5.4
1.56	100	22.0 ± 2.7	100	22.0 ± 1.9
3.12	100	23.0 ± 2.5	90	21.6 ± 4.9
6.25	100	21.2 ± 3.2	90	20.9 ± 7.8
12.5	100	21.0 ± 2.4	90	21.0 ± 6.9
25	100	20.0 ± 4.1	90	20.4 ± 6.6
50	100	15.3 ± 3.3	80	18.1 ± 8.7
100	100	10.5 ± 3.1	100	20.8 ± 4.2
Test endpoint				
(% v/v)				
LC50	>100	--	>100	--
IC25 (95% CL)	--	50.6 (37.6 - 60.4)	--	>100
IC50	--	>100	--	>100

SD = Standard Deviation, LC = Lethal Concentration, IC = Inhibition Concentration, CL = Confidence Limits.

4.0 QA/QC

The health history of the test organisms used in the exposure was acceptable and met the requirements of the Environment Canada protocol. The test met all control acceptability criteria and water quality parameters remained within ranges specified in the protocol throughout the test. There were no deviations from the test methodology. Uncertainty associated with this test is best described by the standard deviation around the mean and/or the confidence limits around the point estimates.

Results of the reference toxicant test conducted during the testing program are summarized in Table 3. Results for this test fell within the range for organism performance of mean and two standard deviation range, based on historical results obtained by the laboratory with this test. Thus, the sensitivity of the organisms used in this test was appropriate.

Table 3. Reference toxicant test results.

Test Species	Endpoint	Historical Mean (2 SD Range)	CV (%)	Test Date
<i>C. dubia</i>	Survival (LC50): 2.1 g/L NaCl	1.9 (1.5 - 2.4) g/L NaCl	12	December 17, 2014
	Reproduction (IC25): 1.5 g/L NaCl	1.4 (1.0 - 2.0) g/L NaCl	19	

SD = Standard Deviation, CV = Coefficient of Variation, LC = Lethal Concentration, IC = Inhibition Concentration.

APPENDIX A - Toxicity Test Data

Ceriodaphnia dubia Summary Sheet

Client: MT Pollock
 Work Order No.: 14984

Start Date/Time: Dec 17/14 @ 1130h
 Set up by: EMM

Sample Information:

Sample ID: QUR-1
 Sample Date: Dec 16/14
 Date Received: Dec 17/14
 Sample Volume: 15x20L

Test Validity Criteria:

- 1) Mean survival of first generation controls is $\geq 80\%$
- 2) At least 60% of controls have produced three broods within 8 days
- 3) An average of ≥ 15 live young produced per surviving female in the control solutions during the first three broods.
- 4) Invalid if ephippia observed in any control solution at any time.

WQ Ranges:

T ($^{\circ}$ C) = 25 ± 1 ; DO (mg/L) = 3.3 to 8.4; pH = 6.0 to 8.5

Test Organism Information:

Broodstock No.: 120314A
 Age of young (Day 0): <24-h (within 12-h)
 Avg No. young in first 3 broods of previous 7 d: 45
 Mortality (%) in previous 7 d: 10
 Individual female # used ≥ 8 young on test day: 17, 13, 15, 16, 17, 19

NaCl Reference Toxicant Results:

Reference Toxicant ID: cd121
 Stock Solution ID: 14Na02
 Date Initiated: Dec 17/14

7-d LC50 (95% CL): 2.1 (1.5-3.0) g/L NaCl
 7-d IC50 (95% CL): 1.5 (1.3-1.8) g/L NaCl

7-d LC50 Reference Toxicant Mean and Historical Range: 1.9 (1.5-2.4) g/L NaCl CV (%): 12
 7-d IC50 Reference Toxicant Mean and Historical Range: 1.4 (1.0-2.0) g/L NaCl CV (%): 19

Test Results:

	Survival	Reproduction
LC50 % (v/v) (95% CL)	7100	
IC25 % (v/v) (95% CL)		7100 56.6 (37.6-60.4) <small>emm</small>
IC50 % (v/v) (95% CL)		56.6 (37.6-60.4) >100 <small>emm</small>

Ceriodaphnia dubia Summary Sheet

Client: Mount Polley
 Work Order No.: 14984

Start Date/Time: Dec 17/14 @ 12:00h
 Set up by: EMM

Sample Information:

Sample ID: POL-4
 Sample Date: Dec 16/14
 Date Received: Dec 17/14
 Sample Volume: 3 x 20L

Test Validity Criteria:

- 1) Mean survival of first generation controls is $\geq 80\%$
- 2) At least 60% of controls have produced three broods within 8 days
- 3) An average of ≥ 15 live young produced per surviving female in the control solutions during the first three broods.
- 4) Invalid if ephippia observed in any control solution at any time.

WQ Ranges:

T ($^{\circ}$ C) = 25 ± 1 ; DO (mg/L) = 3.3 to 8.4; pH = 6.0 to 8.5

Test Organism Information:

Broodstock No.: 120314A
 Age of young (Day 0): <24-h (within 12-h)
 Avg No. young in first 3 broods of previous 7 d: 42
 Mortality (%) in previous 7 d: 10
 Individual female # used ≥ 8 young on test day: 1, 2, 5, 8, 9, 10, 11

NaCl Reference Toxicant Results:

Reference Toxicant ID: cd121
 Stock Solution ID: 14N902
 Date Initiated: Dec 17/14

7-d LC50 (95% CL): 2.1 (1.5-3.0) ^{g/L emm} g/L NaCl
 7-d IC50 (95% CL): 1.5 (1.3-1.8) ^{g/L emm} g/L NaCl

7-d LC50 Reference Toxicant Mean and Historical Range: 1.9 (1.5-2.4) g/L NaCl CV (%): 12
 7-d IC50 Reference Toxicant Mean and Historical Range: 1.4 (1.0-2.0) g/L NaCl CV (%): 19

Test Results:

	Survival	Reproduction
LC50 % (v/v) (95% CL)	7100	
IC25 % (v/v) (95% CL)		7100
IC50 % (v/v) (95% CL)		7100

This report has been prepared by Nautilus Environmental Company Inc. based on data and/or samples provided by our client and the results of this study are for their sole benefit. Any reliance on the data by a third party is at the sole and exclusive risk of that party. The results presented here relate only to the samples tested.

1.0 INTRODUCTION

Nautilus Environmental Company Inc. conducted toxicity tests for Mount Polley Mining Corporation on samples identified as P2-S and QUR-1. The samples were collected on January 6 and 7, 2015 and delivered to the laboratory in Burnaby, BC on January 7 and 8, 2015. P2-S was transported in three, and QUR-1 in seven 20-L plastic carboys and coolers. The samples were received at temperatures of 2.6 and 4.0°C, and were stored in the dark at $4 \pm 2^\circ\text{C}$ prior to testing. The following sub-lethal toxicity tests were performed on the samples:

- *Ceriodaphnia dubia* survival and reproduction
- 7-d rainbow trout (*Oncorhynchus mykiss*) survival and growth
- 7-d fathead minnow (*Pimephales promelas*) survival and growth

Sample QUR-1 was vacuum filtered through 0.45 µm filter paper and tested in addition to the unfiltered sample only for the *C. dubia* toxicity test.

This report describes the results of these toxicity tests. Copies of laboratory data sheets and printouts of statistical analyses for each test are provided in Appendices A to C. The chain-of-custody form is provided in Appendix D.

2.0 METHODS

Methods for the toxicity tests are summarized in Tables 1 to 3. Testing was conducted according to procedures described by the Environment Canada protocols (2007 and 2011) and methods described by Lazorchak and Smith (2007). Statistical analyses for all tests were performed using CETIS (Tidepool Scientific Software, 2013).

Table 1. Summary of test conditions: *Ceriodaphnia dubia* survival and reproduction test.

Test organism source	In-house culture
Test organism age	<24 h old neonates produced within 12 h
Test type	Static-renewal
Test duration	7 ± 1 day
Test vessel	20 mL test tube
Test volume	15 mL
Test replicates	10 test replicates per treatment
Number of organisms	1 per replicate
Control water	20% Perrier water
Test solution renewal	Daily
Test temperature	25 ± 1°C
Feeding	<i>Pseudokirchneriella subcapitata</i> and YCT
Light intensity	100 to 600 lux at water surface
Photoperiod	16 hours light/8 hours dark
Aeration	None
Test protocol	Environment Canada, (2007) EPS 1/RM/21
Statistical software	CETIS (2013)
Test endpoint	Survival and reproduction
Test acceptability criteria for controls	≥80% survival; ≥15 young per surviving control producing three broods; ≥60% of controls producing three or more broods
Reference toxicant	Sodium chloride

Table 2. Summary of test conditions: rainbow trout (*Oncorhynchus mykiss*) survival and growth test.

Test organism	<i>Oncorhynchus mykiss</i>
Test organism source	Vancouver Island Trout Hatchery, Duncan, BC
Test organism age	3 to 6 days post swim up
Test type	Static renewal
Test duration	7 days
Test vessel	1-L glass containers
Test volume	500 mL
Test replicates	4 per treatment
Number of organisms	5 per replicate
Control water	Moderately-hard water (hardness 80-100 mg/L CaCO ₃)
Test solution renewal	Daily
Test temperature	15 ± 1°C
Feeding	Twice a day with newly hatched brine shrimp (<i>Artemia nauplii</i>)
Light intensity	100 – 500 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	None
Test protocol	Lazorchak and Smith (2007)
Statistical software	CETIS (2013)
Test endpoint	Survival and biomass
Test acceptability criteria for controls	≥90% survival, ≥1.5 times test initiation dry weight
Reference toxicant	Copper chloride

Table 3. Summary of test conditions: fathead minnow (*Pimephales promelas*) survival and growth test.

Test organism	<i>Pimephales promelas</i>
Test organism source	Aquatic BioSystems, Fort Collins, CO
Test organism age	<24 hours
Test type	Static renewal
Test duration	7 days
Test vessel	375-mL glass containers
Test volume	250 mL
Test replicates	3 per treatment
Number of organisms	10 per replicate
Control water	Moderately-hard water (hardness 80-100 mg/L CaCO ₃)
Test solution renewal	Daily
Test temperature	25 ± 1°C
Feeding	Twice a day with newly hatched brine shrimp (<i>Artemia nauplii</i>)
Light intensity	100 – 500 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	None
Test protocol	Environment Canada (2011), EPS 1/RM/22
Statistical software	CETIS (2013)
Test endpoint	Survival and biomass
Test acceptability criteria for controls	≥80% survival, ≥250 µg mean dry weight
Reference toxicant	Sodium chloride

3.0 RESULTS

There were no adverse effects observed on survival and reproduction of *C. dubia* (Table 4), survival and growth of rainbow trout (Table 5) or survival and growth of fathead minnow (Table 6). The LC and IC values were therefore greater than 100% for each of these endpoints in the toxicity tests.

Table 4. Results: *Ceriodaphnia dubia* survival and reproduction test.

4.0 QA/QC

The health history of the test organisms used in the exposures was acceptable and met the requirements of the protocols. The tests met all control acceptability criteria and water quality parameters remained within ranges specified in the protocols throughout the tests. There were no deviations from the test methodologies. Uncertainty associated with these tests is best described by the standard deviation around the mean and/or the confidence limits around the point estimates.

Results of the reference toxicant tests conducted during the testing program are summarized in Table 7. Results of the *C. dubia* and *P. promelas* tests fell within range for organism performance of mean and range, based on historical results obtained by the laboratory with this test. Thus, the sensitivity of the organisms used in these tests was appropriate. Results of the *O. mykiss* reference toxicant test fell outside two standard deviations of the historical results obtained by the laboratory. Approximately one in twenty reference toxicant results would be expected to fall outside of the two standard deviation range. Survival in the control and sample concentrations was high (>95%) and the organisms appeared healthy; therefore, the test results were not affected.

Table 7. Reference toxicant results.

Test Species	Endpoint	Historical Mean (2 SD Range)	CV (%)	Test Date
<i>C. dubia</i>	Survival (LC50): 2.0 g/L NaCl	1.9 (1.5 - 2.4)	12	January 21, 2015
	Reproduction (IC50): 1.4 g/L NaCl	1.4 (1.0 - 2.0)	19	
<i>O. mykiss</i>	Survival (LC50): 37.5 mg/L Cu	77.6 (49.5-121.7)	25	January 8, 2015
<i>P. promelas</i>	Survival (LC50): 4.6 g/L NaCl	4.4 (3.4 - 5.5)	13	January 8, 2015
	Biomass (IC50): 4.1 g/L NaCl	3.8 (2.8 - 5.3)	18	

SD = Standard Deviation, CV = Coefficient of Variation, IC = Inhibition Concentration, LC = Lethal Concentration.

APPENDIX A - *Ceriodaphnia dubia* Toxicity Test Data

Ceriodaphnia dubia Summary Sheet

Client: Mount Palley
 Work Order No.: 15020

Start Date/Time: Jan 7 14^{15mm} @ 1030h
 Set up by: EMM

Sample Information:

Sample ID: P2-S
 Sample Date: Jan 6/15
 Date Received: Jan 7/15
 Sample Volume: 3x20L

Test Validity Criteria:

- 1) Mean survival of first generation controls is >80 %
- 2) At least 60% of controls have produced three broods within 8 days
- 3) An average of ≥15 live young produced per surviving female in the control solutions during the first three broods.
- 4) Invalid if ephippia observed in any control solution at any time.

WQ Ranges:

T (°C) = 25 ± 1; DO (mg/L) = 3.3 to 8.4 ; pH = 6.0 to 8.5

Test Organism Information:

Broodstock No.: 1224^{14mm}
 Age of young (Day 0): <24-h (within 12-h)
 Avg No. young in first 3 broods of previous 7 d: 42
 Mortality (%) in previous 7 d: 5
 Individual female # used ≥8 young on test day: 13,14,15,16,17,18

NaCl Reference Toxicant Results:

Reference Toxicant ID: Ca122
 Stock Solution ID: 15NaCl
 Date Initiated: Jan 21/15

7-d LC50 (95% CL): 2.0 (1.7-2.3) g/L NaCl
 7-d IC50 (95% CL): 1.4 (1.2-1.5) g/L NaCl

7-d LC50 Reference Toxicant Mean and Historical Range: 1.9 (1.5-3.4) g/L NaCl CV (%): 12
 7-d IC50 Reference Toxicant Mean and Historical Range: 1.4 (1.0-2.0) g/L NaCl CV (%): 19

Test Results:

	Survival	Reproduction
LC50 % (v/v) (95% CL)	7100	7100
IC25 % (v/v) (95% CL)	7100	7100
IC50 % (v/v) (95% CL)	7100	7100

Ceriodaphnia dubia Summary Sheet

Client: Mount Palley
 Work Order No.: 15024

Start Date/Time: Jan 8/15 @ 1130h
 Set up by: EMM

Sample Information:

Sample ID: QUR-1
 Sample Date: Jan 7/15
 Date Received: Jan 8/15
 Sample Volume: 7X 20L

Test Validity Criteria:

- 1) Mean survival of first generation controls is $\geq 80\%$
- 2) At least 60% of controls have produced three broods within 8 days
- 3) An average of ≥ 15 live young produced per surviving female in the control solutions during the first three broods.
- 4) Invalid if ephippia observed in any control solution at any time.

WQ Ranges:

T ($^{\circ}$ C) = 25 ± 1 ; DO (mg/L) = 3.3 to 8.4 ; pH = 6.0 to 8.5

Test Organism Information:

Broodstock No.: 123014
 Age of young (Day 0): <24-h (within 12-h)
 Avg No. young in first 3 broods of previous 7 d: 20
 Mortality (%) in previous 7 d: 5
 Individual female # used ≥ 8 young on test day: 2,3,4,5,6,7,8,9,15,16,17,18,19,20

NaCl Reference Toxicant Results:

Reference Toxicant ID: CD122
 Stock Solution ID: 15NaCl
 Date Initiated: Jan 21/15

7-d LC50 (95% CL): 2.0 (1.7 - 2.3) g/L NaCl
 7-d IC50 (95% CL): 1.4 (1.2 - 1.5) g/L NaCl

7-d LC50 Reference Toxicant Mean and Historical Range: 1.9 (1.5 - 2.4) g/L NaCl CV (%): 12
 7-d IC50 Reference Toxicant Mean and Historical Range: 1.4 (1.0 - 2.0) g/L NaCl CV (%): 19

Ceriodaphnia dubia Summary Sheet

Client: Mount Polley
 Work Order No.: 15024

Start Date/Time: Jan 8/15 @ 1200h
 Set up by: EM/M

Sample Information:

Sample ID: QUR-1 (Filtered)
 Sample Date: Jan 7/15
 Date Received: Jan 8/15
 Sample Volume: 7x20L

Test Validity Criteria:

- 1) Mean survival of first generation controls is $\geq 80\%$
- 2) At least 60% of controls have produced three broods within 8 days
- 3) An average of ≥ 15 live young produced per surviving female in the control solutions during the first three broods.
- 4) Invalid if ephippia observed in any control solution at any time.

WQ Ranges:

T ($^{\circ}$ C) = 25 ± 1 ; DO (mg/L) = 3.3 to 8.4 ; pH = 6.0 to 8.5

Test Organism Information:

Broodstock No.: 123014
 Age of young (Day 0): <24-h (within 12-h)
 Avg No. young in first 3 broods of previous 7 d: 20
 Mortality (%) in previous 7 d: 5
 Individual female # used ≥ 8 young on test day: 2,3,4,5,6,7,8,9,15,16,17,18,19,20

NaCl Reference Toxicant Results:

Reference Toxicant ID: cd122
 Stock Solution ID: 15NaCl
 Date Initiated: Jan 2/15

7-d LC50 (95% CL): 2.0 (1.7 - 2.3) g/L NaCl
 7-d IC50 (95% CL): 1.4 (1.2 - 1.5) g/L NaCl

7-d LC50 Reference Toxicant Mean and Historical Range: 1.9 (1.5 - 2.4) g/L NaCl CV (%): 12
 7-d IC50 Reference Toxicant Mean and Historical Range: 1.4 (1.0 - 2.0) g/L NaCl CV (%): 19

Test Results:

	Survival	Reproduction
LC50 % (v/v) (95% CL)	7100	
IC25 % (v/v) (95% CL)		7100
IC50 % (v/v) (95% CL)		7100

APPENDIX B - Rainbow Trout (*Oncorhynchus mykiss*) Toxicity Test Data

Rainbow Trout Swimup Test Summary Sheet

Client: Mt Polley

Start Date/Time: JAN 8 / 2015 @ 1400h

Work Order No.: 15021

Test Species: Oncorhynchus mykiss

Sample Information:

Sample ID: P2-S

Sample Date: JAN 6 / 15

Date Received: JAN 7 / 15

Sample Volume: 3 x 20L

Dilution Water:

Type: Moderately Hard Water
 Hardness (mg/L CaCO₃): EC 128 98
 Alkalinity (mg/L CaCO₃): EC 86 62
 Batch: 010615 | 010915 EC

Test Organism Information:

Batch No.: 010715
 Source: Vancouver Island Trout Hatchery
 Loading Density: N/A

Copper Reference Toxicant Results:

Reference Toxicant ID: ATCLII
 Stock Solution ID: 15Cu01
 Date Initiated: JAN 8 / 15
 7-d EC50 (95% CL): 37.5 (32.12 - 43.79) mg/L Cu
 Reference Toxicant Mean ± 2 SD: 77.63 (49.54 - 121.7) mg/L Cu
 Reference Toxicant CV (%): 25.20

Test Results:

	Sample ID	
	Swimup Survival	Swimup Dry Weight

APPENDIX C - Fathead Minnow (*Pimephales promelas*) Toxicity Test Data

Fathead Minnow Test Summary Sheet
(7-d *Pimephales promelas* Survival and Growth Test)

Client: Mount Polley
Work Order No.: 15019

Start Date/Time: JAN 8/15 @ 1500h
Test Species: P. promelas

Sample Information:

Sample ID: P2-S
Sample Date: JAN 6/15
Date Received: JAN 7/15
Sample Volume: 3x 20L

Dilution Water (initial water quality):

Type: Moderately Hard Water
Temperature (°C): 24.5
pH: 7.6
Dissolved Oxygen (mg/L): 8.0
Hardness (mg/L CaCO₃): 82
Alkalinity (mg/L CaCO₃): 52

Test Validity Criteria:

The test is invalid if:

- 1) for the control solutions, the combined and cumulative incidence of any mortalities, or fish showing loss of equilibrium or other signs of atypical swimming behavior, is >20%
- 2) the average dry weight of the surviving control fish does not attain 250 ug when the fish are dried and weighed.

WQ Ranges:

T (°C) = 25 ± 1; DO (mg/L) = 3.3 to 8.4; pH = 6.5 to 8.5

Test Organism Information:

Batch No.: 010815
Source: Aquatic Biosystems, CO
Age: 224 hrs

NaCl Reference Toxicant Results:

Reference Toxicant ID: PP10?
Stock Solution ID: n/a
Date Initiated: JAN 8/15
7-d EC50 (95% CL): 4.6 (3.7 - 5.7) g/L NaCl
7-d IC50 (95% CL): 4.1 (3.4 - 5.1) g/L NaCl

Survival:

Reference Toxicant Mean and Historical Range: 4.4 (3.4 - 5.5) CV (%) 13

Biomass:

Reference Toxicant Mean and Historical Range: 3.8 (2.8 - 5.3) CV (%) 18

Test Results:

	Survival	Biomass

Fathead Minnow Test Summary Sheet
(7-d *Pimephales promelas* Survival and Growth Test)

Client: Mount Polley
Work Order No.: 15023

Start Date/Time: Jan 8/15 @ 1500h
Test Species: P. promelas

Sample Information:

Sample ID: OUR-1
Sample Date: Jan 7/15
Date Received: Jan 8/15
Sample Volume: 7x20L

Dilution Water (initial water quality):

Type: Moderately Hard Water
Temperature (°C): 24.5
pH: 7.6
Dissolved Oxygen (mg/L): 8.0
Hardness (mg/L CaCO₃): 82
Alkalinity (mg/L CaCO₃): 52

Test Validity Criteria:

The test is invalid if:

- 1) for the control solutions, the combined and cumulative incidence of any mortalities, or fish showing loss of equilibrium or other signs of atypical swimming behavior, is >20%
- 2) the average dry weight of the surviving control fish does not attain 250 ug when the fish are dried and weighed.

WQ Ranges:
T (°C) = 25 ± 1; DO (mg/L) = 3.3 to 8.4; pH = 6.5 to 8.5

Test Organism Information:

Batch No.: 010815
Source: Aquatic Biosystems, CO
Age: 24 hrs

NaCl Reference Toxicant Results:

Reference Toxicant ID: PP103
Stock Solution ID: n/a
Date Initiated: Jan 8/15
7-d EC50 (95% CL): 4.6 (3.7 - 5.7) g/L NaCl
7-d IC50 (95% CL): 4.1 (3.4 - 5.1) g/L NaCl

Survival:
Reference Toxicant Mean and Historical Range: 4.4 (3.4 - 5.5) CV (%): 13

Biomass:
Reference Toxicant Mean and Historical Range: 3.8 (2.8 - 5.3) CV (%): 18

This report has been prepared by Nautilus Environmental Company Inc. based on data and/or samples provided by our client and the results of this study are for their sole benefit. Any reliance on the data by a third party is at the sole and exclusive risk of that party. The results presented here relate only to the samples tested.

1.0 INTRODUCTION

Nautilus Environmental Company Inc. conducted toxicity tests for Mount Polley Mining Corporation on samples identified as QUL-66-0M and QUL-66-85M. The samples were collected on January 15, 2015 and delivered to the laboratory in Burnaby, BC on January 16, 2015. Each sample was transported in three 20-L plastic carboys inside coolers. The samples were received at temperatures of 4.0 and 4.4°C and were stored in the dark at $4 \pm 2^\circ\text{C}$ prior to testing. The following sub-lethal toxicity tests were performed on the samples:

- *Ceriodaphnia dubia* survival and reproduction
- 7-d rainbow trout (*Oncorhynchus mykiss*) survival and growth
- 7-d fathead minnow (*Pimephales promelas*) survival and growth

The samples were vacuum filtered through 0.45 µm filter paper and tested in addition to unfiltered sample only for the *C. dubia* toxicity test.

This report describes the results of these toxicity tests. Copies of laboratory data sheets and printouts of statistical analyses for each test are provided in Appendices A to C. The chain-of-custody form is provided in Appendix D.

2.0 METHODS

Methods for the toxicity tests are summarized in Tables 1 to 3. Testing was conducted according to procedures described by the Environment Canada protocols (2007 and 2011) and methods described by Lazorchak and Smith (2007). Statistical analyses for all tests were performed using CETIS (Tidepool Scientific Software, 2013).

Table 1. Summary of test conditions: *Ceriodaphnia dubia* survival and reproduction test.

Test organism	<i>Ceriodaphnia dubia</i>
Test organism source	In-house culture
Test organism age	<24 h old neonates produced within 12 h
Test type	Static-renewal
Test duration	7 ± 1 day
Test vessel	20 mL test tube
Test volume	15 mL
Test replicates	10 test replicates per treatment
Number of organisms	1 per replicate
Control water	20% Perrier water
Test solution renewal	Daily
Test temperature	25 ± 1°C
Feeding	<i>Pseudokirchneriella subcapitata</i> and YCT
Light intensity	100 to 600 lux at water surface
Photoperiod	16 hours light/8 hours dark
Aeration	None
Test protocol	Environment Canada, (2007) EPS 1/RM/21
Statistical software	CETIS (2013)
Test endpoint	Survival and reproduction
Test acceptability criteria for controls	≥80% survival; ≥15 young per surviving control producing three broods; ≥60% of controls producing three or more broods
Reference toxicant	Sodium chloride

Table 2. Summary of test conditions: rainbow trout (*Oncorhynchus mykiss*) survival and growth test.

Test organism	<i>Oncorhynchus mykiss</i>
Test organism source	Vancouver Island Trout Hatchery, Duncan, BC
Test organism age	3 to 6 days post swim up
Test type	Static renewal
Test duration	7 days
Test vessel	1-L glass containers
Test volume	500 mL
Test replicates	4 per treatment
Number of organisms	5 per replicate
Control water	Moderately-hard water (hardness 80-100 mg/L CaCO ₃)
Test solution renewal	Daily
Test temperature	15 ± 1°C
Feeding	Twice a day with newly hatched brine shrimp (<i>Artemia nauplii</i>)
Light intensity	100 – 500 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	None
Test protocol	Lazorchak and Smith (2007)
Statistical software	CETIS (2013)
Test endpoint	Survival and biomass
Test acceptability criteria for controls	≥90% survival, ≥1.5 times test initiation dry weight
Reference toxicant	Copper chloride

Table 3. Summary of test conditions: fathead minnow (*Pimephales promelas*) survival and growth test.

Test organism	<i>Pimephales promelas</i>
Test organism source	Aquatic BioSystems, Fort Collins, CO
Test organism age	<24 hours
Test type	Static renewal
Test duration	7 days
Test vessel	375-mL glass containers
Test volume	250 mL
Test replicates	3 per treatment
Number of organisms	10 per replicate
Control water	Moderately-hard water (hardness 80-100 mg/L CaCO ₃)
Test solution renewal	Daily
Test temperature	25 ± 1°C
Feeding	Twice a day with newly hatched brine shrimp (<i>Artemia nauplii</i>)
Light intensity	100 – 500 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	None
Test protocol	Environment Canada (2011), EPS 1/RM/22
Statistical software	CETIS (2013)
Test endpoint	Survival and biomass
Test acceptability criteria for controls	≥80% survival, ≥250 µg mean dry weight
Reference toxicant	Sodium chloride

3.0 RESULTS

Results of the toxicity tests conducted on samples QUL-66-0M and QUL-66-85M using *C. dubia*, rainbow trout swim up and fathead minnow are provided in Tables 4 to 6. No adverse effects on survival were observed in the samples, resulting in LC50 values of >100% for the toxicity tests.

Adverse effects on *C. dubia* reproduction were observed on the unfiltered samples; the IC25 values were 11.1 and 8.3% for QUL-66-0M and QUL-66-85M, respectively. The corresponding filtered samples exhibited no toxicity with IC25 values of >100%. There were no adverse effects on rainbow trout swim up biomass or dry weight; the IC25 values were >100%. For the fathead minnow test, there were adverse effects on biomass but not dry weight; the IC25 for biomass was 83.2% for QUL-66-0M and 95.6% for QUL-66-85M.

Table 4. Results: *Ceriodaphnia dubia* survival and reproduction test.

4.0 QA/QC

The health history of the test organisms used in the exposures was acceptable and met the requirements of the protocols. The tests met all control acceptability criteria and water quality parameters remained within ranges specified in the protocols throughout the tests. There were no deviations from the test methodologies. Uncertainty associated with these tests is best described by the standard deviation around the mean and/or the confidence limits around the point estimates.

Results of the reference toxicant tests conducted during the testing program are summarized in Table 7. Results for these tests fell within the range for organism performance of mean and two standard deviation range, based on historical results obtained by the laboratory with these tests. Thus, the sensitivity of the organisms used in these tests was appropriate.

Table 7. Reference toxicant results.

Test Species	Endpoint	Historical Mean (2 SD Range)	CV (%)	Test Date
<i>C. dubia</i>	Survival (LC50): 2.0 g/L NaCl	1.9 (1.5 - 2.4)	12	January 21, 2015
	Reproduction (IC50): 1.4 g/L NaCl	1.4 (1.0 - 2.0)	19	
<i>O. mykiss</i>	Survival (LC50): 55.9 mg/L Cu	72.1 (38.6 - 134.9)	37	January 16, 2015
<i>P. promelas</i>	Survival (LC50): 4.8 g/L NaCl	4.3 (3.4 - 5.5)	13	January 16, 2015
	Biomass (IC50): 4.0 g/L NaCl	3.8 (2.8 - 5.2)	17	

SD = Standard Deviation, CV = Coefficient of Variation, IC = Inhibition Concentration, LC = Lethal Concentration.

APPENDIX A - *Ceriodaphnia dubia* Toxicity Test Data

Ceriodaphnia dubia Summary Sheet

Client: Mount Pooley
 Work Order No.: 15044

Start Date/Time: Jan 16/15 @ 12:00h
 Set up by: KLP

Sample Information:

Sample ID: QUL-06-0m (unfiltered)
 Sample Date: Jan 15/15
 Date Received: Jan 16/15
 Sample Volume: 3 x 20L

Test Validity Criteria:

- 1) Mean survival of first generation controls is $\geq 80\%$
- 2) At least 60% of controls have produced three broods within 8 days
- 3) An average of ≥ 15 live young produced per surviving female in the control solutions during the first three broods.
- 4) Invalid if ephippia observed in any control solution at any time.

WQ Ranges:
 T ($^{\circ}$ C) = 25 ± 1 ; DO (mg/L) = 3.3 to 8.4 ; pH = 6.0 to 8.5

Test Organism Information:

Broodstock No.: BB010715 A+B
 Age of young (Day 0): <24-h (within 12-h)
 Avg No. young in first 3 broods of previous 7 d: 27
 Mortality (%) in previous 7 d: 0
 Individual female # used ≥ 8 young on test day: 1, 7, 13, 16, 18, 20, 21, 30

NaCl Reference Toxicant Results:

Reference Toxicant ID: cd122
 Stock Solution ID: 15 NaCl
 Date Initiated: Jan 21/15

7-d LC50 (95% CL): 2.0 (1.7-2.3) g/L NaCl
 7-d IC50 (95% CL): 1.4 (1.2-1.5) g/L NaCl

7-d LC50 Reference Toxicant Mean and Historical Range: 1.9 (1.5-2.4) g/L NaCl CV (%): 12
 7-d IC50 Reference Toxicant Mean and Historical Range: 1.4 (1.0-2.0) g/L NaCl CV (%): 19

Test Results:

	Survival	Reproduction
LC50 % (v/v) (95% CL)	7100	
IC25 % (v/v) (95% CL)		11.1 (7.2-29.1)
IC50 % (v/v) (95% CL)		7100

Ceriodaphnia dubia Summary Sheet

Client: Mount Polley
 Work Order No.: 15044

Start Date/Time: Jan 16/15 @ 12:30h
 Set up by: KLP

Sample Information:

Sample ID: QUL-66-0m (Filtered)
 Sample Date: Jan 15/15
 Date Received: Jan 16/15
 Sample Volume: 3x20L

Test Validity Criteria:

- 1) Mean survival of first generation controls is $\geq 80\%$
- 2) At least 60% of controls have produced three broods within 8 days
- 3) An average of ≥ 15 live young produced per surviving female in the control solutions during the first three broods.
- 4) Invalid if ephippia observed in any control solution at any time.

WQ Ranges:

T ($^{\circ}$ C) = 25 ± 1 ; DO (mg/L) = 3.3 to 8.4; pH = 6.0 to 8.5

Test Organism Information:

Broodstock No.: BB010715 A+B
 Age of young (Day 0): <24-h (within 12-h)
 Avg No. young in first 3 broods of previous 7 d: 27
 Mortality (%) in previous 7 d: 0
 Individual female # used ≥ 8 young on test day: 1-7, 13, 16, 18, 20-30

NaCl Reference Toxicant Results:

Reference Toxicant ID: cd122
 Stock Solution ID: 15Na01
 Date Initiated: Jan 21/15

7-d LC50 (95% CL): 2.0 (1.7-2.3) g/L NaCl
 7-d IC50 (95% CL): 1.4 (1.2-1.5) g/L NaCl

7-d LC50 Reference Toxicant Mean and Historical Range: 1.9 (1.5-2.4) g/L NaCl CV (%): 12
 7-d IC50 Reference Toxicant Mean and Historical Range: 1.4 (1.0-2.0) g/L NaCl CV (%): 19

Test Results:

	Survival	Reproduction
LC50 % (v/v) (95% CL)	7100	
IC25 % (v/v) (95% CL)		7100
IC50 % (v/v) (95% CL)		7100

Ceriodaphnia dubia Summary Sheet

Client: Mount Polley
 Work Order No.: 15044

Start Date/Time: Jan 16/15 @ 12:00h
 Set up by: KLP

Sample Information:

Sample ID: QVL-66-ESm (Unfiltered)
 Sample Date: Jan 15/15
 Date Received: Jan 16/15
 Sample Volume: 3 x 20L

Test Validity Criteria:

- 1) Mean survival of first generation controls is $\geq 80\%$
- 2) At least 60% of controls have produced three broods within 8 days
- 3) An average of ≥ 15 live young produced per surviving female in the control solutions during the first three broods.
- 4) Invalid if ephippia observed in any control solution at any time.

WQ Ranges:

T ($^{\circ}$ C) = 25 ± 1 ; DO (mg/L) = 3.3 to 8.4; pH = 6.0 to 8.5

Test Organism Information:

Broodstock No.: BB 010715 A+B
 Age of young (Day 0): <24-h (within 12-h)
 Avg No. young in first 3 broods of previous 7 d: 27
 Mortality (%) in previous 7 d: 0
 Individual female # used ≥ 8 young on test day: 1, 7, 13, 16, 18, 20, 30

NaCl Reference Toxicant Results:

Reference Toxicant ID: cd122
 Stock Solution ID: 15 NaCl
 Date Initiated: Jan 21/15

7-d LC50 (95% CL): 2.0 (1.7 - 2.3) g/L NaCl
 7-d IC50 (95% CL): 1.4 (1.2 - 1.5) g/L NaCl

7-d LC50 Reference Toxicant Mean and Historical Range: 1.9 (1.5 - 2.4) g/L NaCl CV (%): 12
 7-d IC50 Reference Toxicant Mean and Historical Range: 1.4 (1.0 - 2.0) g/L NaCl CV (%): 19

Test Results:

	Survival	Reproduction
LC50 % (v/v) (95% CL)	7100	
IC25 % (v/v) (95% CL)		6.3 (2.3 - 23.0)
IC50 % (v/v) (95% CL)		7100

Ceriodaphnia dubia Summary Sheet

Client: Mount Polley
 Work Order No.: 15044

Start Date/Time: Jan 16/15 @ 1200h
 Set up by: KLP

Sample Information:

Sample ID: 09L-66-85m (Filtered)
 Sample Date: Jan 15/15
 Date Received: Jan 16/15
 Sample Volume: 3x20L

Test Validity Criteria:

- 1) Mean survival of first generation controls is $\geq 80\%$
- 2) At least 60% of controls have produced three broods within 8 days
- 3) An average of ≥ 15 live young produced per surviving female in the control solutions during the first three broods.
- 4) Invalid if ephippia observed in any control solution at any time.

WQ Ranges:
 T ($^{\circ}$ C) = 25 ± 1 ; DO (mg/L) = 3.3 to 8.4; pH = 6.0 to 8.5

Test Organism Information:

Broodstock No.: BB 010715 A+B
 Age of young (Day 0): <24-h (within 12-h)
 Avg No. young in first 3 broods of previous 7 d: 27
 Mortality (%) in previous 7 d: 0
 Individual female # used ≥ 8 young on test day: 1-7, 13, 16, 18, 20-30

NaCl Reference Toxicant Results:

Reference Toxicant ID: Cd122
 Stock Solution ID: 15Na01
 Date Initiated: Jan 21/15

7-d LC50 (95% CL): 2.0 (1.7-2.3) g/L NaCl
 7-d IC50 (95% CL): 1.4 (1.2-1.5) g/L NaCl

7-d LC50 Reference Toxicant Mean and Historical Range: 1.9 (1.5-2.4) g/L NaCl CV (%): 12
 7-d IC50 Reference Toxicant Mean and Historical Range: 1.4 (1.0-2.0) g/L NaCl CV (%): 19

Test Results:

	Survival	Reproduction
LC50 % (v/v) (95% CL)	7100	
IC25 % (v/v) (95% CL)		7100
IC50 % (v/v) (95% CL)		7100

APPENDIX B - Rainbow Trout (*Oncorhynchus mykiss*) Toxicity Test Data

Rainbow Trout Swimup Test Summary Sheet

Client: Mount Polley

Start Date/Time: JAN16/15 @ 1100h

Work Order No.: 15043

Test Species: Oncorhynchus mykiss

Sample Information:

Sample ID: QUL-66-0M
 Sample Date: JAN15/15
 Date Received: JAN16/15
 Sample Volume: 3x20L

Dilution Water:

Type: Moderately Hard Water
 Hardness (mg/L CaCO₃): 10
 Alkalinity (mg/L CaCO₃): 6

Test Organism Information:

Batch No.: 011415
 Source: Vancouver Island Trout Hatchery
 Loading Density: N/A

Copper Reference Toxicant Results:

Reference Toxicant ID: RTCL12
 Stock Solution ID: 13Cu05
 Date Initiated: JAN16/15
 7-d EC50 (95% CL): 55.94 (48.68-64.28) µg/L Cu

Reference Toxicant Mean ± 2 SD: 72.1 (38.61-134.9) µg/L Cu
 Reference Toxicant CV (%): 36.70%

Test Results:

APPENDIX C - Fathead Minnow (*Pimephales promelas*) Toxicity Test Data

Fathead Minnow Test Summary Sheet
(7-d *Pimephales promelas* Survival and Growth Test)

Client: Mount Polley
Work Order No.: 15042

Start Date/Time: Jan 16/15 @ 1400h
Test Species: P. promelas

Sample Information:

Sample ID: QUL-66-DM
Sample Date: Jan 15/15
Date Received: Jan 16/15
Sample Volume: 3 x 20L

Dilution Water (initial water quality):

Type: Moderately Hard Water
Temperature (°C): 26.0
pH: 8.0
Dissolved Oxygen (mg/L): 8.0
Hardness (mg/L CaCO₃): 100
Alkalinity (mg/L CaCO₃): 62

Test Validity Criteria:

The test is invalid if:

- 1) for the control solutions, the combined and cumulative incidence of any mortalities, or fish showing loss of equilibrium or other signs of atypical swimming behavior, is >20%
- 2) the average dry weight of the surviving control fish does not attain 250 ug when the fish are dried and weighed.

WQ Ranges:

T (°C) = 25 ± 1; DO (mg/L) = 3.3 to 8.4; pH = 6.5 to 8.5

Test Organism Information:

Batch No.: 011615
Source: Aquatic Biosystems, CO
Age: 24 hrs

NaCl Reference Toxicant Results:

Reference Toxicant ID: PP105
Stock Solution ID: nil
Date Initiated: Jan 16/15
7-d EC50 (95% CL): 4.8 (4.1-5.7)
7-d IC50 (95% CL): 4.0 (3.6-4.5)

Survival:

Reference Toxicant Mean and Historical Range: 4.3 (3.4-5.5) CV (%): 13

Biomass:

Reference Toxicant Mean and Historical Range: 3.8 (2.8-5.2) CV (%): 17

Test Results:

Fathead Minnow Test Summary Sheet
(7-d *Pimephales promelas* Survival and Growth Test)

Client: Mount Polley
Work Order No.: 15042

Start Date/Time: Jan 16/15 @ 1400h
Test Species: P. promelas

Sample Information:

Sample ID: QUL66-8SM
Sample Date: Jan 15/15
Date Received: Jan 16/15
Sample Volume: 5K206

Dilution Water (initial water quality):

Type: Moderately Hard water
Temperature (°C): 26.3
pH: 8.0
Dissolved Oxygen (mg/L): 8.0
Hardness (mg/L CaCO₃): 100
Alkalinity (mg/L CaCO₃): 62

Test Validity Criteria:

The test is invalid if:

- 1) for the control solutions, the combined and cumulative incidence of any mortalities, or fish showing loss of equilibrium or other signs of atypical swimming behavior, is >20%
- 2) the average dry weight of the surviving control fish does not attain 250 ug when the fish are dried and weighed.

WQ Ranges:

T (°C) = 25 ± 1; DO (mg/L) = 3.3 to 8.4; pH = 6.5 to 8.5

Test Organism Information:

Batch No.: 011615
Source: Aquatic Biosystems, CO
Age: 224 hrs

NaCl Reference Toxicant Results:

Reference Toxicant ID: PP105
Stock Solution ID: N/A
Date Initiated: Jan 16/15
7-d EC50 (95% CL): 4.8 (4.1-5.7)
7-d IC50 (95% CL): 4.0 (3.6-4.5)

Survival:

Reference Toxicant Mean and Historical Range: 4.3 (3.4-5.5) CV (%): 13

Biomass:

Reference Toxicant Mean and Historical Range: 3.8 (2.8-5.2) CV (%): 17

Test Results:

	Survival	Biomass

This report has been prepared by Nautilus Environmental Company Inc. based on data and/or samples provided by our client and the results of this study are for their sole benefit. Any reliance on the data by a third party is at the sole and exclusive risk of that party. The results presented here relate only to the samples tested.

1.0 INTRODUCTION

Nautilus Environmental Company Inc. conducted toxicity tests for Mount Polley Mining Corporation on a sample identified as QUR-1. The sample was collected on February 10, 2015 and delivered to the laboratory in Burnaby, BC on February 11, 2015. The sample was transported in two 20-L plastic carboys and coolers. The sample was received at a temperature of 4.0°C and was stored in the dark at $4 \pm 2^\circ\text{C}$ prior to testing. The following sub-lethal toxicity tests were performed on the sample:

- *Ceriodaphnia dubia* survival and reproduction
- 7-d fathead minnow (*Pimephales promelas*) survival and growth

This report describes the results of these toxicity tests. Copies of laboratory data sheets and printouts of statistical analyses for each test are provided in Appendices A and B. The chain-of-custody form is provided in Appendix C.

2.0 METHODS

Methods for the toxicity tests are summarized in Tables 1 and 2. Testing was conducted according to procedures described by the Environment Canada protocols (2007 and 2011). Statistical analyses for all tests were performed using CETIS (Tidepool Scientific Software, 2013).

Table 1. Summary of test conditions: *Ceriodaphnia dubia* survival and reproduction test.

Test organism	<i>Ceriodaphnia dubia</i>
Test organism source	In-house culture
Test organism age	<24 h old neonates produced within 12 h
Test type	Static-renewal
Test duration	7 ± 1 day
Test vessel	20 mL test tube
Test volume	15 mL
Test replicates	10 test replicates per treatment
Number of organisms	1 per replicate
Control water	20% Perrier water
Test solution renewal	Daily
Test temperature	25 ± 1°C
Feeding	<i>Pseudokirchneriella subcapitata</i> and YCT
Light intensity	100 to 600 lux at water surface
Photoperiod	16 hours light/8 hours dark
Aeration	None
Test protocol	Environment Canada, (2007) EPS 1/RM/21
Statistical software	CETIS (2013)
Test endpoint	Survival and reproduction
Test acceptability criteria for controls	≥80% survival; ≥15 young per surviving control producing three broods; ≥60% of controls producing three or more broods
Reference toxicant	Sodium chloride

Table 2. Summary of test conditions: fathead minnow (*Pimephales promelas*) survival and growth test.

Test organism	<i>Pimephales promelas</i>
Test organism source	Aquatic BioSystems, Fort Collins, CO
Test organism age	<24 hours
Test type	Static renewal
Test duration	7 days
Test vessel	375-mL glass containers
Test volume	250 mL
Test replicates	3 per treatment
Number of organisms	10 per replicate
Control water	Moderately-hard water (hardness 80-100 mg/L CaCO ₃)
Test solution renewal	Daily
Test temperature	25 ± 1°C
Feeding	Twice a day with newly hatched brine shrimp (<i>Artemia nauplii</i>)
Light intensity	100 – 500 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	None
Test protocol	Environment Canada (2011), EPS 1/RM/22
Statistical software	CETIS (2013)
Test endpoint	Survival and biomass
Test acceptability criteria for controls	≥80% survival, ≥250 µg mean dry weight
Reference toxicant	Sodium chloride

3.0 RESULTS

No adverse effects were observed on survival and reproduction of *C. dubia* (Table 3) or survival, biomass and dry weight of fathead minnows; the LC50, IC25 and IC50 values were >100% in the toxicity tests.

Table 3. Results: *Ceriodaphnia dubia* survival and reproduction test.

Concentration (% v/v)	Survival (%)	Reproduction (mean ± SD)
Control	100	27.3 ± 3.1
1.56	100	26.5 ± 2.6
3.12	100	28.7 ± 3.0
6.25	100	27.6 ± 1.9
12.5	100	26.1 ± 3.9
25	100	27.2 ± 3.3
50	100	23.9 ± 4.0
100	100	23.5 ± 5.0
Test endpoint (% v/v)		
LC50	>100	--
IC25	--	>100
IC50	--	>100

SD = Standard Deviation, LC = Lethal Concentration, IC = Inhibition Concentration.

Table 4. Results: fathead minnow (*Pimephales promelas*) survival and growth test.

Concentration (% v/v)	Mean ± SD		
	Survival (%)	Biomass (µg)	Dry Weight (µg)
Control	93.3 ± 11.6	774.7 ± 71.1	832.4 ± 30.2
1.56	90.0 ± 0.0	716.0 ± 68.6	795.6 ± 76.2
3.1	93.3 ± 5.8	737.3 ± 45.0	790.3 ± 26.5
6.25	93.3 ± 11.6	765.0 ± 153.8	814.5 ± 74.9
12.5	83.3 ± 20.8	706.7 ± 140.3	857.9 ± 70.2
25	96.7 ± 5.8	791.3 ± 46.0	820.1 ± 57.2
50	96.7 ± 5.8	761.0 ± 113.3	787.3 ± 104.0
100	96.7 ± 5.8	738.0 ± 86.6	762.9 ± 66.5
Test endpoint (% v/v)			
LC25	>100	--	--
LC50	>100	--	--
IC25	--	>100	>100
IC50	--	>100	>100

SD = Standard Deviation, LC = Lethal Concentration, IC = Inhibition Concentration.

4.0 QA/QC

The health history of the test organisms used in the exposures was acceptable and met the requirements of the Environment Canada protocols. The tests met all control acceptability criteria and water quality parameters remained within ranges specified in the protocols throughout the tests. There were no deviations from the test methodologies. Uncertainty associated with these tests is best described by the standard deviation around the mean and/or the confidence limits around the point estimates.

Results of the reference toxicant tests conducted during the testing program are summarized in Table 5. Results of the *C. dubia* test fell within the range for organism performance of mean and two standard deviation range, based on historical results obtained by the laboratory with this tests. Thus, the sensitivity of the organisms used in this test was appropriate. Results of the *P. promelas* test was outside of two standard deviations of the historical results obtained by the laboratory for the survival endpoint. The LC50 was 6.0 g/L NaCl and slightly higher than the two standard deviation range of 3.5 to 5.6 g/L NaCl for this test. Approximately one in twenty reference toxicant results would be expected to fall outside of the two standard deviation range due to variability in organism sensitivity. The IC25 for *P. promelas* biomass fell within two standard deviations of the historical results obtained by the laboratory.

Table 5. Reference toxicant results.

Test Species	Endpoint	Historical Mean (2 SD Range)	CV (%)	Test Date
<i>C. dubia</i>	Survival (LC50): 2.0 g/L NaCl	1.9 (1.5 - 2.4)	12	January 28 , 2015
	Reproduction (IC50): 1.6 g/L NaCl	1.4 (1.0 - 2.0)	18	
<i>P. promelas</i>	Survival (LC50): 6.0 g/L NaCl	4.4 (3.5 - 5.6)	12	February 11, 2015
	Biomass (IC50): 4.8 g/L NaCl	3.9 (2.9 - 5.2)	16	

SD = Standard Deviation, CV = Coefficient of Variation, IC = Inhibition Concentration, LC = Lethal Concentration.

APPENDIX A - *Ceriodaphnia dubia* Toxicity Test Data

Ceriodaphnia dubia Summary Sheet

Client: Mount Palley Mining Corp Start Date/Time: Feb 11/15 @ 1130h
 Work Order No.: 15083 Set up by: EMM

Sample Information:

Sample ID: 042-1
 Sample Date: Feb 10/15
 Date Received: Feb 11/15
 Sample Volume: 2x20L

Test Validity Criteria:

- 1) Mean survival of first generation controls is $\geq 80\%$
- 2) At least 60% of controls have produced three broods within 8 days
- 3) An average of ≥ 15 live young produced per surviving female in the control solutions during the first three broods.
- 4) Invalid if ephippia observed in any control solution at any time.

WQ Ranges:

T (°C) = 25 ± 1 ; DO (mg/L) = 3.3 to 8.4 ; pH = 6.0 to 8.5

Test Organism Information:

Broodstock No.: 012915
 Age of young (Day 0): <24-h (within 12-h)
 Avg No. young in first 3 broods of previous 7 d: 39
 Mortality (%) in previous 7 d: 5
 Individual female # used ≥ 8 young on test day: 11, 15, 16, 17, 18, 19, 20

NaCl Reference Toxicant Results:

Reference Toxicant ID: cd124
 Stock Solution ID: 15 NaCl
 Date Initiated: Jan 28/15

7-d LC50 (95% CL): 2.0 (1.7-2.3) g/L NaCl
 7-d IC50 (95% CL): 1.6 (1.1-1.8) g/L NaCl

7-d LC50 Reference Toxicant Mean and Historical Range: 1.9 (1.5-2.4) g/L NaCl CV (%): 12
 7-d IC50 Reference Toxicant Mean and Historical Range: 1.4 (1.0-2.0) g/L NaCl CV (%): 18

Test Results:

	Survival	Reproduction
LC50 % (v/v) (95% CL)	>100	
IC25 % (v/v) (95% CL)		>100
IC50 % (v/v) (95% CL)		>100

APPENDIX B - Fathead Minnow (*Pimephales promelas*) Toxicity Test Data

Fathead Minnow Test Summary Sheet
(7-d *Pimephales promelas* Survival and Growth Test)

Client: Mount Polley
Work Order No.: 15082

Start Date/Time: Feb 11/15 @ 1400h
Test Species: P. promelas

Sample Information:

Sample ID: OUR-1
Sample Date: Feb 10/15
Date Received: Feb 11/15
Sample Volume: 2x20L

Dilution Water (initial water quality):

Type: Moderately Hard Water
Temperature (°C): 24.0
pH: 8.0
Dissolved Oxygen (mg/L): 7.8
Hardness (mg/L CaCO₃): 80
Alkalinity (mg/L CaCO₃): 60

Test Validity Criteria:

The test is invalid if:

- 1) for the control solutions, the combined and cumulative incidence of any mortalities, or fish showing loss of equilibrium or other signs of atypical swimming behavior, is >20%
- 2) the average dry weight of the surviving control fish does not attain 250 ug when the fish are dried and weighed.

WQ Ranges:

T (°C) = 25 ± 1; DO (mg/L) = 3.3 to 8.4; pH = 6.5 to 8.5

Test Organism Information:

Batch No.: 021115
Source: Aquatic Biosystems, CO
Age: 24 hrs

NaCl Reference Toxicant Results:

Reference Toxicant ID: PP106
Stock Solution ID: n/a
Date Initiated: Feb 11/15
7-d EC50 (95% CL): 6.0 (5.3-6.9) (5.2-6.8) g/L NaCl
7-d IC50 (95% CL): 4.8 (4.0-5.9) g/L NaCl

Survival:

Reference Toxicant Mean and Historical Range: 4.4 (3.5-5.6) CV (%): 12

Biomass:

Reference Toxicant Mean and Historical Range: 3.9 (2.9-5.2) CV (%): 16

Test Results:

	Survival	Biomass
LC25 % (v/v) (95% CL)	>100	>100
LC50 % (v/v) (95% CL)	>100	>100

This report has been prepared by Nautilus Environmental Company Inc. based on data and/or samples provided by our client and the results of this study are for their sole benefit. Any reliance on the data by a third party is at the sole and exclusive risk of that party. The results presented here relate only to the samples tested.

1.0 INTRODUCTION

Nautilus Environmental Company Inc. conducted toxicity tests for Mount Polley Mining Corporation on samples identified as QUR-1 and QUL-66-0M. The samples were collected on March 2 and 3, 2015 and delivered to the laboratory in Burnaby, BC on March 4, 2015. QUR-1 was transported in two, and QUL-66-0M in three 20-L plastic carboys and coolers. The samples were received at a temperature of 2.5°C, and were stored in the dark at $4 \pm 2^\circ\text{C}$ prior to testing. The following sub-lethal toxicity tests were performed on the samples:

- *Ceriodaphnia dubia* survival and reproduction
- 7-d rainbow trout (*Oncorhynchus mykiss*) survival and growth
- 7-d fathead minnow (*Pimephales promelas*) survival and growth

Several protocol deviations occurred during the 7-d rainbow trout survival and growth test. During the QA review of the data, the deviations were determined to invalidate the test results. Therefore, the data for this test is not provided in this report.

Sample QUL-66-0M was vacuum filtered through 0.45 µm filter paper and tested in addition to the unfiltered sample for the *C. dubia* toxicity test.

This report describes the results of the *C. dubia* and fathead minnow toxicity tests. Copies of laboratory data sheets and printouts of statistical analyses for each test are provided in Appendices A and B. The chain-of-custody form is provided in Appendix C.

2.0 METHODS

Methods for the toxicity tests are summarized in Tables 1 and 2. Testing was conducted according to procedures described by the Environment Canada protocols (2007 and 2011). Statistical analyses for all tests were performed using CETIS (Tidepool Scientific Software, 2013).

Table 1. Summary of test conditions: *Ceriodaphnia dubia* survival and reproduction test.

Test organism	<i>Ceriodaphnia dubia</i>
Test organism source	In-house culture
Test organism age	<24 h old neonates produced within 12 h
Test type	Static-renewal
Test duration	7 ± 1 day
Test vessel	20 mL test tube
Test volume	15 mL
Test replicates	10 test replicates per treatment
Number of organisms	1 per replicate
Control water	20% Perrier water
Test solution renewal	Daily
Test temperature	25 ± 1°C
Feeding	<i>Pseudokirchneriella subcapitata</i> and YCT
Light intensity	100 to 600 lux at water surface
Photoperiod	16 hours light/8 hours dark
Aeration	None
Test protocol	Environment Canada, (2007) EPS 1/RM/21
Statistical software	CETIS (2013)
Test endpoint	Survival and reproduction
Test acceptability criteria for controls	≥80% survival; ≥15 young per surviving control producing three broods; ≥60% of controls producing three or more broods
Reference toxicant	Sodium chloride

Table 2. Summary of test conditions: fathead minnow (*Pimephales promelas*) survival and growth test.

Test organism	<i>Pimephales promelas</i>
Test organism source	Aquatic BioSystems, Fort Collins, CO
Test organism age	<24 hours
Test type	Static renewal
Test duration	7 days
Test vessel	375-mL glass containers
Test volume	250 mL
Test replicates	3 per treatment
Number of organisms	10 per replicate
Control water	Moderately-hard water (hardness 80-100 mg/L CaCO ₃)
Test solution renewal	Daily
Test temperature	25 ± 1°C
Feeding	Twice a day with newly hatched brine shrimp (<i>Artemia nauplii</i>)
Light intensity	100 – 500 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	None
Test protocol	Environment Canada (2011), EPS 1/RM/22
Statistical software	CETIS (2013)
Test endpoint	Survival and biomass
Test acceptability criteria for controls	≥80% survival, ≥250 µg mean dry weight
Reference toxicant	Sodium chloride

3.0 RESULTS

Results of the toxicity tests conducted on samples QUR-1 and QUL-66-0M using *C. dubia* and fathead minnow are provided in Tables 3 and 4. No adverse effects on *C. dubia* or fathead minnow survival were observed in the samples, resulting in LC50 values of >100%. There were no adverse effects on fathead minnow biomass or dry weight; the IC25 values were >100%.

A reduction in *C. dubia* reproduction was observed in both samples; the IC25 values were 95.9 and 74.2% for QUR-1 and QUL-66-0M, respectively. The corresponding filtered sample for QUL-66-0M exhibited no toxicity with an IC25 value of >100%.

Table 3. Results: *Ceriodaphnia dubia* survival and reproduction test.

4.0 QA/QC

The health history of the test organisms used in the exposures was acceptable and met the requirements of the protocols. The tests met all control acceptability criteria and water quality parameters remained within ranges specified in the protocols throughout the tests. There were no deviations from the test methodologies. Uncertainty associated with these tests is best described by the standard deviation around the mean and/or the confidence limits around the point estimates.

Results of the reference toxicant tests conducted during the testing program are summarized in Table 5. Results for these tests fell within the range for organism performance of mean and two standard deviation range, based on historical results obtained by the laboratory with these tests. Thus, the sensitivity of the organisms used in these tests was appropriate.

Table 5. Reference toxicant results.

Test Species	Endpoint	Historical Mean (2 SD Range)	CV (%)	Test Date
<i>C. dubia</i>	Survival (LC50): 2.0 g/L NaCl	2.0 (1.6 - 2.4)	11	February 25, 2015
	Reproduction (IC50): 1.4 g/L NaCl	1.5 (1.1 - 2.0)	16	
<i>P. promelas</i>	Survival (LC50): 5.6 g/L NaCl	4.4 (3.4 - 5.8)	14	March 4, 2015
	Biomass (IC50): 4.6 g/L NaCl	3.9 (2.9 - 5.2)	16	

SD = Standard Deviation, CV = Coefficient of Variation, IC = Inhibition Concentration, LC = Lethal Concentration.

APPENDIX A - *Ceriodaphnia dubia* Toxicity Test Data

Ceriodaphnia dubia Summary Sheet

Client: Mount Kelly
 Work Order No.: 15135

Start Date/Time: March 4/15 @ 1300h
 Set up by: EMM

Sample Information:

Sample ID: 042-1
 Sample Date: March 3/15
 Date Received: March 4/15
 Sample Volume: 40L and 16L
(2x20L) (4x4L)

Test Validity Criteria:

- 1) Mean survival of first generation controls is $\geq 80\%$
- 2) At least 60% of controls have produced three broods within 8 days
- 3) An average of ≥ 15 live young produced per surviving female in the control solutions during the first three broods.
- 4) Invalid if ephippia observed in any control solution at any time.

WQ Ranges:

T ($^{\circ}$ C) = 25 ± 1 ; DO (mg/L) = 3.3 to 8.4 ; pH = 6.0 to 8.5

Test Organism Information:

Broodstock No.: 021915
 Age of young (Day 0): <24-h (within 12-h)
 Avg No. young in first 3 broods of previous 7 d: 40
 Mortality (%) in previous 7 d: 0
 Individual female # used ≥ 8 young on test day: 16, 17, 18, 19, 20

NaCl Reference Toxicant Results:

Reference Toxicant ID: 0d126
 Stock Solution ID: 15 NaCl
 Date Initiated: Feb 25/15

7-d LC50 (95% CL): 2.0 (1.7-2.3) g/L NaCl
 7-d IC50 (95% CL): 1.4 (1.2-1.7) g/L NaCl

7-d LC50 Reference Toxicant Mean and Historical Range: 2.0 (1.6-2.4) g/L NaCl CV (%): 11
 7-d IC50 Reference Toxicant Mean and Historical Range: 1.5 (1.1-2.0) g/L NaCl CV (%): 16

Test Results:

	Survival	Reproduction
LC50 % (v/v) (95% CL)	>100	50.0
IC25 % (v/v) (95% CL)		95.9 (38.6 - MA)
IC50 % (v/v) (95% CL)		>100

Ceriodaphnia dubia Summary Sheet

Client: Mount Pelley
 Work Order No.: 15139

Start Date/Time: March 4/15 @ 1230h
 Set up by: EMM

Sample Information:

Sample ID: DU-66-01 (unfiltered)
 Sample Date: March 2/15
 Date Received: March 4/15
 Sample Volume: 20 x 3

Test Validity Criteria:

- 1) Mean survival of first generation controls is $\geq 80\%$
- 2) At least 60% of controls have produced three broods within 8 days
- 3) An average of ≥ 15 live young produced per surviving female in the control solutions during the first three broods.
- 4) Invalid if ephippia observed in any control solution at any time.

WQ Ranges:

T ($^{\circ}$ C) = 25 ± 1 ; DO (mg/L) = 3.3 to 8.4; pH = 6.0 to 8.5

Test Organism Information:

Broodstock No.: C22015
 Age of young (Day 0): <24-h (within 12-h)
 Avg No. young in first 3 broods of previous 7 d: 30
 Mortality (%) in previous 7 d: 0
 Individual female # used ≥ 8 young on test day: 1, 4, 6, 10, 12, 13, 15, 16

NaCl Reference Toxicant Results:

Reference Toxicant ID: CD126
 Stock Solution ID: 5% NaCl
 Date Initiated: Feb 25/15

7-d LC50 (95% CL): 2.0 (1.7-2.3) g/L NaCl
 7-d IC50 (95% CL): 1.4 (1.2-1.7) g/L NaCl

7-d LC50 Reference Toxicant Mean and Historical Range: 2.0 (1.6-2.4) g/L NaCl CV (%): 11
 7-d IC50 Reference Toxicant Mean and Historical Range: 1.5 (1.1-2.0) g/L NaCl CV (%): 16

Test Results:

Ceriodaphnia dubia Summary Sheet

Client: Mount Pelley
 Work Order No.: 15139

Start Date/Time: March 4/15 00 12:15h
 Set up by: EMM

Sample Information:

Sample ID: QUL-66-01 (Filtered)
 Sample Date: March 2/15
 Date Received: March 4/15
 Sample Volume: 20 x 3

Test Validity Criteria:

- 1) Mean survival of first generation controls is $\geq 80\%$
- 2) At least 60% of controls have produced three broods within 8 days
- 3) An average of ≥ 15 live young produced per surviving female in the control solutions during the first three broods.
- 4) Invalid if ephippia observed in any control solution at any time.

WQ Ranges:

T ($^{\circ}$ C) = 25 ± 1 ; DO (mg/L) = 3.3 to 8.4; pH = 6.0 to 8.5

Test Organism Information:

Broodstock No.: 022015
 Age of young (Day 0): <24-h (within 12-h)
 Avg No. young in first 3 broods of previous 7 d: 30
 Mortality (%) in previous 7 d: 0
 Individual female # used ≥ 8 young on test day: 1, 4, 6, 10, 12, 13, 15, 16.

NaCl Reference Toxicant Results:

Reference Toxicant ID: Cd 126
 Stock Solution ID: 15ba01
 Date Initiated: Feb 25/15

7-d LC50 (95% CL): 2.0 (1.7-2.3) g/L NaCl
 7-d IC50 (95% CL): 1.4 (1.2-1.7) g/L NaCl

7-d LC50 Reference Toxicant Mean and Historical Range: 2.0 (1.6-2.4) g/L NaCl CV (%): 11
 7-d IC50 Reference Toxicant Mean and Historical Range: 1.5 (1.1-2.0) g/L NaCl CV (%): 16

Test Results:

APPENDIX B - Fathead Minnow (*Pimephales promelas*) Toxicity Test Data

Fathead Minnow Test Summary Sheet

(7-d *Pimephales promelas* Survival and Growth Test)

Client: Mount Polley
 Work Order No.: 15134

Start Date/Time: Mar 4/15 @ 1415h
 Test Species: P. promelas

Sample Information:

Sample ID: QUR-1
 Sample Date: Mar 3/15
 Date Received: Mar 4/15
 Sample Volume: 2x 20L

Dilution Water (initial water quality):

Type: Moderately Hard Water
 Temperature (°C): 25.0
 pH: 7.8
 Dissolved Oxygen (mg/L): 7.9
 Hardness (mg/L CaCO₃): 100
 Alkalinity (mg/L CaCO₃): 64

Test Validity Criteria:

The test is invalid if:

- 1) for the control solutions, the combined and cumulative incidence of any mortalities, or fish showing loss of equilibrium or other signs of atypical swimming behavior, is >20%
- 2) the average dry weight of the surviving control fish does not attain 250 ug when the fish are dried and weighed.

WQ Ranges:

T (°C) = 25 ± 1; DO (mg/L) = 3.3 to 8.4; pH = 6.5 to 8.5

Test Organism Information:

Batch No.: 030415
 Source: Aquatic Biosystems, CO
 Age: 24 hrs

NaCl Reference Toxicant Results:

Reference Toxicant ID: PP107
 Stock Solution ID: n/a
 Date Initiated: Mar 4/15
 7-d EC50 (95% CL): 5.6 (4.9-6.5) g/L NaCl
 7-d IC50 (95% CL): 4.6 (4.2-5.2) g/L NaCl

Survival:

Reference Toxicant Mean and Historical Range: 4.4 (3.4-5.8) g/L NaCl CV (%): 14

Biomass:

Reference Toxicant Mean and Historical Range: 3.9 (2.9-5.2) g/L NaCl CV (%): 16

Test Results:

	Survival	Biomass
LC25 % (v/v) (95% CL)	>100	
LC50 % (v/v) (95% CL)	>100	
IC25 % (v/v) (95% CL)		>100
IC50 % (v/v) (95% CL)		>100

Fathead Minnow Test Summary Sheet
(7-d *Pimephales promelas* Survival and Growth Test)

Client: Mount Polley
Work Order No.: 15137

Start Date/Time: Mar 4/15 @ 1445h
Test Species: *P. promelas*

Sample Information:

Sample ID: QUL-66-0M
Sample Date: Mar 2/15
Date Received: Mar 4/15
Sample Volume: 38x 20L
13L

Dilution Water (initial water quality):

Type: Moderately Hard Water
Temperature (°C): 25.0
pH: 7.8
Dissolved Oxygen (mg/L): 7.9
Hardness (mg/L CaCO₃): 100
Alkalinity (mg/L CaCO₃): 64

Test Validity Criteria:

The test is invalid if:

- 1) for the control solutions, the combined and cumulative incidence of any mortalities, or fish showing loss of equilibrium or other signs of atypical swimming behavior, is >20%
- 2) the average dry weight of the surviving control fish does not attain 250 ug when the fish are dried and weighed.

WQ Ranges:

T (°C) = 25 ± 1; DO (mg/L) = 3.3 to 8.4; pH = 6.5 to 8.5

Test Organism Information:

Batch No.: 020415 030415
Source: Aquatic Biosystems, CO
Age: 224 hrs

NaCl Reference Toxicant Results:

Reference Toxicant ID: PP107
Stock Solution ID: n/a
Date Initiated: Mar 4/15
7-d EC50 (95% CL): 5.6 (4.9-6.5)

This report has been prepared by Nautilus Environmental Company Inc. based on data and/or samples provided by our client and the results of this study are for their sole benefit. Any reliance on the data by a third party is at the sole and exclusive risk of that party. The results presented here relate only to the samples tested.

1.0 INTRODUCTION

Nautilus Environmental Company Inc. conducted toxicity tests for Mount Polley Mining Corporation on a sample identified as P2-S. The sample was collected on April 14, 2015 and delivered to the laboratory in Burnaby, BC on April 15, 2015. The sample was transported in three 20-L plastic carboys and coolers. The sample was received at a temperature of 6.5°C, and was stored in the dark at $4 \pm 2^\circ\text{C}$ prior to testing. The following sub-lethal toxicity tests were performed on the samples:

- *Ceriodaphnia dubia* survival and reproduction
- 7-d rainbow trout (*Oncorhynchus mykiss*) survival and growth
- 7-d fathead minnow (*Pimephales promelas*) survival and growth

The 7-d fathead minnow survival and growth test was conducted at Hydroqual Laboratories in Calgary, AB. A 20-L subsample of P2-S was sent from Nautilus Environmental in Burnaby, BC to Hydroqual Laboratories in Calgary, AB on April 16, 2015. The sample arrived at Hydroqual Laboratories on April 17, 2015 and a 7-d fathead minnow survival and growth test was initiated.

This report describes the results of these toxicity tests. Copies of laboratory data sheets and printouts of statistical analyses for each test are provided in Appendices A to C. The chain-of-custody form is provided in Appendix D.

2.0 METHODS

Methods for the toxicity tests are summarized in Tables 1 to 3. Testing was conducted according to procedures described by the Environment Canada protocols (2007 and 2011) and methods described by Lazorchak and Smith (2007). Statistical analyses for all tests were performed using CETIS (Tidepool Scientific Software, 2013).

Table 1. Summary of test conditions: *Ceriodaphnia dubia* survival and reproduction test.

Test organism	<i>Ceriodaphnia dubia</i>
Test organism source	In-house culture
Test organism age	<24 h old neonates produced within 12 h
Test type	Static-renewal
Test duration	7 ± 1 day
Test vessel	20 mL test tube
Test volume	15 mL
Test replicates	10 test replicates per treatment
Number of organisms	1 per replicate
Control water	20% Perrier water
Test solution renewal	Daily
Test temperature	25 ± 1°C
Feeding	<i>Pseudokirchneriella subcapitata</i> and YCT
Light intensity	100 to 600 lux at water surface
Photoperiod	16 hours light/8 hours dark
Aeration	None
Test protocol	Environment Canada, (2007) EPS 1/RM/21
Statistical software	CETIS (2013)
Test endpoint	Survival and reproduction
Test acceptability criteria for controls	≥80% survival; ≥15 young per surviving control producing three broods; ≥60% of controls producing three or more broods
Reference toxicant	Sodium chloride

Table 2. Summary of test conditions: rainbow trout (*Oncorhynchus mykiss*) survival and growth test.

Test organism	<i>Oncorhynchus mykiss</i>
Test organism source	Aqua Farm, Langley, BC
Test organism age	2-to 6-days post swim up
Test type	Static renewal
Test duration	7 days
Test vessel	1-L glass containers
Test volume	500 mL
Test replicates	4 per treatment
Number of organisms	5 per replicate
Control water	Moderately-hard water (hardness 80-100 mg/L CaCO ₃)
Test solution renewal	Daily
Test temperature	15 ± 1°C
Feeding	Twice a day with newly hatched brine shrimp (<i>Artemia nauplii</i>)
Light intensity	100 – 500 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	None
Test protocol	Lazorchak and Smith (2007)
Statistical software	CETIS (2013)
Test endpoint	Survival and biomass
Test acceptability criteria for controls	≥90% survival, ≥1.5 times test initiation dry weight
Reference toxicant	Copper chloride

Table 3. Summary of test conditions: fathead minnow (*Pimephales promelas*) survival and growth test.

Test organism	<i>Pimephales promelas</i>
Test organism source	Aquatox Inc., Hot Springs, AR
Test organism age	<24 hours
Test type	Static renewal
Test duration	7 days
Test vessel	500-mL plastic containers
Test volume	250 mL
Test replicates	4 per treatment
Number of organisms	10 per replicate
Control water	Dechlorinated municipal tap water (City of Calgary)
Test solution renewal	Daily
Test temperature	25 ± 1°C
Feeding	Twice a day with newly hatched brine shrimp (<i>Artemia nauplii</i>)
Light intensity	100 – 500 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	None
Test protocol	Environment Canada (2011), EPS 1/RM/22
Statistical software	CETIS (2013)
Test endpoint	Survival and biomass
Test acceptability criteria for controls	≥80% survival, ≥250 µg mean dry weight
Reference toxicant	Sodium chloride

3.0 RESULTS

There were no adverse effects observed on survival and reproduction of *C. dubia* (Table 4), survival and growth of rainbow trout (Table 5) or survival and growth of fathead minnow (Table 6). The LC and IC values were therefore greater than 100% for each of these endpoints in the toxicity tests.

Table 4. Results: *Ceriodaphnia dubia* survival and reproduction test.

Concentration (% v/v)	Survival (%)	Reproduction (mean ± SD)
Control	100	22.3 ± 3.6
1.56	100	21.1 ± 3.5
3.12	100	20.0 ± 4.5
6.25	100	21.4 ± 3.3
12.5	100	20.3 ± 3.7
25	100	22.3 ± 3.2
50	100	20.4 ± 4.7
100	100	23.7 ± 3.4
Test Endpoint (% v/v)		
LC50	>100	--
IC25	--	>100
IC50	--	>100

SD = Standard Deviation, LC = Lethal Concentration, IC = Inhibition Concentration.

Table 5. Results: rainbow trout (*Oncorhynchus mykiss*) survival and growth test.

Concentration (% v/v)	Survival (%)	Biomass (mg)	Dry Weight (mg)
Control	100.0 ± 0.0	34.7 ± 1.0	34.7 ± 1.0
6.25	100.0 ± 0.0	31.3 ± 1.1	31.3 ± 1.1
12.5	100.0 ± 0.0	28.4 ± 3.3	28.4 ± 3.3
25	100.0 ± 0.0	30.2 ± 0.6	30.2 ± 0.6
50	100.0 ± 0.0	30.1 ± 0.7	30.1 ± 0.7
100	100.0 ± 0.0	29.1 ± 1.6	29.1 ± 1.6
Test endpoint (% v/v)			
LC50	>100	--	--
IC25	--	>100	>100
IC50	--	>100	>100

SD = Standard Deviation, LC = Lethal Concentration, IC = Inhibition Concentration.

Table 6. Results: fathead minnow (*Pimephales promelas*) survival and growth test.

Concentration (% v/v)	Survival (%)	Biomass (µg)	Dry Weight (µg)
Control	97.5 ± 5.0	450.5 ± 39.7	461.7 ± 25.6
1.56	97.5 ± 5.0	500.7 ± 30.7	515.6 ± 56.8
3.1	90.0 ± 8.2	573.2 ± 184.2	628.6 ± 144.6
6.25	92.5 ± 5.0	509.0 ± 33.8	550.1 ± 13.0
12.5	92.5 ± 9.6	441.7 ± 25.2	480.3 ± 41.4
25	96.7 ± 5.8*	436.7 ± 5.7*	452.8 ± 27.0*
50	92.5 ± 9.6	542.0 ± 105.9	585.1 ± 88.2
100	92.5 ± 5.0	456.5 ± 41.8	492.8 ± 19.0
Test endpoint (% v/v)			
LC50	>100	--	--
IC25	--	>100	>100
IC50	--	>100	>100

SD = Standard Deviation, LC = Lethal Concentration, IC = Inhibition Concentration.

*Replicate B excluded from statistical analysis. Refer to QA/QC Section 4.0.

4.0 QA/QC

The health history of the test organisms used in the exposures was acceptable and met the requirements of the protocols. The tests met all control acceptability criteria and water quality parameters remained within ranges specified in the protocols throughout the tests. There were no deviations from the test methodologies. Uncertainty associated with these tests is best described by the standard deviation around the mean and/or the confidence limits around the point estimates.

On Day 5 of the fathead minnow test, eight of the ten organisms in replicate B of the 25% concentration were accidentally killed due to technician error. Therefore, this replicate was not included in survival, biomass or dry weigh calculations.

Results of the reference toxicant tests conducted during the testing program are summarized in Table 7. Results for the tests fell within the range for organism performance of mean and two standard deviation range, based on historical results obtained by the laboratories with these tests. Thus, the sensitivity of the organisms used in these tests was appropriate.

Table 7. Reference toxicant results.

Test Species	Endpoint	Historical Mean (2 SD Range)	CV (%)	Test Date
<i>C. dubia</i>	Survival (LC50): 2.1 g/L NaCl	2.0 (1.6 - 2.4)	11	April 22, 2015
	Reproduction (IC50): 1.4 g/L NaCl	1.5 (1.2 - 1.9)	14	
<i>O. mykiss</i>	Survival (LC50): 51.2 µg/L Cu	67.2 (34.4 - 131.5)	40	April 16, 2015
	Biomass (IC50): 48.0 µg/L Cu	66.6 (31.5 - 140.7)	45	
<i>P. promelas</i>	Survival (LC50): 1.0 g/L NaCl	1.1 (0.7 - 1.7)	14	April 17, 2015
	Biomass (IC50): 1.0 g/L NaCl	0.6 (0.4 - 1.0)	17	

SD = Standard Deviation, CV = Coefficient of Variation, IC = Inhibition Concentration, LC = Lethal Concentration.

APPENDIX A - *Ceriodaphnia dubia* Toxicity Test Data

Ceriodaphnia dubia Summary Sheet

Client: Mount Polley
 Work Order No.: 15298

Start Date/Time: April 16/15 @ 1030h
 Set up by: MLT

Sample Information:

Sample ID: P2-S
 Sample Date: April 14, 2015
 Date Received: April 16, 2015
 Sample Volume: 3 x 20L

Test Validity Criteria:

- 1) Mean survival of first generation controls is $\geq 80\%$
- 2) At least 60% of controls have produced three broods within 8 days
- 3) An average of ≥ 15 live young produced per surviving female in the control solutions during the first three broods.
- 4) Invalid if ephippia observed in any control solution at any time.

WQ Ranges:
 T ($^{\circ}$ C) = 25 ± 1 ; DO (mg/L) = 3.3 to 8.4; pH = 6.0 to 8.5

Test Organism Information:

Broodstock No.: 040915B
 Age of young (Day 0): <24-h (within 12-h)
 Avg No. young in first 3 broods of previous 7 d: 30
 Mortality (%) in previous 7 d: 0
 Individual female # used ≥ 8 young on test day: 22, 23, 26, 27, 28, 29, 30

NaCl Reference Toxicant Results:

Reference Toxicant ID: ^{WQ} Cd127-Cd128
 Stock Solution ID: 15 NaCl
 Date Initiated: ~~March 25, 2015~~ April 22, 2015

7-d LC50 (95% CL): 2.1 (1.5-2.2) ^{WQ} g/L NaCl
 7-d IC50 (95% CL): 1.4 (1.2-1.8) ^{WQ} g/L NaCl
 7-d LC50 Reference Toxicant Mean and Historical Range: 2.0 (1.6-2.4) ^{WQ} g/L NaCl CV (%): 11
 7-d IC50 Reference Toxicant Mean and Historical Range: 1.5 (1.2-1.9) ^{WQ} g/L NaCl CV (%): 14

APPENDIX B - Rainbow Trout (*Oncorhynchus mykiss*) Toxicity Test Data

Rainbow Trout Swimup Test Summary Sheet

Client: Mount Polly Start Date/Time: Apr 16/15 @ 1330h
 Work Order No.: WB 15300 Test Species: Oncorhynchus mykiss

Sample Information:

Sample ID: P2-S
 Sample Date: Apr 14/15
 Date Received: Apr 16/15
 Sample Volume: 3x20L

Dilution Water:

Type: Moderately Hard Water
 Hardness (mg/L CaCO₃): 98 | 100
 Alkalinity (mg/L CaCO₃): 64 | 64
 Batch # 041315 | 041715

Test Organism Information:

Batch No.: 041415
 Source: Aqua Farm
 Average Initial Dry Weight: 15.4 (mg)

Copper Reference Toxicant Results:

Reference Toxicant ID: RTCL14
 Stock Solution ID: 15CuO2
 Date Initiated: Apr 16/15
 7-d LC50 (95% CL): 51.2 (45.7-57.5) (Cu (ug/L))
 7-d IC50 (95% CL): 48.0 (46.3-50.2) (Cu (ug/L))

7-d LC50 Reference Toxicant Mean and Historical Range: 67.2 (34.4-131.5) (Cu (ug/L)) CV(%) 39.9
 7-d IC50 Reference Toxicant Mean and Historical Range: 66.6 (31.5-140.7) (Cu (ug/L)) CV(%) 45.4

Test Results:

	Survival	Biomass	Dry Weight
LC25 % (v/v) (95% CL)	>100%		
LC50 % (v/v) (95% CL)	>100%		
IC25 % (v/v) (95% CL)		>100%	>100%
IC50 % (v/v) (95% CL)		>100%	>100%

Test Conditions

Client: NAU104
Reference: 15-0428-01-FMD

Method: Biological Test Method: Test of Larval Growth and Survival Using Fathead minnows. Environment Canada, EPS 1/RM/22, Second Edition, February 2011.

Test type: Fathead Minnow 7-d Survival and Growth Static Renewal Test (WTR-ME-052)

Species: *Pimephales promelas*

Age: ≤ 24 hour post hatch

Organism source: Aquatox Inc., Hot Springs, Arkansas (Batch 20150417FM)

Culture conditions: temperature, 25 °C; dissolved oxygen, 95-100 % saturation

Shipped: 2015/04/16

Breeding Stock Mortality: < 1 % during the week prior to test initiation

Organisms upon receipt: mortality, < 1 %; temperature, 25°C; dissolved oxygen, 13.8 mg/L

No acclimation was necessary. Test organisms maintained at 25 ± 1°C until loaded. The EC guidance document on the importation of test organisms (1999) has been followed. Test organisms were received in good condition, with inflated swim bladders and normal feeding behaviour.

Organism observation: No unusual behaviour or appearance or treatment of test organisms was noted prior to shipping, upon arrival, preceding or during the test. Normal feeding behaviour was noted during the test.

Sample initial chemistry: pH: 6.5; EC: 279 (µS/cm); DO: 9.5 (mg/L); temperature: 18 °C
hardness (mg CaCO₃/L): 88; colour: colourless; odour: odourless

Sample holding time: 3 days (must be ≤ 3 days); The test was conducted with three subsamples samples a, b, and c were for days 0 to 2, 3 to 5, and 6 respectively

Sample storage: 4 ± 2°C in darkness

Test vessel: Tests were conducted in 500 mL plastic vessels

Test volume: 250 mL of solution (depth of 6.5 cm), replenished daily

Control/dilution water: The control and dilution water was dechlorinated City of Calgary water acclimated to the test conditions; no chemicals were added to the dilution/control water
A second control was not set up for this test. However, duplicate controls are run in the reference toxicant for each batch of fish.

Test concentrations: 7 effluent concentrations (1.6, 3.2, 6.3, 13, 25, 50, 100% (v/v)
plus a negative control)

Test replicates: Ten fish ≤ 24 hours old were loaded per test vessel; 4 replicates/conc.

Feeding: The test organisms were fed twice daily newly-hatched brine shrimp nauplii
The fish are not fed during the final 12 hours of the test

Measurements: pH, conductivity, dissolved oxygen and temperature were measured daily

Sample pre-treatment: The sample was not aerated, pH or hardness adjusted prior to or during testing.
No sample filtration, settling, or decanting occurred prior to or during testing
The dissolved oxygen concentration (mg/L) was: 9.4
The sample pH was: 7.6

Lighting: Overhead full spectrum fluorescent lights

Photoperiod: 16h light:8h dark

Test temperature: 25 ± 1°C

Our liability is limited to the cost of the test requested. The test results only relate to the sample as received. No liability in whole or in part is assumed for the collection, handling or transport of the sample, application or interpretation of the test data or results.

Note: Outlined sections are protocol deviations explained on the comment page

Test Conditions

Client: NAU104 Reference: 15-0428-01-FMD

Endpoint: Survival, 7-d LC50 (with 95% confidence limits)
Biomass, 7-d IC25 (with 95% confidence limits)
Test endpoints were bracketed by at least 1 test concentration
(except for <1.6% or >100 %)
No outliers were observed within the data set

Test validity: Control had 98% survival (must \geq 80%)
Control had 0% abnormal behaviour (must < 20%), e.g. atypical swimming, loss of equilibrium

The average dry weight of the control fish was 0.46 (must \geq 0.25 mg)

Reference toxicant: 7-d test with NaCl initiated April 17, 2015;
current results: (7-d LC50 and 95% confidence limits) = 3.09 (3.05-3.13) log (mg/L NaCl)
current results: (7-d IC25 and 95% confidence limits) = 3.01 (2.94-3.03) log (mg/L NaCl)
The reference toxicant test was performed under the same conditions as those used during this test.

Note: Outlined sections are protocol deviations explained on the comment page

Our liability is limited to the cost of the test requested. The test results only relate to the sample as received. No liability in whole or in part is assumed for the collection, handling or transport of the sample, application or interpretation of the test data or results.

Our liability is limited to the cost of the test requested. The test reports only relate to the sample as received. No liability in whole or in part is assumed for the collection, handling or transport of the sample, application or interpretation of the test data or results.

Comments/Statistics

Client: NAU104 Reference: 15-0428-01-FMD

Test Result Comments:

Due to technician error, eight organisms were killed in the 25% concentration on day 5. This replicate is not included in mortality or biomass calculations.

Data Analysis:

Endpoints for mortality could not be calculated. No effect occurred.

Endpoints for biomass could not be calculated. No effect occurred.

Protocol Deviations:

None.

Our liability is limited to the part of the test requested. The test results only relate to the sample as received. No liability in whole or in part is assumed for the collection, handling or transport of the sample, application or interpretation of the test data or results.

Test Method: 7 days Fathead minnow Survival and Growth Test (7 treatments plus a control)
HydroQual Test Method: WTR-ME-046

Reference: Biological Test Method: Test of Larval Growth and Survival Using Fathead minnows. Environment Canada, EPS 1/RM/22, Second Edition, February 2011.

Test Organism:

test species: *Pimephales promelas*
culture source: Aquatox
(Arkansas, USA)
temp of breeding aquaria: 23 - 26 °C
food type: newly-hatched brine shrimp nauplii
frequency of feeding: daily
breeding colony mortality: <1% (last 7 days)
age of test organisms: <24 hours
condition prior to test initiation: normal
batch number: 20150417FM

Test Design:

test type: static renewal
toxicant: sodium chloride
test vessel: polypropylene cups, 11 x 9 cm
volume of test vessel (ml): 500
test volume (ml): 250
depth of test solution: >3 cm
replicates per treatment: 4 replicates
organisms per replicate: 10
feeding: twice daily
temperature (°C): 24-26
photoperiod: 16 hours light: 8 hours dark
light level (surface): 100-500 lux (full spectrum)

Control/Dilution Water:

source: dechlorinated City of Calgary tap water
no chemicals were added to the dilution water
pH (units): 6.9
conductance (µS/cm): 411
dissolved oxygen (mg/L): 5.9
NH₄⁺ (mg/L): <0.1
hardness (mg CaCO₃/L): 174
alkalinity (mg CaCO₃/L): 148
total residual chlorine (mg/L): <0.01

Comments: None

The test data and results are authorized and verified correct.

Technical Lead

Our liability is limited to the cost of the test requested on the sample as received. No liability in whole or in part is assumed for the collection, handling or transport of the sample, application or interpretation of the test data or results in part or in whole.

Our liability is limited to the cost of the test requested on the sample as received. No liability in whole or in part is assumed for the collection, handling or transport of the sample, application or interpretation of the test data or results in part or in whole.

GENERAL TERMS AND CONDITIONS:

These terms and conditions are incorporated into and form part of the Chain of Custody between HydroQual Laboratories Ltd. ("HydroQual") and the party named in the Chain of Custody (the "Client").

1. **Definitions:** Capitalized terms shall have the definition ascribed as such in these General Terms and Conditions and the Chain of Custody.
2. **The Services:** HydroQual will provide the Services to the Client as listed and described in the Chain of Custody.
3. **Prices:** HydroQual may review and change all prices, fees, surcharges or other charges as set out in proposals and/or price quotations if there are changes to HydroQual's cost beyond HydroQual's control, including changes in legislative requirements, Client variations of sample numbers and Client requests for changes to standard reporting requirements. Notwithstanding condition 3, all quotations are reviewed and updated on a yearly basis.
4. **Payment Terms:** The Client shall pay HydroQual within 30 days of the invoice date as provided by HydroQual. HydroQual may, for reasonable business reasons, require the Client to arrange for payment in advance.
5. **Quotation Numbers:** The Client shall provide the proposal and/or price quotation number to HydroQual (where applicable) to ensure correct pricing.
6. **Taxes:** Applicable taxes are not included in prices, surcharges and additional fees and will be added at the time of invoicing.
7. **No Guarantee of Results:** The Client is responsible for informing itself on the limitation of the results and acknowledges that the results are not guaranteed.
8. **Standard of Care:** HydroQual will use reasonable care and diligence as required by the laws of the province or territory where the sample is tested, subject to that level of care and skill ordinarily exercised by other laboratories currently practicing under similar conditions in the same locality, subject to the time limits and financial, physical or other constraints applicable to the Services. No warranty, express or implied, is made.
9. **Storage:** Where possible, HydroQual will store samples until a final report is issued to the Client, after which time HydroQual may discard the sample.
10. **Holds:** If the Client requests a sample be placed on hold, HydroQual will store the sample for the mutually agreed upon written time and price, after which HydroQual will invoice the Client and discard the sample.
11. **Archives:** If the Client requests a sample be archived, HydroQual will store the sample for a mutually agreed upon written time frame and price, after which HydroQual will invoice the Client and discard the sample.
12. **Handling Protocol:** Legal sample handling protocol must be arranged, and provided in writing, before samples are collected. HydroQual will provide a price quotation for legal sample protocol. Samples processed under legal protocol are stored indefinitely, subject to a storage charge as advised by HydroQual.
13. **Samples:** The quality, condition, content and source of samples stored and tested are not known to HydroQual except as declared and described on the Chain of Custody completed and submitted by the Client and accompanying the sample.
14. **Risk of Loss:** HydroQual will use reasonable care to protect samples during storage, however, all samples are stored at the Client's risk and the Client is responsible for obtaining appropriate insurance, if desired. The Client acknowledges that during the performance of the Services samples may be altered, lost, damaged or destroyed and the client forever releases HydroQual from any and all claims the Client may have for any loss or damage to the sample.
15. **Environmental:** the Client must comply with all applicable environmental legislation, including labeling all hazardous samples to comply with Canada's *Workplace Hazardous Materials Information System* and the Alberta *Transfer of Dangerous Goods* regulations, and must provide appropriate material safety data sheets that include the nature of the hazard and a contact name and phone number to call for information. The Client shall defend, indemnify and hold harmless HydroQual for all loss or damages, including any fine or cost of complying with an order of any government authority, resulting from the Client's breach of this paragraph.
16. **Hazardous Materials Disposal:** HydroQual may return, at the Client's cost, hazardous material to the Client for disposal.
17. **Hazardous Materials Surcharge:** HydroQual may apply an additional surcharge for handling of hazardous samples or samples with Naturally Occurring Radioactive Materials ("NORM"), such as and including without limitation, H₂S and CN.
18. **Sample Containers:** HydroQual may ship sample containers to the Client's location by the most cost effective means using HydroQual's preferred courier suppliers, within the specified project timeline. Shipping will be charged back to the Client.
19. **Additional Charges:** HydroQual may charge the Client:
 - (a) for pick-up and delivery services when provided subject in each instance to a minimum charge of \$50.00; and,
 - (b) for rush service (processing samples and/or reporting).
20. **Large Bottle Orders:** The Client shall provide HydroQual with not less than 24 hours' notice for large bottle orders.
21. **Re-Tests:** HydroQual reserves the right to re-test any samples that remain in HydroQual's possession. Re-tests requested by the Client may be charged to Client and Client agrees to pay for such charges.
22. **Waiver:** The Client is responsible for making any assessment regarding the suitability of the Services and the intended results for the Client's purposes and waives any and all claims against HydroQual that the Client may have against HydroQual as a result of the interpretation of the results provided to the Client. The Client shall defend, indemnify and save harmless HydroQual for any and all claims made by any third party against HydroQual in respect of all losses however arising from the performance of the Services or the use of any report provided in the performance of the Services.
23. **LIMITATION OF LIABILITY:** IN NO EVENT SHALL HYDROQUAL BE RESPONSIBLE FOR ANY CONSEQUENTIAL, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY OR PUNITIVE DAMAGES, WHETHER FORESEEABLE OR UNFORESEEABLE (INCLUDING CLAIMS FOR LOSS OF PROFITS OR REVENUE OR LOSSES CAUSED BY STOPPAGE OF OTHER WORK OR IMPAIRMENT OF OTHER ASSETS) INCURRED BY THE CLIENT ARISING OUT OF BREACH OR FAILURE OF EXPRESS OR IMPLIED WARRANTY, BREACH OF CONTRACT, BREACH OF WARRANTY, MISREPRESENTATION, NEGLIGENCE, STRICT LIABILITY IN TORT OR OTHERWISE. IN ANY EVENT, THE LIABILITY OF HYDROQUAL TO THE CLIENT SHALL BE LIMITED TO THE COST OF TESTING THE SAMPLE AS REQUESTED IN THE CHAIN OF CUSTODY UNDER WHICH THE SAMPLE WAS ORIGINALLY DEPOSITED. FOR THE PURPOSES OF THIS PARAGRAPH AND PARAGRAPHS 7, 14, 15, 22, AND 24, AS APPLICABLE, "HYDROQUAL" INCLUDES WITHOUT LIMITATIONS ITS DIRECTORS, OFFICERS, EMPLOYEES AND AFFILIATES AND THE "CLIENT" INCLUDES WITHOUT LIMITATION ANY THIRD PARTY THAT MAY HAVE A CLAIM AGAINST HYDROQUAL THROUGH THE CLIENT.
24. **Notice of Liability:** Notwithstanding paragraph 23, HydroQual shall not be liable to the Client unless the Client provides notice in writing to HydroQual of such loss or damage, together with full particulars thereof, within 30 days of the Client's receipt of the report of the analysis of the sample giving rise to such liability. The provisions of this paragraph allocate the risk between the Client and HydroQual, and the fees to be paid by the Client to HydroQual reflect this allocation of any such risks and the limitations of liability in these General Terms and Conditions.
25. **Entire Agreement:** These General Terms and Conditions, the Chain of Custody and price quotations constitute the entire agreement between the parties and supersede and take precedence over any terms and conditions contained in any documentation provided by the Client. HydroQual's execution of any subsequent documentation from the Client only acknowledges receipt and not acceptance of any terms or conditions therein unless expressly stipulated otherwise by HydroQual. If there is a conflict between these General Terms and Conditions and any other document, these General Terms and Conditions prevail.

APPENDIX C

Summary of Biotic Ligand Model-Derived Predictions of Copper Toxicity and No-Effect Concentrations (PNECs)

APPENDIX C

SUMMARY OF BIOTIC LIGAND MODEL-DERIVED PREDICTIONS OF COPPER TOXICITY AND NO-EFFECT CONCENTRATIONS

Background

Biotic Ligand Models (BLMs) combine a geochemical model, a metal-organic matter binding model and a toxicological model to account for the key factors that determine the bioavailability and toxicity of metals (e.g., DiToro et al. 2001; Santore et al. 2001; Niyogi and Wood 2004; De Schamphelaere and Janssen 2004; USEPA 2007; Peters et al. 2011; Erickson 2013; Smith et al. 2014). In lay terms, they account for the factors that determine the bioavailability of metals in order to predict metal toxicity under specific water quality conditions. Ligands include any ion, molecule, or substance that can bind a metal ion. The models treat organisms as “biotic ligands” that are in competition for metal binding with other ligands (such as dissolved organic matter) and also account for competition between metals and major ions for both abiotic and biotic ligands. BLMs have been developed by a number of organizations and are particularly well accepted for copper due to the strong affinity of copper and aquatic ligands (e.g., USEPA 2007; Peters et al. 2009; Verschoor et al. 2012).

To determine if responses observed in toxicity testing of water samples collected in the Mount Polley Mining Corporation’s (MPMC) aquatic receiving environment between November 2014 and April 2015 were potentially attributable to copper, three BLMs were applied to predict lethal concentrations and predicted no-effect concentrations (PNECs) of copper under the site-specific water quality conditions encountered in the Mount Polley Mine receiving environments evaluated by toxicity testing. The three BLMs applied were: 1) the HydroQual BLM (HydroQual 2007; USEPA 2007) 2) the Bio-Met bioavailability tool (ECHA 2008; Bio-Met 2013); and 3) the PNEC.pro BLM (ECHA 2008; Verschoor et al. 2012; Deltares 2013). Each model requires different inputs and reports different outputs as outlined in Table C.1 and briefly discussed below.

The HydroQual BLM has been adopted by the USEPA and provides Instantaneous Water Quality Criteria, both acute and chronic, that define copper concentrations below which adverse effects would not be expected under the specific water quality that co-occurs with the copper. The HydroQual BLM can be used to calculate the number of toxic units, also referred

to as a risk characterization ratio (RCR) or hazard quotient (HQ). The term RCR is used throughout this letter report, and represents the ratio of the dissolved copper concentration to the BLM-derived no effect concentration. An RCR greater than 1 indicates a dissolved copper concentration greater than the BLM-derived no effect concentration, whereas an RCR lower than 1 indicates a dissolved copper concentration lower than the BLM-derived no effect concentration.

The Bio-Met bioavailability tool is a chronic BLM tool that is a simplification of a “full” chronic BLM developed by the European Chemicals Agency (ECHA 2008). The Bio-Met tool uses pH and concentrations of copper, dissolved organic carbon (DOC) and calcium to calculate “local Environmental Quality Standards” (EQS) for copper under pH and concentrations of dissolved organic carbon and calcium that co-occur with the copper. The corresponding bioavailable copper fraction and a Risk Characterization Ratio (RCR) are also calculated. The Bio-Met model is based on chronic toxicity relationships developed under a variety of water quality conditions. The EQS is a 5th percentile Hazard Concentration (HC5), which is calculated from a Species Sensitivity Distribution (SSD) according to European Union Water Framework Directive (WFD) methodology (European Communities 2011).

PNEC.pro is a simplified chronic BLM tool similar to the Bio-Met tool, with dissolved organic carbon being the only required input and pH, calcium, magnesium and sodium designated as optional input parameters (all of these inputs were used in the present analysis). PNEC.pro calculates Predicted No Effect Concentrations (PNECs), which are similar to EQS determined using the Bio-Met tool (PNECs are also HC5s and are therefore expected to be similar to the EQS). PNEC.pro also provides an RCR and additionally provides a risk probability that characterizes the likelihood of concentrations exceeding the PNEC.

Results

The first question addressed using BLM was whether or not copper concentrations in the toxicity test samples were at or near those that might cause acute lethality to the toxicity test organisms. This question was addressed using the LC50 model in the HydroQual BLM for water quality samples collected concurrent with the toxicity test water samples. Model results indicated that acute toxicity to rainbow trout would not be expected at dissolved copper concentrations lower than approximately 139 µg/L (the lower 95% confidence limit of the mean for Quesnel Lake; Table C.2). The number of copper acute toxic units (actual concentration of dissolved copper divided by the predicted LC50) was 0.016 or lower, meaning that the

dissolved copper concentrations were no more than 1.6% of that required to kill rainbow trout. LC50 values and acute toxic unit values for fathead minnow were generally similar to those for rainbow trout (Table C.2). Acute toxicity to *Ceriodaphnia dubia* (a test organism known to be sensitive to copper; USEPA 2007) would not be expected at dissolved copper concentrations lower than approximately 28 µg/L (the lower 95% confidence limit of the mean for Quesnel Lake; Table C.2). The number of copper acute toxic units (actual concentration of dissolved copper divided by the predicted LC50) was 0.083 or lower, meaning that the dissolved copper concentrations were no more than 8.3% of that required to kill *C. dubia*.

The second question addressed using BLM was whether or not copper concentrations in the toxicity test samples were at or near those that might cause effects to any organism at any life stage and exposure duration. This question was addressed using all three BLMs to predict water-specific safe concentrations (criteria, PNECs, and EQS in the three models, respectively) for water quality samples collected concurrently with samples for toxicity testing. Model results indicated that adverse effects due to copper would not be expected in any of the samples collected for toxicity testing, and all “risk characterization ratios” (RCR; the actual concentration of dissolved copper divided by the water-specific criterion, PNEC or EQS) were no greater than 0.40 (Table C.3). Within Quesnel Lake specifically, which is the only waterbody that contained samples associated with adverse effects, effects to any organism at any life stage and exposure duration would not be expected above 4.7 µg/L (the lowest predicted water-specific safe concentration among the three models). All dissolved copper concentrations measured in Quesnel Lake were well below this level (Table C.3).

¹ all Instantaneous Water Quality Criteria (IWQC), Predicted No-Effect Concentrations (PNECs), and Environmental Quality Standards (EQS) apply only to the specific water quality combinations for which they were calculated
² Criterion Maximum Concentration (acute criterion) = the USEPA national water quality criterion for the highest instream concentration of a toxicant to which organisms can be exposed for a brief period of time without causing an acute effect
³ Acute Toxic Units = dissolved copper concentration divided by the Criterion Maximum Concentration
⁴ Criterion Continuous Concentration (chronic criterion) = the USEPA national water quality criterion for the highest instream concentration of a toxicant to which organisms can be exposed indefinitely without causing unacceptable effect
⁵ Chronic Toxic Units = dissolved copper concentration divided by the Criterion Continuous Concentration
⁶ Predicted No-Effect Concentration
⁷ p-value represents the probability that concentrations exceed the predicted no-effect concentration.
⁸ Risk Characterization Ratio = the ratio of the predicted copper concentration to the concurrent (instantaneous) criterion, standard or predicted no-effect concentration.
⁹ Environmental Quality Standard based bioavailability and a 5th percentile hazard concentration (HC5).
¹⁰ BioF is the bioavailability factor - the ratio of condition-specific bioavailability to generic bioavailability (reference EQS / condition-specific EQS).

 indicates a toxic unit value or a risk characterization ratio of 0.5 to 1.0
 indicates a toxic unit value or a risk characterization ratio ≥ 1.0

glawrence@golder.com**UPDATE ON POST-EVENT AQUATIC TOXICITY TESTING – MARCH TO NOVEMBER 2015**

Golder Associates Ltd. (Golder) is pleased to provide Mount Polley Mining Corporation (MPMC) with the following update on results of aquatic toxicity testing not previously reported in the Surface Water Quality Impact Assessment that was submitted as part of the Post-Event Environmental Impact Assessment Report (PEEIAR) in June 2015 (MPMC 2015; Appendix F). This update focuses on toxicity tests conducted on water samples that were collected by MPMC from receiving environment locations between March and November 2015. Previously reported results of aquatic toxicity tests conducted prior to March 2015 are discussed briefly for context of more recent results.

1.0 POST-EVENT AQUATIC TOXICITY TESTING

In addition to monitoring water quality following the tailings storage facility dam breach (hereafter referred to as the “event”), MPMC also initiated a toxicity testing program where water samples taken from the receiving environment were subject to a battery of standard laboratory tests using sensitive plant, invertebrate, and fish test species. The program provides an important evaluation of the bioavailable fraction of contaminants of potential concern as it is a direct measure of effect using water from the site, and includes sensitive test species representing primary producers, primary consumers, and secondary consumers.

1.1 Initial Toxicity Testing (August 2014 to February 2015)

The results of the initial post-event toxicity testing (August to September 2014) and follow-up toxicity testing (November 2014 to February 2015) were summarized in the PEEIAR (MPMC 2015; Appendix F) and by Minnow Environmental Inc. (Minnow 2015a,b). The toxicity testing program initiated immediately after the event (and carried through the post-event period) indicated that receiving environment waters in Polley Lake, Quesnel Lake, and Quesnel River were not acutely toxic to sensitive plant, invertebrate, and fish species. Sub-lethal, longer term effects were not observed for sensitive plant, invertebrate, and fish species, with the exception of a reproductive test response in invertebrates in some samples.

Golder Associates Ltd.Suite 200 - 2920 Virtual Way, Vancouver, BC, V5M 0C4
Tel: +1 (604) 296 4200 Fax: +1 (604) 298 5253 www.golder.com**Golder Associates: Operations in Africa, Asia, Australasia, Europe, North America and South America**

The latter responses were inferred to be related to suspended matter in the samples, and filtered samples from the same locations did not elicit toxicity. One of the objectives of the follow-up testing was to validate the findings of the initial testing program, both in terms of evaluating filtered versus non-filtered samples and in terms of the overall frequency and magnitude of the reproductive responses previously observed.

1.2 Follow-Up Toxicity Testing (March to November 2015)

Subsequent to the PEEIAR, water samples collected from March to November 2015 were tested using the following sub-lethal toxicity tests:

- 7- to 8-d survival and reproduction of the water flea *Ceriodaphnia dubia* (*C. dubia*) on filtered (0.45 µm) and unfiltered samples to examine the influence of suspended solid, using procedures described by Environment Canada (2007);
- 7-d survival and growth of rainbow trout (*Oncorhynchus mykiss*) swim-up fry using procedures described by Lazorchak and Smith (2007) and WDOE (2008); and,
- 7-d survival and growth of early life stage fathead minnow (*Pimephales promelas*), using procedures described by Environment Canada (2011).

Minnow (2015b) reported the results of the March and April 2015 toxicity tests. Results of the June through November 2015 toxicity tests are reported in this memo (Table 1; Attachment 1), and are summarized below.

- **Fish Toxicity Testing** — No impacts on survival and growth of either fathead minnows or rainbow trout were observed for water samples collected from Polley Lake (P2-Surface), Quesnel Lake (QUL-66, QUL-55, QUL-55a), and Quesnel River (QUR-1).
- **Invertebrate Toxicity Testing** — No impacts on *C. dubia* survival were observed in water samples collected from Polley Lake (P2-Surface), Quesnel Lake (QUL-66, QUL-55a), or Quesnel River (QUR-1). Likewise, no impacts on *C. dubia* reproduction were observed in the samples from Polley Lake (P2-Surface), the filtered samples from Quesnel Lake, or the August and November 2015 unfiltered samples from Quesnel Lake (QUL-55a). The only observed reproduction effects were for a subset of the unfiltered samples.

Reproductive effects in *C. dubia* were reported for the unfiltered samples taken from Quesnel Lake close to the Hazeltine Creek mouth in January and March 2015, but no effects were reported in the corresponding filtered samples. In the unfiltered samples all measured analytes were below corresponding BC water quality guidelines, suggesting that exposure to suspended particulate matter in the unfiltered samples may have resulted in the reproduction responses. One unfiltered sample collected from Quesnel River in March 2015 also showed a slight reproductive test response (Table 1). This response was not associated with elevated water chemistry (i.e., concentrations of all analytes in this sample were below applicable BC water quality guidelines), nor did the response align with fish toxicity testing results reported for the same sample (Table 1).

Table 1: Summary of Post-event Surface Water Sub-lethal Toxicity Testing (March to November 2015)

Test	Sample ID ^a	Date	LC50 ^b (% v/v) ^c (Median Lethal Concentration)	IC25 (% v/v) ^c (25 th Percentile Inhibitory Concentration)	IC50 (% v/v) ^c (Median Inhibitory Concentration)

This report has been prepared by Nautilus Environmental Company Inc. based on data and/or samples provided by our client and the results of this study are for their sole benefit. Any reliance on the data by a third party is at the sole and exclusive risk of that party. The results presented here relate only to the samples tested.

1.0 INTRODUCTION

Nautilus Environmental Company Inc. conducted toxicity tests for Mount Polley Mining Corporation on samples identified as QUR-1 and QUL-55-0m. The samples were initially collected on June 1, 2015 but the control criteria for minimum dry weight at test termination was not achieved. The samples were subsequently collected on June 16, 2015 and delivered to the laboratory in Burnaby, BC on June 17, 2015. Each sample was transported in three 20-L plastic carboys and coolers. The samples were received at temperatures of 10.0 and 10.5°C, respectively and were stored in the dark at $4 \pm 2^\circ\text{C}$ prior to testing.

This report describes the results of the 7-d rainbow trout (*Oncorhynchus mykiss*) survival and growth toxicity test performed on samples QUR-1 and QUL-55-0m. Copies of laboratory data sheets and printouts of statistical analyses are provided in Appendix A. The chain-of-custody forms are provided in Appendix B.

2.0 METHODS

Methods for the toxicity test are summarized in Table 1. Testing was conducted according to methods described by Lazorchak and Smith (2007). Statistical analyses were performed using CETIS (Tidepool Scientific Software, 2013).

Table 1. Summary of test conditions: rainbow trout (*Oncorhynchus mykiss*) survival and growth test.

Test organism	<i>Oncorhynchus mykiss</i>
Test organism source	Aqua Farms JV, Burnaby, BC
Test organism age	3 to 6 days post swim up
Test type	Static renewal
Test duration	7 days
Test vessel	1-L glass containers
Test volume	500 mL
Test replicates	4 per treatment
Number of organisms	5 per replicate
Control water	Moderately-hard water (hardness 80-100 mg/L CaCO ₃)
Test solution renewal	Daily
Test temperature	15 ± 1°C
Feeding	Twice a day with newly hatched brine shrimp (<i>Artemia nauplii</i>)
Light intensity	100 - 500 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	None
Test protocol	Lazorchak and Smith (2007)
Statistical software	CETIS (2013)
Test endpoint	Survival and biomass
Test acceptability criteria for controls	≥90% survival, ≥1.5 times test initiation dry weight
Reference toxicant	Copper chloride

3.0 RESULTS

Results of the rainbow trout survival and growth test are summarized in Table 2. There were no adverse effects observed on survival and growth of rainbow trout. The LC and IC values for QUR-1 and QUL-55-0m were therefore greater than 100%.

Table 2. Results: rainbow trout (*Oncorhynchus mykiss*) survival and growth test.

Concentration (% v/v)	Mean ± SD					
	QUR-1			QUL-55-0m		
	Survival (%)	Biomass (mg)	Dry Weight (mg)	Survival (%)	Biomass (mg)	Dry Weight (mg)
Control	100.0 ± 0.0	25.1 ± 2.2	25.1 ± 2.2	100.0 ± 0.0	24.3 ± 1.7	24.3 ± 1.7
6.25	95.0 ± 10.0	21.0 ± 2.5	22.1 ± 0.8	100.0 ± 0.0	24.4 ± 1.8	24.4 ± 1.8
12.5	100.0 ± 0.0	22.8 ± 1.2	22.8 ± 1.2	95.0 ± 10.0	23.4 ± 2.0	24.7 ± 0.5
25	95.0 ± 10.0	21.6 ± 2.4	22.7 ± 0.4	100.0 ± 0.0	22.3 ± 0.9	22.3 ± 0.9
50	100.0 ± 0.0	24.4 ± 1.0	24.4 ± 1.0	100.0 ± 0.0	23.7 ± 0.8	23.7 ± 0.8
100	100.0 ± 0.0	23.1 ± 2.0	23.1 ± 2.0	100.0 ± 0.0	23.0 ± 1.2	23.0 ± 1.2
Test endpoint						
(% v/v)						
LC50	>100	--	--	>100	--	--
IC25	--	>100	>100	--	>100	>100
IC50	--	>100	>100	--	>100	>100

SD = Standard Deviation, LC = Lethal Concentration, IC = Inhibition Concentration.

4.0 QA/QC

The health history of the test organisms used in the exposure was acceptable and met the requirements of the protocol. The test met all control acceptability criteria and water quality parameters remained within ranges specified in the protocol throughout the test. There were no deviations from the test methodology. Uncertainty associated with this test is best described by the standard deviation around the mean and/or the confidence limits around the point estimates.

Results of the reference toxicant test conducted during the testing program are summarized in Table 3. Results of the reference toxicant test fell within range for organism performance of mean and range, based on historical results obtained by the laboratory with this test. Thus, the sensitivity of the organisms used in this test was appropriate.

Table 3. Reference toxicant results.

Test Species	Endpoint	Historical Mean (2 SD Range)	CV (%)	Test Date
<i>O. mykiss</i>	Survival (LC50): 28.4 µg/L Cu	61.9 (28.4 - 134.7)	48	June 17, 2015
	Biomass (IC50): 27.5 µg/L Cu	61.0 (26.7 - 139.2)	51	

SD = Standard Deviation, CV = Coefficient of Variation, LC = Lethal Concentration, IC = Inhibition Concentration.

This report has been prepared by Nautilus Environmental Company Inc. based on data and/or samples provided by our client and the results of this study are for their sole benefit. Any reliance on the data by a third party is at the sole and exclusive risk of that party. The results presented here relate only to the samples tested.

1.0 INTRODUCTION

Nautilus Environmental Company Inc. conducted toxicity tests for Mount Polley Mining Corporation on samples identified as QUR-1, QUL-55a-0M and P2-S. QUR-1 was collected on August 24 while QUL-55a-0M and P2-S were collected on August 25, 2015. All samples were delivered to the laboratory in Burnaby, BC on August 26, 2015. Samples were transported in in three 20-L plastic carboys and seven 1-L plastic bottles within coolers. The samples were received at temperatures between 8.5 and 11.5°C, and were stored in the dark at $4 \pm 2^\circ\text{C}$ prior to testing. The following sub-lethal toxicity tests were performed on the samples:

- *Ceriodaphnia dubia* survival and reproduction
- 7-d rainbow trout (*Oncorhynchus mykiss*) survival and growth

This report describes the results of the *C. dubia* and swim-up rainbow trout toxicity tests. Copies of laboratory data sheets and printouts of statistical analyses for each test are provided in Appendices A and B. The chain-of-custody form is provided in Appendix C.

2.0 METHODS

Methods for the toxicity tests are summarized in Tables 1 and 2. Testing was conducted according to procedures described by Environment Canada (2007) and methods described by Lazorchak and Smith (2007). Statistical analyses for all tests were performed using CETIS (Tidepool Scientific Software, 2013).

Table 1. Summary of test conditions: *Ceriodaphnia dubia* survival and reproduction test.

Test organism	<i>Ceriodaphnia dubia</i>
Test organism source	In-house culture
Test organism age	<24 hour old neonates within 12 hours of the same age
Test type	Static-renewal
Test duration	7 ± 1 day
Test vessel	20-mL glass test tube
Test volume	15 mL
Test concentrations	Seven concentrations plus laboratory control
Test replicates	10 test replicates per treatment
No. of organisms	1 per replicate
Control water	20% Perrier water and 80% deionized water (hardness 80-100 mg/L CaCO ₃)
Test solution renewal	Daily
Test temperature	25 ± 1°C
Feeding	Daily with <i>Pseudokirchneriella subcapitata</i> and YCT
Light intensity	100 to 600 lux at water surface
Photoperiod	16 hours light/8 hours dark
Aeration	None
Test protocol	Environment Canada (2007), EPS 1/RM/21
Statistical software	CETIS (2013)
Test endpoint	Survival and reproduction
Test acceptability criteria for controls	≥80% survival; ≥15 young per surviving control producing three broods; ≥60% of controls producing three or more broods; no ephippia present
Reference toxicant	Sodium chloride

Table 2. Summary of test conditions: rainbow trout (*Oncorhynchus mykiss*) survival and growth test.

Test organism	<i>Oncorhynchus mykiss</i>
Test organism source	Aqua Farms, Langley, BC
Test organism age	3 to 6 days post swim up
Test type	Static renewal
Test duration	7 days
Test vessel	1-L glass containers
Test volume	500 mL
Test replicates	4 per treatment
Number of organisms	5 per replicate
Control water	Moderately-hard water (hardness 80-100 mg/L CaCO ₃)
Test solution renewal	Daily
Test temperature	15 ± 1°C
Feeding	Twice a day with newly hatched brine shrimp (<i>Artemia nauplii</i>)
Light intensity	100 – 500 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	None
Test protocol	Lazorchak and Smith (2007)
Statistical software	CETIS (2013)
Test endpoint	Survival and biomass
Test acceptability criteria for controls	≥90% survival, ≥1.5 times test initiation dry weight
Reference toxicant	Copper chloride

3.0 RESULTS

Results of the toxicity tests conducted on samples QUR-1, QUL-55a-0M and P2-S using *C. dubia* and rainbow trout are provided in Tables 3 and 4. No adverse effects on *C. dubia* or rainbow trout survival were observed in the samples, resulting in LC50 values of >100%. There were no effects on rainbow trout biomass or dry weight; the IC25 values were >100%. No reduction in *C. dubia* reproduction was observed; the IC25 values were >100%.

Table 3. Results: *Ceriodaphnia dubia* survival and reproduction test.

4.0 QA/QC

The health history of the test organisms used in the exposures was acceptable and met the requirements of the protocols. The tests met all control acceptability criteria and water quality parameters remained within ranges specified in the protocols throughout the tests. There were no deviations from the test methodologies. Uncertainty associated with these tests is best described by the standard deviation around the mean and/or the confidence limits around the point estimates.

Results of the reference toxicant tests conducted during the testing program are summarized in Table 5. Results for the *C. dubia* test fell within the range for organism performance of mean and two standard deviation range, based on historical results obtained by the laboratory with these tests. The *O. mykiss* result was outside two standard deviations of the historical range for the 7-d larval reference toxicant test with copper, but was within three standard deviations of this historical range. An internal investigation did not reveal any issues with the health of the organisms, solution preparation, water quality or other technical errors. Thus, the result was likely due to variability. This high reference toxicant result was unlikely to have affected to test results.

Table 5. Reference toxicant results.

Test Species	Endpoint	Historical Mean (2 SD Range)	CV (%)	Test Date
<i>C. dubia</i>	Survival (LC50): 2.0 g/L NaCl	2.0 (1.8-2.2) g/L NaCl	5	August 14, 2015
	Reproduction (IC50): 1.8 g/L NaCl	1.5 (1.2-1.9) g/L NaCl	14	
<i>O. mykiss</i>	Survival (LC50): 184.7 µg/L Cu	58.7 (26.5-130.2) µg/L Cu	49	August 26, 2015
	Biomass (IC50): 181.9 µg/L Cu	57.9 (25.4-132.1) µg/L Cu	51	

SD = Standard Deviation, CV = Coefficient of Variation, IC = Inhibition Concentration, LC = Lethal Concentration.

APPENDIX A - *Ceriodaphnia dubia* Toxicity Test Data

Ceriodaphnia dubia Summary Sheet

Client: Mount Polley Mining Corporation Start Date/Time: AUG 26, 2015 @ 10:25h
 Work Order No.: 15697 Set up by: EMM

Sample Information:

Sample ID: OUR - 1
 Sample Date: AUG 24, 2015
 Date Received: AUG 26, 2015
 Sample Volume: 7 x 1L

Test Validity Criteria:

- 1) Mean survival of first generation controls is $\geq 80\%$
- 2) At least 60% of controls have produced three broods within 8 days
- 3) An average of ≥ 15 live young produced per surviving female in the control solutions during the first three broods.
- 4) Invalid if ephippia observed in any control solution at any time.

WQ Ranges:

T ($^{\circ}$ C) = 25 ± 1 ; DO (mg/L) = 3.3 to 8.4; pH = 6.0 to 8.5

Test Organism Information:

Broodstock No.: 081415 B
 Age of young (Day 0): <24-h (within 12-h)
 Avg No. young in first 3 broods of previous 7 d: 30 31
 Mortality (%) in previous 7 d: 10
 Individual female # used ≥ 8 young on test day: 21 - 32

NaCl Reference Toxicant Results:

Reference Toxicant ID: Cd 133
 Stock Solution ID: 15NA02
 Date Initiated: AUG 14, 2015

7-d LC50 (95% CL): 2.0 (1.7 - 2.3) g/L NaCl
 7-d IC50 (95% CL): 1.8 (1.7 - 1.9) g/L NaCl

7-d LC50 Reference Toxicant Mean and Historical Range: 2.0 (1.8 - 2.2) g/L NaCl CV (%): 5
 7-d IC50 Reference Toxicant Mean and Historical Range: 1.5 (1.2 - 1.9) g/L NaCl CV (%): 14

Test Results:

Ceriodaphnia dubia Summary Sheet

Client: Mount Polley Mining Corporation
 Work Order No.: 15657

Start Date/Time: AUG 26, 2015 @ 1000h
 Set up by: EMM

Sample Information:

Sample ID: SUL-550 -0m
 Sample Date: AUG 25, 2015
 Date Received: AUG 26, 2015
 Sample Volume: 7 x 1L

Test Validity Criteria:

- 1) Mean survival of first generation controls is $\geq 80\%$
- 2) At least 60% of controls have produced three broods within 8 days
- 3) An average of ≥ 15 live young produced per surviving female in the control solutions during the first three broods.
- 4) Invalid if ephippia observed in any control solution at any time.

WQ Ranges:

T (°C) = 25 ± 1 ; DO (mg/L) = 3.3 to 8.4 ; pH = 6.0 to 8.5

Test Organism Information:

Broodstock No.: 081415 B
 Age of young (Day 0): <24-h (within 12-h)
 Avg No. young in first 3 broods of previous 7 d: 30 31 3W
 Mortality (%) in previous 7 d: 10
 Individual female # used ≥ 8 young on test day: 21 - 32

NaCl Reference Toxicant Results:

Reference Toxicant ID: cd 133
 Stock Solution ID: 15 NA 02
 Date Initiated: AUG 14, 2015

7-d LC50 (95% CL): 2.0 (1.7 - 2.3) g/L NaCl
 7-d IC50 (95% CL): 1.8 (1.7 - 1.9) g/L NaCl

7-d LC50 Reference Toxicant Mean and Historical Range: 2.0 (1.8 - 2.2) g/L NaCl CV (%): 5
 7-d IC50 Reference Toxicant Mean and Historical Range: 1.5 (1.2 - 1.9) g/L NaCl CV (%): 14

Ceriodaphnia dubia Summary Sheet

Client: Mount Polley Mining Corporation
 Work Order No.: 15657

Start Date/Time: AUG 26, 2015 @ 10:5h
 Set up by: EMM

Sample Information:

Sample ID: P2-S
 Sample Date: AUG 25, 2015
 Date Received: AUG 26, 2015
 Sample Volume: 7 x 1L

Test Validity Criteria:

- 1) Mean survival of first generation controls is $\geq 80\%$
- 2) At least 60% of controls have produced three broods within 8 days
- 3) An average of ≥ 15 live young produced per surviving female in the control solutions during the first three broods.
- 4) Invalid if ephippia observed in any control solution at any time.

WQ Ranges:

T ($^{\circ}$ C) = 25 ± 1 ; DO (mg/L) = 3.3 to 8.4; pH = 6.0 to 8.5

Test Organism Information:

Broodstock No.: 081415 B
 Age of young (Day 0): <24-h (within 12-h)
 Avg No. young in first 3 broods of previous 7 d: 31 24
 Mortality (%) in previous 7 d: 10
 Individual female # used ≥ 8 young on test day: 32 - 37

NaCl Reference Toxicant Results:

Reference Toxicant ID: Cd 133
 Stock Solution ID: 15 Na02
 Date Initiated: AUG 14, 2015

7-d LC50 (95% CL): 2.0 (1.7 - 2.3) g/L NaCl
 7-d IC50 (95% CL): 1.8 (1.7 - 1.9) g/L NaCl

7-d LC50 Reference Toxicant Mean and Historical Range: 2.0 (1.8 - 2.2) g/L NaCl CV (%): 5
 7-d IC50 Reference Toxicant Mean and Historical Range: 1.5 (1.2 - 1.9) g/L NaCl CV (%): 14

Rainbow Trout Swimup Test Summary Sheet

Client: Mount Polley Start Date/Time: Aug 26/15 @ 1100h

Work Order No.: 15656 Test Species: Oncorhynchus mykiss

Sample Information:

Sample ID: QUR-1
 Sample Date: Aug 24/15
 Date Received: Aug 26/15
 Sample Volume: 3 x 20L

Dilution Water:

Type: Moderately Hard Water (MHW)
 Hardness (mg/L CaCO₃): 96
 Alkalinity (mg/L CaCO₃): 78

Test Organism Information:

Batch No.: 082015
 Source: Aqua Farm (Langley, BC)
 Average Initial Dry Weight 17.3 (mg)

Copper Reference Toxicant Results:

Reference Toxicant ID: RTCL20
 Stock Solution ID: 15Cu03
 Date Initiated: Aug 26/15 209.6
 7-d LC50 (95% CL): 184.7 (163.1 - 209.6) mg/L Cu
 7-d IC50 (95% CL): 181.7 (160.1 - 196.3) mg/L Cu

7-d LC50 Reference Toxicant Mean and Historical Range: 57.9 (25.4 - 132.1) mg/L Cu CV(%) 57.9
 7-d IC50 Reference Toxicant Mean and Historical Range: 57.9 (25.4 - 132.1) mg/L Cu CV(%) 57.9

Rainbow Trout Swimup Test Summary Sheet

Client: Mount Polley Start Date/Time: Aug 26/15 @ 1115h

Work Order No.: 15656 Test Species: Oncorhynchus mykiss

Sample Information:

Sample ID: QUL-55a-0m
 Sample Date: Aug 25/15
 Date Received: Aug 26/15
 Sample Volume: 3x 20L

Dilution Water:

Type: Moderately Hard Water (MHW)
 Hardness (mg/L CaCO₃): 96
 Alkalinity (mg/L CaCO₃): 78

Test Organism Information:

Batch No.: 082015
 Source: Aqua Farm (Langley, BC)
 Average Initial Dry Weight: 16.2 (mg)

Copper Reference Toxicant Results:

Reference Toxicant ID: RTCL20
 Stock Solution ID: 15CuO3
 Date Initiated: Aug 26/15
 7-d LC50 (95% CL): 184.7 (163.1-2079.0) µg/L Cu
 7-d IC50 (95% CL): 181.9 (160.1-196.3) µg/L Cu

7-d LC50 Reference Toxicant Mean and Historical Range: 58.7 (26.5-130.2) µg/L Cu CV(%) 48.9
 7-d IC50 Reference Toxicant Mean and Historical Range: 57.9 (25.4-132.1) µg/L Cu CV(%) 51.1

Test Results:

Rainbow Trout Swimup Test Summary Sheet

Client: Mount Polley Start Date/Time: Aug 26/15 @ 1130h

Work Order No.: 15656 Test Species: Oncorhynchus mykiss

Sample Information:

Sample ID: P2-5
 Sample Date: Aug 25/15
 Date Received: Aug 26/15
 Sample Volume: 3 x 20L

Dilution Water:

Type: Moderately Hard Water (MHW)
 Hardness (mg/L CaCO₃): 96
 Alkalinity (mg/L CaCO₃): 78

Test Organism Information:

Batch No.: 082015
 Source: Aqua Farm (Langley, BC)
 Average Initial Dry Weight 15.7 (mg)

Copper Reference Toxicant Results:

Reference Toxicant ID: RTCL20
 Stock Solution ID: 15Cu03
 Date Initiated: Aug 26/15
 7-d LC50 (95% CL): 184.7 (163.1 - 209.0) µg/L Cu
 7-d IC50 (95% CL): 181.9 (160.1 - 1936.3) µg/L Cu

7-d LC50 Reference Toxicant Mean and Historical Range: 58.7 (26.4 - 130.2) µg/L Cu CV(%) 48.9
 7-d IC50 Reference Toxicant Mean and Historical Range: 57.9 (26.4 - 133.1) µg/L Cu CV(%) 51.1

Test Results:

	Survival	Biomass	Dry Weight
LC25 % (v/v) (95% CL)	> 100		
LC50 % (v/v) (95% CL)	> 100		
IC25 % (v/v) (95% CL)		> 100	> 100
IC50 % (v/v) (95% CL)		> 100	> 100

This report has been prepared by Nautilus Environmental Company Inc. based on data and/or samples provided by our client and the results of this study are for their sole benefit. Any reliance on the data by a third party is at the sole and exclusive risk of that party. The results presented here relate only to the samples tested.

1.0 INTRODUCTION

Nautilus Environmental Company Inc. conducted toxicity tests for Mount Polley Mining Corporation on samples identified as QUR-1, P2-S and HAC-12. P2-S was collected on November 11, 2015 while QUR-1 and HAC-12 were collected on November 12, 2015. All samples were delivered to the laboratory in Burnaby, BC on November 13, 2015. Samples were transported in three 20-L plastic carboys and seven 1-L plastic bottles within coolers. The samples were received at a temperature between 5.0 and 6.5°C, and were stored in the dark at $4 \pm 2^\circ\text{C}$ prior to testing. The *Ceriodaphnia dubia* survival and reproduction test was performed on samples QUR-1, P2-S and HAC-12. The 7-d rainbow trout (*Oncorhynchus mykiss*) survival and growth test was performed on samples QUR-1 and P2-S.

This report describes the results of the *C. dubia* and swim-up rainbow trout toxicity tests. Copies of laboratory data sheets and printouts of statistical analyses for each test are provided in Appendices A and B. The chain-of-custody forms are provided in Appendix C.

2.0 METHODS

Methods for the toxicity tests are summarized in Tables 1 and 2. Testing was conducted according to procedures described by Environment Canada (2007 and 2011), Lazorchak and Smith (2007) and WDOE (2008). Statistical analyses for all tests were performed using CETIS (Tidepool Scientific Software, 2013).

Table 1. Summary of test conditions: *Ceriodaphnia dubia* survival and reproduction test.

Test organism	<i>Ceriodaphnia dubia</i>
Test organism source	In-house culture
Test organism age	<24 hour old neonates within 12 hours of the same age
Test type	Static-renewal
Test duration	7 ± 1 day
Test vessel	20-mL glass test tube
Test volume	15 mL
Test concentrations	Seven concentrations plus laboratory control
Test replicates	10 test replicates per treatment
No. of organisms	1 per replicate
Control water	20% Perrier water and 80% deionized water (hardness 80-100 mg/L CaCO ₃)
Test solution renewal	Daily
Test temperature	25 ± 1°C
Feeding	Daily with <i>Pseudokirchneriella subcapitata</i> and YCT
Light intensity	100 to 600 lux at water surface
Photoperiod	16 hours light/8 hours dark
Aeration	None
Test protocol	Environment Canada (2007), EPS 1/RM/21
Statistical software	CETIS (2013)
Test endpoint	Survival and reproduction
Test acceptability criteria for controls	≥80% survival; ≥15 young per surviving control producing three broods; ≥60% of controls producing three or more broods; no ephippia present
Reference toxicant	Sodium chloride

Table 2. Summary of test conditions: rainbow trout (*Oncorhynchus mykiss*) survival and growth test.

Test organism	<i>Oncorhynchus mykiss</i>
Test organism source	Aqua Farms, Langley, BC
Test organism age	3 to 6 days post swim up
Test type	Static renewal
Test duration	7 days
Test vessel	1-L glass containers
Test volume	500 mL
Test replicates	4 per treatment
Number of organisms	5 per replicate
Control water	Moderately-hard water (hardness 80-100 mg/L CaCO ₃)
Test solution renewal	Daily
Test temperature	15 ± 1°C
Feeding	Twice a day with newly hatched brine shrimp (<i>Artemia nauplii</i>)
Light intensity	100 – 500 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	None
Test protocol	Lazorchak and Smith (2007), WDOE (2008)
Statistical software	CETIS (2013)
Test endpoint	Survival and biomass
Test acceptability criteria for controls	≥90% survival, ≥1.5 times test initiation dry weight
Reference toxicant	Copper chloride

3.0 RESULTS

Results of the toxicity tests conducted on samples QUR-1, P2-S and HAC-12 are provided in Tables 3 and 4. No adverse effects on *C. dubia* or rainbow trout survival were observed in the samples, resulting in LC50 values of >100%. No reduction in *C. dubia* reproduction was observed; the IC25 values were >100%. There were no adverse effects on rainbow trout biomass or dry weight; the IC25 values were >100%.

Table 3. Results: *Ceriodaphnia dubia* survival and reproduction test.

Concentration (% v/v)	QUR-1		P2-S		HAC-12

SD = Standard Deviation, LC = Lethal Concentration, IC = Inhibition Concentration.

4.0 QA/QC

The health history of the test organisms used in the exposures was acceptable and met the requirements of the protocols. The tests met all control acceptability criteria specified in the protocols throughout the tests. There were no deviations from the test methodologies. Uncertainty associated with these tests is best described by the standard deviation around the mean and/or the confidence limits around the point estimates.

The moderately-hard water control used in the 7-d rainbow trout survival and growth test had a measured hardness of 60 mg/L CaCO₃ which was below the range of 80 - 100 mg/L CaCO₃. However, the water was prepared using the correct amounts of reagent grade salts and water. Thus, the measured value of 60 mg/L CaCO₃ was likely due to a measurement error. Regardless, this discrepancy did not appear to affect the results of the test.

Results of the reference toxicant tests conducted during the testing program are summarized in Table 5. These tests were performed under the same conditions as the samples tested. Results for these tests fell within the range of organism performance of mean and two standard deviation range, based on historical results obtained by the laboratory with these tests. Thus, the sensitivity of the organisms used in these tests was appropriate.

Table 5. Reference toxicant results.

Test Species	Endpoint	Historical Mean (2 SD Range)	CV (%)	Test Date
<i>C. dubia</i>	Survival (LC50): 2.0 g/L NaCl	2.0 (1.8-2.2) g/L NaCl	5	November 3, 2015
	Reproduction (IC50): 1.4 g/L NaCl	1.5 (1.2-2.0) g/L NaCl	14	
<i>O. mykiss</i>	Survival (LC50): 56.4 µg/L Cu	62.4 (24.5-159.0) µg/L Cu	60	November 13, 2015
	Biomass (IC50): 56.0 µg/L Cu	61.4 (23.6-160.3) µg/L Cu	62	

SD = Standard Deviation, CV = Coefficient of Variation, IC = Inhibition Concentration, LC = Lethal Concentration.

APPENDIX A - *Ceriodaphnia dubia* Toxicity Test Data

Ceriodaphnia dubia Summary Sheet

Client: Mount Polley
 Work Order No.: 15927

Start Date/Time: Nov 13/15 @ 1300h
 Set up by: MLT

Sample Information:

Sample ID: DUR-1
 Sample Date: Nov 12/15
 Date Received: Nov 13/15
 Sample Volume: 7 x 1L

Test Validity Criteria:

- 1) Mean survival of first generation controls is $\geq 80\%$
- 2) At least 60% of controls have produced three broods within 8 days
- 3) An average of ≥ 15 live young produced per surviving female in the control solutions during the first three broods.
- 4) Invalid if ephippia observed in any control solution at any time.

WQ Ranges:

T ($^{\circ}$ C) = 25 ± 1 ; DO (mg/L) = 3.3 to 8.4; pH = 6.0 to 8.5

Test Organism Information:

Broodstock No.: 110615B
 Age of young (Day 0): <24-h (within 12-h)
 Avg No. young in first 3 broods of previous 7 d: 26
 Mortality (%) in previous 7 d: 0
 Individual female # used ≥ 8 young on test day: 21, 22, 23, 24, 25, 27

NaCl Reference Toxicant Results:

Reference Toxicant ID: Cd136
 Stock Solution ID: 15NaCl
 Date Initiated: Nov 3/15

7-d LC50 (95% CL): 2.0 (1.7-2.3) g/L NaCl
 7-d IC50 (95% CL): 1.4 (1.1-1.7) g/L NaCl

7-d LC50 Reference Toxicant Mean and Historical Range: 2.0 (1.8-2.2) g/L NaCl CV (%): 5
 7-d IC50 Reference Toxicant Mean and Historical Range: 1.5 (1.2-2.0) g/L NaCl CV (%): 14

Test Results:

Ceriodaphnia dubia Summary Sheet

Client: Mount Polley
 Work Order No.: 15925

Start Date/Time: Nov 13/15 @ 1320h
 Set up by: MLT

Sample Information:

Sample ID: P2-S
 Sample Date: Nov 11/15
 Date Received: Nov 13/15
 Sample Volume: 7 x 1L

Test Validity Criteria:

- 1) Mean survival of first generation controls is $\geq 80\%$
- 2) At least 60% of controls have produced three broods within 8 days
- 3) An average of ≥ 15 live young produced per surviving female in the control solutions during the first three broods.
- 4) Invalid if ephippia observed in any control solution at any time.

WQ Ranges:

T ($^{\circ}$ C) = 25 ± 1 ; DO (mg/L) = 3.3 to 8.4 ; pH = 6.0 to 8.5

Test Organism Information:

Broodstock No.: 110615B
 Age of young (Day 0): <24-h (within 12-h)
 Avg No. young in first 3 broods of previous 7 d: 34
 Mortality (%) in previous 7 d: 0
 Individual female # used ≥ 8 young on test day: 34, 35, 37, 38, 39, 40

NaCl Reference Toxicant Results:

Reference Toxicant ID: cd136
 Stock Solution ID: 15NA03
 Date Initiated: Nov 3/15

7-d LC50 (95% CL): 2.0 (1.7-2.3) g/L NaCl
 7-d IC50 (95% CL): 1.4 (1.1-1.7) g/L NaCl

7-d LC50 Reference Toxicant Mean and Historical Range: 2.0 (1.8-2.2) g/L NaCl CV (%): 5
 7-d IC50 Reference Toxicant Mean and Historical Range: 1.5 (1.2-2.0) g/L NaCl CV (%): 14

Ceriodaphnia dubia Summary Sheet

Client: Mount Polley
 Work Order No.: 15922

Start Date/Time: Nov 13/15 @ 13:0h
 Set up by: MLT

Sample Information:

Sample ID: HAC-12
 Sample Date: NOV 12/15
 Date Received: NOV 13/15
 Sample Volume: 7x1L

Test Validity Criteria:

- 1) Mean survival of first generation controls is $\geq 80\%$
- 2) At least 60% of controls have produced three broods within 8 days
- 3) An average of ≥ 15 live young produced per surviving female in the control solutions during the first three broods.
- 4) Invalid if ephippia observed in any control solution at any time.

WQ Ranges:

T ($^{\circ}$ C) = 25 ± 1 ; DO (mg/L) = 3.3 to 8.4 ; pH = 6.0 to 8.5

Test Organism Information:

Broodstock No.: 110615A
 Age of young (Day 0): <24-h (within 12-h)
 Avg No. young in first 3 broods of previous 7 d: 24
 Mortality (%) in previous 7 d: 10
 Individual female # used ≥ 8 young on test day: 13, 14, 15, 16, 17, 18, 19

NaCl Reference Toxicant Results:

Reference Toxicant ID: cd136
 Stock Solution ID: 15NaO3
 Date Initiated: Nov 3/15

7-d LC50 (95% CL): 2.0 (1.7-2.3) g/L NaCl
 7-d IC50 (95% CL): 1.4 (1.1-1.7) g/L NaCl

7-d LC50 Reference Toxicant Mean and Historical Range: 2.0 (1.8-2.2) g/L NaCl CV (%): 5
 7-d IC50 Reference Toxicant Mean and Historical Range: 1.5 (1.2-2.0) g/L NaCl CV (%): 14

Test Results:

APPENDIX B - Rainbow trout (*Onchorynchus mykiss*) Toxicity Test Data

Rainbow Trout Swimup Test Summary Sheet

Client: Mount Polley

Start Date/Time: Nov 13/15 @ 1330h

Work Order No.: 15928

Test Species: Oncorhynchus mykiss

Sample Information:

Sample ID: QUR-1
 Sample Date: Nov 12/15
 Date Received: Nov 13/15
 Sample Volume: 3 x 20L

Dilution Water:

Type: Moderately Hard Water
 Hardness (mg/L CaCO₃): 60 | 68
 Alkalinity (mg/L CaCO₃): 66 | 52
 Batch: 11215 | 11715

Test Organism Information:

Batch No.: 110515
 Source: Aqua Farm
 Average Initial Dry Weight: 15.3 (mg)
 Age of test organism: 3-6 days post-swim-up

Copper Reference Toxicant Results:

Reference Toxicant ID: RTCL21
 Stock Solution ID: 15Cu04
 Date Initiated: Nov 13/15
 7-d LC50 (95% CL): 56.4 (51.1-64.7) µg/L Cu
 7-d IC50 (95% CL): ~~56.0 (50.8-65.0) µg/L Cu~~ JW 56.0 (50.4-62.6) µg/L Cu
~~-2 64.8 JW~~
 7-d LC50 Reference Toxicant Mean and Historical Range: 62.4 (24.5-159.0) µg/L Cu CV(%) 59.60%
 7-d IC50 Reference Toxicant Mean and Historical Range: 61.4 (23.6-160.3) µg/L Cu CV(%) 61.5%

Test Results:

	Survival	Biomass	Dry Weight
LC25 % (v/v) (95% CL)	>100		
LC50 % (v/v) (95% CL)	>100		
IC25 % (v/v) (95% CL)		>100	>100
IC50 % (v/v) (95% CL)		>100	>100

Re: Chemical Analysis of Benthic Invertebrates Collected in the Vicinity of the Mount Polley Mine - August 2015

Chemical analysis of benthic invertebrates was conducted as part of the ongoing assessment of potential impacts to aquatic environmental health following the failure of the Mount Polley tailings dam in August 2014. The chemistry of sediment (i.e., Minnow 2015a; Minnow 2015b; SRK 2015a; SRK 2015b) and water (Golder 2015) has been characterized within the impacted waterbodies, and results have indicated that the mobility of tailings-associated metals in mine-influenced sediment is low (e.g., Minnow 2015a; SRK 2015a; SRK 2015b; Minnow 2016). Measurement of benthic invertebrate chemistry can characterize the quality of food available to higher trophic levels and help to characterize the bioavailability of metals.

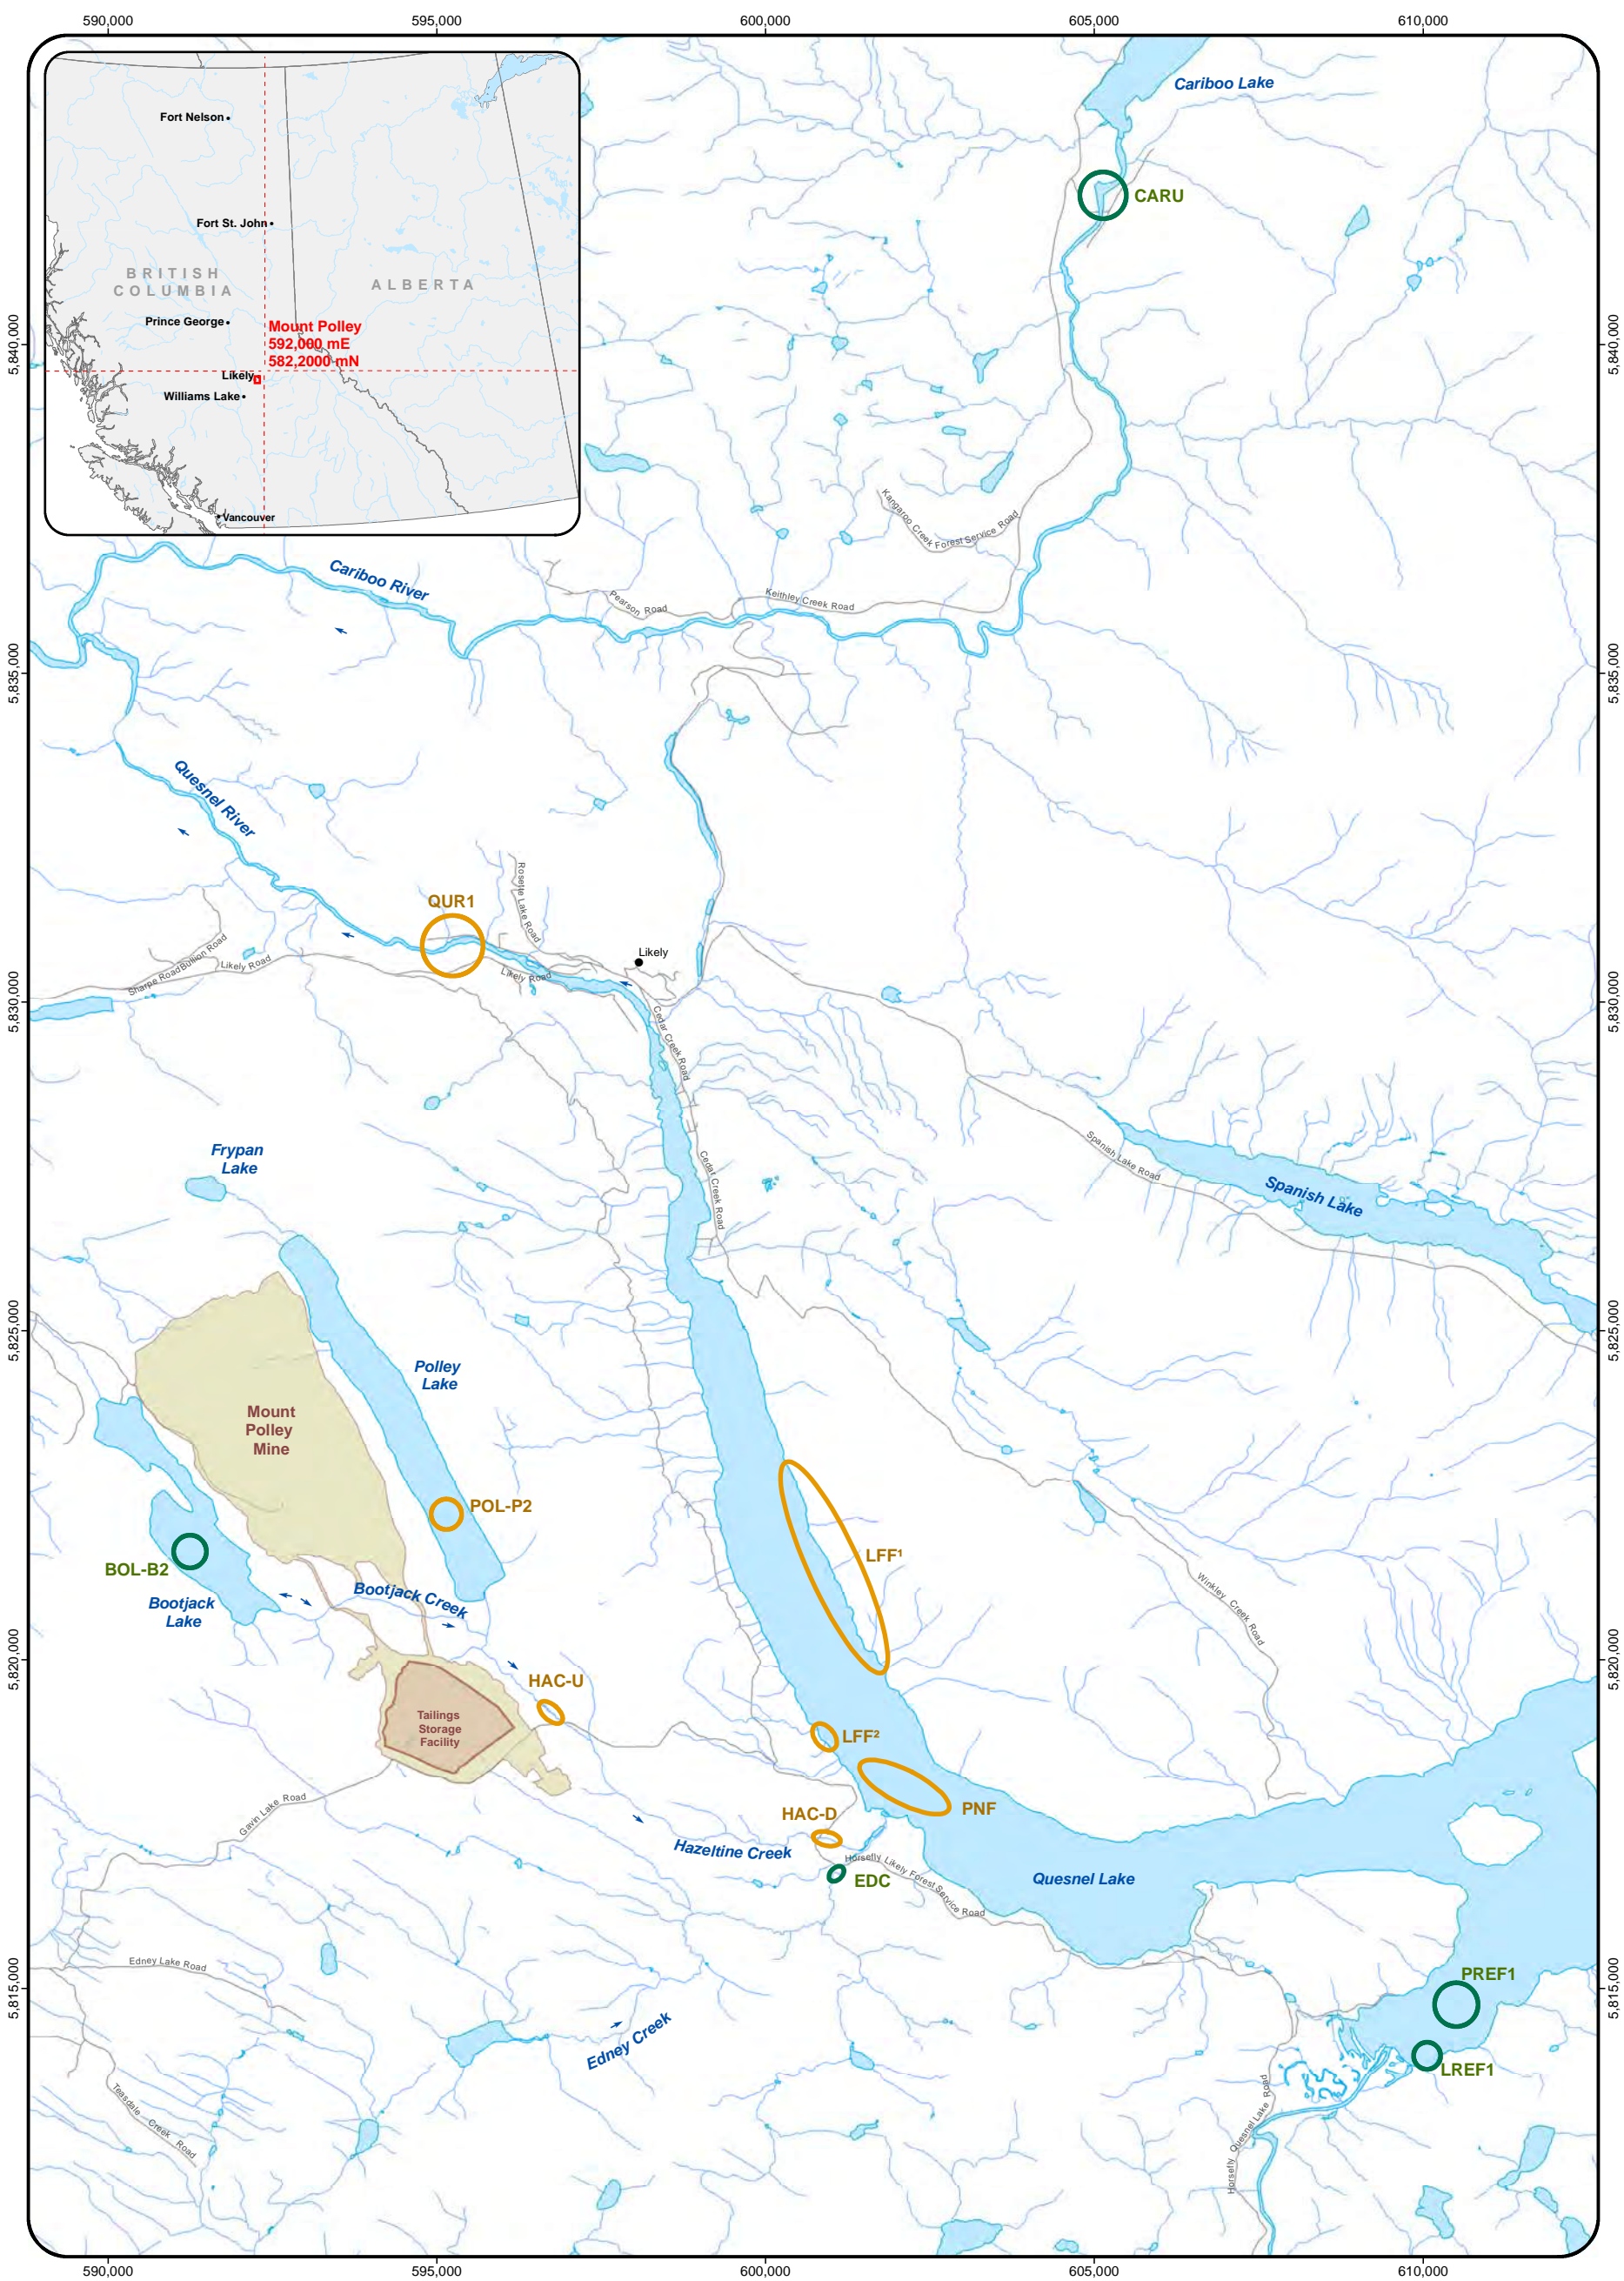

Metal concentrations in benthic invertebrates residing in waterbodies impacted by the tailings dam failure have previously been characterized in the Quesnel River (Minnow 2015a). This characterization was expanded in 2015 to include benthic invertebrates residing in Polley Lake, Quesnel Lake, Hazeltine Creek, Quesnel River, and corresponding reference areas. This memorandum provides a brief summary and interpretation of the associated data.

Methods

Benthic invertebrate samples were collected between August 13th and 26th 2015 from depositional environments (Polley Lake, Quesnel Lake), from erosional environments (Hazeltine Creek, Quesnel River), and from corresponding reference areas (Figure 1; Appendix Table A.1).

Sampling

Benthic invertebrate samples were collected from six depositional sampling areas: Polley Lake (POL-P2) and reference (BOL-B2, Bootjack Lake), Quesnel Lake littoral far-field (LFF) and reference (LREF1), and Quesnel Lake profundal near-field (PNF) and reference (PREF; Figure 1;

Figure 1: Benthic Invertebrate Chemistry Monitoring Areas, August 2015.

Appendix Table A.1). Samples were collected using a stainless steel petite ponar (15.2 cm x 15.2 cm; 0.023 m² sampling area) or standard ponar (22.9 cm x 22.9 cm; 0.052 m² sampling area) in accordance with technical guidance for benthic fauna sampling outlined in the British Columbia Field Sampling Manual (BCWLAP 2003). Grab samples from profundal areas of Quesnel Lake (mean depth approximately 100 meters) were collected with the assistance of a commercial line hauler (Ace Line Hauler Brutus Plus 40™). Once collected, each grab was placed into a sieve bag (either 250 or 500 µm mesh size) and sieved free of as much material as possible. The mesh size of the sieve bag differed among sampling areas, with 250 µm mesh used for deeper lake samples and 500 µm mesh used for shallow lake samples in order to optimize retention of benthic invertebrates while minimizing debris retention. Grabs were composited within the sieve bag (Appendix Table A.1) until the approximate sample weight required for laboratory analysis was obtained (0.2 g wet weight). In some cases, this required returning to a sampling area after measuring the initial sample weight at the field laboratory. After sieving, the retained material (sample) was carefully transferred into a labelled 1 or 2 liter wide mouth plastic jar, or into one or more labelled Ziploc™ bags. Due to low benthic invertebrate abundance at sampling areas POL-P2 (Polley Lake) and PNF (Quesnel profundal near-field), the minimum sample weight could not be obtained despite substantial sampling effort (Appendix Table A.1). Collected samples were stored in a cooler with ice packs then transferred to a refrigerator at the field laboratory prior to further processing. Benthic invertebrate samples were collected concurrent with sediment samples for chemical analysis (reported in Minnow 2015b). Additional supporting information collected at each sampling station included GPS (Geographic Positioning System) coordinates, sampling depth, field meter measurements of temperature, specific conductance, dissolved oxygen and pH (using a YSI EXO™ handheld portable field meter equipped with YSI EXO2™ Sonde), notes on the presence or absence of aquatic vegetation, and other physical observations (Appendix Tables A.1 and A.2)

Benthic invertebrate samples were collected from five erosional sampling areas: upper Hazeltine Creek (HAC-U), lower Hazeltine Creek (HAC-D), a creek reference area (EDC; lower Edney Creek upstream of the area impacted by the tailings dam failure), Quesnel River exposed area (QUR1), and a river reference area (CARU; the Cariboo River downstream of Cariboo Lake; Figure 1; Appendix Table A.1). Samples were collected using a combination of kick and sweep and hand picking methods. The kick and sweep method involved a field technician moving upstream and across the stream channel (in a zig-zag pattern) while holding a kick net (a net with a triangular opening and a 400 µm mesh bag) immediately downstream, and disturbing the substrate with his or her feet to dislodge benthic organisms into the net. The net was then rinsed with water to move all debris and invertebrates to the collection cup at the bottom of the net, the collection cup was removed, contents poured into a white plastic bin, and invertebrates picked

free of debris. Hand picking of benthic invertebrate samples entailed overturning rocks in the streambed and collecting any organisms observed. One or both of these methods (Appendix Table A.1) was employed at each sampling station to collect benthic invertebrate samples, and sampling continued until the minimum required sample weight (0.2 g wet weight) was obtained. Depending on the amount of debris present in the collected kick and sweep sample, benthic invertebrates were either picked free of debris in the field and placed into a labelled Whirl-Pak bag, or samples were placed into a small plastic jar or Ziploc™ bag for further separation at the field laboratory. All sampling equipment was rinsed thoroughly between sampling stations. All samples were stored in a cooler with ice packs until being refrigerated prior to further processing (or until being frozen if samples were processed in the field). Supporting information was collected at each sampling station (or at each area for Quesnel and Cariboo rivers), and included those parameters listed above for depositional environments (Appendix Tables A.1 and A.2), as well as water velocity (using a Marsh-McBirney Flowmate Model 2000 portable velocity meter), stream / river width (using a Bushnell Yardace Pro Sport 450 range finder or tape measure), substrate characteristics, and site photographs.

Supporting water quality samples were collected by Minnow from erosional sampling areas that are not part of the Mount Polley routine water quality monitoring program. All water samples were collected in accordance with the British Columbia Field Sampling Manual (BCWLAP 2003), preserved as required, and shipped to the analytical laboratory (ALS Environmental, Burnaby, BC) within 1-2 days of collection. The water samples collected by Minnow and the routine monitoring water quality samples collected by the Mount Polley Mining Corporation (MPMC) were collected and analysed using the same methods, and are considered herein as part of the same data set for interpretation. All water quality data were obtained from MPMC electronically in MSEXcel format and were subjected to MPMC quality control checks.

Benthic invertebrate samples that required additional debris removal were processed at a field laboratory. Samples were sieved as necessary using site water, and organisms were isolated using stainless steel forceps and placed in small plastic jars or Whirl-Pak bags, weighed to the nearest milligram in the field laboratory using a Scout Pro SPE-123 balance, and frozen. Effort was made to sort as much of the collected sample as reasonable, to ensure that any bias towards larger, mobile organisms was reduced. Split duplicates were collected for 10% of samples. Frozen benthic invertebrate samples were shipped on ice to the Saskatchewan Research Council Analytical Laboratories (SRC). However, a number of samples did not meet SRC's minimum sample weight for analysis (i.e., samples from areas POL-P2 and PNF). As a result, all frozen samples were forwarded to the University of Missouri Research Reactor (MURR, Columbia, MO),

which has the capacity to analyze small sample sizes. A chain of custody (COC) was included with all samples during shipment.

Laboratory Analysis

Upon receipt of the benthic invertebrate samples at MURR, samples were removed from the coolers and logged. Samples were then freeze dried prior to analysis of metals by high-resolution inductively coupled plasma mass spectrometry (HR-ICP-MS). Upon completion of the analyses, a data report was provided by MURR to Minnow electronically in Adobe Acrobat Portable Document Format (PDF; Appendix B) and in MSExcel.

Data Analysis

Upon receipt of benthic invertebrate chemistry data, a Data Quality Assessment (DQA) was completed, including an examination of data completeness, method detection limits achieved, laboratory precision, laboratory accuracy, and field precision. Following the completion of the DQA, chemical data were summarized by area by calculating mean, median, standard deviation, standard error, 95% confidence limits, and minimum and maximum. Values reported as below the method detection limit (MDL) were used at the reported MDL for all calculations of summary statistics and for statistical analyses.

The biomass of benthic invertebrates present at each depositional sampling station was estimated on an area basis (g/m^2) using the surface area of sediment sampled as well as the sample weights determined in the field and at the SRC and MURR analytical laboratories. For sampling areas where the abundance of benthic invertebrates was low (i.e., POL-P2 in Polley Lake and PNF in Quesnel Lake), all organisms present in each sample were collected and weighed, and an approximate benthic invertebrate biomass was determined for each station. For all other depositional samples, the number of available benthic invertebrates exceeded the amount required for laboratory analysis, and the biomass estimates for these samples represent a subsample only. Approximate biomass results were compared between exposed and reference depositional areas to characterize differences in benthic invertebrate abundance.

Analysis of benthic invertebrate chemistry focused on analytes previously identified as Parameters of Interest (POIs) or Indicator Parameters (IPs) in sediment (Minnow 2015a). The POIs included arsenic, copper, iron, manganese, nickel and zinc, and the IPs included barium, calcium, cobalt, molybdenum, phosphorus, selenium, silver, sodium, strontium, tin, titanium, and vanadium (Minnow 2015a). Principal Components Analysis (PCA) was used as a supporting tool to determine if the previously identified POIs and IPs were indeed the parameters that best explained similarities and differences in benthic invertebrate tissue chemistry among stations. PCA was performed using the program PC-ORD[®] version 6 (McCune and Mefford 2011). Benthic

invertebrate concentrations of POIs and IPs were contrasted between exposed and reference areas using the Student's T-test and the non-parametric Mann-Whitney U test. Because some of the data did not satisfy the assumptions of normality of the parametric Student's T-test, the results of the non-parametric test (Mann-Whitney U) were used for data interpretation when the two approaches did not yield the same result. This is consistent with recommendations for approach when the assumptions of the parametric testing cannot be definitively demonstrated (i.e., Sawilowsky 2005). For Hazeltine Creek, some pre-event data were available (from 2010), and additional statistical contrasts of data collected in 2015 versus 2010 were completed.

Concentrations of the POIs and IPs in benthic invertebrates were also evaluated relative to concentrations in sediment (in depositional areas) and relative to concentrations in water (in erosional areas). Ratios of these concentrations are referred to as Biota Sediment Accumulation Factors (BSAFs; [benthic invertebrate sample]/[sediment]) and Bioconcentration Factors (BCFs; [benthic invertebrate sample]/[water]), respectively. BSAFs are often used to describe the accumulation of sediment-associated analytes in tissues of ecological receptors (i.e., Burkhard 2009). BSAFs were calculated using benthic invertebrate and sediment metal concentrations (dry weight) from each sampling area. However, benthic invertebrates were not depurated (i.e., allowed to evacuate their gut contents or with gut contents mechanically removed) prior to chemical analysis. Thus, although the associated concentrations (organisms with gut contents) accurately represent concentrations associated with food for higher trophic level organisms that consume benthic invertebrates, they do not accurately represent metal concentrations in the tissues of benthic organisms. Potential biological effects of metals in organisms (including benthic invertebrates) are usually attributed only to metal concentrations in body tissues (not to the metal concentrations in sediment that may be present in the gut due to ingestion). Benthic invertebrate gut content can significantly affect benthic invertebrate metal concentrations, and as such, must be taken into consideration when assessing the accumulation of metals and the potential for biological effects (Chapman 1985; 2016). The effect of gut content on the measured total metal body burden in invertebrates varies from metal to metal as well as for the same metal in different sediments (Chapman 1985; Amyot et al. 1996). For example, Neumann et al. (1999) found that gut content contributed to a 4.4 fold overestimation of metal body burdens in *Hyalella azteca*, while Gillis et al. (2005) reported that gut content could have contributed to a 5.6 fold overestimation of copper body burden in *Daphnia magna*. Depuration of gut content in fresh water prior to the measurement of metal concentration can be used to correct for the overestimation of tissue burden of metals, but several factors including depuration duration (Mount et al. 1999; Neumann et al. 1999; Gillis et al. 2005) and feeding during depuration (Neumann et al. 1999; Gillis et al. 2005) may influence the effectiveness of depuration. Overall, the substantial influence that gut content can have on tissue metal concentrations must be

considered in the interpretation of benthic invertebrate chemistry results. BCFs are often used to describe the extent to which an analyte is taken up by an organism from the surrounding environment through exposure routes other than diet (i.e., Arnot 2006) and are applicable to erosional areas where sediment is generally not present. BCFs were calculated using benthic invertebrate concentrations (dry weight) and mean dissolved metal concentrations in water from each sampling area. Mean water concentrations were calculated from 2015 water quality data available for each sampling area prior to the benthic invertebrate sampling occurred in August (i.e., January to August 2015). Calculated BSAFs and BCFs were then compared among exposed and reference areas to characterize potential differences in the uptake of metals by organisms in areas impacted by the tailings dam failure. For key analytes, this included a graphical evaluation of relationships between BSAF and sediment chemistry and between BCF and water chemistry, supported by trendlines and 95% prediction limits for the general relationships (i.e., for all stations, by data type [BSAF versus sediment chemistry and BCF versus water chemistry, respectively]).

Results

The reported benthic invertebrate chemistry results were of acceptable quality as characterized by: 1) good detectability of the majority of analytes (Appendix Table C.1); 2) analyte concentrations generally below MDLs in laboratory method blank samples; and 3) good laboratory accuracy, with all certified reference materials and standards results meeting data quality objectives (Appendix Tables C.4 and C.5). Data precision, as measured by laboratory and field duplicate results, indicated some sample heterogeneity and high natural variability, respectively (Appendix Tables C.2 and C.3). As such, the observed variability in laboratory and field precision was considered during data interpretation. Additional details regarding the data quality assessment are presented in Appendix C.

Depositional Environments

Polley Lake

The approximate biomass of benthic invertebrates retrieved from the south basin of Polley Lake was much lower than the biomass collected from the corresponding reference area in Bootjack Lake (exposed area mean <0.17 g/m² wet weight; reference area mean >0.85 g/m² wet weight; Appendix Table A.1). Samples collected from Polley Lake and Bootjack Lake were composed mainly of chironomids (midge larvae) and oligochaetes.

Mean concentrations of the POIs copper and manganese, as well as the IPs molybdenum, selenium, tin, and titanium in benthic invertebrates from Polley Lake were significantly higher than those in the corresponding reference area (Bootjack Lake; Table 1; Appendix Tables D.1 and

Table 1: Summary whole benthic invertebrate and sediment chemistry results from lake sampling areas in the vicinity of the Mount Polley Mine, 2015¹.

¹ Summary statistics were calculated using method detection limit (MDL) values if data were below the MDL. Means are shown with a < symbol if all data used in their calculation were < MDL. If MDLs were variable, means were reported as < the maximum MDL.

² BSAF = Biota Sediment Accumulation Factor; [Mean concentration of analyte in benthic tissue (mg/kg dw)] / [Mean concentration of analyte in sediment (mg/kg dw)]

Mean analyte concentration in benthic invertebrates was significantly higher than in the associated reference area, p < 0.05 (using a non-parametric Mann-Whitney U test).

Mean analyte concentration in benthic invertebrates was significantly lower than in the associated reference area, p < 0.05 (using a non-parametric Mann-Whitney U test).

D.4). Principal Components Analysis (PCA) supported these observations (Appendix Figure D.1; Appendix Tables D.2 – D.3). Mean benthic invertebrate copper concentrations in Polley Lake were approximately six times higher than in the reference area, but also exhibited higher variability (Table 1; Figure 2; Appendix Table D.1), which is consistent with the variability observed in sediment copper concentrations in 2014 (Minnow 2015a) and with the heterogeneous composition of sediment observed during field collections. Elevated benthic invertebrate copper concentrations in Polley Lake relative to reference are not unexpected given the presence of elevated sediment copper concentrations relative to reference (approximately 2x higher; Table 1; Minnow 2015b) and given the known influence of gut content on the determinations of metal concentrations in invertebrates previously discussed (i.e., Chapman 1985; 2016).

BSAFs for Polley Lake were higher than those for the reference area (Bootjack Lake; Table 1). Because BSAFs are ratios, they are generally expected to be higher at lower sediment concentrations than at higher sediment concentrations (Figure 3). Although relationships between sediment concentrations and BSAFs should be interpreted very cautiously due to the fact that benthic invertebrate concentrations include gut content, the fact that BSAFs were higher in Polley Lake even at higher sediment concentrations, suggests that additional investigation is warranted (including examination using depurated organisms).

Quesnel Lake Littoral

The approximate biomass of benthic invertebrate subsamples retrieved from exposed and reference littoral areas of Quesnel Lake were similar (Appendix Table A.1). Quesnel Lake littoral benthic invertebrate samples were composed mainly of chironomids, mayflies, leeches, amphipods, and pea clams.

Mean concentrations of POIs and IPs in benthic invertebrates from the littoral far-field area of Quesnel Lake did not differ from the reference area (Table 1; Appendix Tables D.4 and D.5), including copper (Figure 2). PCA results supported this finding, with very little distinction between the exposed and reference area results (Appendix Figure D.2; Appendix Tables D.6 and D.7).

BSAFs for the Quesnel Lake littoral exposed area (Quesnel Lake LFF) were generally similar to those at the reference area (Table 1). As for Polley Lake, there is some evidence of greater BSAF at some exposed area stations than at the reference area stations at similar sediment copper concentrations (Figure 3). Subject to the same caution as outlined above regarding interpretation of these data, this suggests that additional investigation is warranted (including examination using depurated organisms).

Figure 2: Mean copper concentrations ($\pm t^*SE$) in benthic invertebrate tissue collected in lakes in the vicinity of the Mount Polley Mine, 2015 ¹.

¹ Copper concentrations in exposed sampling areas represented with a * symbol differ significantly from those in the associated reference area, $p < 0.05$ (using a non-parametric Mann-Whitney U test).

Figure 3: Copper BSAF versus sediment copper concentrations. BSAF is the ratio of copper concentration in whole benthic invertebrate samples divided by sediment concentrations.

Quesnel Lake Profundal

The approximate biomass of benthic invertebrates retrieved from the profundal exposed area of Quesnel Lake was much lower than the approximate biomass of benthic invertebrate subsamples retrieved from the corresponding profundal reference area (exposed mean <0.09 g/m² wet weight; reference mean >0.34 g/m² wet weight; Appendix Table A.1). Samples collected from both profundal areas of Quesnel Lake were composed mainly of chironomids.

Copper was the only POI or IP with a mean benthic invertebrate concentration in the profundal near-field area of Quesnel Lake that was significantly greater than the reference area mean (Table 1; Appendix Tables D.4 and D.8). PCA demonstrated a separation between the near-field and reference samples, but copper was not a dominant component (Appendix Figure D.3, Appendix Table D.9 and D.10). The concentration of copper in benthic invertebrates collected from the near-field exposed area exceeded reference by approximately three times (Table 1; Figure 2; Appendix Table D.8). However, as discussed previously, the elevation of copper in benthic invertebrate tissues at the exposed area relative to reference is expected based on the elevated sediment copper concentrations observed in the near-field area (approximately 16x higher than reference sediment; Table 1; Minnow 2015b), and the known confounding influence of gut content on the determinations of tissue metal concentrations in invertebrates (i.e., Chapman 1985; 2016).

BSAFs for copper in the Quesnel Lake profundal near-field area were lower than those observed in the reference area (Table 1), and these lower BSAFs were generally consistent with the overall relationship between BSAFs and sediment concentrations (Figure 3).

Erosional Environments

Hazeltine Creek

Benthic invertebrate samples collected from upper Hazeltine Creek were dominated by a high abundance of black fly larvae, while a more diverse benthic invertebrate assemblage, composed mainly of caddisflies and mayflies, was evident at the lower Hazeltine Creek sampling area. Benthic invertebrate samples collected from Edney Creek were composed of a diverse mix of organisms, including mayflies, stoneflies and caddisflies.

The mean concentrations of all analytes identified as POIs (arsenic, copper, iron, manganese, nickel, and zinc) and most of the IPs (barium, calcium, cobalt, selenium, silver, sodium, strontium, titanium, and vanadium) by Minnow (2015a) were significantly higher in benthic invertebrates from both upper and lower sampling areas of Hazeltine Creek than those in the corresponding reference area (Edney Creek; Table 2; Appendix Tables D.4 and D.12). PCA results confirmed the distinction between the two exposed areas and reference (Appendix Figure D.4; Appendix Tables D.14 – D.15). Mean benthic invertebrate copper concentrations in Hazeltine Creek

² BCF = Bioconcentration Factor; [Mean concentration of analyte in benthic tissue (mg/kg dw)] / [Mean dissolved concentration of analyte in water (mg/L)]. Mean water concentrations calculated using all available data from January to August 2015 for Quesnel and Cariboo Rivers, and all available data from January to June 2010 for Hazeltine Creek Pre-event data.

³ Results are based on a single sampling event, therefore data from this single sample are displayed.

	Mean analyte concentration in benthic invertebrates was significantly higher than in the associated reference area (2015), p < 0.05 (using a non-parametric Mann-Whitney U test).
	Mean analyte concentration in benthic invertebrates was significantly higher than in the associated reference area (2015) and pre-event data for the same creek area (2010, if available), p < 0.05 (using a non-parametric Mann-Whitney U test).
	Mean analyte concentration in benthic invertebrates was significantly higher than in the associated reference area (2015), but significantly lower than the pre-event data for the same creek area (2010, if available), p < 0.05 (using a non-parametric Mann-Whitney U test).
	Mean analyte concentration in benthic invertebrates was significantly lower than in the associated reference area (2015) and significantly lower than pre-event data for the same creek area (2010, if available), p < 0.05 (using a non-parametric Mann-Whitney U test).

exceeded reference by approximately 11 and 13 times in upper and lower Hazeltine Creek areas, respectively (Table 2; Figure 4; Appendix Table D.12). This difference is not unexpected given the higher mean dissolved copper concentrations observed at the exposed areas (approximately 3 and 7 times higher for upper and lower areas respectively; Table 2; Appendix Table D.12). Prior to the failure, however, mean concentrations of all measured POIs (arsenic, copper, manganese, nickel, and zinc) as well as six of the IPs (barium, calcium, cobalt, selenium, strontium, and vanadium) were higher in upper and lower areas of Hazeltine Creek than in the reference area in 2015 (Table 2; Appendix Table D.16). Comparison of benthic invertebrate chemistry results for Hazeltine Creek to those collected prior to the dam failure indicated that mean concentrations of five analytes (copper, barium, cobalt, strontium, and vanadium) increased in the upper Hazeltine Creek, while the mean concentrations of three analytes (copper, calcium, and vanadium) increased in lower Hazeltine Creek (Table 2; Appendix Table D.17). In particular, mean benthic invertebrate copper concentrations were approximately 3.5 and 8 times higher than observed in these sections of the creek prior to the failure (Figure 4; Table 2; Appendix Table D.17). As discussed above, this temporal increase is not unexpected given that mean dissolved copper concentrations observed in 2015 at these areas were approximately 7 and 12 times higher than those measured during pre-failure sampling at upper and lower creek areas respectively; Table 2).

BCFs for copper in Hazeltine Creek observed in 2015 generally exceeded those observed in the reference area (Table 2), however, this was also true for the BCFs from samples collected prior to the tailings dam failure (2010). Examination of relationships between copper BCFs for pre-event (2010) and post-event sampling within Hazeltine Creek indicated that BCFs were higher in upper Hazeltine Creek relative to the lower sampling area both prior to and following the tailings dam failure (Table 2; Figure 5). When BCFs are considered relative to aqueous copper concentrations in Hazeltine Creek, the BCFs within the upper and lower areas of the creek were similar before and after the dam failure, with the relationship for upper Hazeltine Creek following the overall trend between BCFs and water concentrations and the relationship for lower Hazeltine Creek deviating only slightly from the overall trend (Figure 5). This suggests little difference in the current bioavailability of copper to benthic invertebrates in Hazeltine Creek relative to conditions prior to the failure.

Quesnel River

Benthic invertebrate samples collected from the Quesnel River and the corresponding reference area (Cariboo River) were more diverse than those collected from Hazeltine Creek, and were composed mainly of stoneflies, mayflies, caddisflies, and snails.

Figure 4: Mean copper concentrations ($\pm t^*SE$) in benthic invertebrate tissue collected in creeks and rivers in the vicinity of the Mount Polley Mine, 2015^{1,2}.

¹ EDC-1 = Edney Creek (reference); W7 and HAC-U = Upper Hazeltine Creek; W11 and HAC-D = Lower Hazeltine Creek;

CAR = Cariboo River; (reference); CARU = Upper Cariboo River (reference); QUR1 = Quesnel River

² Mean concentrations in exposed sampling areas (2015 only) represented with a * symbol differed significantly from those in the associated reference area (EDC), and those represented with a + symbol differed significantly from pre-event concentrations (2010) within the creek area (upper and lower, respectively), $p < 0.05$ (using a non-parametric Mann-Whitney U test).

³ Mean concentrations in pre-event areas (2010) represented with a ** symbol differed significantly from those in the reference area (EDC, 2015), $p < 0.05$ (using a non-parametric Mann-Whitney U test).

Figure 5: Copper BCF versus dissolved copper concentrations. BCF is the ratio of copper concentration in whole benthic invertebrate samples divided by water concentrations.

Benthic invertebrates from the Quesnel River did not have significantly higher mean concentrations of any of the POIs and IPs (listed above; Minnow 2015a) than those from the reference river (upper Cariboo River; Table 2, Appendix Tables D.4 and D.20). PCA results supported this finding, with very little to no distinction present between the exposed and reference area results (Appendix Figure D.6; Appendix Tables D.21 and D.22). Mean benthic invertebrate copper concentrations and BCFs were generally similar between Quesnel River and the reference river (Table 2; Figure 4; Figure 5; Appendix Table D.20), however greater variability was observed in exposed benthic invertebrate copper concentrations and therefore BCFs (Table 2; Figure 5). The finding of similar exposed area and reference area concentrations is in contrast to the significant difference in copper concentrations observed in benthic invertebrates from this sampling site (QUR1) and reference areas in 2014 (Minnow 2015a). Comparison with results from 2014 (Minnow 2015a) indicated a slight, but statistically non-significant, decrease in benthic invertebrate copper concentrations from 2014 to 2015 (Figure 1). The results of PCA generally support this observation (Appendix Figure D.7; Appendix Tables D.23 – D.24). Relationships between copper BCF and aqueous copper concentrations indicated that BCFs for the two areas were similarly consistent with the overall trend between BCFs and water concentrations (Figure 5). This suggests similar bioavailability in the two rivers.

Summary and Recommendations

The approximate biomass of benthic invertebrates retrieved from two exposed depositional areas (Polley Lake and the profundal near-field area of Quesnel Lake) was much lower than in the corresponding reference areas, and the retrieval of an adequate mass of benthic invertebrates for laboratory analysis required substantial sampling effort. Additional sampling effort in these exposed areas is suggested for future benthic invertebrate chemistry monitoring to obtain larger samples.

The concentrations of metals measured in benthic invertebrates from depositional environments are influenced by gut content and potentially also by adhered sediments. Accordingly, the benthic invertebrate concentrations reported herein for lakes accurately reflect concentrations as food to higher trophic levels, but do not accurately represent metals in the tissues of benthic organisms. Therefore, conclusions regarding differences in observed tissue chemistry results between exposed and reference areas, and any inferences to bioavailability must consider this. Nonetheless, comparison of BSAFs in depositional sampling areas indicated that the uptake and accumulation of copper by biota may be higher than reference for organisms in Polley Lake, slightly higher than reference at a subset of stations in the littoral exposed area of Quesnel Lake, and lower than reference in the profundal exposed area of Quesnel Lake, respectively. Within the erosional areas, comparison of BCFs indicated that uptake of copper by invertebrates was

higher in Hazeltine Creek than reference (Edney Creek), but was similar to the pre-failure condition in Hazeltine Creek. Lastly, BCFs in the Quesnel River were similar to reference.

Due to influence of organism gut content on whole benthic invertebrate metal concentrations, it is suggested that future benthic invertebrate sampling from depositional areas include gut depuration of the sampled organisms.

^a Sample weight was evaluated by three separate methods: 1) Approximation of wet weight at the field laboratory; 2) Measurement of wet weight at Saskatchewan Research Council (SRC) laboratory; 3) Measurement of wet and dry weight at the University of Missouri Research Reactor (MURR). Weights and biomass estimates are represented with a ">" symbol if sorting of the entire grab sample was not required, and a subsample of benthic invertebrates was collected and weighed. All other depositional grab samples were sorted in their entirety to obtain the displayed sample weights.

^b Additional grabs/ effort per composite to achieve volume for quality control duplicate. Displayed sample weights include the weight of quality control duplicates that were collected.

^c Samples were too small to accurately determine % dry matter, therefore wet and dry weights were not reported by the laboratory.

Table A.2: Benthic invertebrate tissue quality supporting measures, Mount Polley Mine, August 2015.

Analysis of Benthic Invertebrate Samples by ICP-MS

Pierre Stecko
Senior Aquatic Scientist / Principal
Minnow Environmental Inc.
101 - 1025 Hillside Ave.
Victoria, BC
V8T 2A2

Date: February 1, 2016

MURR Project # 2205 Set 29
Minnow Project # 2574

Results and limits of detection given in accompanying spreadsheet.

Analysis Notes:

Drying

1. Pre-cleaned 50 mL centrifuge tubes were supplied for sample collection.
2. Upon receipt, samples were held in a -20°C freezer until the freeze-drying process was initiated.
3. Samples were freeze-dried to a constant mass at less than 1 torr (typically ~20 millitorr) and at a trap temperature of -50°C. In this way, sample moisture was removed by sublimation as intended.
4. Freeze-dried samples were homogenized within their freeze drying vessels using a combination of pre-cleaned plastic lab spatulas and glass stir rods which were cleaned with ultrapure water and dried with Kim-wipes between each sample.
5. Some samples were so small that an accurate dry mass % could not be measured. These samples are identified in the spreadsheet table.

Digestion – Large (>100 mg dry) samples

6. Portions of dried samples, or entire samples, were digested for ICP-MS analysis. Samples (up to approx. 200 mg as available) were weighed directly into Teflon digestion vessels. Fisher brand Optima nitric acid was added (2.2 mL). The vessels were sealed and heated to 190°C in a microwave digester. After cooling, the vessels were opened and the contents transferred to pre-cleaned, pre-weighed 50 mL polypropylene centrifuge tubes with rinsing (ultrapure water). The total volume was 50 mL.

Research Reactor Center**

Analytical Chemistry Group
1513 Research Park Dr.
Columbia, MO 65211
Mark Beary, Manager

7. Replicate digestions of several samples were prepared. The third replicate of one of these samples was spiked with ~3 ppm of two multi-element solutions (together containing many, but not all, analytes). Unspiked replicates for this sample are given as “rep 1”, “rep 2”, etc. in the table.
8. Two QC materials were used: NIST SRM 1577 Bovine Liver and NRC CRM DOLT-5. Literature values for SRM 1577 are given in the table, as well as certificate/reference/information values for the DOLT-5.
9. One or more vessel blanks (empty vessels microwaved with digestion acid) were prepared alongside each group of ~20 samples.
10. The exact mass of digested solution was determined in order to calculate an accurate gravimetric dilution factor. The spike was done gravimetrically as well so that the exact level of fortification could be calculated.

Digestion – Small (<100 mg dry) samples

11. Portions of dried samples, or entire samples, were weighed into pre-cleaned PFA scintillation vials. Fisher brand Optima grade nitric acid (HNO₃, 0.3 mL) was added and the vial was placed into a Teflon digestion vessel. Water (10 mL) was added into the vessel but outside the vial, to act as a microwave heating medium. The vessels were sealed and heated to 190°C in a microwave digester.
12. After the vessels cooled, they were opened and the vials retrieved. (The “microwave absorber” water in the vessel was discarded.) The digested sample was transferred with rinsing into a pre-cleaned, pre-weighed polypropylene centrifuge tube and diluted to 10 mL with ultrapure water.
13. This method allows for the digestion of a maximum 20 mg (dry mass) sample size. Previous testing has shown that above this sample mass, there is a danger of losing part of the sample into the “microwave absorber” water. This is because the reaction with nitric acid becomes too vigorous and splattering occurs. Thus even when more sample was available, the sample portions used were limited to 20 mg. Despite this limitation, for samples with <100 mg dry mass, this “small sample” method provides more sensitivity (less dilution) than the “large sample” method.
14. Several samples were digested and analyzed in duplicate; these duplicates are given in the table as “rep 1” and “rep 2”.
15. Two QC materials were used: NIST SRM 1577 Bovine Liver and NRC CRM DOLT-5. Literature values for SRM 1577 are given in the table, as well as certificate/ reference/ information values for the DOLT-5.
16. One or more vessel blanks (empty vials microwaved with digestion acid) were prepared alongside each group of samples.

Research Reactor Center**

Analytical Chemistry Group
1513 Research Park Dr.
Columbia, MO 65211
Mark Beary, Manager

17. The exact mass of digested solution was determined in order to calculate an accurate gravimetric dilution factor.

Preparation of standards and samples

18. Instrument calibration standards were prepared from commercially purchased single- and multi- elemental solutions. Standards were prepared gravimetrically, with weighing at every step, in order to accurately calculate exact concentration values. Four standard series, each with three or four different concentrations, were prepared to calibrate the instrument for all elements of interest.
19. Internal standards Sc and In were added to all standards and digested samples. Internal standards are used to correct for matrix effects in the instrument.

Instrumental analysis

20. The digested samples were analyzed using a PerkinElmer NexION dynamic reaction cell (DRC) ICP-MS. The NexION was run in Kinetic Energy Discrimination (KED) mode which reduces the level of polyatomic interferences relative to the analytes. Helium is used as the collision gas. The NexION exhibits high sensitivity via extremely low backgrounds.
21. The NexION also allows the analysis of high-concentration elements such as Na, Mg, Al, P, K, Ca, Mn, and Fe without having to further dilute the sample. Use of two levels of collision gas flow in KED mode is used to reduce the instrument response for these particular analytes while maintaining high sensitivity for lower-concentration elements.
22. The instrument was calibrated using a four- or five-point curve (zero point standard plus three or four standards per series) for all measured elements. Standards were re-analyzed repeatedly during the multiple analytical runs to ensure continuous correct instrument response.
23. Results are reported in units of ppm, or parts per million by weight ($\mu\text{g/g}$ or mg/kg), relative to the dry weight of the samples.
24. The vessel blanks were found to be generally free of detectable levels of the analytes. When any relatively small background levels were found to be significant and consistent, the results were appropriately corrected.
25. The sample limits of detection (LOD's) are listed in blue font in a separate table below the results table. These limits of detection for each element and sample are the product of the instrument LOD for that element and the total dilution factor of the sample. The instrument LOD's are calculated individually for each element as three times the standard deviation of the elemental concentration measured in 10 runs of the zero point standard (blank 3% HNO_3 with internal standards).
The total sample dilution factor is the mass of digested solution divided by the sample mass.

**University of Missouri-Columbia
Research Reactor Center**

Analytical Chemistry Group
1513 Research Park Dr.
Columbia, MO 65211
Mark Beary, Manager

The sample LOD's vary according to the individual dilution factor for each sample and the instrument background on the day of analysis.

26. Literature values for NIST SRM 1577 are taken from I. Roelandts and E.S. Gladney, "Consensus values for NIST biological and environmental Standard Reference Materials", *Fresenius J Anal Chem* (1998) 360: 327-338. Values for some elements in this SRM are unknown or scarcely published.
27. The certificate of analysis for NRC DOLT-5 is available by request from the National Research Council Canada. The certificate does not provide information for all elements of interest.
28. Spike recovery data for some elements are omitted because the high or variable level of element present in the unspiked sample precluded accurate measurement of percent recovery.

C1.0 INTRODUCTION

A Data Quality Assessment (DQA) was conducted on data collected as part of the Mount Polley Mining Corporation Benthic Invertebrate Chemistry Report, 2015. The objective of the DQA is to define the overall quality of the data presented in the report, and, by extension, the confidence with which the data can be used to derive conclusions.

C1.1 Background

A variety of factors can influence the chemical and biological measurements made in an environmental study and thus affect the accuracy and/or precision of the data. Inconsistencies in sampling or laboratory methods, use of instruments that are inadequately calibrated or which cannot measure to the desired level of accuracy or precision, and contamination of samples in the field or laboratory are just some of the potential factors that can lead to the reporting of data that do not accurately reflect actual environmental conditions. Depending on the magnitude of the problem, inaccuracy or imprecision have the potential to affect the reliability of any conclusions made from the data. Therefore, it is important to ensure that monitoring programs incorporate appropriate steps to control the non-natural sources of data variability (i.e., minimize the variability that does not reflect natural spatial and temporal variability in the environment) and thus assure the quality of the data.

Data quality as a concept is meaningful only when it relates to the intended use of the data. That is, one must know the context in which the data will be interpreted in order to establish a relevant basis for judging whether or not the data set is adequate. DQA involves comparison of actual field and laboratory measurement performance to data quality objectives (DQOs) established for a particular study, such as evaluation of method detection limits, blank sample data, data precision (based on field and laboratory duplicate samples), and data accuracy (based on matrix spike recoveries and/or analysis of standards or certified reference materials).

DQOs were established at the outset of the field program that reflect reasonable and achievable performance expectations. Programs involving a large amount of samples and analytes usually have some results that exceed the DQOs. This is particularly so for multi-element scans (e.g., ICP scans for metals) since the analytical conditions are not necessarily optimal for every element included in the scan. Generally, scan results may be considered acceptable if no more than 20% of the analytes fail to meet the DQO. Overall, the intent of comparing data to DQOs was not to reject any measurement that did not meet the DQO, but to ensure any questionable data received more scrutiny to

determine what effect, if any, this had on interpretation of results within the context of this project.

C1.2 Types of Quality Control Samples

Several types of quality control (QC) samples were assessed as part of laboratory analysis. These samples, and a description of each, include the following:

- **Laboratory Blanks** are samples of de-ionized water and/or appropriate reagent(s) that are handled and analyzed the same way as regular samples. These samples will reflect any contamination of samples occurring in the laboratory (laboratory or method blanks). Concentrations of analytes should not be detectable, although a DQO of twice the method detection limit allows for slight “noise” around the detection limit.
- **Laboratory Duplicates** are replicate sub-samples created in the laboratory from randomly selected field samples which are sub-sampled and then analyzed independently using identical analytical methods. The laboratory duplicate sample results reflect any variability introduced during laboratory sample handling and analysis and thus provide a measure of laboratory precision.
- **Field Duplicates** are replicate samples collected from a randomly selected field station using identical collection and handling methods that are then analyzed separately in the laboratory. The duplicate samples are handled and analyzed in an identical manner in the laboratory. The data from field duplicate samples reflect natural variability, as well as the variability associated with sample collection methods, and therefore provide a measure of field precision.
- **Matrix Spike Recovery Samples** are created in the laboratory by adding a known amount/concentration of a given analyte (or mixture of analytes) to a randomly selected test sample previously divided to create two sub-samples. The spiked and regular sub-samples are then analyzed in an identical manner. The spike recovery represents the difference between the measured spike amount (total amount in spiked sample minus amount in original sample) relative to the known spike amount (as a percentage). The analysis of spiked samples provides an indication of the accuracy of analytical results.
- **Certified Reference Materials** are samples containing known chemical concentrations that are processed and analyzed along with batches of environmental samples. The sample results are then compared to target results

to provide a measure of analytical accuracy. The results are reported as the percent of the known amount that was recovered in the analysis.

C2.0 BENTHIC INVERTEBRATE SAMPLES

Whole benthic invertebrate samples were analyzed by University of Missouri-Columbia Research Reactor Center (MURR), in Columbia, MO. The laboratory report provided is presented in Appendix B.

C2.1 Method Detection Limits

Method detection limits (MDLs) achieved by MURR for whole benthic invertebrate samples were examined and assessed only in cases where sample results were reported as less than the MDL. The achieved MDLs were sufficiently low to produce detectable results for all except eight analytes (Table C.1). For analytes with an available guideline value for the protection of aquatic life, and which is applicable to benthic invertebrates, the MDL should be lower than the guideline value. All reported MDLs were lower than the applicable guideline value (selenium, Table C.1), and were therefore of good quality for effective data interpretation.

C2.2 Laboratory Blank Sample Analysis

One or more laboratory blank samples (empty vials microwaved with digestion acid) were prepared and analysed alongside each group of samples. Analyte concentrations were generally at or below the MDL for the laboratory blank samples, however, sample results were appropriately corrected if relatively small background levels were found to be significant and consistent (Appendix B).

C2.3 Data Precision

Laboratory Duplicate Samples

Replicate digests of benthic invertebrate samples (n=6) were prepared for analysis of laboratory precision (Appendix B). Most elements met the DQO of < 30% RPD within four of the laboratory duplicate samples analysed (Table C.2), with < 18% of elements exceeding the DQO. Multi-element scans usually have some results that exceed the DQOs, but are generally considered acceptable if no more than 20% of the analytes fail to meet the DQO. The DQO was exceeded for a substantial number of elements for two of the duplicate samples (CARU-04 and EDC-D1), suggesting that sample heterogeneity may have played a role in the observed variability, particularly if homogenization was not complete (i.e., crushing and mixing with pre-cleaned plastic lab spatulas and glass stir rods may not have produced a homogeneous powder). As such, laboratory precision

Table C.1: Laboratory method detection limit (MDL) evaluation for whole benthic invertebrate chemistry analysis. Only analytes with < MDL values are reported.

Parameter	Units	British Columbia Water Quality Guideline ^a	Maximum Method Detection Limit Achieved

¹ The method detection limit (MDL) value was used in instances where values less than the MDL were reported. RPD calculation: $=(\text{Absolute}(\text{Replicate 1} - \text{Replicate 2}))/\text{Average}(\text{Replicate 1}, \text{Replicate 2}) * 100$.

associated with analysis of benthic invertebrate samples was considered acceptable, but potential impacts of laboratory precision on data interpretation should be considered.

Field Duplicate Samples

Six duplicate whole benthic invertebrate samples were collected in the field for analysis of field precision. One of the duplicates (LREF1-04) showed acceptable precision, with 87% of the elements included in the ICP-MS scan meeting the DQO of 30% RPD (Table C.3). For the remainder of the duplicate samples, >32% of the metal results for each sample exceeded the DQO (Table C.3). As discussed above, multi-element scans usually have some results that exceed the DQOs, but are generally considered acceptable if no more than 20% of the analytes fail to meet the DQO. This criteria was exceeded in the majority of the field duplicates. The low field precision demonstrated likely due to natural variability, which cannot be controlled through consistent sampling methods.

Overall, the field duplicates sampling results indicate that good field precision was likely not achieved due to naturally variability, and this high field variability should be considered in the data interpretation process.

C2.4 Data Accuracy

Certified Reference Materials

Accuracy of elemental concentration data was determined by analyzing certified reference materials (NIST SRM 1577 bovine liver and NRC CRM DOLT-5 dogfish liver) and comparing achieved values to a DQO recovery of 70 – 130% of the certified value. Some elements listed on the certificates of analysis are lower-confidence values or unconfirmed results presented for informational purposes, rather than certified values (i.e., the value may not necessarily be correct, and may be subject to significant statistical error). These values were not used to judge acceptability of data values and were provided for comparison purposes only (Table C.4).

All metals were recovered at concentrations within the acceptable range of certified CRM values (Table C.4). These results indicate acceptable analytical accuracy associated with analysis of whole benthic invertebrate samples.

Laboratory Matrix Spike Samples

Analyte recoveries for matrix spike samples varied, but were generally within the DQO of 70 – 130% recovery. Many of the analytes could not be included in the analysis, or could not be recovered because the spike concentrations were less than 50% of the average

Table C.3: Field duplicate results for whole benthic invertebrate chemistry analyses. Highlighted values did not meet the data quality objective of ≤ 30% Relative Percent Difference (RPD) ¹.

¹ The method detection limit (MDL) value was used in instances where values less than the MDL were reported.

original concentration measured in the replicates. The percent recovery of one analyte was slightly below the DQO (zirconium, Table C.5), however zirconium is not considered an element of concern in this study. As such, the results of laboratory matrix spike analyses indicated acceptable accuracy for the purposes of this study.

Table C.5: Laboratory matrix spike recoveries associated with whole benthic invertebrate samples. Highlighted values did not meet the data quality objective of 70 - 130% recovery.

Analyte	Units	Matrix Spike (% Recovery)
		EDC-D2
Aluminum	µg/g dw	†
Antimony	µg/g dw	88%
Arsenic	µg/g dw	98%
Barium	µg/g dw	109%
Beryllium	µg/g dw	80%
Bismuth	µg/g dw	91%
Boron	µg/g dw	87%
Cadmium	µg/g dw	94%
Calcium	µg/g dw	*
Cesium	µg/g dw	*
Chromium	µg/g dw	88%
Cobalt	µg/g dw	90%
Copper	µg/g dw	†

Zinc	µg/g dw	†
Zirconium	µg/g dw	66%

* Not spiked. (The element was not included in the multi-element spike solution.)

† Spike too small. (The concentration of the element spiked into sample was less than 50% of the average concentration measured in the replicates.)

C3.0 DATA QUALITY STATEMENT

Overall, the quality of the data collected for this project was considered acceptable to serve the project objectives. However, the variability displayed in laboratory and field precision samples should be considered in the interpretation of benthic invertebrate chemistry results.

APPENDIX D

WHOLE BENTHIC INVERTEBRATE QUALITY DATA

Figure D.1: Biplot of principal component analysis (PCA) of metal concentrations in whole benthic invertebrates from Polley Lake and an associated reference area (Bootjack Lake), Mount Polley Mine, 2015. Vector length is proportional to the magnitude of direct correlation of metals (solid red vector lines) with PCA values of each axis. Only metals with significant (p -value < 0.010) Spearman's correlation and r -values > 0.7 with Axis 1 are displayed. Axis 2 is displayed, but was not statistically significant (Monte Carlo $p = 1.00$).

Figure D.2: Biplot of principal component analysis (PCA) of metal concentrations in whole benthic invertebrates from Quesnel Lake littoral sampling areas, Mount Polley Mine, 2015. Vector length is proportional to the magnitude of direct correlation of metals (solid red vector lines) with PCA values of each axis. Only metals with significant (p -value < 0.010) Spearman's correlation and r -values > 0.7 with Axis 1 are displayed. Axis 2 is displayed, but was not statistically significant (Monte Carlo $p = 0.055$).

Figure D.3: Biplot of principal component analysis (PCA) of metal concentrations in whole benthic invertebrates from Quesnel Lake profundal sampling areas, Mount Polley Mine, 2015. Vector length is proportional to the magnitude of direct correlation of metals (solid red vector lines) with PCA values of each axis. Only metals with significant (p -value < 0.010) Spearman's correlation and r -values > 0.7 with either axis are displayed. Both displayed axes were significant (Monte Carlo $p < 0.05$).

Figure D.4: Biplot of principal component analysis (PCA) of metal concentrations in whole benthic invertebrates from upper and lower areas of Hazeltine Creek and an associated reference area (Edney Creek), Mount Polley Mine, 2015. Vector length is proportional to the magnitude of direct correlation of metals (solid red vector lines) with PCA values of each axis. Only metals with significant (p -value < 0.010) Spearman's correlation and r -values > 0.7 with Axis 1 are displayed. Axis 2 is displayed, but was not statistically significant (Monte Carlo $p = 0.356$).

Figure D.5: Biplot of principal component analysis (PCA) of metal concentrations in whole benthic invertebrates from upper and lower areas of Hazeltine Creek in 2010 and 2015, and an associated reference area (Edney Creek) in 2015, Mount Polley Mine 1. Vector length is proportional to the magnitude of direct correlation of metals (solid red vector lines) with PCA values of each axis. Only metals with significant (p -value < 0.010) Spearman's correlation and r -values > 0.7 with either axis are displayed. Both displayed axes were significant (Monte Carlo $p < 0.05$).

¹ A reduced set of analytes was used for this analysis due to the inclusion of data from 2010 which reported results for fewer analytes than reported in 2015. Metals omitted were: B, Cs, Ga, Fe, P, K, Re, Rb, Ag, Na, Th, Ti, Y, Zr.

Figure D.6: Biplot of principal component analysis (PCA) of metal concentrations in whole benthic invertebrates from the Quesnel River and an associated reference area (Cariboo River), Mount Polley Mine, 2015. Vector length is proportional to the magnitude of direct correlation of metals (solid red vector lines) with PCA values of each axis. Only metals with significant (p -value < 0.010) Spearman's correlation and r -values > 0.7 with either axis are displayed. Both displayed axes were significant (Monte Carlo $p < 0.05$).

Figure D.7: Biplot of principal component analysis (PCA) of metal concentrations in whole benthic invertebrates from the Quesnel River and an associated reference area (Cariboo River) in 2014 and 2015, Mount Polley Mine¹. Vector length is proportional to the magnitude of direct correlation of metals (solid red vector lines) with PCA values of each axis. Only metals with significant (p -value < 0.010) Spearman's correlation and r -values > 0.7 with either axis are displayed. Both displayed axes were significant (Monte Carlo $p < 0.05$).

¹ A reduced set of analytes was used for this analysis due to the inclusion of data from 2014 which reported results for fewer analytes than reported in 2015. Metals omitted were: Bi, Ca, Cs, Ga, Li, Mg, P, K, Re, Rb, Na, Th, Y, Zr.

Table D.2: PCA results displaying eigen value, percent variance explained, Monte Carlo randomization p-values of axis significance, and station scores for whole benthic invertebrate metal concentrations from Polley Lake and associated reference (Bootjack Lake) sampling stations, Mount Polley Mine, 2015. Data were Log (X+1) transformed prior to analysis.

		PCA Axis 1
Eigenvalue		28.8
% Variance explained		75.7
Monte Carlo p		0.0001

Value in exposed area exceeds the Reference 95th Percentile for this parameter. Data from the Reference area was not included in this comparison.

¹ Summary statistics were calculated using method detection limit (MDL) values if data were below the MDL. Means are shown with a < symbol if all data used in their calculation were < MDL. If MDLs were variable, means were reported as < the maximum MDL and this value was used in 95% confidence limit calculations.

Value in exposed area exceeds all available 95th Percentile values (Reference and Historic) for this parameter. Data from the Reference area was not included in this comparison.

¹ Summary statistics were calculated using method detection limit (MDL) values if data were below the MDL. Means are shown with a < symbol if all data used in their calculation were < MDL. If MDLs were variable, means were reported as < the maximum MDL and this value was used in 95% confidence limit calculations.

^a Difference between areas considered to be significant if the result of the non-parametric test (Mann-Whitney U) was $p < 0.05$.

^b Magnitude calculated by comparing the difference between the reference area and pre-event area means to the reference area standard deviation (SD) [(pre-event mean - reference mean) / standard deviation of the reference mean].

^c Minimum effect size detectable calculated based on variance as square root of MSE from ANOVA and $\alpha = \beta = 0.10$. Minimum effect size reported as the minimum number of standard deviations detectable based on reference area standard deviation.

N/A = Not Applicable or unable to be calculated due to a lack of variability in data (all values were the same).

Highlighted values indicate significance at the $p < 0.5$ level.

Barbara Wernick**EMAIL** suzanne_earle@golder.com;
Barbara_Wernick@golder.com**QUESNEL AND POLLEY LAKES 2015 PLANKTON UPDATE REPORT**

Golder Associates Ltd. (Golder) is pleased to provide Mount Polley Mining Corporation (MPMC) with the following update to the *Quesnel and Polley Lakes Aquatic Productivity Impact Assessment* that was submitted as part of the *Post-Event Environmental Impact Assessment Report* (PEEIAR) in June 2015 (MPMC 2015a, Appendix H). The 'event' refers to the tailings dam failure that occurred at the Mount Polley Mine on August 4, 2014, when the Tailings Storage Facility (TSF) Perimeter Embankment failed and there was a subsequent debris flow into the receiving environment. This update focuses primarily on data generated by post-event plankton sampling in Quesnel and Polley lakes undertaken by MPMC over the open-water period between May and September 2015.

1.0 INTRODUCTION

A conceptual ecological model was developed in the Lake Aquatic Productivity Impact Assessment to describe fish-habitat-food interactions. The habitat and food requirements of the lakes were grouped into three general assemblages: 1) littoral zone and benthic habitats; 2) open-water habitat and fish that feed on emerging insects; and 3) open-water habitat and fish that feed on crustacean zooplankton.

To characterize aquatic biota inhabiting the water column of the lakes, ongoing sampling of zooplankton communities and phytoplankton biomass (as chlorophyll *a*) was conducted during the 2015 open water period. This technical memorandum provides an update on plankton communities sampled in the open-water habitats of Quesnel and Polley lakes from May to September 2015.

This technical memorandum is intended to provide a follow up to the PEEIAR and to further characterize plankton communities relevant to the Detailed Site Investigation (DSI) and Human Health and Ecological Risk Assessment (HHERA). The DSI and HHERA are being undertaken as a requirement of the Pollution Abatement Order (107461) issued by the BC MOE in response to the tailings dam failure to satisfy the requirements of the Provincial *Environmental Management Act* and the *Contaminated Sites Regulation* (CSR).

1.1 Background

The term “plankton” is a general term referring to small, usually microscopic organisms that live suspended in the water. *Phytoplankton* are free-floating photosynthesizing algae and cyanobacteria, which fix large amounts of carbon and form the base of the food web for aquatic animals. *Zooplankton* are the free-floating animal constituent of the plankton, and consist of small crustaceans and rotifers. Phytoplankton and zooplankton community metrics can be useful indicators of environmental change because of their rapid response to changes in nutrients or other substances. However, the inherent variability within the plankton community poses a challenge and also limits their usefulness as a monitoring tool. Plankton abundance, biomass, and taxonomic composition vary vertically and horizontally within the open-water; therefore, estimates are sensitive to the number of stations, samples, and the depth of the water column sampled (Findlay and Kling 2001; Paterson 2002). Seasonal succession within the plankton community and natural year-to-year variation also contribute to the inherent variability of these communities (Wetzel 2001; Paterson 2002).

2.0 OBJECTIVES

The overall objective of the *Quesnel and Polley Lakes 2015 Plankton Update Report* is to provide a follow up to the PEEIAR (MPMC 2015a) and to further characterize plankton communities in Quesnel and Polley lakes. This report presents data collected for phytoplankton biomass (as chlorophyll *a*) in Quesnel and Polley lakes, zooplankton community structure, and zooplankton tissue chemistry.

Specifically, the objectives of this report were as follows:

- Provide an update on phytoplankton biomass (as chlorophyll *a*) in Quesnel and Polley lakes;
- Characterize current trophic status of Quesnel and Polley lakes (using chlorophyll *a*, Secchi depth, total phosphorus (TP), and total nitrogen (TN) concentrations);
- Provide an update on zooplankton community composition in Quesnel Lake and characterize community composition in Polley Lake in 2015 to inform future monitoring; and
- Characterize spatial and seasonal variability in zooplankton tissue chemistry in relation to lake water quality.

3.0 METHODS

Sampling was conducted by Mount Polley Mining Company (MPMC) staff following methods outlined in MPMC procedural documents by MPMC and summarized below. Where possible, sampling methods and locations remained consistent with previous sampling methods used in 2014 and for historical data collection. The sampling methods differed between Quesnel Lake and Polley Lake to be consistent with previous data collection methods and to allow comparisons between previous years' datasets. The MPMC sampling procedures for Quesnel Lake were consistent with those used in 2014 by the Quesnel River Research Centre (subcontracted by the Canadian Department of Fisheries and Oceans). For Polley Lake, the MPMC sampling procedures were consistent with those used in 2014 by the British Columbia Ministry of Environment (BC MOE).

3.1 Sampling Locations

Samples were collected from three stations in Quesnel Lake: one exposed station called Hazeltine (QUL-Zoo-1; in the West Arm west of Cariboo Island) and two reference stations, Horsefly (QUL-Zoo-7; near the Horsefly River) and Junction (QUL-Zoo-8; in the Main Basin where the east and north arms meet; Table 1; Figure 1). Samples were also collected from two stations in Polley Lake: P1 and P2 (Table 1; Figure 1).

Table 1: Sampling Locations in Quesnel Lake and Polley Lake, 2015

Lake	Station	Sample ID	Location			Depth (m)
			Zone	Easting	Northing	
Quesnel Lake	Hazeltine	QUL-Zoo-1	10U	601058	5819925	30
	Horsefly	QUL-Zoo-7	10U	612469	5816656	30
	Junction	QUL-Zoo-8	10U	630691	5821991	30
Polley Lake	P1	P1	10U	593708	5824693	28
	P2	P2	10U	595348	5821863	28

3.2 Timing of Sampling

Sampling occurred monthly during the 2015 open-water period between May and September in Quesnel Lake and Polley Lake (Table 2).

Table 2: Sample Collection in Quesnel Lake and Polley Lake, 2015

Lake	Sampling Date	Zooplankton Taxonomy	Zooplankton Tissue Chemistry
Quesnel Lake	20-May-2015	Y	Y
	24-June-2015	Y	Y
	8-July-2015	Y	Y
	20-August-2015	Y	Y
	10-September-2015	Y	Y
Polley Lake	14-May-2015	Y	Y
	11-June-2015	Y	N
	7-July-2015	Y	Y
	11-August-2015	Y	Y
	10-September- 2015	Y	Y

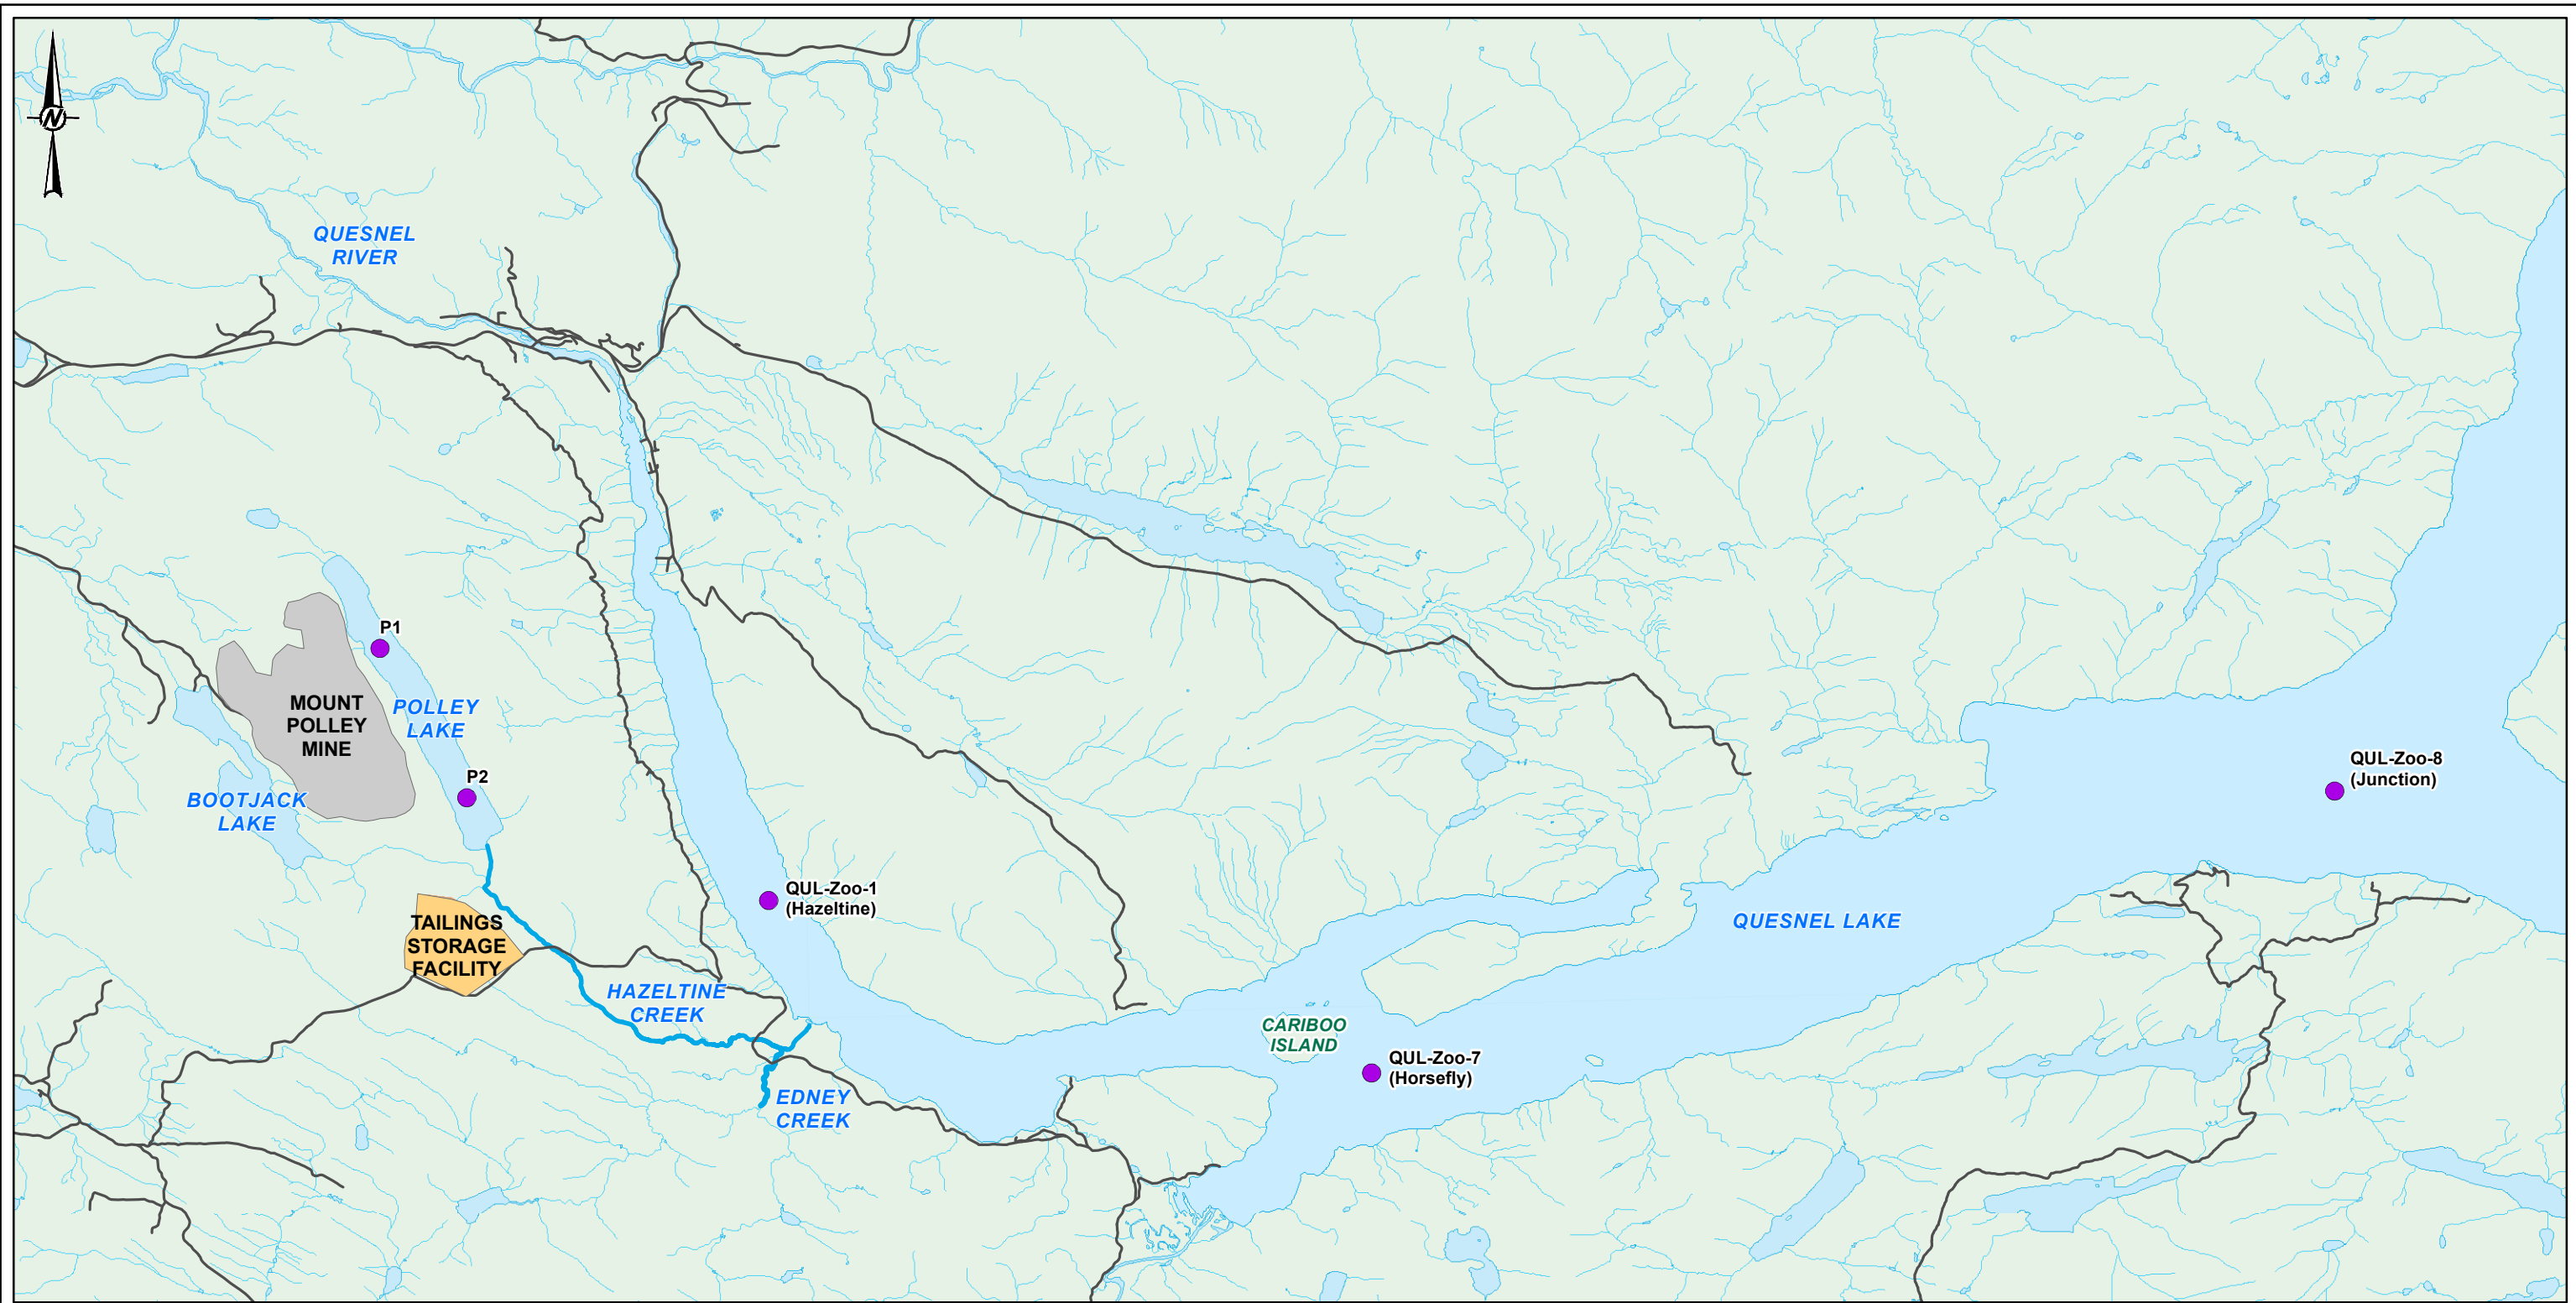

Notes:

Y = yes, sample was collected; N = no results are available due to a laboratory processing error where the sample was initially analysed as water and was discarded prior to the error being identified.

3.3 Field Methods

3.3.1 Nutrients and Phytoplankton Biomass (as chlorophyll *a*)

TN, TP, and chlorophyll *a* concentrations were measured as part of the water quality monitoring program conducted by MPMC. Water quality data was collected by MPMC following the Post TSF-Breach 2015 Monitoring Plan (MPMC 2015b). Detailed field methods for the collection of the nutrient and chlorophyll *a* samples are presented in the *Mount Polley Water Quality Impact Assessment Update* (Golder 2016). Secchi depths were also collected in conjunction with the water quality field program.

Nutrient water quality data were collected from the following stations:

- QUL-18 and QUL-55 in the vicinity of Hazeltine;
- QUL-2a and QUL-40a in the vicinity of Horsefly; and
- QUL-120a in the vicinity of Junction.

3.3.2 Zooplankton Sampling

3.3.2.1 Quesnel Lake

The 2015 zooplankton sample collection in Quesnel and Polley lakes followed methods outlined by the MPMC work order: MPMC-Work-021: Zooplankton Sampling. A single zooplankton sample was collected for taxonomic analysis at each station in Quesnel Lake during each sampling event (Table 2). Zooplankton taxonomy samples were collected using a 0.30 meter (m) diameter, Wisconsin 150 micrometer (μm) Nitex[®] mesh plankton net. The plankton net was lowered to a depth of 30 m and then towed vertically to the water surface at a rate of 0.5 to 1.0 meters per second (m/sec). The sample was then condensed in the cod end and transferred to a 250-milliliter (mL) white Nalgene bottle containing buffered formalin solution. Samples were kept at room temperature and sent to Mary-Jane Hudson (Nanaimo, BC) for analysis of taxonomic composition, abundance, and biomass.

Zooplankton tissue samples were collected using a 0.30 m diameter, 0.90 m length, 50 μm Nitex[®] mesh plankton net. Samples were collected at each station during each of the sampling events in 2015 (Table 2). The plankton net was lowered to a depth of 30 m and then towed vertically to the water surface at a rate of 0.5 m/sec. Multiple hauls were required to obtain sufficient sample for the tissue analysis (a minimum of 1.5 grams (g) of tissue). The samples from multiple hauls were combined into a 250 millilitre (mL) white Nalgene bottle. The tissue samples were then transferred to the freezer and frozen prior to shipment to ALS Environmental (Vancouver, BC).

3.3.2.2 Polley Lake

A single zooplankton sample was collected for taxonomic analysis at each station in Polley Lake during each sampling event (Table 2). Zooplankton taxonomy samples were collected using a 0.30 m diameter, 0.90 m length, 50 μm Nitex[®] mesh plankton net. The plankton net was lowered to a depth of 28 m and then towed vertically to the water surface at a rate of 0.5 m/sec. The sample was then condensed in the cod end and transferred to 1 L wide mouth Nalgene bottle. The samples were preserved with 85% ethanol (at a ratio of 1 to 1). Samples were kept at room temperature and sent to Fraser Environmental Services (Surrey, BC) for analysis of taxonomic composition and abundance.

Zooplankton tissue samples were collected using the same 50 μm Nitex[®] mesh plankton net (Table 2). The plankton net was lowered to a depth of 28 m and then towed vertically to the water surface at a rate of 0.5 m/sec. Multiple hauls were required to obtain sufficient sample for the tissue analysis (a minimum of 1.5 g of tissue). The samples from multiple hauls were combined into a 250 mL white Nalgene bottle. The tissue samples were then transferred to the freezer and frozen prior to shipment to ALS Environmental.

3.4 Laboratory Methods

3.4.1 Zooplankton Community

The taxonomic laboratories differed for Quesnel Lake and Polley Lake to be consistent with previous years' results and to allow comparisons to previous data. Due to differences in taxonomists as well as units¹, the zooplankton data from Quesnel and Polley lakes are not comparable. The raw taxonomic results are provided in Attachment 2.

3.4.1.1 Quesnel Lake

Samples were analyzed for the following: 150 zooplankton \leq 600 μ m which includes a maximum of 50 nauplii, 100 \geq 600 μ m and $<$ 1.2mm and 100 zooplankton \geq 1.2mm were enumerated. Copepoda and cladocera were identified to genus. Chironomids and nauplii were also identified. Body length of each animal was measured (excluding spines).

Taxonomic results were converted to density and biomass estimates by Dan Selbie (Fisheries and Oceans Canada). Biomass and density estimates were summarized by prevalent major taxonomic groups.

3.4.1.2 Polley Lake

The total volume of each sample collected from Polley Lake was measured and recorded. A 50 mL subsample was then removed from each sample and placed in a petri dish for identification of zooplankton taxa. Exact volumes of each sub-sample were dependent on the density of organisms in the sample. A smaller or diluted volume was used for densely populated samples or samples were concentrated by centrifugation or sedimentation for sparsely populated samples. Samples were scanned at increasing powers of magnification on a compound microscope to identify the cladocerans, cyclopoid copepods, calanoid copepods, and rotifers present in the sample.

Following identification, enumeration occurred on at least three 1-mL homogenized subsamples from each sample. If sufficient organisms were not enumerated with the three 1-mL subsamples, subsampling continued until at least 200 organisms were enumerated. The subsamples were first transferred to a Sedgwick-Rafter cell counter and allowed to settle for 15 minute prior to enumeration. The entire subsamples in the Sedgwick-Rafter counters were enumerated using the strip counting method on an inverted or stereoscopic microscope. In addition, 1/16 and 1/8 of the sample were enumerated. The total number of organisms per sample for each species was calculated by taking the average count of each species from all the subsamples counted and multiplying it by the total volume.

3.4.2 Zooplankton Tissue Chemistry

Mercury was analyzed by cold vapour atomic fluorescence spectroscopy (CVAFS) and other metals were analyzed by high resolution inductively coupled plasma spectrometry (HR-ICPMS). Analysis was conducted on dried samples and the analytical results were reported as mg/kg dry weight (dw). Information regarding analytical methods is provided in Attachment 3.

¹ Quesnel Lake data were reported in areal (value/m²) whereas Polley Lake data were reported in volumetric units (value/m³).

3.5 Data Analysis

3.5.1 Phytoplankton Biomass and Trophic Status

Spatial and temporal trends in phytoplankton biomass were qualitatively (visually) examined by plotting chlorophyll *a* concentrations measured from water samples collected near the lake surface.

Trophic status is a useful means of classifying lakes and can be used as an indicator to describe the productivity of a system. Trophic status of a waterbody can be evaluated by examining the concentrations of chlorophyll *a*, nutrients, and water transparency. Chlorophyll *a* is the primary photosynthetic pigment in phytoplankton, and is often used as a surrogate measure of phytoplankton biomass and production in lakes (Franklin et al. 2012). The essential nutrients necessary for phytoplankton growth are nitrogen, phosphorus, carbon, and for some groups (e.g., diatoms), silica. The primary nutrient that often limits phytoplankton growth in lakes is phosphorus (Schindler 1974); therefore, phosphorus is often used to establish the trophic status of lakes. Secchi depth (a measure of water transparency) can be used as a coarse surrogate of phytoplankton biomass because, in many waterbodies, Secchi depth is inversely related to phytoplankton biomass (Dodds and Whiles 2010); therefore, Secchi depth is also considered when evaluating trophic status.

The three main classes of trophic status are the following:

- oligotrophic (nutrient-poor, unproductive systems);
- mesotrophic (moderately productive systems); and
- eutrophic (nutrient-rich, highly productive systems).

The trophic status of Quesnel and Polley lakes was evaluated by examining the nutrient water quality data (TP and TN), chlorophyll *a*, and water transparency (Secchi depth) data. The trophic status was determined using the Vollenweider (1970) trophic classification scheme for lakes (using TP, TN, chlorophyll *a*, and Secchi depth; Table 3); CCME (2004; Table 4), and TSI (Table 5).

Table 3: General Trophic Classification of Lakes

Trophic Status	Total Phosphorus (µg/L)		Total Nitrogen (µg/L)		Chlorophyll <i>a</i> (µg/L)		Secchi Depth (m)	
	Mean	Range	Mean	Range	Mean	Range	Mean	Range
Oligotrophic	8.0	3.0 to 17.7	661	307 to 1630	1.7	0.3 to 4.5	9.9	5.4 to 28.3
Mesotrophic	26.7	10.9 to 95.6	753	361 to 1367	4.7	3.0 to 11.0	4.2	1.5 to 8.1

Source: Vollenweider (1970).

µg/L = micrograms per litre; m = metre.

Table 4: Trophic Classification of Canadian Lakes Based on Total Phosphorus Trigger Concentrations

Trophic Status	Total Phosphorus (mg/L)
Ultra-oligotrophic (very nutrient-poor)	<0.004
Oligotrophic (nutrient-poor)	0.004 to 0.01
Mesotrophic (containing a moderate level of nutrients)	0.01 to 0.02
Meso-eutrophic (containing moderate to high levels of nutrients)	0.02 to 0.035
Eutrophic (nutrient-rich)	0.035 to 0.1
Hyper-eutrophic (very nutrient-rich)	>0.1

Sources: CCME (2004); Environment Canada (2004).

mg/L = milligrams per litre; < = less than; > = greater than; n/a = not applicable.

The TSI is a numerical trophic state index for lakes that classifies lakes on a scale of 0 to 100 (Carlson 1977). The index number is calculated from Secchi depth, chlorophyll *a*, and TP using the following equations (Carlson 1977):

Equation 1

$$TSI (TP) = 10 \left(6 - \frac{\ln \frac{48}{TP}}{\ln 2} \right)$$

Equation 2

$$TSI (Chl) = 10 \left(6 - \frac{2.04 - 0.68 \ln Chl}{\ln 2} \right)$$

Equation 3

$$TSI (Secchi) = 10 \left(6 - \frac{\ln SD}{\ln 2} \right)$$

where:

- TSI = trophic state index;
- TP = total phosphorus;
- ln = the natural log;
- Chl = chlorophyll *a*; and
- Secchi = Secchi depth.

Values calculated using these equations are multiplied by 10 to give the scale a range of 0 to 100. The numerical scales for each of the trophic status indices are presented in Table 5.

Table 5: Comparison of Trophic State Index Classification and General Trophic Classification of Lakes

Trophic State Index	Total Phosphorus (mg/L)	Chlorophyll <i>a</i> (µg/L)	Secchi Depth (m)	General Trophic Classification
<30 to 40	0.0 to 0.012	0 to 2.6	>8.0 to 4	Oligotrophic
40 to 50	0.012 to 0.024	2.6 to 20	4 to 2	Mesotrophic
50 to 70	0.024 to 0.096	20 to 56	2 to 0.5	Eutrophic
70 to 100+	0.096 to 0.384+	56 to 155+	0.5 to <0.25	Hyper-eutrophic

Source: Carlson (1977).

mg/L – milligram per litre; µg/L = micrograms/litre; m = metre; < = less than; > = greater than;

Phosphorus is generally the limiting nutrient for primary production in most Canadian lakes (Schindler 1974). Lakes with a nitrogen to phosphorus molar ratio (N:P ratio) of greater than 23 are expected to be phosphorus limited, whereas nitrogen is more likely to be the limiting nutrient in lakes with an N:P ratio of less than 23 (Wetzel 2001). The N:P ratio was calculated for Quesnel and Polley lakes to evaluate nutrient limitation in the lakes.

3.5.2 Zooplankton Community

Spatial and temporal trends in total abundance and biomass of zooplankton were qualitatively examined by visually plotting the data. Relative abundance of major zooplankton groups was calculated using data from the following taxonomic groups: Cladocera (water fleas), Calanoida (calanoid copepods), Cyclopoida (cyclopoid copepods), and Rotifera (rotifers). The three types of crustaceans are considered separately because of taxonomic and ecological differences. In addition, cyclopoid and calanoid copepods are separated because calanoid copepods are typically herbivorous, feeding on phytoplankton (small free-floating plants), whereas cyclopoid copepods are typically omnivorous, feeding on phytoplankton and small zooplankton (Brönmark and Hansson 1998). Calanoid copepods are almost exclusively found in the open-water, while cyclopoid copepods are dominated by littoral species, although a few pelagic species of cyclopoid copepods can account for a major component of the planktonic community.

For Polley Lake, total abundance and the relative abundance of each major group were plotted by sampling period for each station in 2015. No 2014 community composition data were available for Polley Lake. For Quesnel Lake, both total abundance and biomass results were available. The 2015 data were plotted with results from fall of 2014 and a qualitative comparison was made.

3.5.3 Zooplankton Tissue Chemistry

Zooplankton tissue samples were analyzed for a suite of metals; however, only arsenic, copper, mercury, and selenium are evaluated further herein. Copper is evaluated because it was considered a parameter of concern based on water column concentrations; and selenium, mercury and arsenic are considered parameters of potential concern because their primary mode of toxicity is via dietary uptake versus direct toxicity from a water exposure, or can biomagnify (e.g., mercury) in the food chain. Zooplankton tissue concentrations of copper, selenium, mercury, and arsenic were plotted by sampling period for each station in Quesnel and Polley lakes in 2015. For Quesnel Lake the 2015 data were plotted with results from 2014 and a qualitative comparison was made. No 2014 results were available for Polley Lake. For the 2015 tissue concentrations of mercury, the method detection limit was raised for a particular station or sampling period as a result of comparable levels of the analyte in the method blank; therefore, a range of detection limits was reported for this parameter.

Aqueous concentrations of arsenic, copper, mercury, and selenium were plotted for samples collected at the closest water quality station to tissue collection for which water quality data exists for August 2014 to December 2015. Time-series plots were visually examined to assess similar trends in tissue and aqueous concentrations of these parameters.

3.6 Quality Assurance/Quality Control

3.6.1 Field

To examine variability introduced by field sampling procedures, taxonomic accuracy, and reproducibility of the processing and analysis methods, one field duplicate was collected for zooplankton taxonomy analysis at station P1 in Polley Lake during the September sampling program. The relative percent difference (RPD) was calculated, which compares abundances of each major group between duplicate samples.

RPDs for plankton community samples were calculated for discussion purposes rather than a comparison to a threshold because a high level of variability is expected and assigning a threshold is not appropriate for these types of samples.

3.6.2 Laboratory – Tissue Chemistry

Laboratory quality assurance/quality control (QA/QC) included the analysis of laboratory duplicates, spiked samples, and blanks to assess precision and accuracy of analyses. Laboratory QA/QC reports were reviewed upon receipt to confirm that the appropriate QA/QC information had been reported and that the laboratory data quality objectives (DQOs) had been met.

4.0 RESULTS

4.1 Quesnel Lake

4.1.1 Phytoplankton Biomass and Trophic Status

Summary tables of Secchi depth, chlorophyll *a*, TP, TN concentrations and N:P ratios in Quesnel Lake in the 2015 sampling program are provided in Attachment 1, Table A1-1. Results from the TSI calculations are provided in Attachment 1, Table A1-2.

Periphyton biomass (as chlorophyll *a*) in Quesnel Lake were variable but generally increased through the open water period from May to September 2015 (Figure 2). The highest concentration of 0.947 µg/L was observed in September at QUL-18. Secchi depth was also seasonally variable and ranged from 4.8 m (at QUL-18 in June) to 14.1 m (at QUL-2/a in August and QUL-18 in September). TP concentrations were below 3.5 µg/L at all locations and the majority of samples were below the detection limit of 2.0 µg/L. TN concentrations were below 200 µg/L with the exception of one value of 498 µg/L measured in September at QUL-120a. The N:P ratio ranged from 16 to 113 and was generally above 23 indicating that the lake is likely to be phosphorus limited.

Note: open symbol indicates sample was below detection limit

Figure 2: Mean Chlorophyll a Concentrations in Quesnel Lake, 2015

Based on the TSI calculations for TP, Secchi depths, and chlorophyll *a* from the open water-sampling period in Quesnel Lake, the trophic status of the lake was considered to be oligotrophic (Table 6). Quesnel Lake can also be classified as oligotrophic based on the classification systems of Vollenweider (1970) and CCME (2004) TP trigger ranges for Canadian lakes.

Table 6: Summary of Trophic Status Index in Quesnel Lake, 2015

Variable	May	June	July	August	September
TSI (TP)	17 ± 1	12 ± 3	4 ± 0	8 ± 4	8 ± 4
TSI (TChl)	22 ± 2	13 ± 6	29 ± 2	25 ± 5	35 ± 2
TSI (Secchi)	34 ± 0	32 ± 1	29 ± 1	25 ± 2	27 ± 2
Trophic Status Classification	Oligotrophic ^(a)				

Notes:

a) Oligotrophic system based on Carlson (1977).

TSI mean values plus/minus standard error presented. TSI=Trophic status index; TP = total phosphorus; TChl = total chlorophyll *a*; Secchi = Secchi Depth.

4.1.2 Zooplankton Community

Summary tables of zooplankton taxonomy results for Quesnel Lake are provided in Attachment 1, Tables A1-3, A1-4, and A1-5. Raw data and taxonomic methods are provided in Attachment 2.

Overall, total zooplankton biomass (Figure 3) and abundance (Figure 4) were generally lowest at Horsefly and highest at Junction both during the fall of 2014 and through the spring/summer of 2015. Both biomass and abundance decreased from September through November in 2014 and were higher again in the following spring. Through the open-water period of 2015, abundance increased initially and then decreased, depending on the station. In comparison, abundance was at its peak in May and then generally declined through to September. Both abundance and biomass were similar between September 2014 and 2015.

Zooplankton biomass in Quesnel Lake appeared to be dominated by either cyclopoid copepods or cladocerans with some seasonal variability between fall 2014 and the 2015 open water period of all three stations (Figure 5). Cyclopoid copepods were generally dominant in spring and early-summer and cladocerans dominant in late-summer and fall. Calanoid copepods were generally present in lower numbers compared to other taxa with the exception of May 2015 where up to 51% of the zooplankton biomass at Horsefly was composed of calanoid copepods.

In terms of zooplankton abundance, similar trends were observed compared to relative composition for zooplankton biomass. In fall of 2014, cyclopoid copepods were the dominant taxa at all stations (Figure 6). In 2015, zooplankton abundance was made up primarily of cyclopoid copepods in May, June and July followed by a shift to cladocerans representing the dominant taxa in August and September (Figure 6). Calanoid copepods were more abundant in the samples during the spring sampling period (up to 54% at Horsefly in May) but this taxon was generally less than 10% of the population from July to September.

Figure 3: Total Zooplankton Biomass in Quesnel Lake, 2014 and 2015

Notes: ns = not sampled; weekly sampling conducted during 2014; monthly sampling conducted during 2015.

Figure 6: Relative Zooplankton Abundance in Quesnel Lake, 2014 and 2015

4.1.3 Zooplankton Tissue Chemistry

Results for tissue chemistry measured in zooplankton collected from Quesnel Lake in the 2015 sampling program are provided in Attachment 1, Table A1-6. Analytical laboratory reports are provided in Attachment 3. Time-series plots of arsenic, copper, mercury, and selenium concentrations in zooplankton tissue and surface water are provided in Figures 7 to 10. Aqueous concentrations were plotted from surface samples collected at water quality stations QUL-18 (closest to tissue station Hazeltine), QUL-40/a (closest to tissue station Horsefly), and QUL-120/a (closest to tissue station Junction). For mercury, due to limited water chemistry data, no water chemistry data was plotted.

Arsenic

In 2014, arsenic tissue concentrations ranged from 1.81 to 7.58 mg/kg dw, with the highest concentration observed at Junction (reference) in September (Figure 7). In October and November, arsenic concentrations in zooplankton tissue appeared to increase at all three stations. In 2015, arsenic concentrations were similar among stations in terms of magnitude and temporal variability, and the highest concentration (7.89 mg/kg dw; observed in September at Hazeltine) was within the range observed at Junction during the previous fall.

Aqueous arsenic concentrations were initially higher relative to reference stations due to the event, but declined over the sampling period (Figure 7). In 2015, aqueous arsenic concentrations were generally similar at all three stations. Arsenic concentrations were below the BC WQG in all samples. The trends in tissue concentrations do not reflect what is observed in arsenic concentrations in surface water collected from nearby locations.

Copper

No consistent trends were observed in zooplankton copper concentrations measured in sampling events from 2014 and 2015 (Figure 8). Tissue concentrations of copper were generally higher at Hazeltine compared to the other two stations. In 2014, tissue concentrations of copper appeared to increase from October to November; however, this same increasing trend was not observed to continue in 2015. One elevated copper concentration of 254 mg/kg dw was observed in May 2015 but concentrations were lower during in the next sampling event in June. The copper concentration in May 2015 (254 mg/kg dw) appears to be anomalous, given that copper does not biomagnify in freshwater systems (Cardwell et al. 2013) and aqueous copper concentrations in May 2015 (Figure 8) were similar to or lower than aqueous concentrations during other sampling events that did not result in comparable copper concentrations in tissue (e.g., November 2014). Copper was re-analyzed twice for the May 2015 tissue sample, and the results were 146 mg/kg dw and 163 mg/kg dw. Although the reanalyzed concentrations were lower than the original concentration of 254 mg/kg dw, they were still higher than would be expected, based on paired tissue and aqueous copper concentrations for other months (e.g., November 2014).

The copper concentrations at Hazeltine in June may have been partially in response to copper associated with increasing suspended solids in the water column during lake turn over as small particulates may have been attached to phytoplankton biomass and consumed incidentally. When aquatic invertebrates have ingested sediment particles and gut contents are not cleared prior to whole tissue analysis, actual uptake by the organism can be overestimated (Gillis et al. 2005; Sibley et al. 1997). Alternatively, the higher concentrations at Hazeltine in June 2015 may be a result of natural variability in tissue copper concentrations at comparable aqueous copper concentrations. For example, total aqueous copper concentrations near Hazeltine in June 2015 and August 2015 were similar (Figure 8), even though the tissue copper concentration at Hazeltine in June 2015 (49.9 mg/kg dw) was more than 50% higher than the tissue copper concentration in August 2015 (30 mg/kg dw). This interpretation is further supported by the fact that the tissue copper concentration at Junction (a reference location) in September 2015 (42.7 mg/kg dw) was comparable to the tissue copper concentration at Hazeltine in June 2015 (49.9 mg/kg dw).

Aqueous copper concentrations initially increased relative to reference areas due to the event, but declined over the sampling period to concentrations below the BC WQG in 2015 (Figure 9). At all three stations, aqueous copper concentrations displayed an increasing trend from August to December 2014, and a slight decreasing trend (Hazeltine and Horsefly) or no discernable trend (Junction) through 2015. These general patterns were also observed in copper tissue concentrations collected from comparable stations.

Mercury

Zooplankton tissue mercury concentrations were variable at all three stations (Figure 9). In several samples, mercury concentrations were below detection limits because of elevated detection limits due to high moisture content in the samples. In 2015, tissue concentrations of mercury at Hazeltine and Junction increased between May and September to values within the range observed at Junction in September 2014.

Aqueous mercury data are sparse and aqueous concentrations were below the reported detection limit in all samples and interpretation of aqueous mercury trends is therefore limited.

Selenium

Zooplankton tissue selenium concentrations appeared to exhibit a generally increasing trend at all stations throughout the 2015 sampling period with the exception of the August 2015 sampling event when lower concentrations were observed (Figure 10). Throughout the 2015 sampling period, selenium concentrations at Hazeltine were observed to be higher than selenium concentrations at Horsefly and Junction stations. Selenium concentrations were generally below the BC interim dietary guideline for tissue consumption by fish (BC MOE 2014). The guideline was designated interim by BC MOE (2014) pending additional data to verify the protection afforded by this value. The dietary BC WQG was used for comparative purposes only, as it is intended to be applied to the average concentration of at least eight replicate (composite) tissue samples representing an appropriate invertebrate or other prey species (BC MOE 2014).

In July and September 2015 zooplankton tissue concentrations of selenium measured at Hazeltine and Junction were above the dietary guideline. The highest concentration was observed at Hazeltine in September 2015 with a value of 9.53 mg/kg dw observed (Figure 10).

High detection limits for selenium from August 2014 to March 2015 prevented the ability to observe trends during this time. Aqueous selenium concentrations displayed a slight decreasing trend at all stations after April 2015 (Figure 10). The decreasing trend in aqueous concentrations was not observed in tissue selenium concentrations collected from Hazeltine, Horsefly, and Junction, which all showed a general increasing trend.

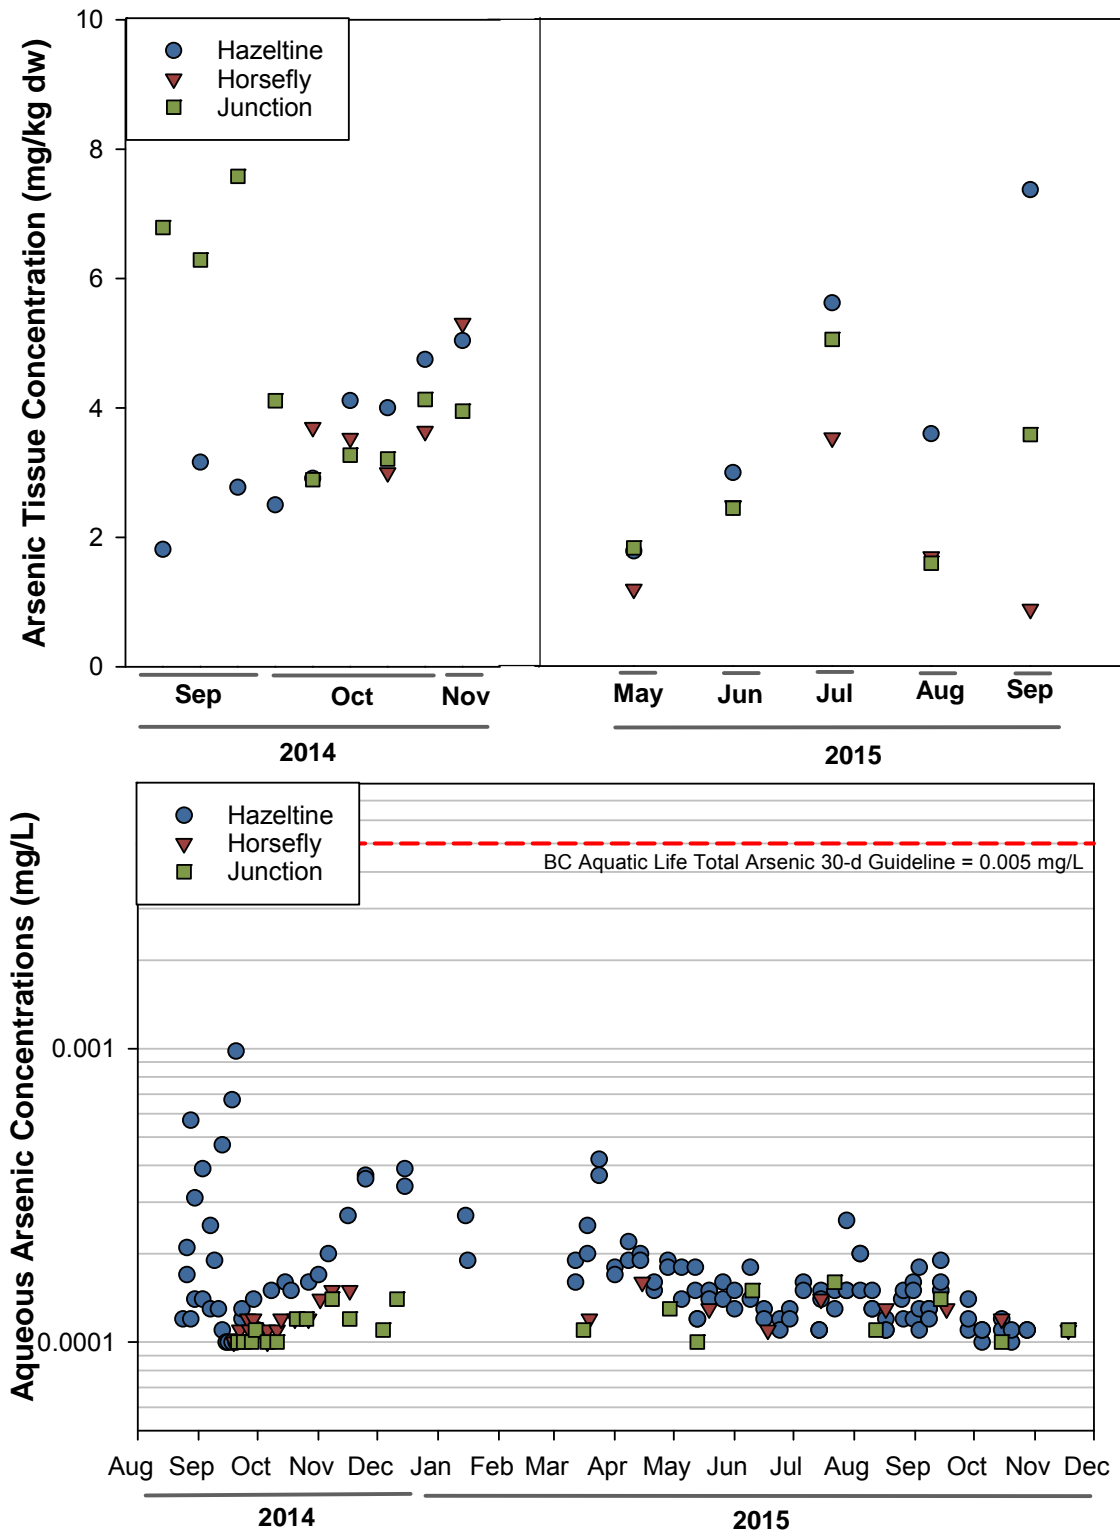

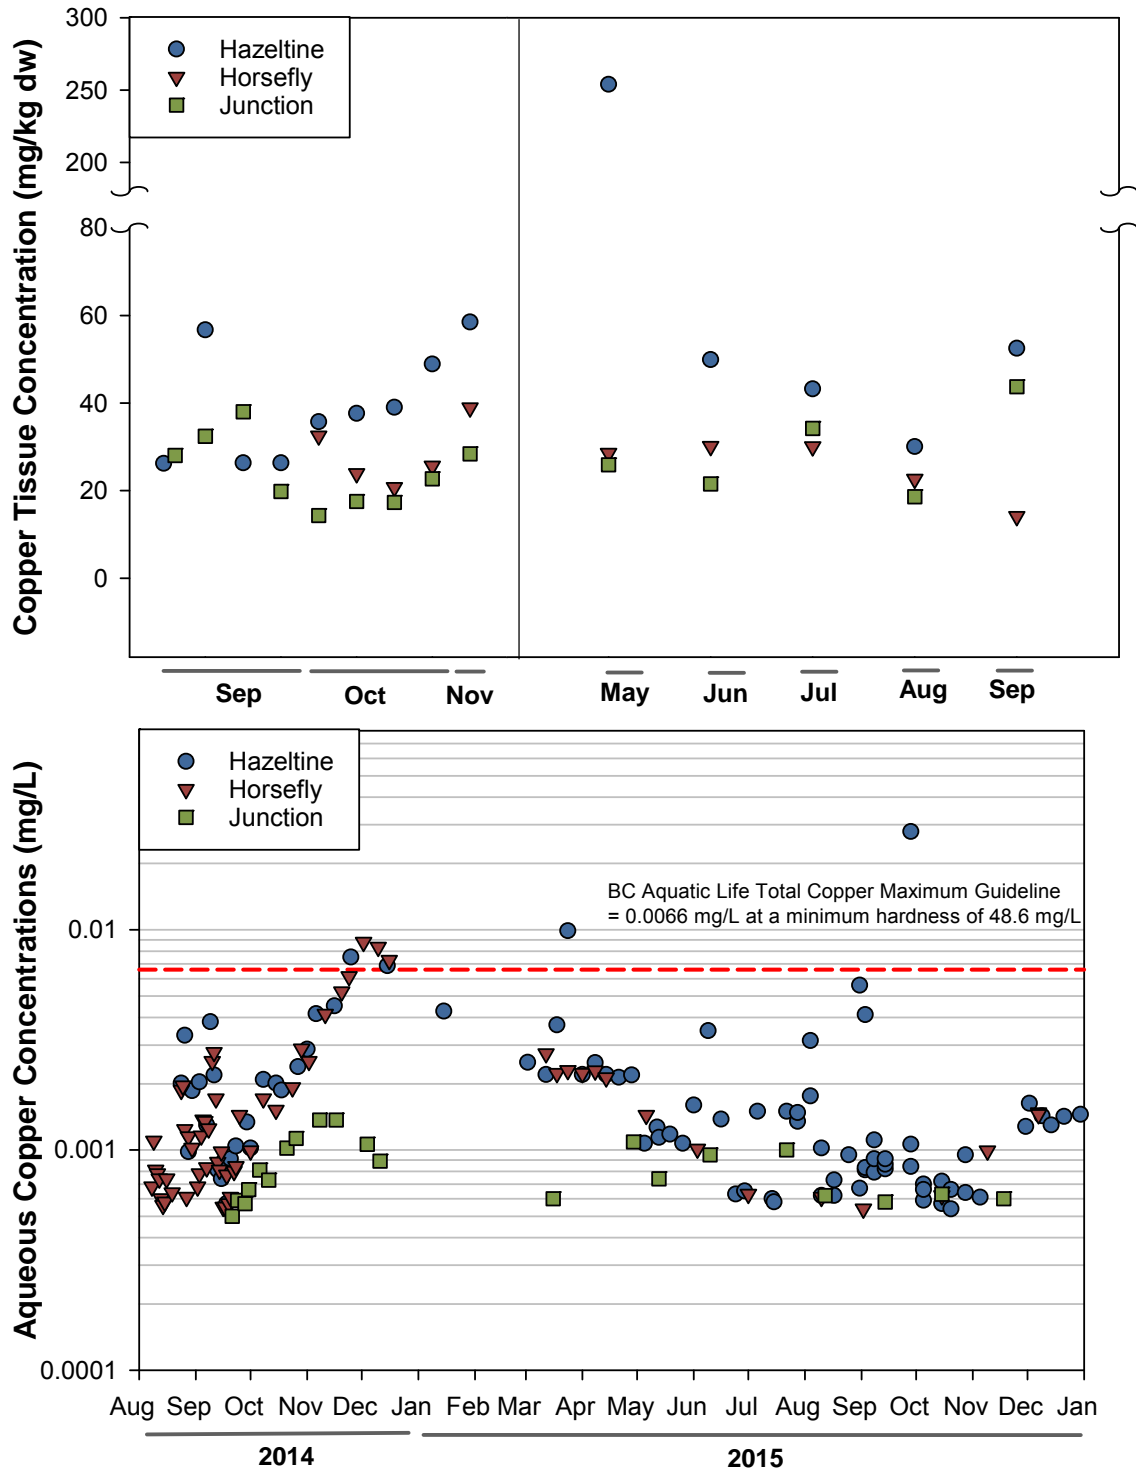

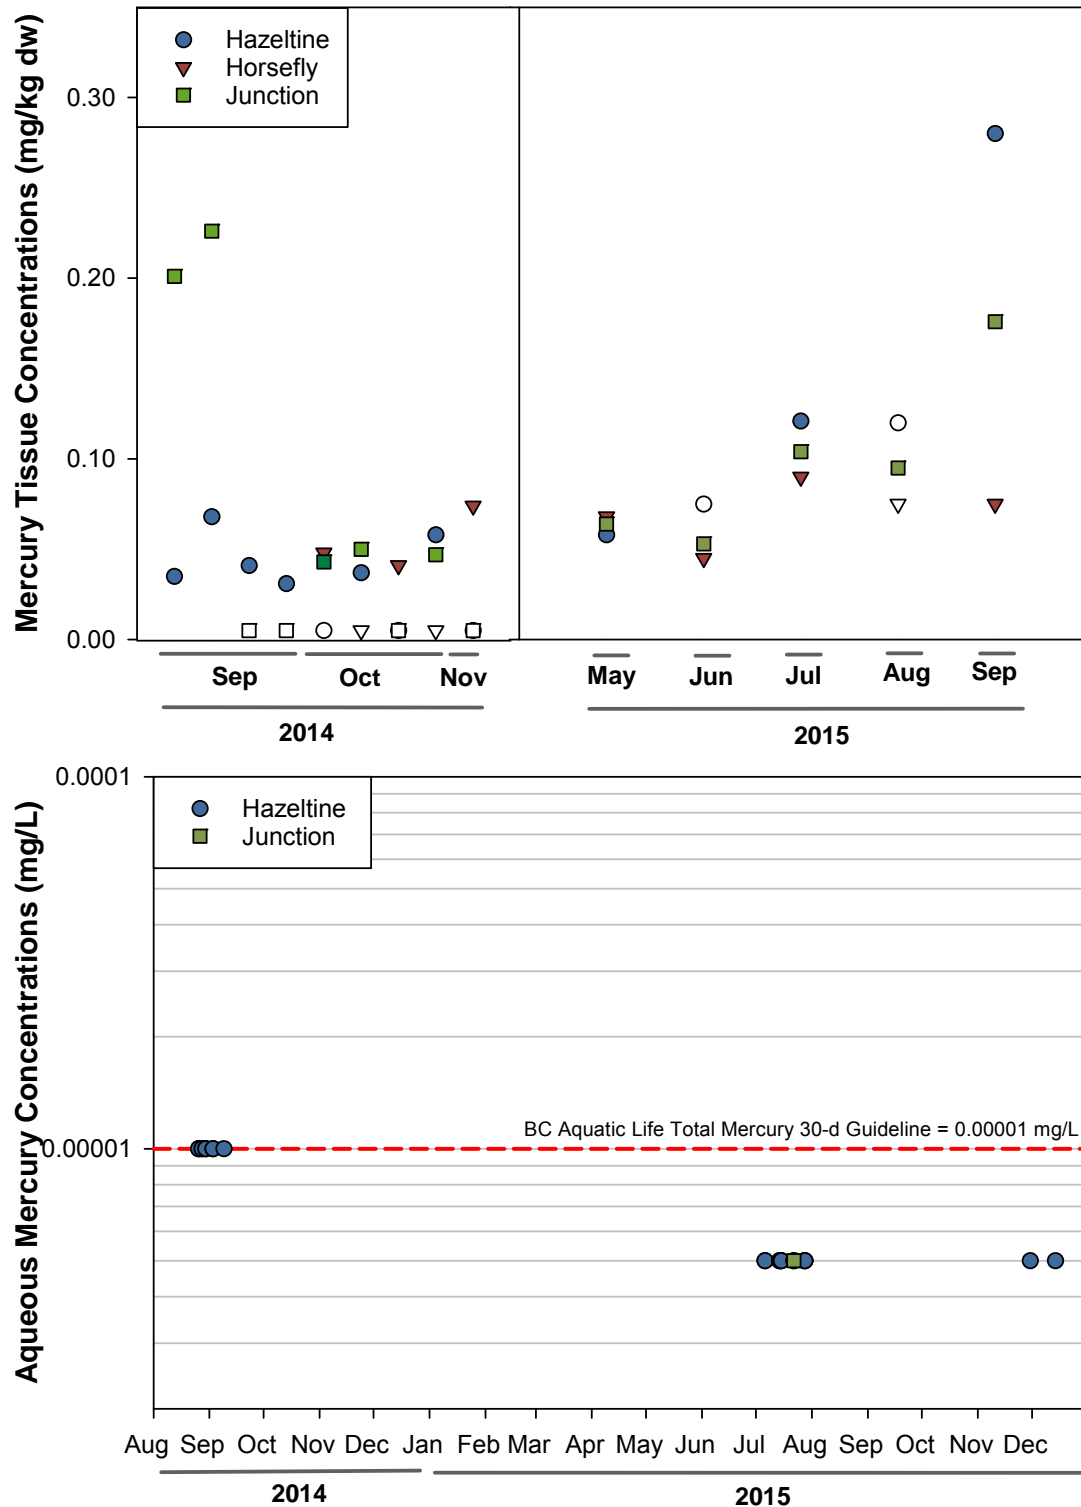

Figure 7: Concentrations of Arsenic in Zooplankton Tissue (top) and Surface Water (bottom) Collected from Quesnel Lake in Fall 2014 and 2015.

Note: Potentially anomalous value observed in Hazeltine in May 2015.

Figure 8: Concentrations of Copper in Zooplankton Tissue (top) and Surface Water (bottom) Collected from Quesnel Lake in Fall 2014 and 2015.

Note: For tissue concentrations (top figure) open symbols represent non-detect values. Where applicable full detection limits are shown. Aqueous mercury concentrations were below detection limits and show variable detection limits between years.

Figure 9: Concentrations of Mercury in Zooplankton Tissue (top) and Surface Water (bottom) Collected from Quesnel Lake in Fall 2014 and 2015.

Note: Aqueous selenium concentrations in 2014 and early 2015 were all below analytical detection limits. Where applicable, full detection limits are shown.

4.2 Polley Lake

4.2.1 Phytoplankton Biomass and Trophic Status

Summary tables of Secchi depth, chlorophyll *a*, total phosphorus, total nitrogen concentrations and N:P ratios in Polley Lake in the 2015 sampling program are provided in Attachment 1, Table A1-7. Results from the TSI calculations are provided in Attachment 1, Table A1-8.

In Polley Lake, chlorophyll *a* concentrations were different between stations P1 and P2 in May, July, and September 2015 (Figure 11). Both stations showed a similar pattern where there were decreases in chlorophyll *a* concentrations in June and August, 2015. Similar concentrations of chlorophyll *a* were observed at the two stations in June and August. Secchi depth was lower for Polley Lake compared to Quesnel Lake. Secchi depth values ranged from 2.1 m (at P2 in May) to 7.3 m (at P1 in September). TP concentrations ranged from 6.4 µg/L to 20.1 µg/L with a general decreasing trend observed through the open water period. TN concentrations ranged from 326 µg/L to 409 µg/L with no apparent seasonal trends. The N:P ratio was lower than Quesnel Lake and ranged from 8 to 25, indicating that the lake is potentially nitrogen limited or co-limited by both nitrogen and phosphorus.

Based on the TSI calculations for TP, Secchi depths, and chlorophyll *a* concentrations from the open water-sampling period in Quesnel Lake, the trophic status of the lake was oligotrophic to mesotrophic (Table 7). Polley Lake can also be classified as ranging from oligotrophic to mesotrophic based on the classification systems of Vollenweider (1970). Total phosphorus values were occasionally above the CCME (2004) TP trigger ranges for oligotrophic lakes (10 µg/L).

Figure 11: Chlorophyll *a* Concentrations at Stations P1 and P2 in Polley Lake, 2015

Table 7: Summary of Trophic Status in Polley Lake, 2015

Variable	P1					P2				
	May	June	July	August	September	May	June	July	August	September
TSI (TP)	47	40	44	32	32	47	41	44	31	32

TSI=Trophic status index

4.2.2 Zooplankton Community

Summary tables of zooplankton taxonomy results for Polley Lake are provided in Attachment 1, Table A1-9 and A1-10. Raw data and taxonomic methods are provided in Attachment 2.

Total zooplankton abundance in Polley Lake was lower at station P1 than at P2 for all sampling events, with the exception of the June 11, 2015 sampling event in which abundance was similar between stations (Figure 12). Both stations showed an increase in zooplankton abundance between May and June followed by a decline from June to August/September. No biomass calculations were made so it is unknown whether zooplankton biomass follows a similar seasonal pattern compared to abundance.

Similar community composition was observed at the two stations in Polley Lake. Copepod nauplii made up the greatest proportion of total zooplankton abundance in Polley Lake between May and July (29 to 71%; Figure 13). Copepod nauplii were also dominant in the September sample at P2 and represented 60% of the total abundance. In the remainder of the samples for August and September, cyclopoid copepods were the dominant taxa (52 to 60%; Figure 13). Cladocerans, rotifers, and calanoid copepods were generally present in smaller numbers at both stations through the open water period.

Figure 12: Total Zooplankton Abundance in Polley Lake, 2015

Figure 13: Relative Zooplankton Abundance in Polley Lake, 2015

4.2.3 Zooplankton Tissue Chemistry

Results for tissue chemistry measured in zooplankton collected from Polley Lake in the 2015 sampling program are provided in Attachment 1, Table A1-11. Analytical laboratory reports are provided in Attachment 3. Time-series plots of arsenic, copper, mercury, and selenium concentrations in zooplankton tissue and surface water (where available) are provided in Figures 14 to 17.

Arsenic

Arsenic concentrations in zooplankton tissue were generally similar between sampling stations (P1 and P2) in Polley Lake in 2015 with the exception of the September sampling event when P1 was higher (Figure 14). Tissue concentrations of arsenic displayed an increasing trend from May to September at P1 (Figure 14). An increasing trend was also observed at P2 from May to August but decreased during the September sampling event.

No trends were observed in aqueous arsenic concentrations over the sampling period in 2015 (Figure 14). Aqueous arsenic concentrations were below the BC WQG in all samples collected from P1 and P2. Although tissue concentrations of arsenic displayed an increasing trend at P1 (from May to September 2015) and P2 (from May to August 2015), aqueous concentrations of arsenic were generally stable during this timeframe.

Copper

Copper concentrations in zooplankton tissue were generally similar between sampling stations (P1 and P2) in Polley Lake in 2015 with the exception of the September sampling event when P1 was higher (Figure 15). Tissue concentrations of copper displayed an increasing trend from May to September at P1 (Figure 15). An increasing trend was also observed at P2 from May to August but copper concentrations decreased during the September sampling event.

A slight increasing trend was observed in aqueous copper concentrations over the sampling period in 2015 (Figure 15). Aqueous copper concentrations were below the BC short-term maximum WQG in all samples collected from P1 and P2.

Mercury

Mercury concentrations in zooplankton tissue were generally similar between sampling stations (P1 and P2) in Polley Lake in 2015 with the exception of the September sampling event when P1 was higher (Figure 16). August and September mercury tissue concentrations were higher at both stations compared to mercury concentrations in May and July.

Aqueous mercury data were limited and all below the reported detection limit; therefore, comparison of tissue to aqueous mercury concentrations could not be made.

Selenium

Selenium concentrations in zooplankton tissue were generally similar between sampling stations (P1 and P2) in Polley Lake in 2015 with the exception of the September sampling event when P1 was higher (Figure 17). Tissue concentrations of selenium displayed an increasing trend from May to September at P1 (Figure 17). No discernable trend was observed at P2. Zooplankton tissue selenium concentrations were at or above the BC interim dietary guideline for tissue consumption by fish (BC MOE 2014) at both stations during the sampling events in Polley Lake in 2015.

Aqueous selenium concentrations displayed a slight decreasing trend throughout the sampling period in 2015. The trend in aqueous concentrations was not observed in tissue selenium concentrations at P1 (which showed a general increasing trend) or P2 (which lacked any discernable trend).

Figure 17: Concentrations of Selenium Measured in Zooplankton Tissue (top) and Surface Water (bottom) Collected from Polley Lake, 2015.

4.3 Quality Assurance/Quality Control

4.3.1 Zooplankton Community

Results of the field QA/QC are provided in Table 8. RPD's were calculated on total abundance as well as at the major group level between duplicates collected for zooplankton taxonomy.

The RPD was below 50% when calculated on total abundance (Table 8). At the major group level an RPD of 135% was calculated for copepod nauplii. All other RPDs were below 50%.

Table 8: Quality Control Comparison of Zooplankton Abundance in Polley Lake, 2015

Major Taxonomic Group	Polley Lake		
	10-Sep-15		
	P1	P1-Duplicate	RPD
	(org/m ³)	(org/m ³)	(%)
Cyclopid Copepod	3,416	4,948	37
Calanoid Copepod	352	462	27
Copepod nauplii	167	858	135
Cladocera	1,300	1,089	18
Rotifera	167	165	1
Total Zooplankton	5,402	7,522	33

Note:

Percent errors were calculated using data at the precision level provided by the taxonomist; tabulated laboratory data are rounded for presentation purposes.

org/m³ = organisms per cubic metre; RPD = relative percent difference; Sep = September; % = percent.

4.3.2 Zooplankton Tissue Chemistry

4.3.2.1 Laboratory Data Quality Objectives

Results of laboratory DQOs are provided in Attachment 3. Extraction from the certified reference material analyzed in conjunction with tissues met the laboratory's objectives, except for one of the two reference materials for sodium in laboratory file L1618673. ALS concluded that this result was due to contamination because the second reference material for sodium met the laboratory DQO and re-analysis of L1618673 samples confirmed the initial sodium concentrations in these samples (Can Dang, pers. comm.). Therefore, the certified reference material for sodium that did not meet the ALS DQO is not expected to affect the reliability of the results.

Relative percent differences for duplicates met the laboratory objectives in most tissue chemistry files. In laboratory files L1618673 and L1633703, relative percent differences for some elements in duplicates exceeded the laboratory objective of 40%. During laboratory analysis, homogenization of the sample may not have been complete, such that subsampling for analysis resulted in variability in the results. In laboratory file L1618673, parameters with relative percent differences that exceeded the laboratory DQO included aluminum, arsenic, barium, cadmium, chromium, cobalt, iron, magnesium, nickel, phosphorus, potassium, rubidium, sodium, thallium, uranium, vanadium, and zinc. In laboratory file L1633703, the relative percent difference for one parameter (thallium) exceeded the laboratory DQO. These duplicate results indicate slightly elevated uncertainty in the precision of the listed parameters' values in the given batch.

The QA/QC sample results for the tissue analysis met the laboratory's DQOs for laboratory blanks, with the exception of detected concentrations of zinc in laboratory files L1640343 and L1640340. Detected concentrations in method blanks were within five times the detection limit. Limits of reporting were adjusted for samples with concentrations below five times of the blank level.

4.3.2.2 *Sample Processing*

For three of the nine laboratory files provided in Attachment 3, the chain of custody form for the zooplankton tissue chemistry samples has the sample type as “other” and the analysis request as “Total Metals (ICPMS)”. Because the tissue samples were submitted in a 250 mL white Nalgene bottle that was filled with water, ALS assumed the sample was being submitted for analysis of total metals in water, rather than tissue (the 250 mL white Nalgene bottle is the bottle type supplied by ALS for analysis of total metals in water). Laboratory files for which the sample type was miscommunicated include:

- L1640343 (tissue samples collected from Polley Lake in July, 2015);
- L1633703 (tissue samples collected from Quesnel Lake in June, 2015); and
- L1640340 (tissue samples collected from Quesnel Lake in July, 2015).

Upon receipt of samples in the aforementioned laboratory files, ALS acidified the entire sample (i.e., the entire 250 mL Nalgene bottle, including the tissue chemistry sample). A water subsample was then taken from the 250 mL Nalgene bottle and analyzed for total metals in water. After analysis of the water sample, the mine staff informed ALS that the intended sample type was tissue. At this time, ALS dried the remaining sample and processed the tissue for metals analysis. Golder asked ALS to comment on the potential effect of sampling processing on the tissue results. However, ALS was unsure what effect, if any, the sample processing would have on the tissue chemistry results.

In addition to the laboratory files listed above, the sample type was also miscommunicated for zooplankton tissue chemistry samples collected from Polley Lake in June, 2015. Unlike the laboratory files listed above, the June 2015 Polley Lake samples were acidified, analyzed for total metals in water, and discarded before the sample type miscommunication was identified.

5.0 SUMMARY

During the 2015 field program, plankton communities were sampled at three stations in Quesnel Lake and two stations in Polley Lake during the open water period from May to September. The overall objective of the plankton sampling program was to characterize plankton communities in the lakes and to provide information to inform the HHERA and future lake monitoring programs.

A brief summary of the findings for Quesnel Lake sampling is provided below:

- Phytoplankton biomass (as chlorophyll *a*) in Quesnel Lake was below 1.0 µg/L in all sampling events but varied seasonally. Chlorophyll *a* concentrations generally increased through the open water period from May to September. Overall, Quesnel Lake is classified as oligotrophic based on several classification systems, which use nutrients (total phosphorus and total nitrogen), Secchi depths, and chlorophyll *a* concentrations to evaluate trophic status.
- Total zooplankton biomass and abundance in Quesnel Lake during the open water period of 2015 was generally higher than values observed during post-event sampling in fall of 2014. Seasonal variability was observed through the open water period of 2015 with a generally increasing trend in biomass and a generally decreasing trend in abundance observed from May to September 2015.

- Zooplankton biomass and abundance in Quesnel Lake were generally dominated by either cyclopoid copepods or cladocerans. Seasonal differences were observed throughout the open water period of 2015 with cyclopoid copepods generally dominant in spring and early-summer and cladocerans dominant in late-summer and fall. Limited spatial variability was observed among stations with similar trends observed at the Hazeltine, Horsefly, and Junctions stations through the open water period in 2015.
- Zooplankton tissue concentrations of copper, selenium, mercury, and arsenic were plotted by sampling period for each station in Quesnel Lake to qualitatively evaluate trends in these parameters in comparison to aqueous concentrations of these parameters at comparable water quality sampling locations.
 - An increasing trend in arsenic concentrations was observed in zooplankton tissue from all three stations; however, this trend was not observed in aqueous arsenic concentrations at comparable water sampling stations. In 2015, aqueous arsenic concentrations were generally similar at all three stations and all concentrations were below the BC WQG. The trends in tissue concentrations do not reflect what is observed in arsenic concentrations in surface water collected from nearby locations.
 - No consistent trends were observed in zooplankton copper concentrations measured in sampling events from 2014 and 2015. Tissue concentrations of copper were generally higher at Hazeltine compared to the other two stations. In 2014, tissue concentrations of copper appeared to increase from October to November; however, this same increasing trend was not observed to continue in 2015. One elevated copper concentration was observed at Hazeltine in May 2015. Given that copper does not biomagnify in freshwater systems (Cardwell et al. 2013) and aqueous copper concentrations in May 2015 were similar to or lower than aqueous concentrations during other sampling events that did not result in comparable copper concentrations in tissue, this elevated value appears to be anomalous.
 - Zooplankton tissue mercury concentrations were variable at all three stations, with no consistent spatial or temporal trends. In 2015, tissue concentrations of mercury at Hazeltine and Junction increased between May and September to values within the range observed at Junction in September 2014. Aqueous mercury data are sparse and aqueous concentrations were below the reported detection limit in all samples and interpretation of aqueous mercury trends is therefore limited.
 - Zooplankton tissue selenium concentrations appeared to exhibit a generally increasing trend at all stations throughout the 2015 sampling period with the exception of the August 2015 sampling event when lower concentrations were observed. Over the open-water period of 2015, aqueous selenium concentrations exhibited a slight decreasing trend.

A brief summary of the findings for Polley Lake sampling is as follows:

- Trophic status of Polley Lake was classified as ranging from oligotrophic to mesotrophic based on nutrients, Secchi depth, and chlorophyll *a* concentrations measured during the 2015 period.
- Total zooplankton abundance in Polley Lake increased from May to June followed by a decline in abundance from June to August. In September, P1 had an increase in zooplankton abundance where P2 had a slight decline from August. No biomass calculations were made so it is unknown whether zooplankton biomass follows a similar seasonal pattern compared to abundance.

- Similar community composition was observed at the two stations in Polley Lake. Copepod nauplii made up the greatest proportion of total zooplankton abundance in Polley Lake between May and July whereas cyclopoid copepods were generally dominant in August and September. Cladocerans, rotifers, and calanoid copepods were generally present in smaller numbers at both stations through the open water period.
- Zooplankton tissue concentrations of arsenic, copper, mercury, and selenium were generally similar between sampling stations (P1 and P2) in Polley Lake in 2015 with the exception of the September sampling event when P1 was consistently higher than P2 for arsenic, copper, mercury, and selenium.
 - Tissue concentrations of arsenic, copper, mercury, and selenium displayed an increasing trend from May to September at P1. This trend was not observed in aqueous concentrations of these parameters with the exception of copper, which also exhibited a slight increase in aqueous concentrations at both sampling locations.
 - Zooplankton tissue selenium concentrations were at or above the BC interim dietary guideline for tissue consumption by fish (BC MOE 2014) at both stations during the sampling events in Polley Lake in 2015.

Due to laboratory processing errors and lack of replication in zooplankton tissue chemistry samples, the ability to characterize natural variability and identify discernible trends in zooplankton tissue chemistry is limited. Field replication and evaluation of sample collection protocols would be helpful to characterize the normal range of variability in this biological matrix and evaluate the usefulness as a long-term monitoring tool.

Ongoing monitoring of plankton communities during the open water period in Quesnel and Polley lakes will continue to provide information related to seasonal and spatial variability in limnological characteristics of these lakes. Information related to lower trophic level communities, such as phytoplankton and zooplankton, will contribute to the interpretation of the overall assessment of fish productivity in the lake.

6.0 STATEMENT OF LIMITATIONS

This technical memorandum was prepared for the exclusive use of MPMC. The inferences concerning the data, site and receiving environment conditions contained in this memorandum are based on information obtained during investigations conducted at the site by Golder Associates Ltd. (Golder), other consultants and MPMC, and are based solely on the condition of the site at the time of the site studies and subsequent investigations and remediation and other information obtained by Golder, as described in this memorandum. Soil, surface water and groundwater conditions may vary with location, depth, time, sampling methodology, analytical techniques and other factors.

In evaluating the subject site and water quality data, Golder has relied in good faith on information provided. The factual data, interpretations and recommendations pertain to a specific project as described in this memorandum, based on the information obtained during the assessment by Golder on the dates cited in the memorandum, and are not applicable to any other project or site location. Golder accepts no responsibility for any deficiency or inaccuracy contained in this memorandum as a result of reliance on the aforementioned information.

The findings and conclusions documented in this memorandum have been prepared for the specific application to this project, and have been developed in a manner consistent with that level of care normally exercised by environmental professionals currently practising under similar conditions in the jurisdiction. Golder makes no other warranty, expressed or implied and assumes no liability with respect to the use of the information contained in this memorandum at the subject site, or any other site, for other than its intended purpose.

Any use which a third party makes of this memorandum, or any reliance on or decisions to be made based on it, are the responsibility of such third parties. Golder accepts no responsibility for damages, if any, suffered by any third party as a result of decisions made or action based on this memorandum. All third parties relying on this memorandum do so at their own risk. Electronic media is susceptible to unauthorized modification, deterioration and incompatibility and therefore no party can rely upon the electronic media versions of Golder's memorandum or other work product. Golder is not responsible for any unauthorized use or modifications of this memorandum.

MPMC may rely on the information contained in this memorandum subject to the above limitations.

Golder makes no other representation whatsoever, including those concerning the legal significance of its findings, or as to other legal matters touched on in this memorandum, including, but not limited to, ownership of any property, or the application of any law to the facts set forth herein.

If new information is discovered during future work, including excavations, sampling, soil boring, predictive geochemistry or other investigations, Golder should be requested to re-evaluate the conclusions of this memorandum and to provide amendments, as required, prior to any reliance upon the information presented herein. The validity of this memorandum is affected by any change of site conditions, purpose, development plans or significant delay from the date of this memorandum in initiating or completing the project.

7.0 CLOSURE

We trust that this information is sufficient for your needs at this time. Should you have any questions or concerns, please do not hesitate to contact the undersigned at 604-296-4200.

Table A1-7: Secchi Depth, Chlorophyll a, Total Phosphorus and Total Nitrogen Data for Polley Lake, 2015

Station	Month	Secchi Depth (m)	Chlorophyll a ($\mu\text{g/L}$)	Total Phosphorus ($\mu\text{g/L}$)	Total Nitrogen ($\mu\text{g/L}$)	N:P Ratio
P1	May	3.4	1.700	19.2	363	9
	June	6.0	0.156	12.1	406	15
	July	4.5	1.730	16.1	367	10
	August	6.0	0.618	7.1	335	21
	September	7.3	1.480	6.8	382	25
P2	May	2.1	1.010	20.1	380	9
	June	6.9	0.238	13.3	409	14
	July	3.1	0.832	15.0	359	11
	August	5.5	0.511	6.4	326	23
	September	5.8	1.010	6.9	370	24

P=Polley Lake; m=metre; $\mu\text{g/L}$ = microgram per litre; - = no data; < = less than; N:P = molar ratio of nitrogen to phosphorus concentrations

Table A1-8: Trophic Status Index Calculations for Polley Lake, 2015

Station	Month	Trophic Status Index		
		TSI (Secchi) ^(a)	TSI (Chl) ^(b)	TSI (TP) ^(c)
P1	May	42	45	47
	June	34	21	40
	July	38	45	44
	August	34	35	32
	September	31	43	32
P2	May	49	40	47
	June	32	26	41
	July	44	38	44
	August	35	33	31
	September	35	40	32

P=Polley Lake; TSI = Trophic Status Index; Chl = chlorophyll a; TP = total phosphorus; nutrient data provided by Mt Polley Mine.

(a) $TSI(\text{Secchi}) = 10(6 - (\ln(\text{Secchi Depth})/\ln 2))$

(b) $TSI(\text{Chl}) = 10(6 - (2.04 - 0.68 \ln \text{Chl}/\ln 2))$

(c) $TSI(\text{TP}) = 10(6 - (\ln(48/\text{TP})/\ln 2))$

Statement of Work:

The objectives were to identify, enumerate, and size samples of freshwater zooplankton using microcomputer-based measuring system and to supply data in data files according to the following work specifications.

Specifications:

The work required the identification, enumeration, and sizing of freshwater zooplankton in samples collected from Quesnel Lake. The analysis of each sample required quantitative subsampling, identification usually to genus, measurement of each animal by a microcomputer image measuring system, sending data in ASCII file format to the contact person. To process the data further, contact DFO – Steve McDonald at Steve.McDonald@dfo-mpo.gc.ca or Kelly Malange at <mailto:Kelly.Malange@dfo-mpo.gc.ca>.

Sample analysis:

The analysis of each sample, 150 zooplankton $\leq 600\mu\text{m}$ which includes a maximum of 50 nauplii, $100 \geq 600\mu\text{m}$ and $< 1.2\text{mm}$ and 100 zooplankton $\geq 1.2\text{mm}$ were enumerated. Copepoda and cladocera were identified to genus. Chironomids and nauplii were identified as such. The body length excluding spines of each animal was measured. Cladocera lengths are from the anterior margin of the head or helmet to the base of the tail spine. Copepoda lengths are to the base of the caudal rami. The identity and length of each zooplankton is entered and in datafiles under a unique code for each genera (supplied by DFO contact). Identifications are based of the following taxonomic keys (eg. Balcer et al 1984, Stemberger 1979, Kiefer 1978).

The following codes were used in the files:

Cladocera: Eubosmina – EUB, Leptodora kindti – LEP, Holopedium gibberum – HOL, Polyphemus pediculus – POY, Scapholeberis sp. – SCA, Sida crystalline – SID.

Cyclopoid Copepods: Diacyclops sp. – DCY

Calanoid Copepods: Epischura sp. - EPI, DPT – Diaptomus sp., Nauplii – NPL.

Chironomid larva – CHI.

Telephone and Fax (604) 588-9738
FRASER ENVIRONMENTAL SERVICES**

METHODS MANUAL

Details of the analytical methods used by Fraser Environmental Services are described here. Our firm employs similar standard techniques to ensure consistency over time. The QA/QC procedures employed can be found in the QA/QC Manual.

Phytoplankton Identification and Enumeration

Scope :

This method describes the identification and enumeration of phytoplankton.

Summary :

The sample is settled overnight and the slide is examined. Using the appropriate keys and procedures, phytoplankton can then be identified and subsequently enumerated.

Apparatus :

1. Utermohl-type settling chambers
2. Inverted microscope
3. Compound microscope
4. Appropriate taxonomic keys

Reagents :

1. Lugol's Solution : prepared as outlined in **Standard Methods for the Examination of Water and Wastewater**.

Procedure :

1. Calibrate the microscope using stage and ocular micrometers (see Section 1, page 8 for procedure).
2. Confirm that the sample is appropriately preserved.
3. Settle out an appropriate sample volume randomly removed depending on the density of organisms (usually 100 mL) for approximately 24 hours. Use smaller or diluted volumes for densely populated samples or concentrate sparsely populated samples by centrifugation or by sedimentation.
4. Scan the entire slide at increasing powers of magnification to determine which species/genera are present. Identify the organisms observed to the requested level if possible.
5. Once the identifications are made, do the counts. Count at least 20 random fields,

continue counting until you get a total count of at least 100 for the dominant species. Statistical tests for randomness will be performed.

6. Enumerate the data by a total cell count (cells/mL). Calculate the per mL total for each species or genera by multiplying the actual count by the factor F as defined below :

$$F = \frac{A / r^2 \pi N}{V}$$

where A= the area of the settling chamber

r= the radius of the field

N= the number of fields counted

V= the volume settled

Taxonomic Keys :

1. Bourrelly, P. (1966)
2. Cleve-Euler, A. (1951)
3. Cleve-Euler, A. (1968)
4. Contant, H. (1978)
5. Dodd, J. (1947)
6. Germain, H. (1981)
7. Hustedt, F. (1930)
8. Hustedt, F. (1985)
9. John, D., B. Whitton, and A. Brook. (2002)
9. Komarek, J. and K. Anagnostidis. (1999)
10. Patrick, R. (1966)
11. Patrick, R. (1975)
12. Pennak, R. (1953)
13. Prescott, G. (1978)
14. Prescott, G. (1982)
15. Stein, J. (1975)
16. Ward, H.B. (1959)
17. Webber, C. (1966)
18. Wehr, J. D. and R. G. Sheath. (2003)

Note : Other taxonomic keys may be used but they will be cited in the data summary.

Periphyton Identification and Enumeration

Scope :

This method describes the identification and enumeration of periphyton.

Summary :

The sample is settled for at least two hours and the slide is examined. The minimum settling time is dependent on the volume of the chamber used. Using the appropriate keys and procedures, periphyton can then be identified and subsequently enumerated.

Apparatus :

1. Utermohl-type settling chambers
2. Inverted microscope
3. Compound microscope
4. Appropriate taxonomic keys

Reagents :

1. Lugol's Solution : prepared as outlined in **Standard Methods for the Examination of Water and Wastewater**.
2. Hyrax mounting medium (or other medium with similar optical properties).

Procedure :

1. Calibrate the microscope using stage and ocular micrometers (see Section 1, page 8 for procedure).
2. Confirm that the sample is appropriately preserved. Measure and record the total volume of the sample.
3. Settle out an appropriate sample volume randomly removed, depending on the density of organisms (usually 10 mL) for approximately 4 hours. Use smaller or diluted volumes for densely populated samples or concentrate sparsely populated samples by centrifugation or by sedimentation.
4. Scan the entire chamber at increasing powers of magnification to determine which species/genera are present. Identify the organisms observed to the requested level if possible.
5. If required prepare three diatom slides using either pyrolysis or acid digestion to clear the frustules. See Standard Methods for the Examination of Water and Wastewater for further details of these procedures.
6. Once the identifications are made, do the counts. From the settling chambers, count at least 20 random fields (at 1000X and/or 400X) continue counting until you get a count of at least 100 for the dominant species. Count at least one transect at 400X and two transects at 200X for more accurate counts of the less dominant species.

7. Enumerate the data by a total cell count (cells/mL). Calculate the per mL total for each species or genera by multiplying the actual count by the factor F as defined below :

$$F = \frac{A / r^2 \pi N}{V}$$

where A= the area of the settling chamber
 r= the radius of the field
 N= the number of fields counted
 V= the volume settled

The cells per total sample can then be determined by multiplying by the total sample volume. Then divide by the area sampled to get cells per cm². In other words the count can be multiplied by factor P as defined below to get cells per cm² :

$$P = \frac{FD V_t}{A_s}$$

where F = the factor defined previously
 D = the dilution
 V_t = the total sample volume
 A_s = the area sampled (cm²)

Zooplankton Identification and Enumeration

Scope:

This method describes the identification and enumeration of zooplankton.

Summary:

The sample is settled and the slide is examined. Using the appropriate keys and procedures, zooplankton can then be identified and subsequently enumerated.

Apparatus:

1. Sedgwick-Rafters
2. Inverted microscope
3. Compound microscope
4. Stereoscopic microscope
5. Appropriate taxonomic keys

Reagents:

1. Preservative such as 70% ethanol or 10% buffered formalin
2. 0.04% rose bengal stain

Procedure:

1. Confirm that the sample is appropriately preserved. Measure and record the total volume of the sample.
2. Examine an appropriate sample volume depending on the density of organisms (usually 50 mL) in a petri dish. Use smaller or diluted volumes for densely populated samples or concentrate sparsely populated samples by centrifugation or by sedimentation.
3. Scan the entire sample at increasing powers of magnification to determine which species/genera are present. Identify the organisms observed to the requested level if possible.
4. Once the identifications are made, do the counts. Settle out a 1mL aliquot of a well mixed subsample in a Sedgwick-Rafter, allow to settle for at least 15 minutes. Count the entire cell using a strip counting method. Count at least 3 of the 1mL aliquots, continue counting until you get a total count of at least 200 zooplankton organisms. Also do counts of 1/16 and 1/8 of the sample.
5. Enumerate the data by calculating the total number of organisms per sample for each species or genera. Take an average count for each species or genera from all the aliquots counted. This gives you an organisms per mL count. Now the volume can then be multiplied in to give you a count of organisms per total sample. The counts may be expressed as a number/unit volume or a number/unit area, depending on the instructions in the requisition.

Benthic Invertebrate Identification and Enumeration

Scope:

This method describes the identification and enumeration of benthic invertebrates.

Summary:

The sample is fractionated into various sizes. Invertebrates are removed, sorted, identified and enumerated using appropriate procedures and taxonomic keys.

Apparatus:

1. Nested screens of various sizes 1 - .001 mm
2. Dissecting microscope
3. Subsampling equipment (splitter, Stemple pipette, or gridded petri dish)
4. Compound microscope equipped with phase contrast

Reagents:

1. ethanol
2. mounting media (CMCP, Euparol)
3. KOH

Procedure:

1. Wash and decant animals and detritus from sediments and preservative.
2. Sieve through nested screens. Size classes are similar to Cummins et al. 1973.
3. Microscope sort for benthic invertebrates. Remove from detritus. Identify individuals to appropriate taxa.
4. Identified taxa will be sorted in 70% ethanol in glass vials.
5. If a sample unit contains a very large number of individuals in a given taxon, it may be necessary to subsample to obtain an estimate because the time required to count is prohibitive (Merritt and Cummins 1984). If subsampling is required, size fraction and subsample volumes will be based on the nature of the sample, especially the density of benthic invertebrates. For example, size fractions will be made up to a constant volume (500-1000 mL) and 1 - 3 subsamples (40 mL) will be randomly removed (Merritt and Cummins 1984). Statistical tests for randomness will be performed according to Elliot (1977). Subsamples will be identified as in procedure 3.
6. If permanent microscope slides are required to be made in order to identify benthic invertebrates to a particular level, the following two procedures will be used : a) direct slide mounting from water or ethanol if CMC or Euparol is used, or b) the clearing of opaque tissues by heating in 5-10% KOH solution until transparent, then transfer to distilled water and 95% ethanol 1 minute, then use mounting media.

Taxonomic Keys:

Certified Reference Material	Sodium (Na)-Total	RM-H	L1618673-1

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLB	Detection Limit was raised due to detection of analyte at comparable level in Method Blank.
DUP-H	Duplicate results outside ALS DQO, due to sample heterogeneity.
RM-H	Reference Material recovery was above ALS DQO. Non-detected sample results are considered reliable. Other results, if reported, have been qualified.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
HG-DRY-MICR-CVAF-VA	Tissue	Mercury in Tissue by CVAFS Micro (DRY)	EPA 200.3, EPA 245.7
<p>This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.</p>			
MET-DRY-MICR-HRMS-VA	Tissue	Metals in Tissue by HR-ICPMS Micro (DRY)	EPA 200.3/200.8
<p>Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on dry weight basis.</p> <p>Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.</p>			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Duplicate	Thallium (Tl)-Total	DUP-H	L1633703-1, -2, -3
Matrix Spike	Sodium (Na)-Total	MS-B	L1633703-1, -2, -3
Matrix Spike	Strontium (Sr)-Total	MS-B	L1633703-1, -2, -3

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLB	Detection Limit was raised due to detection of analyte at comparable level in Method Blank.
DLIS	Detection Limit Adjusted: Insufficient Sample
DUP-H	Duplicate results outside ALS DQO, due to sample heterogeneity.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
HARDNESS-CALC-VA	Water	Hardness	APHA 2340B
Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO ₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.			
HG-DRY-MICR-CVAF-VA	Tissue	Mercury in Tissue by CVAFS Micro (DRY)	EPA 200.3, EPA 245.7
This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.			
MET-DRY-MICR-HRMS-VA	Tissue	Metals in Tissue by HR-ICPMS Micro (DRY)	EPA 200.3/200.8
Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on dry weight basis.			
Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.			
MET-T-CCMS-VA	Water	Total Metals in Water by CRC ICPMS	EPA 200.2/6020A (mod)
Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.			
Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.			
MET-TOT-ICP-VA	Water	Total Metals in Water by ICPOES	EPA SW-846 3005A/6010B
This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or microwave oven (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Method Blank	Zinc (Zn)-Total	MB-LOR	L1640340-1, -2, -3

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLB	Detection Limit Raised. Analyte detected at comparable level in Method Blank.
DLIS	Detection Limit Adjusted: Insufficient Sample
DLIV	Detection Limit Adjusted: Lower Initial Volume
MB-LOR	Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
HARDNESS-CALC-VA	Water	Hardness	APHA 2340B
Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO ₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.			
HG-DRY-MICR-CVAF-VA	Tissue	Mercury in Tissue by CVAFS Micro (DRY)	EPA 200.3, EPA 245.7
This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.			
MET-DRY-MICR-HRMS-VA	Tissue	Metals in Tissue by HR-ICPMS Micro (DRY)	EPA 200.3/200.8
Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on dry weight basis.			
Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.			
MET-T-CCMS-VA	Water	Total Metals in Water by CRC ICPMS	EPA 200.2/6020A (mod)
Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.			
Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.			
MET-TOT-ICP-VA	Water	Total Metals in Water by ICPOES	EPA SW-846 3005A/6010B
This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or microwave oven (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

Sample Parameter Qualifier Definitions:

Qualifier	Description
J	Duplicate results and limits are expressed in terms of absolute difference.
MB-LOR	Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level.
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Reference Information

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLB	Detection Limit Raised. Analyte detected at comparable level in Method Blank.
DLHM	Detection Limit Adjusted: Sample has High Moisture Content

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
HG-DRY-MICR-CVAF-VA	Tissue	Mercury in Tissue by CVAFS Micro (DRY)	EPA 200.3, EPA 245.7
<p>This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.</p>			
MET-DRY-MICR-HRMS-VA	Tissue	Metals in Tissue by HR-ICPMS Micro (DRY)	EPA 200.3/200.8
<p>Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on dry weight basis.</p> <p>Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.</p>			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
----------------------------	---------------------

Chain of Custody Numbers:

P0205

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

	Iron (Fe)-Total (mg/kg)		1540	334	1940
	Lead (Pb)-Total (mg/kg)		0.62	2.14	0.95
	Lithium (Li)-Total (mg/kg)		<3.5 ^{DLHM}	0.63	2.2
	Magnesium (Mg)-Total (mg/kg)		9440	2530	4440
	Manganese (Mn)-Total (mg/kg)		152	48.9	110
	Mercury (Hg)-Total (mg/kg)		0.28	0.075	0.176
	Molybdenum (Mo)-Total (mg/kg)		2.40	0.724	1.29
	Nickel (Ni)-Total (mg/kg)		6.9	2.06	4.98
	Phosphorus (P)-Total (mg/kg)		45300	11500	25000
	Potassium (K)-Total (mg/kg)		25000	13300	17200
	Rubidium (Rb)-Total (mg/kg)		46.1	14.5	25.0
	Selenium (Se)-Total (mg/kg)		9.53	3.60	4.98
	Sodium (Na)-Total (mg/kg)		21000	10700	13900
	Strontium (Sr)-Total (mg/kg)		894	194	388
	Tellurium (Te)-Total (mg/kg)		<0.14 ^{DLHM}	<0.020	<0.060 ^{DLHM}
	Thallium (Tl)-Total (mg/kg)		0.059	0.0258	0.0370
	Tin (Sn)-Total (mg/kg)		<0.70 ^{DLHM}	<0.10	<0.30 ^{DLHM}
	Uranium (U)-Total (mg/kg)		0.573	0.121	0.236
	Vanadium (V)-Total (mg/kg)		2.63	0.39	3.31
	Zinc (Zn)-Total (mg/kg)		263	75.4	180
	Zirconium (Zr)-Total (mg/kg)		<1.4 ^{DLHM}	<0.20	0.67

* Please refer to the Reference Information section for an explanation of any qualifiers detected.

Reference Information

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLHM	Detection Limit Adjusted: Sample has High Moisture Content

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
HG-DRY-MICR-CVAF-VA	Tissue	Mercury in Tissue by CVAFS Micro (DRY)	EPA 200.3, EPA 245.7
<p>This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.</p>			
MET-DRY-MICR-HRMS-VA	Tissue	Metals in Tissue by HR-ICPMS Micro (DRY)	EPA 200.3/200.8
<p>Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on dry weight basis.</p> <p>Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.</p>			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
----------------------------	---------------------

Chain of Custody Numbers:

P0212

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Sample Parameter Qualifier Definitions:

Qualifier	Description
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Certified Reference Material	Sodium (Na)-Total	RM-H	L1618713-1, -2

Qualifiers for Individual Parameters Listed:

Qualifier	Description
RM-H	Reference Material recovery was above ALS DQO. Non-detected sample results are considered reliable. Other results, if reported, have been qualified.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
---------------	--------	------------------	--------------------

HG-DRY-MICR-CVAF-VA Tissue Mercury in Tissue by CVAFS Micro (DRY) EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

MET-DRY-MICR-HRMS-VA Tissue Metals in Tissue by HR-ICPMS Micro (DRY) EPA 200.3/200.8

Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on dry weight basis.

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
----------------------------	---------------------

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Sample Parameter Qualifier Definitions:

Qualifier	Description
RM-H	Reference Material recovery was above ALS DQO. Non-detected sample results are considered reliable. Other results, if reported, have been qualified.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Method Blank	Zinc (Zn)-Total	MB-LOR	L1640343-1, -2

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLB	Detection Limit was raised due to detection of analyte at comparable level in Method Blank.
MB-LOR	Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level.
