NOTES:

(1) stated as 50% (allocable to Imperial)

(2) Mill Head Value (MHV) is a calculation of the value of material mined, in Canadian dollars per metric tonne, once it reaches the Crusher Pocket.

This includes all downstream costs from the crusher forward, including: Milling / Concentrate handling and transportation / Treatment and refining / Royalties / Sustaining capital / Administration and head office overhead costs.

Large capital costs associated with expansions, such as mining fleet additions, or replacements are not included. See table 17.24 in the Technical report available on this site for metal recovery formulas, costs and parameters used to calculate this value.

(3) For the Boundary Zone and Pond Zone Mineral Resource, a \$40 per tonne MHV cut-off grade was applied.

This value reflects the targeted unit mining cost assuming a long-hole open-stopping mining scenario with backfill.

For the Northeast Zone underground Mineral Resource, a \$30 per tonne MHV cut-off was employed.

This value reflects the potential that the larger size of the Northeast Zone will make it amenable to lower-cost bulk mining methods such as sublevel caving.
