[b] For calculation of pre-breach 95th percentile values see Appendix Table D.2.4. For calculation of reference 95th percentile values see Appendix Table D.2.5. Pre-breach sediment metal concentrations are based predominantly on bulk sediment rather than the fines fraction (<63 µm). The 5th percentile is reported for pH.

[c] Total Organic Carbon (TOC) and metals data are presented for the <63 µm sediment fraction for post-breach (2014 to 2024) data only. TOC and metals data presented for pre-breach results represent bulk sediment samples (see Appendix Table D.2.4)

[d] Total sulphur measured in bulk sediment, not the <63 µm fraction.

APPENDIX D.3
PERIPHYTON COMMUNITY AND PRODUCTIVITY

Table D.3.1: Periphyton Community and Productivity Metrics for the Upper Hazeltine Creek (HAC-R1, HAC-U [HAC-R2], HAC-R3; Exposed), Frypan Creek (FPC-R3; Reference), and Upper Edney Creek (EDC-U; Reference) Monitoring Areas, 1995 to 2024

Notes: "-" indicates no value. mg/m² = milligrams per metre squared. g/m² = grams per metre squared. Periphyton community metrics that could be calculated for historical (baseline and pre-breach) data were limited due to the qualitative nature of these data. Periphyton data were classified as "Other" taxa in laboratory results issued in 2018 but the taxonomic groups contained in this category were unknown (i.e., unknown taxonomic identification of these organisms), but suspected to include Phaeophytes, Chrysophytes, and Rhodophytes. See Minnow 2019a for detailed laboratory results for 2018. Data reported in 2018 for this "Other" category was therefore excluded from data presentation and analyses in the present report. Periphyton taxonomy results have not been reported in an "Other" category by the laboratory since 2018. See report Section 4.2.3.1 for details.

[a] W9 is the historical sampling area associated with EDC-U and W7 is the historical sampling area associated with HAC-U.

[b] HAC-R2 is the alternate name used for the HAC-U sampling area for Habitat Remediation Working Group (HRWG) reporting.

Periphyton community metrics that could be calculated for historical (baseline and pre-breach) data were limited due to the qualitative nature of these data. Periphyton data were classified as "Other" taxa in laboratory results issued in 2018 but the taxonomic groups contained in this category were unknown (i.e., unknown taxonomic identification of these organisms), but suspected to include Phaeophytes, Chrysophytes, and Rhodophytes. See Minnow 2019a for detailed laboratory results for 2018. Data reported in 2018 for this "Other" category was therefore excluded from data presentation and analyses in the present report. Periphyton taxonomy results have not been reported in an "Other" category by the laboratory since 2018. See report Section 4.2.3.1 for details.

[a] W9 is the historical sampling area associated with EDC-U and W7 is the historical sampling area associated with HAC-U.

[b] HAC-R2 is the alternate name used for the HAC-U sampling area for HRWG reporting.

Table D.3.1: Periphyton Community and Productivity Metrics for the Upper Hazeltine Creek (HAC-R1, HAC-U [HAC-R2], HAC-R3; Exposed), Frypan Creek (FPC-R3; Reference), and Upper Edney Creek (EDC-U; Reference) Monitoring Areas, 1995 to 2024

Notes: "-" indicates no value. mg/m² = milligrams per metre squared. g/m² = grams per metre squared. Periphyton community metrics that could be calculated for historical (baseline and pre-breach) data were limited due to the qualitative nature of these data. Periphyton data were classified as "Other" taxa in laboratory results issued in 2018 but the taxonomic groups contained in this category were unknown (i.e., unknown taxonomic identification of these organisms), but suspected to include Phaeophytes, Chrysophytes, and Rhodophytes. See Minnow 2019a for detailed laboratory results for 2018. Data reported in 2018 for this "Other" category was therefore excluded from data presentation and analyses in the present report. Periphyton taxonomy results have not been reported in an "Other" category by the laboratory since 2018. See report Section 4.2.3.1 for details.

[a] W9 is the historical sampling area associated with EDC-U and W7 is the historical sampling area associated with HAC-U.

[b] HAC-R2 is the alternate name used for the HAC-U sampling area for HRWG reporting.

Notes: "-" indicates no value. mg/m² = milligrams per metre squared. g/m² = grams per metre squared. Periphyton community metrics that could be calculated for historical (baseline and pre-breach) data were limited due to the qualitative nature of these data. Data do not exist for each endpoint in each year; only years with reported data for a given endpoint are presented. Periphyton data were classified as "Other" taxa in laboratory results issued in 2018 but the taxonomic groups contained in this category were unknown (i.e., unknown taxonomic identification of these organisms), but suspected to include Phaeophytes, Chrysophytes, and Rhodophytes. See Minnow 2019a for detailed laboratory results for 2018. Data reported in 2018 for this "Other" category has therefore excluded from data presentation and analyses in the present report. Periphyton taxonomy results have not been reported in an "Other" category by the laboratory since 2018. See report Section 4.2.3.1 for details.

[a] W7 is the pre-breach sampling area associated with HAC-R1 and HAC-U. W9 is the pre-breach sampling area associated with EDC-U.

[b] HAC-R2 is the alternate name used for the HAC-U sampling area for HRWG reporting.

Notes: "-" indicates no value. mg/m² = milligrams per metre squared. g/m² = grams per metre squared. Periphyton community metrics that could be calculated for historical (baseline and pre-breach) data were limited due to the qualitative nature of these data. Data do not exist for each endpoint in each year; only years with reported data for a given endpoint are presented. Periphyton data were classified as "Other" taxa in laboratory results issued in 2018 but the taxonomic groups contained in this category were unknown (i.e., unknown taxonomic identification of these organisms), but suspected to include Phaeophytes, Chrysophytes, and Rhodophytes. See Minnow 2019a for detailed laboratory results for 2018. Data reported in 2018 for this "Other" category has therefore excluded from data presentation and analyses in the present report. Periphyton taxonomy results have not been reported in an "Other" category by the laboratory since 2018. See report Section 4.2.3.1 for details.

[a] W7 is the pre-breach sampling area associated with HAC-R1 and HAC-U. W9 is the pre-breach sampling area associated with EDC-U.

[b] HAC-R2 is the alternate name used for the HAC-U sampling area for HRWG reporting.

Data do not exist for each endpoint in each year; only years with reported data for a given endpoint are presented. Periphyton data were classified as "Other" taxa in laboratory results issued in 2018 but the taxonomic groups contained in this category were unknown (i.e., unknown taxonomic identification of these organisms), but suspected to include Phaeophytes, Chrysophytes, and Rhodophytes. See Minnow 2019a for detailed laboratory results for 2018. Data reported in 2018 for this "Other" category has therefore excluded from data presentation and analyses in the present report. Periphyton taxonomy results have not been reported in an "Other" category by the laboratory since 2018. See report Section 4.2.3.1 for details.

[a] W7 is the pre-breach sampling area associated with HAC-R1 and HAC-U. W9 is the pre-breach sampling area associated with EDC-U.

[b] HAC-R2 is the alternate name used for the HAC-U sampling area for HRWG reporting.

Table D.3.2: Summary Statistics of Periphyton Community and Productivity Metrics for the Upper Hazeltine Creek (HAC-R1, HAC-U [HAC-R2], HAC-R3; Exposed), Frypan Creek (FPC-R3; Reference), and Upper Edney Creek (EDC-U; Reference) Monitoring Areas, 1995 to 2024

Notes: "-" indicates no value. mg/m² = milligrams per metre squared. g/m² = grams per metre squared. Periphyton community metrics that could be calculated for historical (baseline and pre-breach) data were limited due to the qualitative nature of these data. Data do not exist for each endpoint in each year; only years with reported data for a given endpoint are presented. Periphyton data were classified as "Other" taxa in laboratory results issued in 2018 but the taxonomic groups contained in this category were unknown (i.e., unknown taxonomic identification of these organisms), but suspected to include Phaeophytes, Chrysophytes, and Rhodophytes. See Minnow 2019a for detailed laboratory results for 2018. Data reported in 2018 for this "Other" category has therefore excluded from data presentation and analyses in the present report. Periphyton taxonomy results have not been reported in an "Other" category by the laboratory since 2018. See report Section 4.2.3.1 for details.

[a] W7 is the pre-breach sampling area associated with HAC-R1 and HAC-U. W9 is the pre-breach sampling area associated with EDC-U.

[b] HAC-R2 is the alternate name used for the HAC-U sampling area for HRWG reporting.

Notes: "-" = no value. EPT = Ephemeroptera, Plecoptera, Trichoptera. DW = dry weight. WW = wet weight. #/m^2 = number per square metre. g/m^2 = grams per square metre. Reference area EDC-U was not sampled in 2020 due to habitat differences (in water depth and flow) relative to the remediated areas HAC-R1 and HAC-U (HAC-R2). Monitoring at area HAC-R3 was initiated in 2020. See Section 4.3 for details.

[a] UHC is the pre-breach sampling area associated with HAC-R1 and HAC-U. UER is the pre-breach sampling area associated with EDC-U.

[b] HAC-R2 is the alternate name used for the HAC-U sampling area for HRWG reporting.

Notes: "-" = no value. EPT = Ephemeroptera, Plecoptera, Trichoptera. DW = dry weight. WW = wet weight. #/m^2 = number per square metre. g/m^2 = grams per square metre. Reference area EDC-U was not sampled in 2020 due to habitat differences (in water depth and flow) relative to the remediated areas HAC-R1 and HAC-U (HAC-R2). Monitoring at area HAC-R3 was initiated in 2020. See Section 4.3 for details.

[a] UHC is the pre-breach sampling area associated with HAC-R1, HAC-U (HAC-R2), and HAC-R3. UER is the pre-breach sampling area associated with EDC-U.

[b] HAC-R2 is the alternate name used for the HAC-U sampling area for HRWG reporting.

Notes: " - " = no value. EPT = Ephemeroptera, Plecoptera, Trichoptera. DW = dry weight. WW = wet weight. #/m^2 = number per square metre. g/m^2 = grams per square metre. Reference area EDC-U was not sampled in 2020 due to habitat differences (in water depth and flow) relative to the remediated areas HAC-R1 and HAC-U (HAC-R2). Monitoring at area HAC-R3 was initiated in 2020. See Section 4.3 for details.

[a] UHC is the historical sampling area associated with HAC-R1, HAC-U (HAC-R2), and HAC-R3, and UER is the historical sampling area associated with EDC-U.

[b] HAC-R2 is the alternate name used for the HAC-U sampling area for HRWG reporting.

Table D.4.2: Summary Statistics of Benthic Invertebrate Community Metrics for the Upper Hazeltine Creek (HAC-R1, HAC-U [HAC-R2], HAC-R3; Exposed), Frypan Creek (FPC-R3; Reference), and Upper Edney Creek (EDC-U; Reference) Monitoring Areas, 2007 to 2024

Monitoring at area HAC-R3 was initiated in 2020. See Section 4.3 for details.

[a] UHC is the historical sampling area associated with HAC-R1, HAC-U (HAC-R2), and HAC-R3, and UER is the historical sampling area associated with EDC-U.

[b] HAC-R2 is the alternate name used for the HAC-U sampling area for HRWG reporting.

Table D.4.2: Summary Statistics of Benthic Invertebrate Community Metrics for the Upper Hazeltine Creek (HAC-R1, HAC-U [HAC-R2], HAC-R3; Exposed), Frypan Creek (FPC-R3; Reference), and Upper Edney Creek (EDC-U; Reference) Monitoring Areas, 2007 to 2024

Notes: " - " = no value. EPT = Ephemeroptera, Plecoptera, Trichoptera. DW = dry weight. WW = wet weight. #/m^2 = number per square metre. g/m^2 = grams per square metre. Reference area EDC-U was not sampled in 2020 due to habitat differences (in water depth and flow) relative to the remediated areas HAC-R1 and HAC-U (HAC-R2). Monitoring at area HAC-R3 was initiated in 2020. See Section 4.3 for details.

[a] UHC is the historical sampling area associated with HAC-R1, HAC-U (HAC-R2), and HAC-R3, and UER is the historical sampling area associated with EDC-U.

[b] HAC-R2 is the alternate name used for the HAC-U sampling area for HRWG reporting.

Notes: " - " = no value. EPT = Ephemeroptera, Plecoptera, Trichoptera. DW = dry weight. WW = wet weight. #/m^2 = number per square metre. g/m^2 = grams per square metre. Reference area EDC-U was not sampled in 2020 due to habitat differences (in water depth and flow) relative to the remediated areas HAC-R1 and HAC-U (HAC-R2). Monitoring at area HAC-R3 was initiated in 2020. See Section 4.3 for details.

[a] UHC is the historical sampling area associated with HAC-R1, HAC-U (HAC-R2), and HAC-R3, and UER is the historical sampling area associated with EDC-U.

[b] HAC-R2 is the alternate name used for the HAC-U sampling area for HRWG reporting.

Notes: " - " = no value. EPT = Ephemeroptera, Plecoptera, Trichoptera. DW = dry weight. WW = wet weight. #/m^2 = number per square metre. g/m^2 = grams per square metre. Reference area EDC-U was not sampled in 2020 due to habitat differences (in water depth and flow) relative to the remediated areas HAC-R1 and HAC-U (HAC-R2). Monitoring at area HAC-R3 was initiated in 2020. See Section 4.3 for details.

[a] UHC is the historical sampling area associated with HAC-R1, HAC-U (HAC-R2), and HAC-R3, and UER is the historical sampling area associated with EDC-U.

[b] HAC-R2 is the alternate name used for the HAC-U sampling area for HRWG reporting.

Note: "-" indicates no data.

[a] UHC is the pre-breach sampling area associated with HAC-R1, HAC-U (HAC-R2), and HAC-R3. UER is the pre-breach sampling area associated with EDC-U.

[b] HAC-R2 is the alternate name used for the HAC-U sampling area for HRWG reporting.

[c] Benthic invertebrate community sampling was not completed at the upper Edney Creek reference area (EDC-U) in 2020 due to habitat differences relative to the remediated areas (HAC-R1 and HAC-U; Minnow 2021a).

Table D.4.3: Benthic Invertebrate Community Supporting Measures for the Upper Hazeltine Creek (HAC-R1, HAC-U [HAC-R2], HAC-R3; Exposed), Frypan Creek (FPC-R3; Reference), and Upper Edney Creek (EDC-U; Reference) Monitoring Areas, 2018 to 2024

Note: "-" indicates no data.

[a] UHC is the pre-breach sampling area associated with HAC-R1, HAC-U (HAC-R2), and HAC-R3. UER is the pre-breach sampling area associated with EDC-U.

[b] HAC-R2 is the alternate name used for the HAC-U sampling area for HRWG reporting.

[c] Benthic invertebrate community sampling was not completed at the upper Edney Creek reference area (EDC-U) in 2020 due to habitat differences relative to the remediated areas (HAC-R1 and HAC-U; Minnow 2021a).

APPENDIX D.5
PERIPHYTON AND BENTHIC INVERTEBRATE TISSUE QUALITY

Notes: "-" = no data or summary statistic could not be calculated. mg/kg dw = milligrams per kilogram dry weight. All summary statistics are reported to three significant digits for display purposes and were calculated using the Kaplan-Meier method. Sample identifiers presented in this table are an abbreviated version of the full sample identifiers and exclude a pre-fix (MP_) and a suffix (YYYY-MM; where YYYY represents the year [i.e., 2024] and MM represents the month [e.g., 08]) used in the full sample identifiers.

[a] HAC-R2 is the alternate name used the for the HAC-U sampling area for HRWG reporting.

Value exceeds the British Columbia interim guideline for selenium in invertebrate tissue (4 mg/kg dw; BCMOE 2014).

Notes: "-" = no data or summary statistic could not be calculated. mg/kg dw = milligrams per kilogram dry weight. All summary statistics are reported to three significant digits for display purposes and were calculated using the Kaplan-Meier method. Sample identifiers presented in this table are an abbreviated version of the full sample identifiers and exclude a pre-fix (MP_) and a suffix (YYYY-MM; where YYYY represents the year [i.e., 2024] and MM represents the month [e.g., 08]) used in the full sample identifiers.

[a] HAC-R2 is the alternate name used the for the HAC-U sampling area for HRWG reporting.

Value exceeds the British Columbia interim guideline for selenium in invertebrate tissue (4 mg/kg dw; BCMOE 2014).

Notes: "-" = no data or summary statistic could not be calculated. mg/kg dw = milligrams per kilogram dry weight. All summary statistics are reported to three significant digits for display purposes and were calculated using the Kaplan-Meier method. Sample identifiers presented in this table are an abbreviated version of the full sample identifiers and exclude a pre-fix (MP_) and a suffix (YYYY-MM; where YYYY represents the year [i.e., 2024] and MM represents the month [e.g., 08]) used in the full sample identifiers.

[a] HAC-R2 is the alternate name used the for the HAC-U sampling area for HRWG reporting.

Table D.5.3: **Composite-Taxa Benthic Invertebrate Tissue Quality Data from the Upper Hazeltine Creek (HAC-R1, HAC-U [HAC-R2]; Exposed) and Upper Edney Creek (EDC-U; Reference) Monitoring Areas, 2024[a]**

Value exceeds the British Columbia interim guideline for selenium in invertebrate tissue (4 mg/kg dw; BCMOE 2014).

Notes: "-" = no data or summary statistic could not be calculated. mg/kg dw = milligrams per kilogram dry weight. All summary statistics are reported to three significant digits for display purposes and were calculated using the Kaplan-Meier method. Sample identifiers presented in this table are an abbreviated version of the full sample identifiers and exclude a pre-fix (MP_) and a suffix (YYYY-MM; where YYYY represents the year [i.e., 2024] and MM represents the month [e.g., 08]) used in the full sample identifiers.

[a] HAC-R2 is the alternate name used the for the HAC-U sampling area for HRWG reporting.

Table D.5.4: Periphyton Tissue Quality Data from the Lower Hazeltine Creek (HAC-D [HAC-R5]; Exposed) and Lower Edney Creek (E1 [EDC-EXP]; Exposed and EDC-D [EDC-REF]; Reference) Monitoring Areas, 2024[a]

Notes: "-" = no data or summary statistic could not be calculated. mg/kg dw = milligrams per kilogram dry weight. All summary statistics are reported to three significant digits for display purposes and were calculated using the Kaplan-Meier method. Sample identifiers presented in this table are an abbreviated version of the full sample identifiers and exclude a pre-fix (MP_) and a suffix (YYYY-MM; where YYYY represents the year [i.e., 2024] and MM represents the month [e.g., 08]) used in the full sample identifiers.

[a] EDC-REF, EDC-EXP, and HAC-R5 are alternate names used the for the EDC-D, E1, and HAC-D sampling areas, respectively, for HRWG reporting.

Table D.5.5: **Caddisfly Tissue Quality Data from the Lower Hazeltine Creek (HAC-D [HAC-R5]; Exposed) and Lower Edney Creek (E1 [EDC-EXP]; Exposed and EDC-D [EDC-REF]; Reference) Monitoring Areas, 2024**[a]

Value exceeds the British Columbia interim guideline for selenium in invertebrate tissue (4 mg/kg dw; BCMOE 2014).

Notes: "-" = no data or summary statistic could not be calculated. mg/kg dw = milligrams per kilogram dry weight. All summary statistics are reported to three significant digits for display purposes and were calculated using the Kaplan-Meier method. Sample identifiers presented in this table are an abbreviated version of the full sample identifiers and exclude a pre-fix (MP_) and a suffix (YYYY-MM; where YYYY represents the year [i.e., 2024] and MM represents the month [e.g., 08]) used in the full sample identifiers.

[a] EDC-REF, EDC-EXP, and HAC-R5 are alternate names used the for the EDC-D, E1, and HAC-D sampling areas, respectively, for HRWG reporting.

Table D.5.5: **Caddisfly Tissue Quality Data from the Lower Hazeltine Creek (HAC-D [HAC-R5]; Exposed) and Lower Edney Creek (E1 [EDC-EXP]; Exposed and EDC-D [EDC-REF]; Reference) Monitoring Areas, 2024[a]**

Value exceeds the British Columbia interim guideline for selenium in invertebrate tissue (4 mg/kg dw; BCMOE 2014).

Notes: "-" = no data or summary statistic could not be calculated. mg/kg dw = milligrams per kilogram dry weight. All summary statistics are reported to three significant digits for display purposes and were calculated using the Kaplan-Meier method. Sample identifiers presented in this table are an abbreviated version of the full sample identifiers and exclude a pre-fix (MP_) and a suffix (YYYY-MM; where YYYY represents the year [i.e., 2024] and MM represents the month [e.g., 08]) used in the full sample identifiers.

[a] EDC-REF, EDC-EXP, and HAC-R5 are alternate names used the for the EDC-D, E1, and HAC-D sampling areas, respectively, for HRWG reporting.

Table D.5.6: Composite-Taxa Benthic Invertebrate Tissue Quality Data from the Lower Hazeltine Creek (HAC-D [HAC-R5]; Exposed) and Lower Edney Creek (E1 [EDC-EXP]; Exposed and EDC-D [EDC-REF]; Reference) Monitoring Areas, 2024[a]

Notes: UTM = Universal Transverse Mercator. NAD = North American Datum. m = meters. Closed-station backpack electrofishing was completed in Hazeltine Creek and Frypan Creek in 2024 for the purpose of Habitat Remediation Working Group (HRWG) reporting (Minnow 2025); only stations associated with fish tissue quality sample collection are presented here. See Minnow (2025) for fishing effort and catch records for all stations sampled in August 2024. HAC-R2 is the alternate name used the for the HAC-U sampling area for HRWG reporting.

[a] A subset of fish were sacrificed in order to assess fish tissue selenium concentrations. Aging structures and whole-body tissue samples were collected.

Table D.6.3: Minnow Trapping Catch Data Associated with Fish Tissue Collections from the Lower Hazeltine Creek (HAC-D [HAC-R5]; Exposed) and Lower Edney Creek (EDC-D [EDC-REF]; Exposed) Monitoring Areas, August and October 2024

Notes: ID = identifier. UTM = Universal Transverse Mercator. NAD = North American Datum. m = metres. ft = feet. CPUE = catch-per-unit-effort. EDC-REF and HAC-R5 are the alternate names used the for the EDC-D and HAC-D sampling areas for HRWG reporting. Due to water temperatures above 20°C in August 2024, minnow traps were not reset in HAC-R5.

[a] CPUE = total # of fish / trap*days.

Table D.6.4: Physical Measurements of Rainbow Trout Retained for Tissue Sampling from the Upper Hazeltine Creek (HAC-R1 and HAC-U [HAC-R2]; Exposed) and Frypan Creek (FPC-R2; Reference) Monitoring Areas, September 2018

Value exceeds Selenium Guideline for Aquatic life, fish muscle or whole-body tissue (4 mg/kg dw; BCMOE 2014).

Value exceeds Se Guideline for Human Health, general population, high consumption (7.3 mg/kg dw; BCMOE 2014).

Value exceeds Se Guideline for Human Health, general population, moderate consumption (14.5 mg/kg dw; BCMOE 2014).

Value exceeds Hg Guideline for Human Health (0.5 mg/kg ww; CFIA 2015).

Notes: "-" = no data available or standard deviation not calculated. mg/kg = milligrams per kilogram, dw = dry weight, ww = wet weight, WB = whole-body, LRL = laboratory reporting limit. Data were originally reported in Minnow (2019d). HAC-R2 is the alternate name used the for the HAC-U sampling area for HRWG reporting.

[a] All summary statistics were reported to three significant digits for display purposes. All summary statistics were calculated using the Kaplan-Meier method.

Value exceeds Selenium Guideline for Aquatic life, fish muscle or whole-body tissue (4 mg/kg dw; BCMOE 2014).

Value exceeds Se Guideline for Human Health, general population, high consumption (7.3 mg/kg dw; BCMOE 2014).

Value exceeds Se Guideline for Human Health, general population, moderate consumption (14.5 mg/kg dw; BCMOE 2014).

Value exceeds Hg Guideline for Human Health (0.5 mg/kg ww; CFIA 2015).

Notes: "-" = no data available or standard deviation not calculated. mg/kg = milligrams per kilogram, dw = dry weight, ww = wet weight, WB = whole-body, LRL = laboratory reporting limit. Data were originally reported in Minnow (2019d). HAC-R2 is the alternate name used the for the HAC-U sampling area for HRWG reporting.

[a] All summary statistics were reported to three significant digits for display purposes. All summary statistics were calculated using the Kaplan-Meier method.

Value exceeds Se Guideline for Aquatic Life, fish muscle or whole body tissue (4 mg/kg dw; BCMOE 2014).

Value exceeds Se Guideline for Human Health, general population, high consumption (7.3 mg/kg dw; BCMOE 2014).

Value exceeds Se Guideline for Human Health, general population, moderate consumption (14.5 mg/kg dw; BCMOE 2014).

Value exceeds Hg Guideline for Human Health (0.5 mg/kg ww; CFIA 2015).

Notes: "-" = no data available or standard deviation not calculated. mg/kg = milligrams per kilogram. dw = dry weight. ww = wet weight. LRL = laboratory reporting limit. All summary statistics were calculated using the Kaplan-Meier method and were reported to three significant digits for display purposes.

[a] HAC-R2 is the alternate name used the for the HAC-U sampling areas for HRWG reporting.

APPENDIX E
STATISTICAL ANALYSES - LAKE HABITAT

APPENDIX E.1
SEDIMENT QUALITY

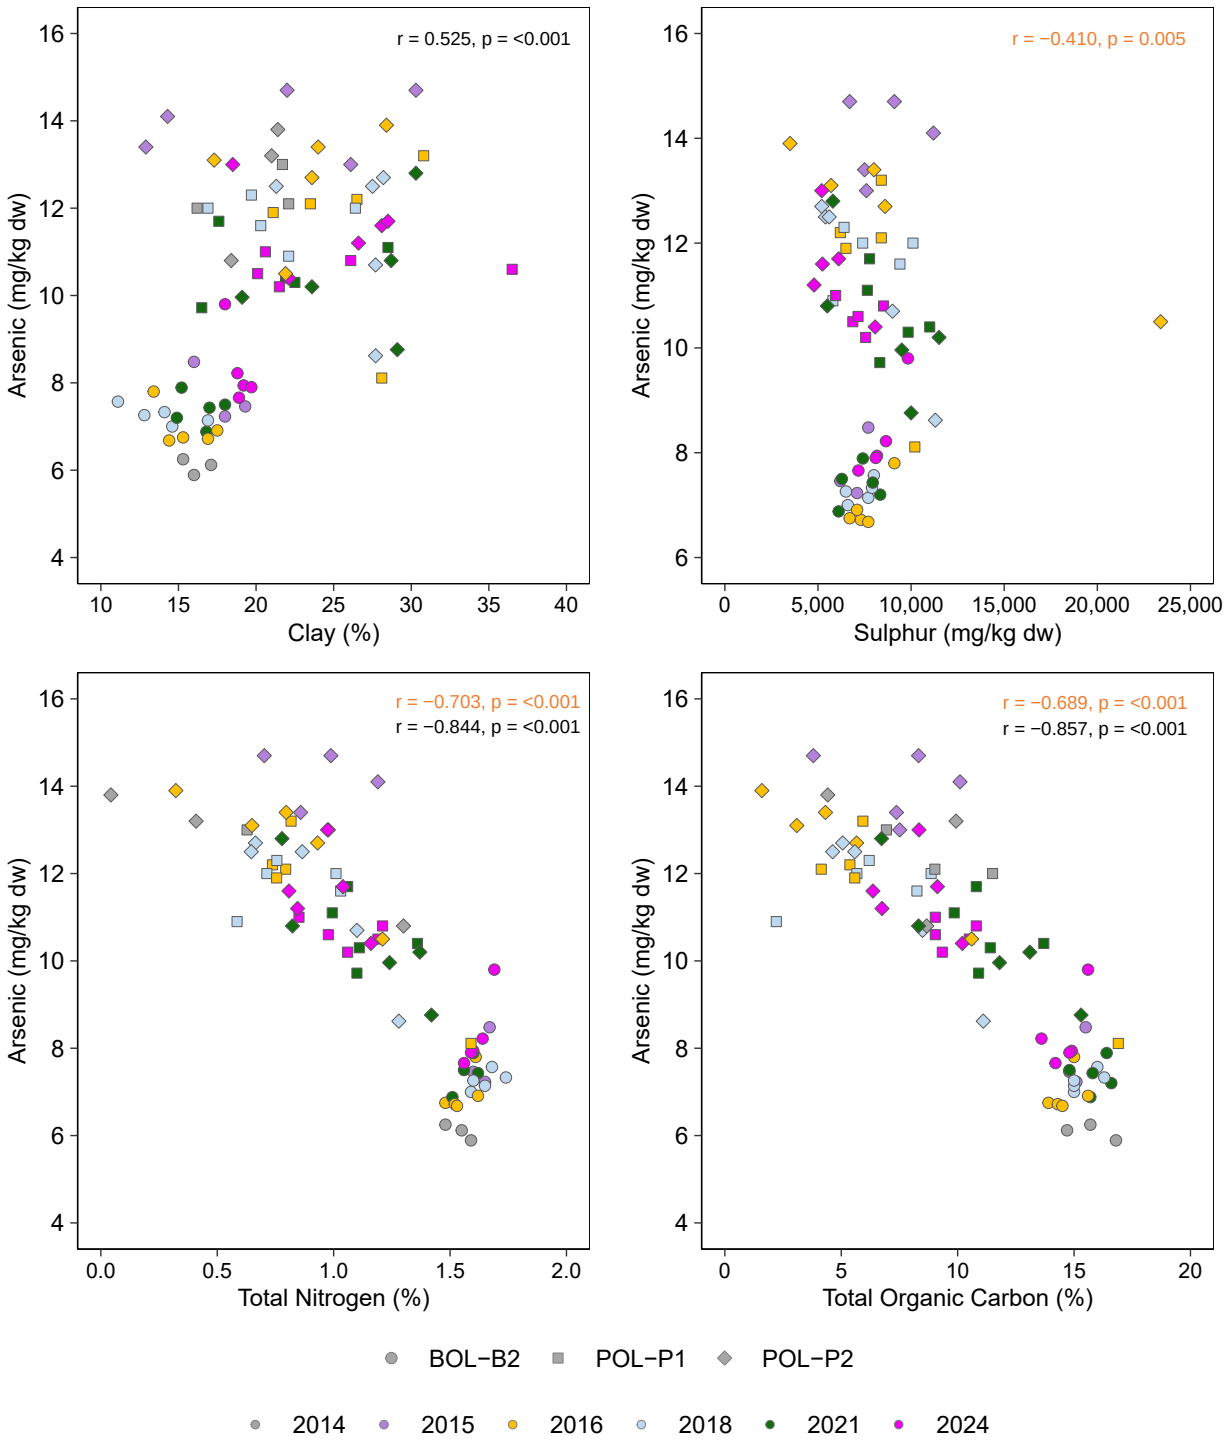

Figure E.1.1: Scatterplots of Significant Spearman's Correlation Relationships (p < 0.0125, Bonferroni Corrected) Between Analyte of Interest Concentrations (<63 µm Fraction) and Sediment Physical and Chemical Parameters for the Polley Lake (POL-P1, POL-P2; Exposed) and Bootjack Lake (BOL-B2; Reference) Deep Monitoring Areas, 2014 to 2024

Notes: mg/kg dw = milligrams per kilogram dry weight. Results of correlations that evaluated data from the deep areas of Polley Lake (POL−P1, POL−P2) and Bootjack Lake (BOL−B2) are shown in black font on each plot. Results of correlations that only evaluated data from the deep areas of Polley Lake (POL−P1, POL−P2) are shown in red font. An absence of either the red or black font on a plot indicates the displayed variables were not significantly correlated for the associated data grouping (black font = POL−P1, POL−P2 and BOL−B2; red font = POL−P1 and POL−P2 only). Open data points indicate at least one of the two variables plotted were <LRL.

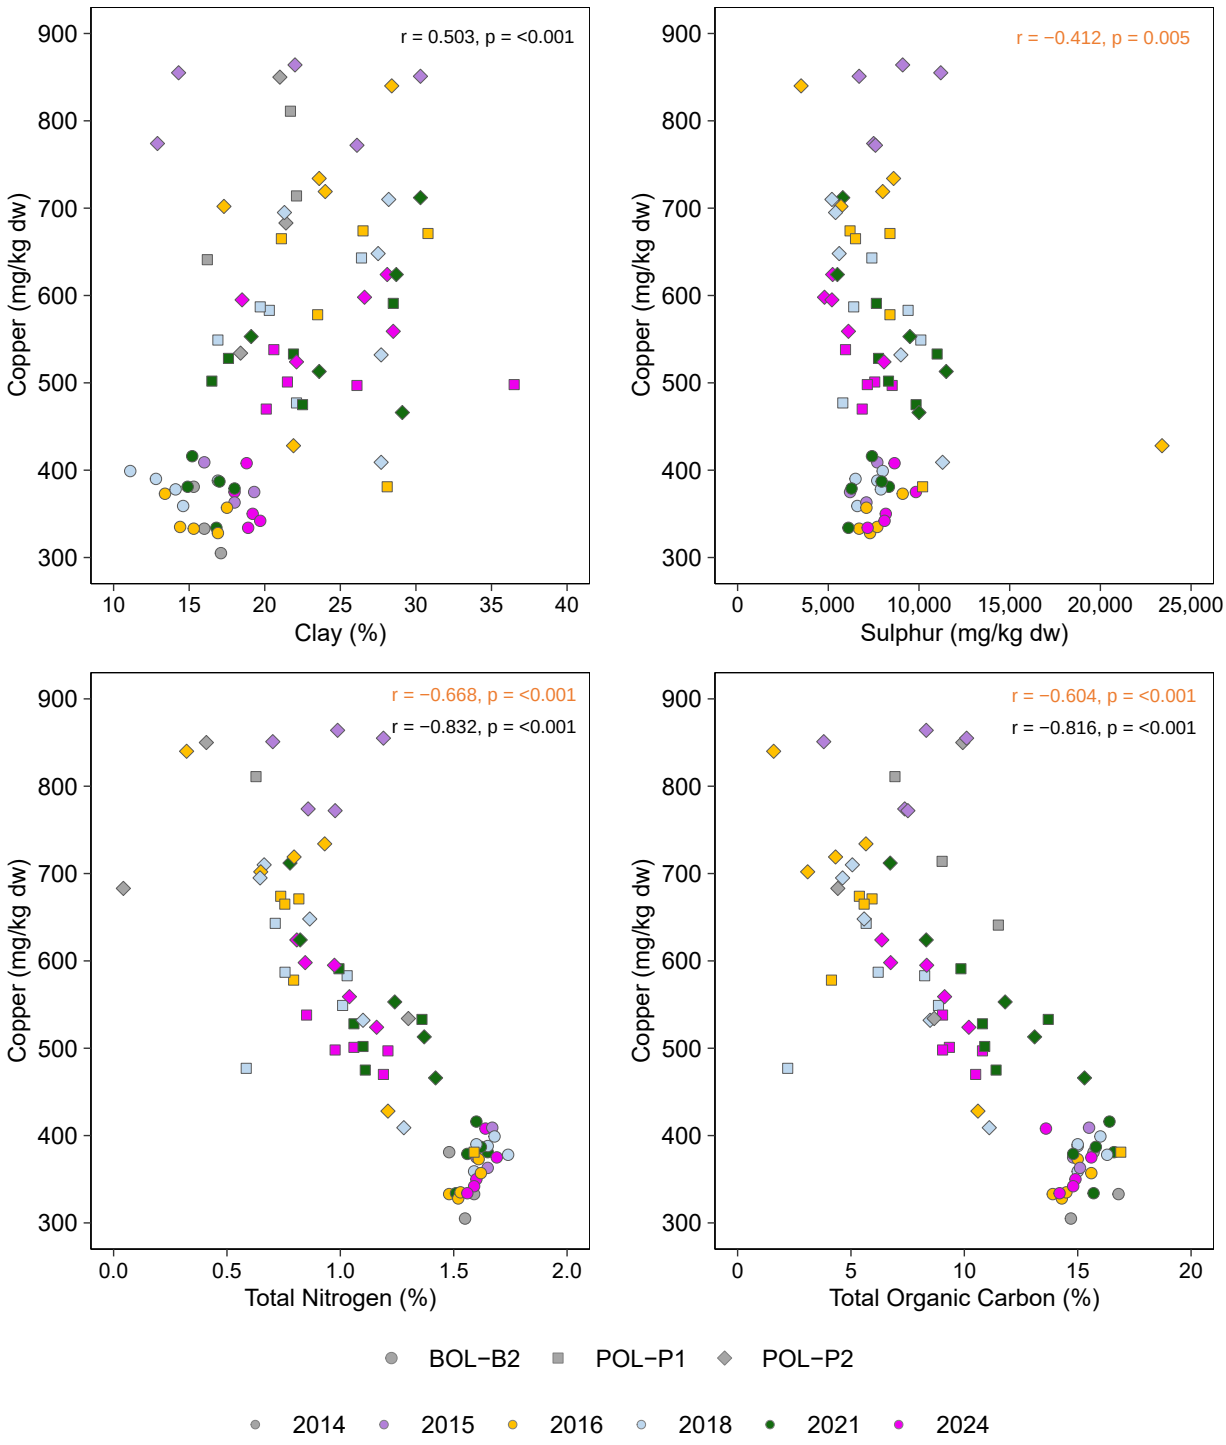

Figure E.1.1: Scatterplots of Significant Spearman's Correlation Relationships (p < 0.0125, Bonferroni Corrected) Between Analyte of Interest Concentrations (<63 µm Fraction) and Sediment Physical and Chemical Parameters for the Polley Lake (POL-P1, POL-P2; Exposed) and Bootjack Lake (BOL-B2; Reference) Deep Monitoring Areas, 2014 to 2024

Notes: mg/kg dw = milligrams per kilogram dry weight. Results of correlations that evaluated data from the deep areas of Polley Lake (POL−P1, POL−P2) and Bootjack Lake (BOL−B2) are shown in black font on each plot. Results of correlations that only evaluated data from the deep areas of Polley Lake (POL−P1, POL−P2) are shown in red font. An absence of either the red or black font on a plot indicates the displayed variables were not significantly correlated for the associated data grouping (black font = POL−P1, POL−P2 and BOL−B2; red font = POL−P1 and POL−P2 only). Open data points indicate at least one of the two variables plotted were <LRL.

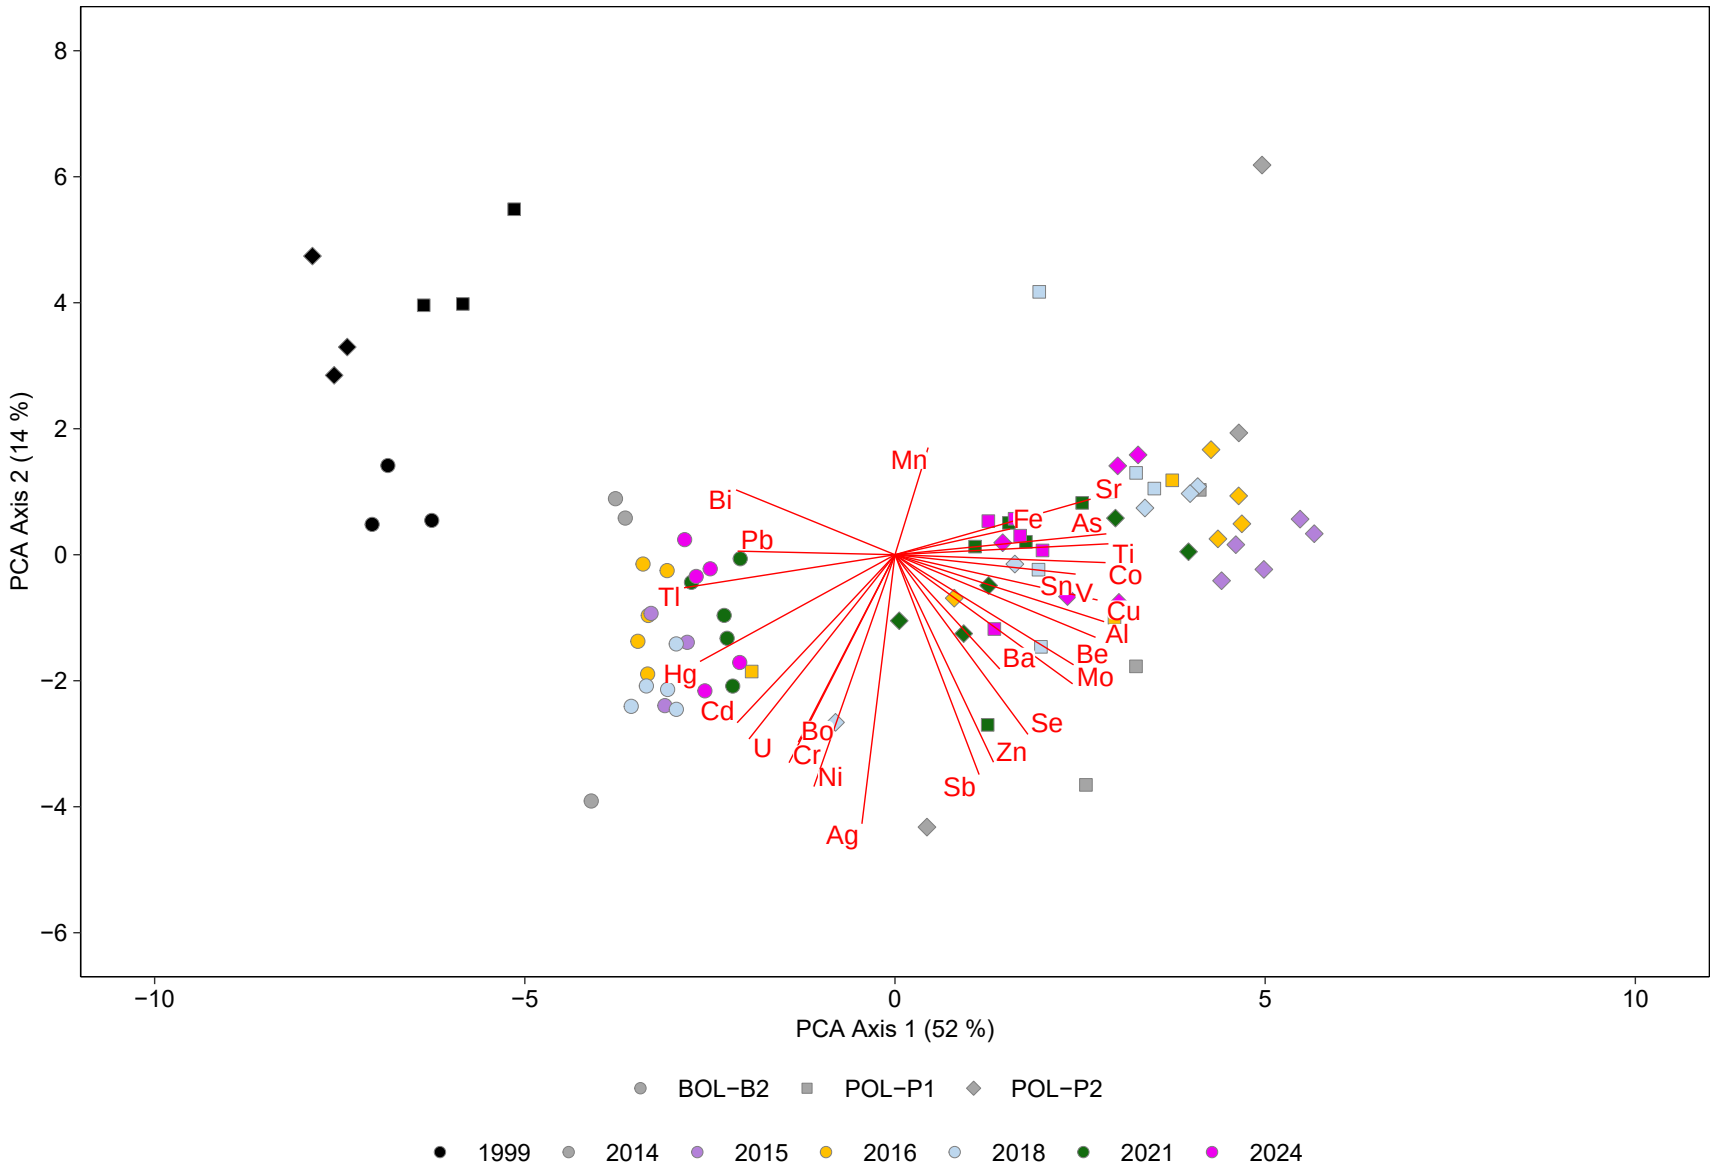

Figure E.1.2: Biplot of Principal Components Analysis (PCA) Axis Scores (PC1, PC2) for Metal Concentrations inSediment (<63 µm Fraction) for Polley Lake (POL−P1, POL−P2; Exposed) and Bootjack Lake (BOL−B2; Reference) Deep Monitoring Areas, 1999 to 2024

Notes: PCA conducted on correlation matrix with $\log_{10}$ transformed concentrations. Vectors represent the PC loadings for each parameter (scaled). Parameters that had more than 25% censored data were excluded from the analyses.

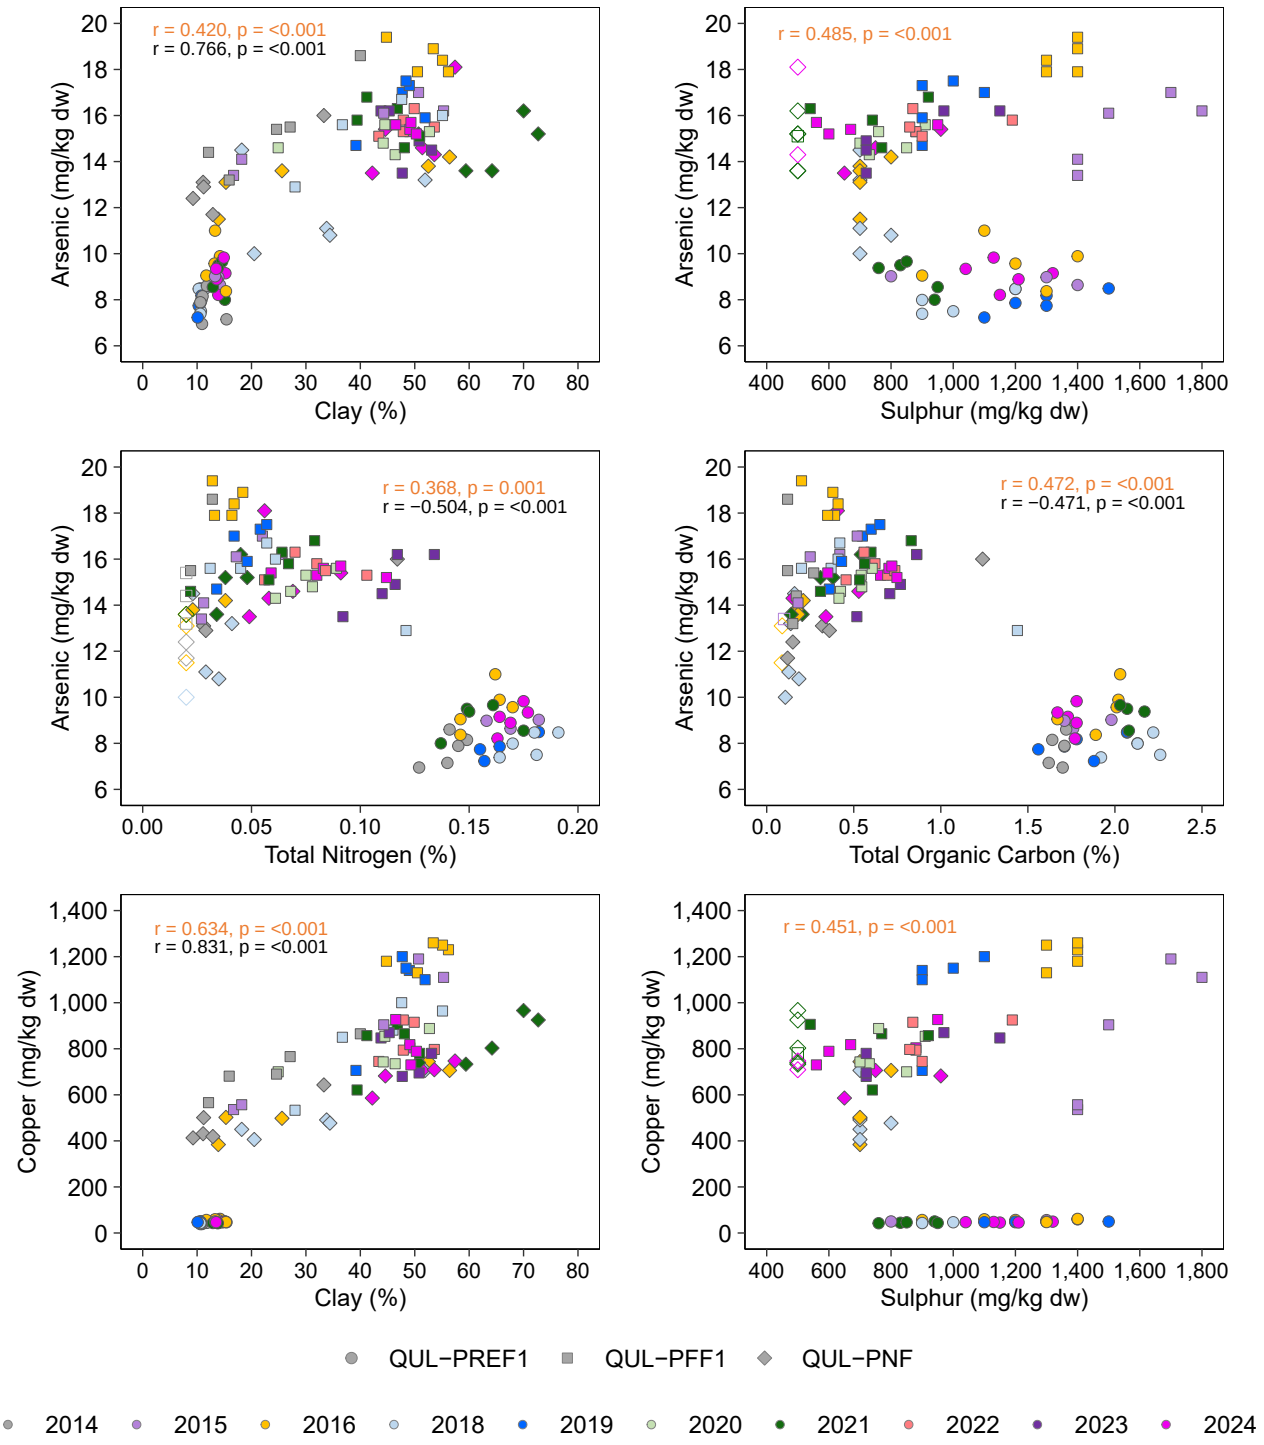

Figure E.1.3: Scatterplots of Significant Spearman's Correlation Relationships (p < 0.0125, Bonferroni Corrected) Between Analyte of Interest Concentrations (<63 µm Fraction) and Sediment Physical and Chemical Parameters for the Quesnel Lake (QUL−PNF and QUL−PFF1; Exposed and QUL−PREF1; Reference) Deep Monitoring Areas, 2014 to 2024

Notes: mg/kg dw = milligrams per kilogram dry weight. Results of correlations that evaluated data from deep exposed and reference sampling areas of Quesnel Lake (QUL−PNF, QUL−PFF1, QUL−PREF1) are shown in black font on each plot. Results of correlations that only evaluated data from the deep exposed area of Quesnel Lake (QUL−PNF) are shown in red font. An absence of either the red or black font on a plot indicates the displayed variables were not significantly correlated for the associated data grouping (black font = QUL−PNF, QUL−PFF1 and QUL−PREF1; red font = QUL−PNF and QUL-PFF1 only). Open data points indicate at least one of the two variables plotted were <LRL. QUL−PREF1 was not sampled in 2020, 2022, or 2023.

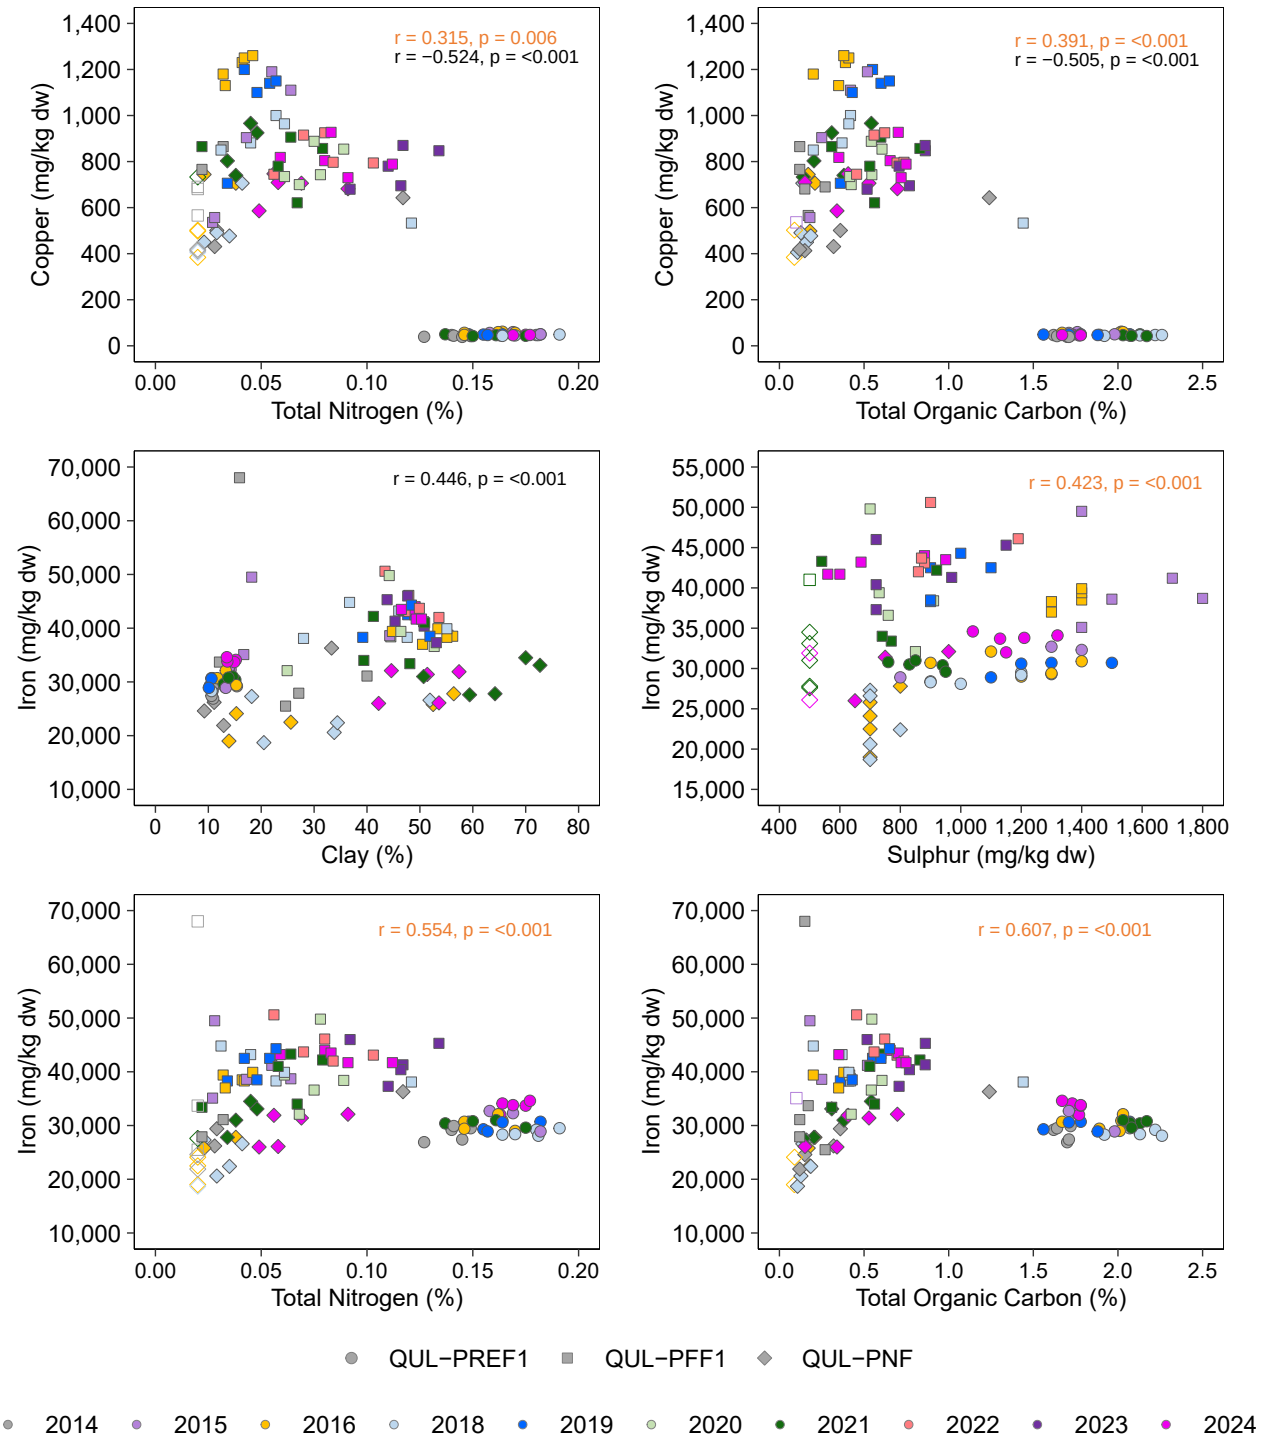

Figure E.1.3: Scatterplots of Significant Spearman's Correlation Relationships (p < 0.0125, Bonferroni Corrected) Between Analyte of Interest Concentrations (<63 µm Fraction) and Sediment Physical and Chemical Parameters for the Quesnel Lake (QUL−PNF and QUL−PFF1; Exposed and QUL−PREF1; Reference) Deep Monitoring Areas, 2014 to 2024

Notes: mg/kg dw = milligrams per kilogram dry weight. Results of correlations that evaluated data from deep exposed and reference sampling areas of Quesnel Lake (QUL−PNF, QUL−PFF1, QUL−PREF1) are shown in black font on each plot. Results of correlations that only evaluated data from the deep exposed area of Quesnel Lake (QUL−PNF) are shown in red font. An absence of either the red or black font on a plot indicates the displayed variables were not significantly correlated for the associated data grouping (black font = QUL−PNF, QUL−PFF1 and QUL−PREF1; red font = QUL−PNF and QUL-PFF1 only). Open data points indicate at least one of the two variables plotted were <LRL. QUL−PREF1 was not sampled in 2020, 2022, or 2023.

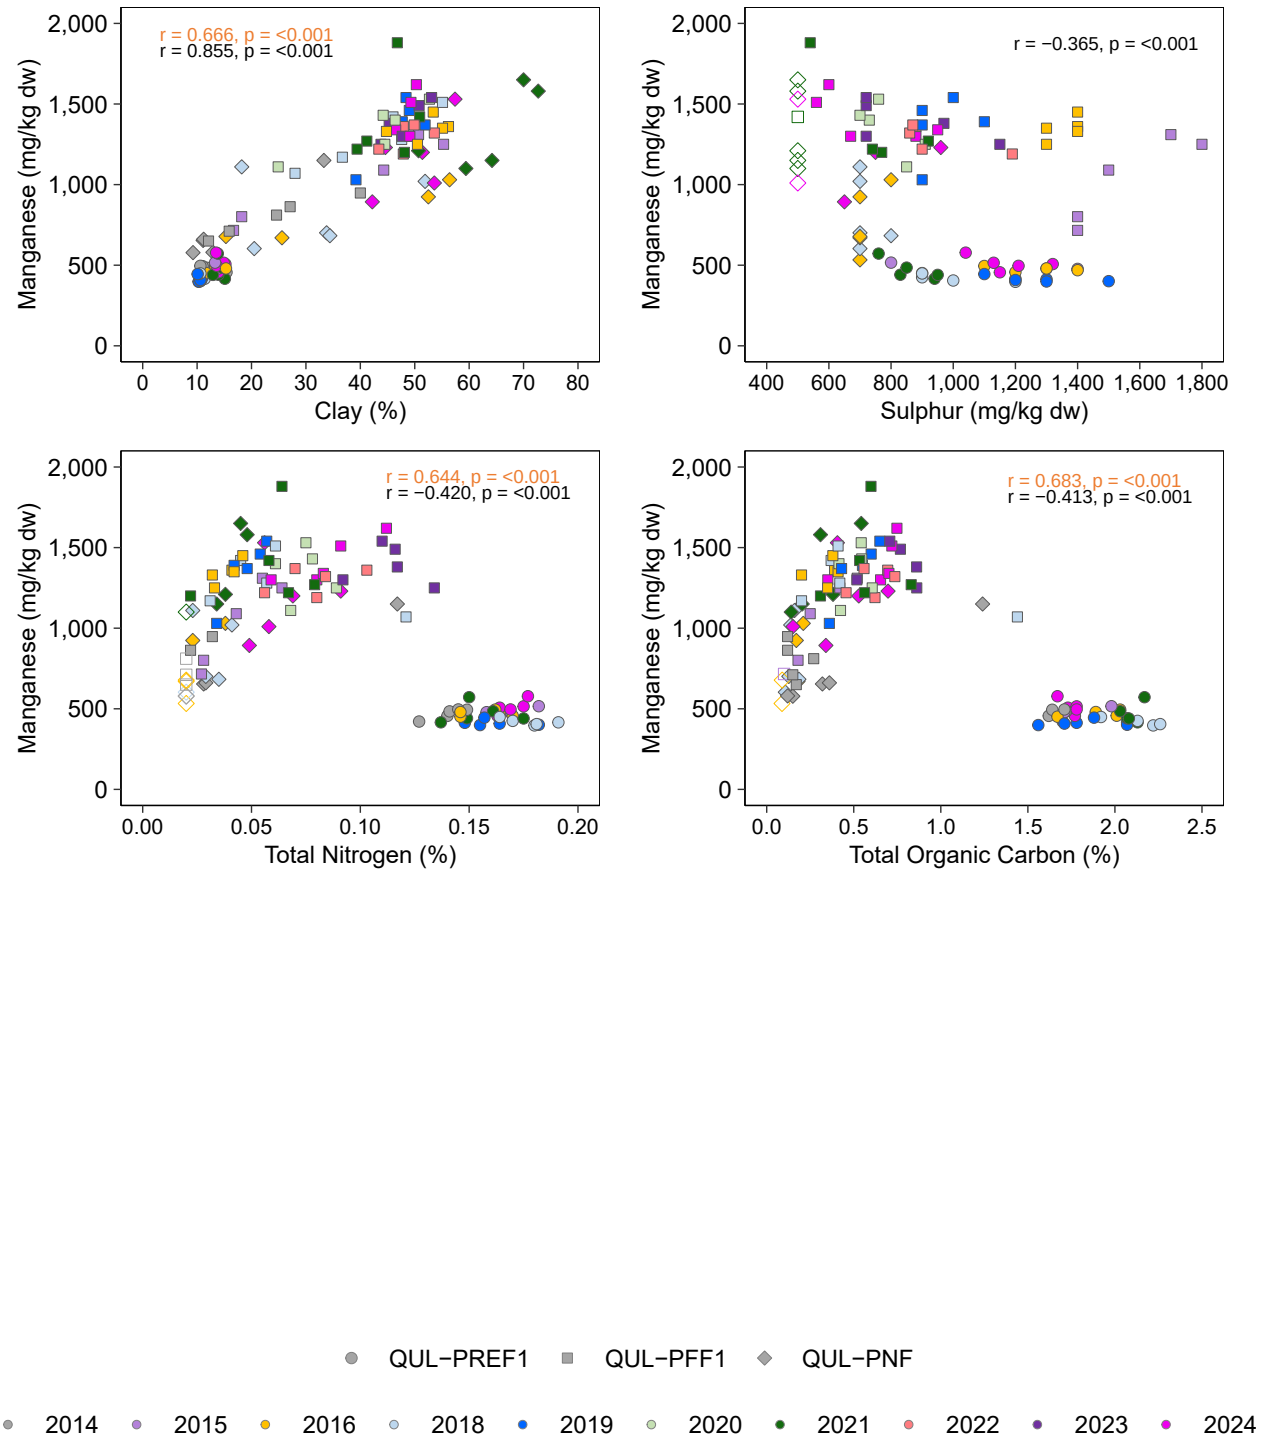

Figure E.1.3: Scatterplots of Significant Spearman's Correlation Relationships (p < 0.0125, Bonferroni Corrected) Between Analyte of Interest Concentrations (<63 µm Fraction) and Sediment Physical and Chemical Parameters for the Quesnel Lake (QUL−PNF and QUL−PFF1; Exposed and QUL−PREF1; Reference) Deep Monitoring Areas, 2014 to 2024

Notes: mg/kg dw = milligrams per kilogram dry weight. Results of correlations that evaluated data from deep exposed and reference sampling areas of Quesnel Lake (QUL−PNF, QUL−PFF1, QUL−PREF1) are shown in black font on each plot. Results of correlations that only evaluated data from the deep exposed area of Quesnel Lake (QUL−PNF) are shown in red font. An absence of either the red or black font on a plot indicates the displayed variables were not significantly correlated for the associated data grouping (black font = QUL−PNF, QUL−PFF1 and QUL−PREF1; red font = QUL−PNF and QUL-PFF1 only). Open data points indicate at least one of the two variables plotted were <LRL. QUL−PREF1 was not sampled in 2020, 2022, or 2023.

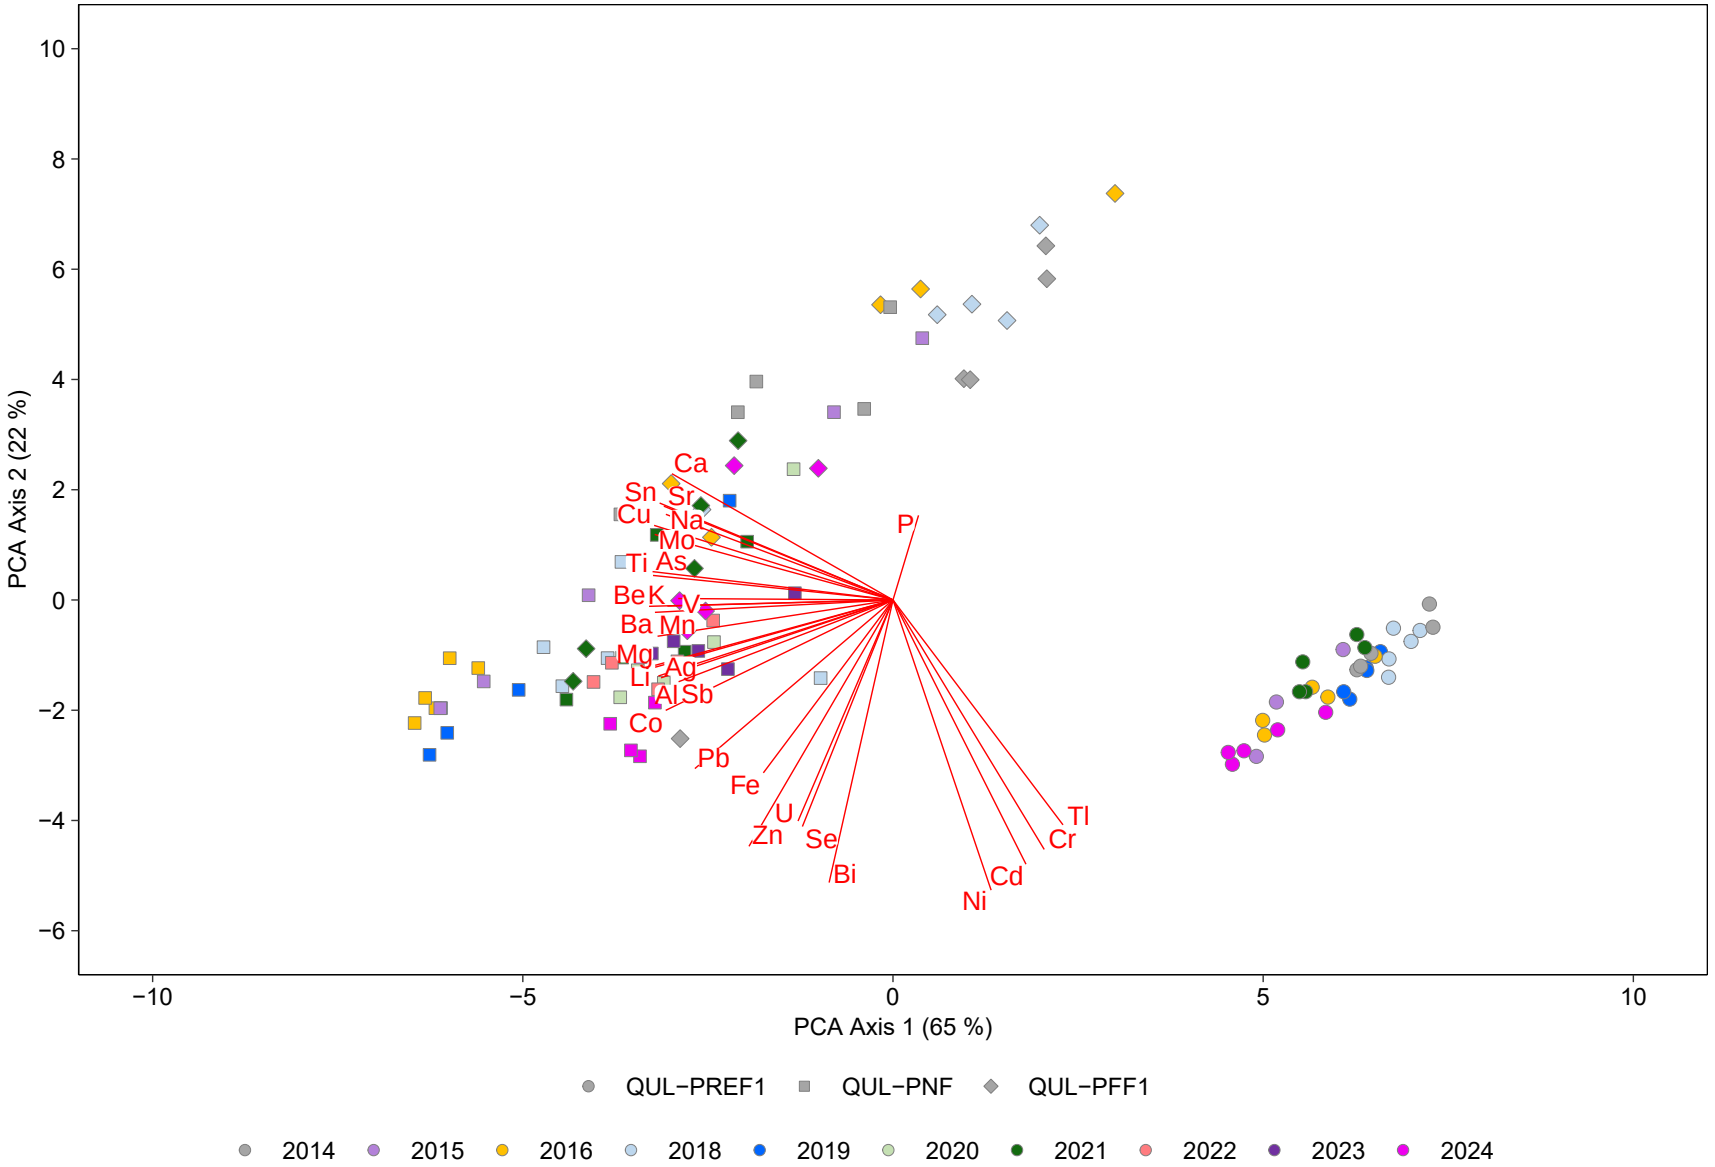

Figure E.1.4: Biplot of Principal Components Analysis (PCA) Axis Scores (PC1, PC2) for Metal Concentrations in Sediment (<63 µm Fraction) for the Quesnel Lake (QUL−PNF and QUL−PFF1;Exposed and QUL−PREF1; Reference) Deep Monitoring Areas, 2014 to 2024

Notes: PCA conducted on correlation matrix with $\log_{10}$ transformed concentrations. Vectors represent the PC loadings for each parameter (scaled). Parameters that had more than 25% censored data were excluded from the analyses. QUL−PREF1 was not sampled in 2020, 2022, or 2023.

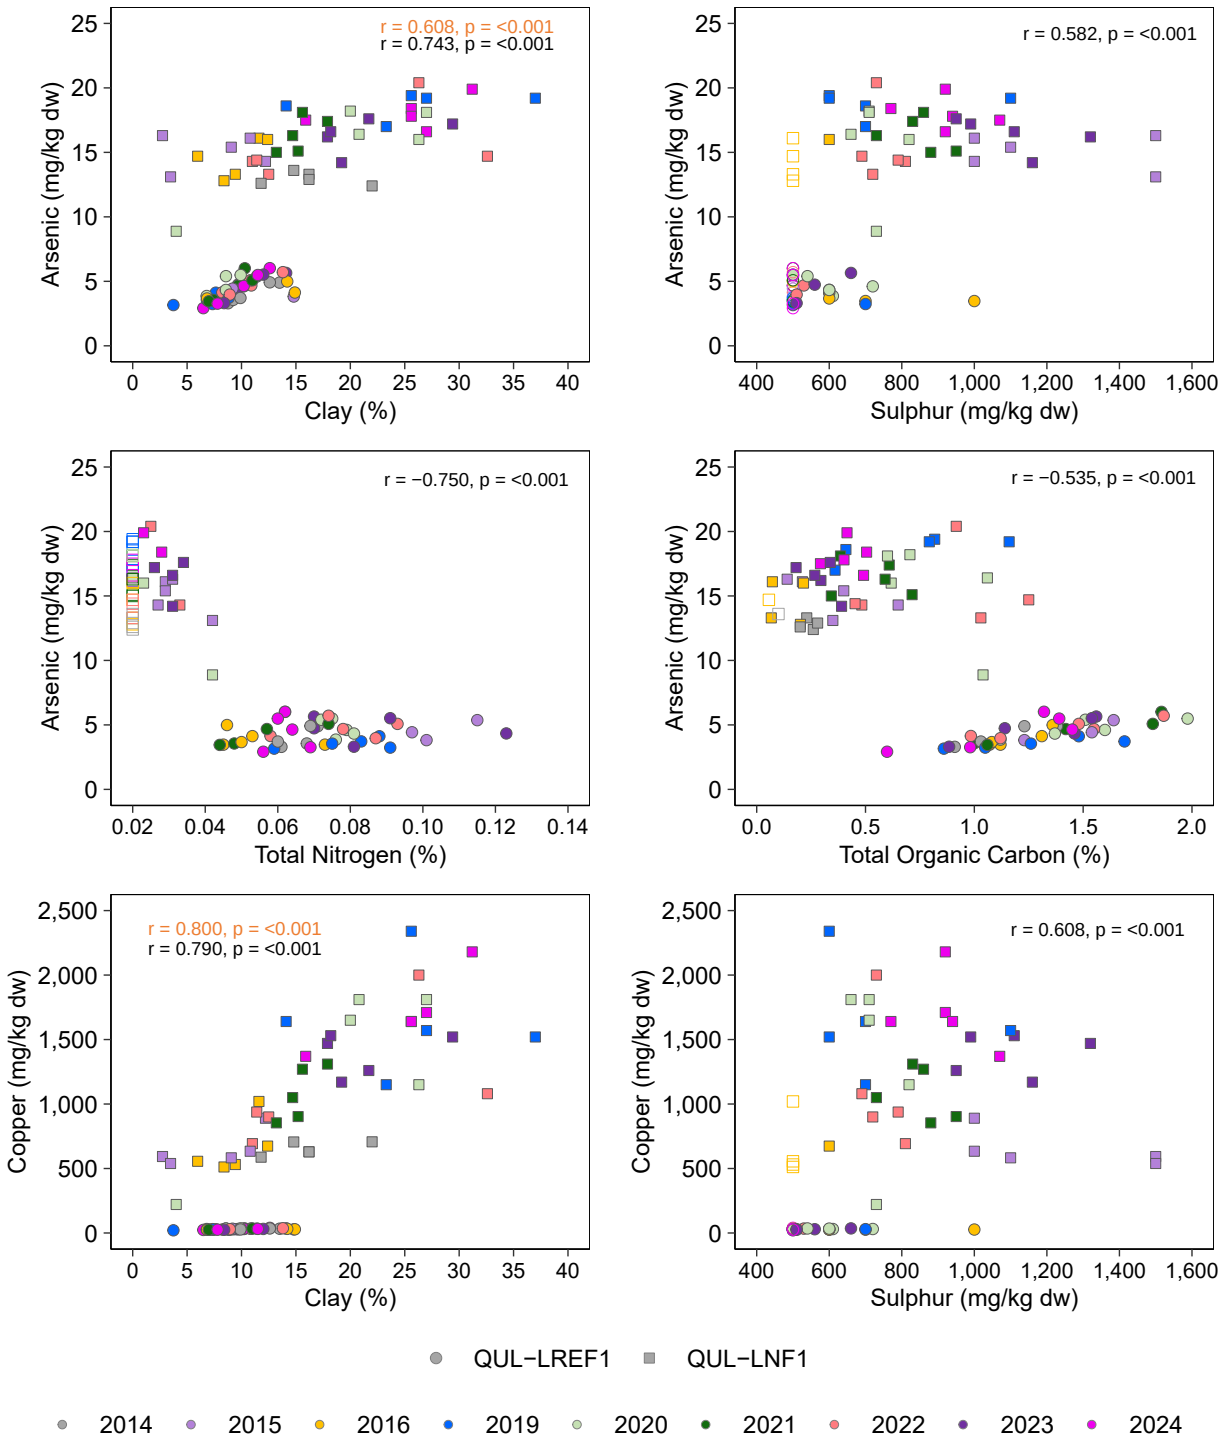

Figure E.1.5: Scatterplots of Significant Spearman's Correlation Relationships (p < 0.0125, Bonferroni Corrected) Between Analyte of Interest Concentrations (<63 µm Fraction) and Sediment Physical and Chemical Parameters for the Quesnel (QUL-LNF1; Exposed and QUL-LREF1; Reference) Shallow Monitoring Areas, 2014 to 2024

Notes: mg/kg dw = milligrams per kilogram dry weight. Results of correlations that evaluated data from shallow exposed and reference sampling areas of Quesnel Lake (QUL−LREF1, QUL−LNF1) are shown in black font on each plot. Results of correlations that only evaluated data from the shallow exposed area of Quesnel Lake (QUL−LNF1) are shown in red font. An absence of either the red or black font on a plot indicates the displayed variables were not significantly correlated for the associated data grouping (black font = QUL−LNF1 and QUL−LREF1; red font = QUL− LNF1 only). Open data points indicate at least one of the two variables plotted were <LRL.

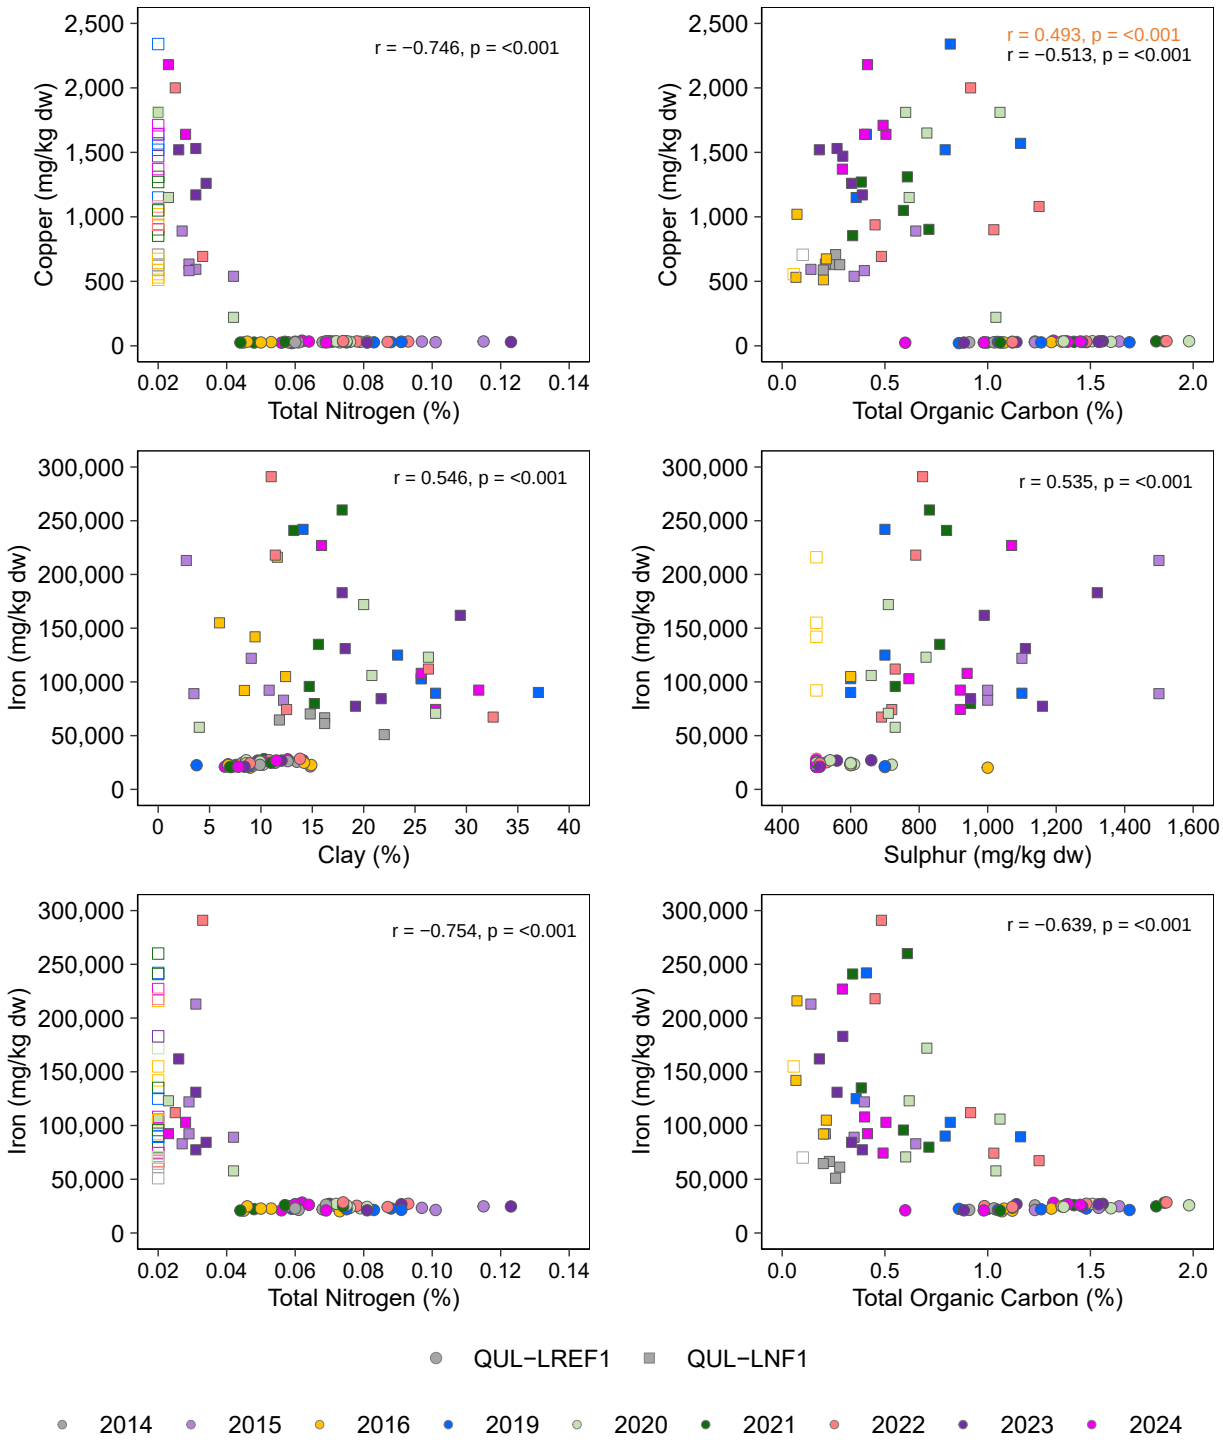

Figure E.1.5: Scatterplots of Significant Spearman's Correlation Relationships (p < 0.0125, Bonferroni Corrected) Between Analyte of Interest Concentrations (<63 µm Fraction) and Sediment Physical and Chemical Parameters for the Quesnel (QUL-LNF1; Exposed and QUL-LREF1; Reference) Shallow Monitoring Areas, 2014 to 2024

Open data points indicate at least one of the two variables plotted were <LRL.

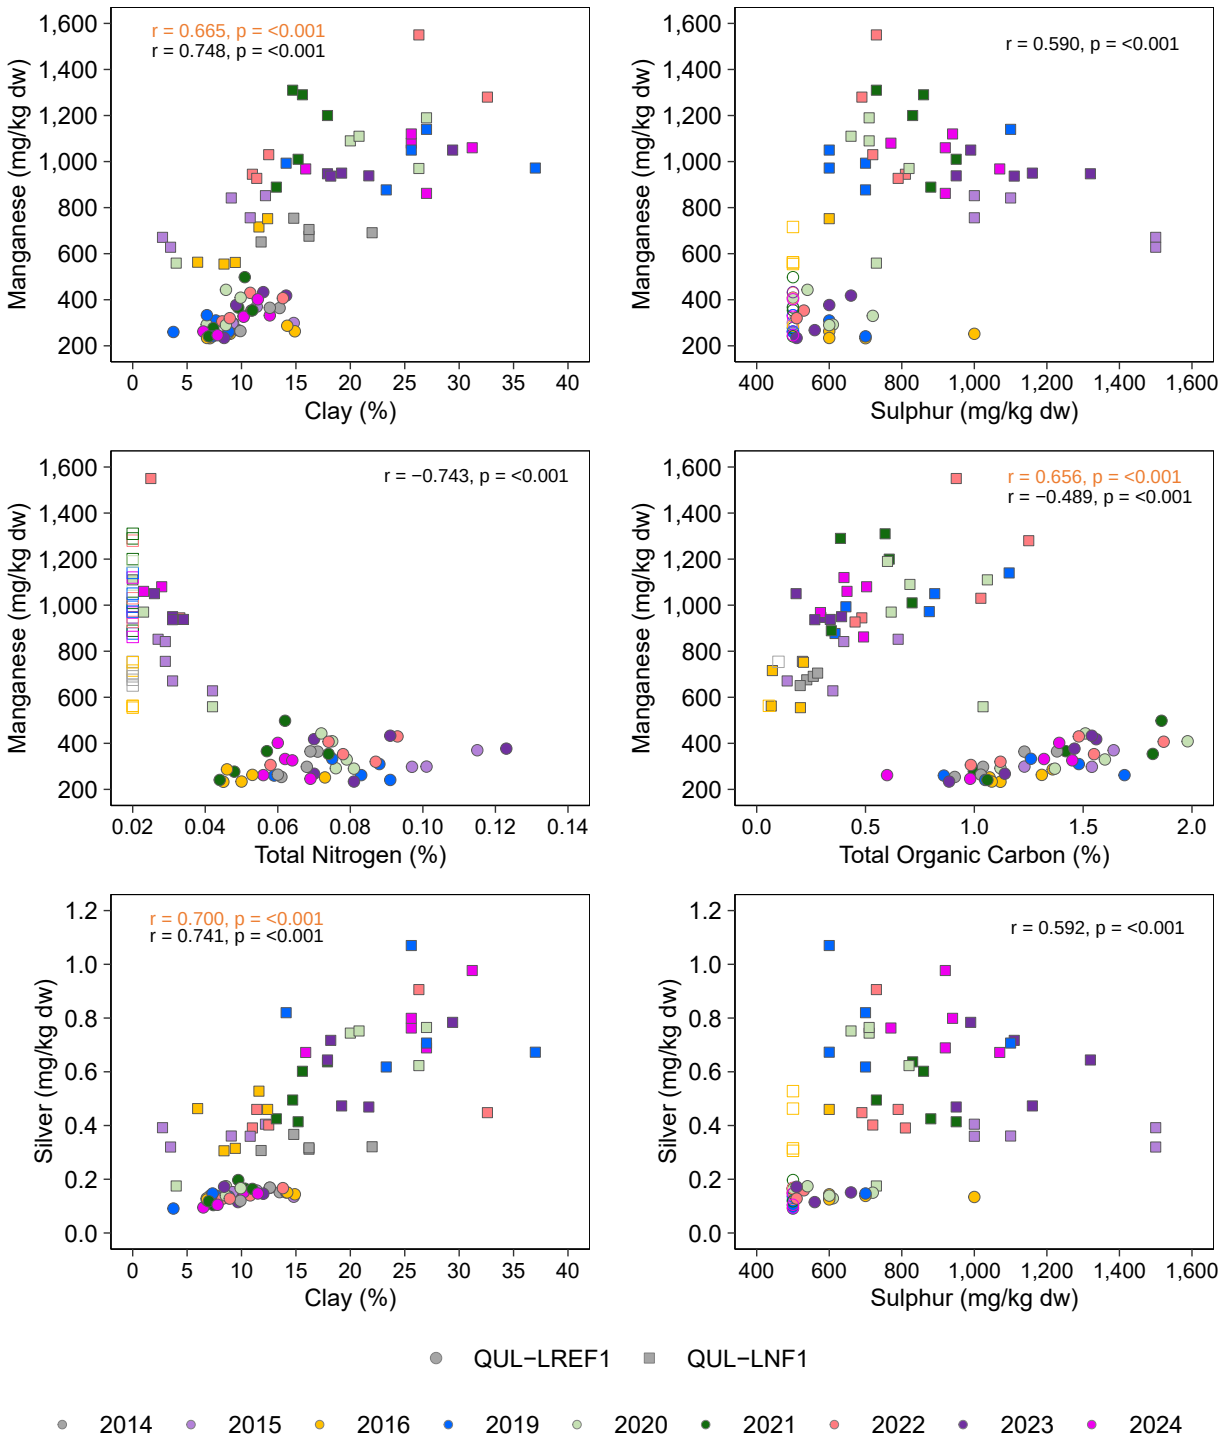

Figure E.1.5: Scatterplots of Significant Spearman's Correlation Relationships (p < 0.0125, Bonferroni Corrected) Between Analyte of Interest Concentrations (<63 µm Fraction) and Sediment Physical and Chemical Parameters for the Quesnel (QUL-LNF1; Exposed and QUL-LREF1; Reference) Shallow Monitoring Areas, 2014 to 2024

Notes: mg/kg dw = milligrams per kilogram dry weight. Results of correlations that evaluated data from shallow exposed and reference sampling areas of Quesnel Lake (QUL−LREF1, QUL−LNF1) are shown in black font on each plot. Results of correlations that only evaluated data from the shallow exposed area of Quesnel Lake (QUL−LNF1) are shown in red font. An absence of either the red or black font on a plot indicates the displayed variables were not significantly correlated for the associated data grouping (black font = QUL−LNF1 and QUL−LREF1; red font = QUL− LNF1 only). Open data points indicate at least one of the two variables plotted were <LRL.

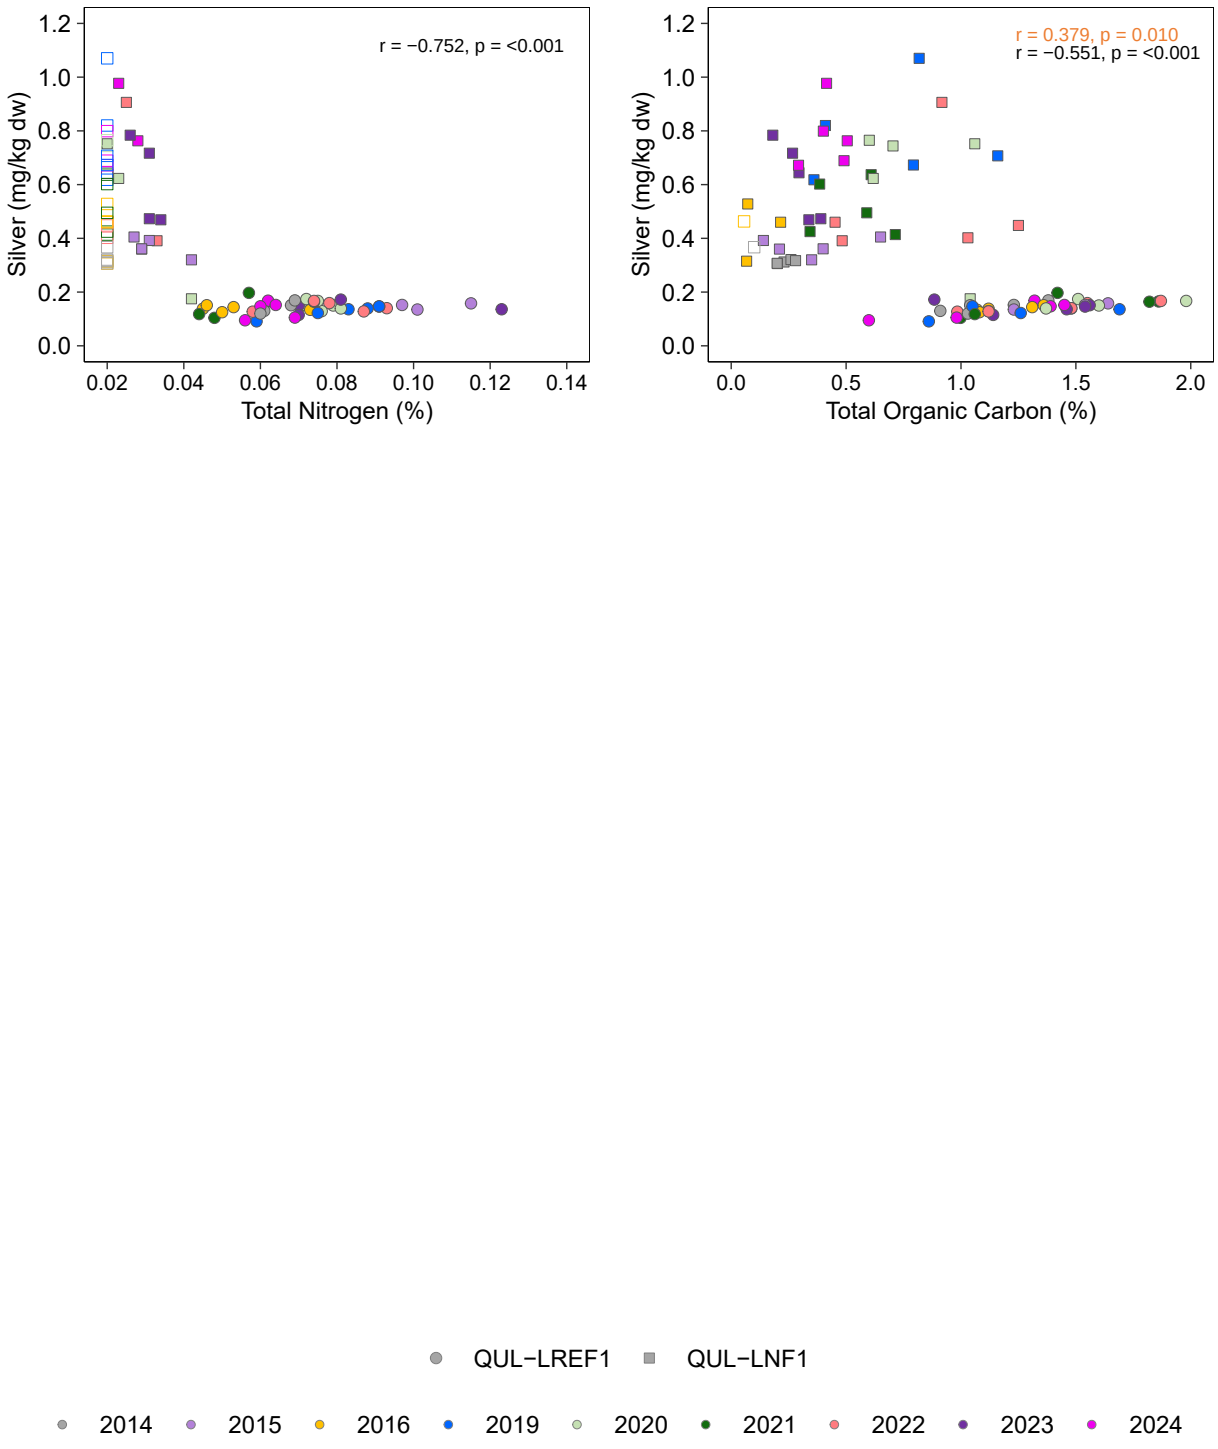

Figure E.1.5: Scatterplots of Significant Spearman's Correlation Relationships (p < 0.0125, Bonferroni Corrected) Between Analyte of Interest Concentrations (<63 µm Fraction) and Sediment Physical and Chemical Parameters for the Quesnel (QUL-LNF1; Exposed and QUL-LREF1; Reference) Shallow Monitoring Areas, 2014 to 2024

Notes: mg/kg dw = milligrams per kilogram dry weight. Results of correlations that evaluated data from shallow exposed and reference sampling areas of Quesnel Lake (QUL−LREF1, QUL−LNF1) are shown in black font on each plot. Results of correlations that only evaluated data from the shallow exposed area of Quesnel Lake (QUL−LNF1) are shown in red font. An absence of either the red or black font on a plot indicates the displayed variables were not significantly correlated for the associated data grouping (black font = QUL−LNF1 and QUL−LREF1; red font = QUL− LNF1 only). Open data points indicate at least one of the two variables plotted were <LRL.

Table E.1.1: Statistical Comparisons of Exposed - Reference Relative Differences of Sediment Analyte of Interest Concentrations (<63 µm Fraction) for the Polley Lake (POL-P1, POL-P2; Exposed) and Bootjack Lake (BOL-B2; Reference) Deep Monitoring Areas, 2014 to 2024

ANOVA Model						Group	Exposed - Reference Relative Differences Among Years[a]						Relative MOD for Exposed - Reference Over Time (%)[b]

	Sig. (2-tailed)	<0.001	<0.001	<0.001	0.144	<0.001	0.884	<0.001	0.005

Significant correlation; p-value < 0.0125 (p<0.05, Bonferroni corrected for 4 independent variables).

Notes: mg/kg dw = milligrams per kilogram dry weight; % = percent. Analyte of Interest was defined as an analyte at the exposed areas with a mean concentration that exceeded guidelines as well as pre-breach and reference 95th percentile values.

[a] Results below the Laboratory Reporting Limit (LRL) were used at the LRL for calculations.

[b] Clay and Total Organic Carbon: n = 77; Sulphur: n = 68; Total Nitrogen: n =75.

[c] Clay and Total Organic Carbon: n = 51; Sulphur: n = 45; Total Nitrogen: n = 49.

[d] % clay represents the clay proportion of the < 63 µm (silt and clay) sediment fraction that was used for metals analysis. % clay was calculated as: [% clay] / [% silt and clay].

Table E.1.4: Principal Components (PC) and Percentage of Variance Explained for the Principal Component Analysis (PCA) of Sediment Metal Concentrations (<63 µm Fraction) for the Polley Lake (POL-P1, POL-P2; Exposed) and Bootjack Lake (BOL-B2; Reference) Deep Monitoring Areas, 1999 to 2024

Significant correlation; p-value < 0.0125 (p<0.05, Bonferroni corrected for 4 independent variables).

Notes: mg/kg dw = milligrams per kilogram dry weight. % = percent. Analyte of Interest was defined as an analyte at the exposed areas with a mean concentration that exceeded guidelines as well as reference 95th percentile values.

[a] Results below the Laboratory Reporting Limit (LRL) were used at the LRL for calculations.

[b] n = 108 for comparisons except for comparisons to total sulphur, where n = 88.

[c] n = 75 for comparisons except for comparisons to sulphur, where n = 70.

[d] % clay represents the clay proportion of the < 63 µm (silt and clay) sediment fraction that was used for metals analysis. % clay was calculated as: [% clay] / [% silt and clay].

Table E.1.9: Principal Components (PC) and Percentage of Variance Explained for the Principal Component Analysis (PCA) of Sediment Metal Concentrations (<63 µm Fraction) for the Quesnel Lake (QUL-PNF and QUL-PFF1; Exposed and QUL-PREF1; Reference) Deep Monitoring Areas, 2014 to 2024

[b] n = 88 for comparisons except for comparisons to total sulphur, where n = 78.

[c] n = 45 for comparisons except for comparisons to sulphur, where n = 40.

[d] % clay represents the clay proportion of the < 63 µm (silt and clay) sediment fraction that was used for metals analysis. % clay was calculated as: [% clay] / [% silt and clay].

APPENDIX E.2
PLANKTON COMMUNITY AND PRODUCTIVITY

APPENDIX E2 PLANKTON DATA COLLAPSING METHODS

E2 PLANKTON DATA COLLAPSING METHODS 1
E2.1 Zooplankton 1
E2.2 Phytoplankton 1

E2 PLANKTON DATA COLLAPSING METHODS

E2.1 Zooplankton

Zooplankton community densities were calculated by the laboratory, Biologica Environmental Services (Biologica; Appendix G). Biologica used sampling information (haul depth, net diameter; provided by Minnow) and zooplankton abundances in each sample to calculate densities for taxa within each sample using the following formula:

$$Density(\frac{\#}{L}) = \frac{Abundance}{Haul\ Depth\ (m) \times \left(0.25\pi \times \left(Net\ mouth\ diameter\ (m)\right)^2\right) * 1000}$$

Zooplankton taxa identified in samples from the vicinity of the Mount Polley Mine typically are part of four major taxonomic groups: Cladocera, Rotifera, Calanoida, and Cyclopoida. Cladocera and Rotifera are easier to identify than Calanoida and Cyclopoida and have better developed taxonomic classifications. Therefore, decisions regarding taxonomic resolution of Cladocera and Rotifera taxa were made using a decision key, as described in Appendix E.4 (i.e., Resolving mixed-levels of taxonomic resolution for benthic invertebrates). Calanoida and Cyclopoida are less consistently identified to lower (i.e., higher resolution) taxonomic levels than Cladocera and Rotifera, making them unsuitable for the decision key described above for resolving inconsistent taxonomic resolution. Thus, inconsistent taxonomic resolution with within the Calanoida and Cyclopoida orders was resolved by pooling results within their respective major taxonomic group level (i.e., higher taxonomic resolution) for analysis, with the Copepod Nauplii stage remaining as a separate taxon group.

E2.2 Phytoplankton

Phytoplankton taxa are commonly identified to genus level but are occasionally identified to species level / species complex level (i.e., higher resolution) or phylum level (i.e., lower resolution). Due to the high proportion of ambiguously resolved taxa within phytoplankton data, phytoplankton taxonomy is not suited for the decision key described in Appendix E.4.

As such phytoplankton data were processed prior to analysis as follows. Phytoplankton taxa identified to species were rolled up to genus, and taxa identified to genus remained at genus. Two morphological groups, centric and pennate Diatoms, were considered as genera for the purpose of resolving taxonomic resolution. For each sample, taxa at a higher taxonomic level (e.g., phylum) were proportionally assigned to a lower taxonomic level (i.e., genera) if taxa at a lower taxonomic level were present in that sample. In cases where taxa at a lower taxonomic level were not observed in a sample, the taxon was assigned to the most common lower taxonomic level present in samples from that monitoring station (e.g., QUL-ZOO-1) in the present sampling year. If a lower taxonomic level was not observed at that station, the original taxonomic level was retained.

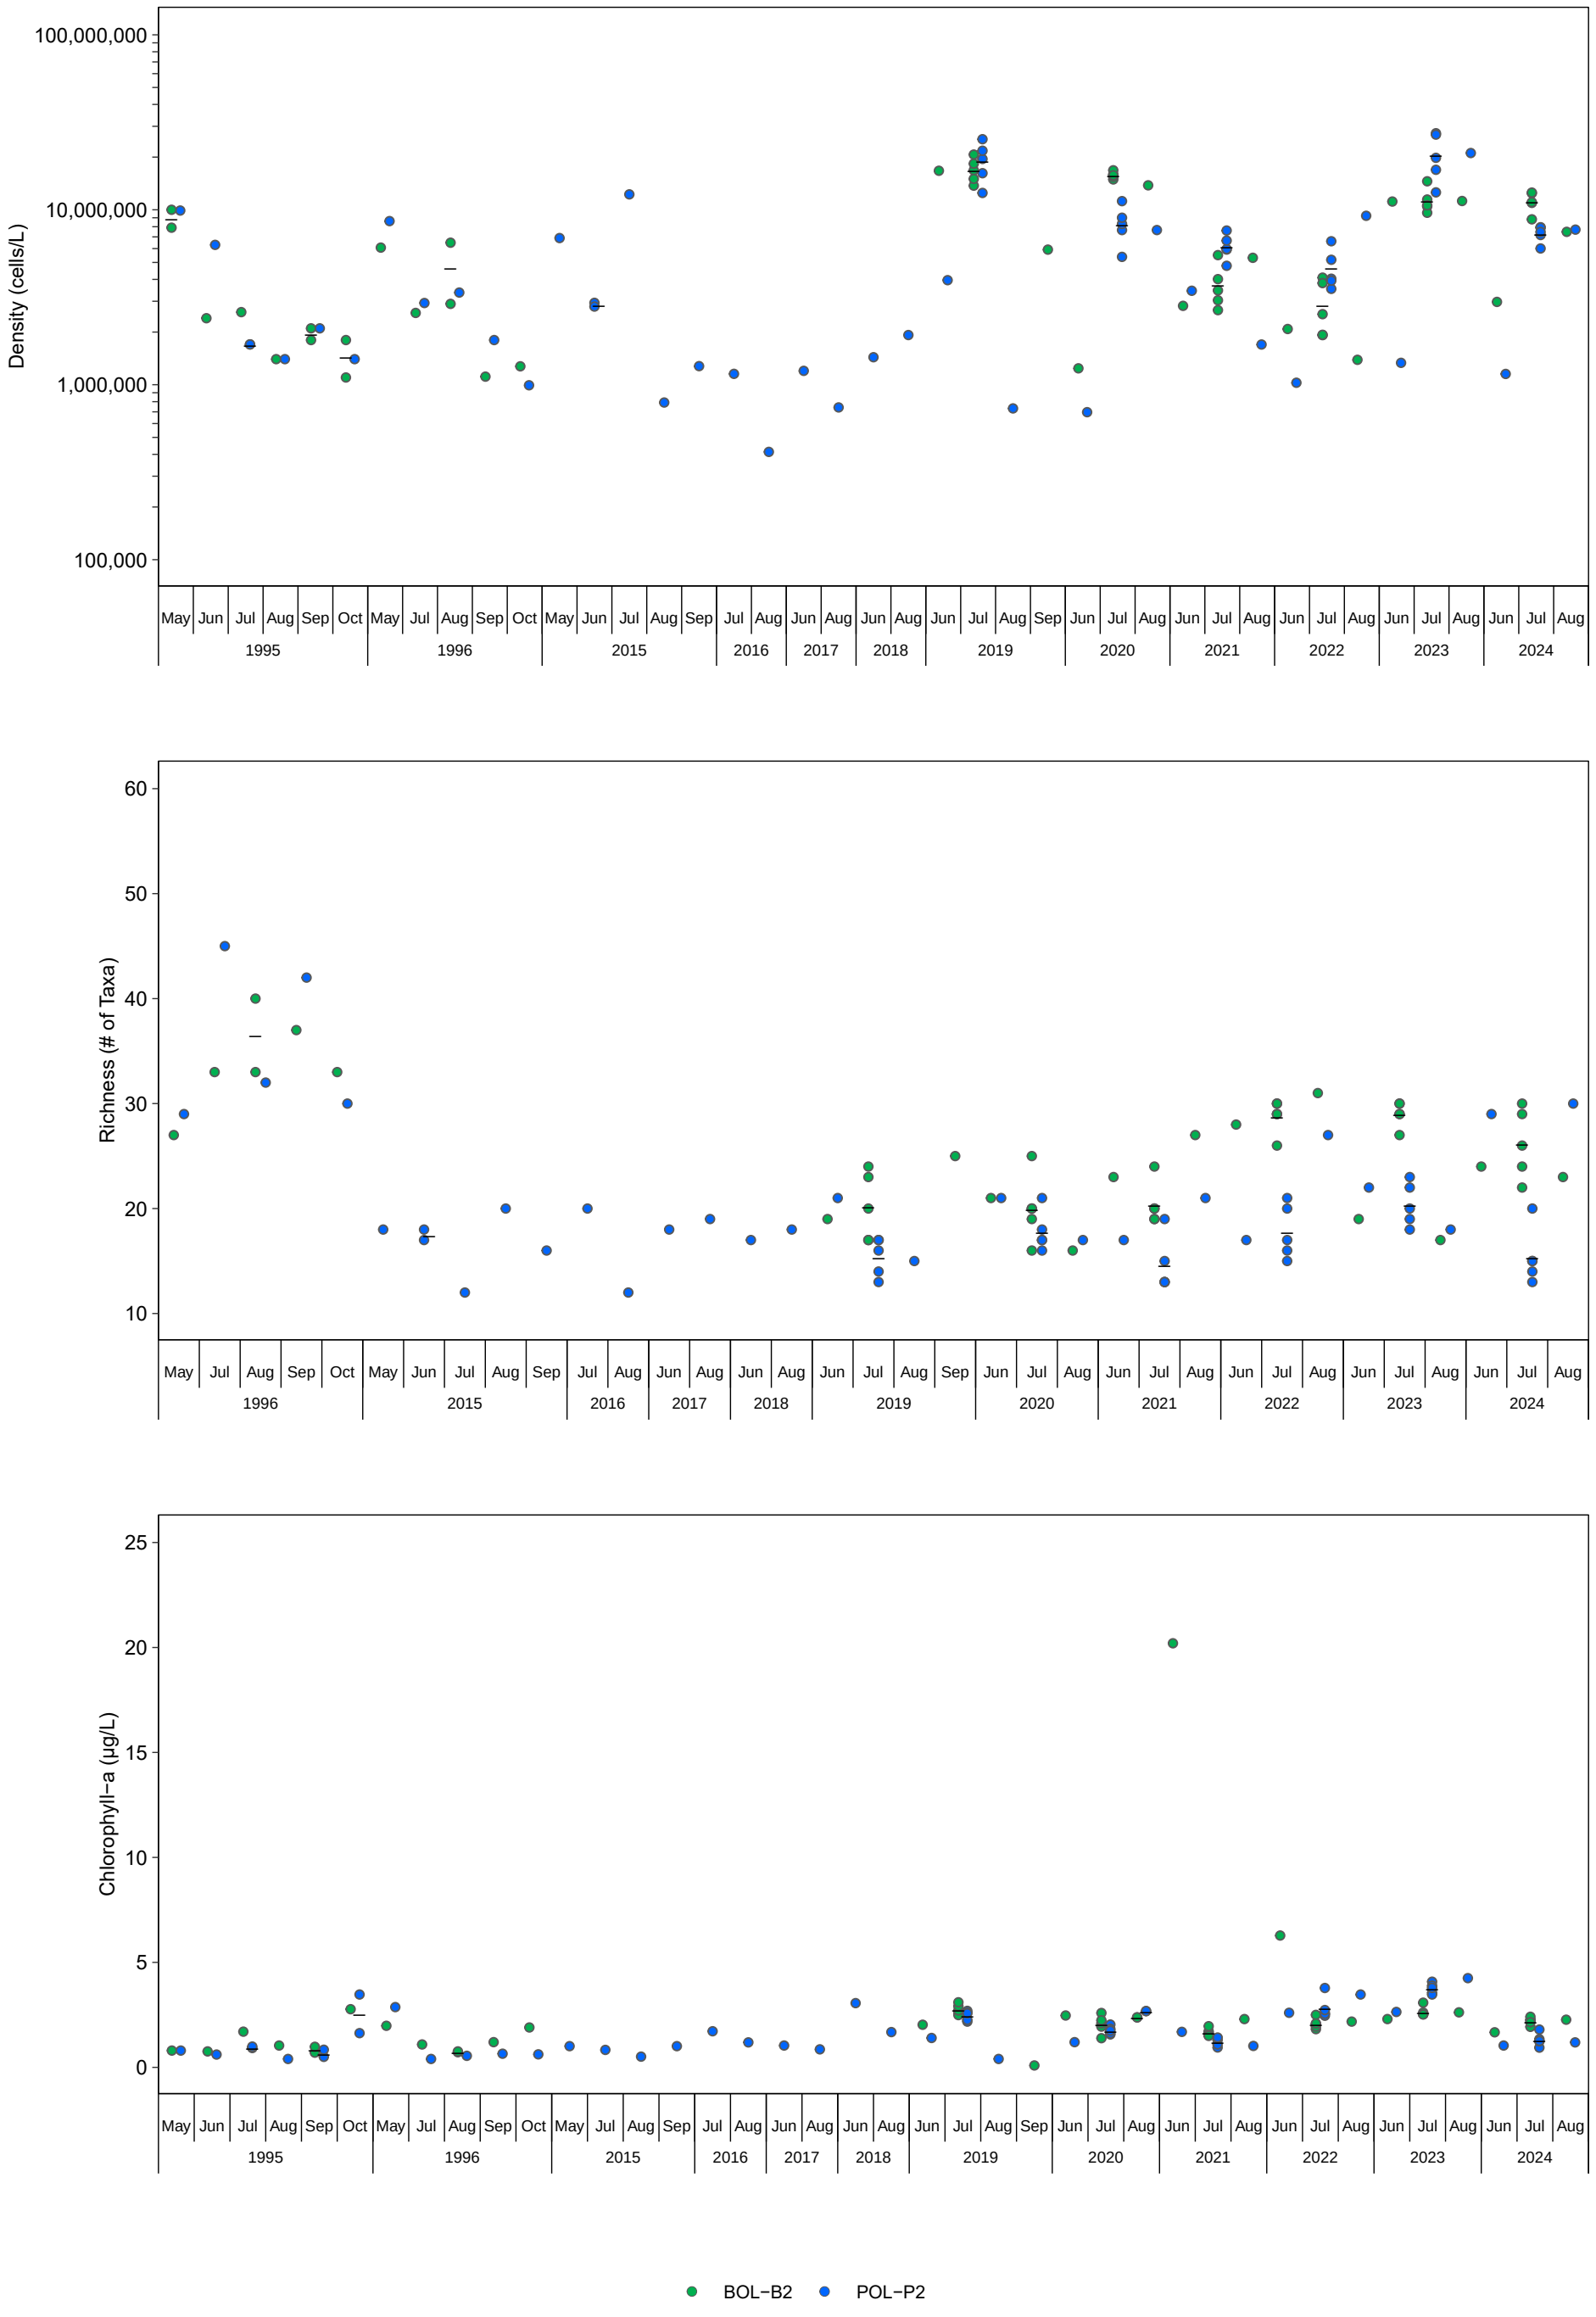

Figure E.2.1: Phytoplankton Community Metrics for the Polley Lake (POL−P2; Exposed) and Bootjack Lake (BOL−B2; Reference) Monitoring Areas, 1995 to 2024

Notes: µg/L = micrograms per litre. Green represents reference data and blue represents exposed data. Black bars represent mean values.

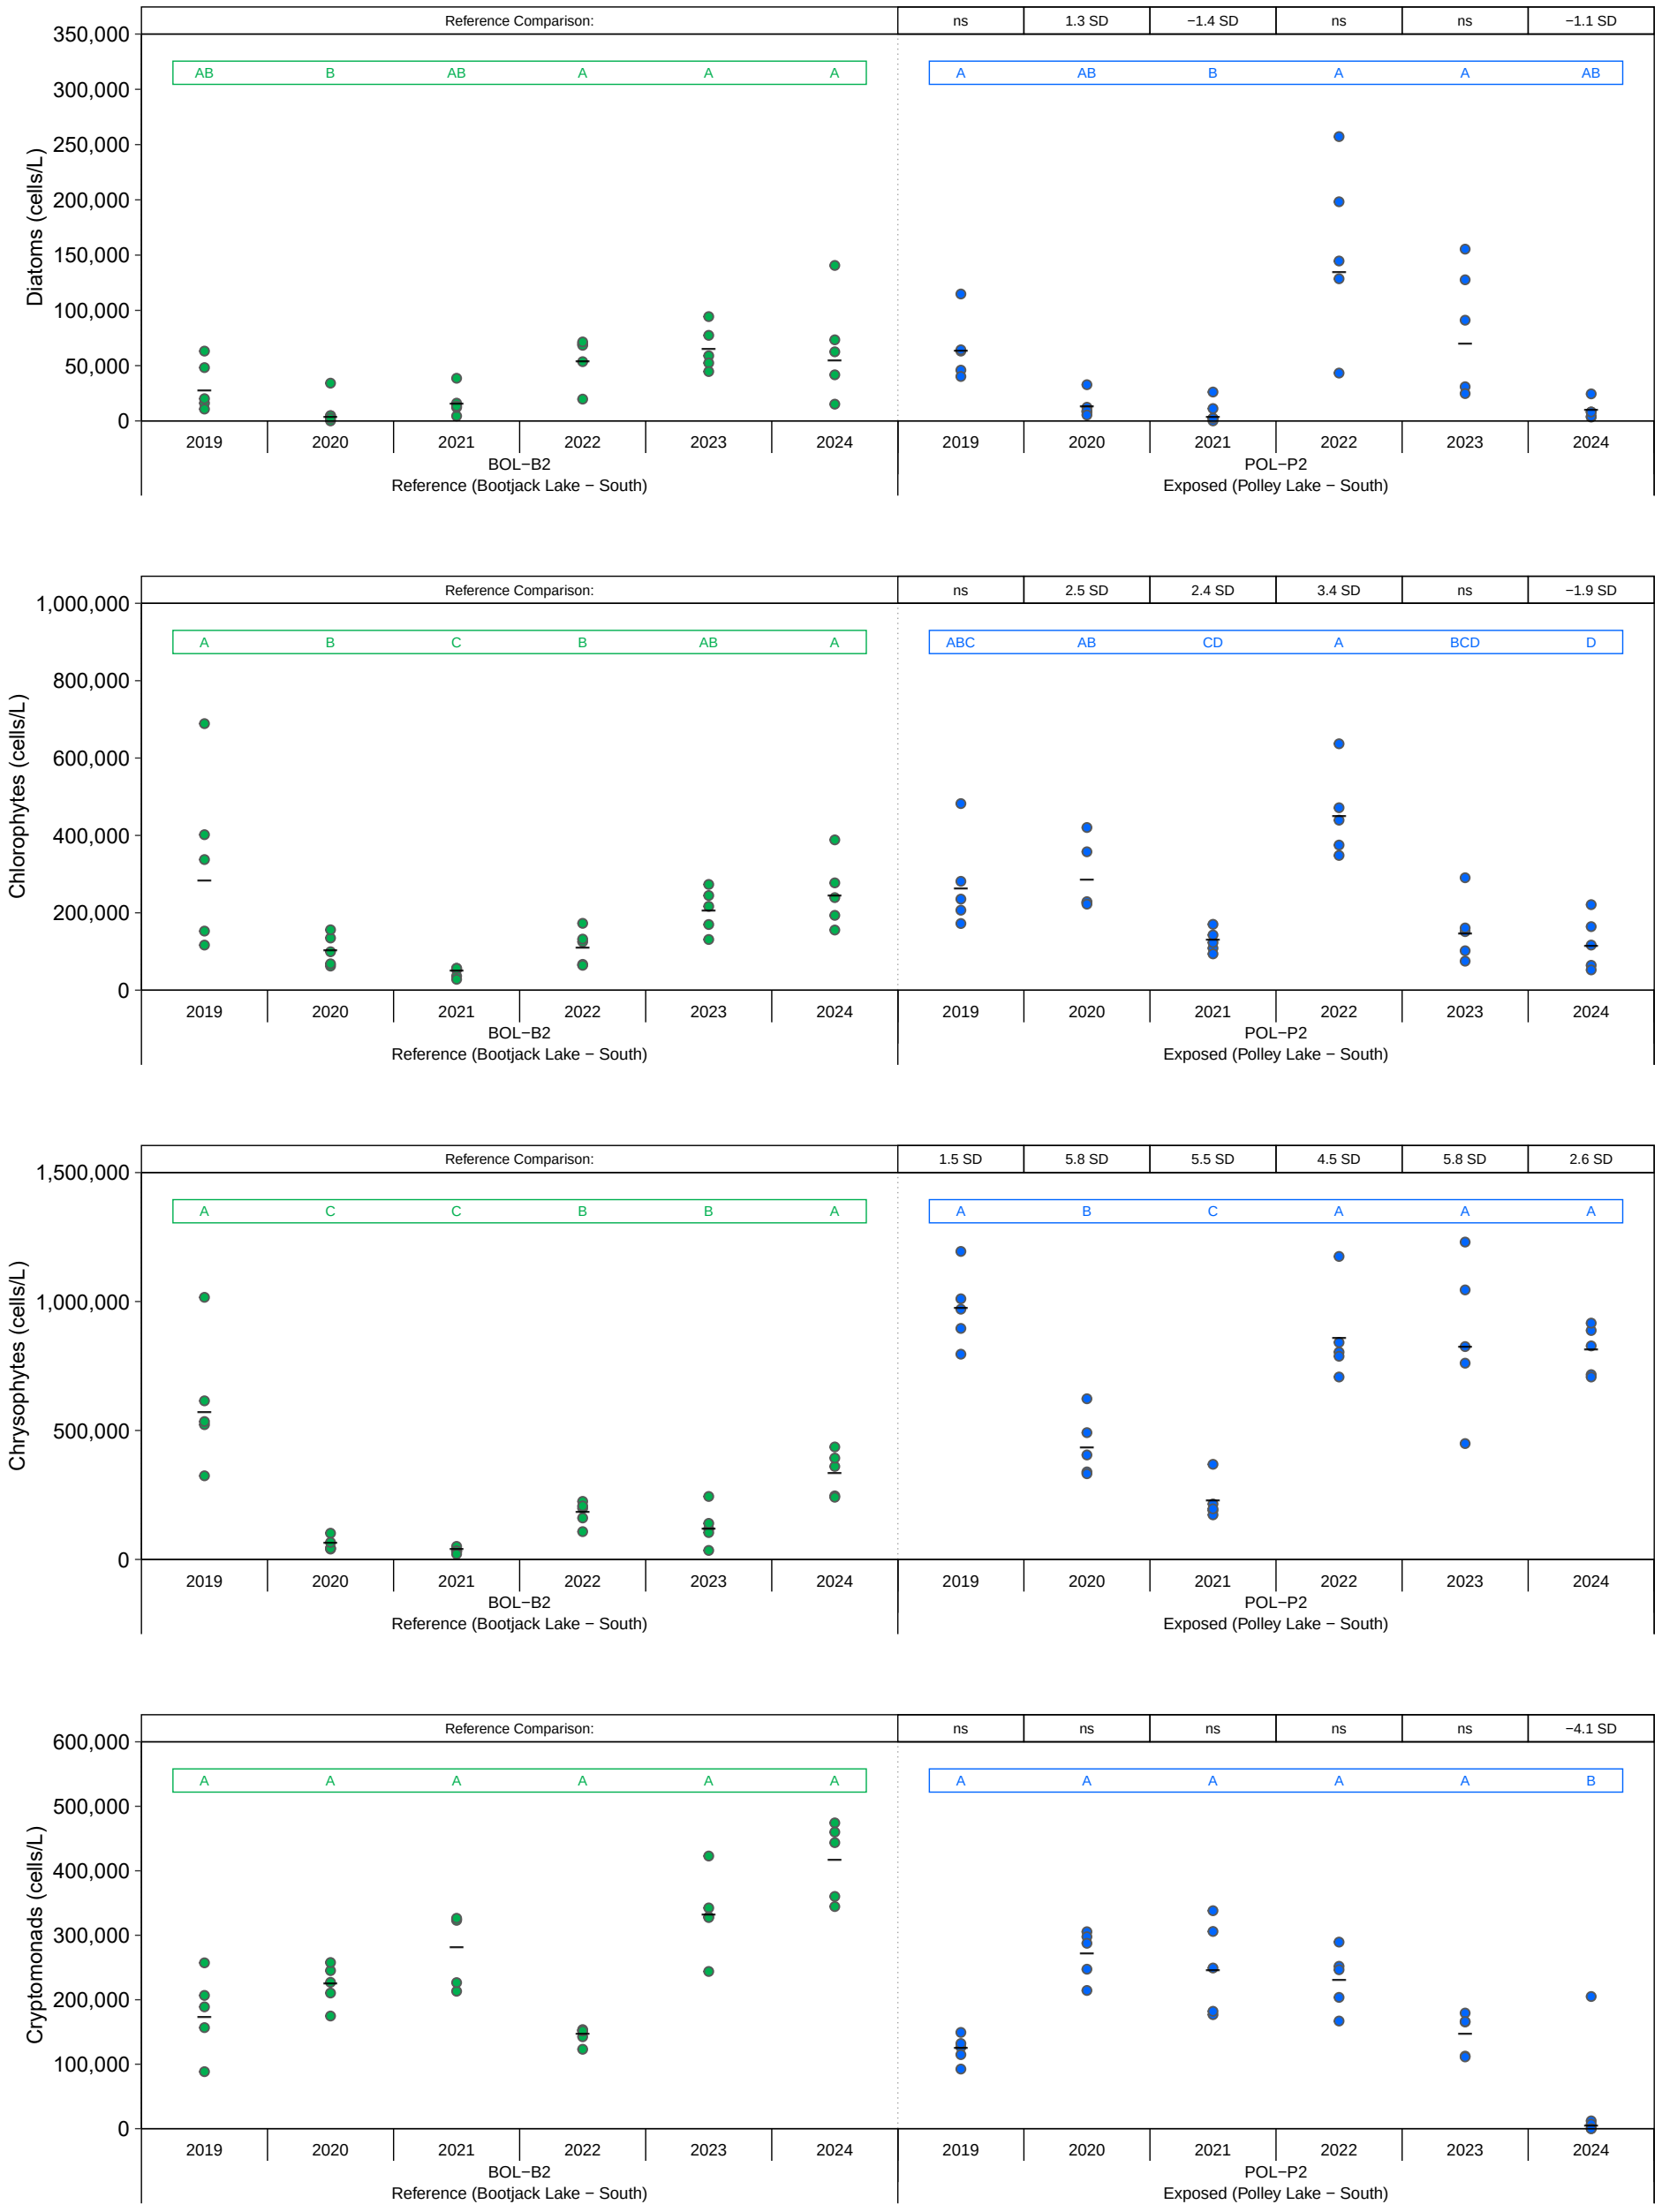

Figure E.2.2: Phytoplankton Community Metrics for the Polley Lake (POL−P2; Exposed) and Bootjack Lake (BOL−B2; Reference) Monitoring Areas in July, 2019 to 2024

Notes: Green represents reference data and blue represents exposed data. Black bars represent measures of central tendency (mean, geometric mean, or median depending on if analysis was conducted on untransformed, log10− transformed or rank−transformed data). Coloured letters represent significant (p−value <0.1) *post hoc* comparisons within areas over time; years that share a letter of the same colour (e.g., A, B) within a box of the same colour do not differ significantly within an area. A number above the plot indicates significant exposed vs. reference *post hoc* comparisons within a given year. The magnitude of difference (MOD) for these significant *post hoc* comparisons are expressed in units of standard deviation (SD) or median absolute deviations (MAD; if the data were rank−transformed prior to analysis) relative to reference. 'ns' indicates a non−significant contrast; 'nm' indicates that the MOD could not be calculated because MAD = 0. For plots of phytoplankton results prior to 2019, see Minnow (2019a, 2020a, 2021a). For results of single phytoplankton samples collected in June and August 2024, see Appendix Table C.3.1. Radiophytes were excluded from the statistical comparisons because of insufficient data (i.e., this taxon was reported at BOL−B2 in 2024 only).

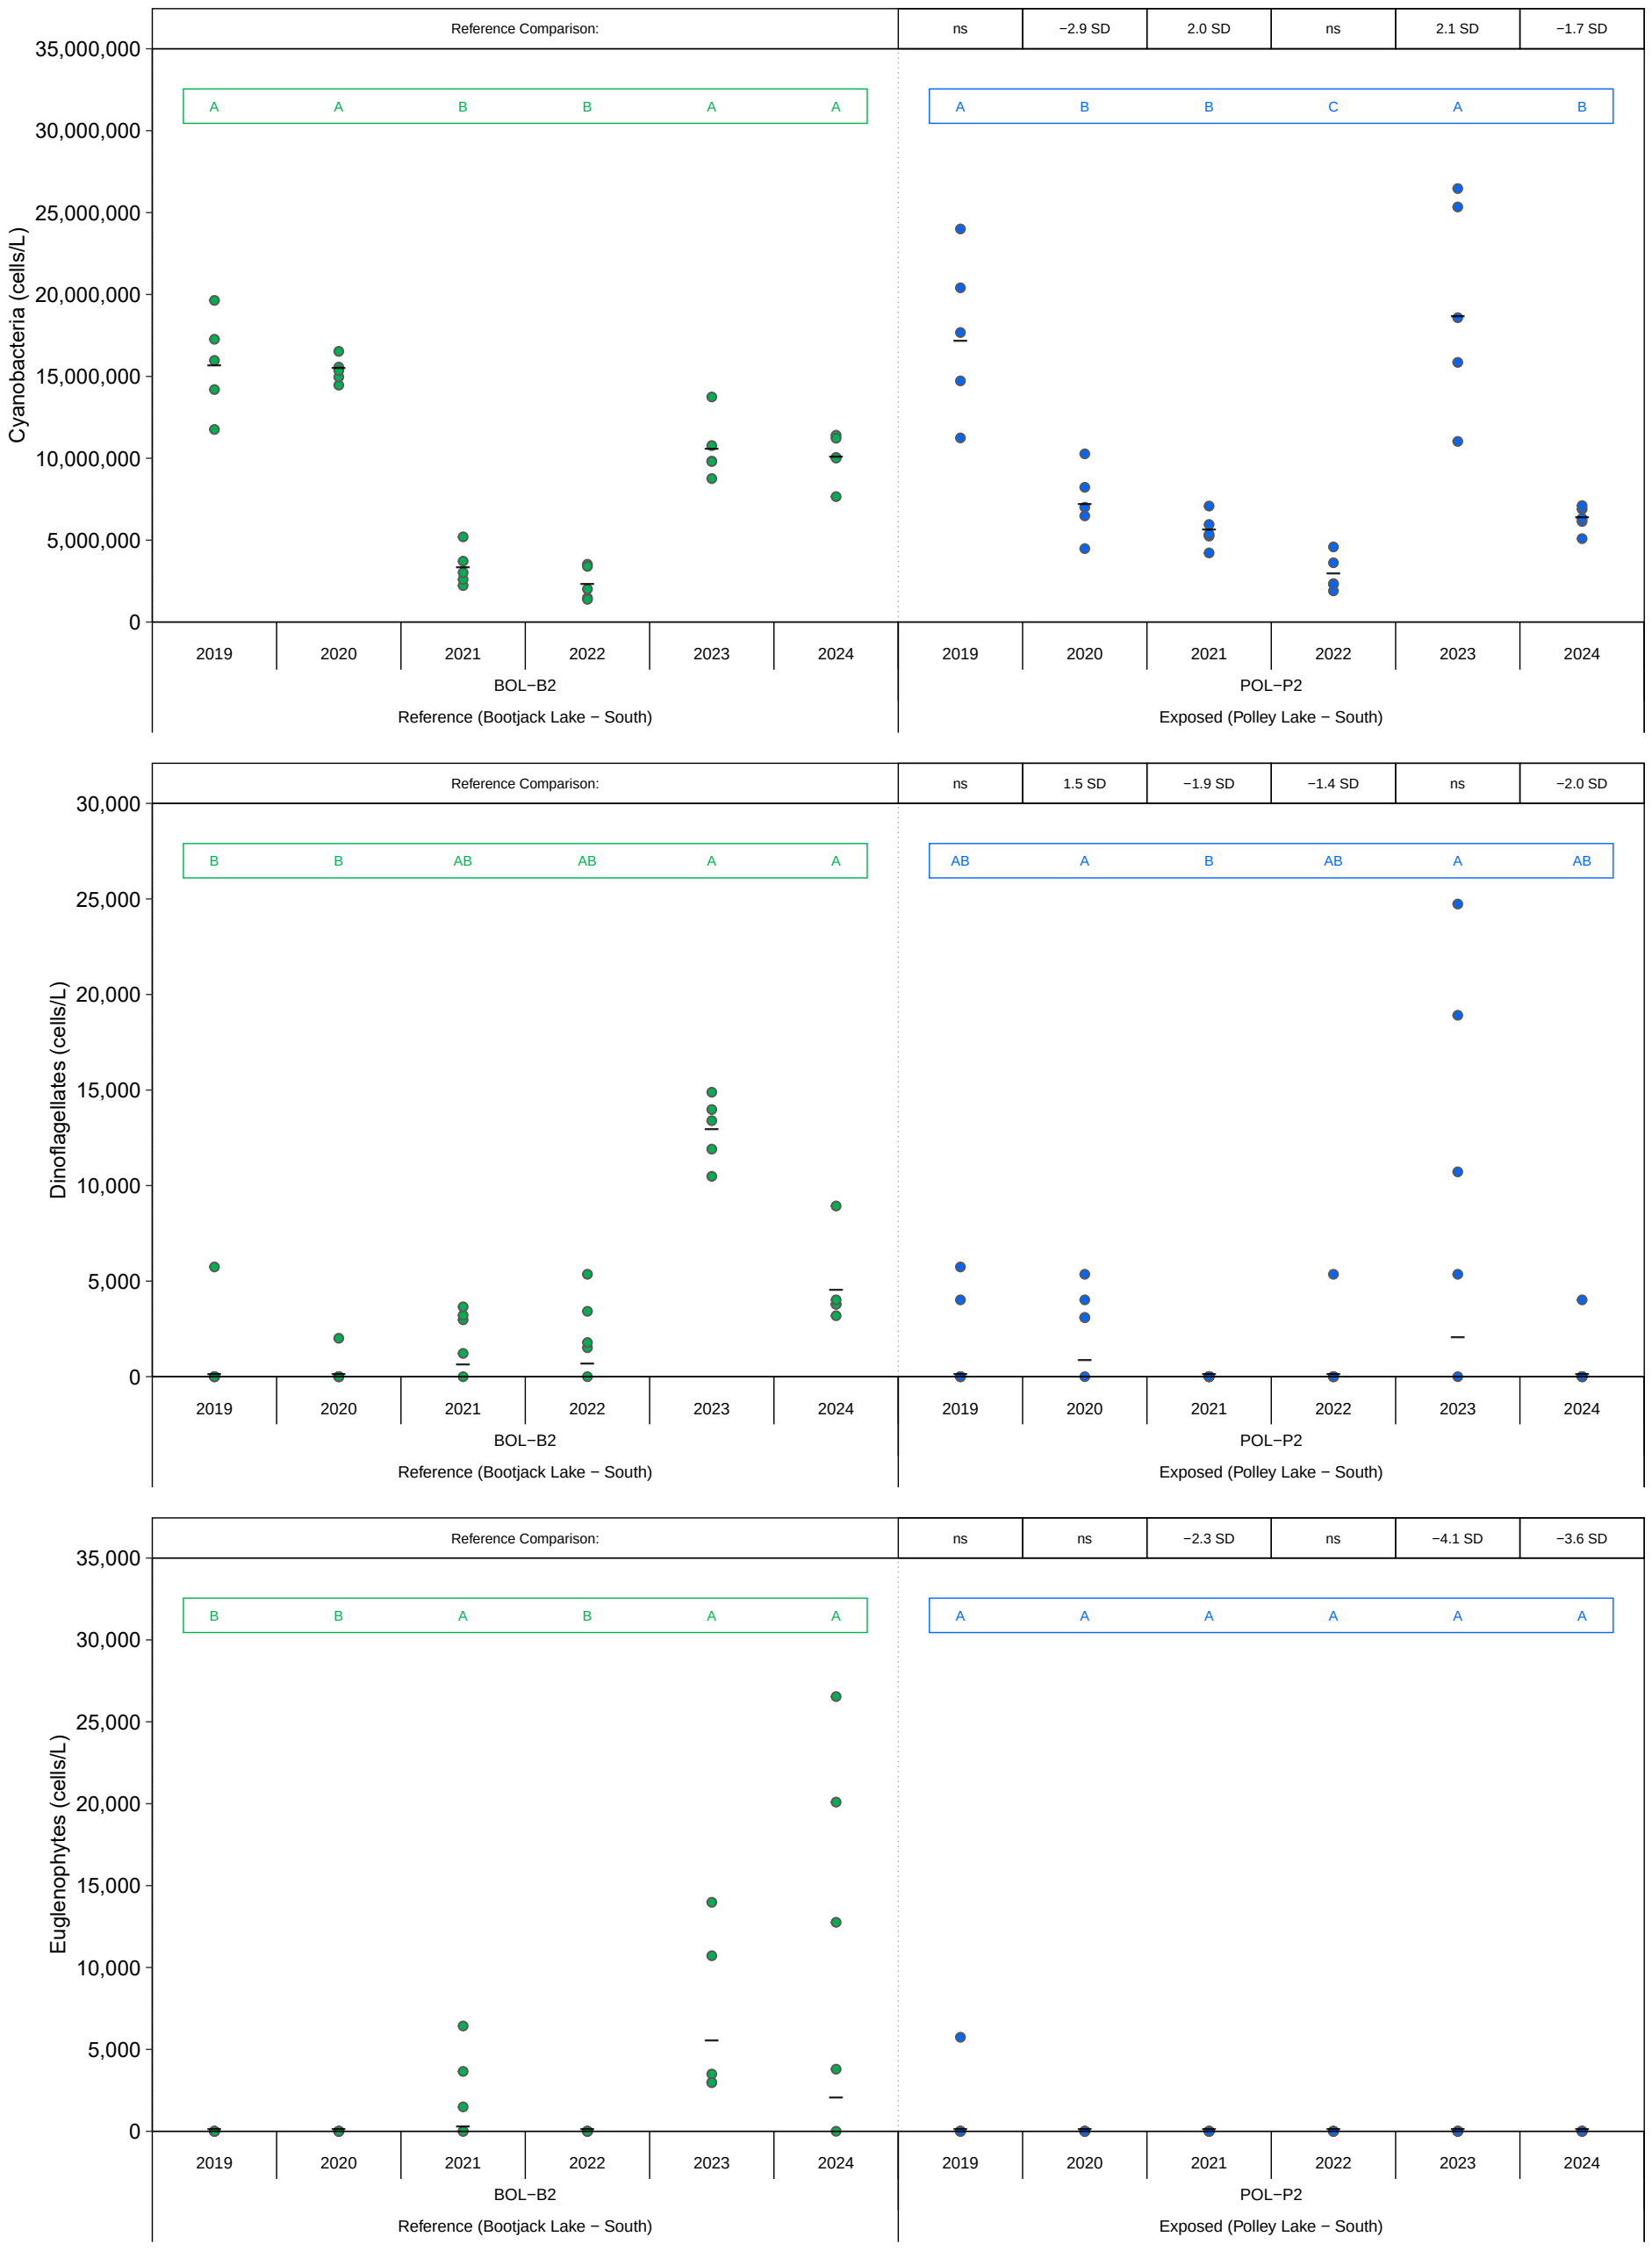

Figure E.2.2: Phytoplankton Community Metrics for the Polley Lake (POL−P2; Exposed) and Bootjack Lake (BOL−B2; Reference) Monitoring Areas in July, 2019 to 2024

Notes: Green represents reference data and blue represents exposed data. Black bars represent measures of central tendency (mean, geometric mean, or median depending on if analysis was conducted on untransformed, log10− transformed or rank−transformed data). Coloured letters represent significant (p−value <0.1) *post hoc* comparisons within areas over time; years that share a letter of the same colour (e.g., A, B) within a box of the same colour do not differ significantly within an area. A number above the plot indicates significant exposed vs. reference *post hoc* comparisons within a given year. The magnitude of difference (MOD) for these significant *post hoc* comparisons are expressed in units of standard deviation (SD) or median absolute deviations (MAD; if the data were rank−transformed prior to analysis) relative to reference. 'ns' indicates a non−significant contrast; 'nm' indicates that the MOD could not be calculated because MAD = 0. For plots of phytoplankton results prior to 2019, see Minnow (2019a, 2020a, 2021a). For results of single phytoplankton samples collected in June and August 2024, see Appendix Table C.3.1. Radiophytes were excluded from the statistical comparisons because of insufficient data (i.e., this taxon was reported at BOL−B2 in 2024 only).

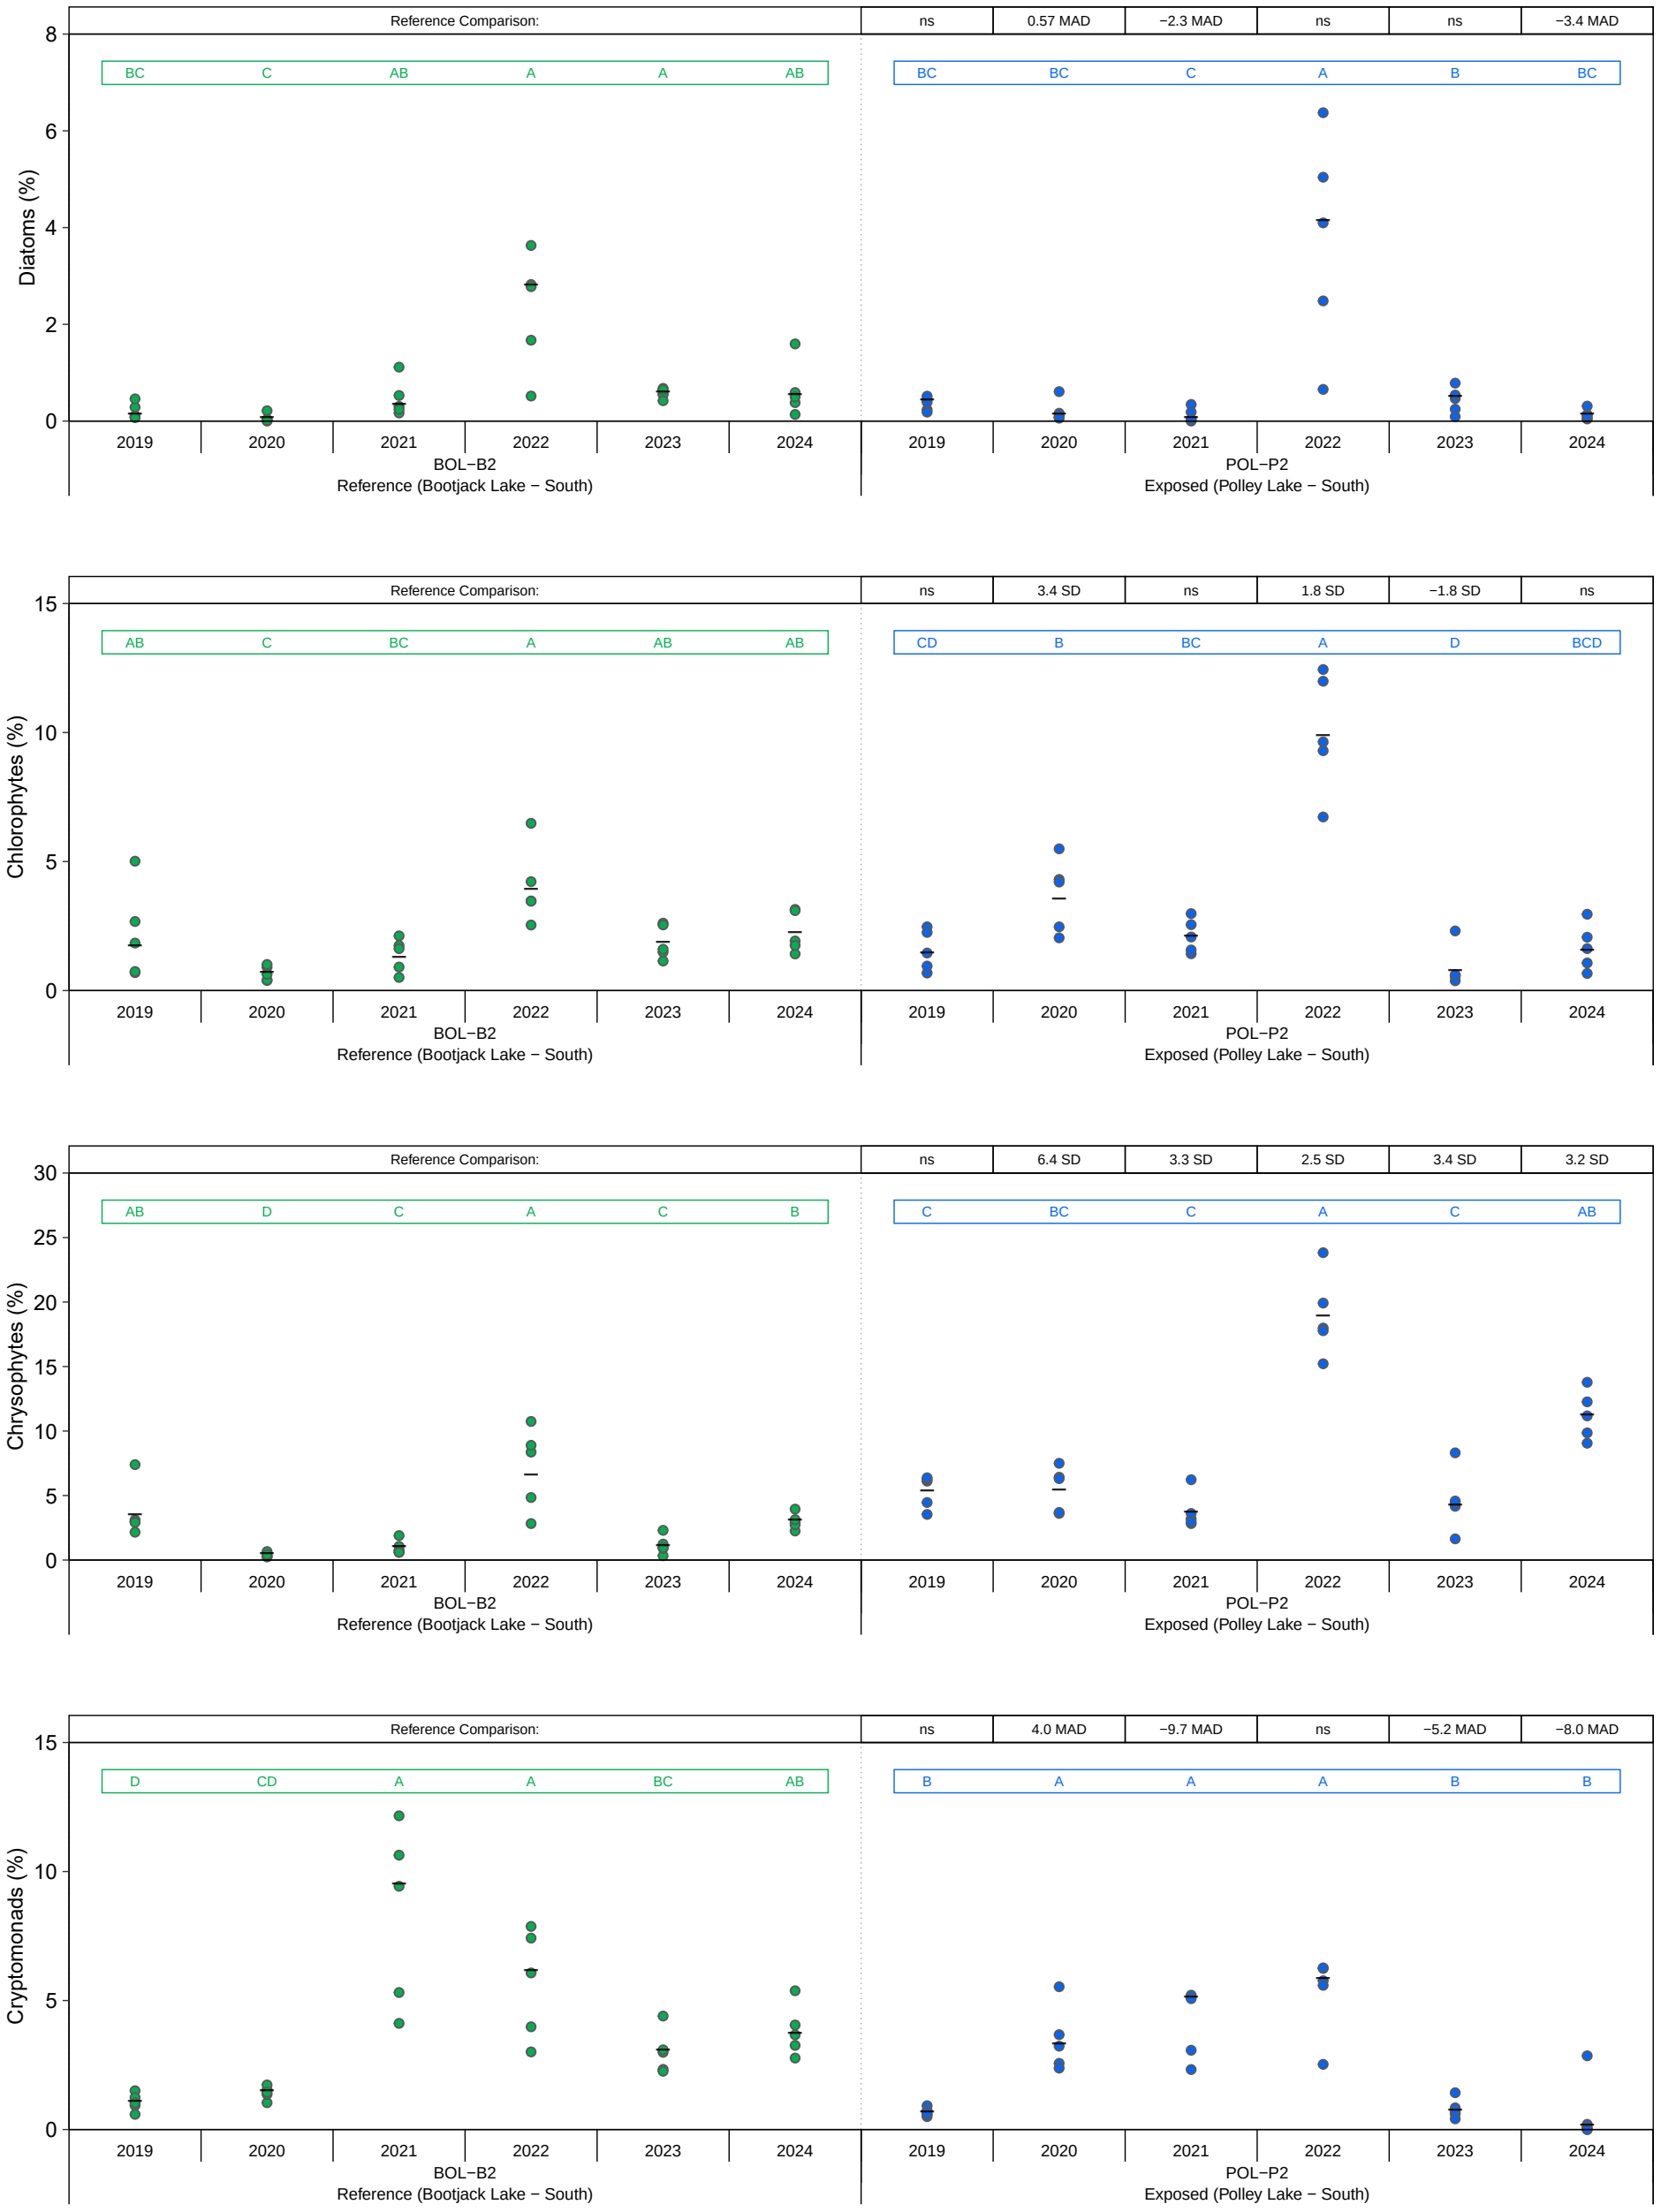

Figure E.2.2: Phytoplankton Community Metrics for the Polley Lake (POL−P2; Exposed) and Bootjack Lake (BOL−B2; Reference) Monitoring Areas in July, 2019 to 2024

Notes: Green represents reference data and blue represents exposed data. Black bars represent measures of central tendency (mean, geometric mean, or median depending on if analysis was conducted on untransformed, log10− transformed or rank−transformed data). Coloured letters represent significant (p−value <0.1) *post hoc* comparisons within areas over time; years that share a letter of the same colour (e.g., A, B) within a box of the same colour do not differ significantly within an area. A number above the plot indicates significant exposed vs. reference *post hoc* comparisons within a given year. The magnitude of difference (MOD) for these significant *post hoc* comparisons are expressed in units of standard deviation (SD) or median absolute deviations (MAD; if the data were rank−transformed prior to analysis) relative to reference. 'ns' indicates a non-significant contrast; 'nm' indicates that the MOD could not be calculated because MAD = 0. For plots of phytoplankton results prior to 2019, see Minnow (2019a, 2020a, 2021a). For results of single phytoplankton samples collected in June and August 2024, see Appendix Table C.3.1. Radiophytes were excluded from the statistical comparisons because of insufficient data (i.e., this taxon was reported at BOL−B2 in 2024 only).

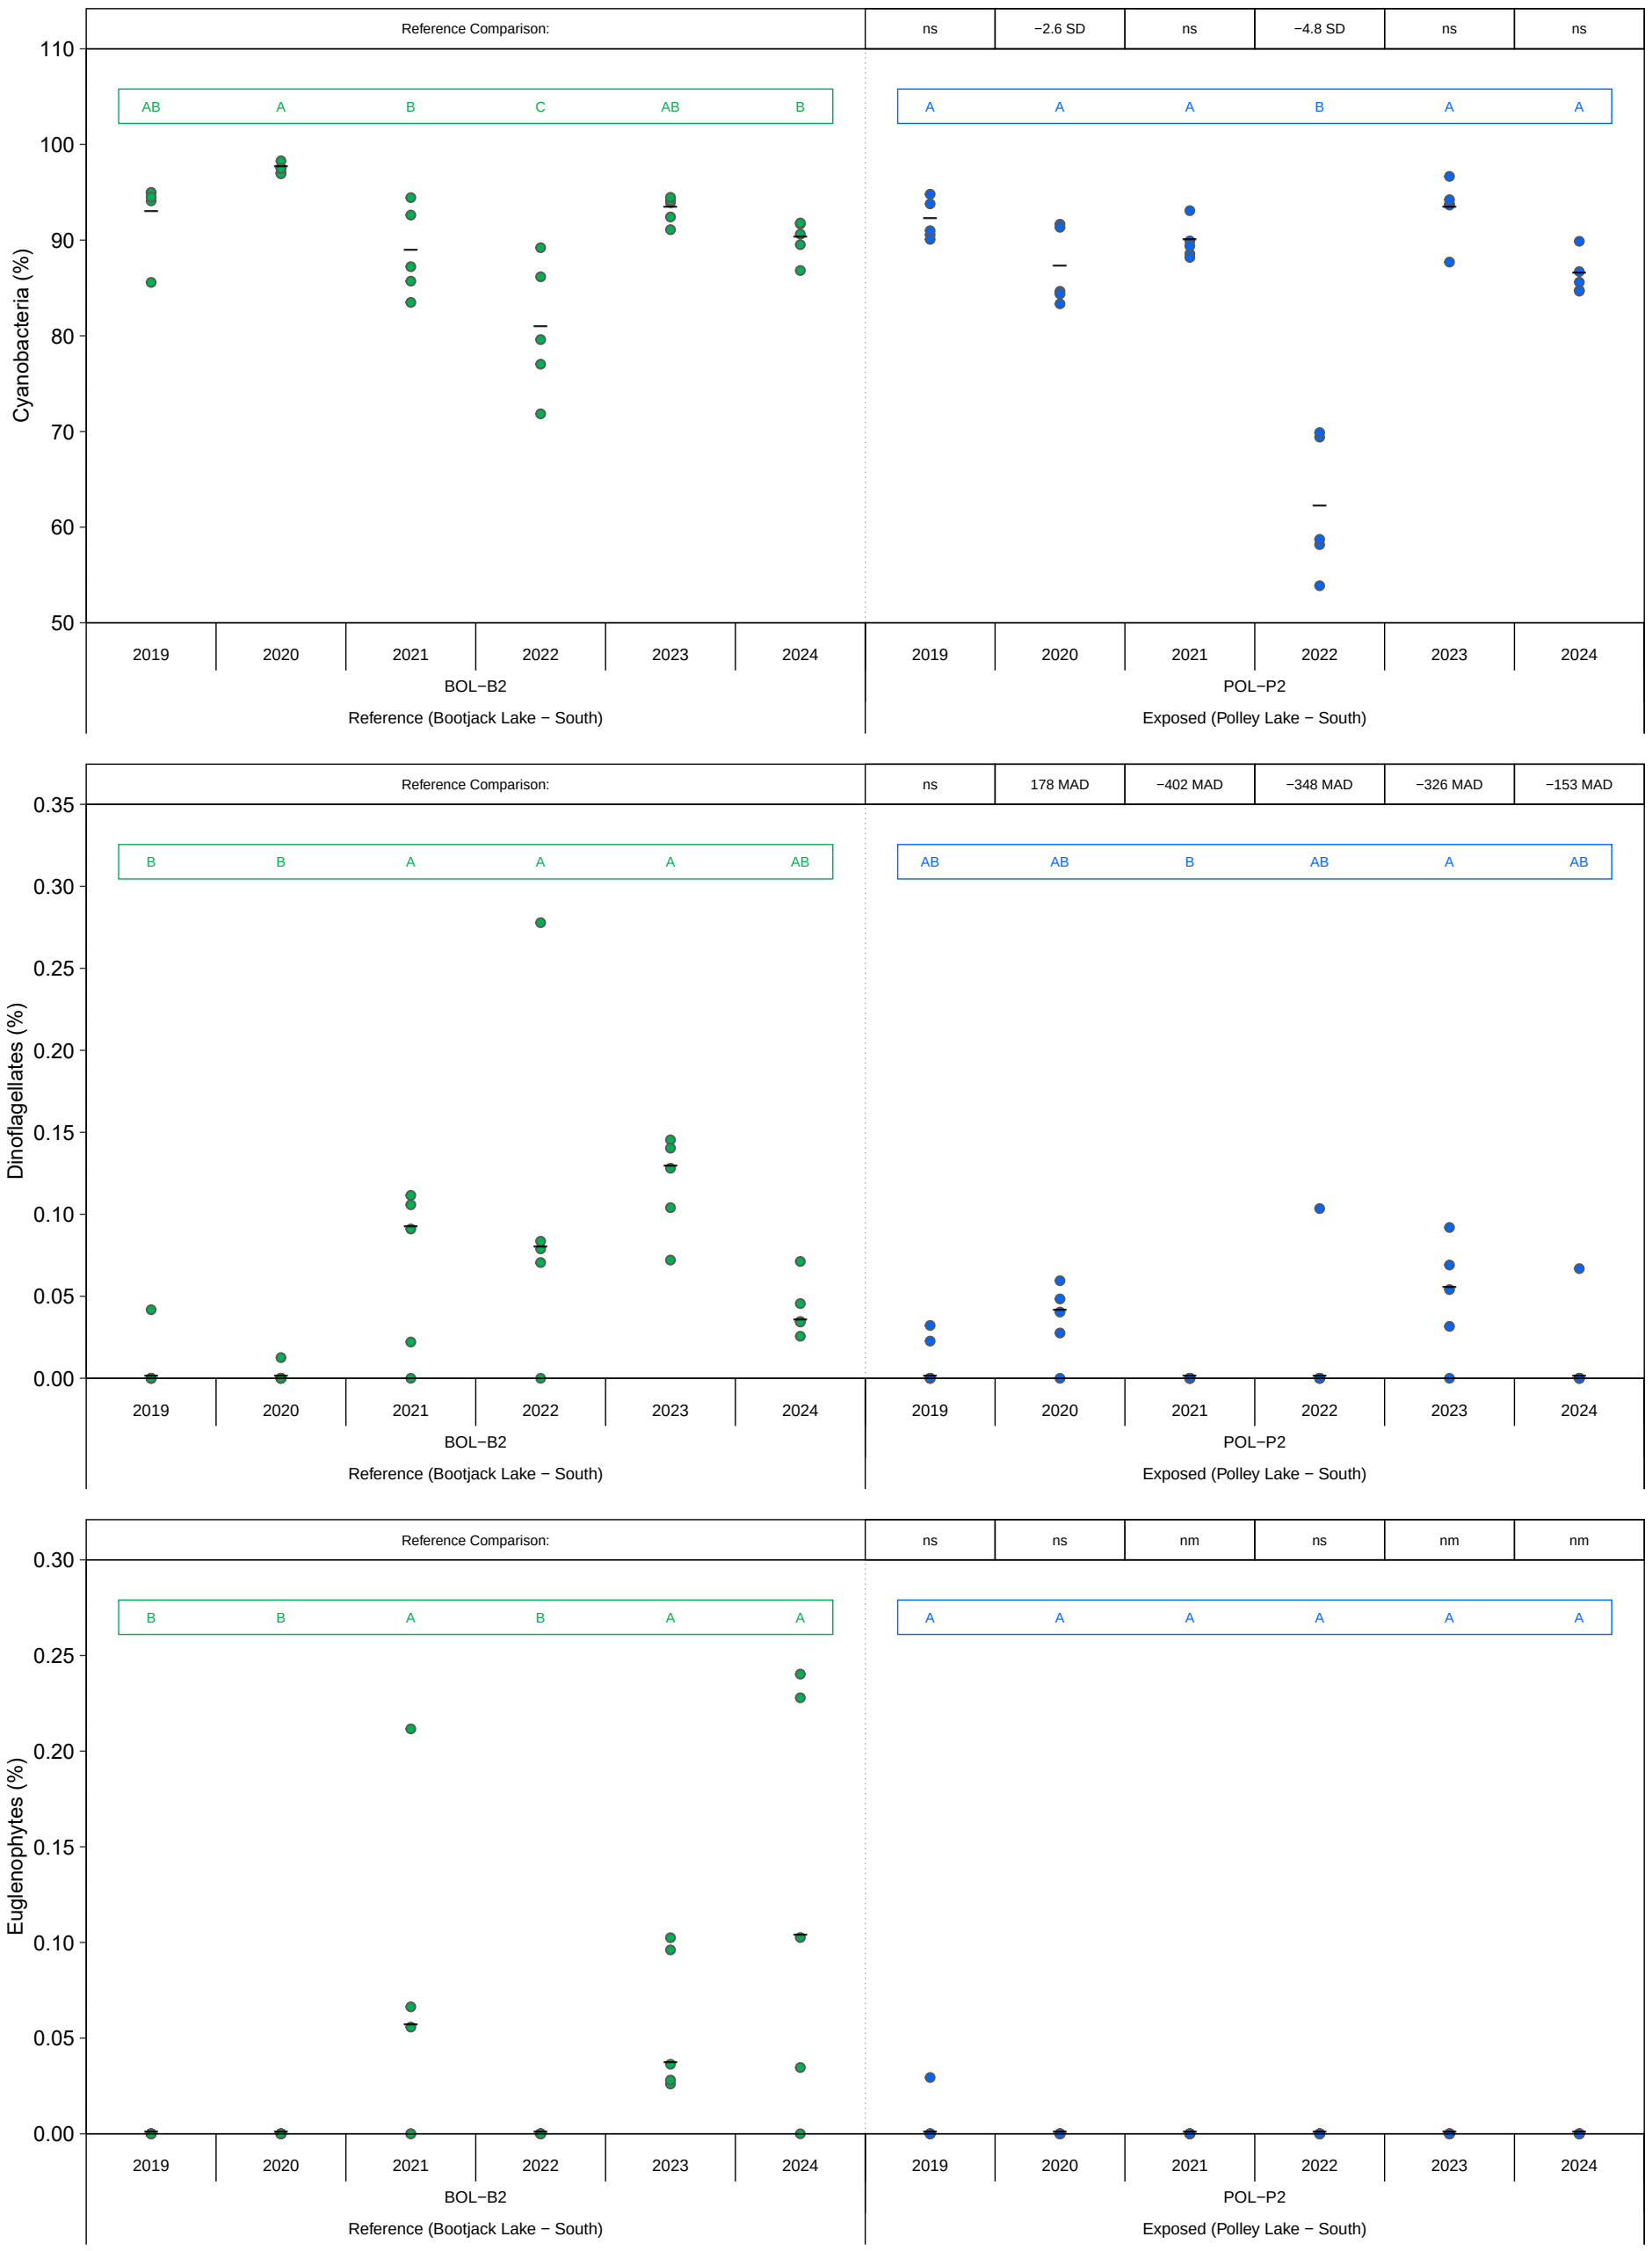

Figure E.2.2: Phytoplankton Community Metrics for the Polley Lake (POL−P2; Exposed) and Bootjack Lake (BOL−B2; Reference) Monitoring Areas in July, 2019 to 2024

Notes: Green represents reference data and blue represents exposed data. Black bars represent measures of central tendency (mean, geometric mean, or median depending on if analysis was conducted on untransformed, log10− transformed or rank−transformed data). Coloured letters represent significant (p−value <0.1) *post hoc* comparisons within areas over time; years that share a letter of the same colour (e.g., A, B) within a box of the same colour do not differ significantly within an area. A number above the plot indicates significant exposed vs. reference *post hoc* comparisons within a given year. The magnitude of difference (MOD) for these significant *post hoc* comparisons are expressed in units of standard deviation (SD) or median absolute deviations (MAD; if the data were rank−transformed prior to analysis) relative to reference. 'ns' indicates a non−significant contrast; 'nm' indicates that the MOD could not be calculated because MAD = 0. For plots of phytoplankton results prior to 2019, see Minnow (2019a, 2020a, 2021a). For results of single phytoplankton samples collected in June and August 2024, see Appendix Table C.3.1. Radiophytes were excluded from the statistical comparisons because of insufficient data (i.e., this taxon was reported at BOL−B2 in 2024 only).

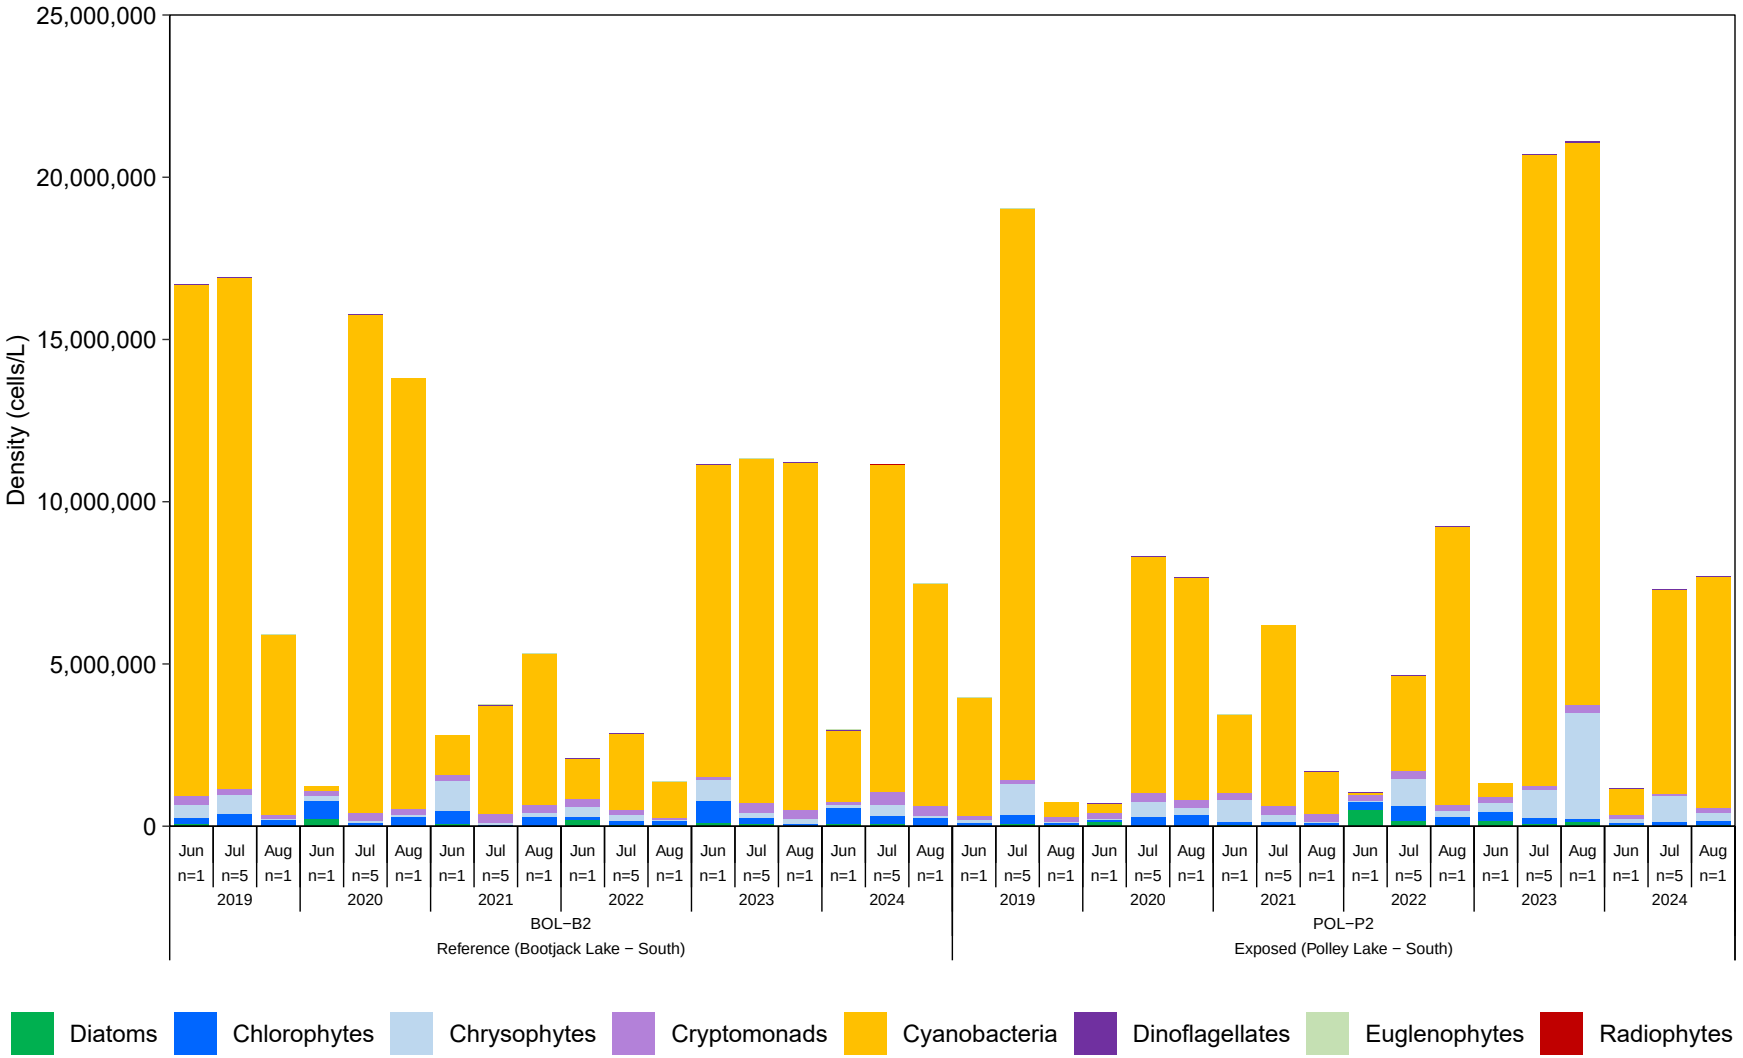

Figure E.2.3: Mean Densities of Major Phytoplankton Taxa for the Polley Lake (POL−P2; Exposed) and Bootjack Lake (BOL−B2; Reference) Monitoring Areas, 2019 to 2024

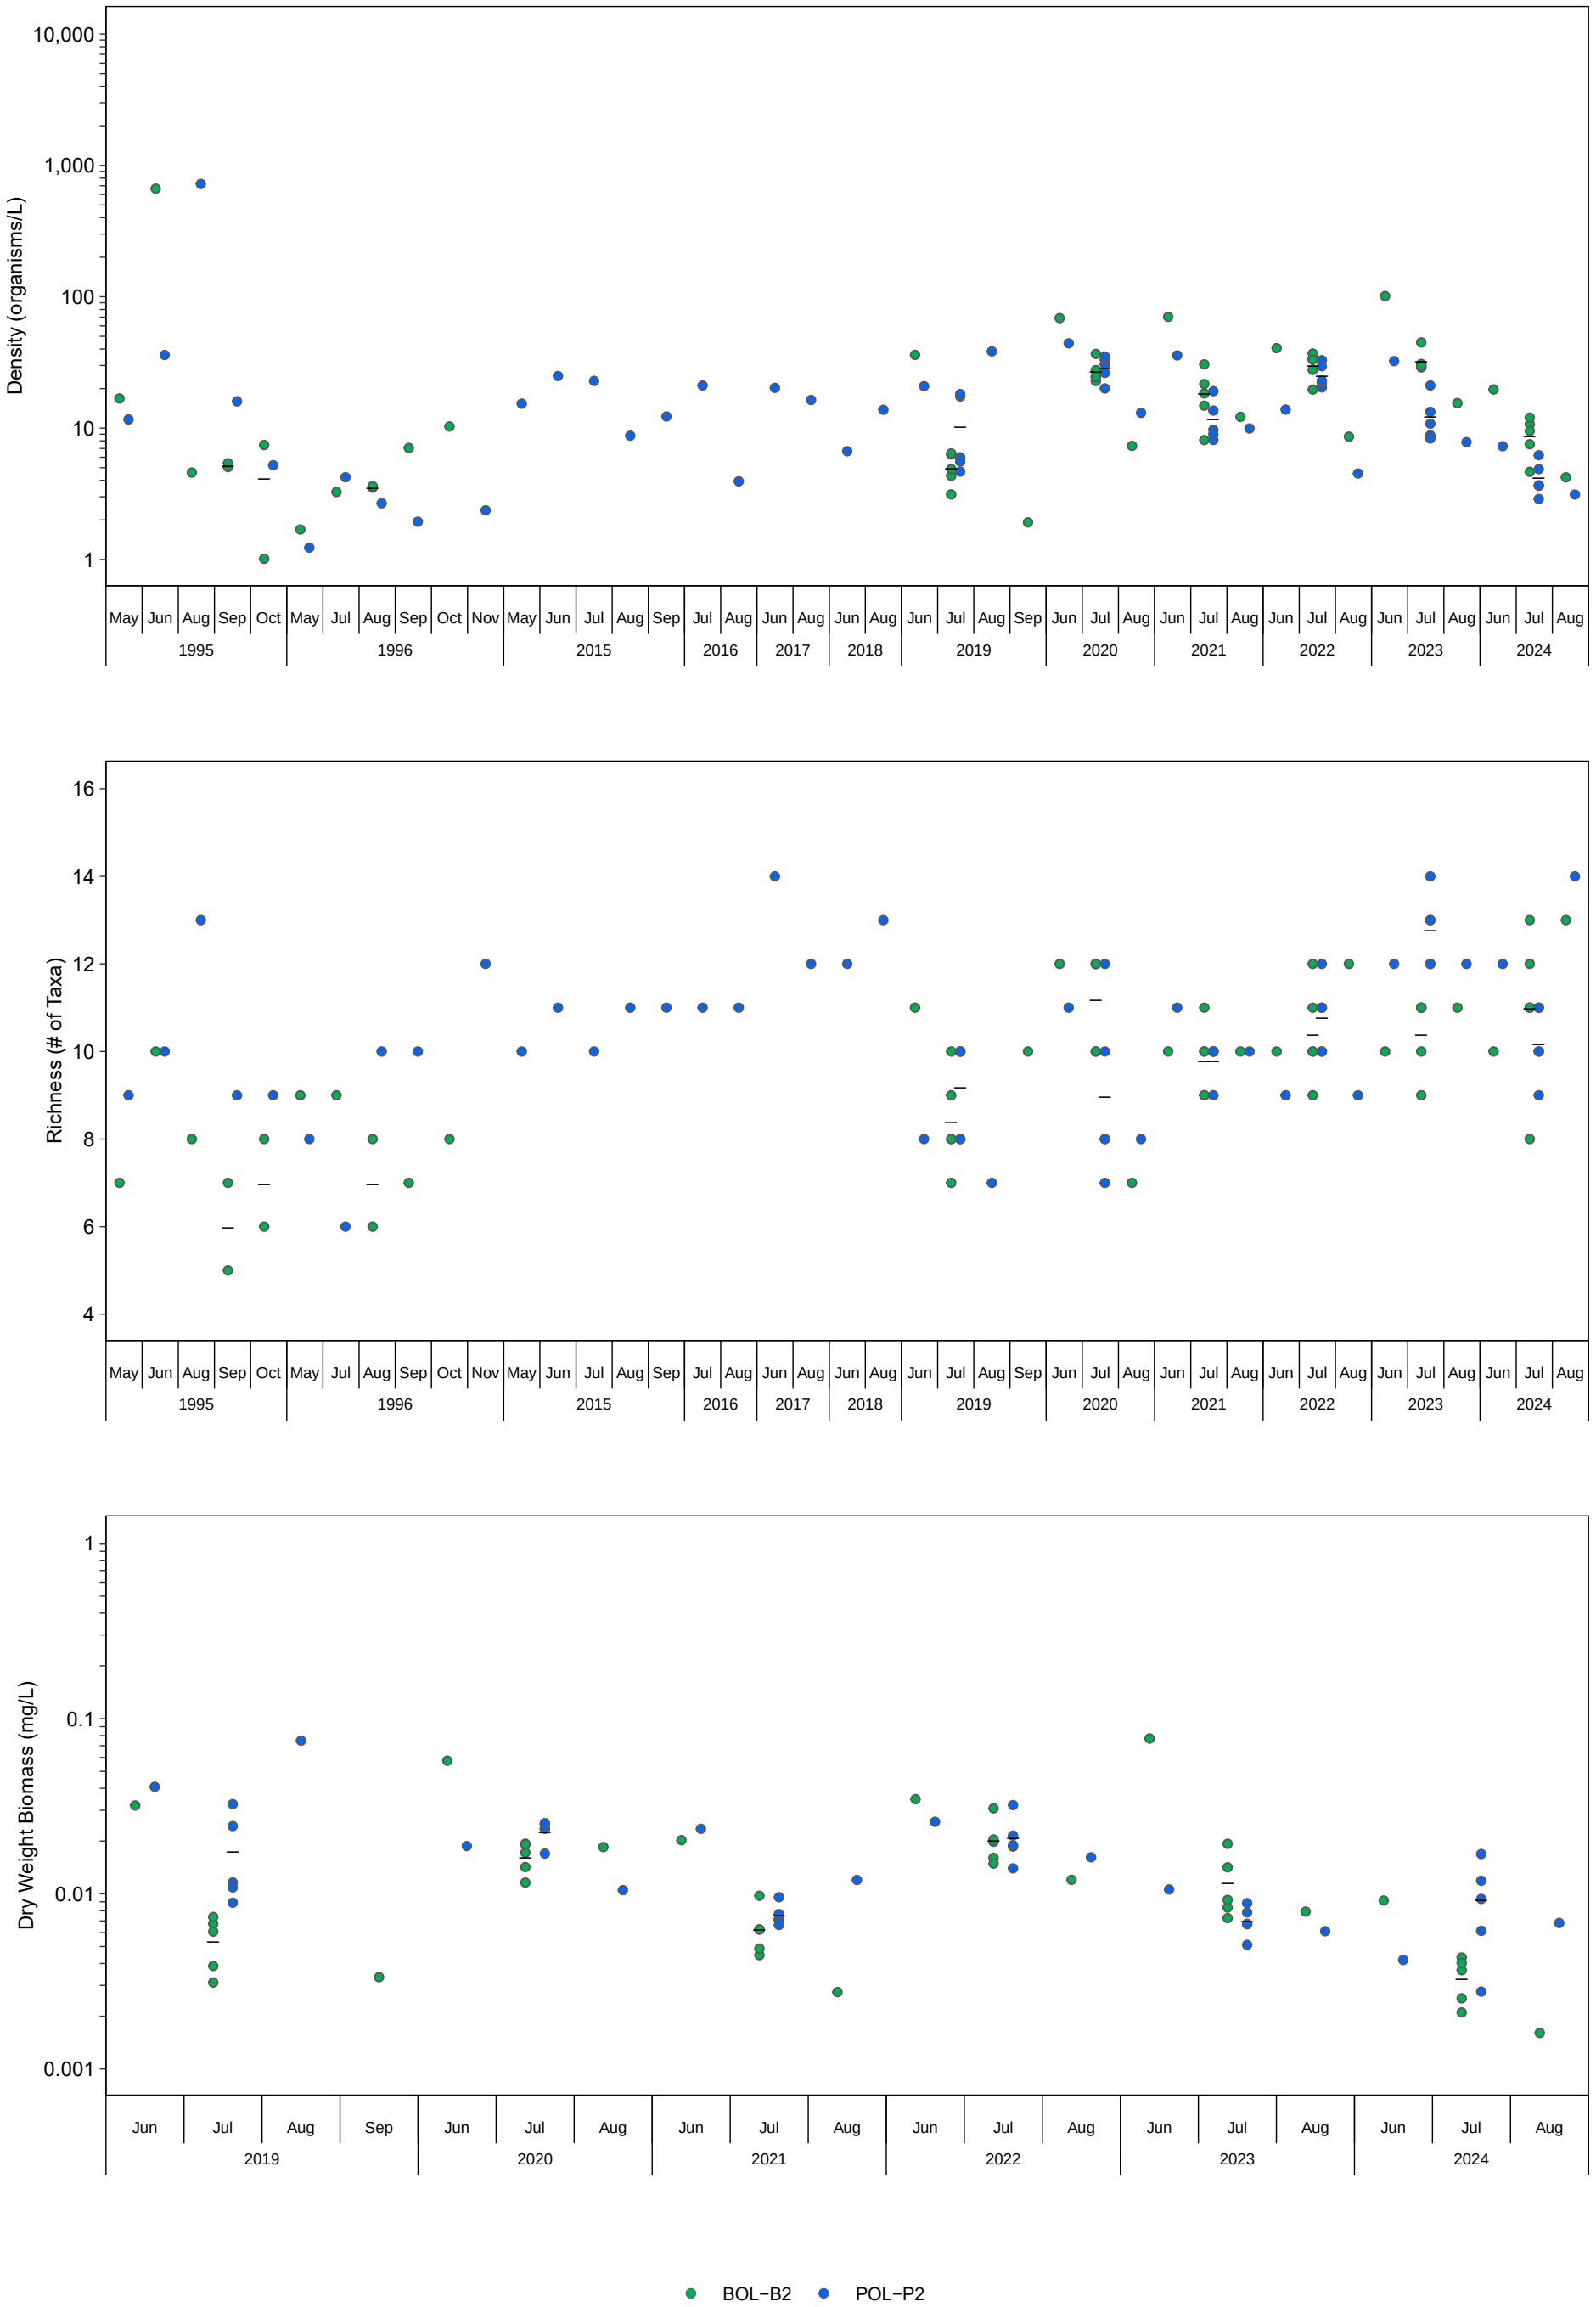

Figure E.2.4: Zooplankton Community Metrics for the Polley Lake (POL−P2; Exposed) and Bootjack Lake (BOL−B2; Reference) Monitoring Areas, 1995 to 2024

Notes: mg/L = milligrams per litre. Green represents reference data and blue represents exposed data. Black bars represent mean values. Results displayed for POL-P2 (August 2019; above) for the same sampling area and date differ from those presented in previous reports (Minnow 2020a, 2021a, 2022a) due to revised calculations.

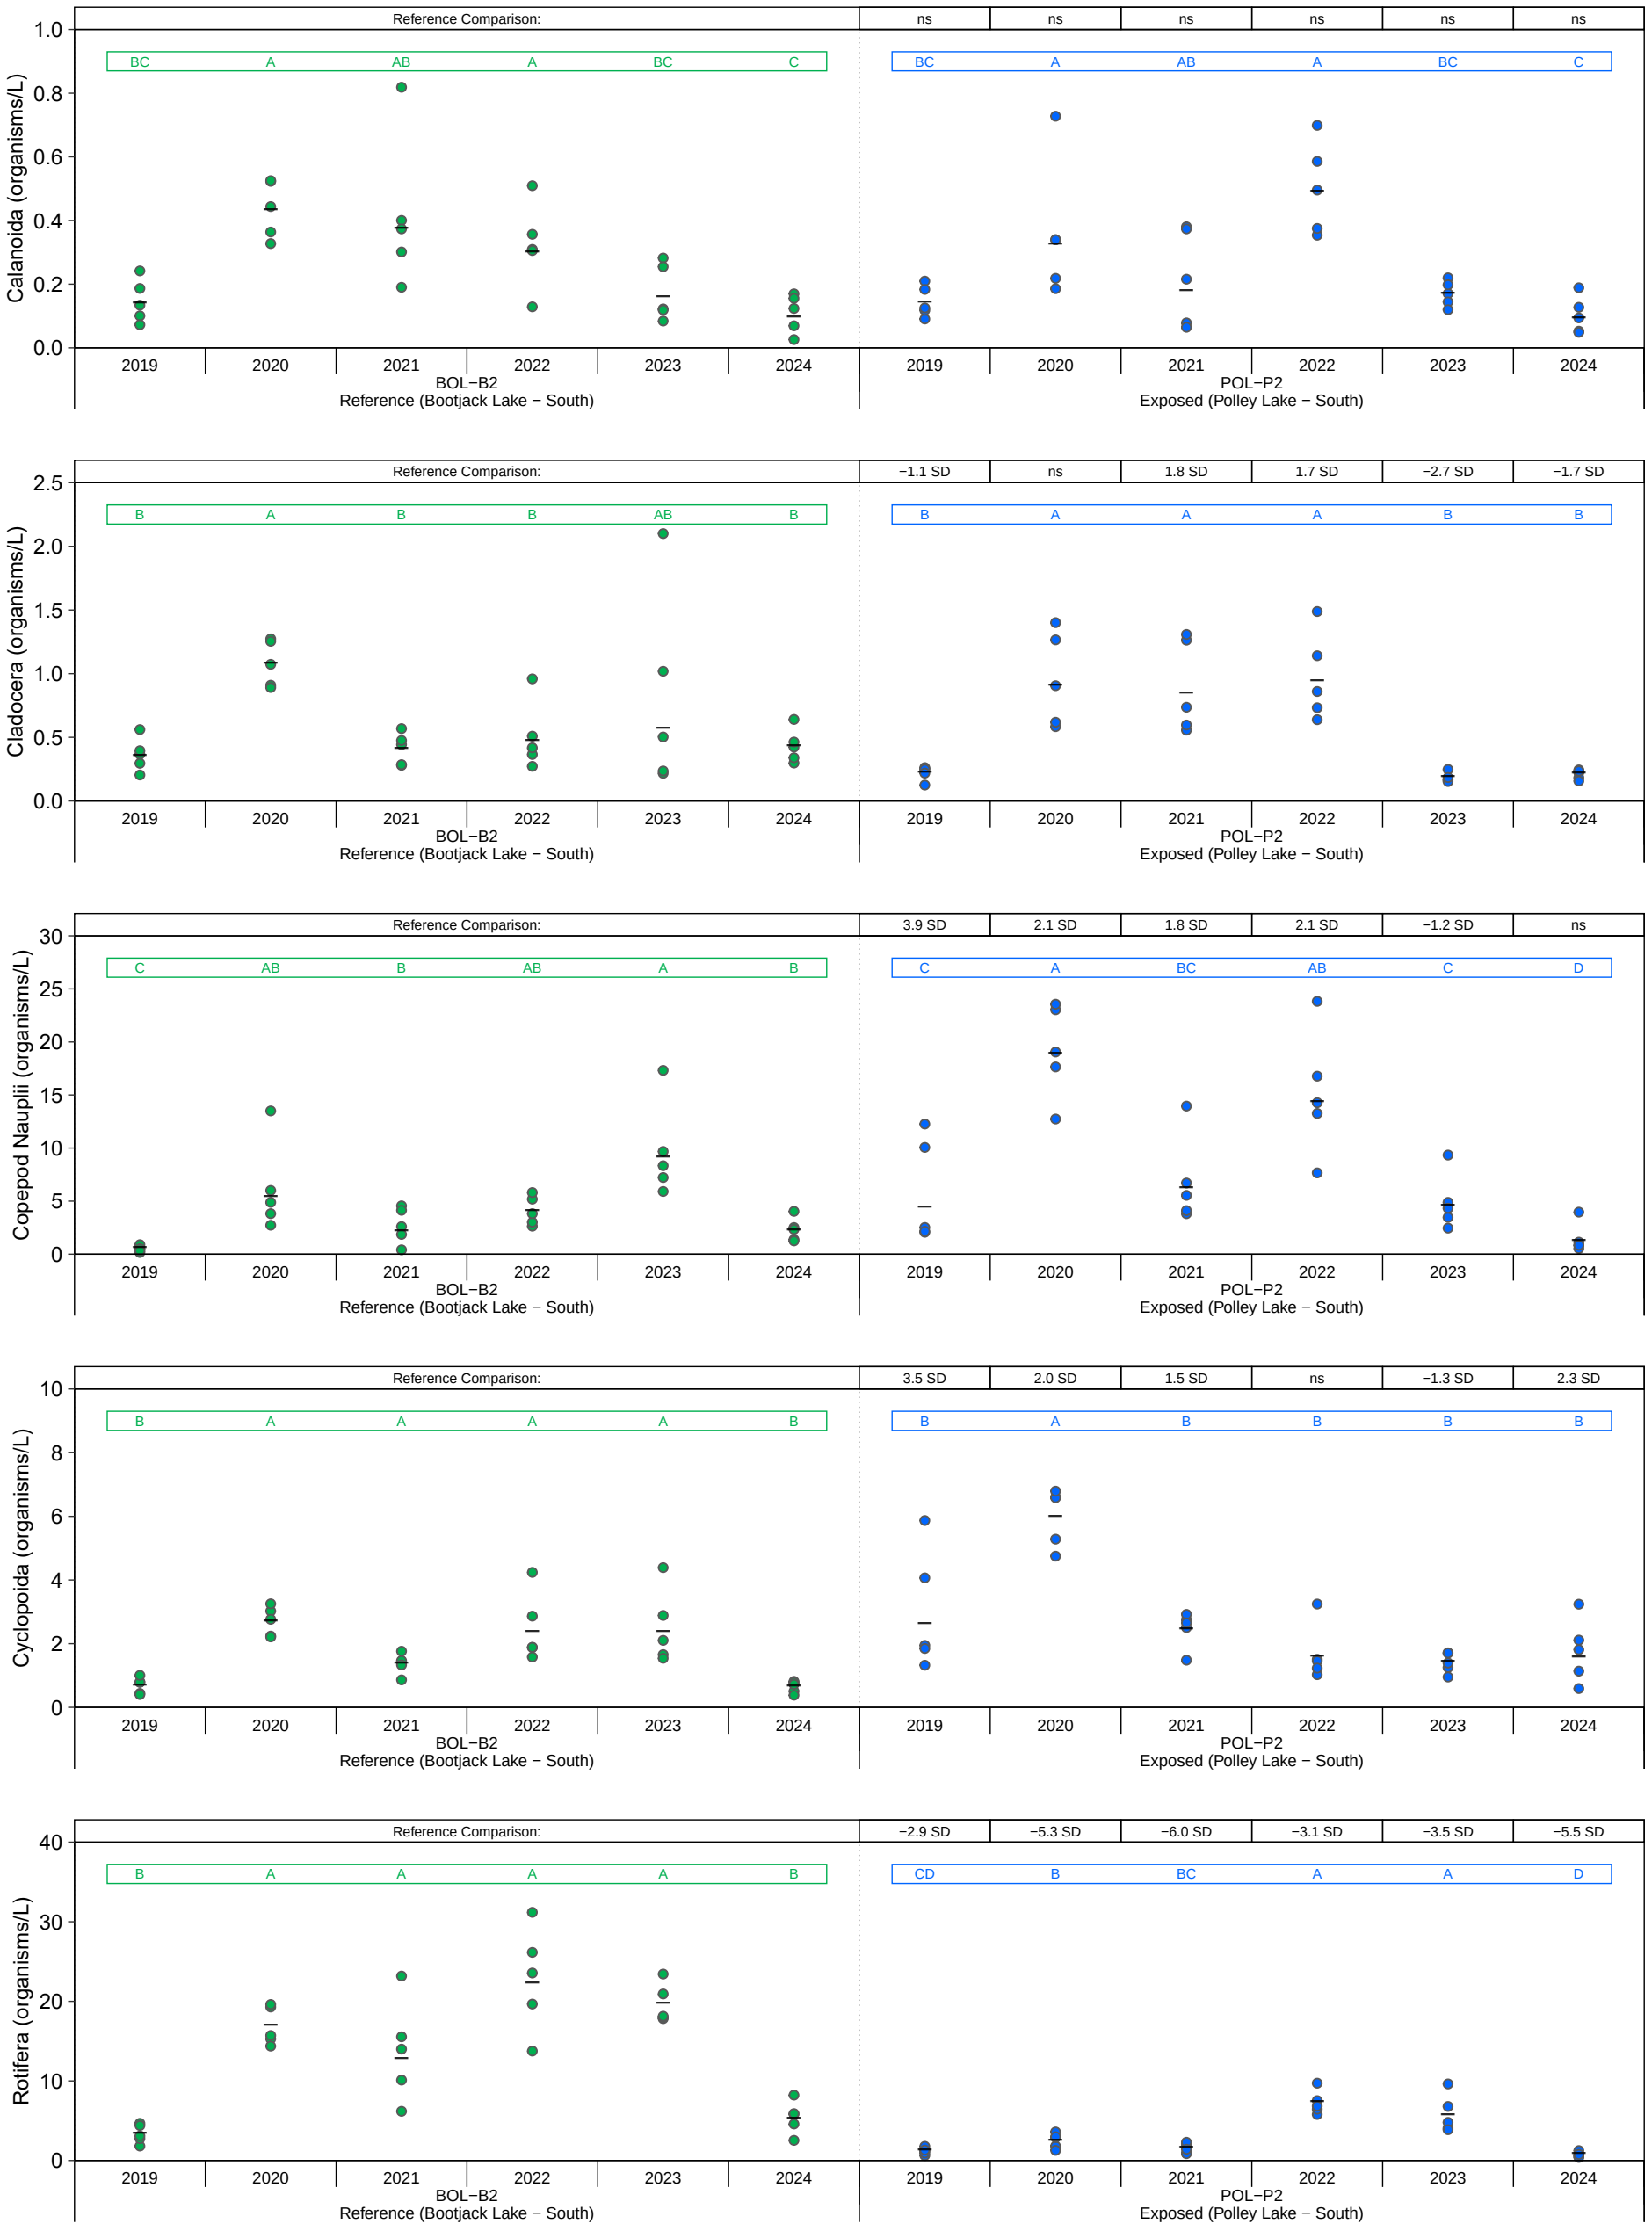

Figure E.2.5: Zooplankton Community Metrics for the Polley Lake (POL−P2; Exposed) and Bootjack Lake (BOL−B2; Reference) Monitoring Areas in July, 2019 to 2024

Notes: Green represents reference data and blue represents exposed data. Black bars represent measures of central tendency (mean, geometric mean, or median depending on if analysis was conducted on untransformed, log10− transformed or rank−transformed data). Coloured letters represent significant (p−value <0.1) post hoc comparisons within areas over time; years that share a letter of the same colour (e.g., A, B) within a box of the same colour do not differ significantly within an area. A number above the plot indicates significant exposed vs. reference post hoc comparisons within a given year. The magnitude of difference (MOD) for these significant post hoc comparisons are expressed in units of standard deviation (SD). 'ns' indicates a non−significant contrast. For plots of zooplankton results prior to 2019, see Minnow (2019a, 2020a, 2021a, 2022a). For results of single zooplankton samples collected in June and August 2024, see Appendix Table C.3.3.

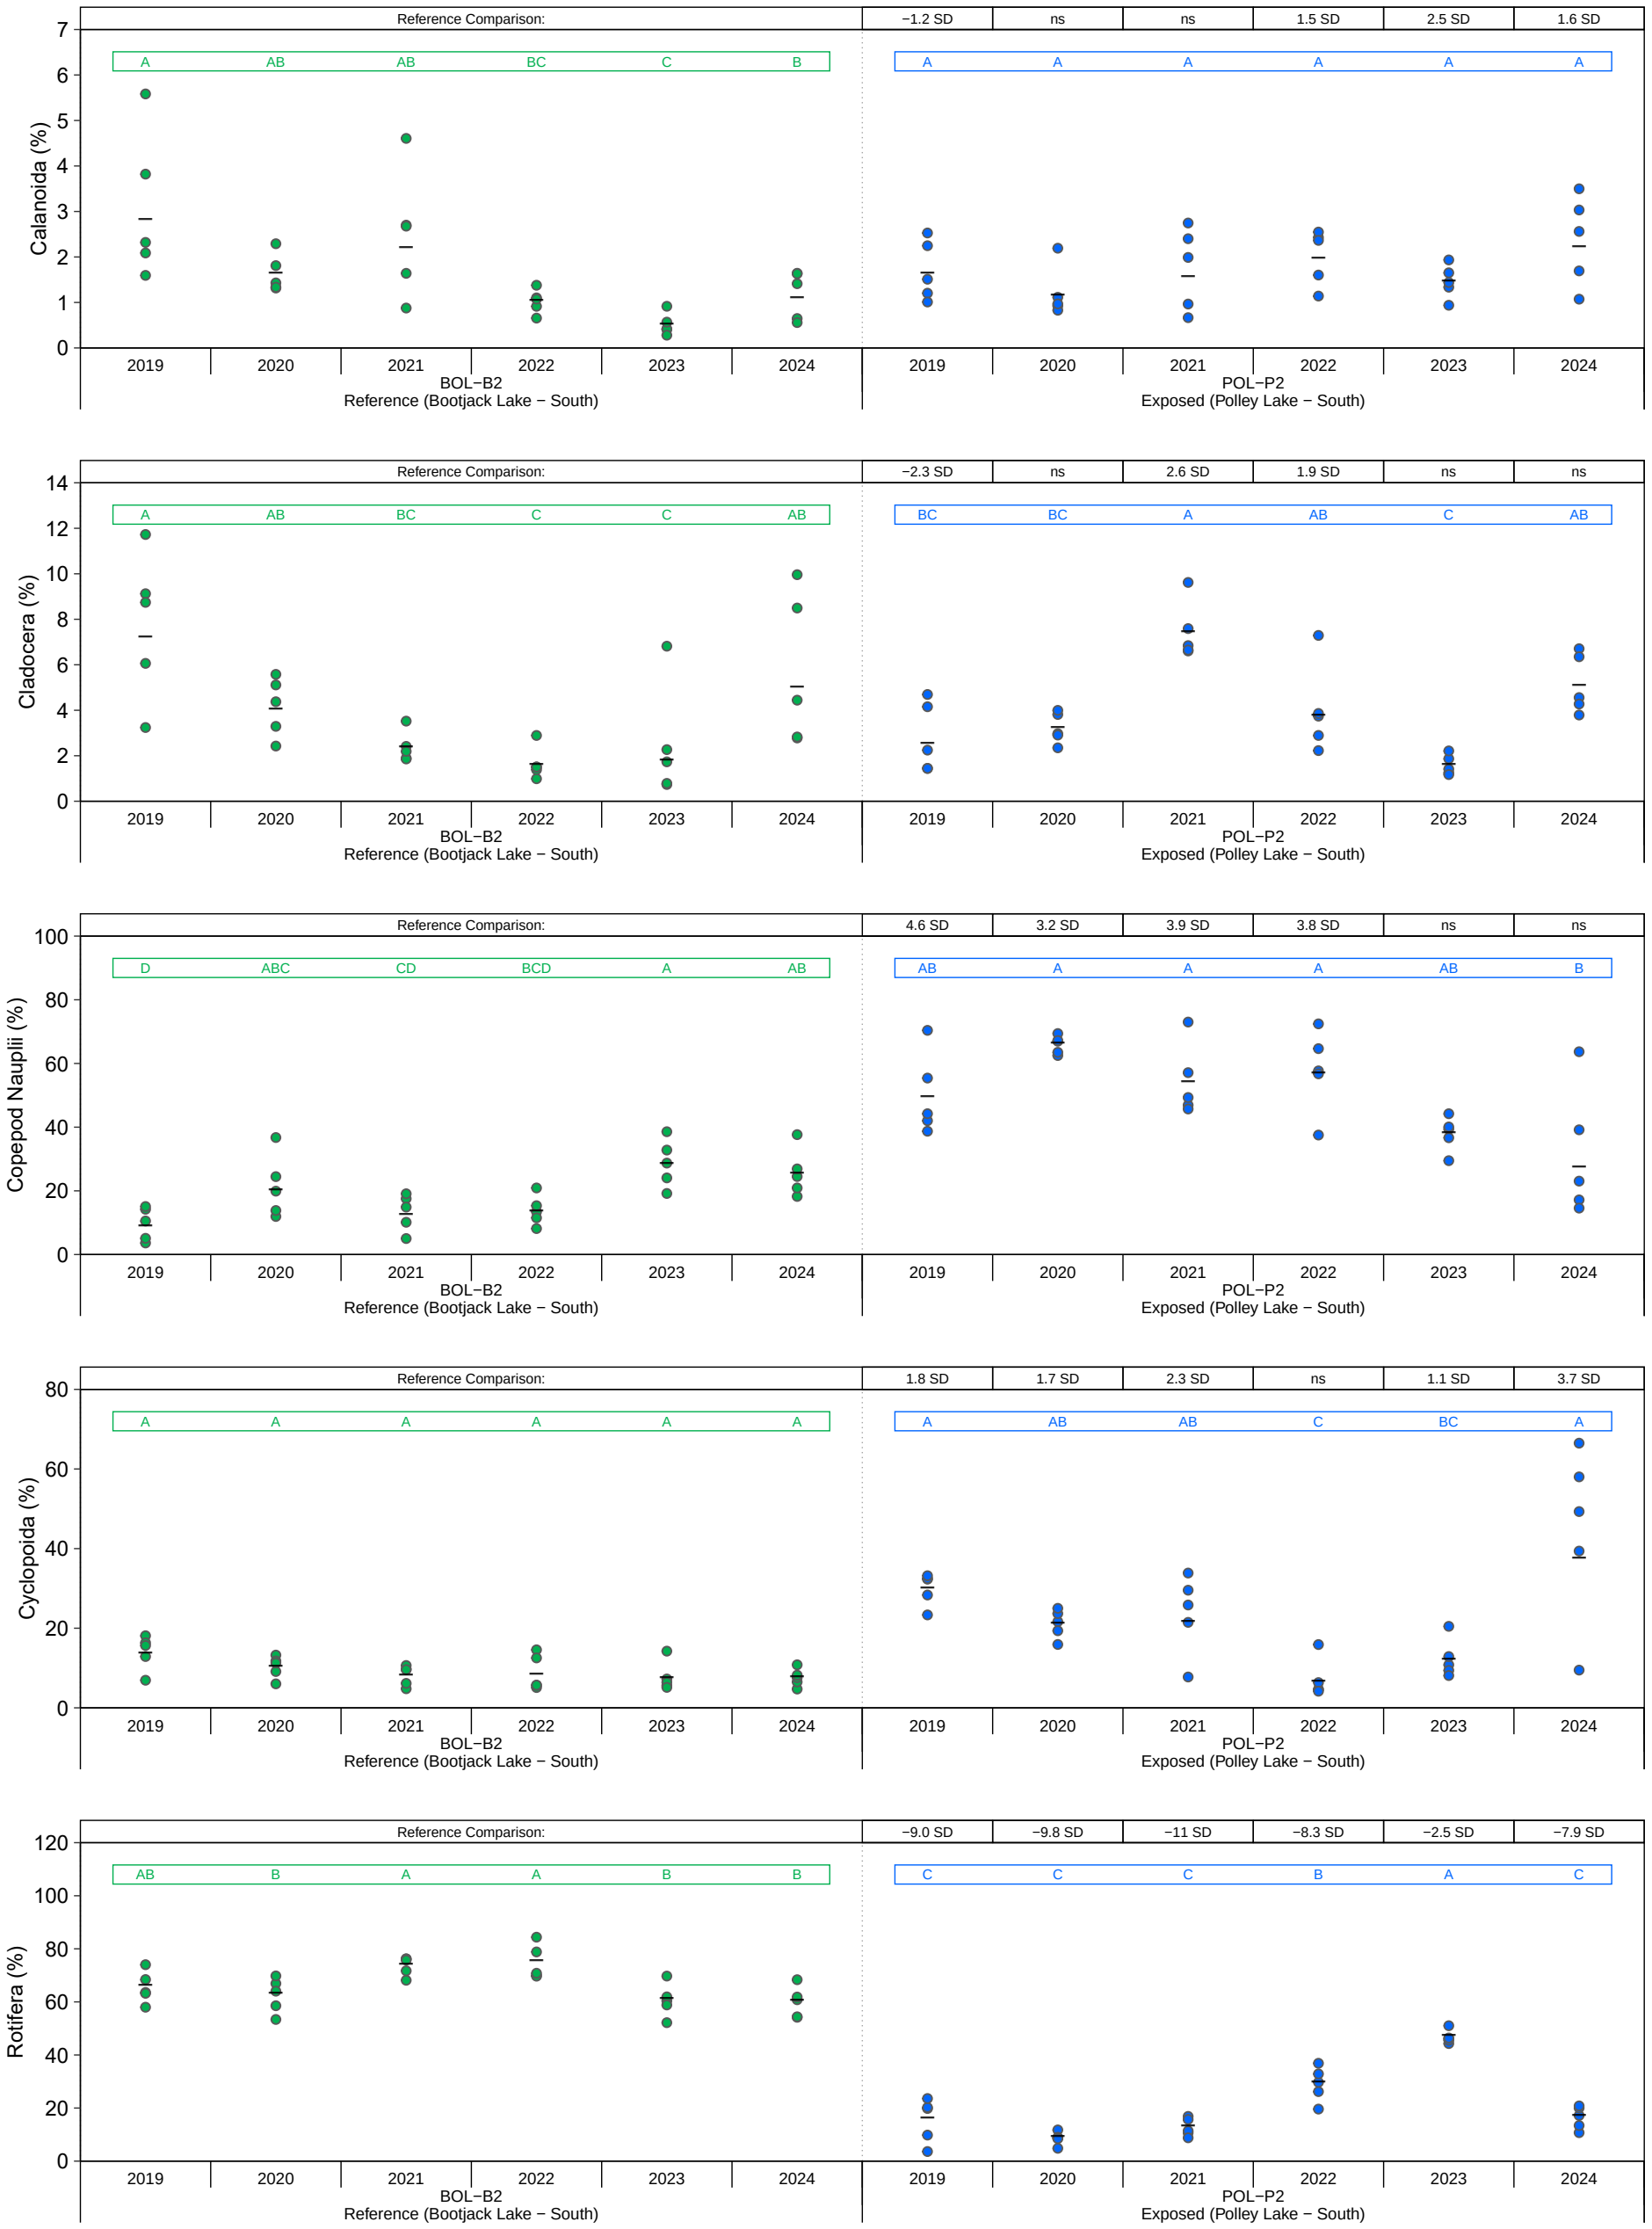

Figure E.2.5: Zooplankton Community Metrics for the Polley Lake (POL−P2; Exposed) and Bootjack Lake (BOL−B2; Reference) Monitoring Areas in July, 2019 to 2024

Notes: Green represents reference data and blue represents exposed data. Black bars represent measures of central tendency (mean, geometric mean, or median depending on if analysis was conducted on untransformed, log10− transformed or rank−transformed data). Coloured letters represent significant (p−value <0.1) post hoc comparisons within areas over time; years that share a letter of the same colour (e.g., A, B) within a box of the same colour do not differ significantly within an area. A number above the plot indicates significant exposed vs. reference post hoc comparisons within a given year. The magnitude of difference (MOD) for these significant post hoc comparisons are expressed in units of standard deviation (SD). 'ns' indicates a non−significant contrast. [a] MCT = Measure of Central Tendency, which is the mean, geometric mean, or median depending on if analysis was conducted on untransformed, log10-transformed, or rank-transformed data.

[b] Magnitude of difference (MOD) calculated for two-way ANOVA as (Exposed Mean - Reference Mean)/SD (or [Mean - Baseline Mean]/SD for temporal comparisons) on the transformed scale, where SD was the pooled standard deviation of the model residuals. MOD calculated for Kruskal-Wallis (i.e., rank-transformed data) as (Exposed Median - Reference Median)/MAD, where MAD was the pooled median absolute deviation.

P-value < 0.05

Magnitude of Difference (MOD) < -2

Magnitude of Difference (MOD) > 2

Notes: ANOVA = Analysis of Variance. "-" = no data available. "ns" = non significant. Euglenophytes were recorded in June 2023, so were excluded from statistical analyses that focus on July data only.

[a] MCT = Measure of Central Tendency, which is the mean, geometric mean, or median depending on if analysis was conducted on untransformed, log10-transformed, or rank-transformed data.

[b] Magnitude of difference (MOD) calculated for two-way ANOVA as (Exposed Mean - Reference Mean)/SD (or [Mean - Baseline Mean]/SD for temporal comparisons) on the transformed scale, where SD was the pooled standard deviation of the model residuals. MOD calculated for Kruskal-Wallis (i.e., rank-transformed data) as (Exposed Median - Reference Median)/MAD, where MAD was the pooled median absolute deviation.

APPENDIX E.3
ZOOPLANKTON TISSUE QUALITY

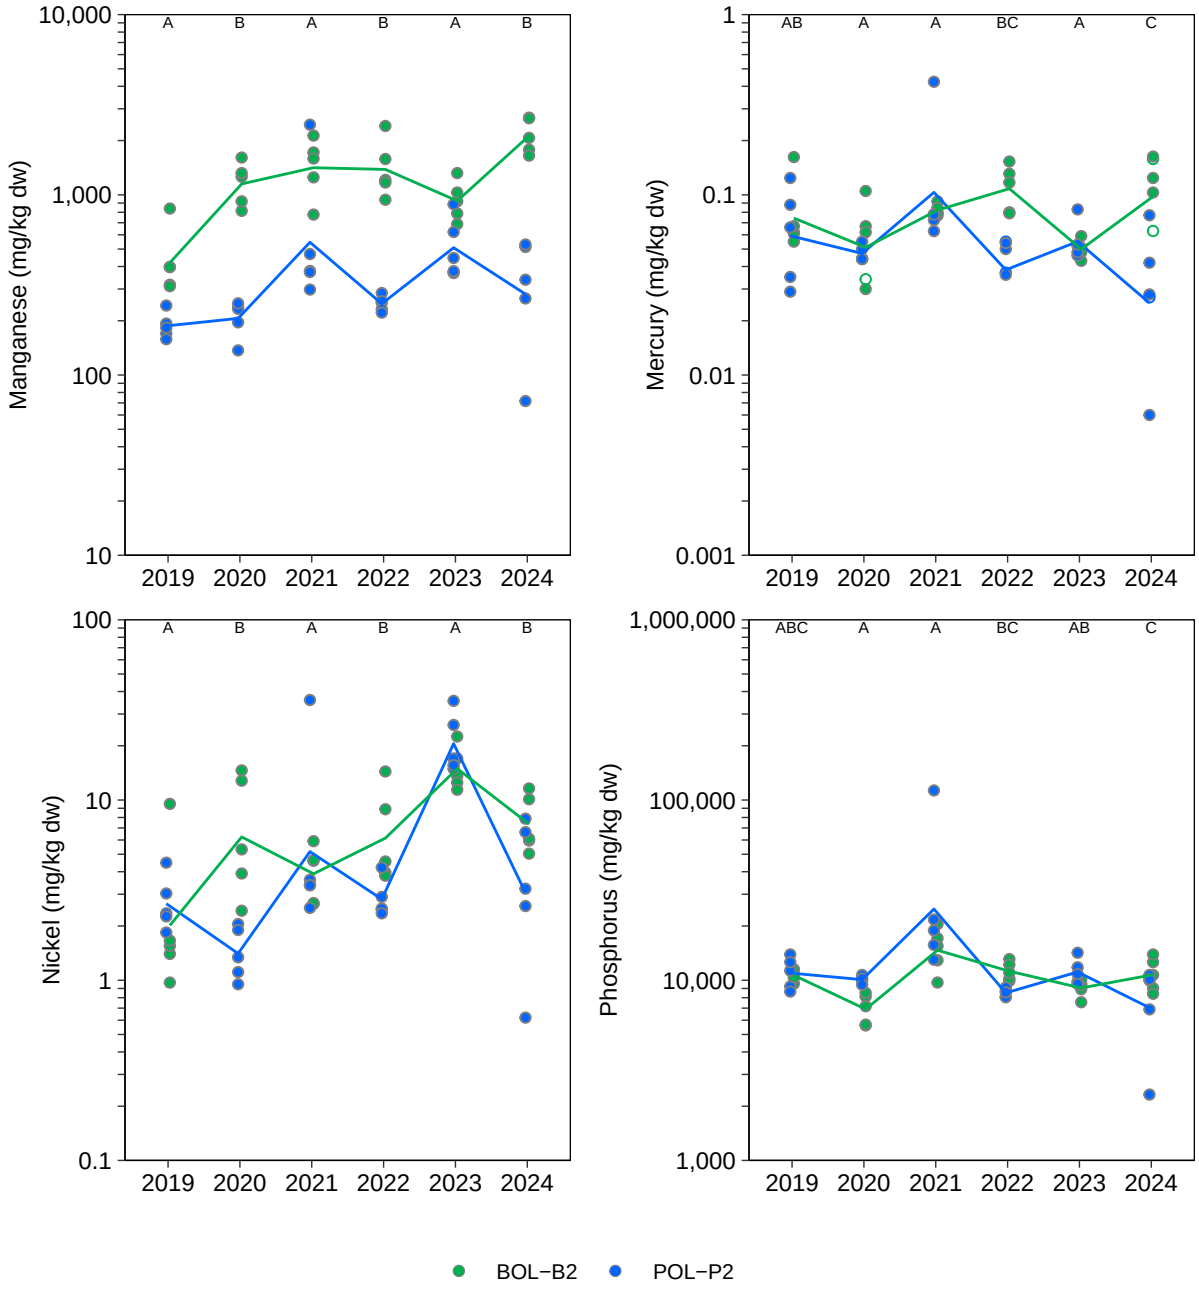

Figure E.3.1: Zooplankton Tissue Primary and Secondary Analyte Concentrations with a Significant Negative Exposed − Reference Difference and a Significant Area x Year Effect for the Polley Lake (POL−P2; Exposed) and Bootjack Lake (BOL−B2; Reference) Monitoring Areas in July, 2019 to 2024

Notes: mg/kg dw = milligrams per kilogram dry weight. Green represents reference areas and blue represents exposed areas. Concentrations below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL and the open symbol represents one or more values reported below the LRL. Individual samples are plotted and lines join the least−squares estimated mean values for years included in the statistical analysis (i.e., not <LRL). Statistical analyses were conducted using a two−way ANOVA with factors Area and Year. The models were fit using Maximum Likelihood Estimation with an assumed log−normal distribution. Years that share a letter (e.g., A,B,C) have ratios of concentrations (Exposed : Reference) that do not differ significantly (p−value < 0.05) among years. Letter A was assigned to the year with the highest ratio of concentrations (Exposed : Reference). Only years with samples from both reference and exposed areas are plotted.

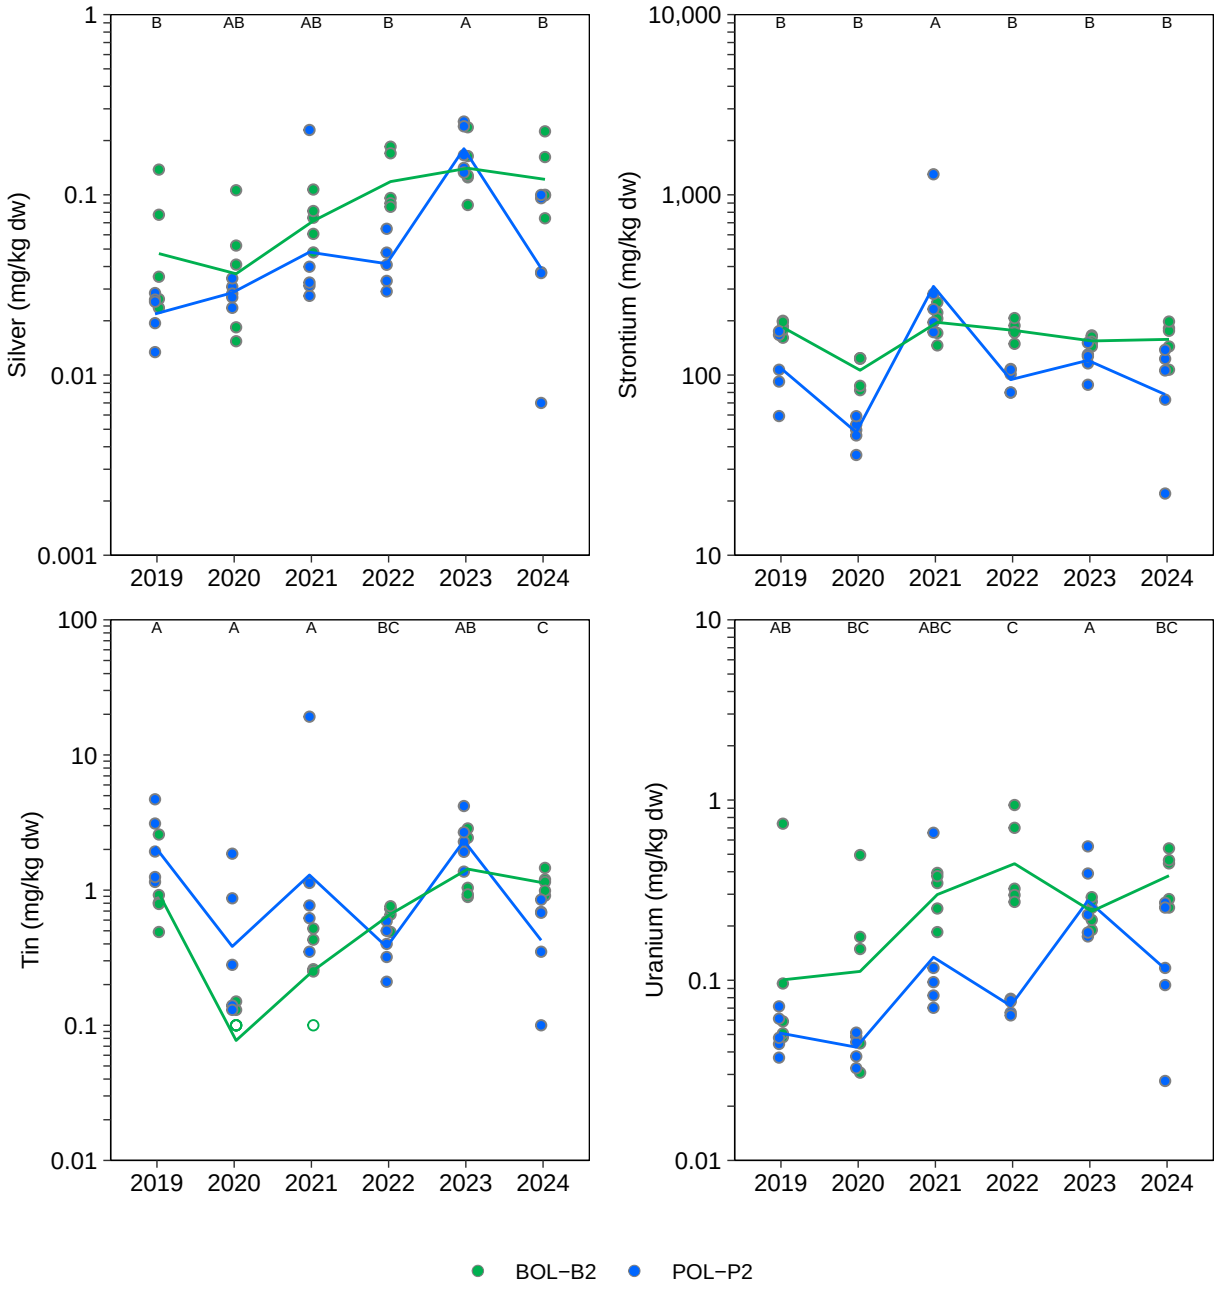

Figure E.3.1: Zooplankton Tissue Primary and Secondary Analyte Concentrations with a Significant Negative Exposed − Reference Difference and a Significant Area x Year Effect for the Polley Lake (POL−P2; Exposed) and Bootjack Lake (BOL−B2; Reference) Monitoring Areas in July, 2019 to 2024

APPENDIX E.4
BENTHIC INVERTEBRATE COMMUNITY

APPENDIX E4 RESOLVING MIXED-LEVELS OF TAXONOMIC RESOLUTION FOR BENTHIC INVERTEBRATES

E.4.1 INTRODUCTION 1
E.4.2 DECISION KEY 3
E.4.3 REFERENCES 4

E.4.1 INTRODUCTION

Processing of benthic invertebrate data for ecological assessment generally involves determining taxonomic richness (number of taxa present) as well as community composition, which is typically assessed using abundances (and/or density) of all taxa present and their relative proportion of the total community. Taxonomic richness and community composition can be informative metrics on their own, however they are also utilized in the calculation of diversity indices (e.g., Simpson's Evenness and Simpson's Diversity). Determination of taxonomic richness and community composition from taxonomic data can be complicated by inconsistencies in taxonomic data, relating to the taxonomic level to which organisms can practicably be identified by the laboratory ("resolution"). Taxonomists endeavour to classify organisms within the most specific taxon (a defined taxonomic identity of any rank) possible, generally Genus or Species, however specimens that are damaged or are in an early developmental stage may lack the morphological features necessary to confirm an identification to the same level that can be achieved for some adult specimens. Furthermore, the information needed to confirm the identification of specimens may not be available in taxonomic keys or other resources. When individuals of a single taxon are identified to different levels of resolution within a single sample they are considered redundant or "ambiguous" taxa. The presence of these ambiguous taxa may result in inflated estimates of richness or distorted patterns of diversity across sites. For example, some specimens may be identified to the genus level (e.g., *Baetis*) while others are identified to the species level (e.g., *Baetis tricaudatus*). If ambiguous taxa are not resolved, then the coarser-resolution taxon (i.e., the Genus-level, *Baetis*) is counted as a unique taxon when it may actually be the same species as the finer-level taxon (i.e., species-level, *B. tricaudatus*). Therefore, one consequence of the common practice of identifying organisms to the lowest practicable taxonomic level (LPL) is that the "species list" (complete list of taxa identified) from any site contains a mixture of taxa (or "mixed level") wherein an individual taxon may have multiple specimens identified to several different levels of taxonomic resolution. As a result, benthic invertebrate data typically comprise a mixture of identification levels due to difficulties in achieving a uniform Species, Genus, or even Family-level identification for aquatic macroinvertebrates (Cranston 1990) and must undergo additional consolidation steps prior to data analysis.

At least four options are available for dealing with taxa identified to mixed-levels of taxonomic resolution:

1. remove data for any organisms identified to a level less specific than the target resolution (i.e., anything not at the Genus or Species level);

2. group all data for any organisms identified to a level less specific than the target resolution into an "Other" group, a standalone but undefined taxon;

3. proportionally distribute data for any organisms identified to a level less specific than the target resolution into values for organisms positively identified to target resolution according to the ratios of those positively identified taxa (i.e. “rolling down” unidentified taxa to more specific taxonomic levels); or

4. combine all related taxa least-specific taxon to which consistent identification is possible (i.e. “rolling up” unidentified taxa to less-specific taxonomic levels – often family-level).

Option 1 (though sometimes used) is unsatisfactory because a bias is introduced into the sample (as taxa that are difficult to identify are not randomly distributed, but rather occur more frequently in particular Classes, Orders, and Families). The second option (also sometimes used) is unsatisfactory because organisms grouped as “Other” contribute no useful information (beyond increasing the total density estimate), and complicate further analyses. The third option assumes that the ratio of taxa among ambiguous taxa is the same as in specimens of identified decisively, which may or may not be accurate. The fourth option is most conservative but may lead to a significant loss of data. For example, specimens of the genera *Baetis* and *Pseudocloeon* might be lumped together and analyzed as Baetidae. The preferred option for analysis depends on the distribution of the organisms among taxa. If identified specimens in the two genera above constitute only 10% of the total abundance, it may be most appropriate to lump them together with the other 90% in the less-specific taxon (Family: Baetidae). Conversely, if 90% of the identified organisms fall into the two Genera, it is more defensible to apportion the ambiguous taxa identified only to Baetidae (Family) into the values for specimens identified to Genus, and any resulting error may not seriously bias the analysis. In order to standardize the decision-making process, reduce subjectivity, and improve the efficiency of benthic community data processing, Minnow has developed and applied a decision key which is used in the processing of all benthic invertebrate community data.

E.4.2 DECISION KEY

Resolution of redundant or ambiguous taxa was achieved through implementation of a decision key that dictated criteria for data processing (Figure E.4.1). The first two options for dealing with taxa identified to mixed-levels of taxonomic resolution outlined in Section E.4.1 were considered unsatisfactory, therefore the decision key makes use of abundance and richness criteria to apply options 3 (roll-down) and 4 (roll-up) for each level of the taxonomic hierarchy. This method preserves as much detailed taxonomic information as possible, while addressing issues of taxonomic ambiguities. The decision key was modified from the Puget Sound Long-Term Marine Sediment Benthic Invertebrate Summary and is outlined below (Weakland et al. 2018).

The decision key rules are summarised as follows (see Figure E.4.1 for details).

- If identifications have not been taken to the same level consistently over multiple years of monitoring, data are rolled up to a less-specific taxonomic level. If identifications have been taken to the same level consistently over multiple years or only one year of data is available, they are kept at their respective taxonomic levels.
- If for a taxa identified to mixed-levels of resolution it is known that differentiating among specimens at more-specific levels of identification is notably challenging (e.g. due to inconsistencies in taxonomic keys or fragility of defining features) then all taxa are rolled up to a less-specific taxonomic level. If the difficulty of identifications are of mixed levels of difficulty, then easy-to-identify taxa are left at their respective level of identification, whereas difficult-to-identify taxa are rolled up to a less-specific level. If the identifications are easy, then they are kept at their respective taxonomic levels.
- For examples that have satisfied the above criteria, if there are no more-specific levels of identification or there are no organisms identified to a more-specific taxon, they are left at that level of identification.

E.4.3 REFERENCES

Cranston, P.S. 1990. Biomonitoring and invertebrate taxonomy. Environmental Monitoring and Assessment 14: 265-273

Weakland, S., V. Partridge, and M. Dutch. 2018. Sediment Quality in Puget Sound: Changes in chemistry, toxicity, and benthic invertebrates at multiple geographic scales, 1989–2015. Publication Number: 18-03-004.https://fortress.wa.gov/ecy/publications/SummaryPages/1803004.html

Identifications have NOT been taken to the same level consistently over multiple years

Identifications have been taken to the same level consistently over multiple years (or only 1 year of data available)

More specific identifications are not easily achievable

Mixed levels of difficulty to achieve identification at more specific levels

More specific identifications are easily achievable

Leave easy-to-identify levels separate and roll up levels that are difficult to identify into the less specific taxonomic level

Taxon is redundant (representatives of ≥1 more-specific taxon identified in samples)

Taxon is at most-specific identified level and there are no redundant more-specifically identified taxa

Roll Up to less-specific level

Taxon level contains only one more specific identification

Taxon level contains >1 more specific identification

Keep assigned identifications at their levels

Abundance at less-specifically identified level is ≤50% of the combined total abundance of that taxon and more specifically identified taxa (family/genus/species, etc.).

Abundance at less-specific level is >50% of the combined total abundance of that taxon and more-specifically identified taxa (family/genus/species, etc.)

Proportionally assign less-specifically identified abundance to more specifically identified taxa

Less-specifically identified taxon contains only 2 more specific identifications and ≥50% of the combined abundance of that taxon and more specifically identified taxa

Less-specifically identified taxon contains >2 more specific identifications and ≥50% of the combined abundance of that taxon and more specifically identified taxa

Roll to higher level

Leave the less AND more-specific levels of identification

Decision Key for Resolving Mixed Levels of Taxonomic Resolution

Figure E.4.2: Benthic Invertebrate Community Metrics for the Polley Lake (POL-P1, POL-P2; Exposed) and Bootjack Lake (BOL-B2; Reference) Deep Monitoring Areas, 1999 to 2024

Notes: EPT = Ephemeroptera, Plecoptera, Trichoptera. Green represents reference data and blue or purple represents exposed data. Black bars represent measures of central tendency (mean, geometric mean, or median depending on if analysis was conducted on untransformed, log10− transformed or rank−transformed data). Coloured letters represent significant (p−value <0.1) post−hoc comparisons within areas over time; years that share a letter of the same colour (e.g., A, B) within a box of the same colour do not differ significantly within an area. A number above the plot indicates significant exposed vs. reference post−hoc comparisons within a given year. The magnitude of difference (MOD) for these significant post−hoc comparisons is expressed in units of standard deviation (SD) or median absolute deviations (MAD; if the data were rank−transformed prior to analysis) relative to reference. 'ns' indicates a non−significant contrast; 'nm' indicates that the MOD could not be calculated because MAD = 0.

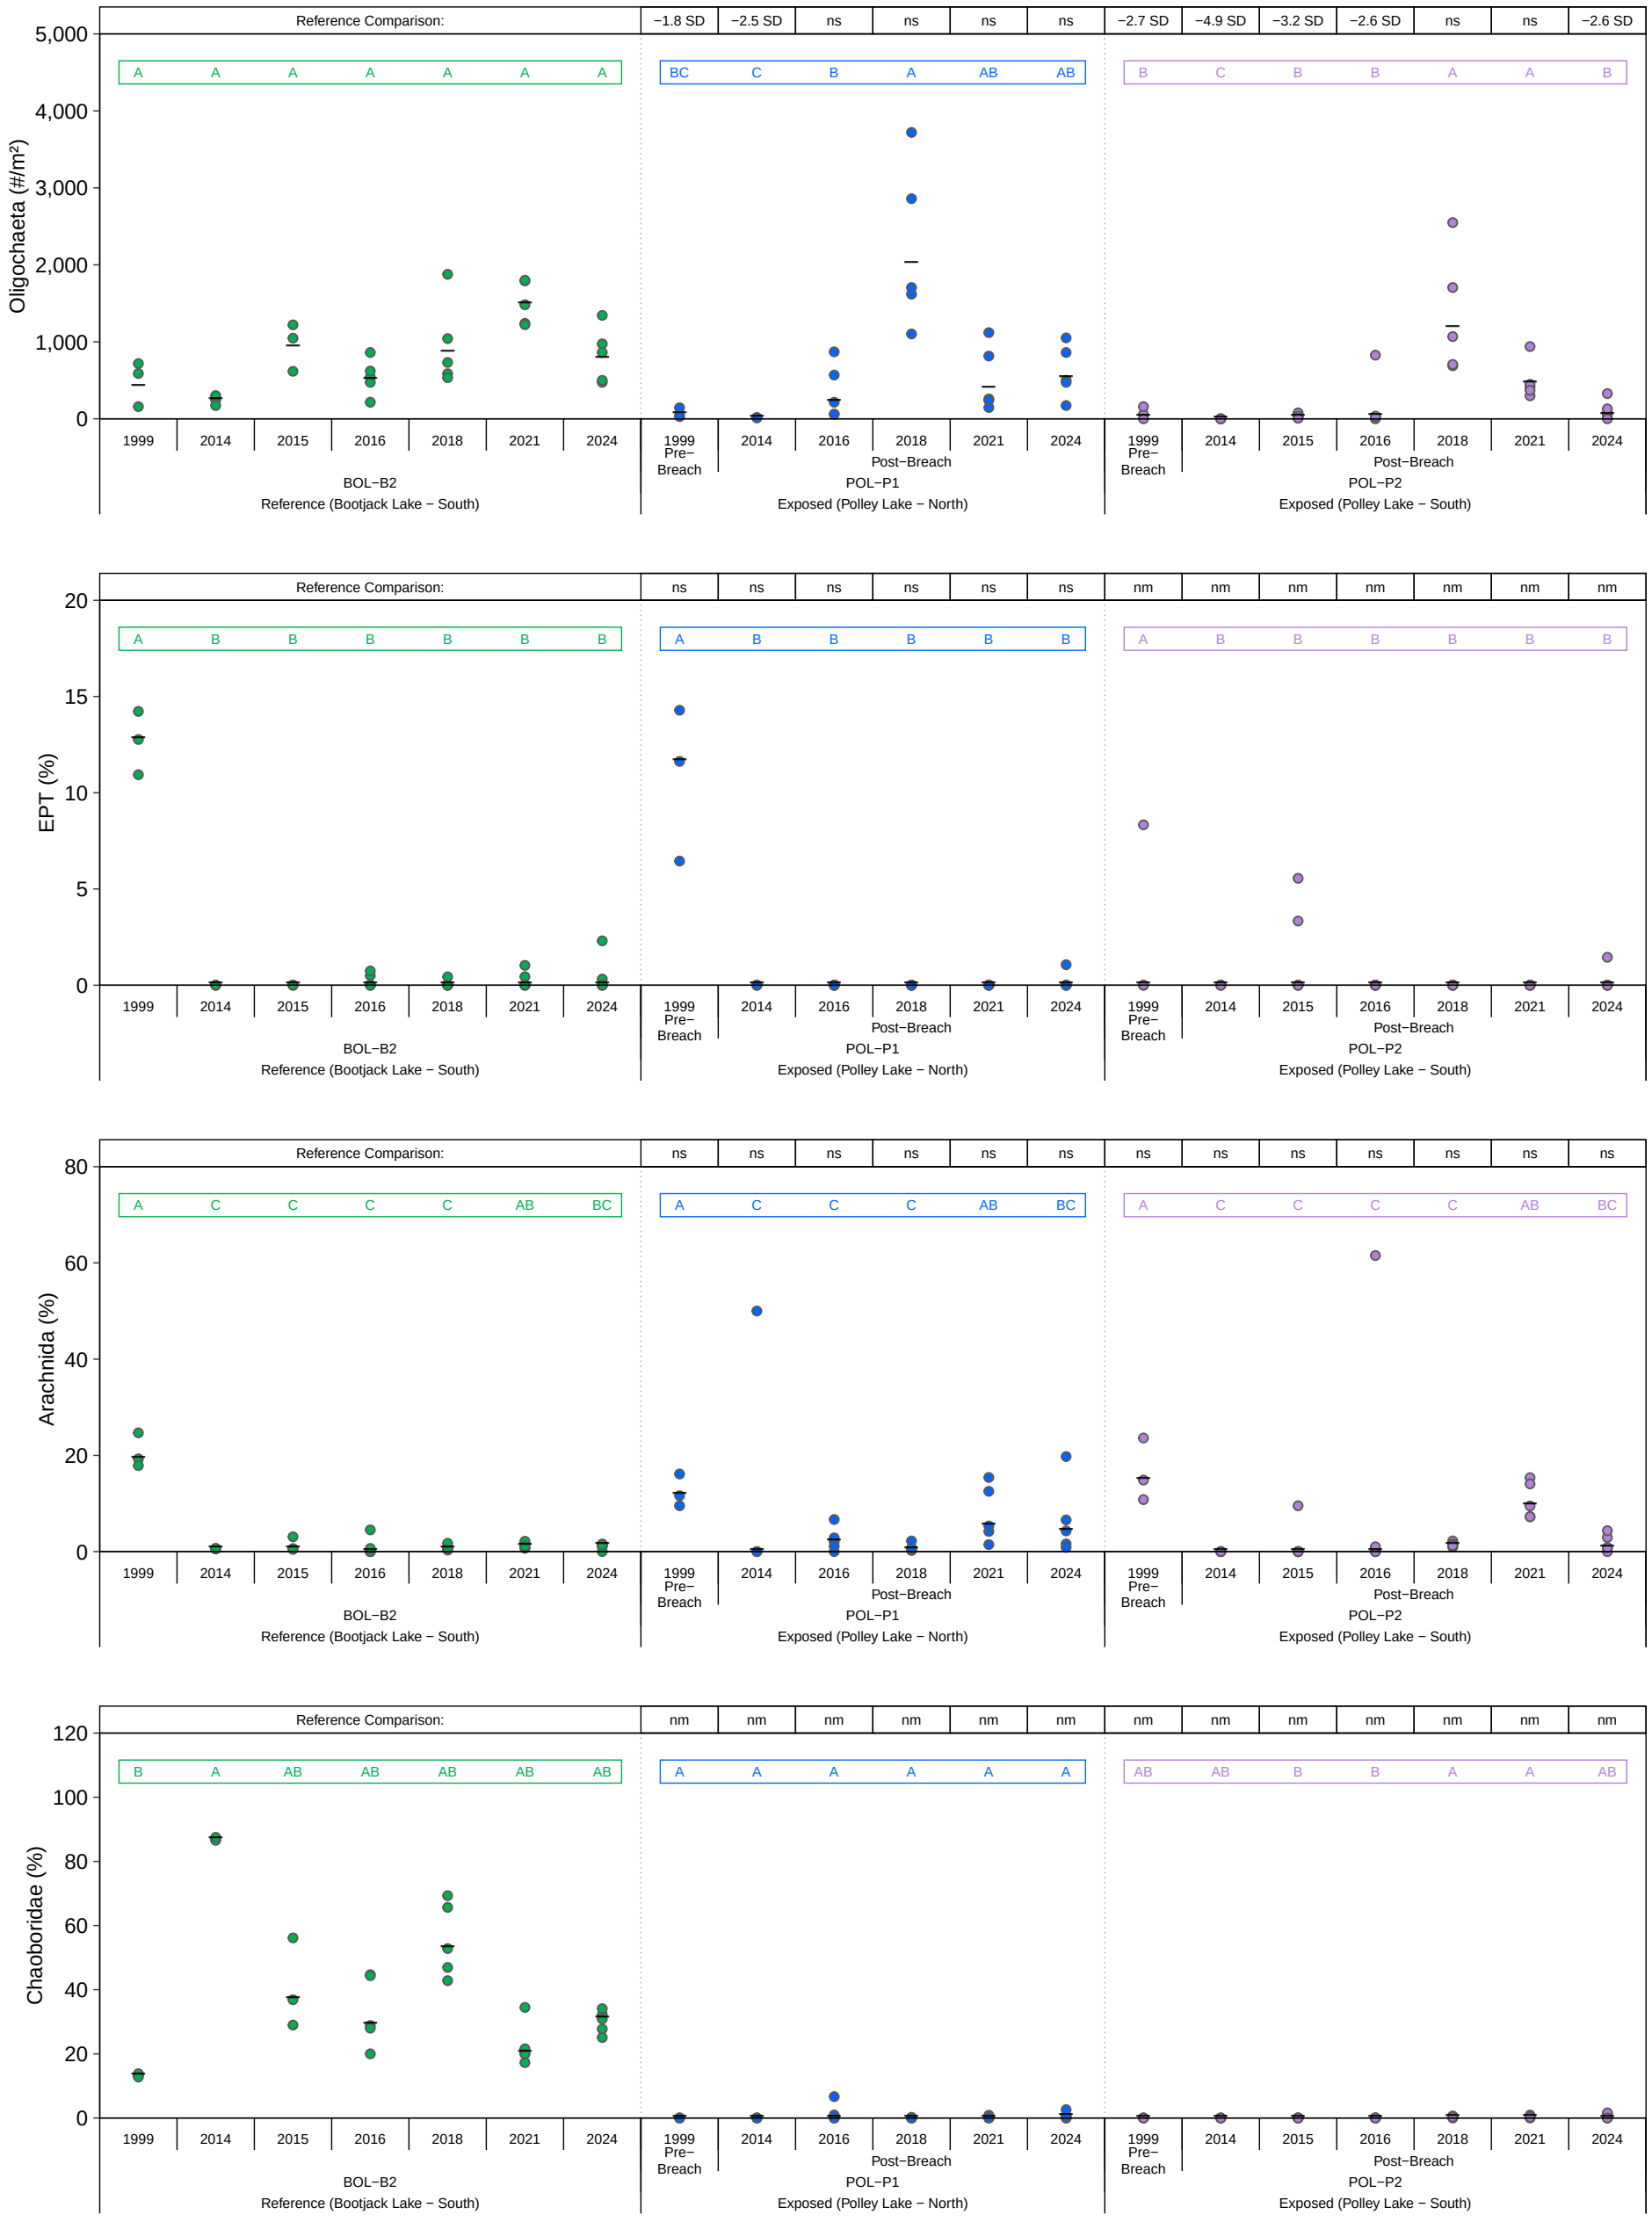

Figure E.4.2: Benthic Invertebrate Community Metrics for the Polley Lake (POL-P1, POL-P2; Exposed) and Bootjack Lake (BOL-B2; Reference) Deep Monitoring Areas, 1999 to 2024

Notes: EPT = Ephemeroptera, Plecoptera, Trichoptera. Green represents reference data and blue or purple represents exposed data. Black bars represent measures of central tendency (mean, geometric mean, or median depending on if analysis was conducted on untransformed, log10− transformed or rank−transformed data). Coloured letters represent significant (p−value <0.1) post−hoc comparisons within areas over time; years that share a letter of the same colour (e.g., A, B) within a box of the same colour do not differ significantly within an area. A number above the plot indicates significant exposed vs. reference post−hoc comparisons within a given year. The magnitude of difference (MOD) for these significant post−hoc comparisons is expressed in units of standard deviation (SD) or median absolute deviations (MAD; if the data were rank−transformed prior to analysis) relative to reference. 'ns' indicates a non−significant contrast; 'nm' indicates that the MOD could not be calculated because MAD = 0.

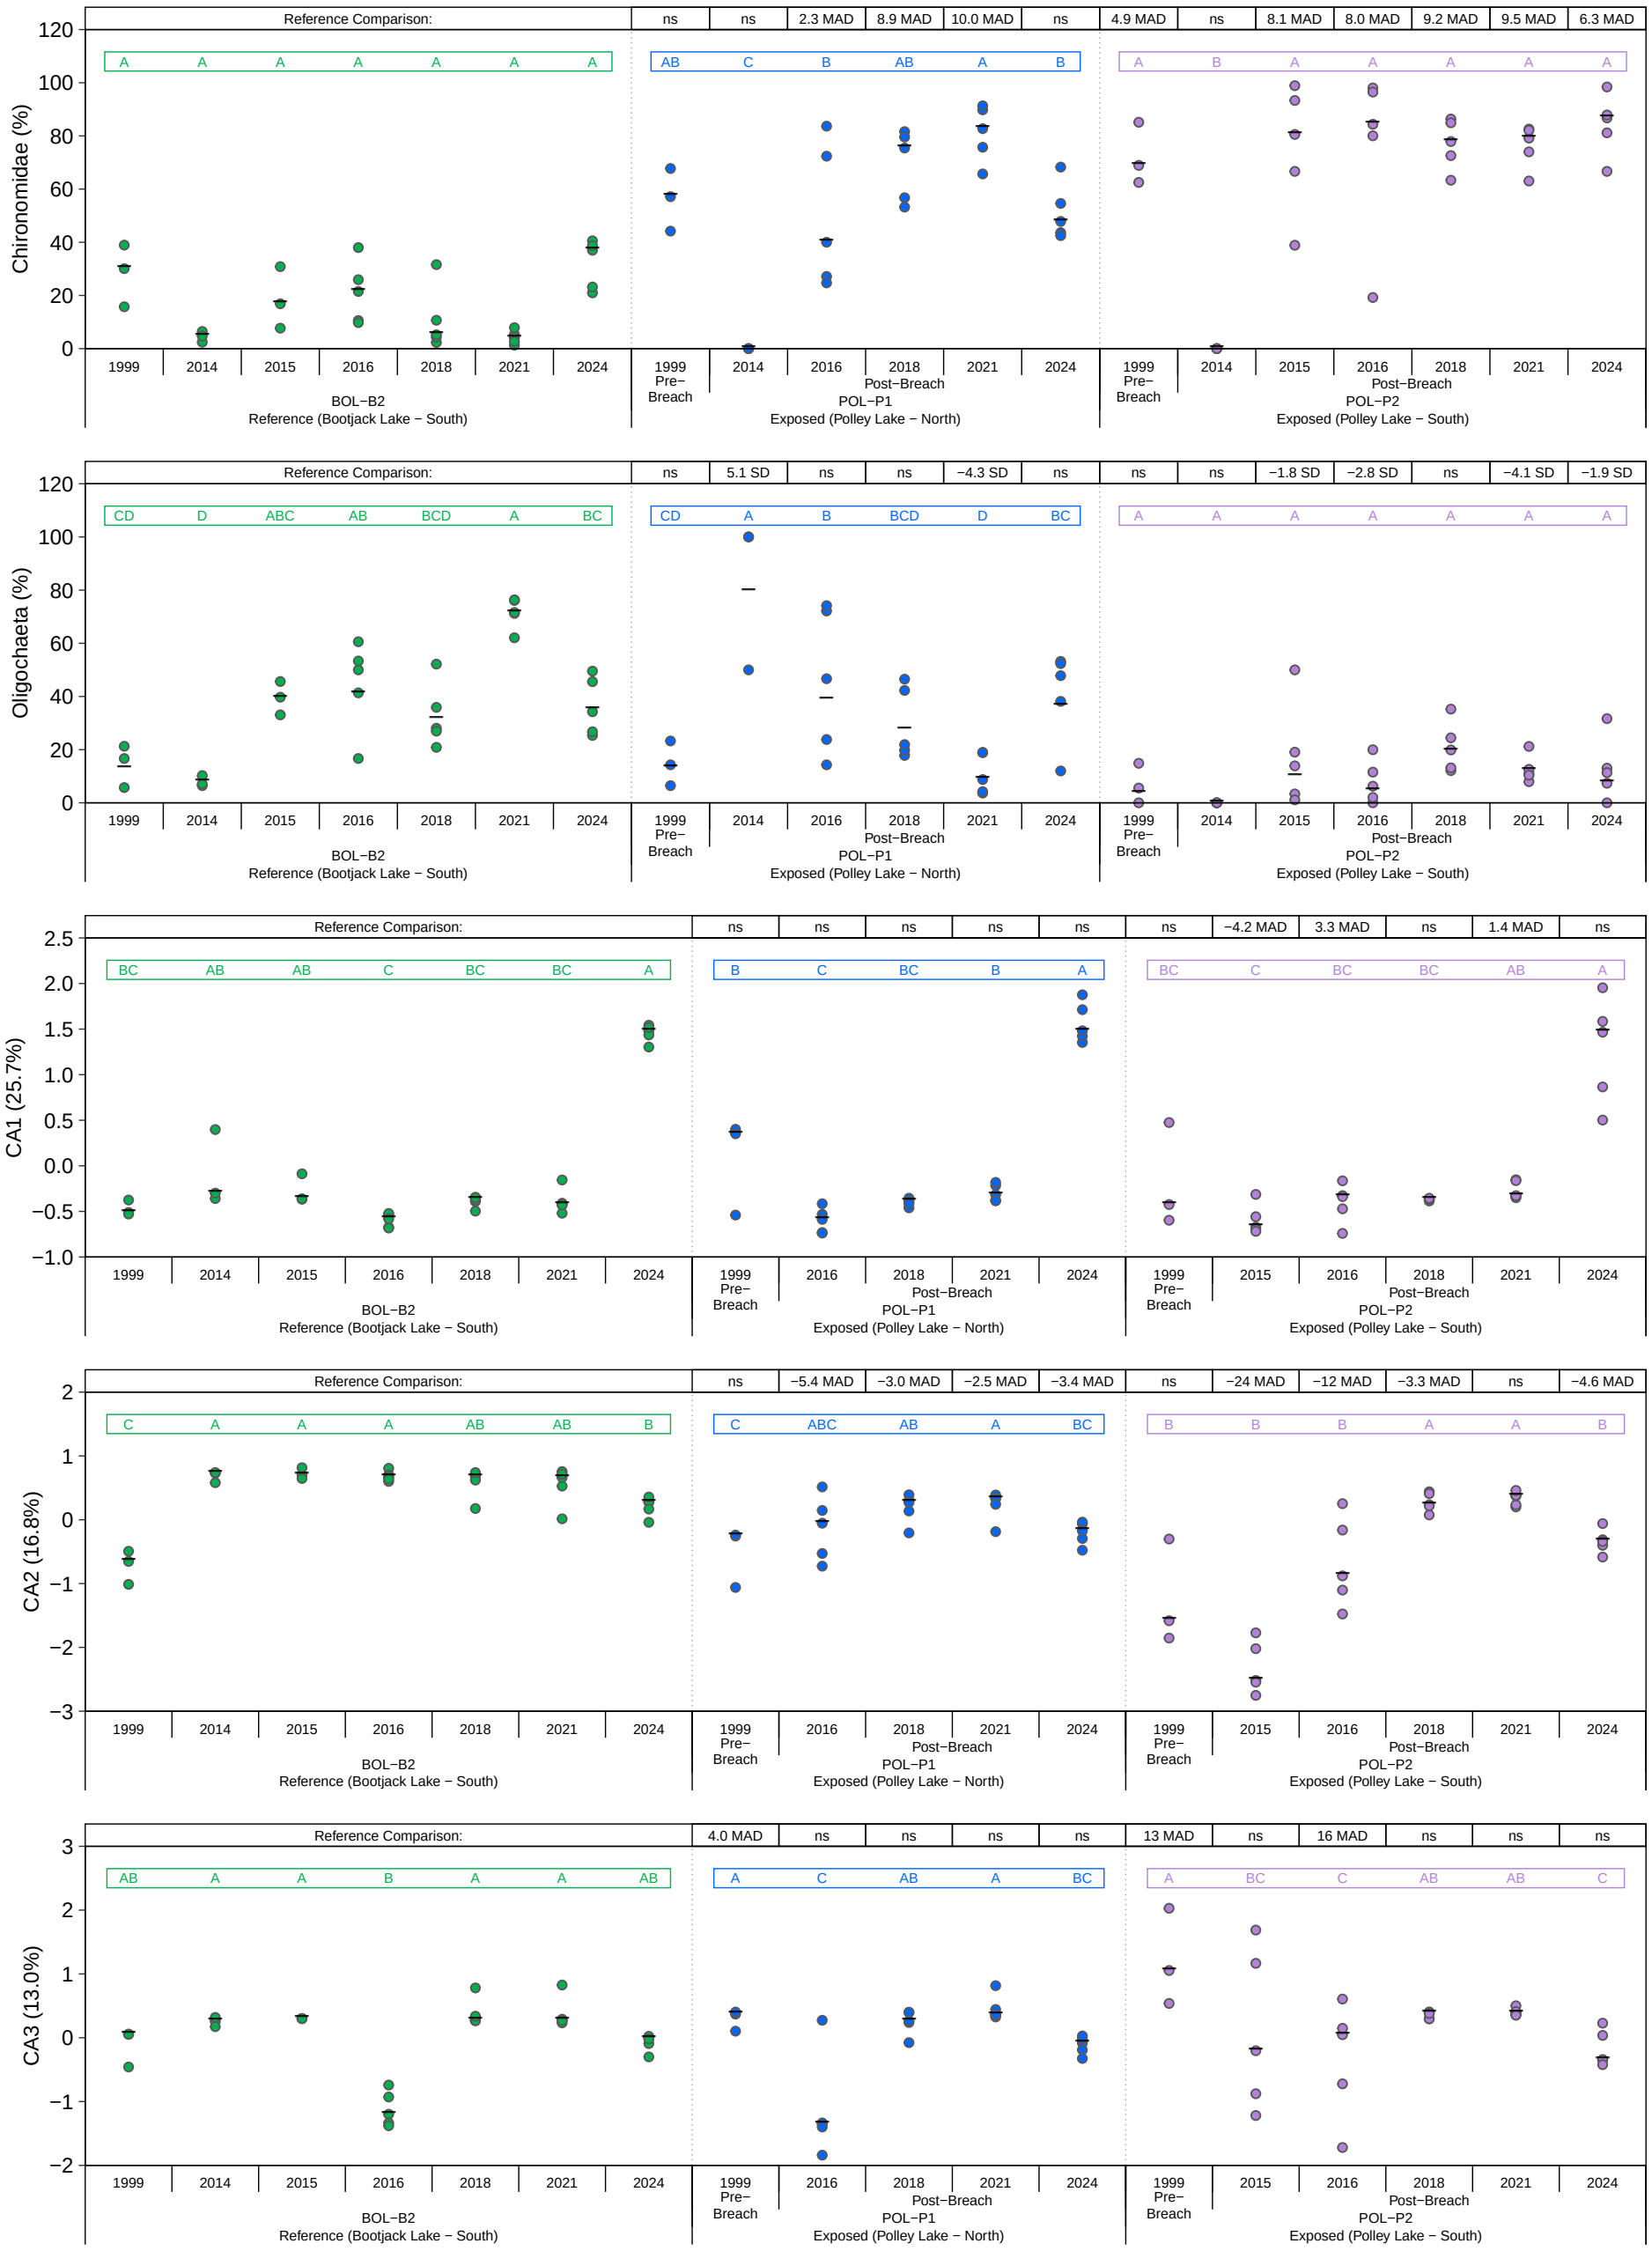

Figure E.4.2: Benthic Invertebrate Community Metrics for the Polley Lake (POL-P1, POL-P2; Exposed) and Bootjack Lake (BOL-B2; Reference) Deep Monitoring Areas, 1999 to 2024

Notes: EPT = Ephemeroptera, Plecoptera, Trichoptera. Green represents reference data and blue or purple represents exposed data. Black bars represent measures of central tendency (mean, geometric mean, or median depending on if analysis was conducted on untransformed, log10− transformed or rank−transformed data). Coloured letters represent significant (p−value <0.1) post−hoc comparisons within areas over time; years that share a letter of the same colour (e.g., A, B) within a box of the same colour do not differ significantly within an area. The magnitude of difference (MOD) for these significant post−hoc comparisons is expressed in units of standard deviation (SD) or median absolute deviations (MAD; if the data were rank−transformed prior to analysis) relative to reference. 'ns' indicates a non−significant contrast; 'nm' indicates that the MOD could not be calculated because MAD = 0.

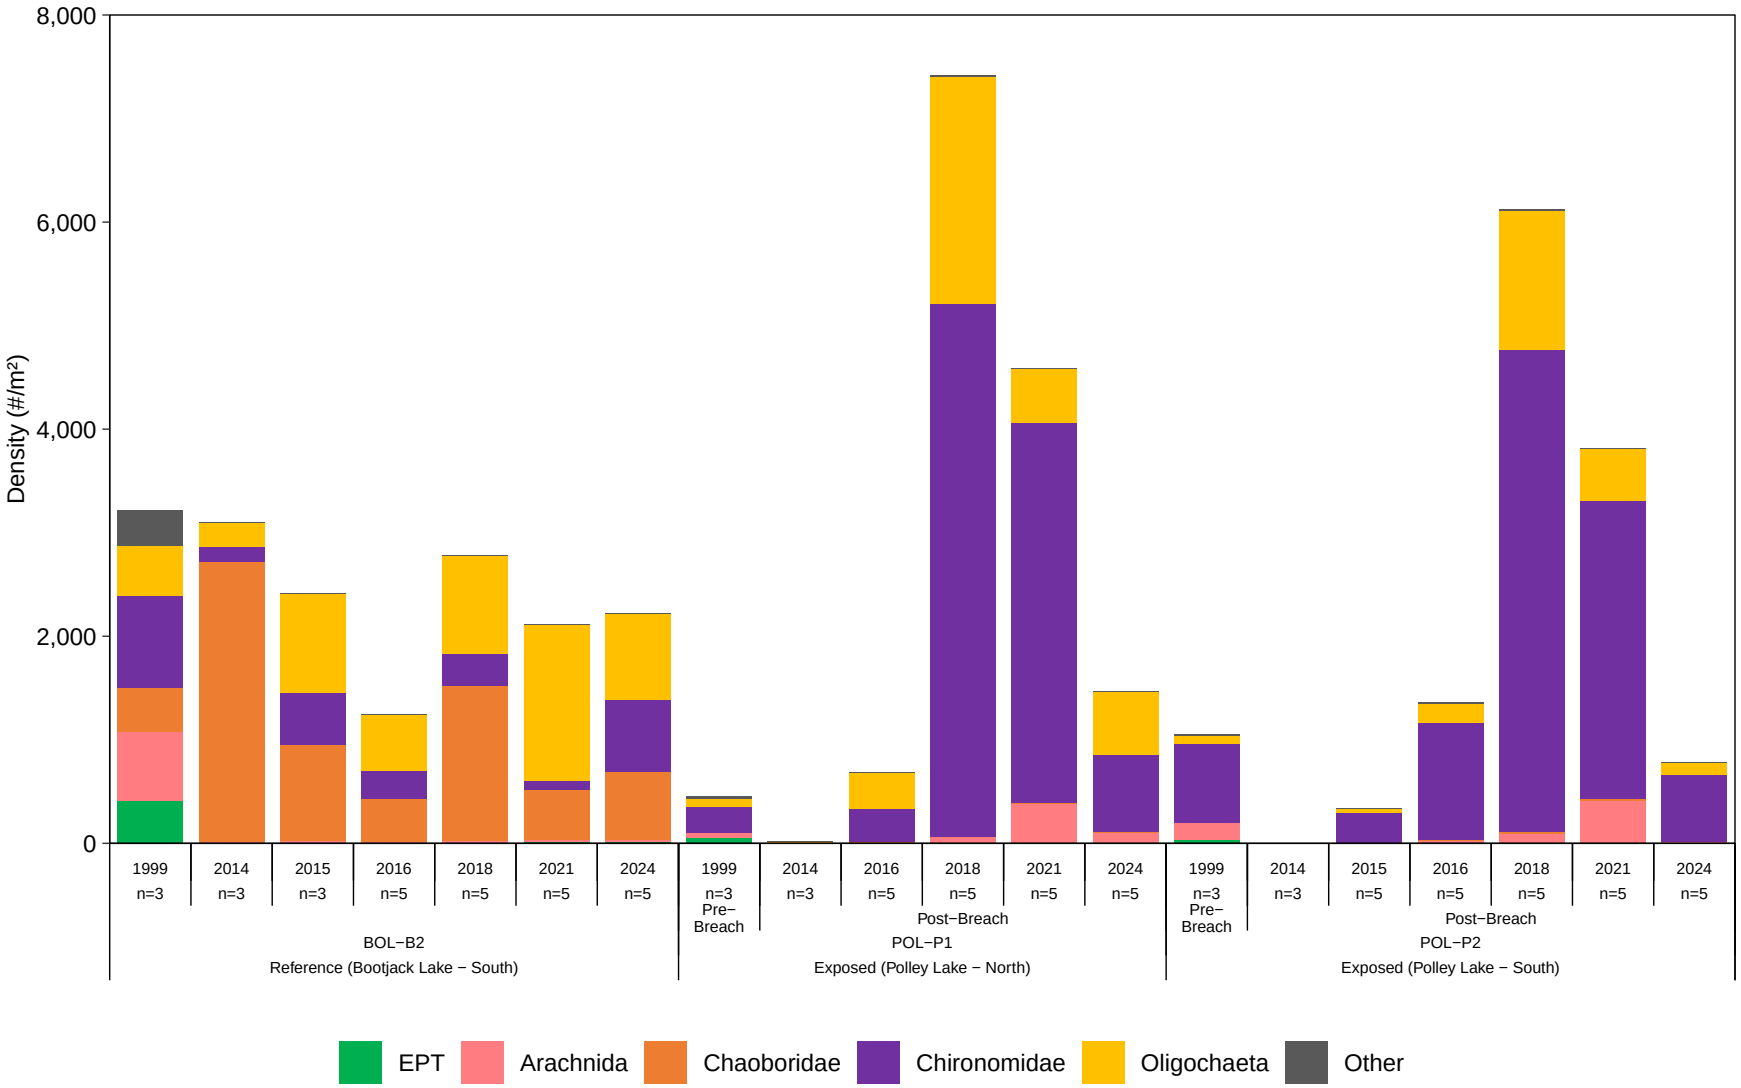

Figure E.4.3: Mean Densities of Major Benthic Invertebrate Taxa for the Polley Lake (POL-P1, POL-P2; Exposed) and Bootjack Lake (BOL-B2; Reference) Deep Monitoring Areas, 1999 to 2024

Notes: #/m² = number per square metre. EPT = Ephemeroptera, Plecoptera, Trichoptera. Total organism density at POL−P2 was zero in all replicates collected in 2014.

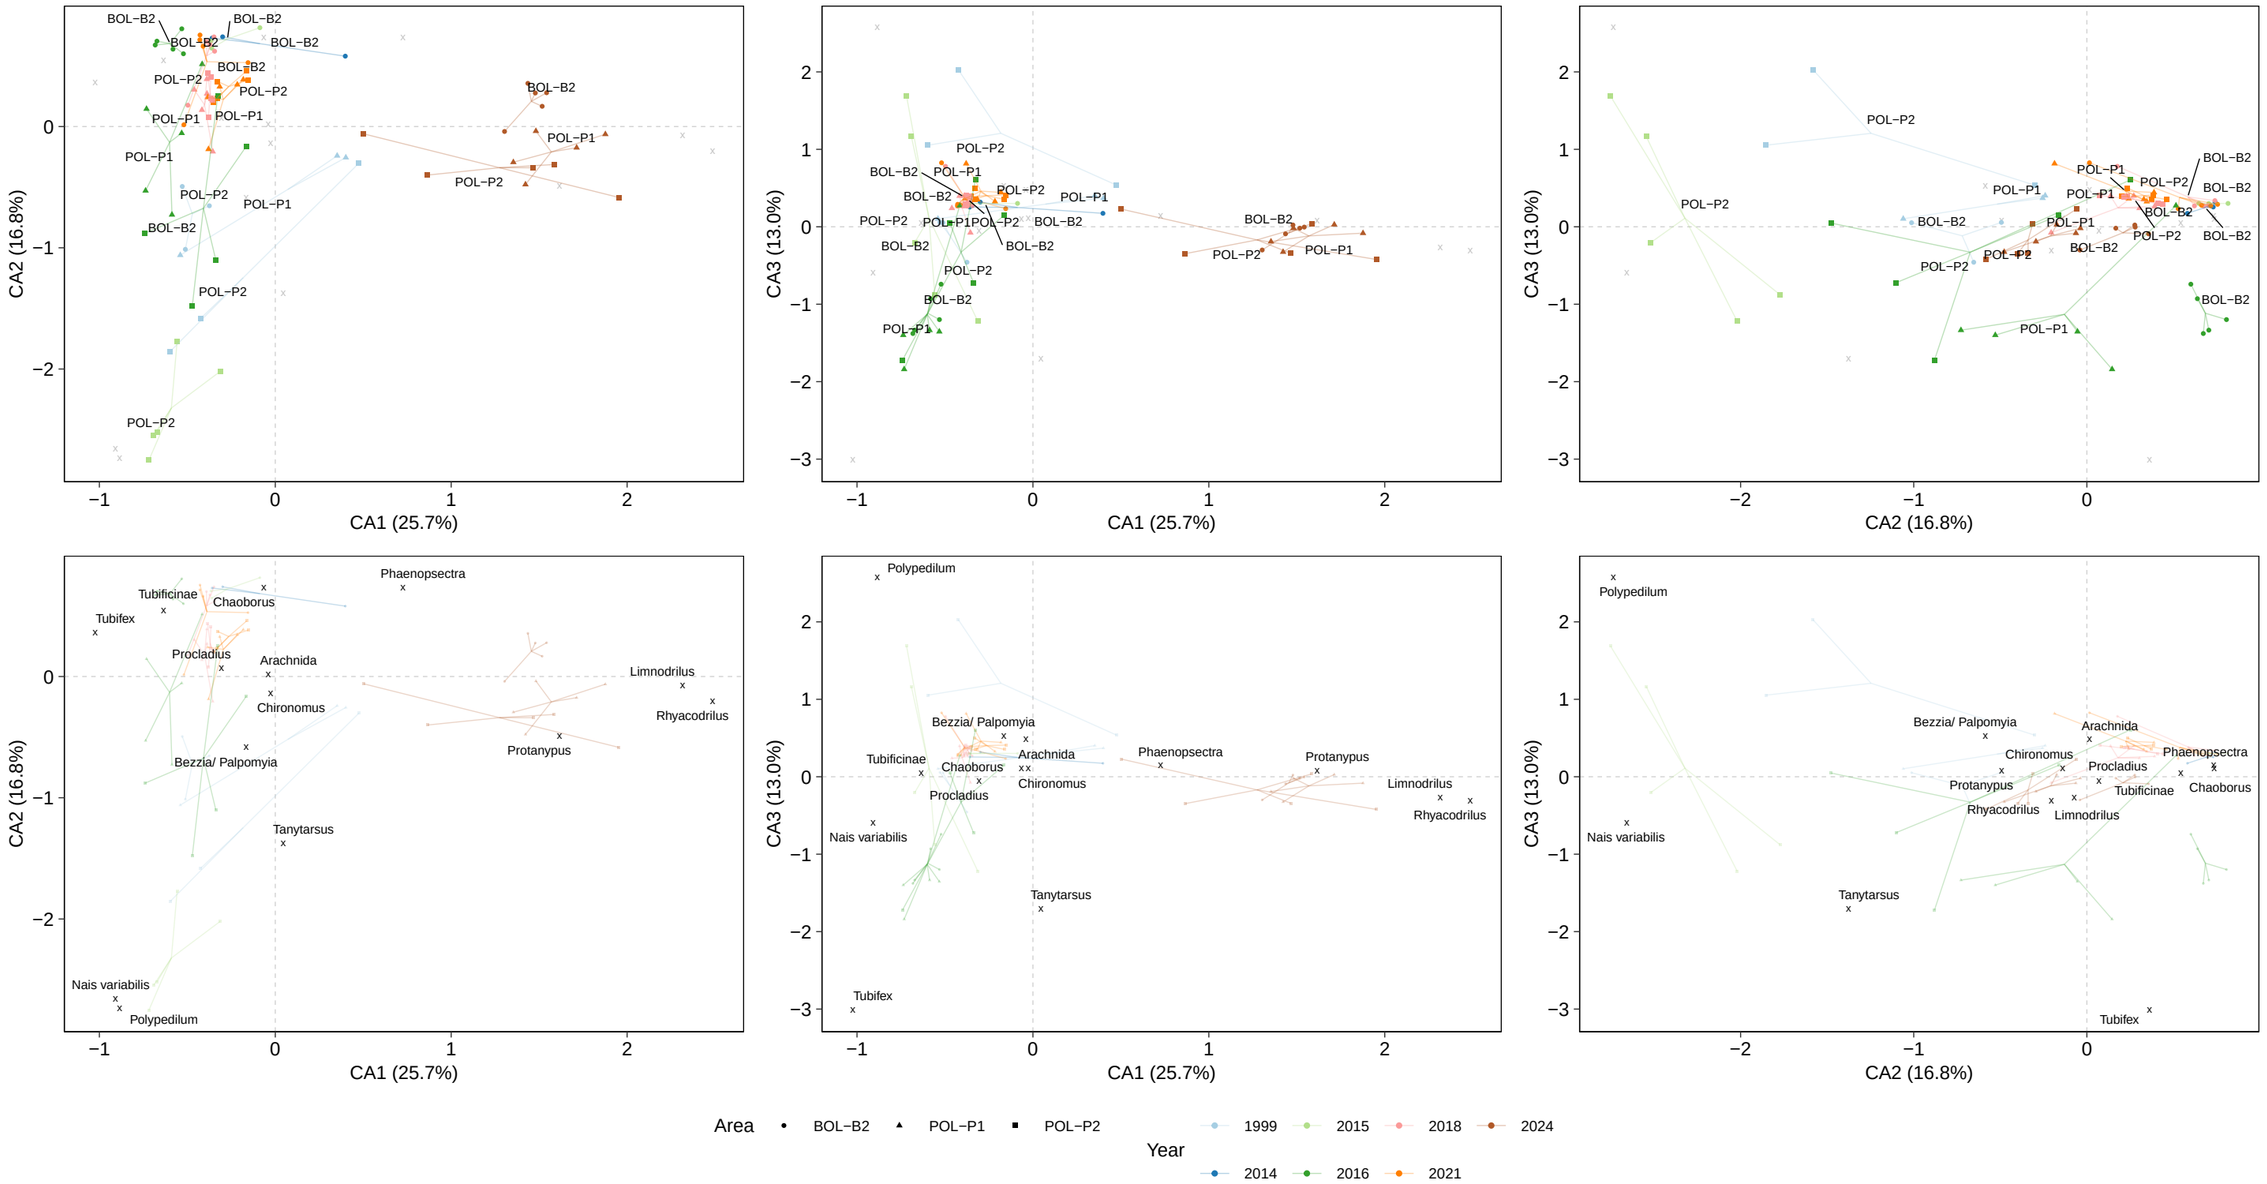

Figure E.4.4: Biplots of Correspondence Analysis Station and Taxon Scores of Benthic Invertebrate Community Data for the Polley Lake (POL-P1, POL-P2; Exposed) and Bootjack Lake (BOL-B2; Reference) Deep Monitoring Areas, 1999 to 2024

Notes: Analysis was completed using data at the Lowest Practicable Level (LPL). Taxa present at fewer than 1% of samples or less than 1% of total abundance were excluded from the analysis. Correspondence Analysis was conducted on ln(x+1)−transformed densities. Results from POL−P1 and POL−P2 in 2014 were excluded from CA due to insufficient taxon richness in samples (≤1 taxon / sample).

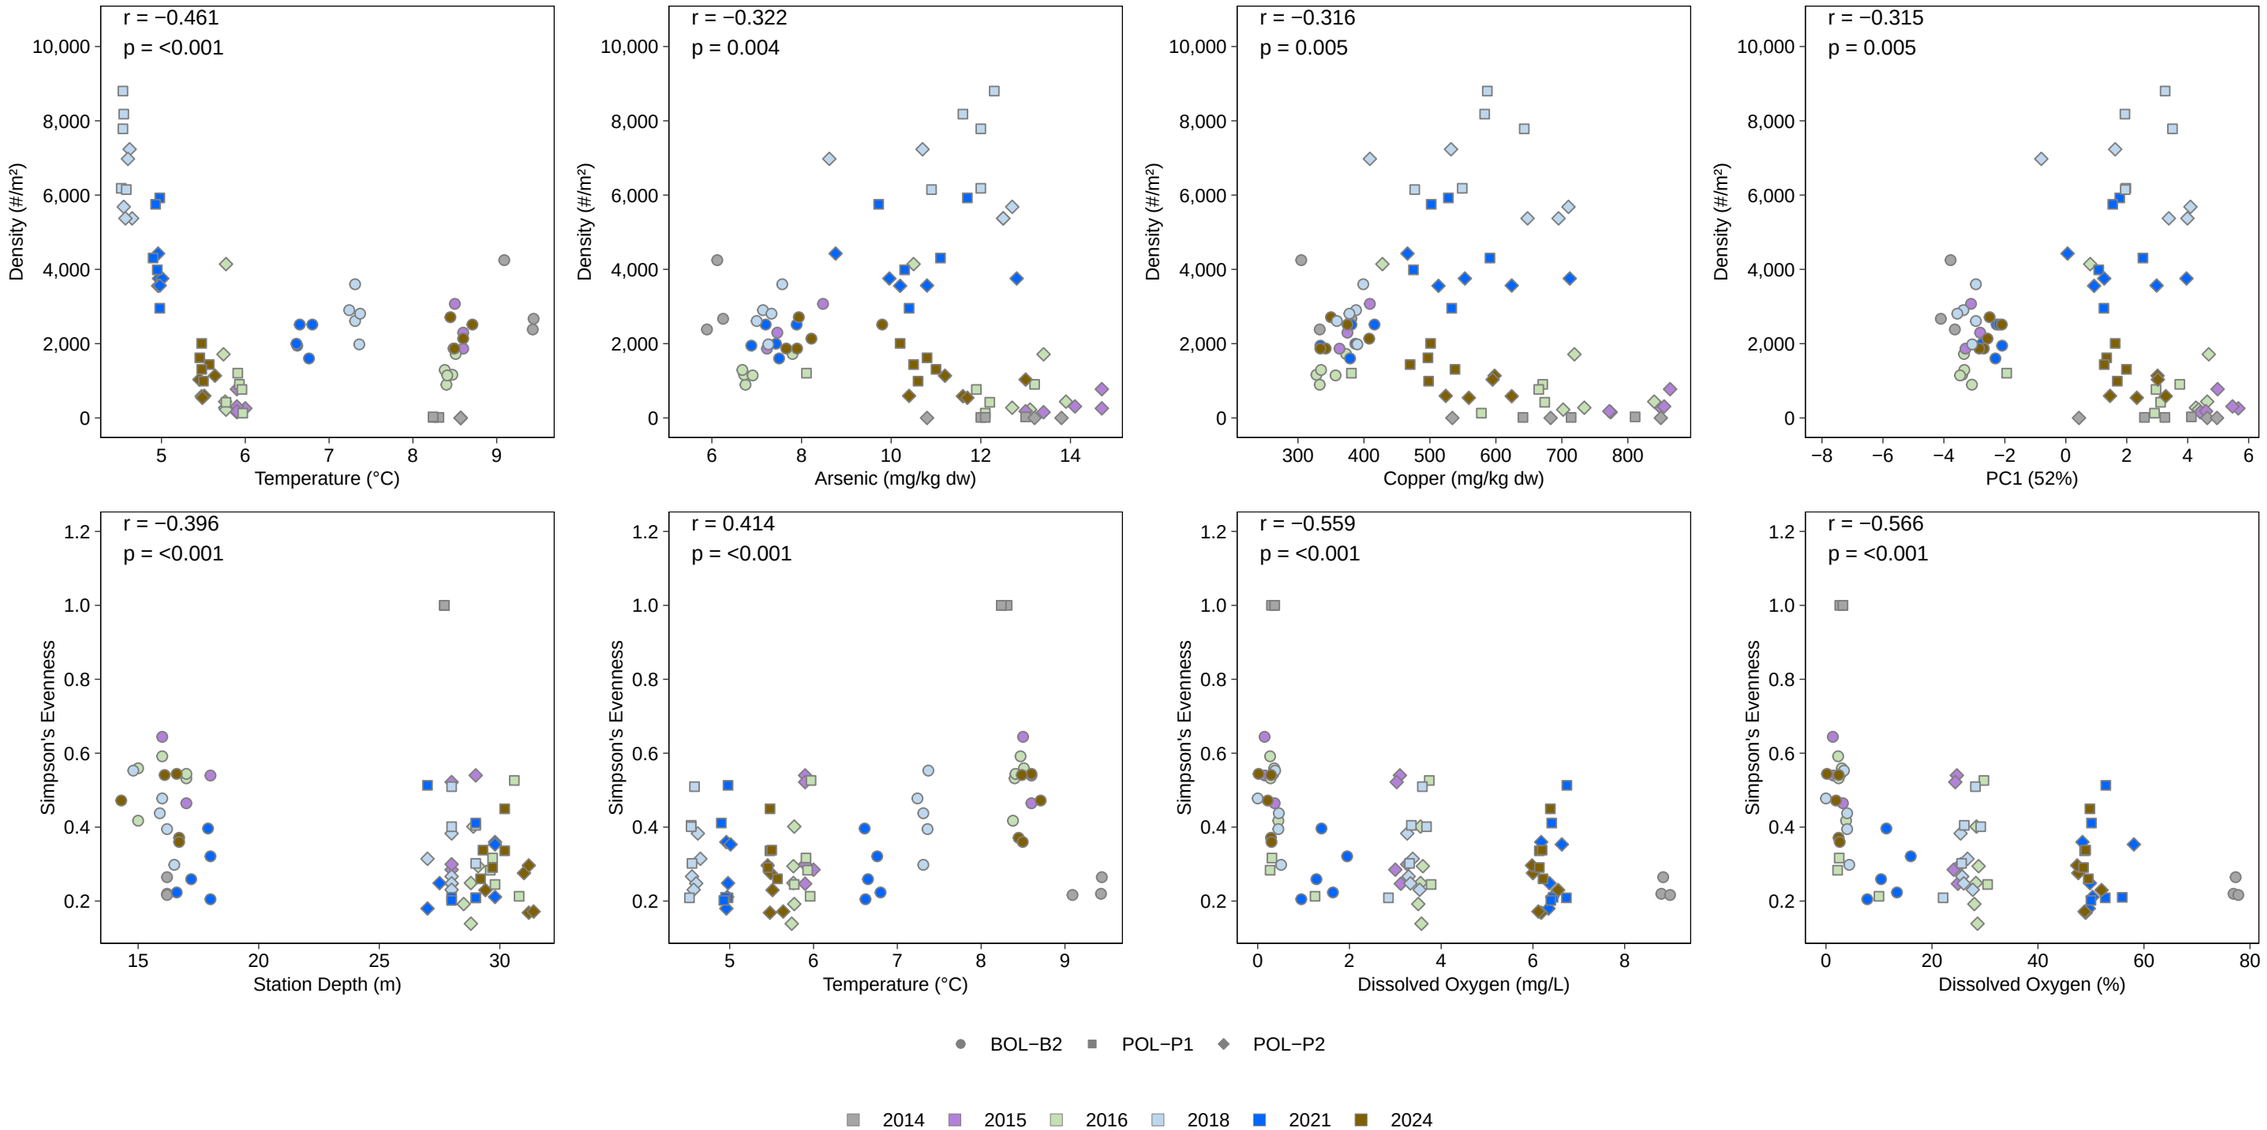

Figure E.4.5: Scatterplots of Significant Spearman's Correlation Relationships (p < 0.00416, Bonferroni Corrected) between Benthic Invertebrate Community Metrics and Chemical and Physical Sediment Quality Parameters for the Polley Lake (POL-P1, POL-P2; Exposed) and Bootjack Lake (BOL-B2; Reference) Deep Monitoring Areas, 1999 to 2024

Notes: #/m²= number per square metre, mg/kg dw = milligrams per kilogram dry weight. Correlations were completed using data from 2014 to 2024.

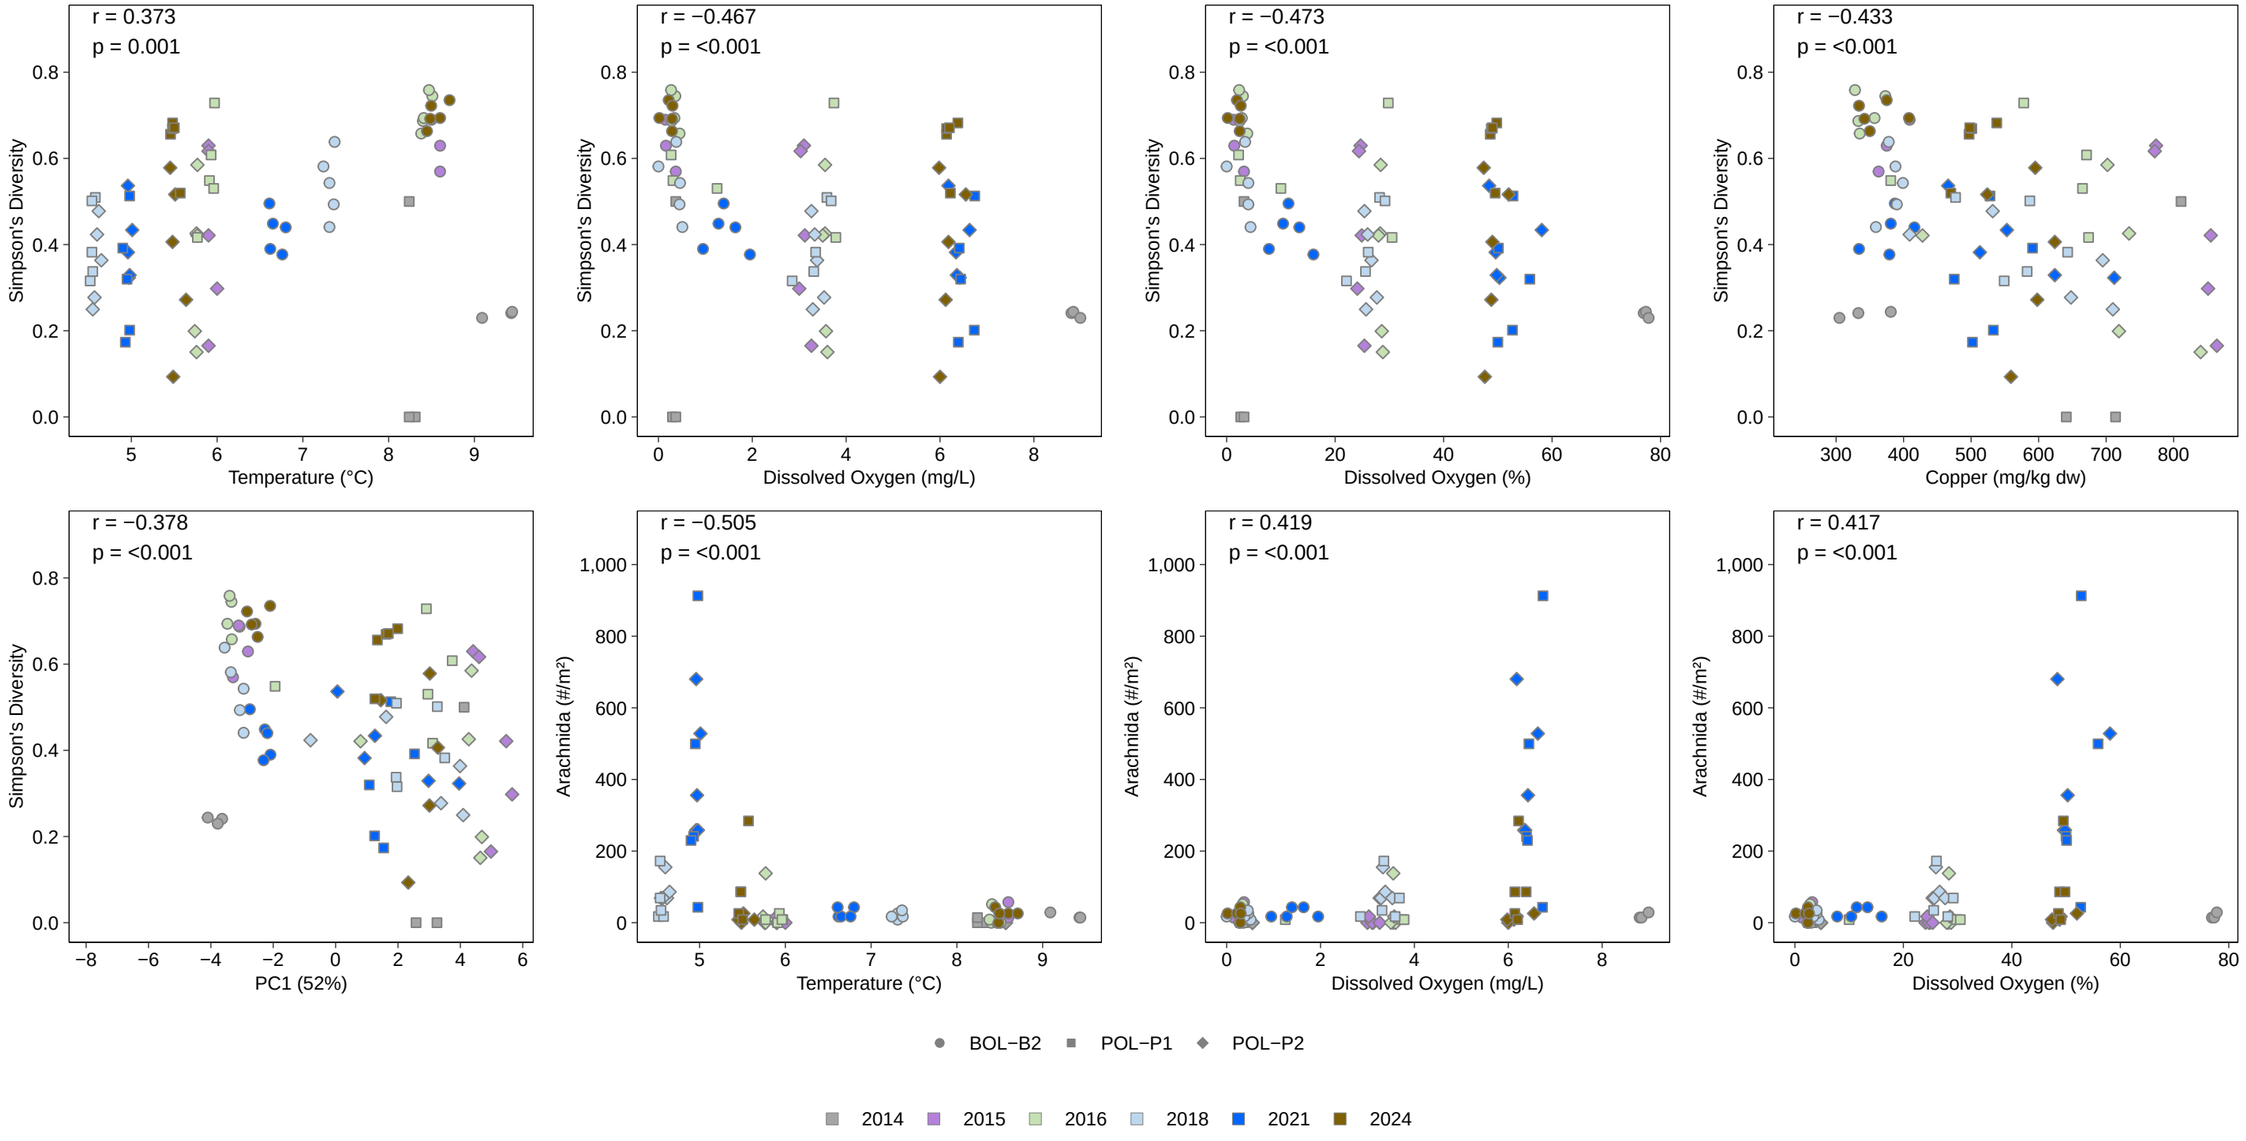

Figure E.4.5: Scatterplots of Significant Spearman's Correlation Relationships (p < 0.00416, Bonferroni Corrected) between Benthic Invertebrate Community Metrics and Chemical and Physical Sediment Quality Parameters for the Polley Lake (POL-P1, POL-P2; Exposed) and Bootjack Lake (BOL-B2; Reference) Deep Monitoring Areas, 1999 to 2024

Notes: #/m²= number per square metre, mg/kg dw = milligrams per kilogram dry weight. Correlations were completed using data from 2014 to 2024.

Area x Year or Area P-value < 0.1.
Magnitude of Difference (MOD) < -2.
Magnitude of Difference (MOD) > 2.

Notes: EPT = Ephemeroptera, Plecoptera, Trichoptera, "-" = no data available. "nc" = no comparison. "ns" = no significance. "nm" = Contrast MODs could not be calculated because the MAD=0 (MAD = Median Absolute Deviation).

[a] MCT = Measure of Central Tendency, which is the mean, geometric mean, or median depending on if analysis was conducted on untransformed, log10-transformed, or rank-transformed data.

[b] Magnitude of difference (MOD) calculated for two-way Analysis of Variance (ANOVA) as (Exposed Mean - Reference Mean)/SD (or [Mean - Baseline Mean]/SD for temporal comparisons) on the transformed scale, where SD was the pooled standard deviation of the model residuals. MOD calculated for Kruskal-Wallis (i.e., rank-transformed data) as (Exposed Median - Reference Median)/MAD, where MAD was the pooled Median Absolute Deviation.

Magnitude of Difference (MOD) < -2.
Magnitude of Difference (MOD) > 2.

Notes: EPT = Ephemeroptera, Plecoptera, Trichoptera, "-" = no data available. "nc" = no comparison. "ns" = no significance. "nm" = Contrast MODs could not be calculated because the MAD=0 (MAD = Median Absolute Deviation).

[a] MCT = Measure of Central Tendency, which is the mean, geometric mean, or median depending on if analysis was conducted on untransformed, log10-transformed, or rank-transformed data.

[b] Magnitude of difference (MOD) calculated for two-way Analysis of Variance (ANOVA) as (Exposed Mean - Reference Mean)/SD (or [Mean - Baseline Mean]/SD for temporal comparisons) on the transformed scale, where SD was the pooled standard deviation of the model residuals. MOD calculated for Kruskal-Wallis (i.e., rank-transformed data) as (Exposed Median - Reference Median)/MAD, where MAD was the pooled Median Absolute Deviation.

Magnitude of Difference (MOD) > 2.

Notes: EPT = Ephemeroptera, Plecoptera, Trichoptera, "-" = no data available. "nc" = no comparison. "ns" = no significance.

[a] MCT = Measure of Central Tendency, which is the mean, geometric mean, or median depending on if analysis was conducted on untransformed, log10-transformed, or rank-transformed data.

[b] Magnitude of difference (MOD) calculated for two-way Analysis of Variance (ANOVA) as (Exposed Mean - Reference Mean)/SD (or [Mean - Baseline Mean]/SD for temporal comparisons) on the transformed scale, where SD was the pooled standard deviation of the model residuals. MOD calculated for Kruskal-Wallis (i.e., rank-transformed data) as (Exposed Median - Reference Median)/MAD, where MAD was the pooled Median Absolute Deviation.

Notes: "-" no applicable data. Correspondence Analysis was conducted using ln(x+1)-transformed relative density benthic invertebrate results at the Lowest Practicable Level (LPL).

APPENDIX E.5
FISH POPULATION HEALTH

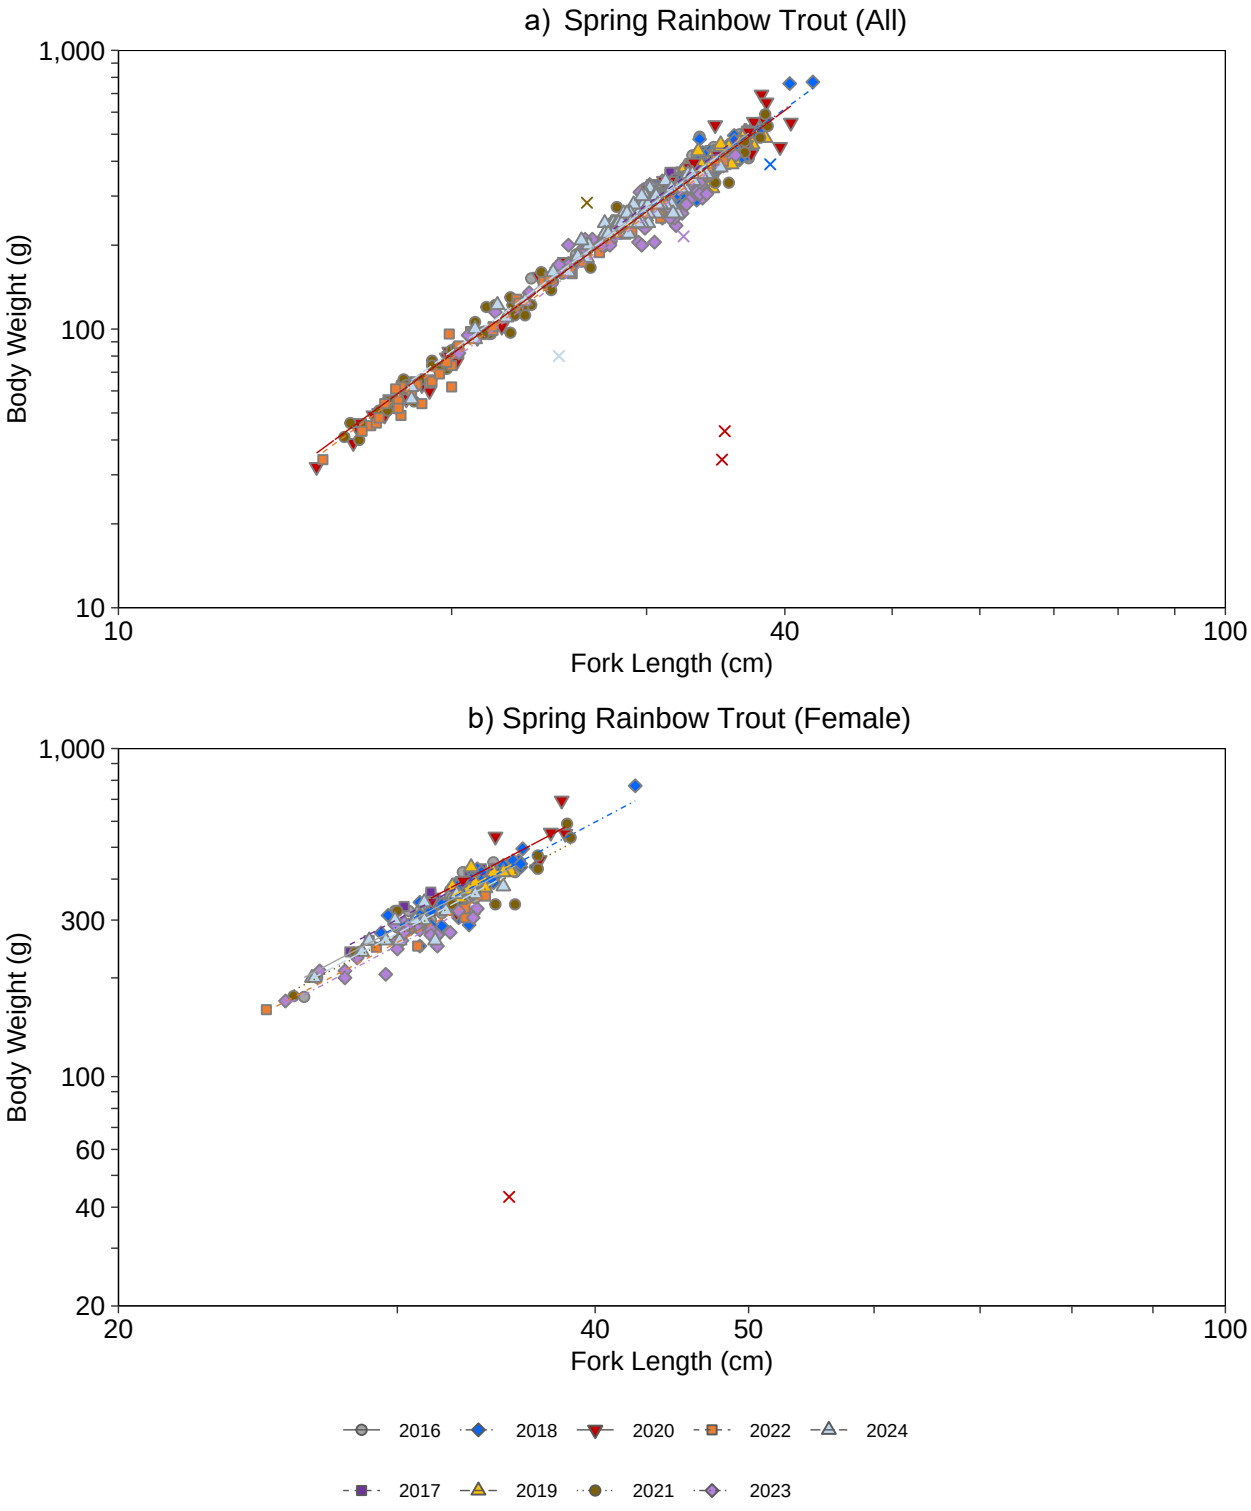

Figure E.5.1: Condition (Weight−at−Length) of a) All Rainbow Trout and b) Female Rainbow Trout for Polley Lake in Spring, 2016 to 2024

Note: Outliers removed from the statistical analyses are plotted with an x through them.

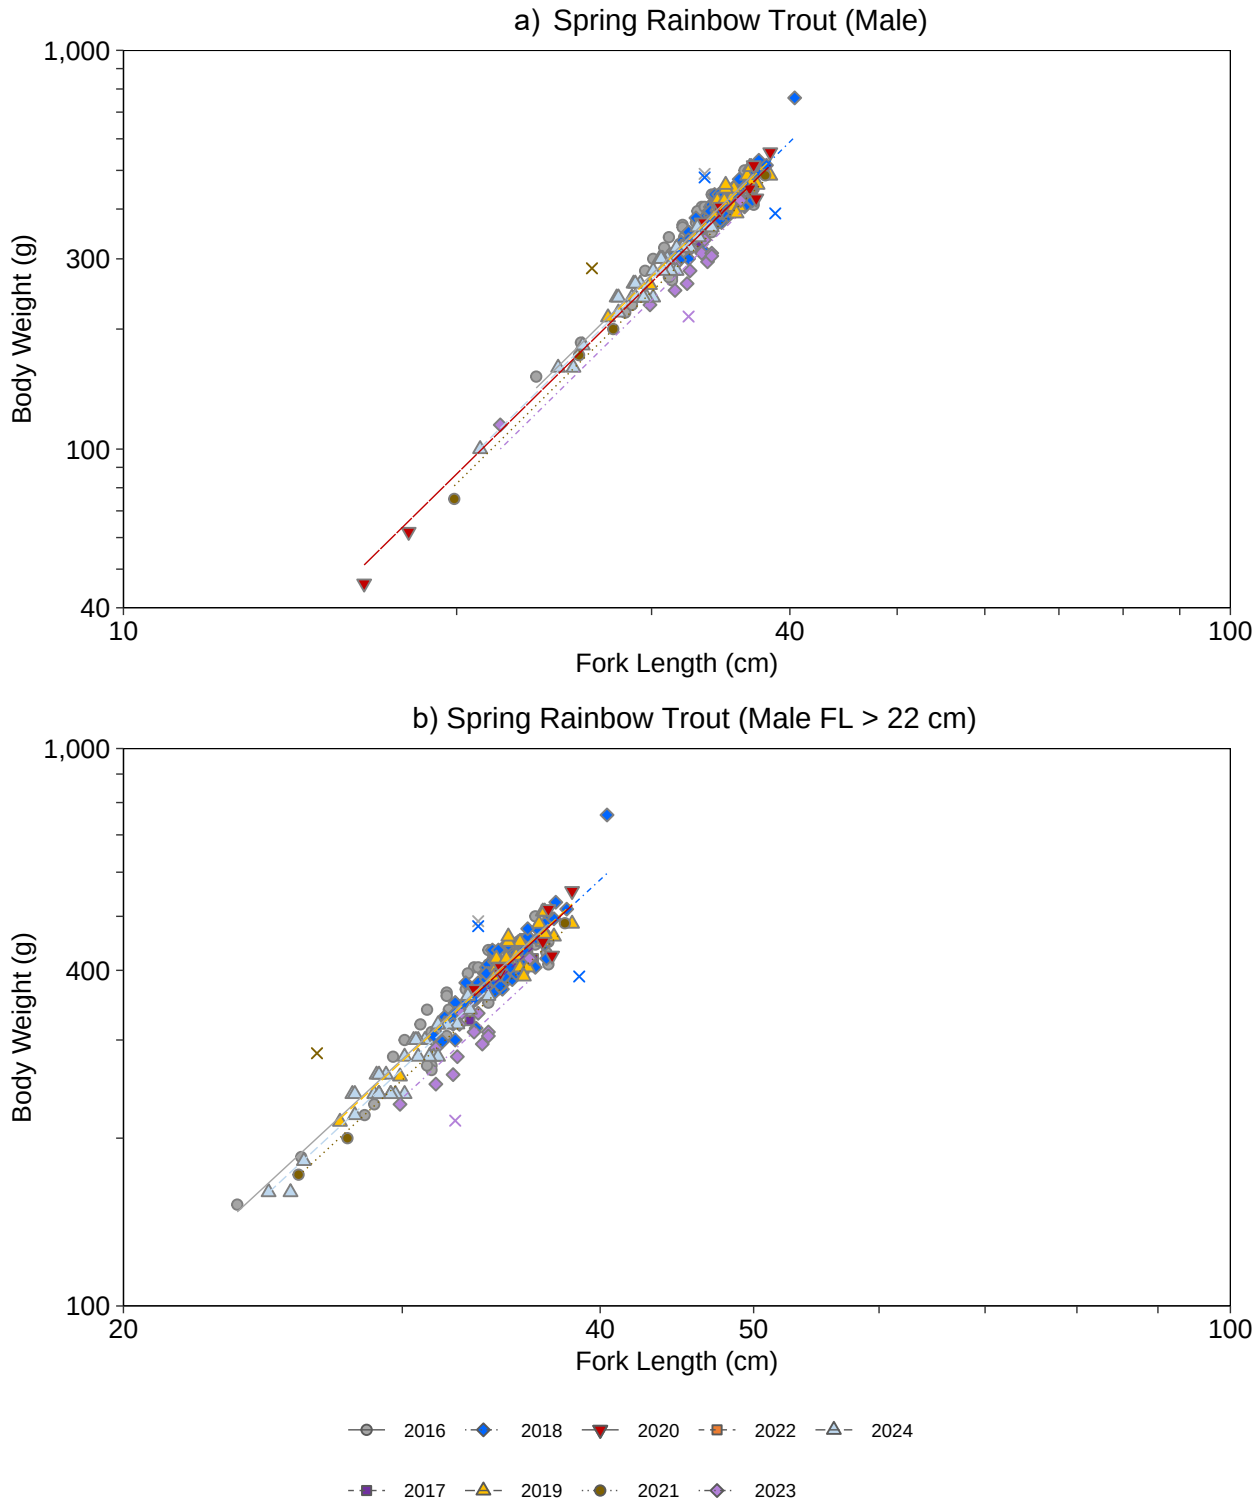

Figure E.5.1: Condition (Weight−at−Length) of a) Male Rainbow Trout and b) Male Rainbow Trout With Fork Length Greater than 22 cm for Polley Lake in Spring, 2016 to 2024

Notes: Outliers removed from the statistical analyses are plotted with an x through them. Only fish with a fork length greater than 22 cm were included in the analysis

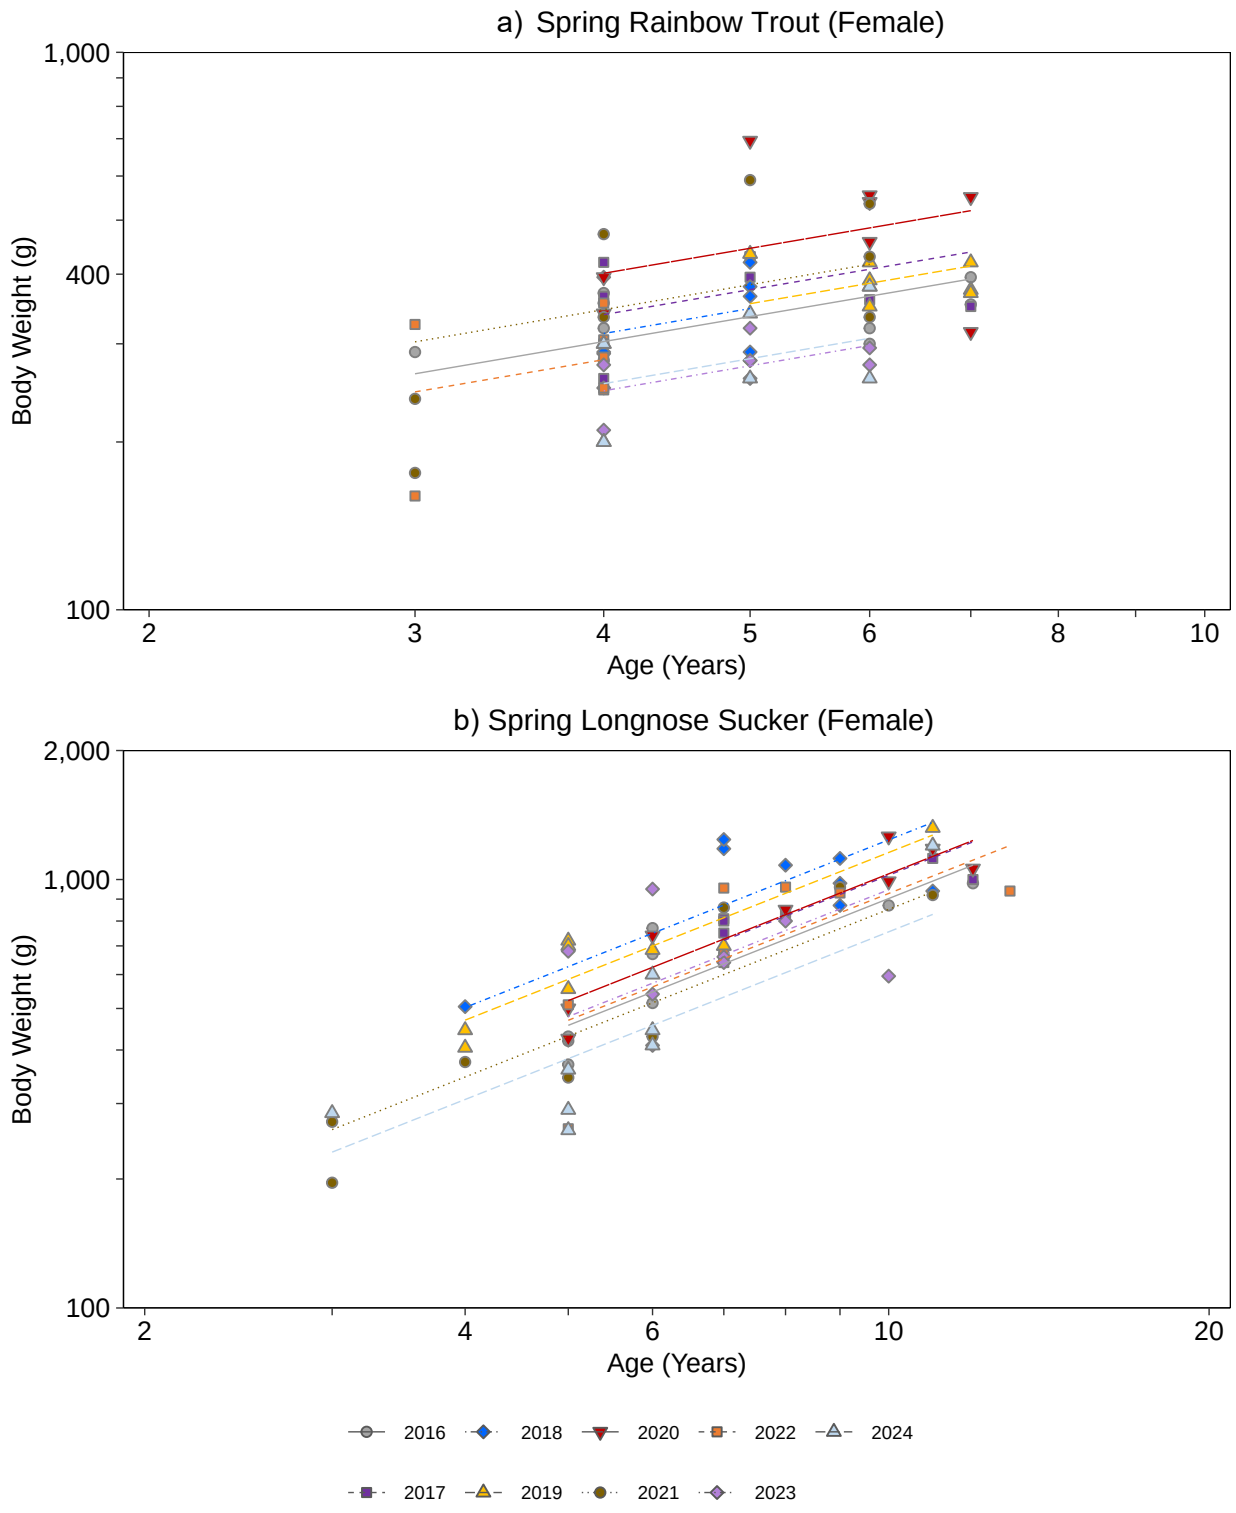

Figure E.5.2: Weight−at−Age of a) Female Rainbow Trout and b) Female Longnose Sucker for Polley Lake in Spring, 2016 to 2024

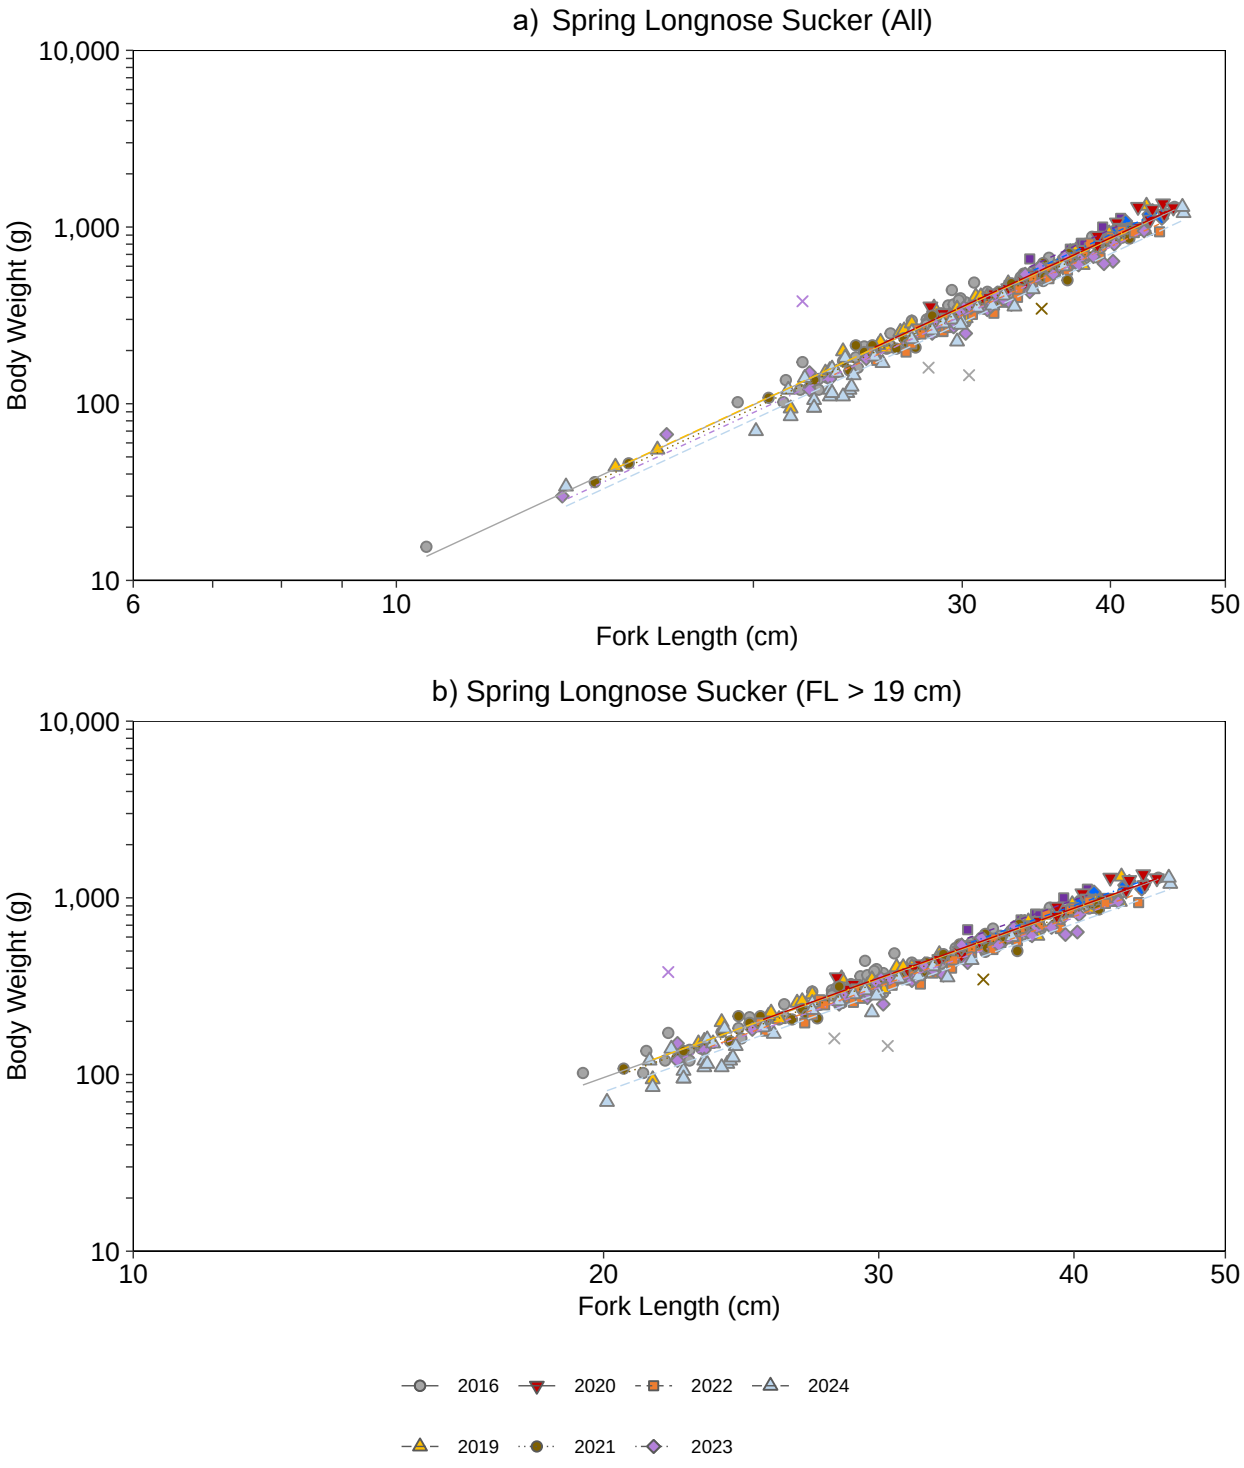

Figure E.5.3: Condition (Weight−at−Length) of a) All Longnose Sucker and b) Longnose Sucker With Fork Length Greater than 19 cm for Polley Lake in Spring, 2016 to 2024

Notes: Outliers removed from the statistical analyses are plotted with an x through them. Only fish with a fork length greater than 19 cm were included in the analysis.

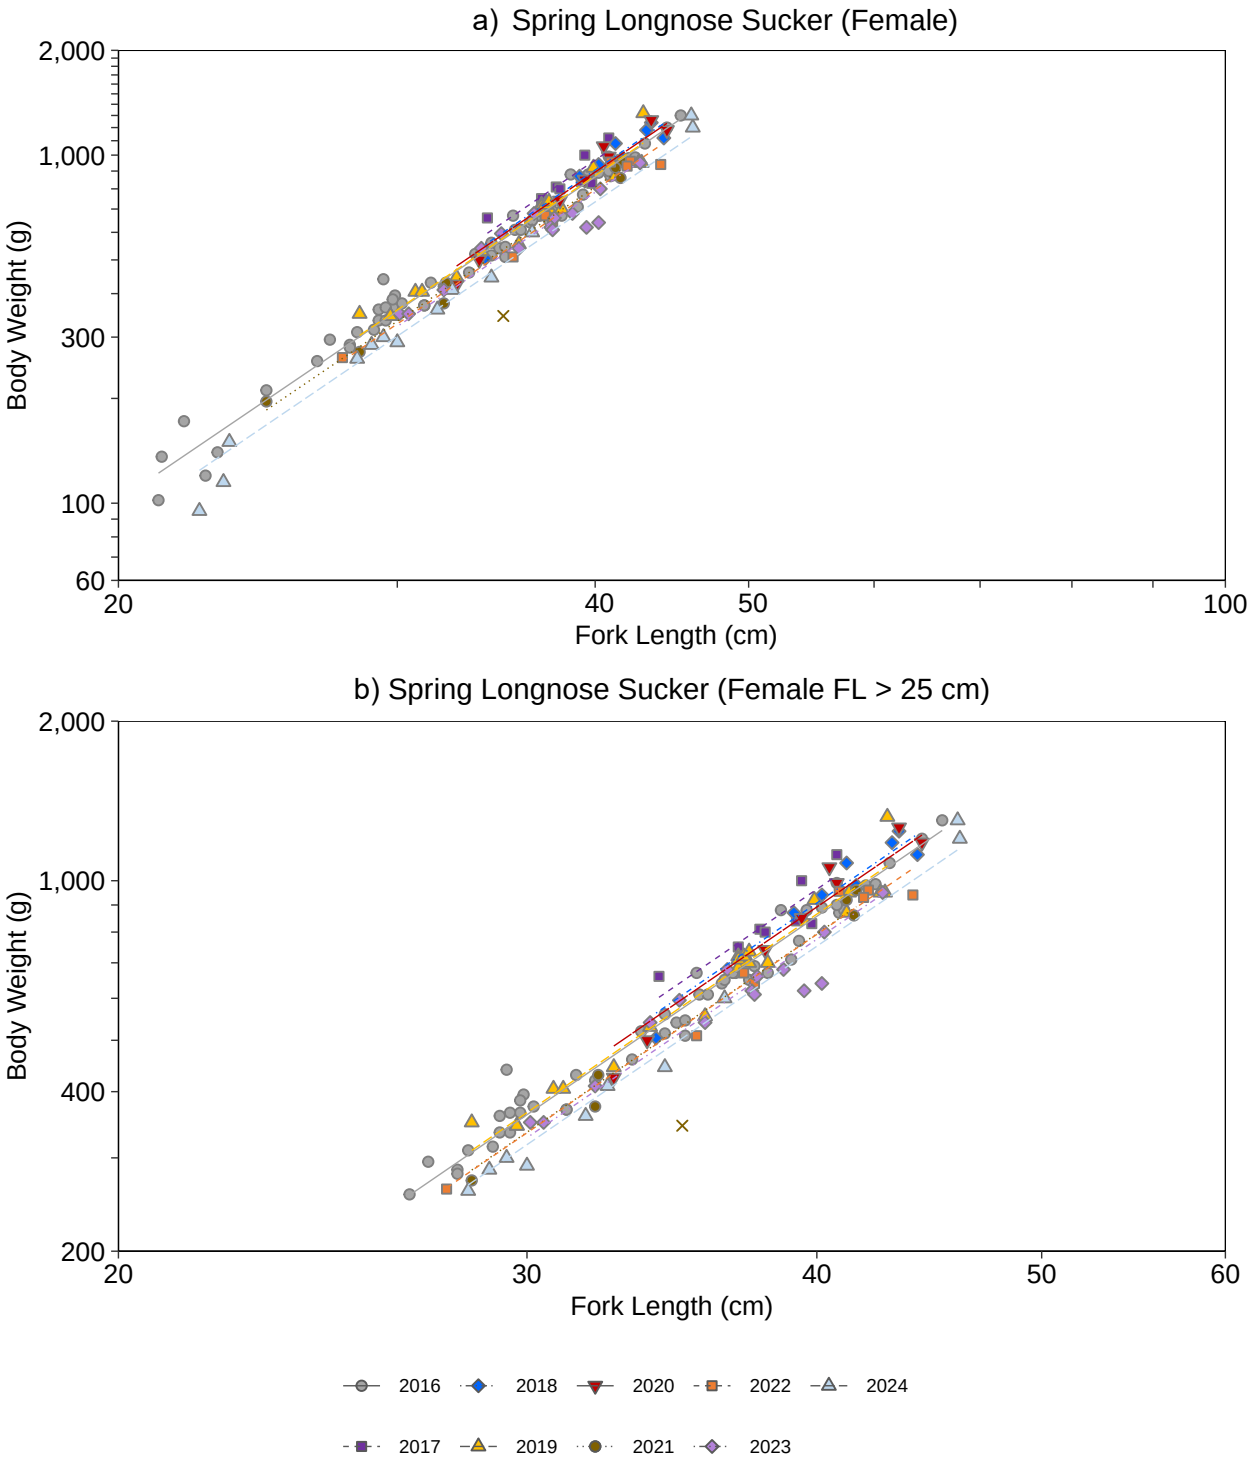

Figure E.5.3: Condition (Weight−at−Length) of a) Female Longnose Sucker and b) Female Longnose Sucker With Fork Length Greater than 25 cm for Polley Lake in Spring, 2016 to 2024

Notes: Outliers removed from the statistical analyses are plotted with an x through them. Only fish with a fork length greater than 25 cm were included in the analysis.

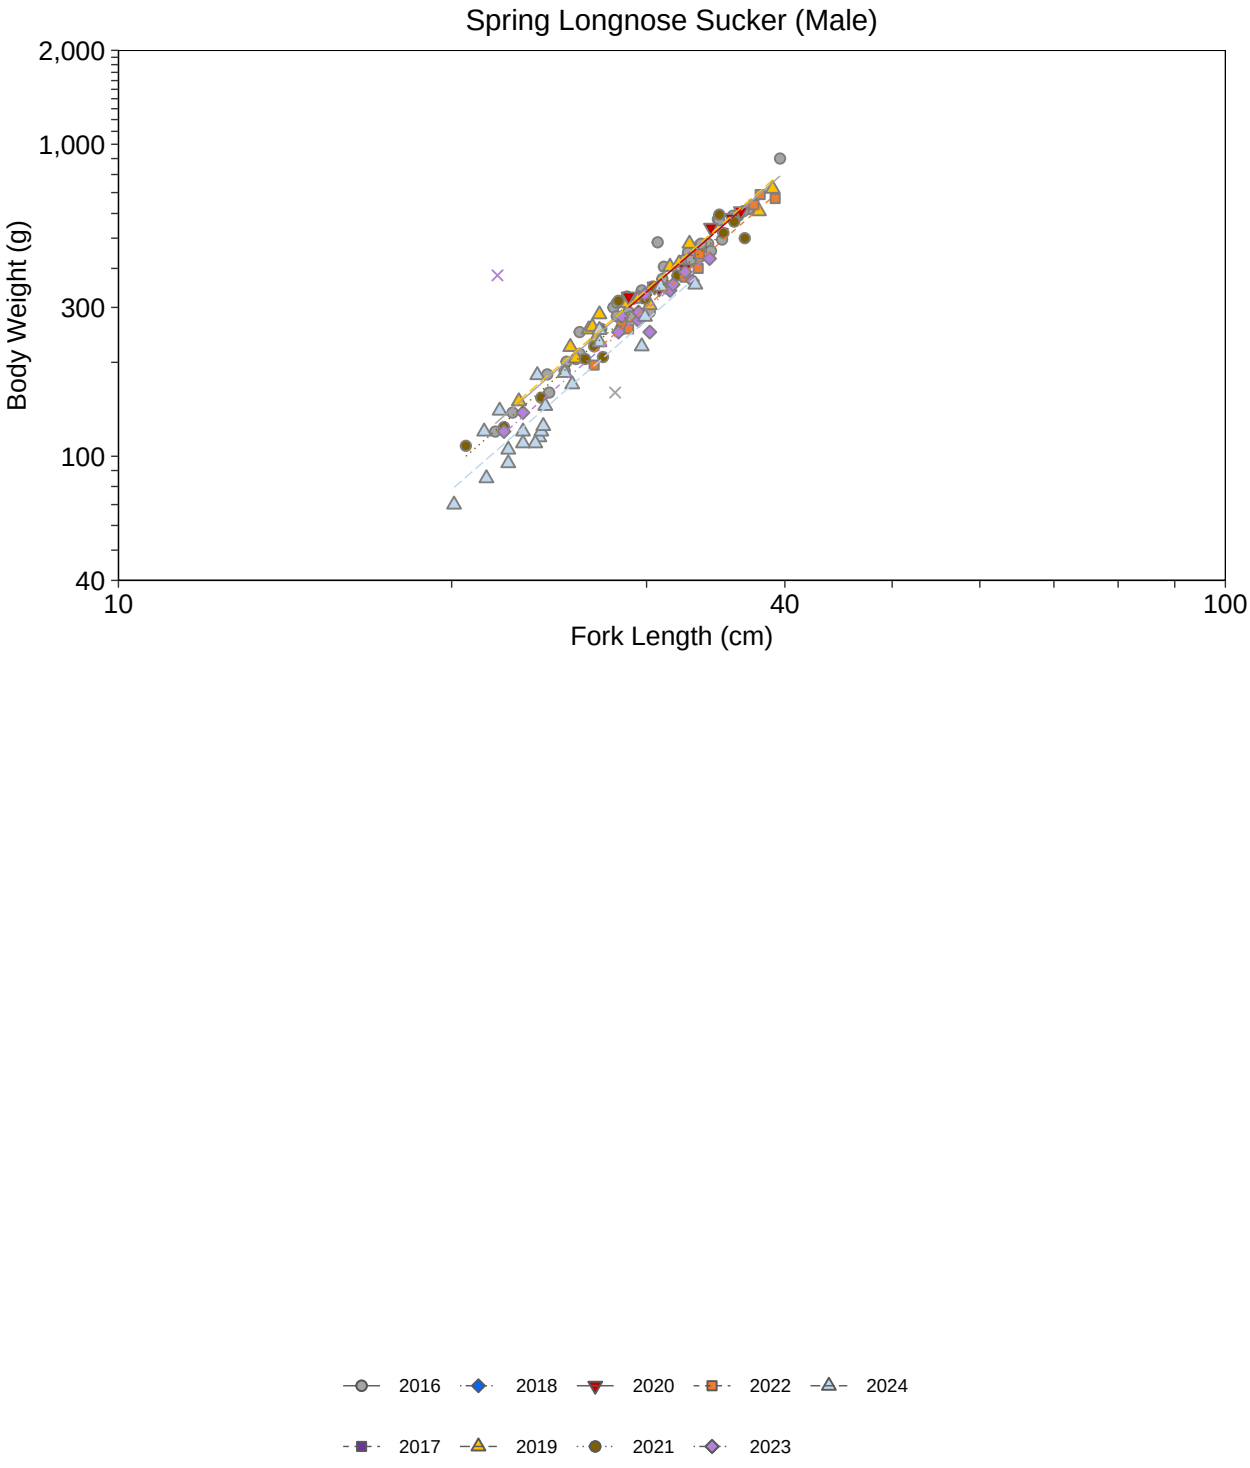

Figure E.5.3: Condition (Weight−at−Length) of Male Longnose Sucker for Polley Lake in Spring, 2016 to 2024

Note: Outliers removed from the statistical analyses are plotted with an x through them.

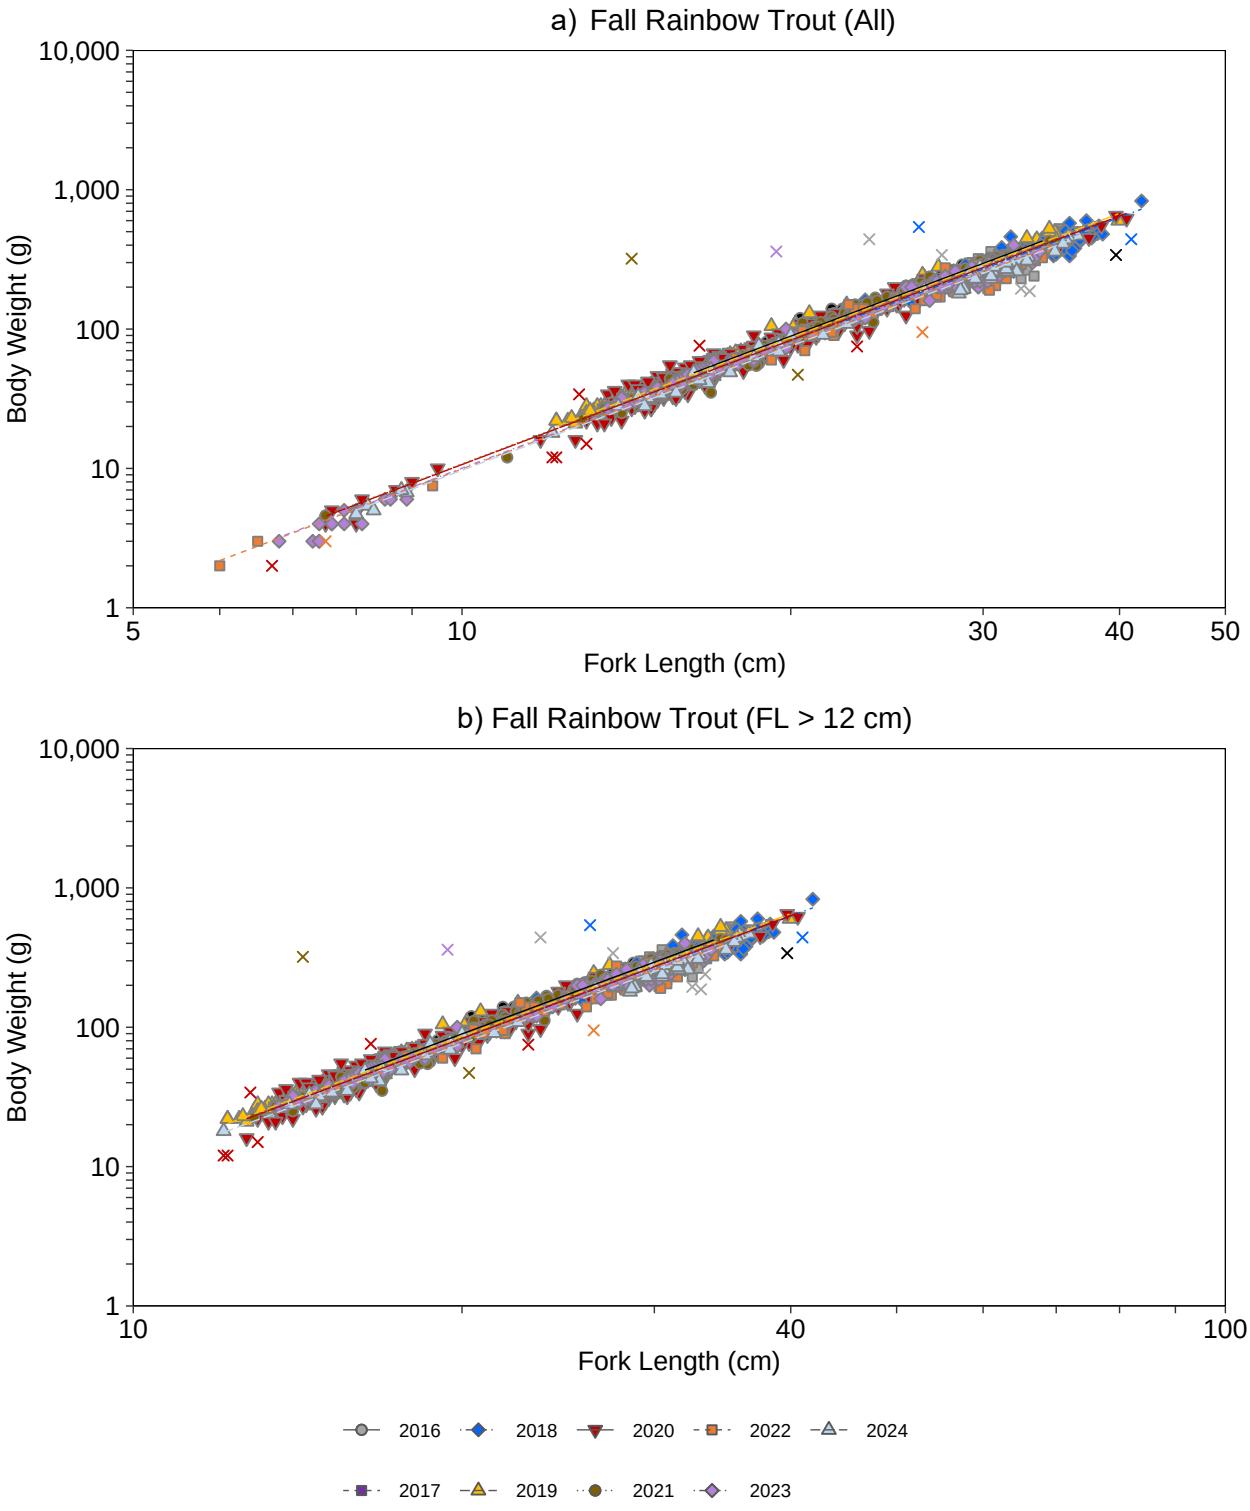

Figure E.5.4: Condition (Weight−at−Length) of a) All Rainbow Trout and b) Rainbow Trout With Fork Length Greater than 12 cm for Polley Lake in Fall, 2014 to 2024

Notes: Outliers removed from the statistical analyses are plotted with an x through them. Only fish with a fork length greater than 12 cm were included in the analysis.

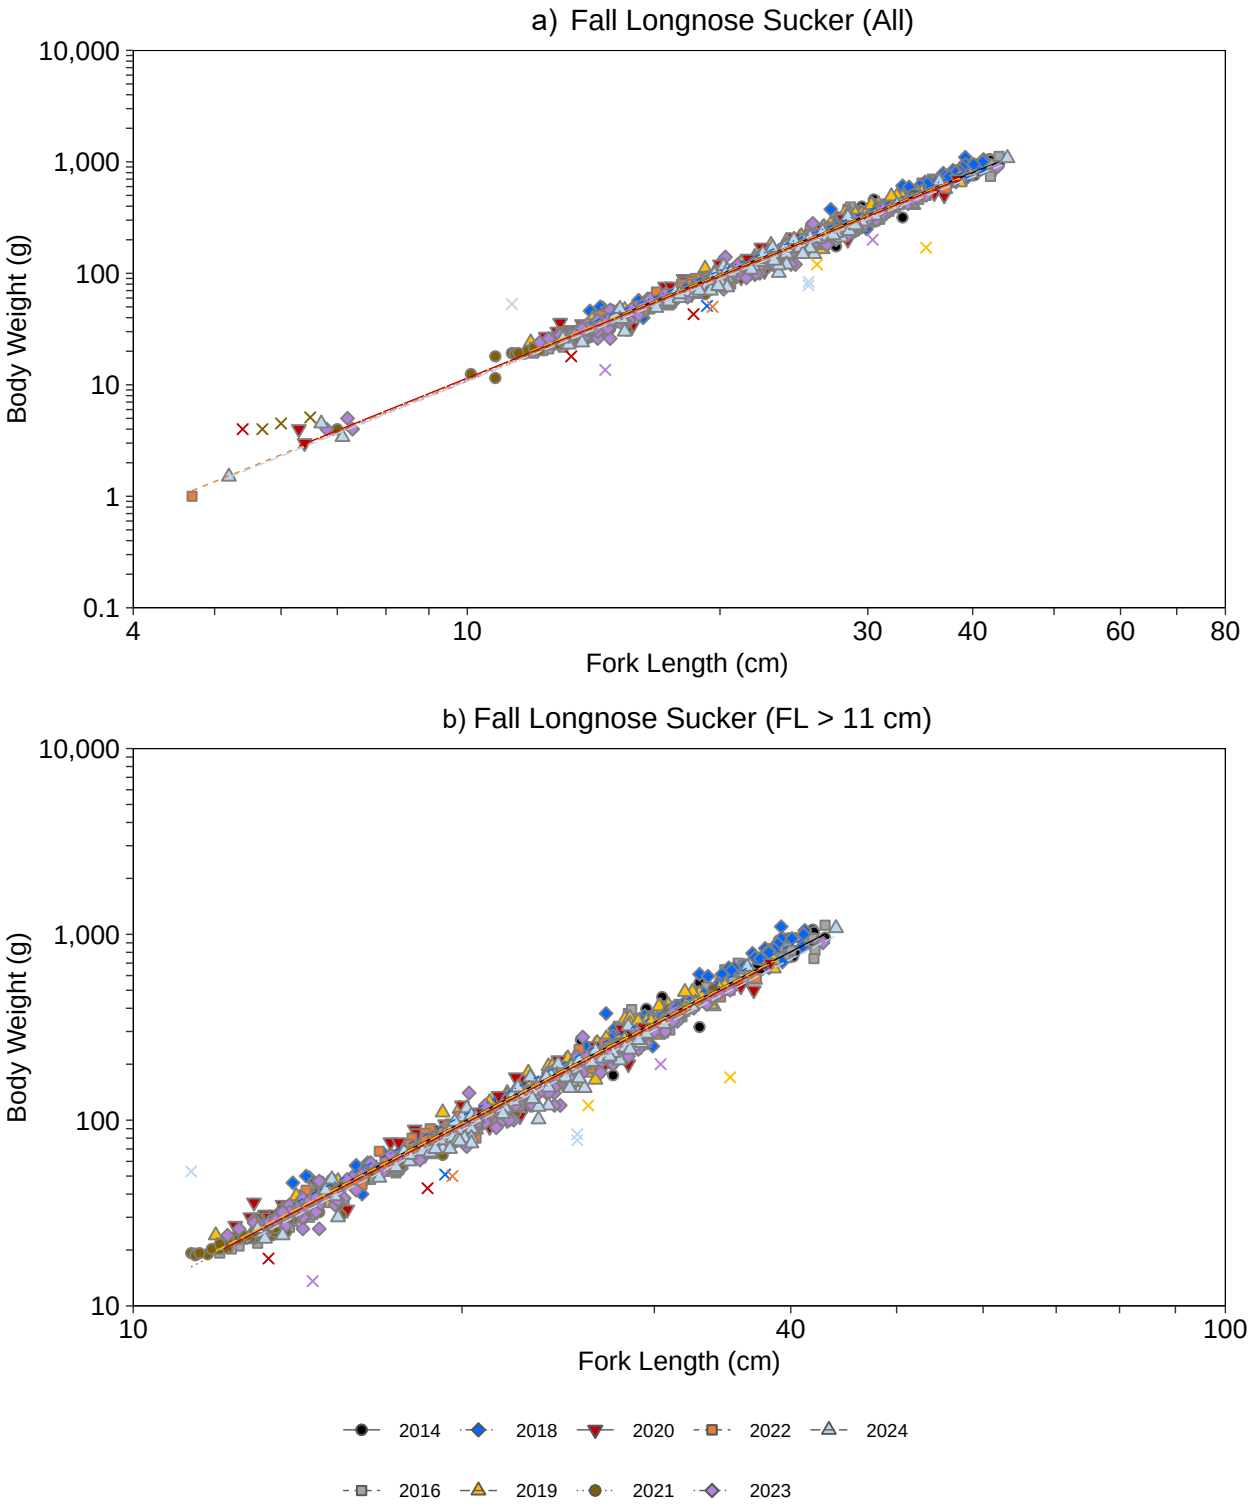

Figure E.5.4: Condition (Weight−at−Length) of a) All Longnose Sucker and b) Longnose Sucker With Fork Length Greater than 11 cm for Polley Lake in Fall, 2014 to 2024

Notes: Outliers removed from the statistical analyses are plotted with an x through them. Only fish with a fork length greater than 11 cm were included in the analysis.

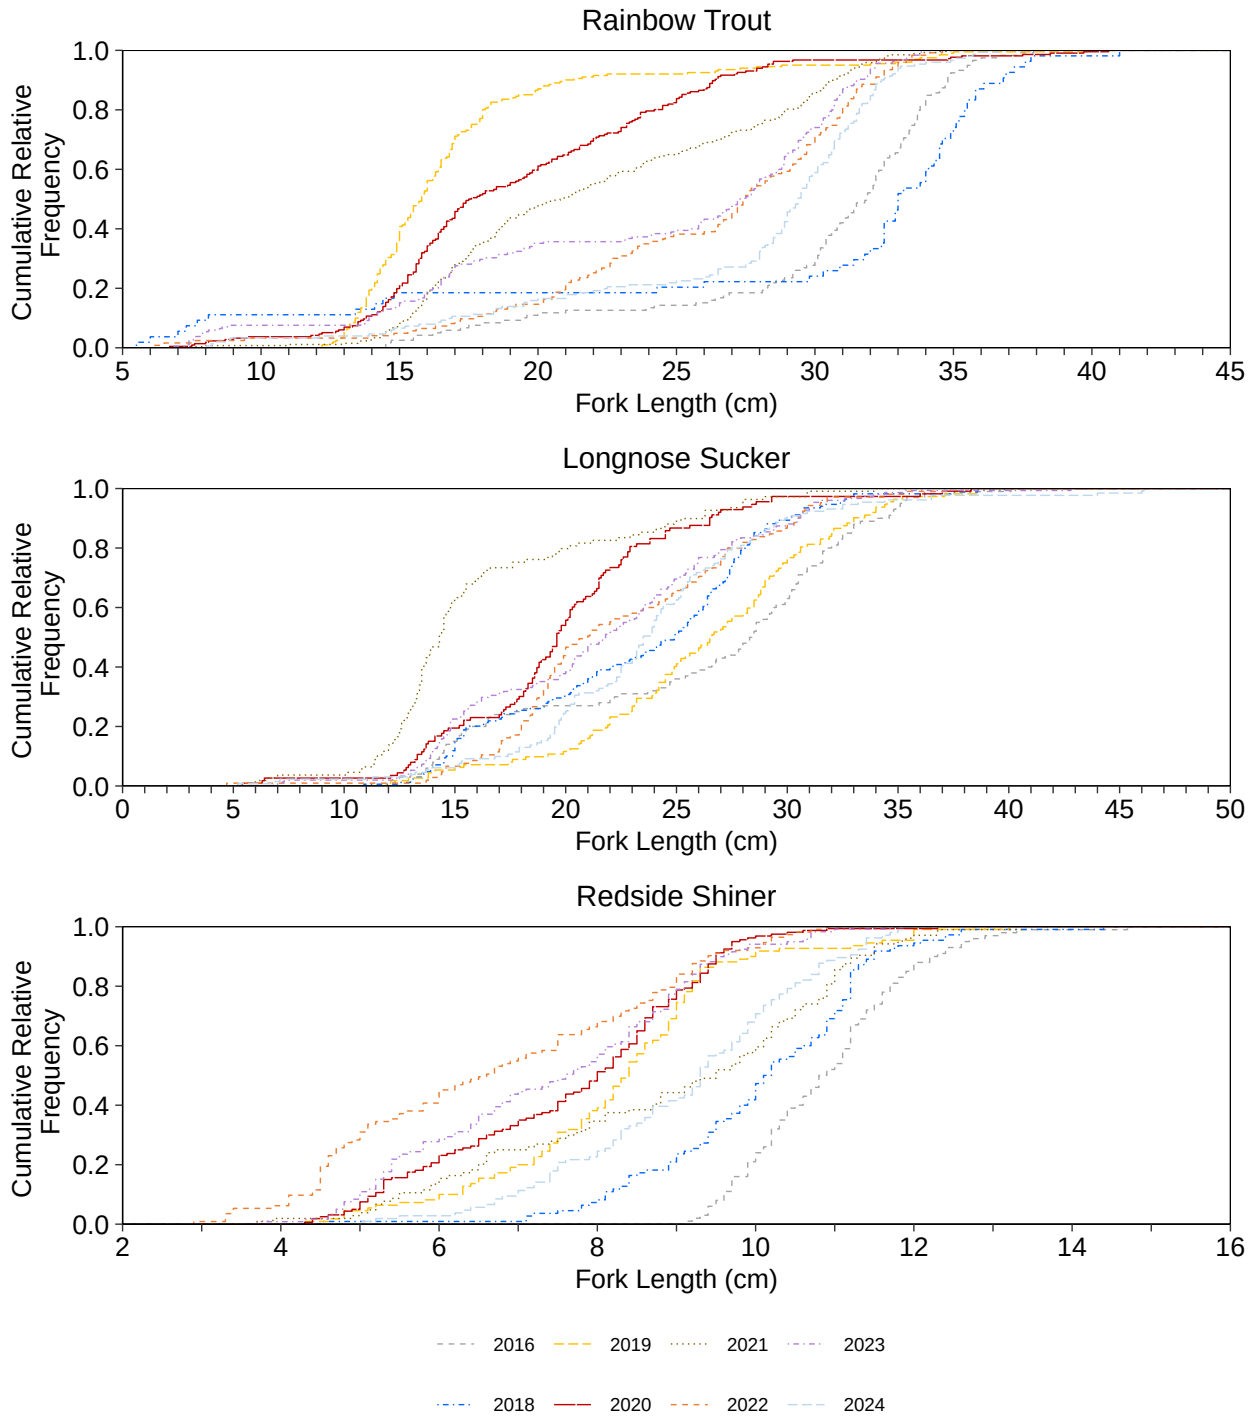

Figure E.5.5: Cumulative Relative Frequency Distributions of Rainbow Trout, Longnose Sucker, and Redside Shiner from Randomized Fall Hoop Netting in Polley Lake, 2016 to 2024

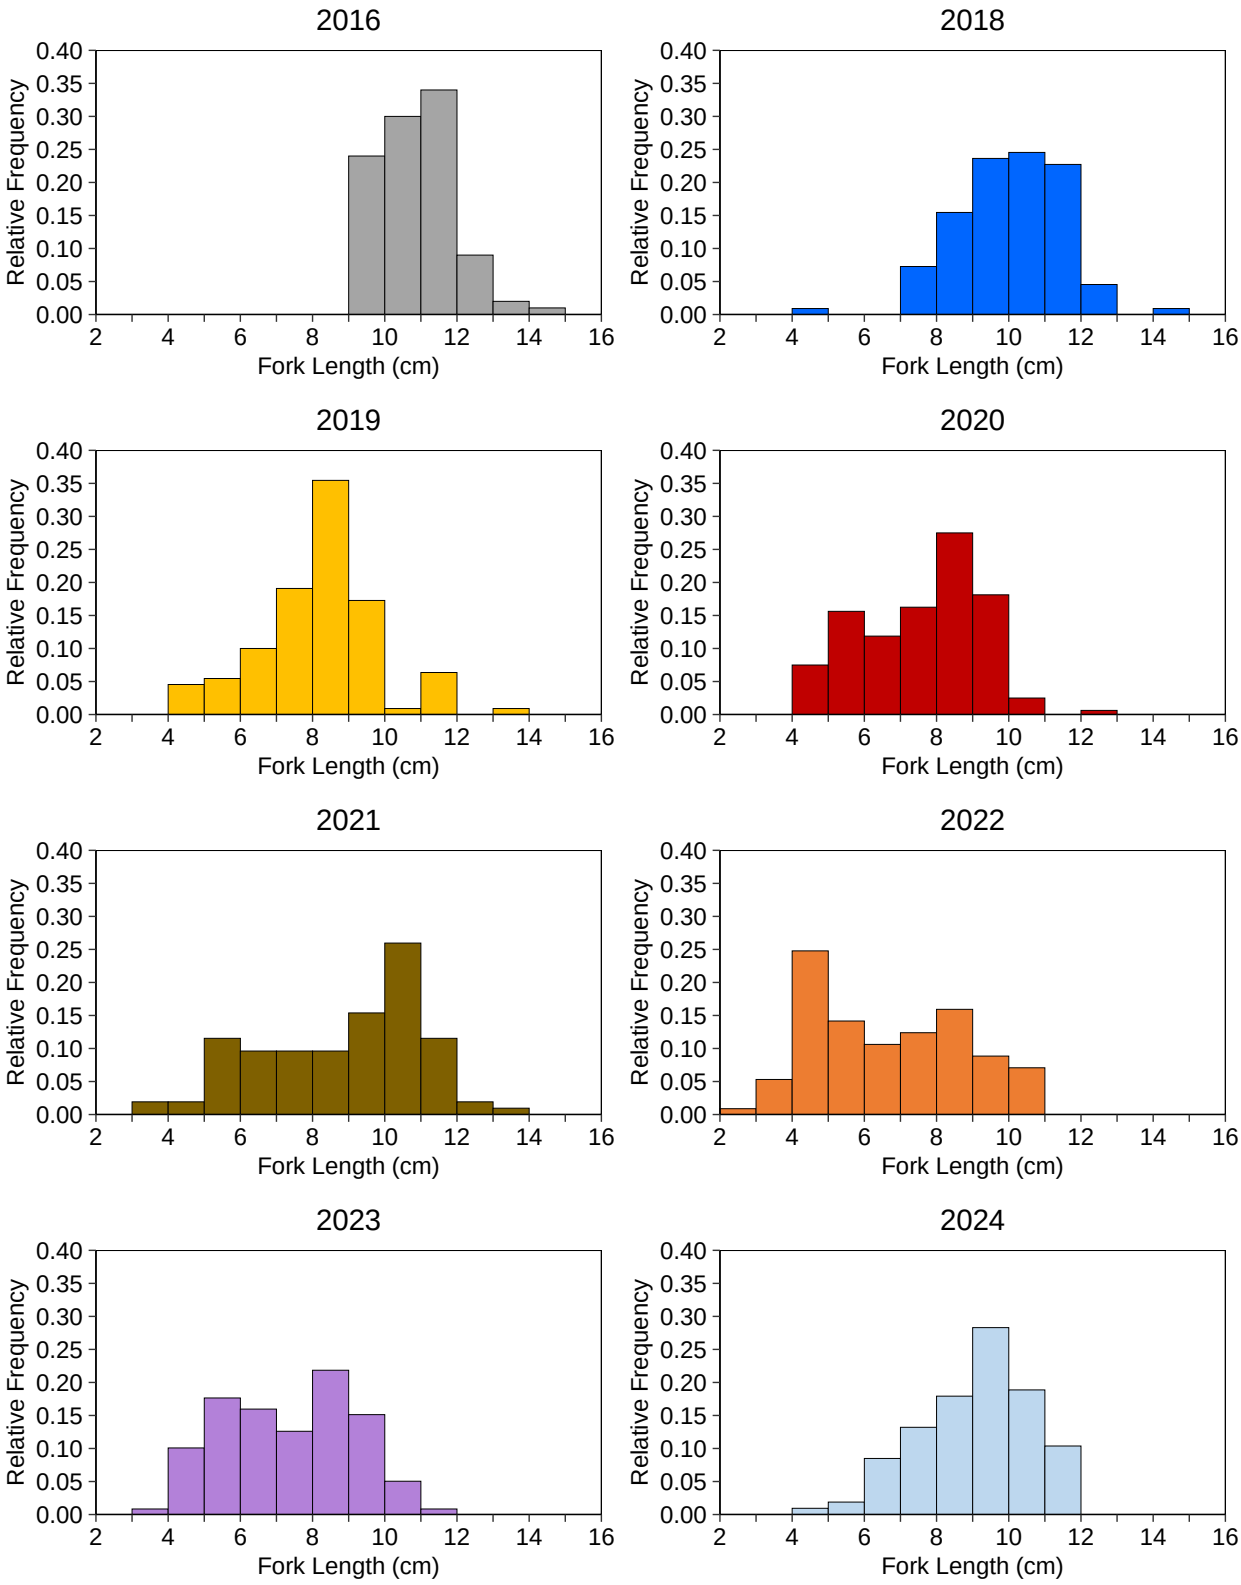

Figure E.5.6: Redside Shiner Length Frequency Distributions for Randomized Fall Hoopnetting in Polley Lake, 2016 to 2024

Table E.5.1: Statistical Comparisons of Condition and Weight-at-Age of Rainbow Trout and Longnose Sucker for Polley Lake in Spring and Fall, 2014 to 2024

P-value < 0.1.
Mean is significantly greater than baseline year.
Mean is significantly lower than baseline year.
Covariate was not significant therefore an ANOVA was conducted.

Note: "-" = no data; ANCOVA = analysis of covariance; ANOVA = analysis of variance; ns = not significant.

[a] Model: $Y = \beta_0 + \beta_1(Cov) + \beta_2(Year) + \beta_3(Cov \times Year) + \varepsilon$.

[b] The mean value of the covariate (that corresponds to the adjusted means for the response variable) for the parallel slope ANCOVA model or the minimum and maximum values of the overlap in covariate values for the interaction ANCOVA model.

[c] The median, mean (geometric mean for log10-transformed variables), and adjusted mean are reported for ANCOVA, and the predicted means of the regression line equations for minimum and maximum values of the covariate (where the data sets overlap) for ANCOVAs where a significant interaction (i.e., different slopes) occurs.

[d] Calculated as the difference in measure of central tendency (MCT) between years (i.e., 2024 minus baseline year), expressed as a percentage of the baseline year MCT.

[e] Outliers removed. See Table Appendix E.5.2 for details.

[f] ANCOVA proceeded under the assumption that the slopes are practically parallel (a difference < 0.02) following Environment Canada (2012).

Table E.5.1: Statistical Comparisons of Condition and Weight-at-Age of Rainbow Trout and Longnose Sucker for Polley Lake in Spring and Fall, 2014 to 2024

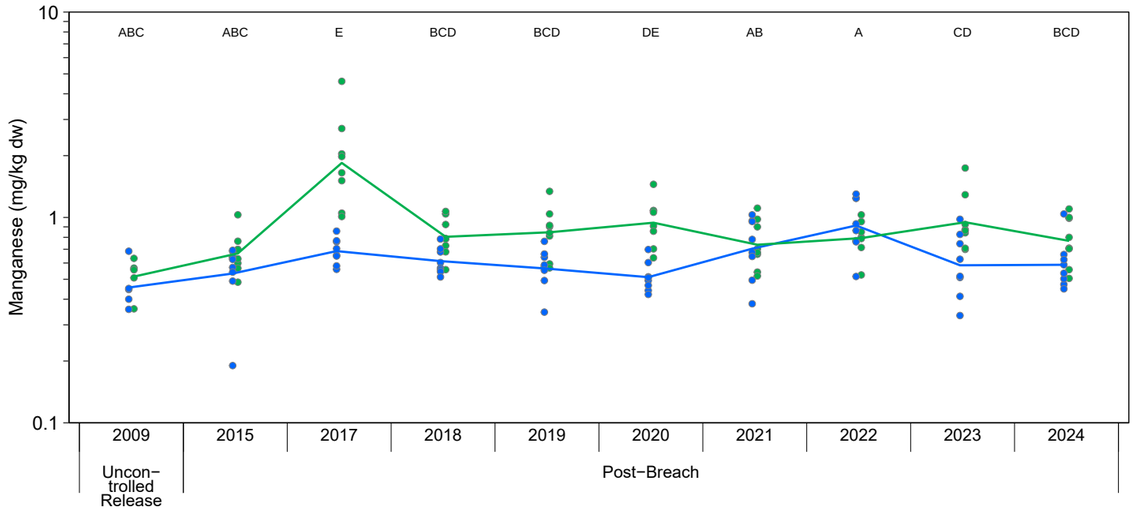
APPENDIX E.6
FISH TISSUE QUALITY



Bootjack Lake Polley Lake

Figure E.6.1: Rainbow Trout Muscle Tissue Primary and Secondary Analyte Concentrations with a Significant Negative Exposed − Reference Difference and a Significant Area x Year Effect for Polley Lake (POL; Exposed) and Bootjack Lake (BOL; Reference), 1995 to 2024

Notes: mg/kg = milligrams per kilogram, dw = dry weight, <LRL = lower than the laboratory reporting limit. Green represents reference area and blue represents exposed area. Data are not available for all years within the date range identified; only years with available data are displayed and these are analyte−dependent. Concentrations <LRL are plotted as open symbols at the LRL and the open symbol represents one or more values reported below the LRL. Individual samples are plotted and lines join the least−squares estimated mean values for years included in the statistical analysis (i.e., not <LRL). Statistical analyses were conducted using a two−way ANOVA with factors Area and Year. The models were fit using Maximum Likelihood Estimation with an assumed log−normal distribution. Years that share a letter (e.g., A,B,C) have ratios of concentrations (Polley Lake:Bootjack Lake) that do not differ significantly (p−value < 0.05) among years. Letter A was assigned to the year with the highest ratio of concentrations (Polley Lake:Bootjack Lake). Only years with samples from both reference and exposed areas are plotted.

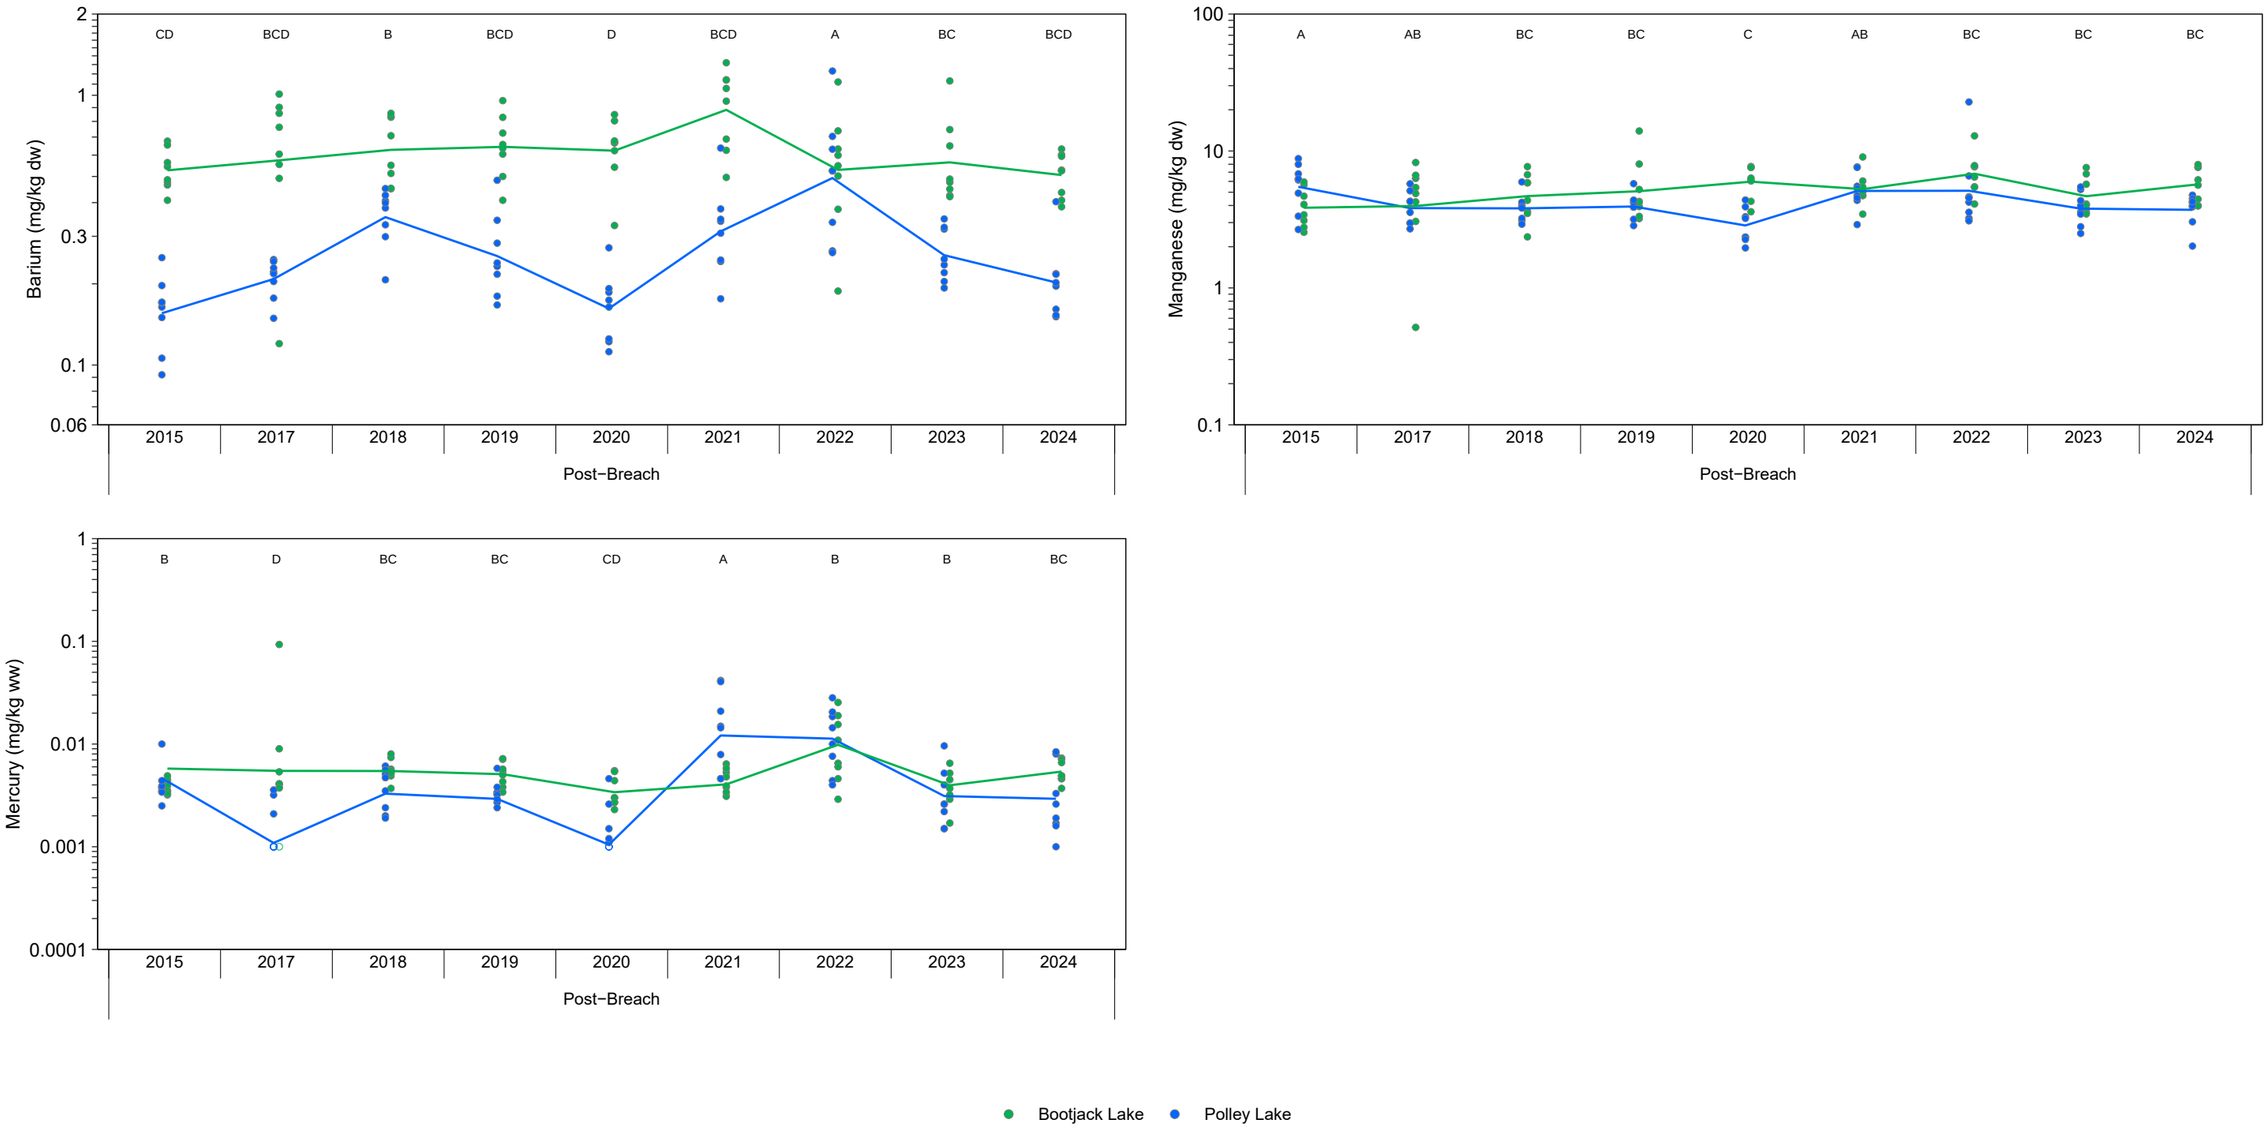


Figure E.6.2: Rainbow Trout Ovary Tissue Primary and Secondary Analyte Concentrations with a Significant Negative Exposed − Reference Difference and a Significant Area x Year Effect for Polley Lake (POL; Exposed) and Bootjack Lake (BOL; Reference), 2012 to 2024

Notes: mg/kg = milligrams per kilogram, dw = dry weight, ww = wet weight, <LRL = lower than the laboratory reporting limit. Green represents reference area and blue represents exposed area. Data are not available for all years within the date range identified; only years with available data are displayed and these are analyte−dependent. Concentrations <LRL are plotted as open symbols at the LRL and the open symbol represents one or more values reported below the LRL. Individual samples are plotted and lines join the least−squares estimated mean values for years included in the statistical analysis (i.e., not <LRL). Statistical analyses were conducted using a two−way ANOVA with factors Area and Year. The models were fit using Maximum Likelihood Estimation with an assumed log−normal distribution. Years that share a letter (e.g., A,B,C) have ratios of concentrations (Polley Lake:Bootjack Lake) that do not differ significantly (p−value < 0.05) among years. Letter A was assigned to the year with the highest ratio of concentrations (Polley Lake:Bootjack Lake). Only years with samples from both reference and exposed areas are plotted.

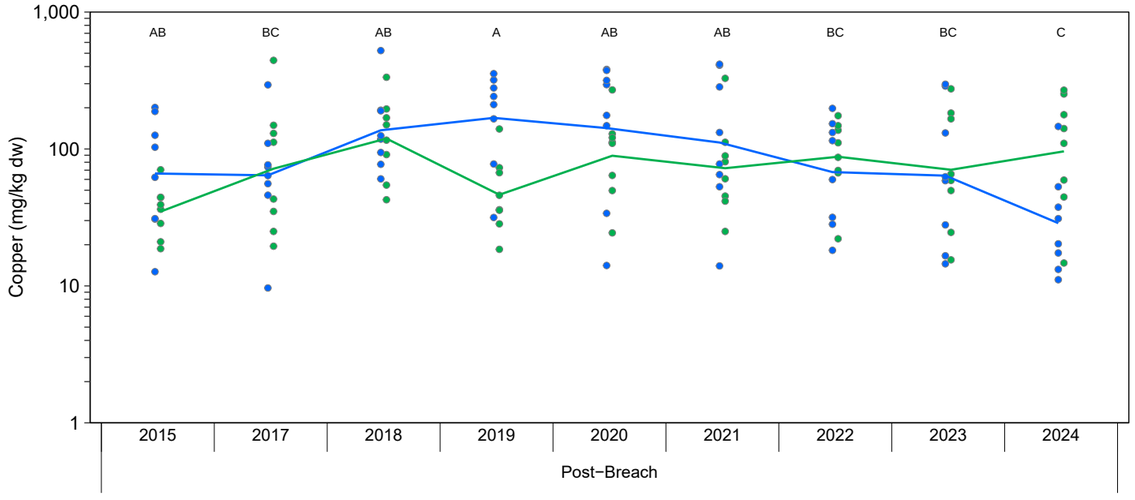

Figure E.6.3: Rainbow Trout Liver Tissue Primary and Secondary Analyte Concentrations with a Significant Negative Exposed − Reference Difference and a Significant Area x Year Effect for Polley Lake (POL; Exposed) and Bootjack Lake (BOL; Reference), 1995 to 2024

Notes: mg/kg = milligrams per kilogram, dw = dry weight, <LRL = lower than the laboratory reporting limit. Green represents reference area and blue represents exposed area. Data are not available for all years within the date range identified; only years with available data are displayed and these are analyte−dependent. Concentrations below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL and the open symbol represents one or more values reported below the LRL. Individual samples are plotted and lines join the least−squares estimated mean values for years included in the statistical analysis (i.e., not <LRL). Statistical analyses were conducted using a two−way ANOVA with factors Area and Year. The models were fit using Maximum Likelihood Estimation with an assumed log−normal distribution. Years that share a letter (e.g., A,B,C) have ratios of concentrations (Polley Lake:Bootjack Lake) that do not differ significantly (p−value < 0.05) among years. Letter A was assigned to the year with the highest ratio of concentrations (Polley Lake:Bootjack Lake). Only years with samples from both reference and exposed areas are plotted.

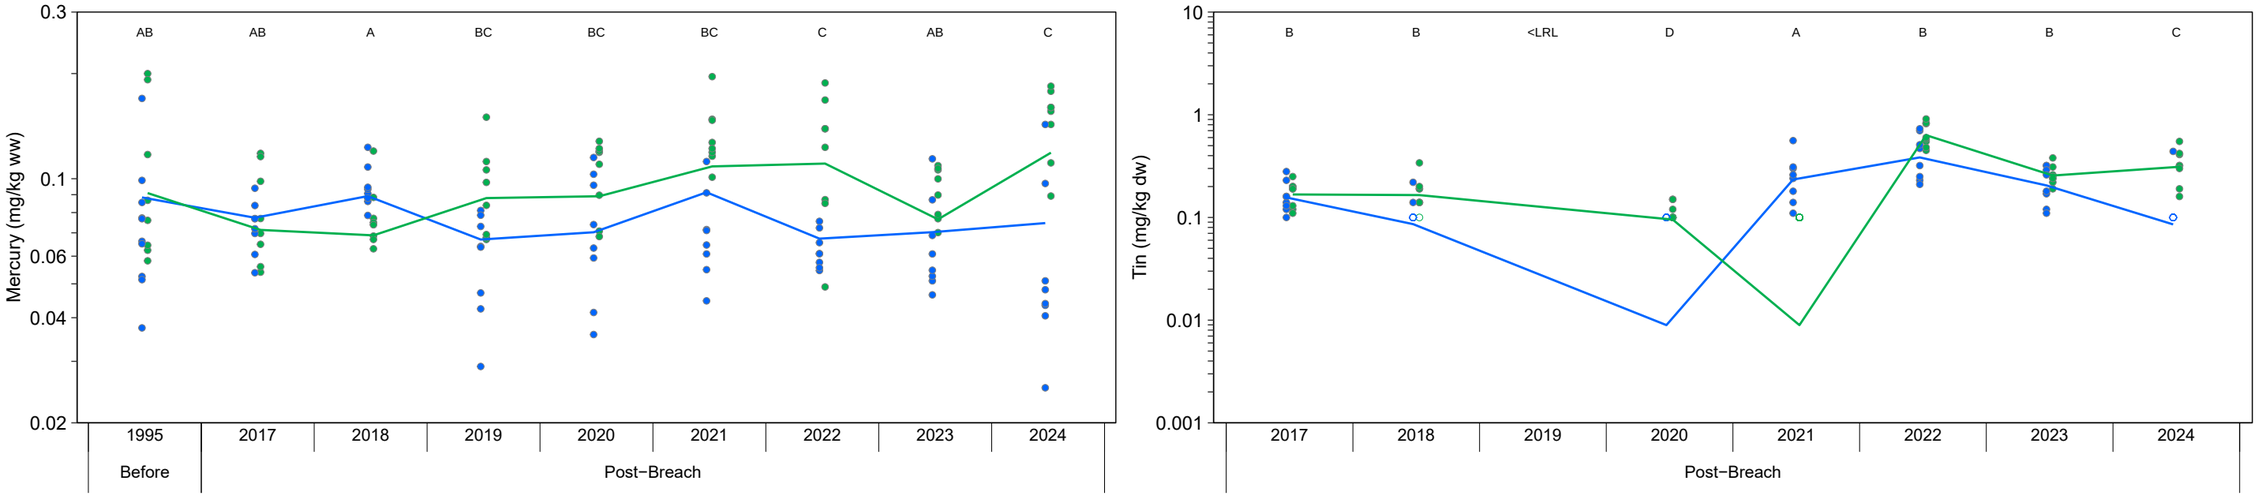

Figure E.6.4: Longnose Sucker Muscle Tissue Primary and Secondary Analyte Concentrations with a Significant Negative Exposed − Reference Difference and a Significant Area x Year Effect for Polley Lake (POL; Exposed) and Bootjack Lake (BOL; Reference), 1995 to 2024

Notes: mg/kg = milligrams per kilogram, dw = dry weight, ww = wet weight, <LRL = lower than the laboratory reporting limit. Green represents reference area and blue represents exposed area. Data are not available for all years within the date range identified; only years with available data are displayed and these are analyte−dependent. Concentrations <LRL are plotted as open symbols at the LRL and the open symbol represents one or more values reported below the LRL. Individual samples are plotted and lines join the least−squares estimated mean values for years included in the statistical analysis (i.e., not <LRL). Statistical analyses were conducted using a two−way ANOVA with factors Area and Year. The models were fit using Maximum Likelihood Estimation with an assumed log−normal distribution. Years that share a letter (e.g., A,B,C) have ratios of concentrations (Polley Lake:Bootjack Lake) that do not differ significantly (p−value < 0.05) among years. Letter A was assigned to the year with the highest ratio of concentrations (Polley Lake:Bootjack Lake). Only years with samples from both reference and exposed areas are plotted.

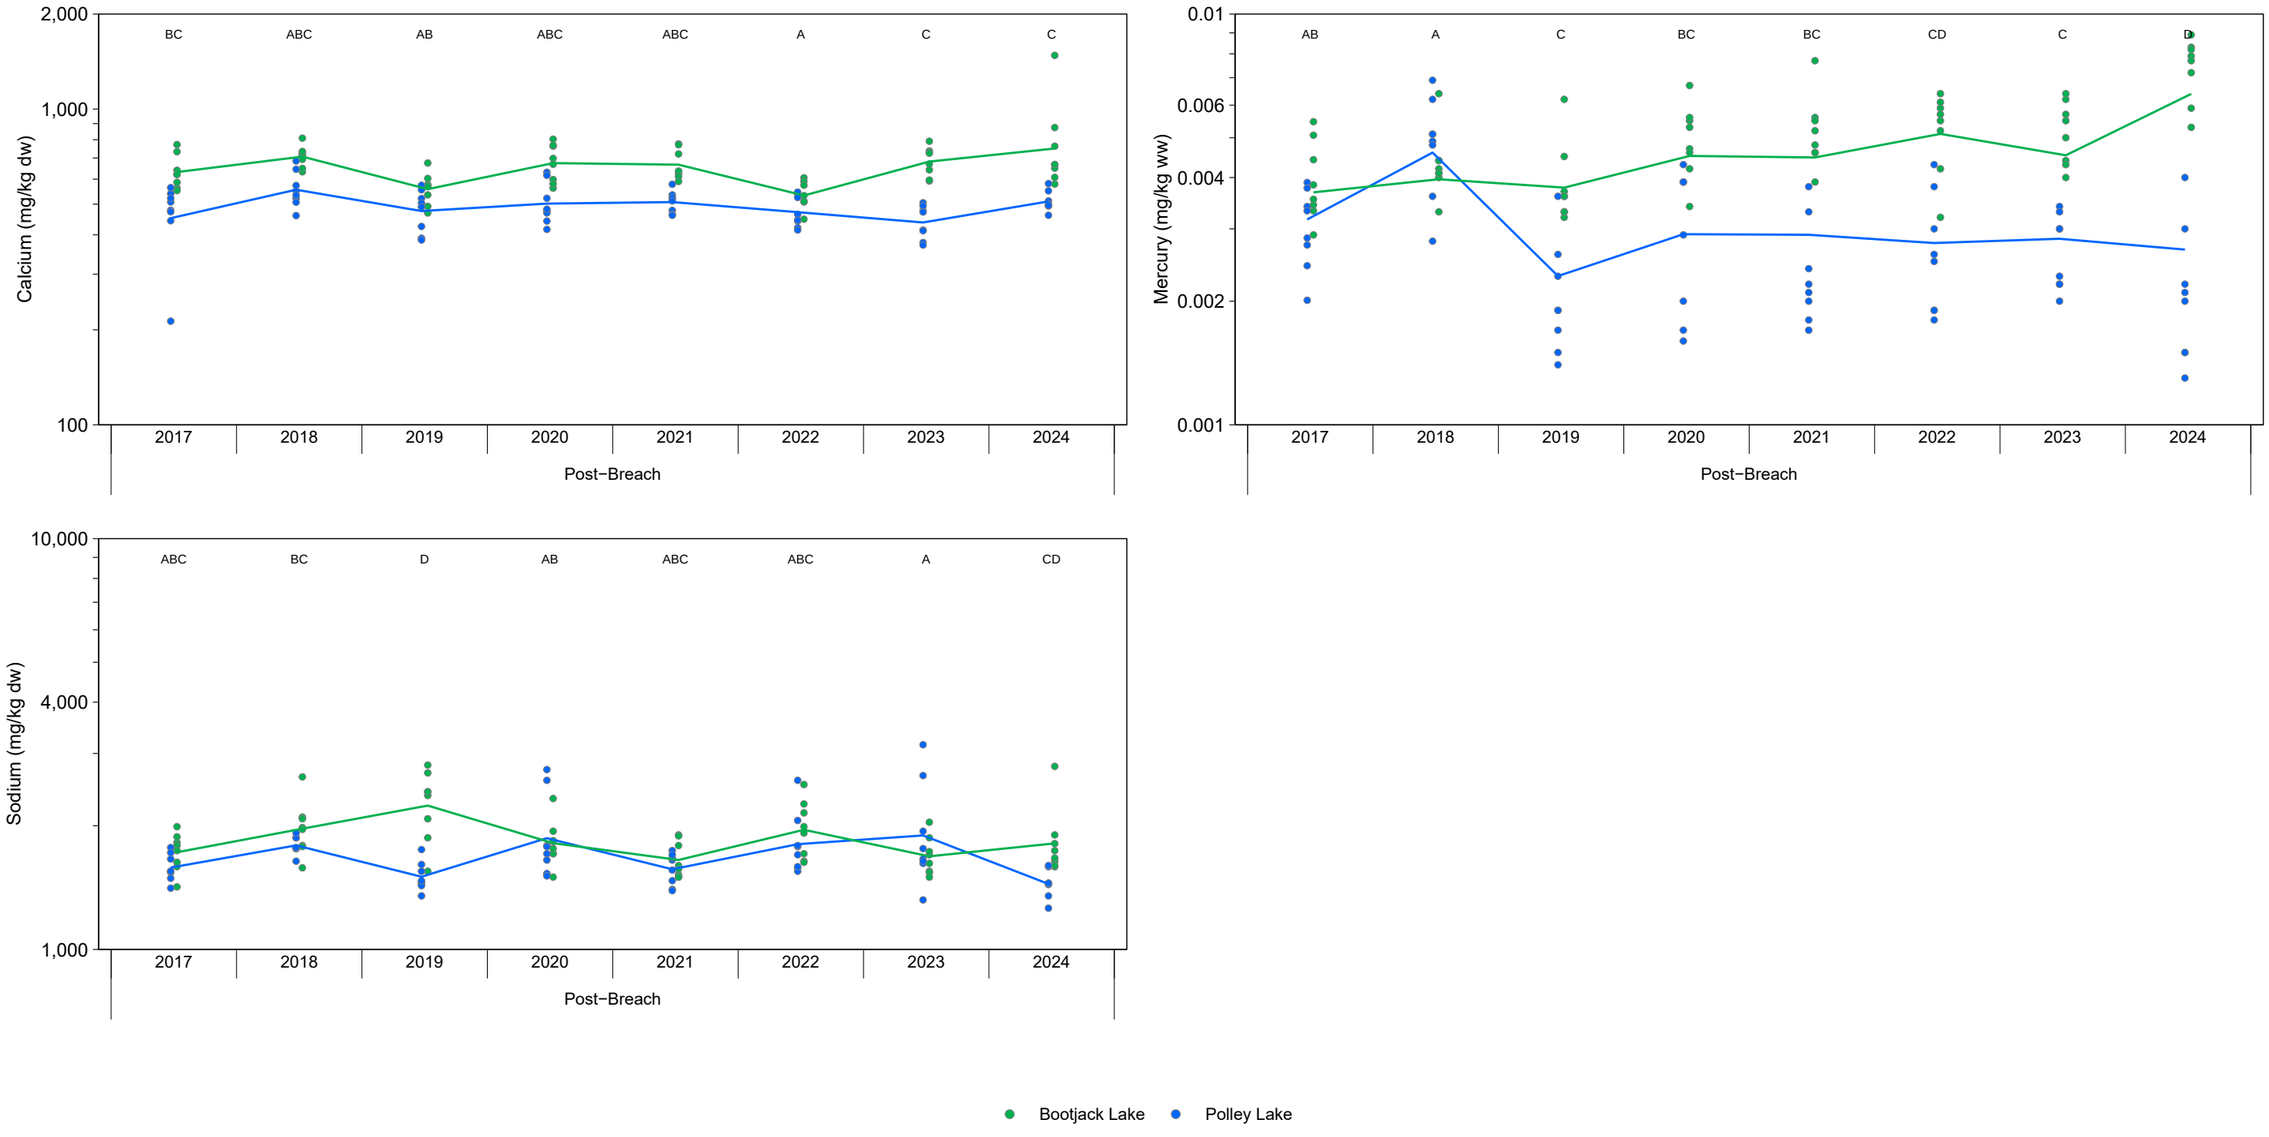

Figure E.6.5: Longnose Sucker Ovary Tissue Primary and Secondary Analyte Concentrations with a Significant Negative Exposed − Reference Difference and a Significant Area x Year Effect for Polley Lake (POL; Exposed) and Bootjack Lake (BOL; Reference), 2012 to 2024

Notes: mg/kg = milligrams per kilogram, dw = dry weight, ww = wet weight, <LRL = lower than the laboratory reporting limit. Green represents reference area and blue represents exposed area. Data are not available for all years within the date range identified; only years with available data are displayed and these are analyte−dependent. Concentrations <LRL are plotted as open symbols at the LRL and the open symbol represents one or more values reported below the LRL. Individual samples are plotted and lines join the least−squares estimated mean values for years included in the statistical analysis (i.e., not <LRL). Statistical analyses were conducted using a two−way ANOVA with factors Area and Year. The models were fit using Maximum Likelihood Estimation with an assumed log−normal distribution. Area x Year or Area P-value < 0.05.

Contrast is significant (α = 0.05) and magnitude of difference is positive.

Contrast is significant (α = 0.05) and magnitude of difference is negative.

Notes: **Bold font** = Data for either exposed or reference in the indicated year were entirely <LRL, leading to a less accurate estimate of the mean for the <LRL result and greater uncertainty for the calculated MOD. No MOD is displayed if the comparison was not significant. "-" = no data available or no post-hoc test conducted because of censored data; "LRL" = Laboratory reporting limit; "nt" = not tested because all data were reported below the LRL or because there were only data for a single time period; "ns" = not significant; "baseline" = first year of data included in analysis; "<LRL" = greater than 50% LRL data for both stations so the time period was omitted from the analysis; "ww" = wet weight; "ANOVA" = analysis of variance; "MLE" = censored regression using maximum likelihood estimation; "ANCOVA" = two-way analysis of covariance using censored regression, MOD = magnitude of difference. Data were analysed in units of mg/kg dry weight except mercury which was analysed in units of mg/kg wet weight. Merged cells across years indicate that the Area × Time term was not significant, therefore MOD is for all years combined. Only years with samples from both reference and exposed were included in the analysis.

[a] Years that share a letter (e.g., A,B,C) had ratios of concentrations (Polley Lake: Bootjack Lake) that do not differ significantly among years. Letters are assigned such that A is assigned to the year with the highest ratio of concentrations (Polley Lake: Bootjack Lake).

[b] Magnitude of difference (MOD) calculated on backtransformed least-squares means for the observed time period as $(Exp_{observed} - Exp_{predicted})/(Exp_{predicted})\times 100\%$ where $Exp_{predicted} = Ref_{observed} + (Exp_{baseline} - Ref_{baseline})$.

[c] Magnitude of difference (MOD) calculated on backtransformed least-squares means as (Exp-Ref)/Ref x 100%.

[d] Conducted as a two-way ANCOVA with $\log_{10}$(fork length) as a covariate and all contrasts were conducted using mean $\log_{10}$(fork length).

[e] Results of statistical contrasts for age, fork length, and body weight may differ among tissue types for a given species due to different sample sizes or sampling years among tissue types. Only the results associated with muscle and ovary tissue types were used in data interpretation.

Area x Year or Area P-value < 0.05.

Contrast is significant (α = 0.05) and magnitude of difference is positive.

Contrast is significant (α = 0.05) and magnitude of difference is negative.

Notes: **Bold font** = Data for either exposed or reference in the indicated year were entirely <LRL, leading to a less accurate estimate of the mean for the <LRL result and greater uncertainty for the calculated MOD. No MOD is displayed if the comparison was not significant. "-" = no data available or no post-hoc test conducted because of censored data; "LRL" = Laboratory reporting limit; "nt" = not tested because all data were reported below the LRL or because there were only data for a single time period; "ns" = not significant; "baseline" = first year of data included in analysis; "<LRL" = greater than 50% LRL data for both stations so the time period was omitted from the analysis; "ww" = wet weight; "ANOVA" = analysis of variance; "MLE" = censored regression using maximum likelihood estimation; "ANCOVA" = two-way analysis of covariance using censored regression, MOD = magnitude of difference. Data were analysed in units of mg/kg dry weight except mercury which was analysed in units of mg/kg wet weight. Merged cells across years indicate that the Area × Time term was not significant, therefore MOD is for all years combined. Only years with samples from both reference and exposed were included in the analysis.

[a] Years that share a letter (e.g., A,B,C) had ratios of concentrations (Polley Lake: Bootjack Lake) that do not differ significantly among years. Letters are assigned such that A is assigned to the year with the highest ratio of concentrations (Polley Lake: Bootjack Lake).

[b] Magnitude of difference (MOD) calculated on backtransformed least-squares means for the observed time period as $(Exp_{observed} - Exp_{predicted})/(Exp_{predicted})\times 100\%$ where $Exp_{predicted} = Ref_{observed} + (Exp_{baseline} - Ref_{baseline})$.

[c] Magnitude of difference (MOD) calculated on backtransformed least-squares means as (Exp-Ref)/Ref x 100%.

[d] Conducted as a two-way ANCOVA with $\log_{10}$(fork length) as a covariate and all contrasts were conducted using mean $\log_{10}$(fork length).

[e] Results of statistical contrasts for age, fork length, and body weight may differ among tissue types for a given species due to different sample sizes or sampling years among tissue types. Only the results associated with muscle and ovary tissue types were used in data interpretation.

Area x Year or Area P-value < 0.05.

Contrast is significant (α = 0.05) and magnitude of difference is positive.

Contrast is significant (α = 0.05) and magnitude of difference is negative.

Notes: **Bold font** = Data for either exposed or reference in the indicated year were entirely <LRL, leading to a less accurate estimate of the mean for the <LRL result and greater uncertainty for the calculated MOD. No MOD is displayed if the comparison was not significant. "-" = no data available or no post-hoc test conducted because of censored data; "LRL" = Laboratory reporting limit; "nt" = not tested because all data were reported below the LRL or because there were only data for a single time period; "ns" = not significant; "baseline" = first year of data included in analysis; "<LRL" = greater than 50% LRL data for both stations so the time period was omitted from the analysis; "ww" = wet weight; "ANOVA" = analysis of variance; "MLE" = censored regression using maximum likelihood estimation; "ANCOVA" = two-way analysis of covariance using censored regression, MOD = magnitude of difference. Data were analysed in units of mg/kg dry weight except mercury which was analysed in units of mg/kg wet weight. Merged cells across years indicate that the Area × Time term was not significant, therefore MOD is for all years combined. Only years with samples from both reference and exposed were included in the analysis.

[a] Years that share a letter (e.g., A,B,C) had ratios of concentrations (Polley Lake: Bootjack Lake) that do not differ significantly among years. Letters are assigned such that A is assigned to the year with the highest ratio of concentrations (Polley Lake: Bootjack Lake).

[b] Magnitude of difference (MOD) calculated on backtransformed least-squares means for the observed time period as $(Exp_{observed} - Exp_{predicted})/(Exp_{predicted})\times 100\%$ where $Exp_{predicted} = Ref_{observed} + (Exp_{baseline} - Ref_{baseline})$.

[c] Magnitude of difference (MOD) calculated on backtransformed least-squares means as (Exp-Ref)/Ref x 100%.

[d] Conducted as a two-way ANCOVA with $\log_{10}$(fork length) as a covariate and all contrasts were conducted using mean $\log_{10}$(fork length).

[e] Results of statistical contrasts for age, fork length, and body weight may differ among tissue types for a given species due to different sample sizes or sampling years among tissue types. Only the results associated with muscle and ovary tissue types were used in data interpretation.

Area x Year or Area P-value < 0.05.

Contrast is significant (α = 0.05) and magnitude of difference is positive.

Contrast is significant (α = 0.05) and magnitude of difference is negative.

Notes: **Bold font** = Data for either exposed or reference in the indicated year were entirely <LRL, leading to a less accurate estimate of the mean for the <LRL result and greater uncertainty for the calculated MOD. No MOD is displayed if the comparison was not significant. "-" = no data available or no post-hoc test conducted because of censored data; "LRL" = Laboratory reporting limit; "nt" = not tested because all data were reported below the LRL or because there were only data for a single time period; "ns" = not significant; "baseline" = first year of data included in analysis; "<LRL" = greater than 50% LRL data for both stations so the time period was omitted from the analysis; "ww" = wet weight; "ANOVA" = analysis of variance; "MLE" = censored regression using maximum likelihood estimation; "ANCOVA" = two-way analysis of covariance using censored regression, MOD = magnitude of difference. Data were analysed in units of mg/kg dry weight except mercury which was analysed in units of mg/kg wet weight. Merged cells across years indicate that the Area × Time term was not significant, therefore MOD is for all years combined. Only years with samples from both reference and exposed were included in the analysis.

[a] Years that share a letter (e.g., A,B,C) had ratios of concentrations (Polley Lake: Bootjack Lake) that do not differ significantly among years. Letters are assigned such that A is assigned to the year with the highest ratio of concentrations (Polley Lake: Bootjack Lake).

[b] Magnitude of difference (MOD) calculated on backtransformed least-squares means for the observed time period as $(Exp_{observed} - Exp_{predicted})/(Exp_{predicted})\times 100\%$ where $Exp_{predicted} = Ref_{observed} + (Exp_{baseline} - Ref_{baseline})$.

[c] Magnitude of difference (MOD) calculated on backtransformed least-squares means as (Exp-Ref)/Ref x 100%.

[d] Conducted as a two-way ANCOVA with $\log_{10}$(fork length) as a covariate and all contrasts were conducted using mean $\log_{10}$(fork length).

[e] Results of statistical contrasts for age, fork length, and body weight may differ among tissue types for a given species due to different sample sizes or sampling years among tissue types. Only the results associated with muscle and ovary tissue types were used in data interpretation.

Area x Year or Area P-value < 0.05.

Contrast is significant (α = 0.05) and magnitude of difference is positive.

Contrast is significant (α = 0.05) and magnitude of difference is negative.

Notes: **Bold font** = Data for either exposed or reference in the indicated year were entirely <LRL, leading to a less accurate estimate of the mean for the <LRL result and greater uncertainty for the calculated MOD. No MOD is displayed if the comparison was not significant. "-" = no data available or no post-hoc test conducted because of censored data; "LRL" = Laboratory reporting limit; "nt" = not tested because all data were reported below the LRL or because there were only data for a single time period; "ns" = not significant; "baseline" = first year of data included in analysis; "<LRL" = greater than 50% LRL data for both stations so the time period was omitted from the analysis; "ww" = wet weight; "ANOVA" = analysis of variance; "MLE" = censored regression using maximum likelihood estimation; "ANCOVA" = two-way analysis of covariance using censored regression, MOD = magnitude of difference. Data were analysed in units of mg/kg dry weight except mercury which was analysed in units of mg/kg wet weight. Merged cells across years indicate that the Area × Time term was not significant, therefore MOD is for all years combined. Only years with samples from both reference and exposed were included in the analysis.

[a] Years that share a letter (e.g., A,B,C) had ratios of concentrations (Polley Lake: Bootjack Lake) that do not differ significantly among years. Letters are assigned such that A is assigned to the year with the highest ratio of concentrations (Polley Lake: Bootjack Lake

[b] Magnitude of difference (MOD) calculated on backtransformed least-squares means for the observed time period as $(Exp_{observed} - Exp_{predicted})/(Exp_{predicted})\times 100\%$ where $Exp_{predicted} = Ref_{observed} + (Exp_{baseline} - Ref_{baseline})$.

[c] Magnitude of difference (MOD) calculated on backtransformed least-squares means as (Exp-Ref)/Ref x 100%

[d] Conducted as a two-way ANCOVA with $\log_{10}$(fork length) as a covariate and all contrasts were conducted using mean $\log_{10}$(fork length).

[e] Results of statistical contrasts for age, fork length, and body weight may differ among tissue types for a given species due to different sample sizes or sampling years among tissue types. Only the results associated with muscle and ovary tissue types were used in data interpretation.

Area x Year or Area P-value < 0.05.

Contrast is significant (α = 0.05) and magnitude of difference is positive.

Contrast is significant (α = 0.05) and magnitude of difference is negative.

Notes: **Bold font** = Data for either exposed or reference in the indicated year were entirely <LRL, leading to a less accurate estimate of the mean for the <LRL result and greater uncertainty for the calculated MOD. No MOD is displayed if the comparison was not significant. "-" = no data available or *rpost hoc* test conducted because of censored data. "LRL" = Laboratory reporting limit. "nt" = not tested because all data were reported below the method detection limit (LRL) or because there were only data for a single time period. "ns" = not significant. "baseline" = first year of data included in analysis. "<LRL" = greater than 50% LRL data for both stations so the time period was omitted from the analysis. "ww" = wet weight. "ANOVA" = two way analysis of variance. "MLE" = censored regression using maximum likelihood estimation. "ANCOVA" = two-way analysis of covariance using censored regression. MOD = magnitude of difference. Data were analysed in units of mg/kg dry weight except mercury which was analysed in units of mg/kg wet weight. Merged cells across years indicate that the Area × Time term was not significant, therefore MOD is for all years combined. Only years with samples from both reference and exposed were included in the analysis.

[a] Years that share a letter (e.g., A,B,C) had ratios of concentrations (Exposed:Reference) that do not differ significantly among years. Letters are assigned such that A is assigned to the year with the highest ratio of concentrations (Exposed:Reference).

[b] Magnitude of difference (MOD) calculated on backtransformed least-squares means for the observed time period as $(Exp_{observed} - Exp_{predicted})/(Exp_{predicted})\times 100\%$ where $Exp_{predicted} = Ref_{observed} + (Exp_{baseline} - Ref_{baseline})$.

[c] Magnitude of difference (MOD) calculated on backtransformed least-squares means as (Exp-Ref)/Ref x 100%.

[d] Conducted as a two-way ANCOVA with log10(fork length) as a covariate. Because the covariate was significant, all contrasts were conducted using mean log10(fork length).

[e] Results of statistical contrasts for age, fork length, and body weight may differ among tissue types for a given species due to different sample sizes or sampling years among tissue types. Only the results associated with muscle were used in data interpretation.

Table E.6.10: **Statistical Comparisons of Exposed - Reference Relative Differences of Northern Pikeminnow Whole-body Tissue Metal Concentrations for the Quesnel Lake near Hazeltine Creek (QUL-NHC; Exposed) and near Grain Creek (QUL-NGC; Reference) Monitoring Areas, 2016 to 2024**

Area x Year or Area P-value < 0.05.

Contrast is significant (α = 0.05) and magnitude of difference is positive.

Contrast is significant (α = 0.05) and magnitude of difference is negative.

Notes: **Bold font** = Data for either exposed or reference in the indicated year were entirely <LRL, leading to a less accurate estimate of the mean for the <LRL result and greater uncertainty for the calculated MOD. No MOD is displayed if the comparison was not significant. "-" = no data available or no *post hoc* test conducted because of censored data. "LRL" = Laboratory reporting limit. "nt" = not tested because all data were reported below the method detection limit (LRL) or because there were only data for a single time period. "ns" = not significant. "baseline" = first year of data included in analysis. "<LRL" = greater than 50% LRL data for both stations so the time period was omitted from the analysis. "ww" = wet weight. "ANOVA" = two way analysis of variance. "MLE" = censored regression using maximum likelihood estimation. "ANCOVA" = two-way analysis of covariance. MOD = magnitude of difference. Data were analysed in units of mg/kg dry weight except mercury which was analysed in units of mg/kg wet weight. Merged cells across years indicate that the Area × Time term was not significant, therefore MOD is for all years combined. Only years with samples from both reference and exposed were included in the analysis.

[a] Years that share a letter (e.g., A,B,C) had ratios of concentrations (Exposed:Reference) that do not differ significantly among years. Letters are assigned such that A is assigned to the year with the highest ratio of concentrations (Exposed:Reference

[b] Magnitude of difference (MOD) calculated on backtransformed least-squares means for the observed time period as $(Exp_{observed} - Exp_{predicted})/(Exp_{predicted})\times 100\%$ where $Exp_{predicted} = Ref_{observed} + (Exp_{baseline} - Ref_{baseline})$.

[c] Magnitude of difference (MOD) calculated on backtransformed least-squares means as (Exp-Ref)/Ref x 100%

[d] Conducted as a two-way ANCOVA with log10(fork length) as a covariate. Because the covariate was significant, all contrasts were conducted using mean log10(fork length

Area x Year or Area P-value < 0.05.

Contrast is significant (α = 0.05) and magnitude of difference is positive.

Contrast is significant (α = 0.05) and magnitude of difference is negative.

Notes: **Bold** font = Data for either exposed or reference in the indicated year were entirely <LRL, leading to a less accurate estimate of the mean for the <LRL result and greater uncertainty for the calculated MOD. No MOD is displayed if the comparison was not significant. "-" = no data available or no post hoc test conducted because of censored data. "LRL" = Laboratory reporting limit. "nt" = not tested because all data were reported below the method detection limit (LRL) or because there were only data for a single time period. "ns" = not significant. "baseline" = first year of data included in analysis. "<LRL" = greater than 50% LRL data for both stations so the time period was omitted from the analysis. "ww" = wet weight. "ANOVA" = two-way analysis of variance. "MLE" = censored regression using maximum likelihood estimation. "ANCOVA" = two-way analysis of covariance. MOD = magnitude of difference. Data were analysed in units of mg/kg dry weight except mercury which was analysed in units of mg/kg wet weight. Merged cells across years indicate that the Area × Time term was not significant, therefore MOD is for all years combined. Only years with samples from both reference and exposed were included in the analysis.

[a] Years that share a letter (e.g., A,B,C) had ratios of concentrations (Exposed:Reference) that do not differ significantly among years. Letters are assigned such that A is assigned to the year with the highest ratio of concentrations (Exposed:Reference

[b] Magnitude of difference (MOD) calculated on backtransformed least-squares means for the observed time period as $(Exp_{observed} - Exp_{predicted})/(Exp_{predicted})\times 100\%$ where $Exp_{predicted} = Ref_{observed} + (Exp_{baseline} - Ref_{baseline})$.

[c] Magnitude of difference (MOD) calculated on backtransformed least-squares means as (Exp-Ref)/Ref x 100%

[d] Conducted as a two-way ANCOVA with log10(fork length) as a covariate. Because the covariate was significant, all contrasts were conducted using mean log10(fork length

[e] Results of statistical contrasts for age, fork length, and body weight may differ among tissue types for a given species due to different sample sizes or sampling years among tissue types. Only the results associated with muscle were used in data interpretation.

Area x Year or Area P-value < 0.05.

Contrast is significant (α = 0.05) and magnitude of difference is positive.

Contrast is significant (α = 0.05) and magnitude of difference is negative.

Notes: **Bold font** = Data for either exposed or reference in the indicated year were entirely <LRL, leading to a less accurate estimate of the mean for the <LRL result and greater uncertainty for the calculated MOD. No MOD is displayed if the comparison was not significant. "-" = no data available or no *post hoc* test conducted because of censored data. "LRL" = Laboratory reporting limit. "nt" = not tested because all data were reported below the method detection limit (LRL) or because there were only data for a single time period. "ns" = not significant. "baseline" = first year of data included in analysis. "<LRL" = greater than 50% LRL data for both stations so the time period was omitted from the analysis. "ww" = wet weight. "ANOVA" = two way analysis of variance. "MLE" = censored regression using maximum likelihood estimation. "ANCOVA" = two-way analysis of covariance. MOD = magnitude of difference. Data were analysed in units of mg/kg dry weight except mercury which was analysed in units of mg/kg wet weight. Merged cells across years indicate that the Area × Time term was not significant, therefore MOD is for all years combined. Only years with samples from both reference and exposed were included in the analysis.

[a] Years that share a letter (e.g., A,B,C) had ratios of concentrations (Exposed:Reference) that do not differ significantly among years. Letters are assigned such that A is assigned to the year with the highest ratio of concentrations (Exposed:Reference).

[b] Magnitude of difference (MOD) calculated on backtransformed least-squares means for the observed time period as $(Exp_{observed} - Exp_{predicted})/(Exp_{predicted}) \times 100\%$ where $Exp_{predicted} = Ref_{observed} + (Exp_{baseline} - Ref_{baseline})$.

[c] Magnitude of difference (MOD) calculated on backtransformed least-squares means as (Exp-Ref)/Ref x 100%.

[d] Conducted as a two-way ANCOVA with log10(fork length) as a covariate. Because the covariate was significant, all contrasts were conducted using mean log10(fork length).

[e] Results of statistical contrasts for age, fork length, and body weight may differ among tissue types for a given species due to different sample sizes or sampling years among tissue types. Only the results associated with muscle were used in data interpretation.

Table E.6.15: **Statistical Comparisons of Exposed - Reference Relative Differences of Lake Trout Liver Tissue Metal Concentrations for the Quesnel Lake near Cedar Point (QUL-NCP; Exposed) and East Arm (QUL-EAA; Reference) Monitoring Areas, 2015 to 2024**

Area x Year or Area P-value < 0.05.
Contrast is significant (α = 0.05) and magnitude of difference is positive.
Contrast is significant (α = 0.05) and magnitude of difference is negative.

Notes: **Bold font** = Data for either exposed or reference in the indicated year were entirely <LRL, leading to a less accurate estimate of the mean for the <LRL result and greater uncertainty for the calculated MOD. No MOD is displayed if the comparison was not significant. "-" = no data available or no *post hoc* test conducted because of censored data. "LRL" = Laboratory reporting limit. "nt" = not tested because all data were reported below the method detection limit (LRL) or because there were only data for a single time period. "ns" = not significant. "baseline" = first year of data included in analysis. "<LRL" = greater than 50% LRL data for both stations so the time period was omitted from the analysis. "ww" = wet weight. "ANOVA" = two way analysis of variance. "MLE" = censored regression using maximum likelihood estimation. "ANCOVA" = two-way analysis of covariance. MOD = magnitude of difference. Data were analysed in units of mg/kg dry weight except mercury which was analysed in units of mg/kg wet weight. Merged cells across years indicate that the Area × Time term was not significant, therefore MOD is for all years combined. Only years with samples from both reference and exposed were included in the analysis.

[a] Years that share a letter (e.g., A,B,C) had ratios of concentrations (Exposed:Reference) that do not differ significantly among years. Letters are assigned such that A is assigned to the year with the highest ratio of concentrations (Exposed:Reference).
[b] Magnitude of difference (MOD) calculated on backtransformed least-squares means for the observed time period as $(Exp_{observed} - Exp_{predicted})/(Exp_{predicted})\times 100\%$ where $Exp_{predicted} = Ref_{observed} + (Exp_{baseline} - Ref_{baseline})$.
[c] Magnitude of difference (MOD) calculated on backtransformed least-squares means as (Exp-Ref)/Ref x 100%.
[d] Conducted as a two-way ANCOVA with log10(fork length) as a covariate. Because the covariate was significant, all contrasts were conducted using mean log10(fork length).
[e] Results of statistical contrasts for age, fork length, and body weight may differ among tissue types for a given species due to different sample sizes or sampling years among tissue types. Only the results associated with muscle were used in data interpretation.

Year P-value < 0.05.

Contrast is significant (α = 0.05) and magnitude of difference is positive.

Contrast is significant (α = 0.05) and magnitude of difference is negative.

Notes: "-" = no data available. "LRL" = Laboratory reporting limit. "nt" = not tested because all data were reported below the method detection limit (LRL) or because there were only data for a single time period. "ns" = not significant. "baseline" = first year of data included in analysis. "<LRL" = greater than 50% of the concentrations were reported as < LRL so the time period was omitted from the analysis. "ANOVA" = one way analysis of variance. ANCOVA = one-way censored analysis of covariance. "MOD" = Magnitude of Difference. 'MLE" = censored regression using maximum likelihood estimation. Data were analysed in units of mg/kg dry weight (dw) except mercury which was analysed in units of mg/kg wet weight (ww).

[a] Years that share a letter (e.g., A,B,C) had concentrations that do not differ significantly among years. Letters are assigned such that A is assigned to the year with the highest concentrations. <LRL = greater than 50% of concentrations were reported as <LRL so the time period was omitted from the analysis.

[b] Magnitude of difference (MOD) calculated on backtransformed least-squares means as (year $_i$-year$_{baseline}$)/year$_{baseline}$ x 100%.

[c] Assessed as a one-way ANCOVA with log10(fork length) as a covariate. Post-hoc comparisons made at mean log10(fork length).

Note: See Table 2.4 for a list of analytes of interest.

APPENDIX F
STATISTICAL ANALYSES - CREEK HABITAT

APPENDIX F.1
SEDIMENT QUALITY

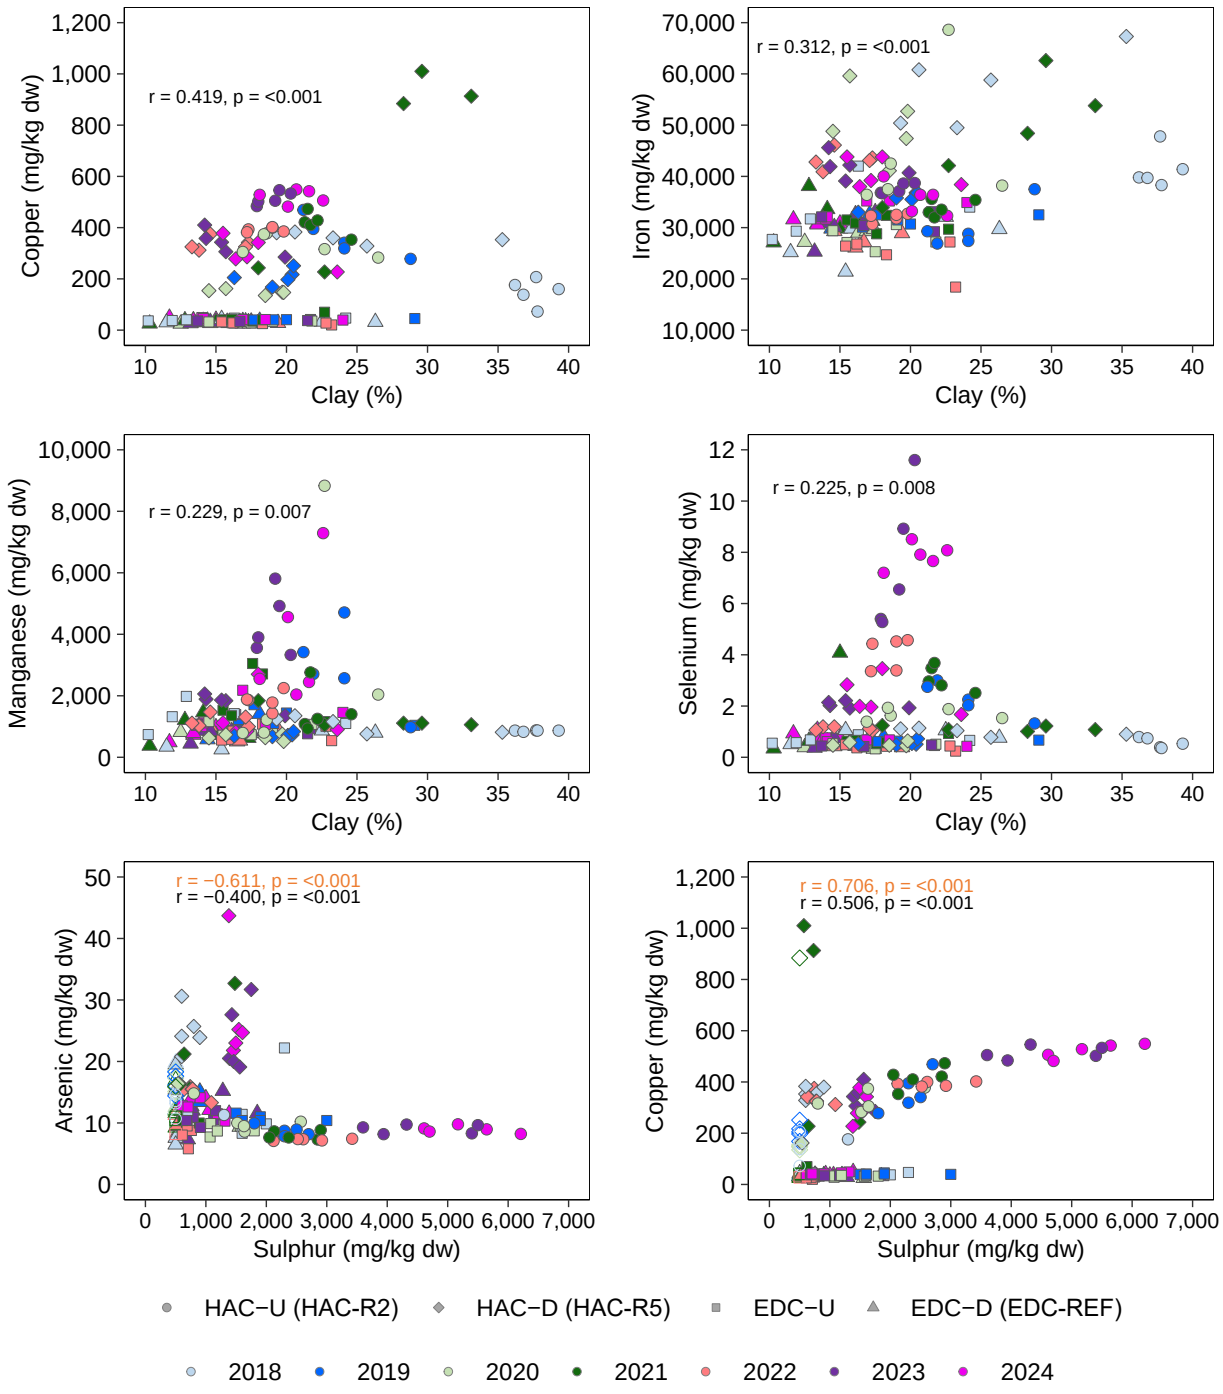

Figure F.1.1: Scatterplots of Significant Spearman's Correlation Relationships (p < 0.0125, Bonferroni Corrected) Between Between Analyte of Interest Concentrations (<63 µm Fraction) and Sediment Physical and Chemical Parameters for the Upper (HAC-U [HAC-R2]; Exposed) and Lower (HAC-D [HAC-R5]; Exposed) Hazeltine Creek and Upper (EDC-U; Reference) and Lower (EDC-D [EDC-REF]; Reference) Edney Creek Monitoring Areas, 2018 to 2024

Notes: mg/kg dw = milligrams per kilogram dry weight. HAC-R2, HAC-R5, and EDC-REF are the alternate names used for the HAC-U, HAC-D, and EDC-D sampling areas, respectively, for HRWG reporting. Results of correlations that evaluated data from exposed (HAC−U and HAC−D) and reference (EDC−U and EDC−D) creek sampling areas are shown in black font on each plot. Results of correlations that only evaluated data from the exposed Hazeltine Creek areas (HAC−U and HAC−D) are shown in orange font. An absence of either the orange or black font on a plot indicates the displayed variables were not significantly correlated for the associated data grouping (black font = HAC−U, HAC−D, EDC−U, and EDC−D; orange font = HAC−U and HAC−D only). Open data points indicate at least one of the two variables plotted were <LRL.

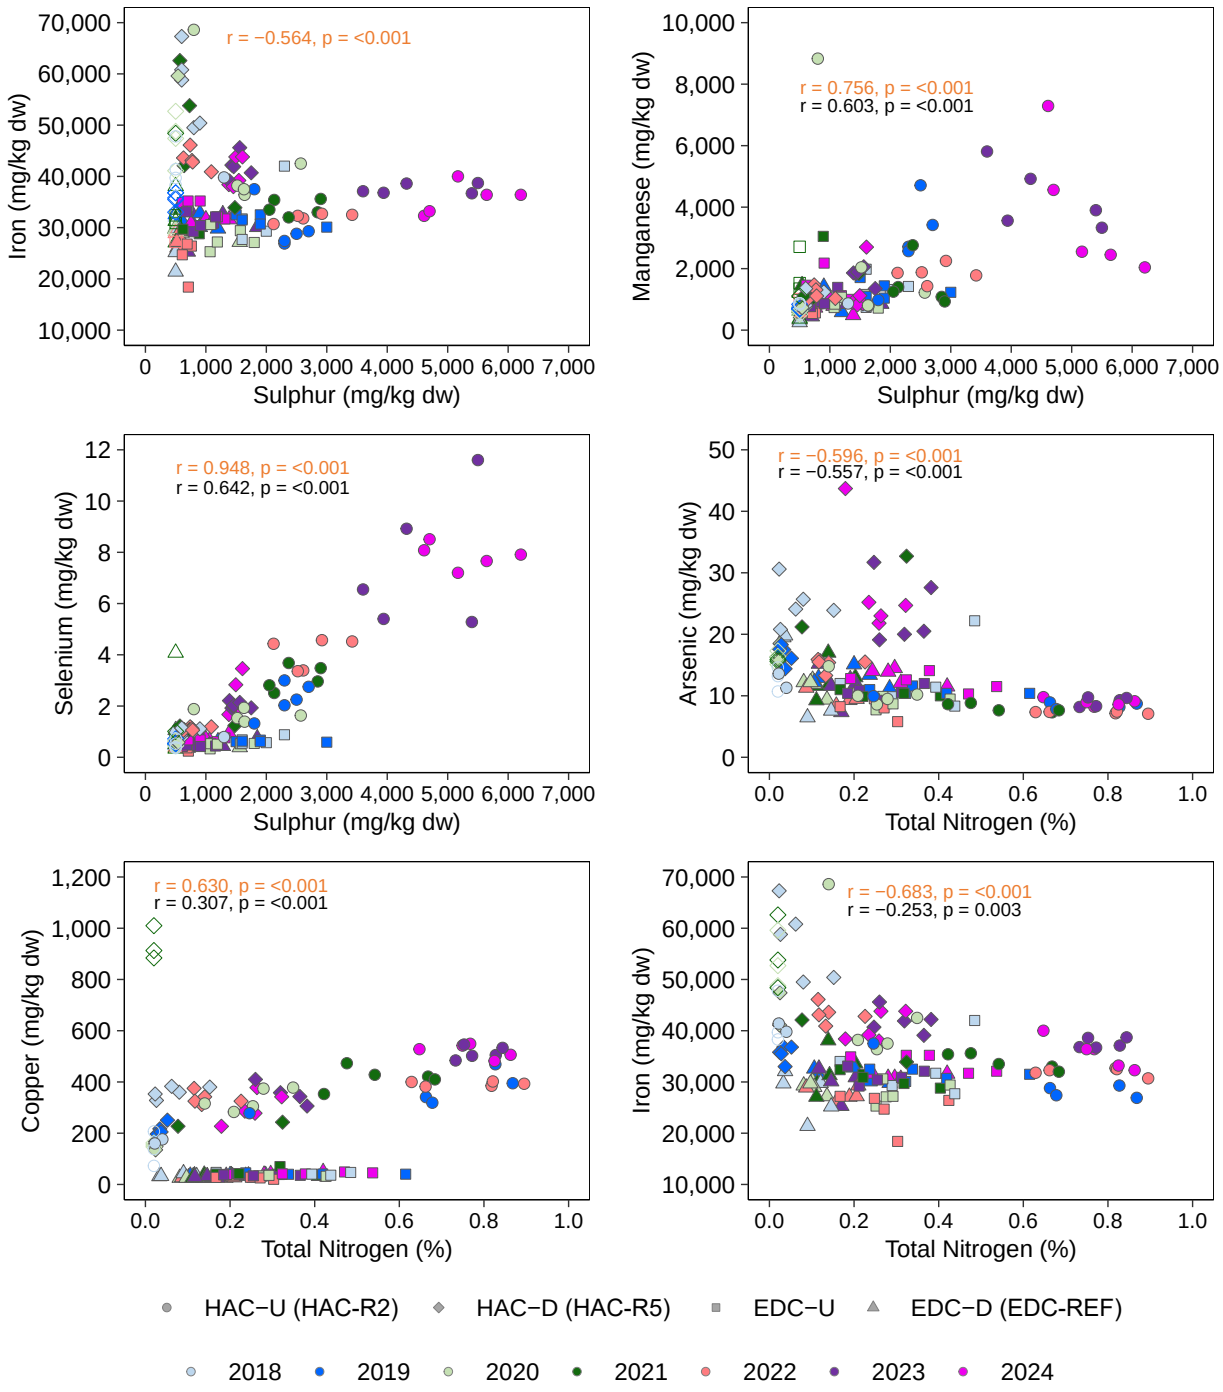

Figure F.1.1: Scatterplots of Significant Spearman's Correlation Relationships (p < 0.0125, Bonferroni Corrected) Between Between Analyte of Interest Concentrations (<63 µm Fraction) and Sediment Physical and Chemical Parameters for the Upper (HAC-U [HAC-R2]; Exposed) and Lower (HAC-D [HAC-R5]; Exposed) Hazeltine Creek and Upper (EDC-U; Reference) and Lower (EDC-D [EDC-REF]; Reference) Edney Creek Monitoring Areas, 2018 to 2024

Notes: mg/kg dw = milligrams per kilogram dry weight. HAC-R2, HAC-R5, and EDC-REF are the alternate names used for the HAC-U, HAC-D, and EDC-D sampling areas, respectively, for HRWG reporting. Results of correlations that evaluated data from exposed (HAC−U and HAC−D) and reference (EDC−U and EDC−D) creek sampling areas are shown in black font on each plot. 	Sig. (2-tailed)	0.008	<0.001	<0.001	0.074	0.232	<0.001	<0.001	<0.001

Significant correlation; p-value < 0. 0125 (p<0.05, Bonferroni corrected for 4 independent variables).

Notes: "mg/kg" = milligrams per kilogram; "dw" = dry weight; "ns" = correlation was non-significant for both datasets. Analyte of Interest was defined as an analyte at the exposed areas with a mean concentration that exceeded guidelines as well as reference 95th percentile values. HAC-R2, HAC-R5, and EDC-REF are the alternate names for the HAC-U, HAC-D, and EDC-D sampling areas, respectively, for HRWG reporting.

[a] Results below the Laboratory Reporting Limit (LRL) were used at the LRL for calculations.

[b] % clay represents the clay proportion of the < 63 µm (silt and clay) sediment fraction that was used for metals analysis. % clay was calculated as: [% clay] / [% silt and clay].

[c] n = 140 for comparisons.

[d] n = 70 for comparisons.

Table F.1.4: Statistical Comparisons of Spatial and Temporal Differences of Sediment Analyte of Interest Concentrations (<63 µm Fraction) for the Lower Hazeltine Creek (HAC-D [HAC-R5]; Exposed) and Lower Edney Creek (EDC-D [EDC-REF]; Reference) Monitoring Areas, 2018 to 2024

APPENDIX F.2
PERIPHYTON COMMUNITY AND PRODUCTIVITY

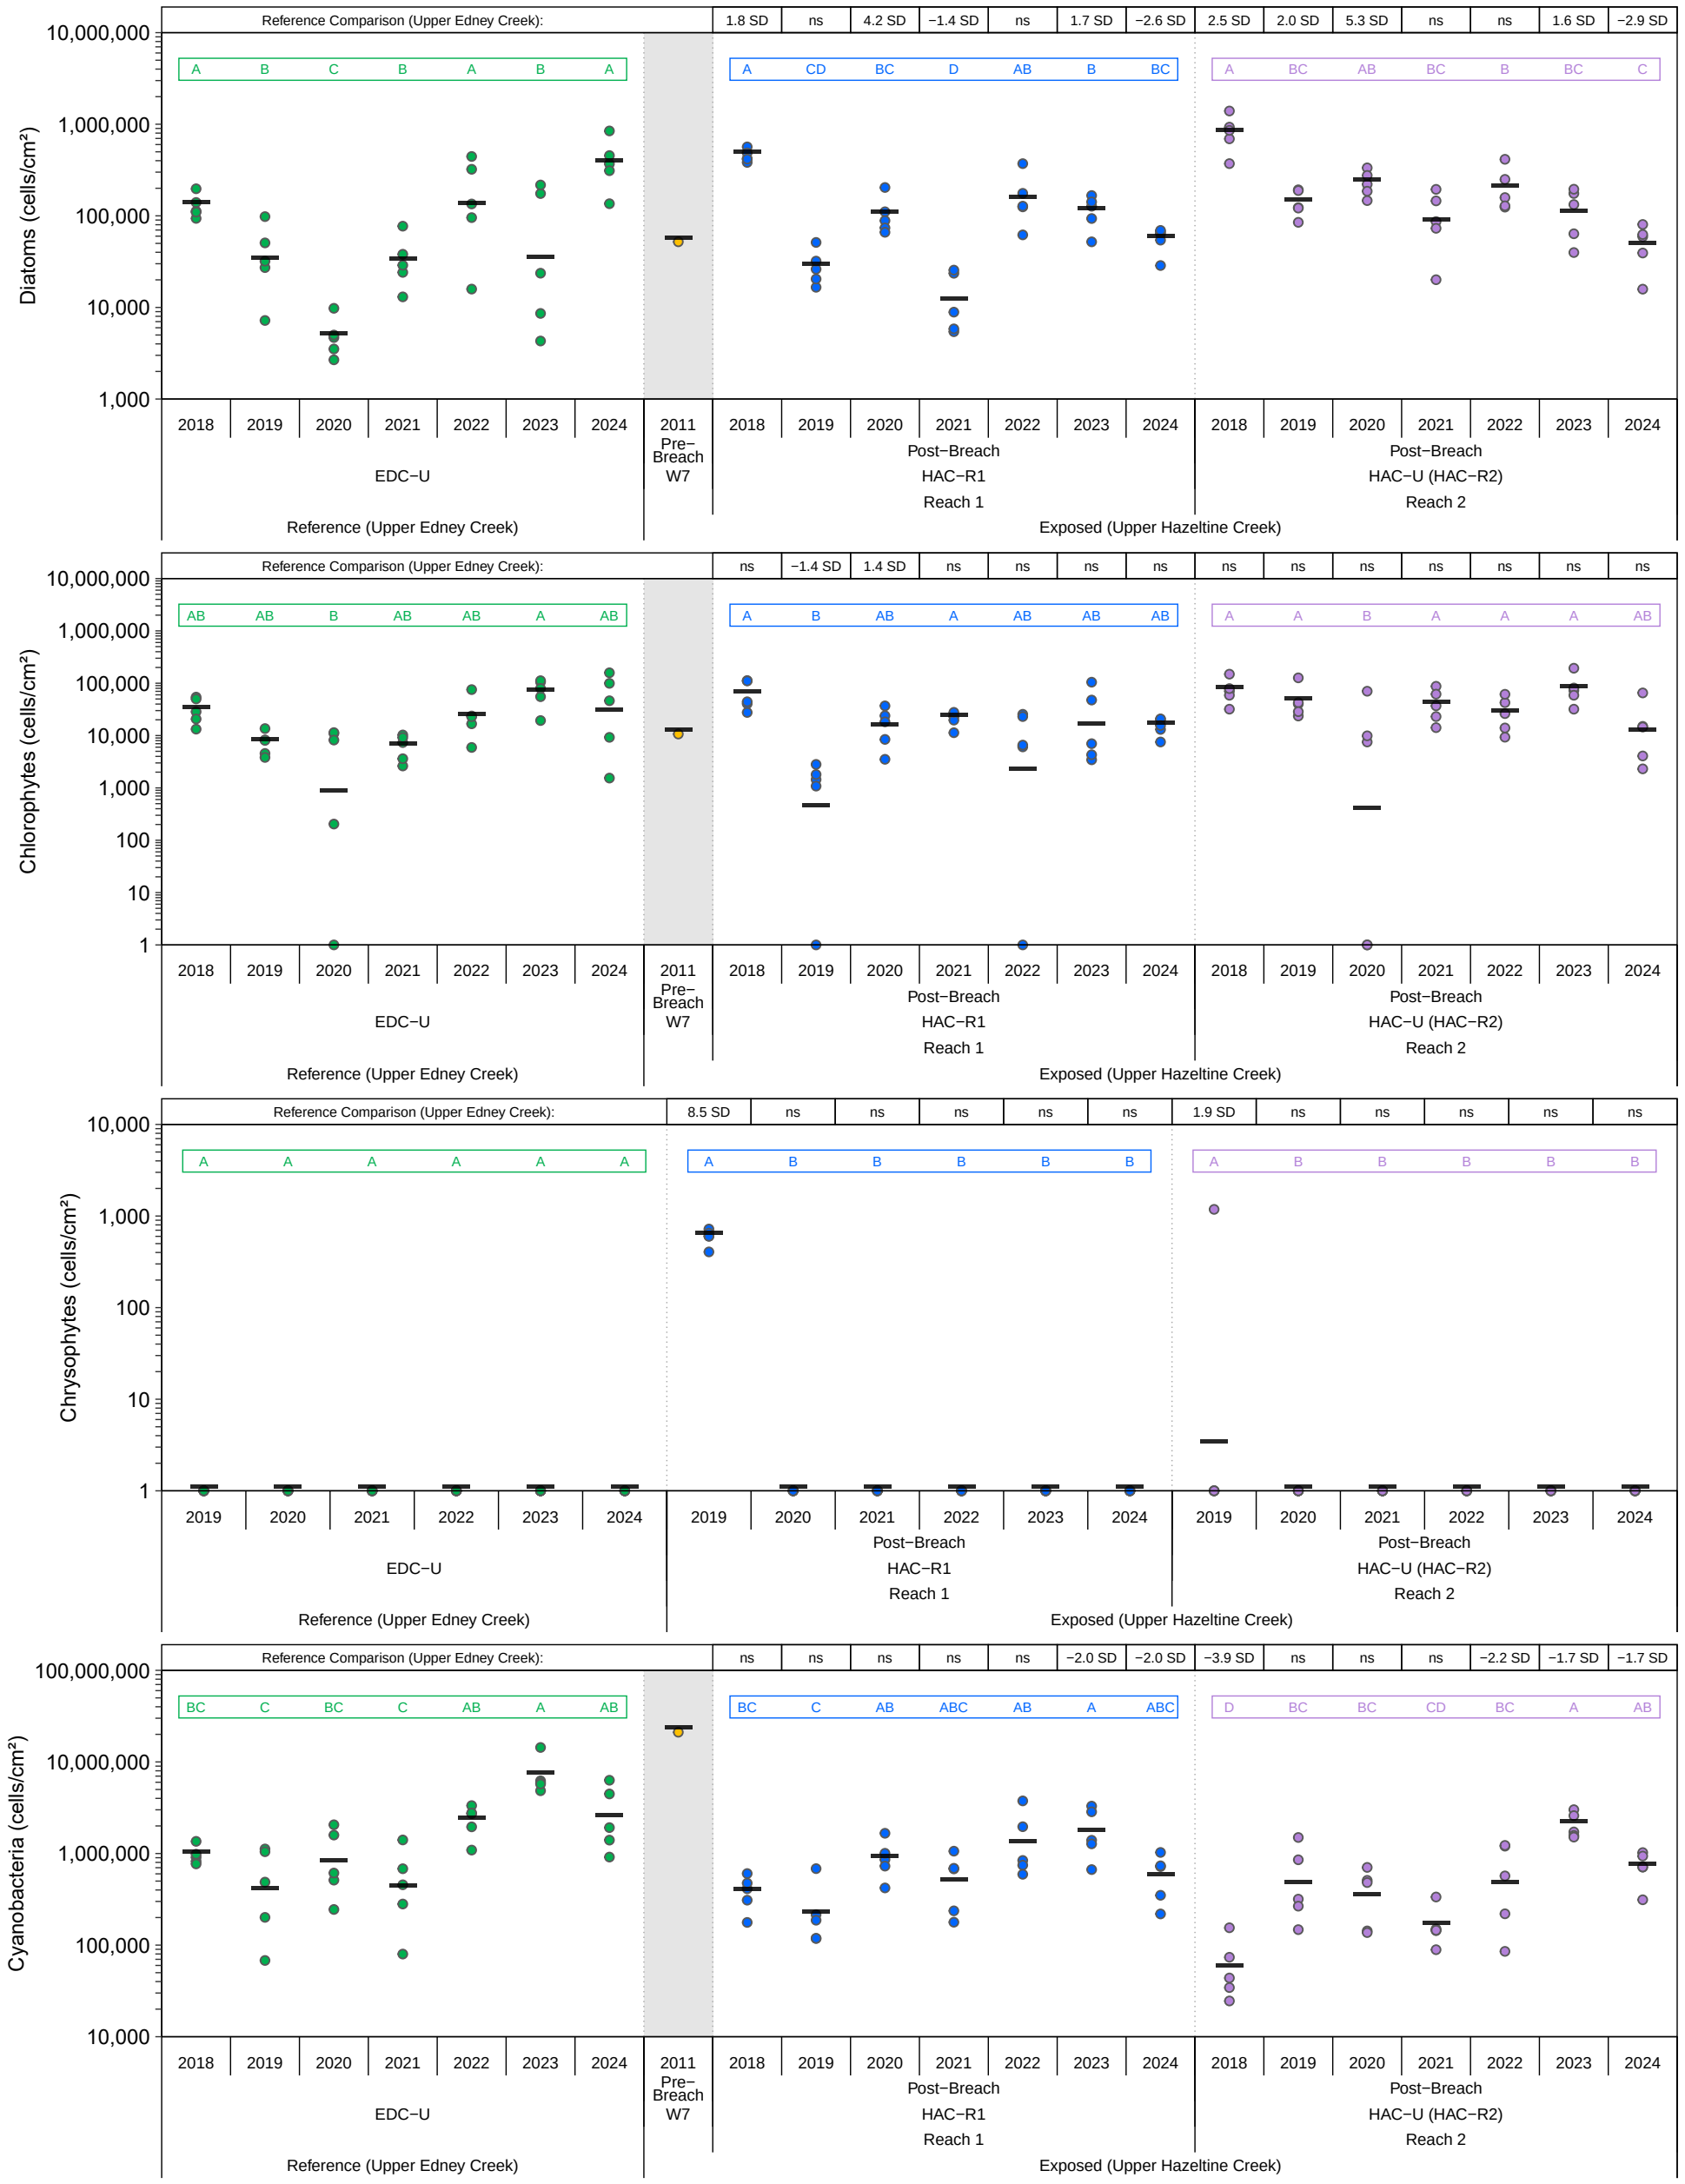

Figure F.2.1: Periphyton Community Metrics for the Upper Hazeltine Creek (HAC−R1, HAC−U [HAC−R2]; Exposed) and Upper Edney Creek (EDC−U; Reference) Monitoring Areas, 1995 to 2024

Notes: The sampling area W7 is the baseline and pre−breach equivalent of the post−breach sampling areas HAC−R1 and HAC−U (2018 to 2024). HAC−R2 is the alternate name used for the HAC−U sampling area for Habitat Remediation Working Group (HRWG) reporting. Black bars represent measures of central tendency (mean, geometric mean, or median depending on if analysis was conducted on untransformed, log10−transformed or rank−transformed data). Coloured letters represent significant (p−value <0.1) *post hoc* comparisons within areas over time; years that share a letter of the same colour (e.g., A, B) within a box of the same colour do not differ significantly within an area. A number above the plot indicates significant exposed vs. reference *post hoc* comparisons within a given year. The magnitude of difference (MOD) for these significant *post hoc* comparisons are expressed in units of standard deviation (SD) or median absolute deviations (MAD; if the data were rank−transformed prior to analysis) relative to reference. A 'ns' indicates a non −significant contrast, and a 'nm' indicates that the MOD could not be calculated because MAD = 0. Grey shading indicates semi−quantitative data that were not included in statistical comparisons but are shown for visual comparison only. Periphyton data were classified as 'Other' taxa in laboratory results issued in 2018 but the taxonomic groups contained in this category were unknown (i.e., unknown taxonomic identification of these organisms), but suspected to include Phaeophytes, Chrysophytes, and Rhodophytes. Temporal statistical contrasts therefore excluded 2018 data for these taxon groups (Phaeophytes, Chrysophytes, and Rhodophytes) which were reported as absent from all samples in 2018 data. See Minnow 2019a for detailed laboratory results for 2018. Data reported in 2018 for this 'Other' category has therefore excluded from data presentation and analyses in the present report. Periphyton taxonomy results have not been reported in an 'Other' category by the laboratory since 2018. See report Section 4.2.3.1 for details. Plots are only displayed for periphyton community endpoints with sufficient data available to complete statistical analyses.

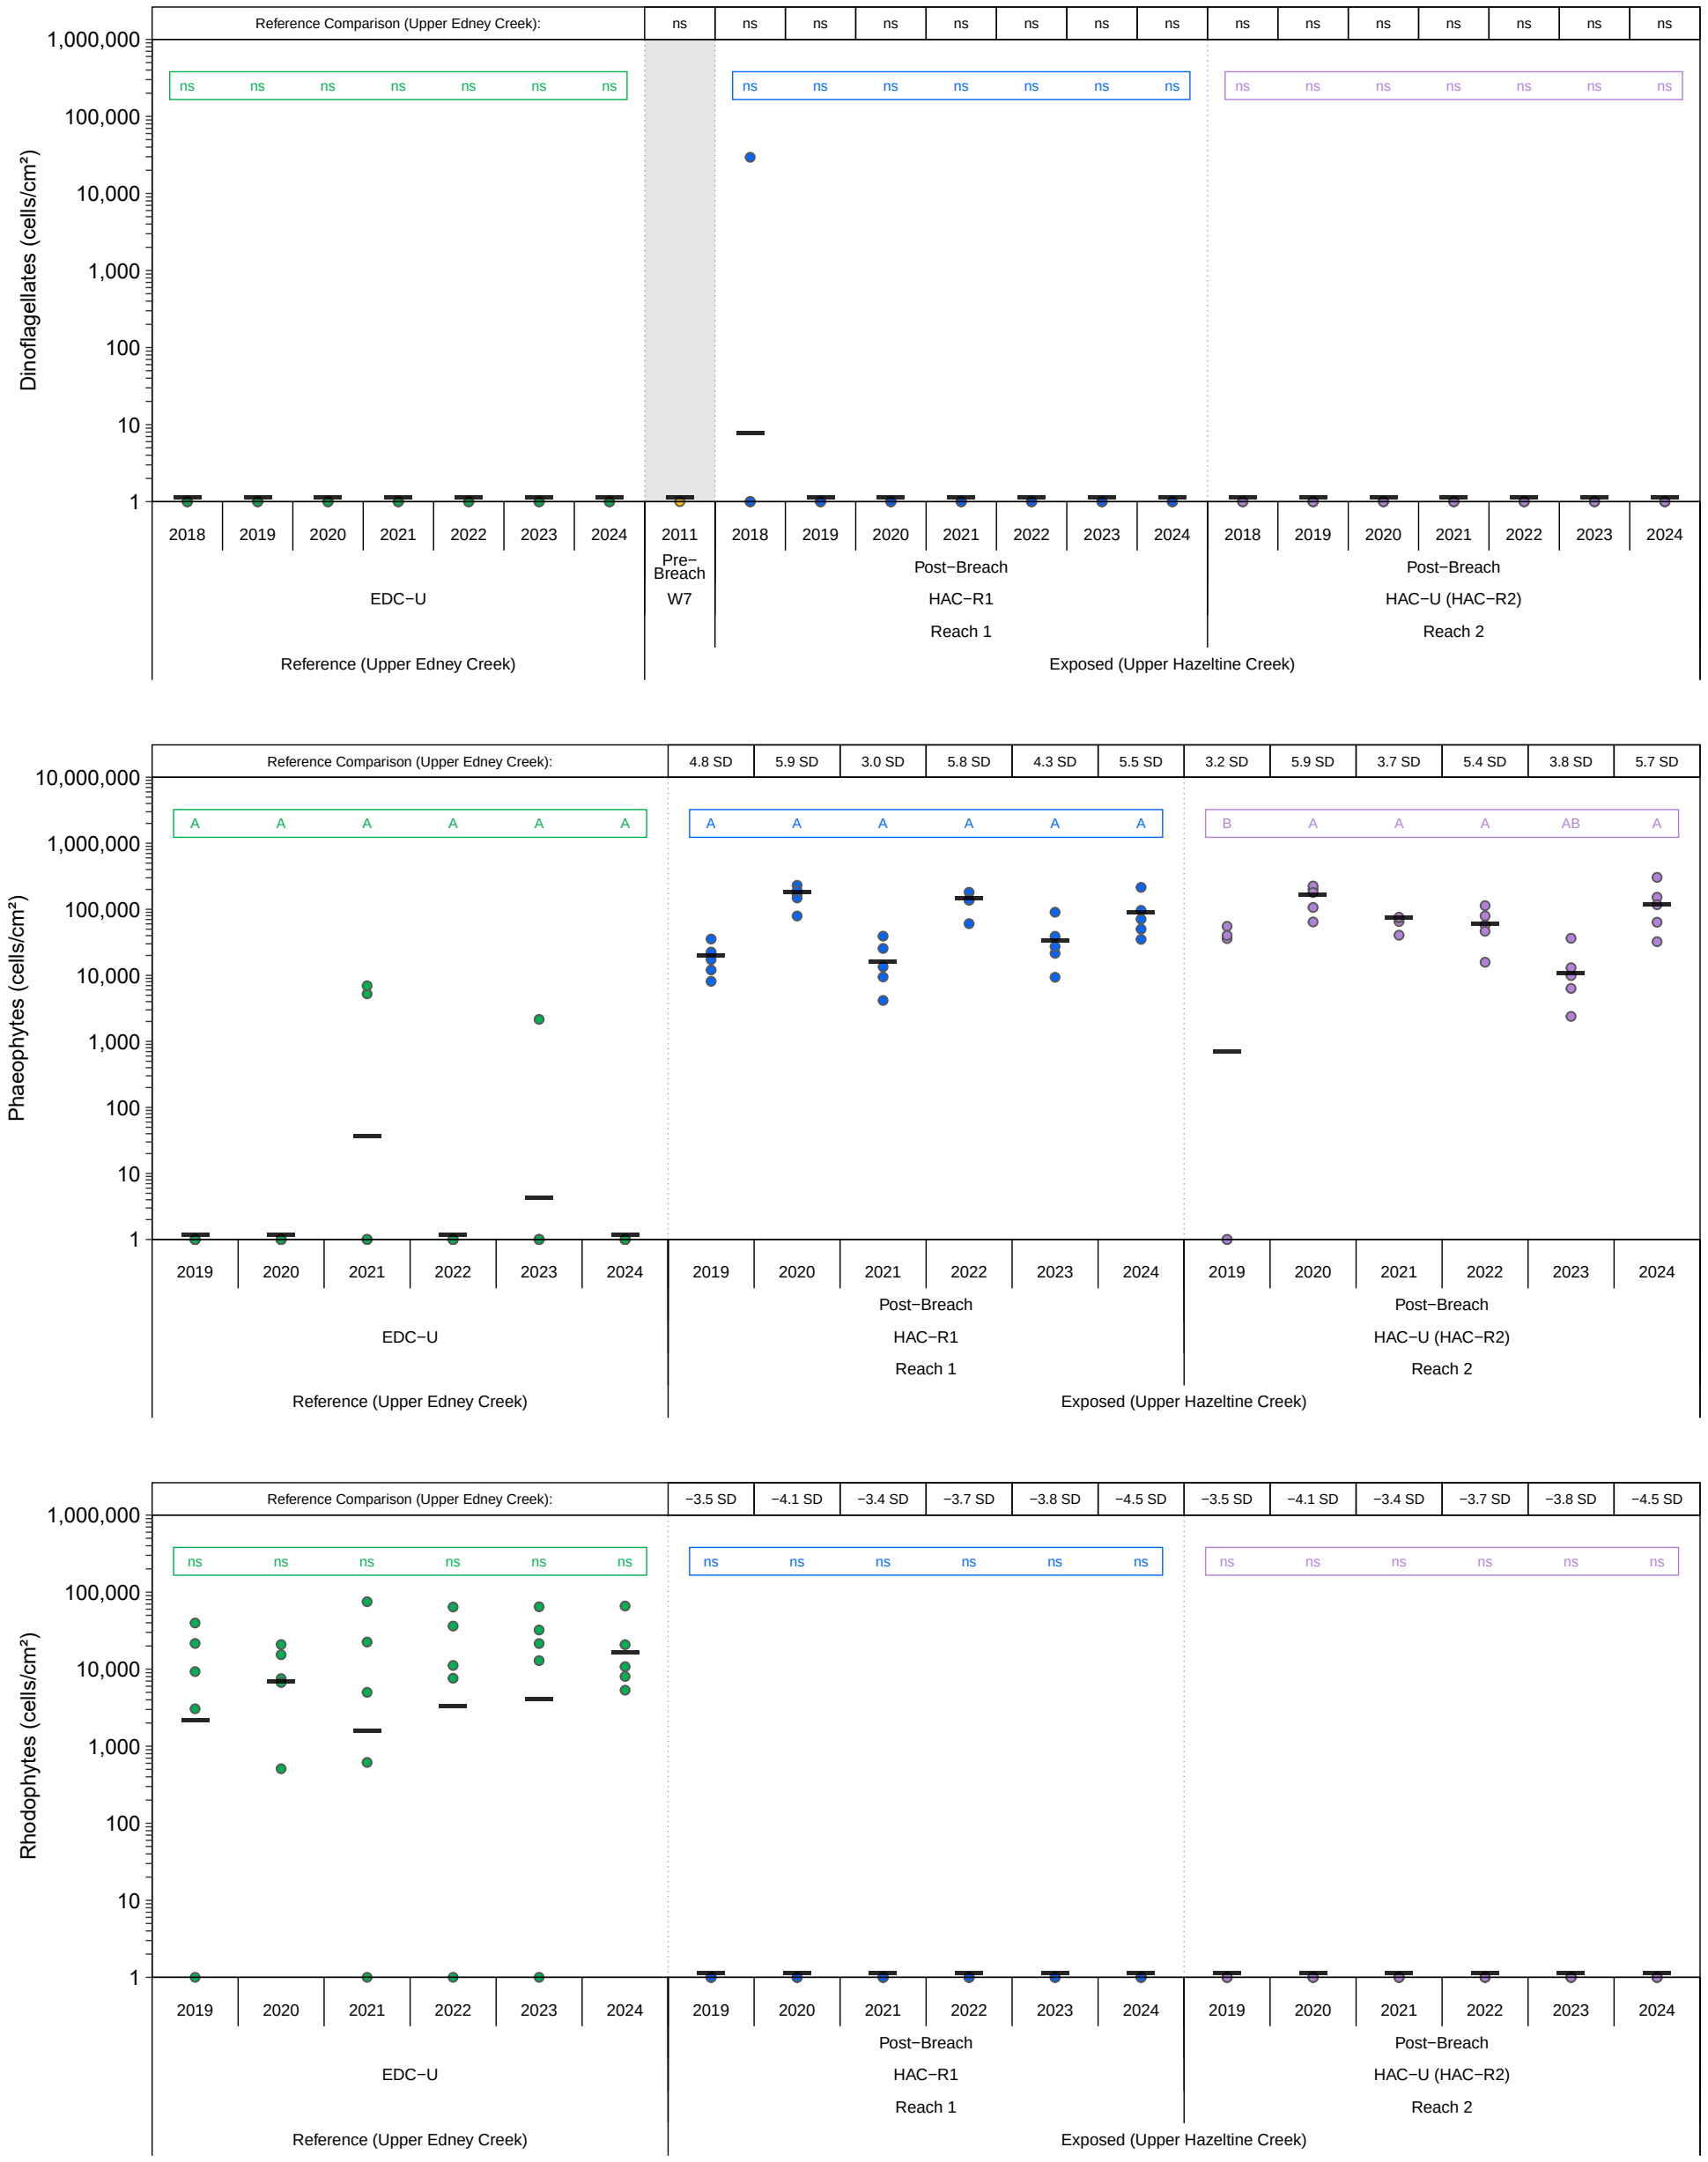

Figure F.2.1: Periphyton Community Metrics for the Upper Hazeltine Creek (HAC−R1, HAC−U [HAC−R2]; Exposed) and Upper Edney Creek (EDC−U; Reference) Monitoring Areas, 1995 to 2024

Notes: The sampling area W7 is the baseline and pre−breach equivalent of the post−breach sampling areas HAC−R1 and HAC−U (2018 to 2024). HAC−R2 is the alternate name used for the HAC−U sampling area for Habitat Remediation Working Group (HRWG) reporting. Black bars represent measures of central tendency (mean, geometric mean, or median depending on if analysis was conducted on untransformed, log10−transformed or rank−transformed data). Coloured letters represent significant (p−value <0.1) *post hoc* comparisons within areas over time; years that share a letter of the same colour (e.g., A, B) within a box of the same colour do not differ significantly within an area. A number above the plot indicates significant exposed vs. reference *post hoc* comparisons within a given year. The magnitude of difference (MOD) for these significant *post hoc* comparisons are expressed in units of standard deviation (SD) or median absolute deviations (MAD; if the data were rank−transformed prior to analysis) relative to reference. A 'ns' indicates a non−significant contrast, and a 'nm' indicates that the MOD could not be calculated because MAD = 0. Grey shading indicates semi−quantitative data that were not included in statistical comparisons but are shown for visual comparison only. Periphyton data were classified as 'Other' taxa in laboratory results issued in 2018 but the taxonomic groups contained in this category were unknown (i.e., unknown taxonomic identification of these organisms), but suspected to include Phaeophytes, Chrysophytes, and Rhodophytes. Temporal statistical contrasts therefore excluded 2018 data for these taxon groups (Phaeophytes, Chrysophytes, and Rhodophytes) which were reported as absent from all samples in 2018 data. See Minnow 2019a for detailed laboratory results for 2018. Data reported in 2018 for this 'Other' category has therefore excluded from data presentation and analyses in the present report. Periphyton taxonomy results have not been reported in an 'Other' category by the laboratory since 2018. See report Section 4.2.3.1 for details. Plots are only displayed for periphyton community endpoints with sufficient data available to complete statistical analyses.

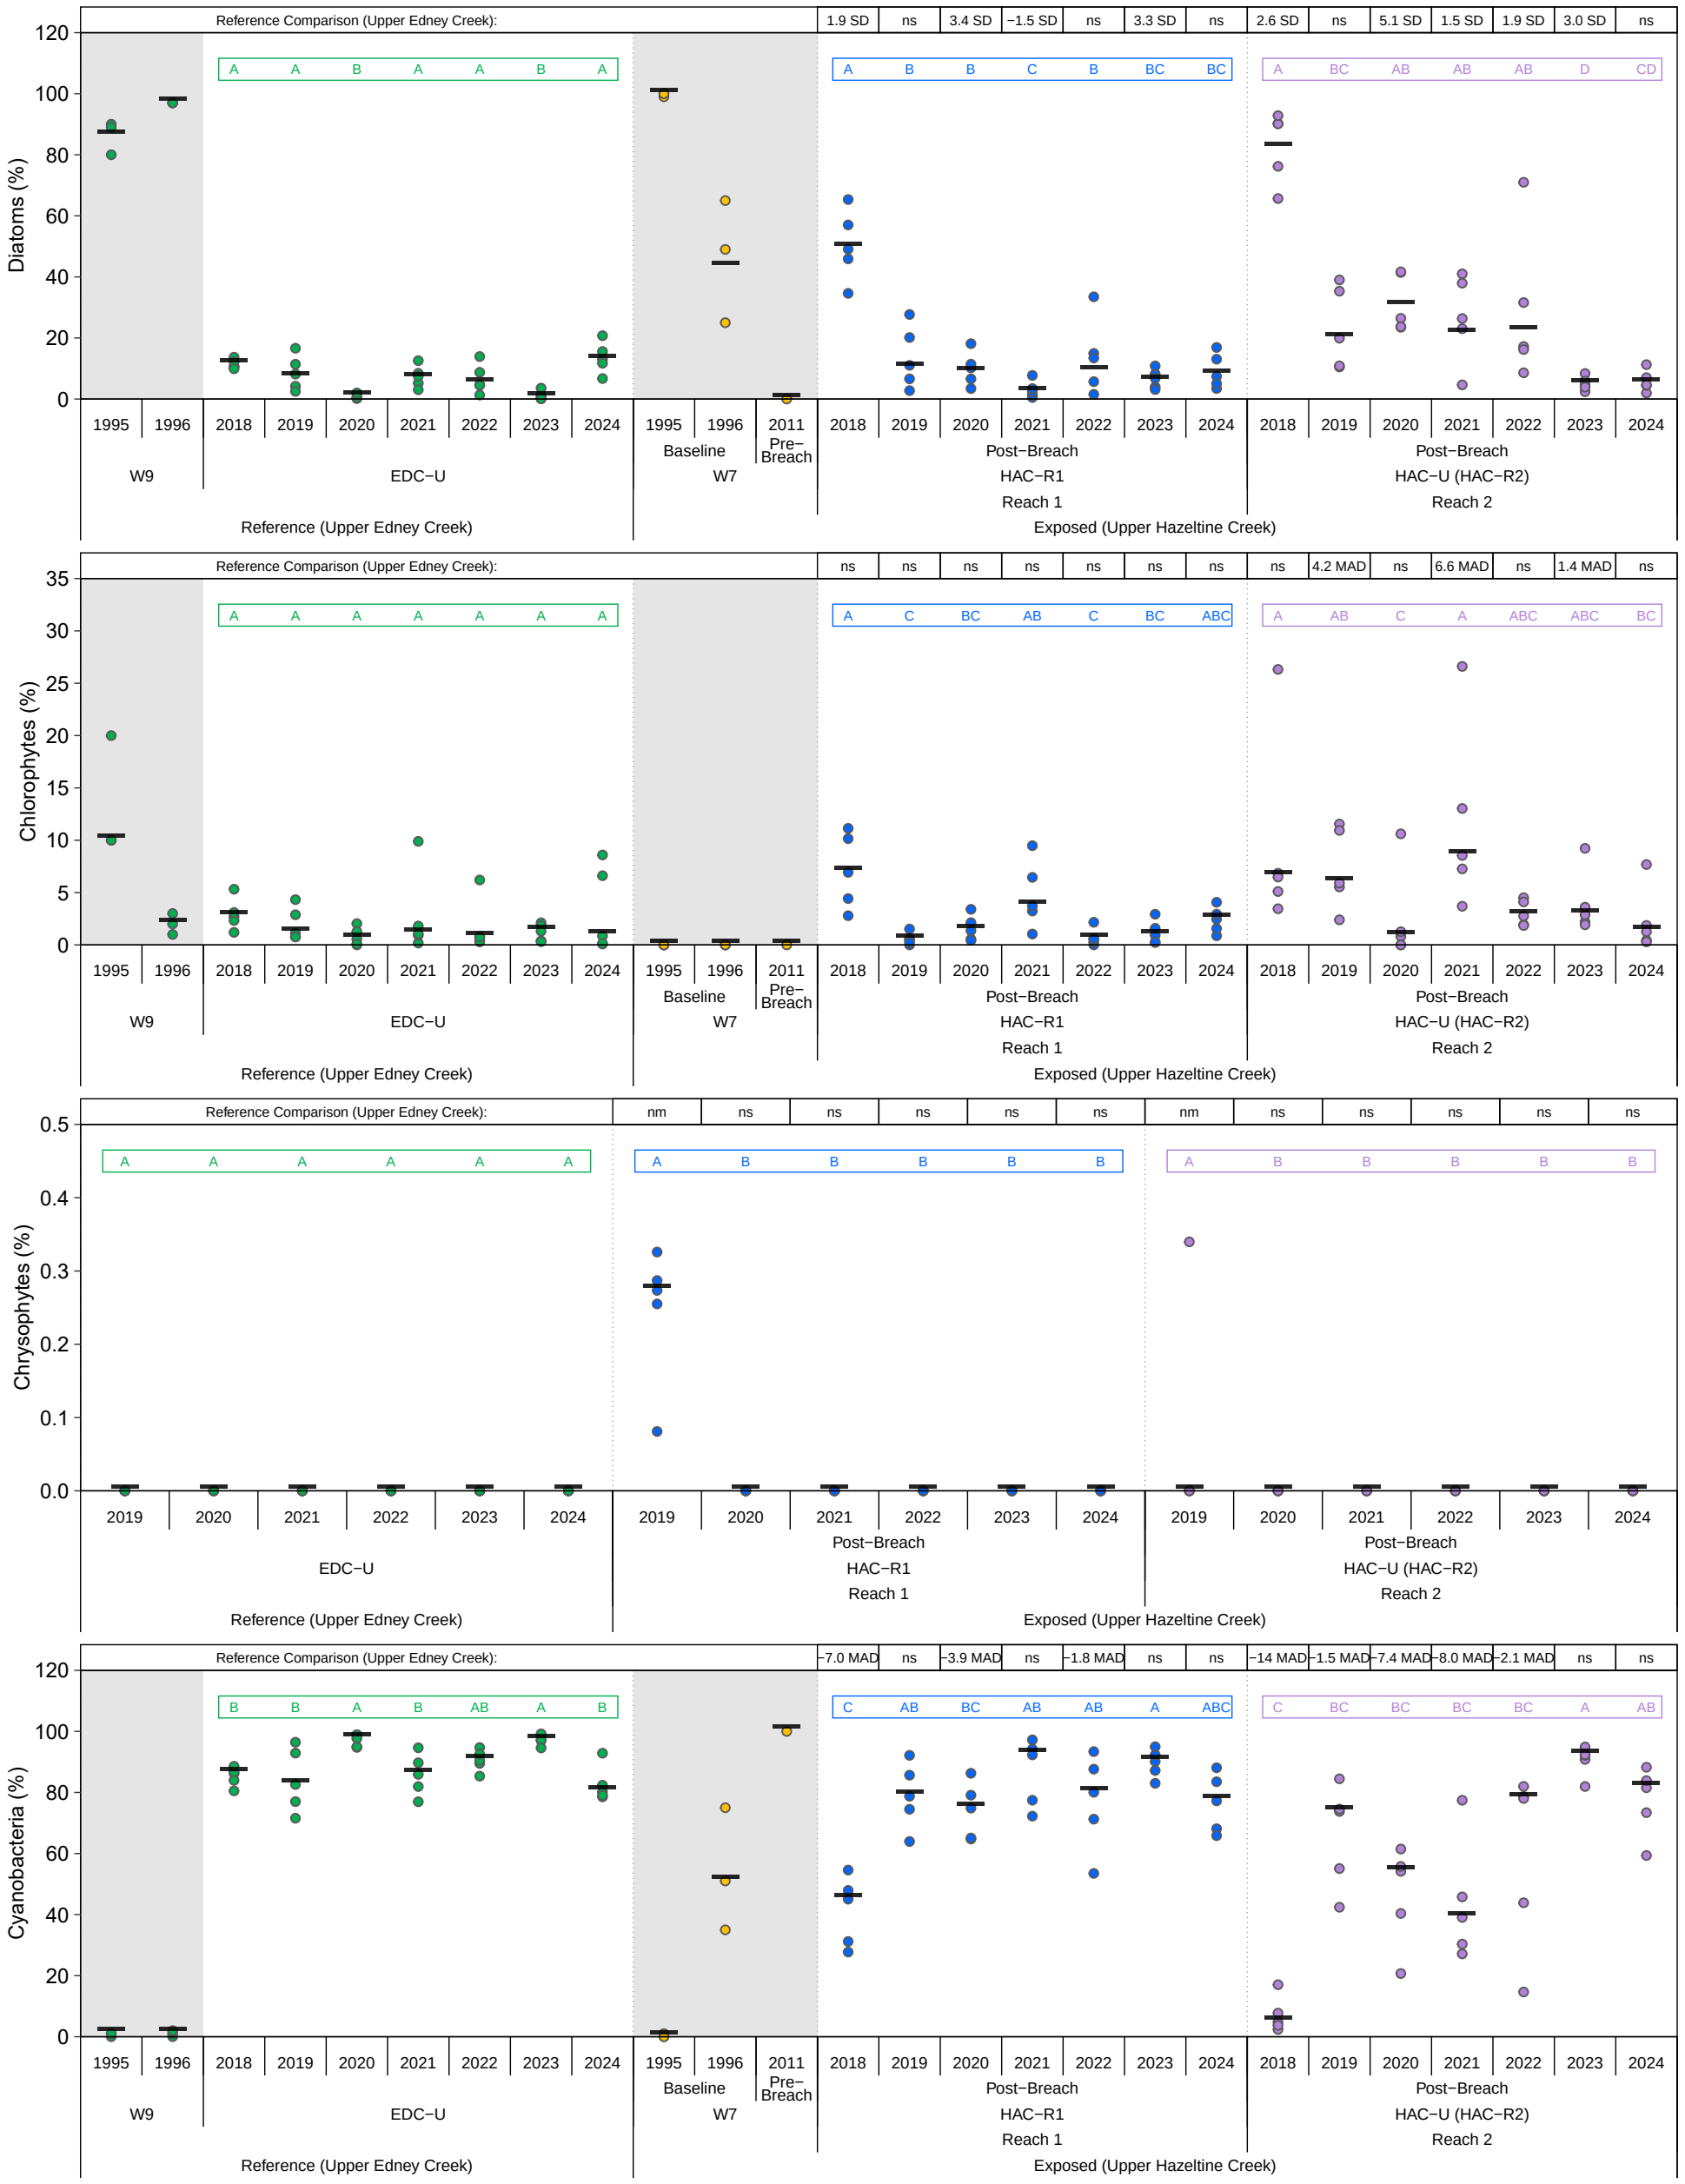

Figure F.2.1: Periphyton Community Metrics for the Upper Hazeltine Creek (HAC−R1, HAC−U [HAC−R2]; Exposed) and Upper Edney Creek (EDC−U; Reference) Monitoring Areas, 1995 to 2024

Notes: The sampling area W7 is the baseline and pre−breach equivalent of the post−breach sampling areas HAC−R1 and HAC−U (2018 to 2024). HAC−R2 is the alternate name used for the HAC−U sampling area for Habitat Remediation Working Group (HRWG) reporting. Black bars represent measures of central tendency (mean, geometric mean, or median depending on if analysis was conducted on untransformed, log10−transformed or rank−transformed data). Coloured letters represent significant (p−value <0.1) *post hoc* comparisons within areas over time; years that share a letter of the same colour (e.g., A, B) within a box of the same colour do not differ significantly within an area. A number above the plot indicates significant exposed vs. reference *post hoc* comparisons within a given year. The magnitude of difference (MOD) for these significant *post hoc* comparisons are expressed in units of standard deviation (SD) or median absolute deviations (MAD; if the data were rank−transformed prior to analysis) relative to reference. A 'ns' indicates a non −significant contrast, and a 'nm' indicates that the MOD could not be calculated because MAD = 0. Grey shading indicates semi−quantitative data that were not included in statistical comparisons but are shown for visual comparison only. Periphyton data were classified as 'Other' taxa in laboratory results issued in 2018 but the taxonomic groups contained in this category were unknown (i.e., unknown taxonomic identification of these organisms), but suspected to include Phaeophytes, Chrysophytes, and Rhodophytes. Temporal statistical contrasts therefore excluded 2018 data for these taxon groups (Phaeophytes, Chrysophytes, and Rhodophytes) which were reported as absent from all samples in 2018 data. See Minnow 2019a for detailed laboratory results for 2018. Data reported in 2018 for this 'Other' category has therefore excluded from data presentation and analyses in the present report. Periphyton taxonomy results have not been reported in an 'Other' category by the laboratory since 2018. See report Section 4.2.3.1 for details. Plots are only displayed for periphyton community endpoints with sufficient data available to complete statistical analyses.

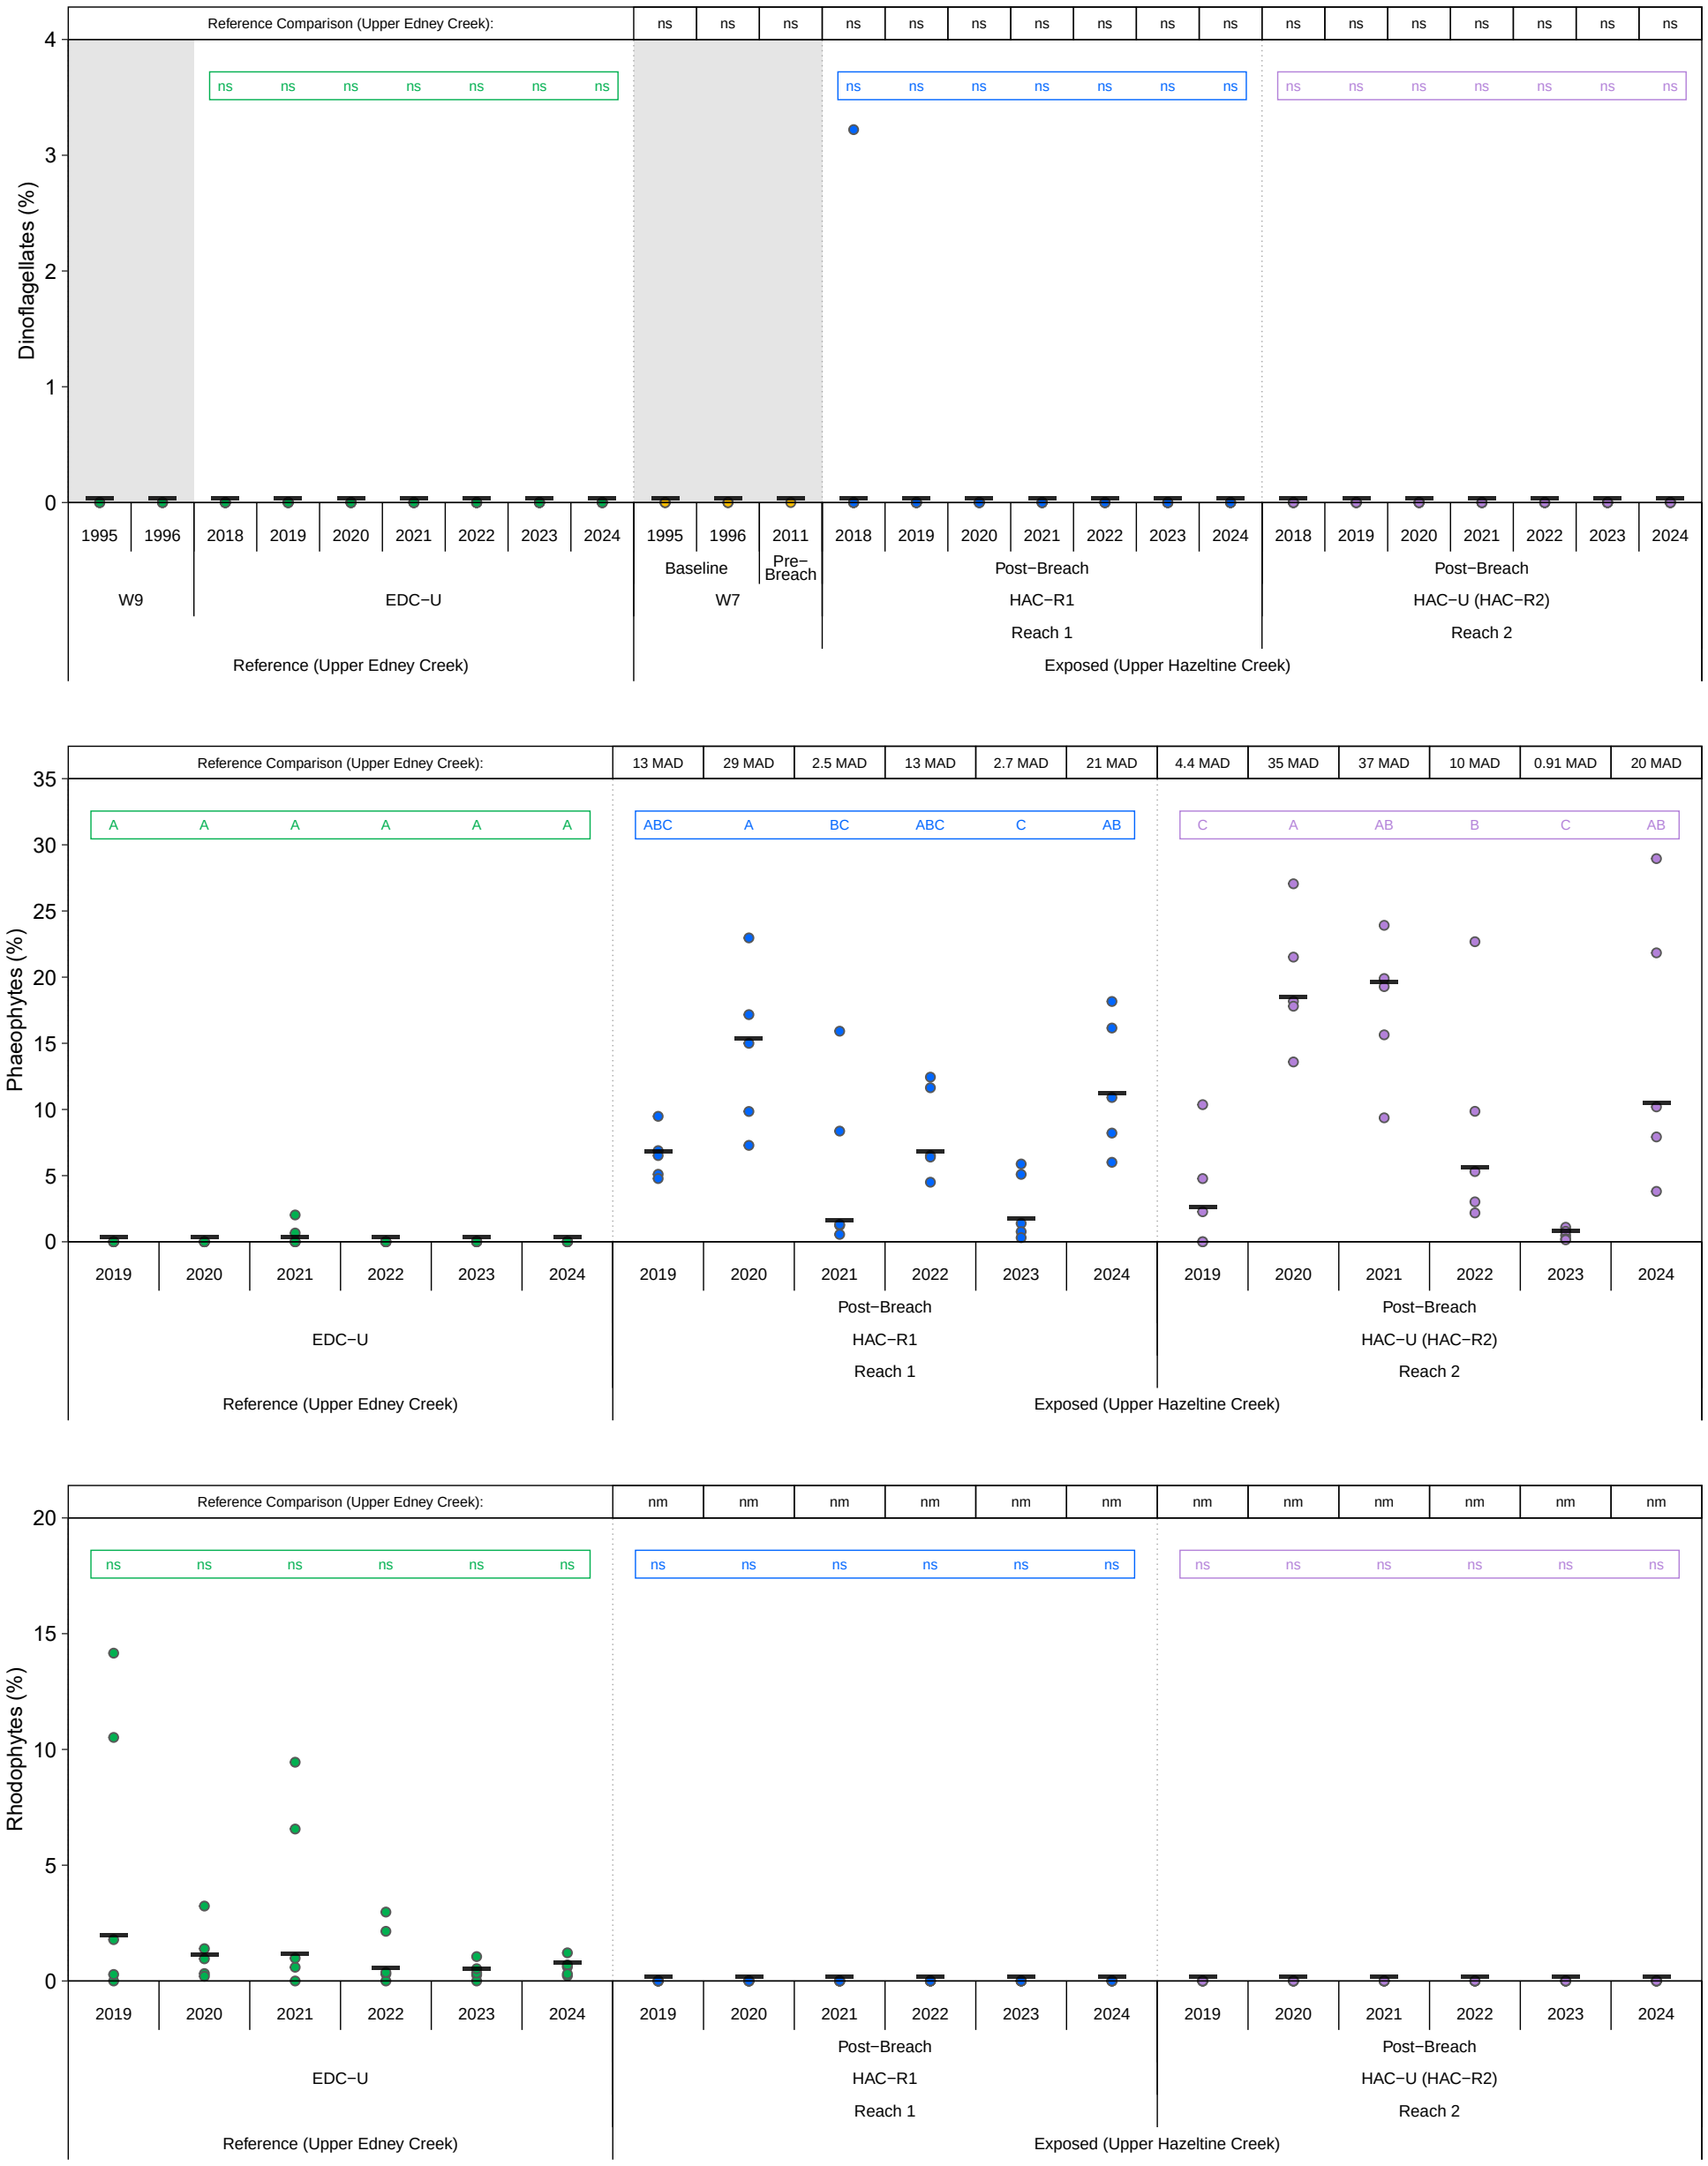

Figure F.2.1: Periphyton Community Metrics for the Upper Hazeltine Creek (HAC−R1, HAC−U [HAC−R2]; Exposed) and Upper Edney Creek (EDC−U; Reference) Monitoring Areas, 1995 to 2024

Notes: The sampling area W7 is the baseline and pre−breach equivalent of the post−breach sampling areas HAC−R1 and HAC−U (2018 to 2024). HAC−R2 is the alternate name used for the HAC−U sampling area for Habitat Remediation Working Group (HRWG) reporting. Black bars represent measures of central tendency (mean, geometric mean, or median depending on if analysis was conducted on untransformed, log10−transformed or rank−transformed data). Coloured letters represent significant (p−value <0.1) *post hoc* comparisons within areas over time; years that share a letter of the same colour (e.g., A, B) within a box of the same colour do not differ significantly within an area. A number above the plot indicates significant exposed vs. reference *post hoc* comparisons within a given year. The magnitude of difference (MOD) for these significant *post hoc* comparisons are expressed in units of standard deviation (SD) or median absolute deviations (MAD; if the data were rank−transformed prior to analysis) relative to reference. A 'ns' indicates a non −significant contrast, and a 'nm' indicates that the MOD could not be calculated because MAD = 0. Grey shading indicates semi−quantitative data that were not included in statistical comparisons but are shown for visual comparison only. Periphyton data were classified as 'Other' taxa in laboratory results issued in 2018 but the taxonomic groups contained in this category were unknown (i.e., unknown taxonomic identification of these organisms), but suspected to include Phaeophytes, Chrysophytes, and Rhodophytes. Temporal statistical contrasts therefore excluded 2018 data for these taxon groups (Phaeophytes, Chrysophytes, and Rhodophytes) which were reported as absent from all samples in 2018 data. See Minnow 2019a for detailed laboratory results for 2018. Data reported in 2018 for this 'Other' category has therefore excluded from data presentation and analyses in the present report. Periphyton taxonomy results have not been reported in an 'Other' category by the laboratory since 2018. See report Section 4.2.3.1 for details. Plots are only displayed for periphyton community endpoints with sufficient data available to complete statistical analyses.

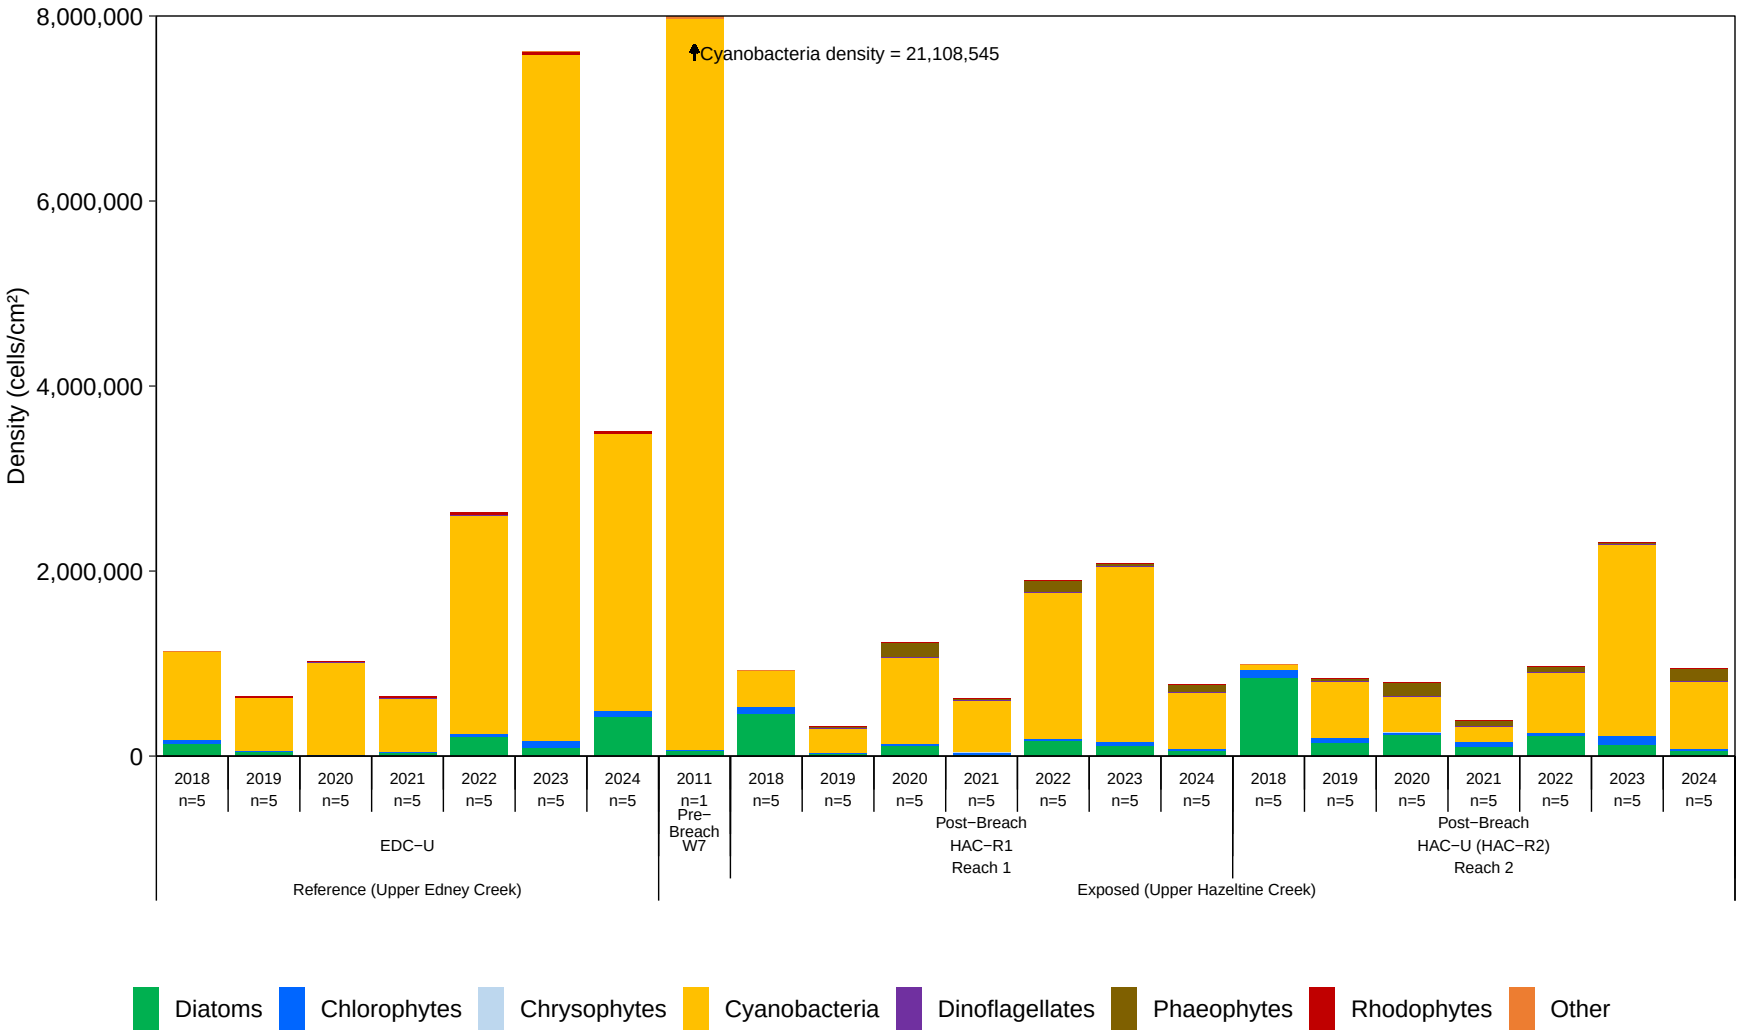

Figure F.2.2: Mean Densities of Major Periphyton Taxa for the Upper Hazeltine Creek (HAC−R1, HAC−U [HAC−R2]; Exposed) and Upper Edney Creek (EDC−U; Reference) Monitoring Areas, 2011 to 2024

Notes: The sampling area W7 is the baseline and pre−breach equivalent of the post−breach sampling areas HAC−R1 and HAC−U (2018 to 2024). HAC−R2 is the alternate name used for the HAC−U sampling area for Habitat Remediation Working Group (HRWG) reporting. In 2018 and earlier, Chrysophytes, Phaeophytes, and Rhodophytes are grouped into the 'Other' category. Periphyton data were classified as 'Other' taxa in laboratory results issued in 2018 but the taxonomic groups contained in this category were unknown (i.e., unknown taxonomic idenification of these organisms), but suspected to include Phaeophytes, Chrysophytes, and Rhodophytes. See Minnow 2019a for detailed laboratory results for 2018. Periphyton taxonomy results have not been reported in an 'Other' category by the laboratory since 2018. See report Section 4.2.3.1 for details.

Table F.2.1: Statistical Comparisons of Periphyton Community Metrics for the Upper Hazeltine Creek (HAC-R1, HAC-U [HAC-R2]; Exposed) and Upper Edney Creek (EDC-U; Reference) Monitoring Areas, 2018 to 2024

P-value < 0.1.
Magnitude of Difference (MOD) < -2.
Magnitude of Difference (MOD) > 2.

Notes: "-" = no data available. "ns" = non significance. "nm" = Contrast MODs could not be calculated because the MAD=0 (MAD = Median Absolute Deviation). HAC-R2 is the alternate name used for the HAC-R2 sampling area for HRWG reporting. Results are only displayed for periphyton community endpoints with sufficient data available to complete statistical analyses. Periphyton data were classified as "Other" taxa in laboratory results issued in 2018 but the taxonomic groups contained in this category were unknown (i.e., unknown taxonomic identification of these organisms), but suspected to include Phaeophytes, Chrysophytes, and Rhodophytes. Temporal statistical contrasts therefore excluded 2018 data for these taxon groups (Phaeophytes, Chrysophytes, and Rhodophytes) which were reported as absent from all samples in 2018 data. See Minnow 2019a for detailed laboratory results for 2018. Data reported in 2018 for this "Other" category has therefore excluded from data presentation and analyses in the present report. Periphyton taxonomy results have not been reported in an "Other" category by the laboratory since 2018. See report Section 4.2.3.1 for details.

[a] MCT = Measure of Central Tendency, which is the mean, geometric mean, or median depending on if analysis was conducted on untransformed, log10-transformed, or rank-transformed data.

[b] Magnitude of difference (MOD) calculated for two-way Analysis of Variance (ANOVA) as (Exposed Mean - Reference Mean)/SD (or [Mean - Baseline Mean]/SD for temporal comparisons) on the transformed scale, where SD was the pooled standard deviation of the model residuals. MOD calculated for Kruskal-Wallis (i.e., rank-transformed data) as (Exposed Median - Reference Median)/MAD, where MAD was the pooled median absolute deviation.

[c] HAC-R2 is the alternate name used for the HAC-U sampling area for Habitat Remediation Working Group (HRWG) reporting.

Table F.2.1: Statistical Comparisons of Periphyton Community Metrics for the Upper Hazeltine Creek (HAC-R1, HAC-U [HAC-R2]; Exposed) and Upper Edney Creek (EDC-U; Reference) Monitoring Areas, 2018 to 2024

Notes: "-" = no data available. "ns" = non significance. "nm" = Contrast MODs could not be calculated because the MAD=0 (MAD = Median Absolute Deviation). HAC-R2 is the alternate name used for the HAC-R2 sampling area for HRWG reporting. Results are only displayed for periphyton community endpoints with sufficient data available to complete statistical analyses. Periphyton data were classified as "Other" taxa in laboratory results issued in 2018 but the taxonomic groups contained in this category were unknown (i.e., unknown taxonomic identification of these organisms), but suspected to include Phaeophytes, Chrysophytes, and Rhodophytes. Temporal statistical contrasts therefore excluded 2018 data for these taxon groups (Phaeophytes, Chrysophytes, and Rhodophytes) which were reported as absent from all samples in 2018 data. See Minnow 2019a for detailed laboratory results for 2018. Data reported in 2018 for this "Other" category has therefore excluded from data presentation and analyses in the present report. Periphyton taxonomy results have not been reported in an "Other" category by the laboratory since 2018. See report Section 4.2.3.1 for details.

[a] MCT = Measure of Central Tendency, which is the mean, geometric mean, or median depending on if analysis was conducted on untransformed, log10-transformed, or rank-transformed data.

[b] Magnitude of difference (MOD) calculated for two-way Analysis of Variance (ANOVA) as (Exposed Mean - Reference Mean)/SD (or [Mean - Baseline Mean]/SD for temporal comparisons) on the transformed scale, where SD was the pooled standard deviation of the model residuals. MOD calculated for Kruskal-Wallis (i.e., rank-transformed data) as (Exposed Median - Reference Median)/MAD, where MAD was the pooled median absolute deviation.

[c] HAC-R2 is the alternate name used for the HAC-U sampling area for Habitat Remediation Working Group (HRWG) reporting.

Table F.2.1: Statistical Comparisons of Periphyton Community Metrics for the Upper Hazeltine Creek (HAC-R1, HAC-U [HAC-R2]; Exposed) and Upper Edney Creek (EDC-U; Reference) Monitoring Areas, 2018 to 2024

[d] Pairwise contrasts of post-breach (2017 to 2024) data from HAC-R1, HAC-U (HAC-R2), and HAC-R3 against baseline (1995 and 1996) and pre-breach (2011) data from W7 are indicated with an * for contrasts to 1995 data , † for contrasts to 1996 data, and ‡ for contrasts to 2011 data in Figure 6.5.

[e] Spatial pairwise contrasts between HAC-R1, HAC-U (HAC-R2), and HAC-R3 in 1995, 1996, and 2011 were not calculated because W7 data from these years represents baseline or pre-breach conditions for HAC-R1, HAC-U (HAC-R2), and HAC-R3.

[f] HAC-R2 is the alternate name used for the HAC-U sampling area for Habitat Remediation Working Group (HRWG) reporting.

APPENDIX F.3
BENTHIC INVERTEBRATE COMMUNITY AND PRODUCTIVITY

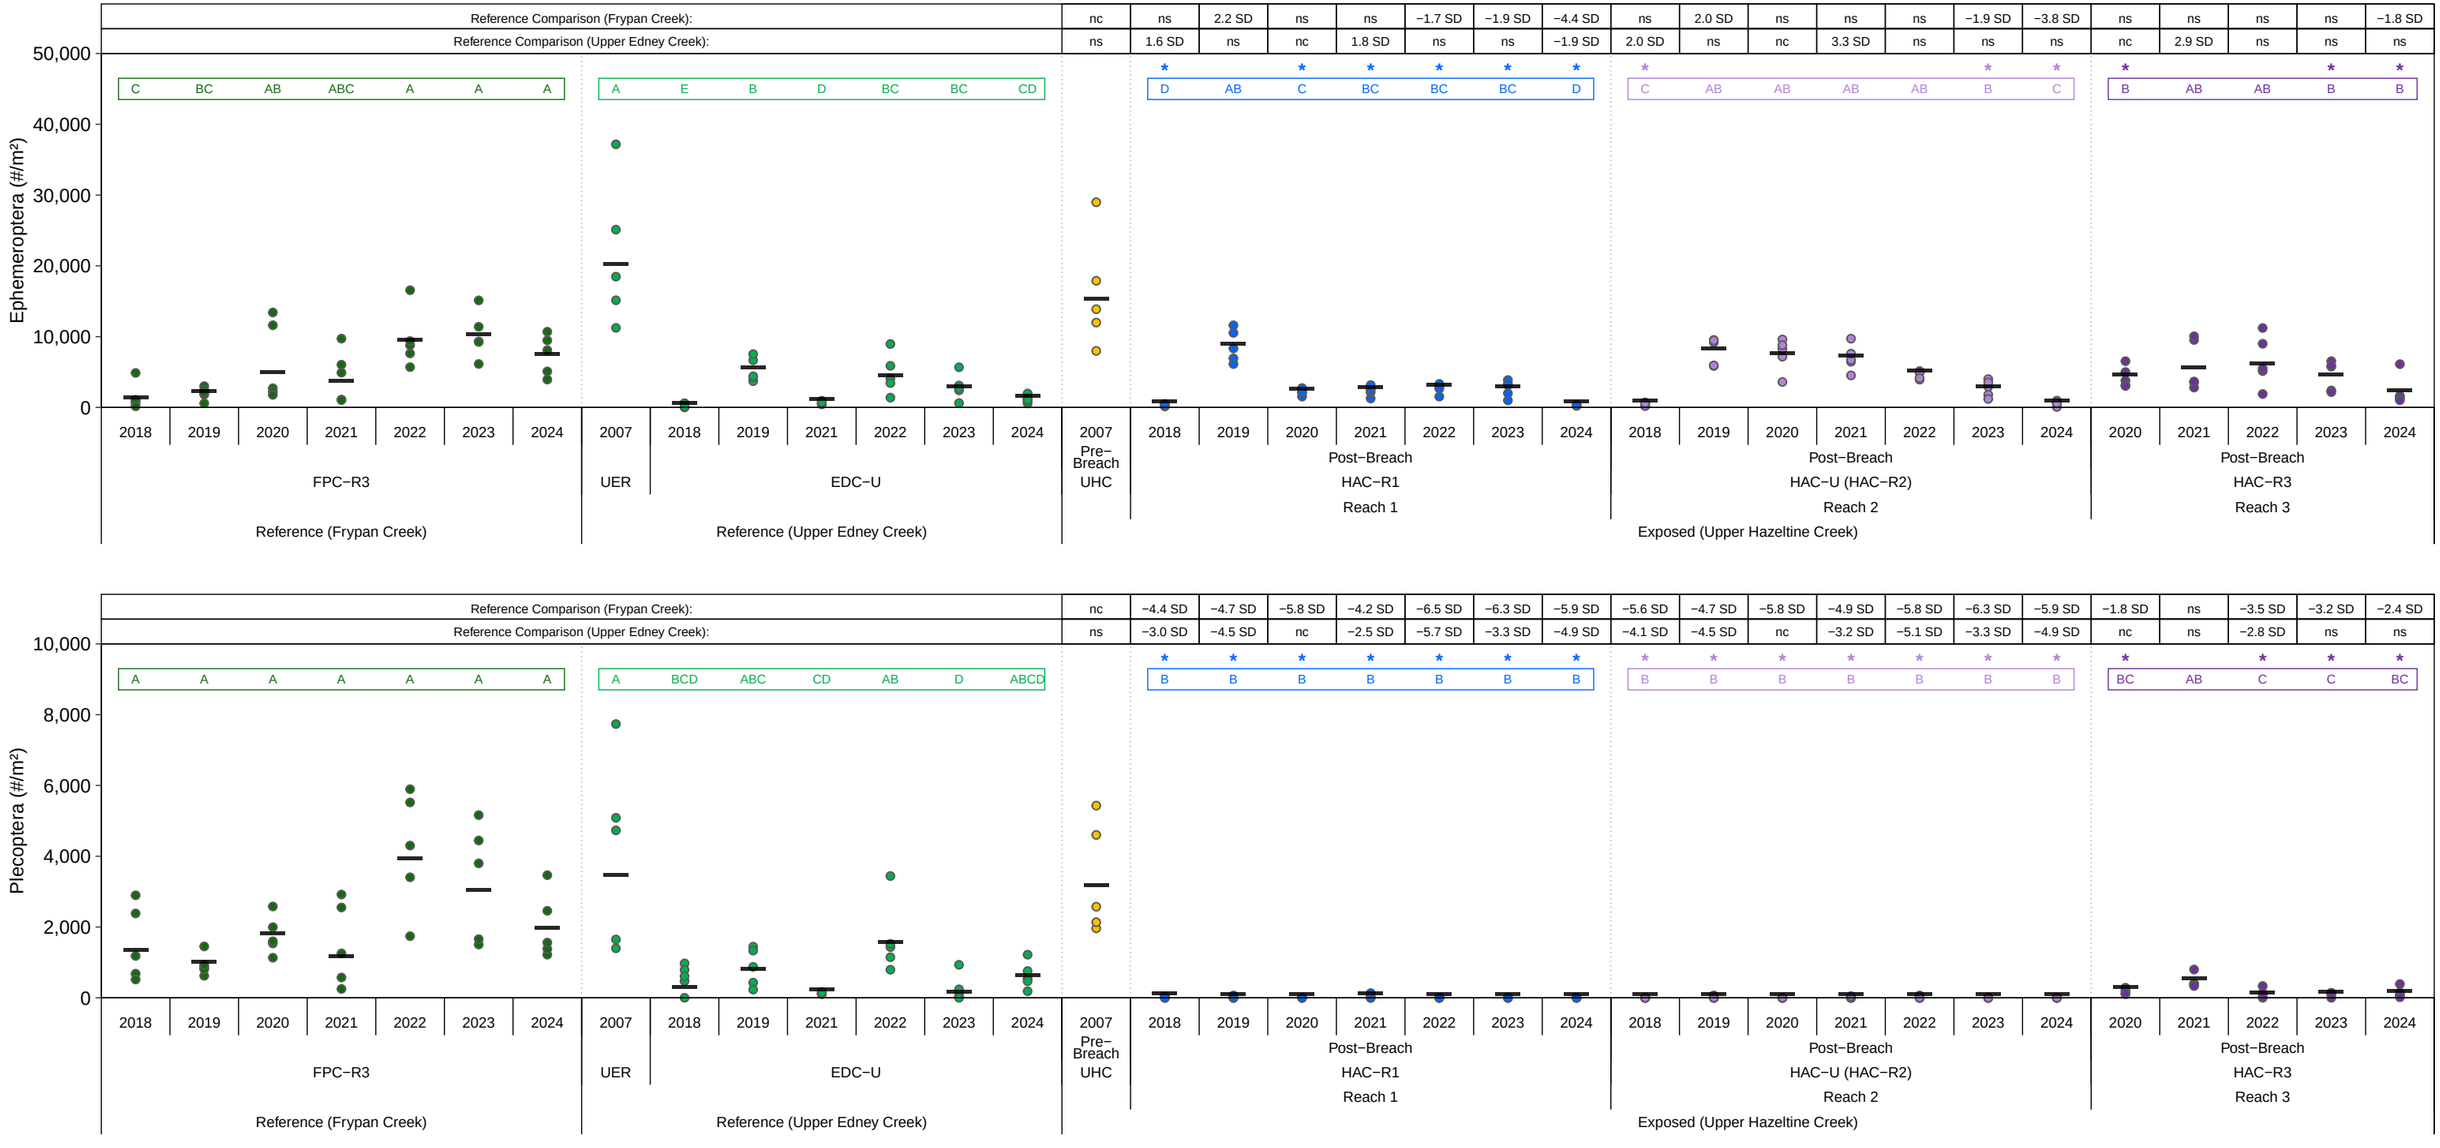

Figure F.3.1: Benthic Invertebrate Community Metrics for Upper Hazeltine Creek (HAC−R1, HAC−U [HAC−R2], HAC−R3; Exposed), Frypan Creek (FPC−R3; Reference), and Upper Edney Creek (EDC−U; Reference) Monitoring Areas, 2007 to 2024

Notes: EPT = Ephemeroptera, Plecoptera, Trichoptera. Reference area EDC−U was not sampled in 2020 due to habitat differences (in water depth and flow) relative to the remediated areas HAC−R1, HAC−U (HAC−R2), and HAC−R3. Monitoring at area HAC−R3 was initiated in 2020. See Section 4.3 for details. Black bars represent measures of central tendency (mean, geometric mean, or median depending on if analysis was conducted on untransformed, log10−transformed or rank−transformed data). Coloured letters represent significant (p−value <0.1) post−hoc comparisons within areas over time; years that share a letter of the same colour (e.g., A, B) within a box of the same colour do not differ significantly within an area. Data from 2007 were used in the analyses to compare post−breach (2018 to 2024) to pre−breach conditions (2007). Post−breach data from HAC−R1, HAC−U (HAC−R2), and HAC−R3 were compared to pre−breach data from upper Hazeltine Creek (UHC), and post−breach data from EDC−U was compared to pre−breach data from upper Edney Creek (UER). An * indicates a significant difference between HAC−R1, HAC−U (HAC−R2), or HAC−R3 and UHC in 2007. A number above the plot indicates significant exposed vs. reference post−hoc comparisons within a given year. The magnitude of difference (MOD) for these significant post−hoc comparisons is expressed in units of standard deviation (SD) or median absolute deviations (MAD; if the data were rank−transformed prior to analysis) relative to reference. A 'nc' indicates no comparisons were possible, a 'ns' indicates a non−significant contrast, and a 'nm' indicates that the MOD could not be calculated because MAD = 0.

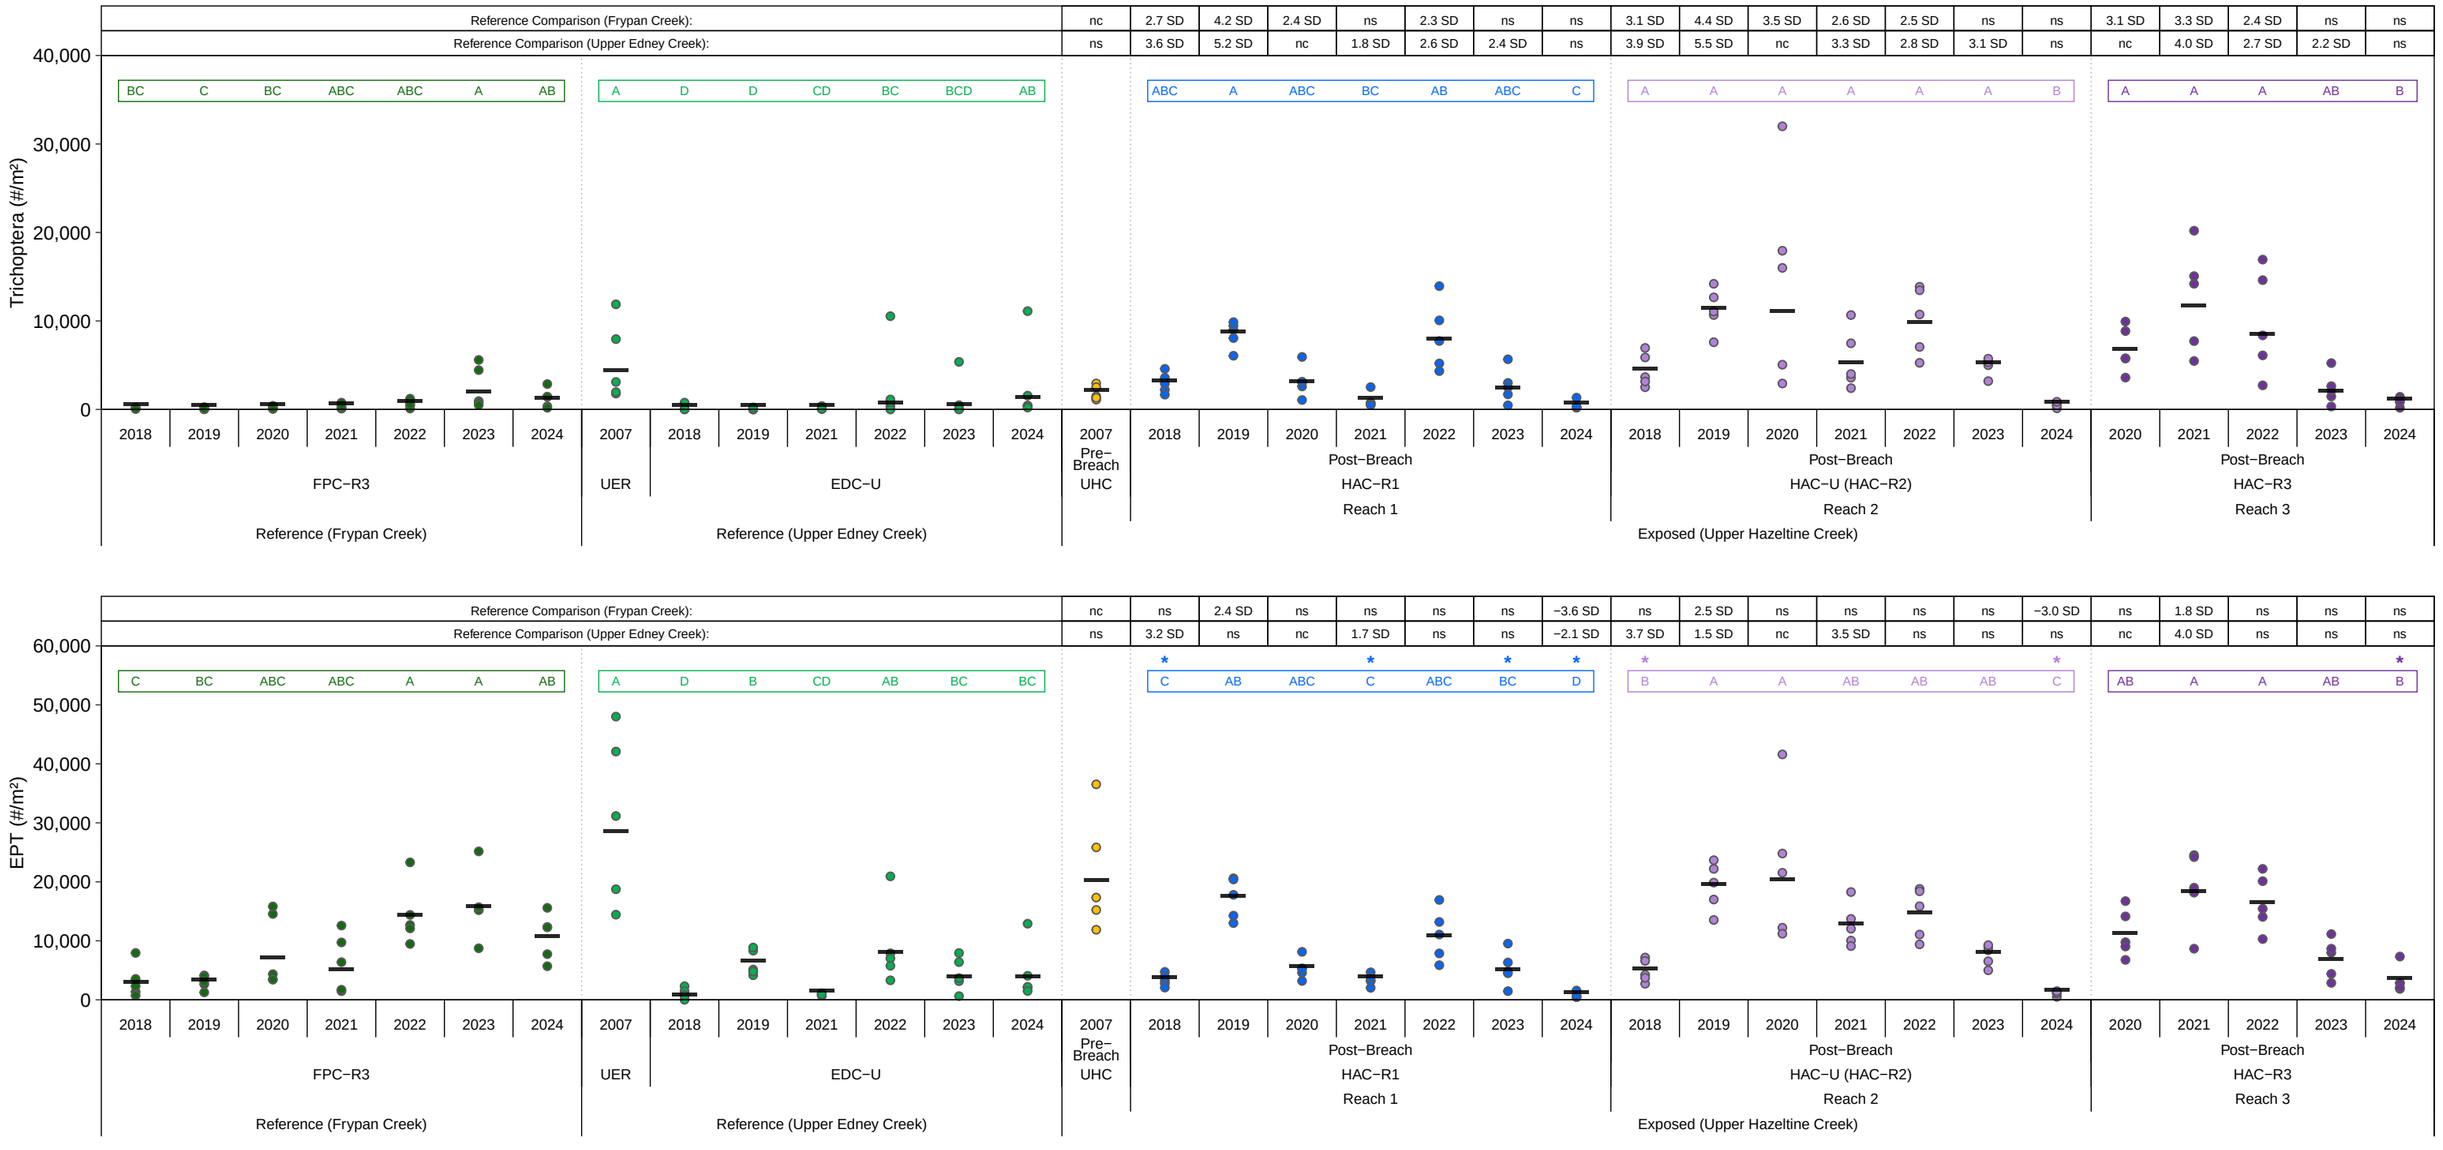

Figure F.3.1: Benthic Invertebrate Community Metrics for Upper Hazeltine Creek (HAC−R1, HAC−U [HAC−R2], HAC−R3; Exposed), Frypan Creek (FPC−R3; Reference), and Upper Edney Creek (EDC−U; Reference) Monitoring Areas, 2007 to 2024

Notes: EPT = Ephemeroptera, Plecoptera, Trichoptera. Reference area EDC−U was not sampled in 2020 due to habitat differences (in water depth and flow) relative to the remediated areas HAC−R1, HAC−U (HAC−R2), and HAC−R3. Monitoring at area HAC−R3 was initiated in 2020. See Section 4.3 for details. Black bars represent measures of central tendency (mean, geometric mean, or median depending on if analysis was conducted on untransformed, log10−transformed or rank−transformed data). Coloured letters represent significant (p−value <0.1) post−hoc comparisons within areas over time; years that share a letter of the same colour (e.g., A, B) within a box of the same colour do not differ significantly within an area. Data from 2007 were used in the analyses to compare post−breach (2018 to 2024) to pre−breach conditions (2007). Post−breach data from HAC−R1, HAC−U (HAC−R2), and HAC−R3 were compared to pre−breach data from upper Hazeltine Creek (UHC), and post−breach data from EDC−U was compared to pre−breach data from upper Edney Creek (UER). An * indicates a significant difference between HAC−R1, HAC−U (HAC−R2), or HAC−R3 and UHC in 2007. A number above the plot indicates significant exposed vs. reference post−hoc comparisons within a given year. The magnitude of difference (MOD) for these significant post−hoc comparisons is expressed in units of standard deviation (SD) or median absolute deviations (MAD; if the data were rank−transformed prior to analysis) relative to reference. A 'nc' indicates no comparisons were possible, a 'ns' indicates a non−significant contrast, and a 'nm' indicates that the MOD could not be calculated because MAD = 0.

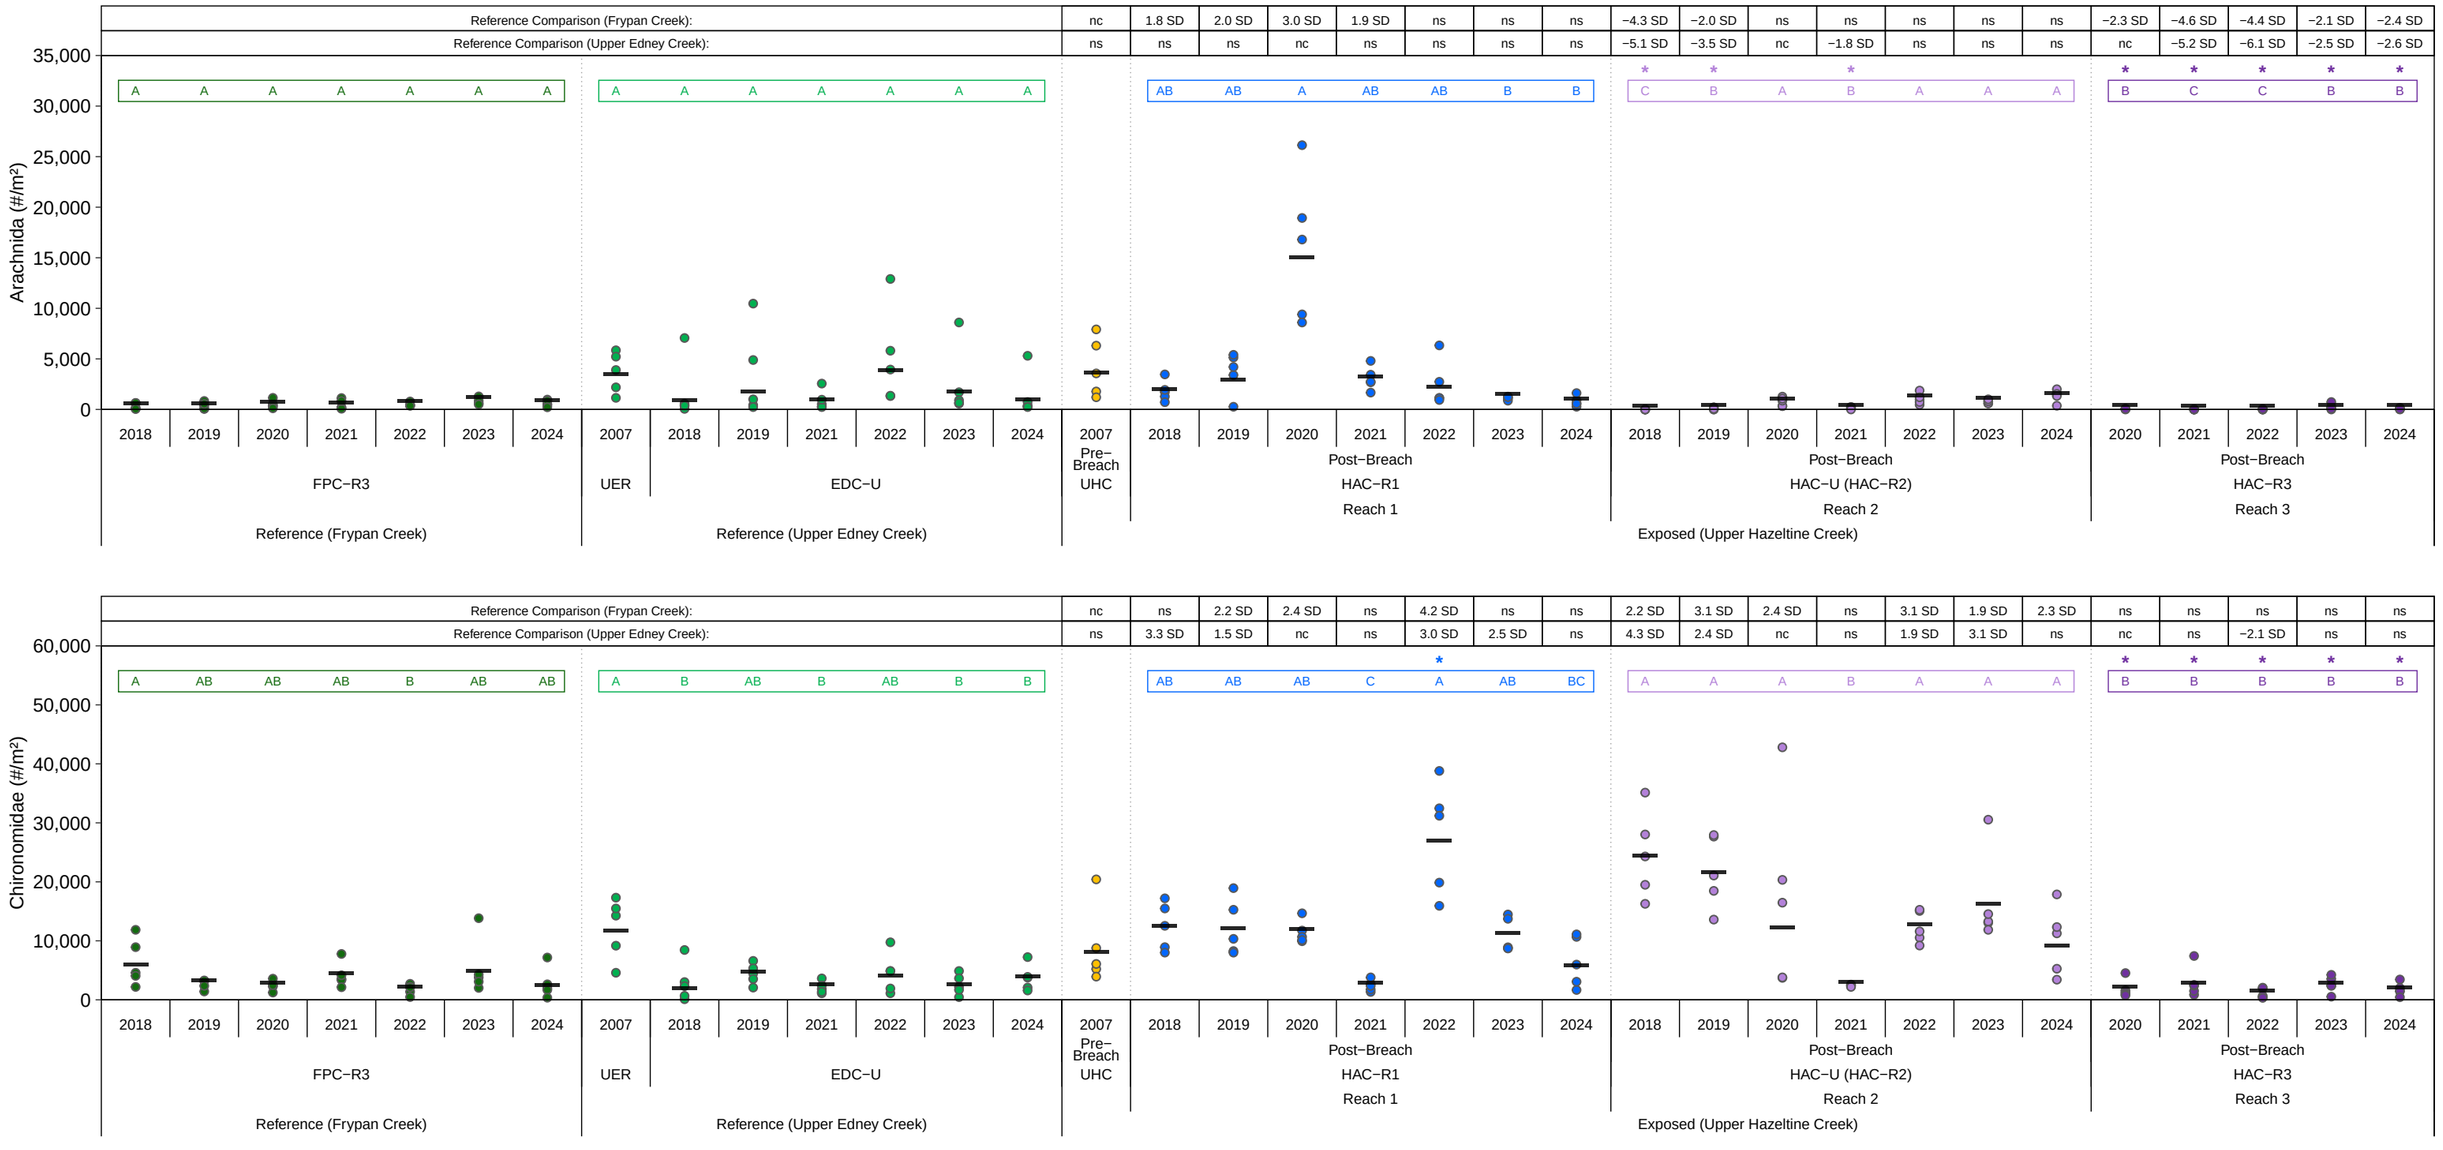

Figure F.3.1: Benthic Invertebrate Community Metrics for Upper Hazeltine Creek (HAC−R1, HAC−U [HAC−R2], HAC−R3; Exposed), Frypan Creek (FPC−R3; Reference), and Upper Edney Creek (EDC−U; Reference) Monitoring Areas, 2007 to 2024

Notes: EPT = Ephemeroptera, Plecoptera, Trichoptera. Reference area EDC−U was not sampled in 2020 due to habitat differences (in water depth and flow) relative to the remediated areas HAC−R1, HAC−U (HAC−R2), and HAC−R3. Monitoring at area HAC−R3 was initiated in 2020. See Section 4.3 for details. The magnitude of difference (MOD) for these significant post−hoc comparisons is expressed in units of standard deviation (SD) or median absolute deviations (MAD; if the data were rank−transformed prior to analysis) relative to reference. A 'nc' indicates no comparisons were possible, a 'ns' indicates a non−significant contrast, and a 'nm' indicates that the MOD could not be calculated because MAD = 0.

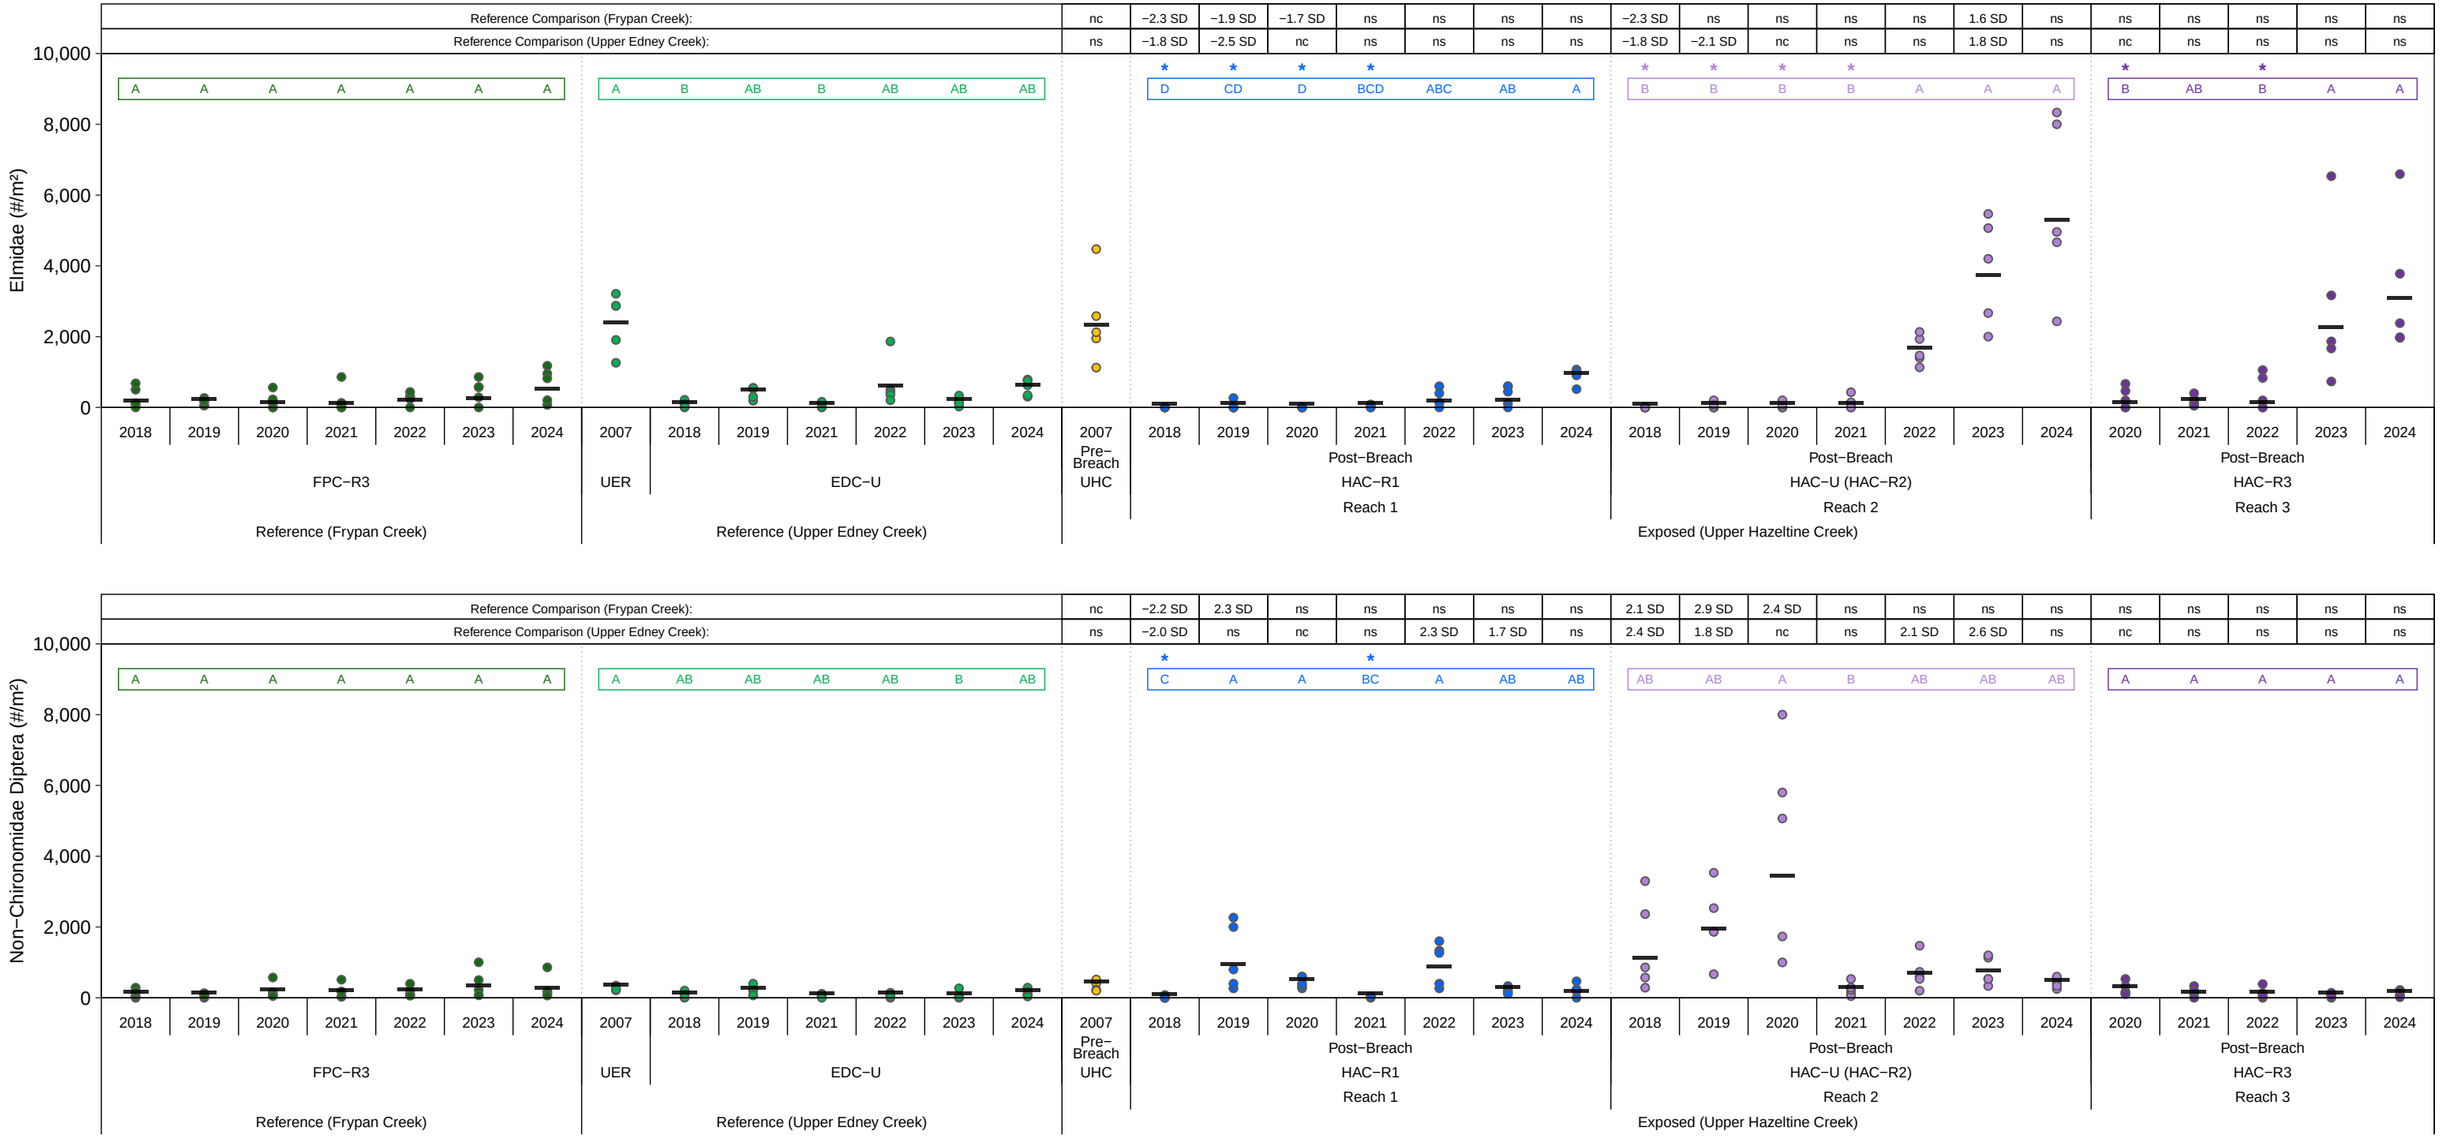

Figure F.3.1: Benthic Invertebrate Community Metrics for Upper Hazeltine Creek (HAC−R1, HAC−U [HAC−R2], HAC−R3; Exposed), Frypan Creek (FPC−R3; Reference), and Upper Edney Creek (EDC−U; Reference) Monitoring Areas, 2007 to 2024

Notes: EPT = Ephemeroptera, Plecoptera, Trichoptera. Reference area EDC−U was not sampled in 2020 due to habitat differences (in water depth and flow) relative to the remediated areas HAC−R1, HAC−U (HAC−R2), and HAC−R3. Monitoring at area HAC−R3 was initiated in 2020. See Section 4.3 for details. Black bars represent measures of central tendency (mean, geometric mean, or median depending on if analysis was conducted on untransformed, log10−transformed or rank−transformed data). Coloured letters represent significant (p−value <0.1) post−hoc comparisons within areas over time; years that share a letter of the same colour (e.g., A, B) within a box of the same colour do not differ significantly within an area. Data from 2007 were used in the analyses to compare post−breach (2018 to 2024) to pre−breach conditions (2007). Post−breach data from HAC−R1, HAC−U (HAC−R2), and HAC−R3 were compared to pre−breach data from upper Hazeltine Creek (UHC), and post−breach data from EDC−U was compared to pre−breach data from upper Edney Creek (UER). An * indicates a significant difference between HAC−R1, HAC−U (HAC−R2), or HAC−R3 and UHC in 2007. A number above the plot indicates significant exposed vs. reference post−hoc comparisons within a given year. The magnitude of difference (MOD) for these significant post−hoc comparisons is expressed in units of standard deviation (SD) or median absolute deviations (MAD; if the data were rank−transformed prior to analysis) relative to reference. A 'nc' indicates no comparisons were possible, a 'ns' indicates a non−significant contrast, and a 'nm' indicates that the MOD could not be calculated because MAD = 0.

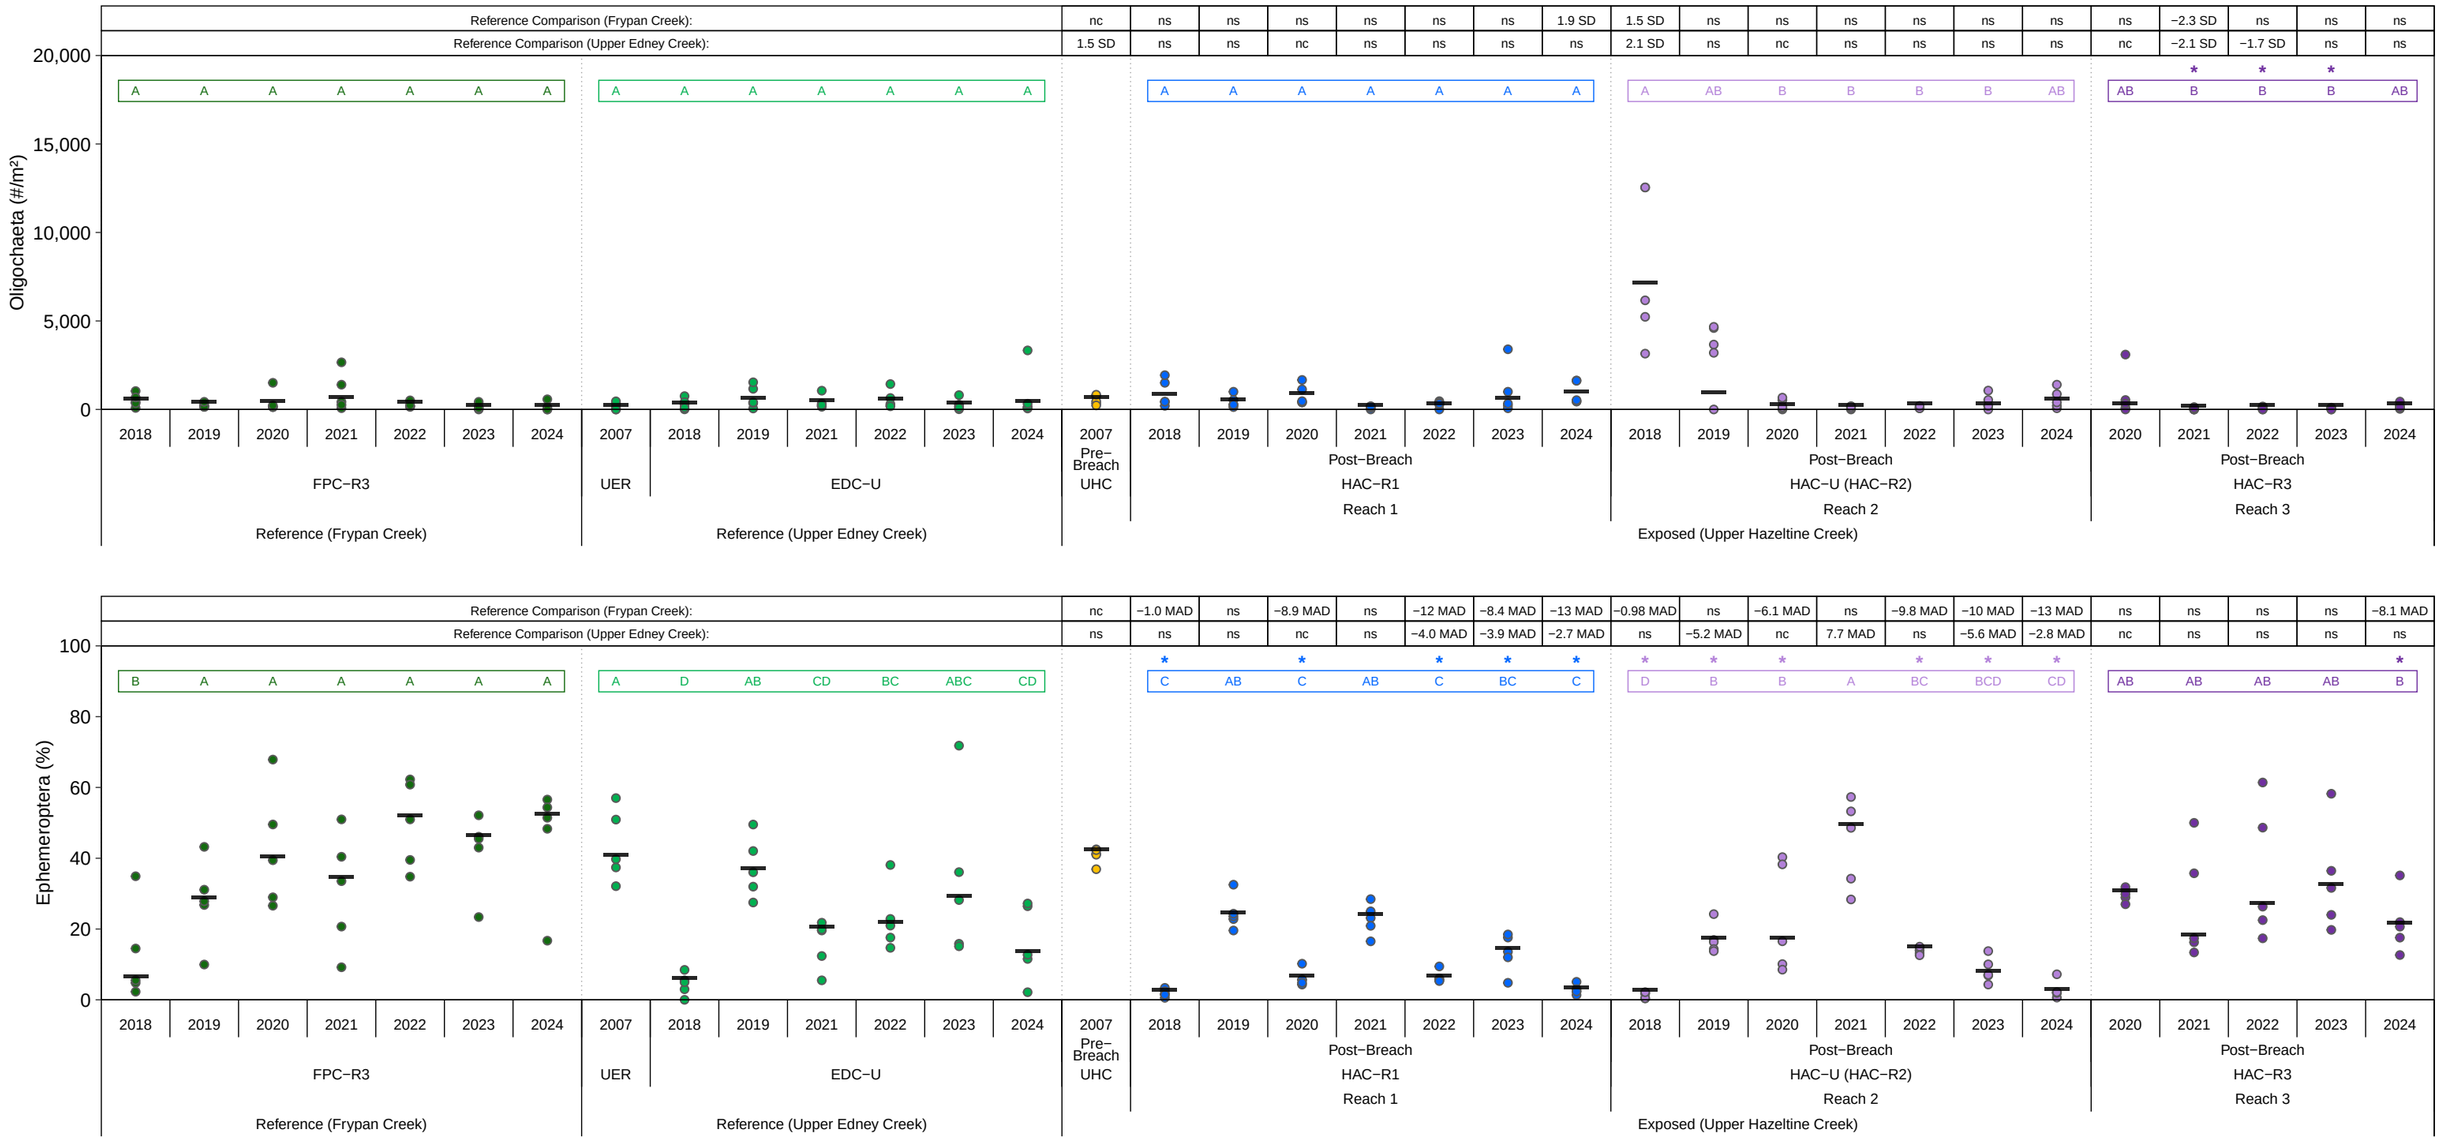

Figure F.3.1: Benthic Invertebrate Community Metrics for Upper Hazeltine Creek (HAC−R1, HAC−U [HAC−R2], HAC−R3; Exposed), Frypan Creek (FPC−R3; Reference), and Upper Edney Creek (EDC−U; Reference) Monitoring Areas, 2007 to 2024

Notes: EPT = Ephemeroptera, Plecoptera, Trichoptera. Reference area EDC−U was not sampled in 2020 due to habitat differences (in water depth and flow) relative to the remediated areas HAC−R1, HAC−U (HAC−R2), and HAC−R3. Monitoring at area HAC−R3 was initiated in 2020. See Section 4.3 for details. Black bars represent measures of central tendency (mean, geometric mean, or median depending on if analysis was conducted on untransformed, log10−transformed or rank−transformed data). Coloured letters represent significant (p−value <0.1) post−hoc comparisons within areas over time; years that share a letter of the same colour (e.g., A, B) within a box of the same colour do not differ significantly within an area. Data from 2007 were used in the analyses to compare post−breach (2018 to 2024) to pre−breach conditions (2007). Post−breach data from HAC−R1, HAC−U (HAC−R2), and HAC−R3 were compared to pre−breach data from upper Hazeltine Creek (UHC), and post−breach data from EDC−U was compared to pre−breach data from upper Edney Creek (UER). An * indicates a significant difference between HAC−R1, HAC−U (HAC−R2), or HAC−R3 and UHC in 2007. A number above the plot indicates significant exposed vs. reference post−hoc comparisons within a given year. The magnitude of difference (MOD) for these significant post−hoc comparisons is expressed in units of standard deviation (SD) or median absolute deviations (MAD; if the data were rank−transformed prior to analysis) relative to reference. A 'nc' indicates no comparisons were possible, a 'ns' indicates a non−significant contrast, and a 'nm' indicates that the MOD could not be calculated because MAD = 0.

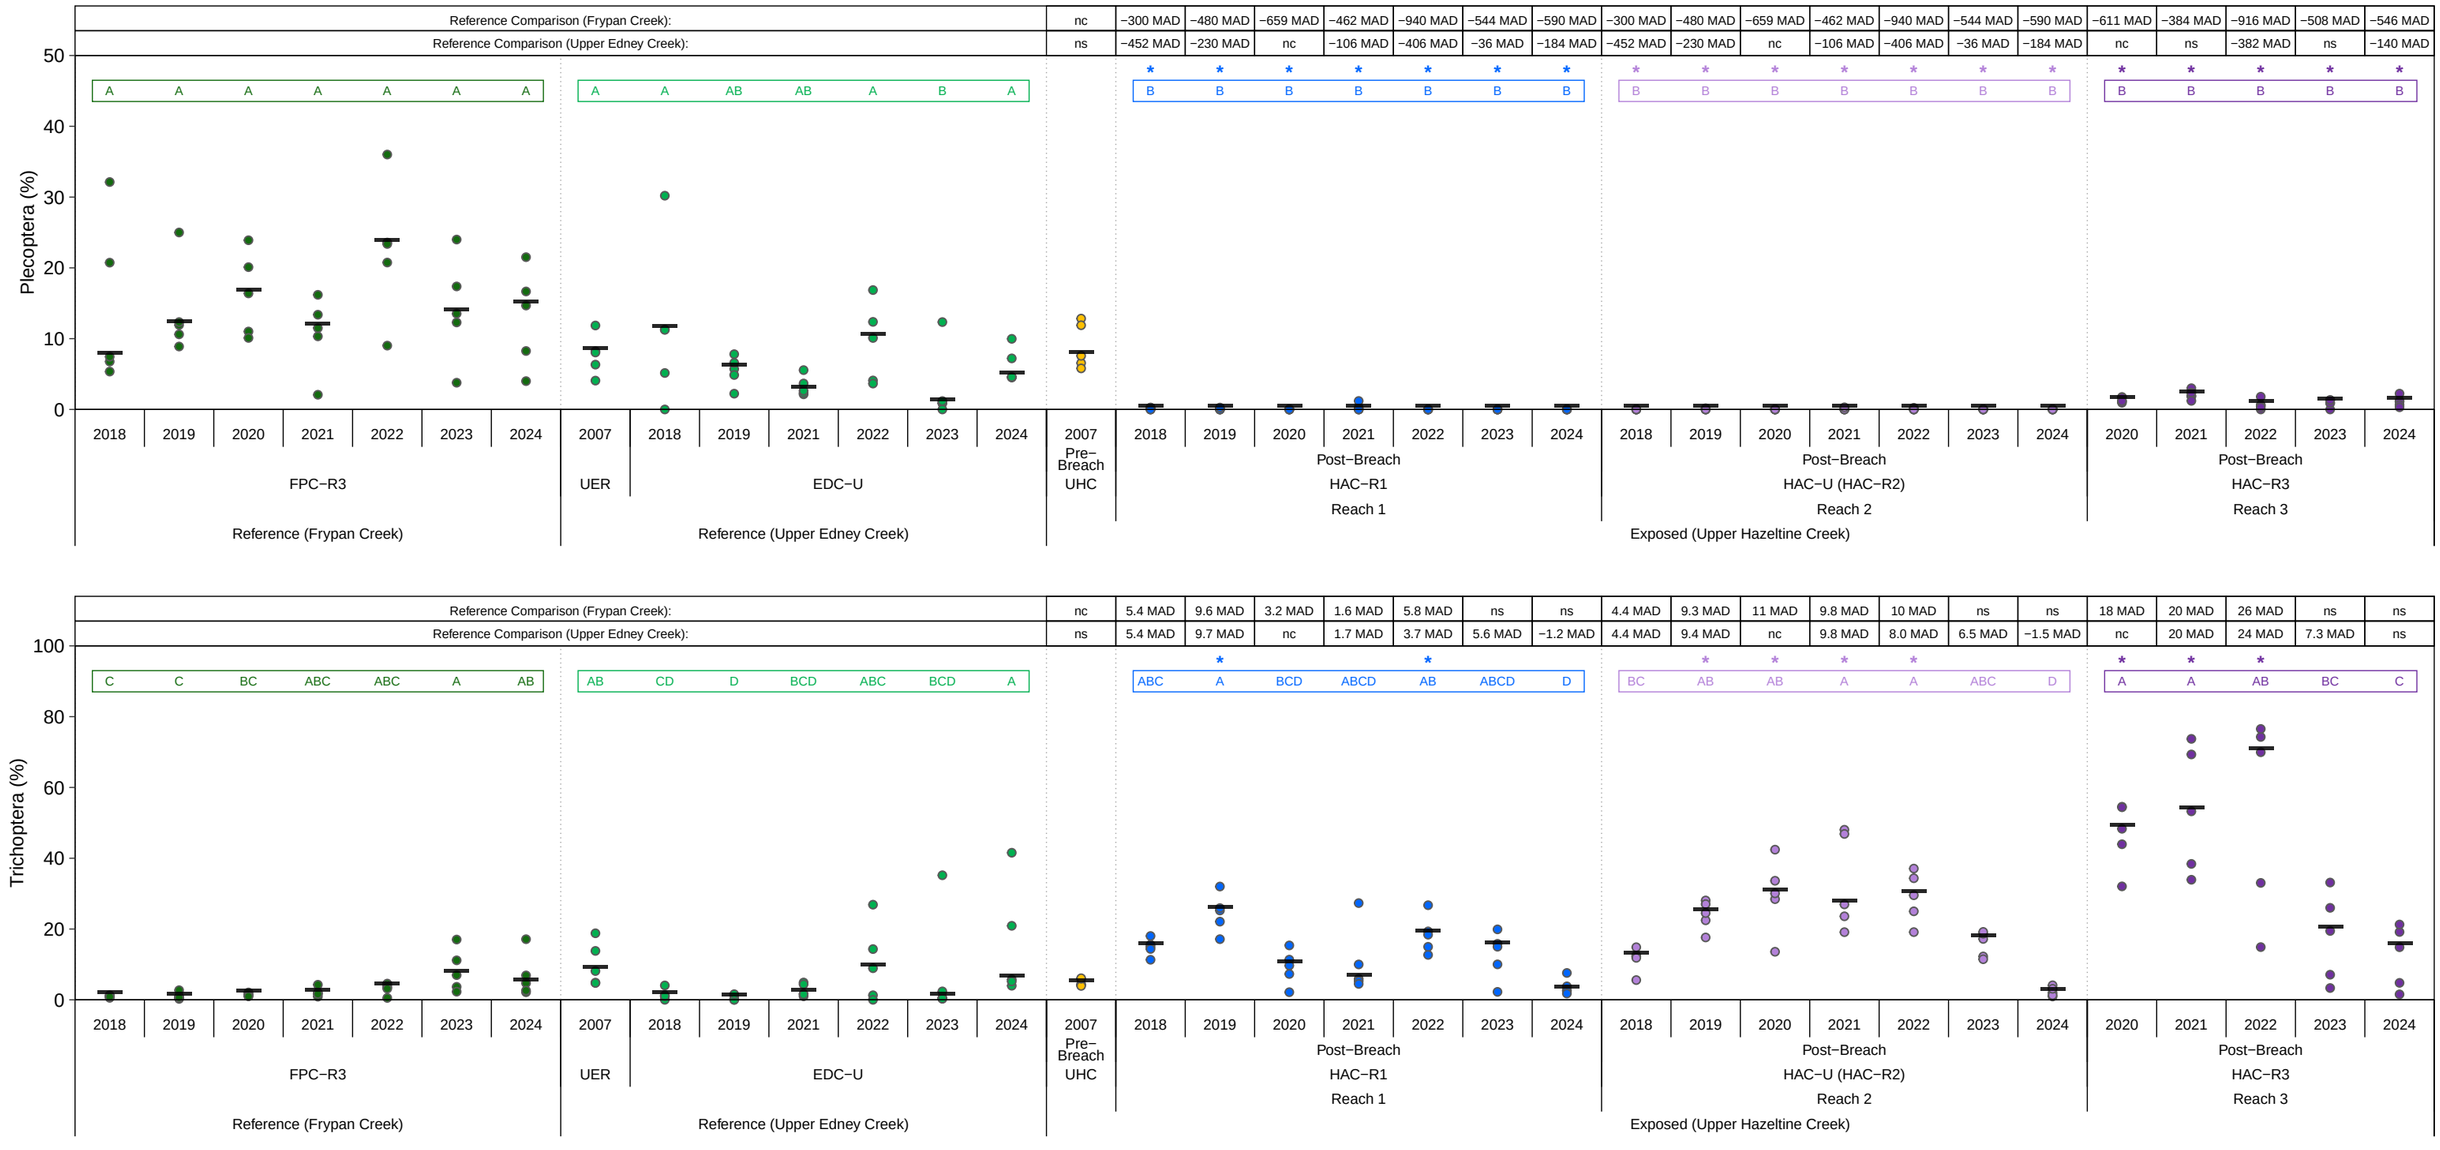

Figure F.3.1: Benthic Invertebrate Community Metrics for Upper Hazeltine Creek (HAC−R1, HAC−U [HAC−R2], HAC−R3; Exposed), Frypan Creek (FPC−R3; Reference), and Upper Edney Creek (EDC−U; Reference) Monitoring Areas, 2007 to 2024

Notes: EPT = Ephemeroptera, Plecoptera, Trichoptera. Reference area EDC−U was not sampled in 2020 due to habitat differences (in water depth and flow) relative to the remediated areas HAC−R1, HAC−U (HAC−R2), and HAC−R3. P-value < 0.1.

Magnitude of Difference (MOD) < -2.

Magnitude of Difference (MOD) > 2.

Notes: "-" = no data available. nc = no comparison. ns = non-significance. nm = Contrast MODs could not be calculated because the Median Absolute Deviation (MAD) = 0. " - " = no value. EPT = Ephemeroptera, Plecoptera, Trichoptera. DW = dry weight. WW = wet weight. #/m^2 = number per square metre. g/m^2 = grams per square metre. Reference area EDC-U was not sampled in 2020 due to habitat differences (in water depth and flow) relative to the remediated areas HAC-R1, HAC-U (HAC-R2), and HAC-R3. Monitoring at area HAC-R3 was initiated in 2020. See Section 4.3 for details.

[a] Data from 2007 were used in the analyses to compare post-breach (2018 to 2024) to pre-breach conditions (2007). Post-breach data from HAC-R1, HAC-U (HAC-R2), and HAC-R3 were compared to pre-breach data from UHC, and post-breach data from EDC-U were compared to pre-breach data from UER.

[b] MCT = Measure of Central Tendency, which is the mean, geometric mean, or median depending on if analysis was conducted on untransformed, log10-transformed, or rank-transformed data.

[c] Magnitude of difference (MOD) calculated for two-way Analysis of Variance (ANOVA) as (Exposed Mean - Reference Mean)/SD (or [Mean - Baseline Mean]/SD for temporal comparisons) on the transformed scale, where SD was the pooled standard deviation of the model residuals. MOD calculated for Kruskal-Wallis (i.e., rank-transformed data) as (Exposed Median - Reference Median)/MAD, where MAD was the pooled median absolute deviation.

[d] Pairwise contrasts of post-breach (2018 to 2024) data from HAC-R1, HAC-U (HAC-R2), HAC-R3 against pre-breach (2007) data from UHC are indicated with an * in Figure F.3.1.

[e] Spatial pairwise contrasts between HAC-R1, HAC-U (HAC-R2), and HAC-R3 in 2007 were not calculated because UHC in 2007 was used to represent pre-breach data for all three areas HAC-R1, HAC-U (HAC-R2), and HAC-R3.

[f] HAC-R2 is the alternate name used for the HAC-U sampling area for Habitat Remediation Working Group (HRWG) reporting.

[g] The two-way ANOVA (*Area*, *Year*, and *Area x Year* terms) was conducted with UHC (2007) considered as a separate area, while the temporal *post hoc* comparisons were conducted with UHC (2007) considered to be the same area as upper Hazeltine Creek areas (HAC-R1, HAC-U (HAC-R2), and HAC-R3 (see Section 4.3.3.2 for details). This difference in treatment of UHC (2007) data is the reason that *post hoc* comparisons were reported for Plecoptera (%) although the 2-way ANOVA was not significant (p > 0.1).

Table F.3.1: Statistical Comparisons of Benthic Invertebrate Community Metrics for the Upper Hazeltine Creek (HAC-R1, HAC-U [HAC-R2], HAC-R3; Exposed), Frypan Creek (FPC-R3; Reference), and Upper Edney Creek (EDC-U; Reference) Monitoring Areas, 2007 to 2024

P-value < 0.1.

Magnitude of Difference (MOD) < -2.

Magnitude of Difference (MOD) > 2.

Notes: "-" = no data available. nc = no comparison. ns = non-significance. nm = Contrast MODs could not be calculated because the Median Absolute Deviation (MAD) = 0. " - " = no value. EPT = Ephemeroptera, Plecoptera, Trichoptera. DW = dry weight. WW = wet weight. #/m^2 = number per square metre. g/m^2 = grams per square metre. Reference area EDC-U was not sampled in 2020 due to habitat differences (in water depth and flow) relative to the remediated areas HAC-R1, HAC-U (HAC-R2), and HAC-R3. Monitoring at area HAC-R3 was initiated in 2020. See Section 4.3 for details.

[a] Data from 2007 were used in the analyses to compare post-breach (2018 to 2024) to pre-breach conditions (2007). Post-breach data from HAC-R1, HAC-U (HAC-R2), and HAC-R3 were compared to pre-breach data from UHC, and post-breach data from EDC-U were compared to pre-breach data from UER.

[b] MCT = Measure of Central Tendency, which is the mean, geometric mean, or median depending on if analysis was conducted on untransformed, log10-transformed, or rank-transformed data.

[c] Magnitude of difference (MOD) calculated for two-way Analysis of Variance (ANOVA) as (Exposed Mean - Reference Mean)/SD (or [Mean - Baseline Mean]/SD for temporal comparisons) on the transformed scale, where SD was the pooled standard deviation of the model residuals. MOD calculated for Kruskal-Wallis (i.e., rank-transformed data) as (Exposed Median - Reference Median)/MAD, where MAD was the pooled median absolute deviation.

[d] Pairwise contrasts of post-breach (2018 to 2024) data from HAC-R1, HAC-U (HAC-R2), HAC-R3 against pre-breach (2007) data from UHC are indicated with an * in Figure F.3.1.

[e] Spatial pairwise contrasts between HAC-R1, HAC-U (HAC-R2), and HAC-R3 in 2007 were not calculated because UHC in 2007 was used to represent pre-breach data for all three areas HAC-R1, HAC-U (HAC-R2), and HAC-R3.

[f] HAC-R2 is the alternate name used for the HAC-U sampling area for Habitat Remediation Working Group (HRWG) reporting.

[g] The two-way ANOVA (*Area*, *Year*, and *Area x Year* terms) was conducted with UHC (2007) considered as a separate area, while the temporal *post hoc* comparisons were conducted with UHC (2007) considered to be the same area as upper Hazeltine Creek areas (HAC-R1, HAC-U (HAC-R2), and HAC-R3 (see Section 4.3.3.2 for details). This difference in treatment of UHC (2007) data is the reason that *post hoc* comparisons were reported for Plecoptera (%) although the 2-way ANOVA was not significant (p > 0.1).

Table F.3.1: Statistical Comparisons of Benthic Invertebrate Community Metrics for the Upper Hazeltine Creek (HAC-R1, HAC-U [HAC-R2], HAC-R3; Exposed), Frypan Creek (FPC-R3; Reference), and Upper Edney Creek (EDC-U; Reference) Monitoring Areas, 2007 to 2024

P-value < 0.1.

Magnitude of Difference (MOD) < -2.

Magnitude of Difference (MOD) > 2.

Notes: "-" = no data available. nc = no comparison. ns = non-significance. nm = Contrast MODs could not be calculated because the Median Absolute Deviation (MAD) = 0. " - " = no value. EPT = Ephemeroptera, Plecoptera, Trichoptera. DW = dry weight. WW = wet weight. #/m^2 = number per square metre. g/m^2 = grams per square metre. Reference area EDC-U was not sampled in 2020 due to habitat differences (in water depth and flow) relative to the remediated areas HAC-R1, HAC-U (HAC-R2), and HAC-R3. Monitoring at area HAC-R3 was initiated in 2020. See Section 4.3 for details.

[a] Data from 2007 were used in the analyses to compare post-breach (2018 to 2024) to pre-breach conditions (2007). Post-breach data from HAC-R1, HAC-U (HAC-R2), and HAC-R3 were compared to pre-breach data from UHC, and post-breach data from EDC-U were compared to pre-breach data from UER.

[b] MCT = Measure of Central Tendency, which is the mean, geometric mean, or median depending on if analysis was conducted on untransformed, log10-transformed, or rank-transformed data.

[c] Magnitude of difference (MOD) calculated for two-way Analysis of Variance (ANOVA) as (Exposed Mean - Reference Mean)/SD (or [Mean - Baseline Mean]/SD for temporal comparisons) on the transformed scale, where SD was the pooled standard deviation of the model residuals. MOD calculated for Kruskal-Wallis (i.e., rank-transformed data) as (Exposed Median - Reference Median)/MAD, where MAD was the pooled median absolute deviation.

[d] Pairwise contrasts of post-breach (2018 to 2024) data from HAC-R1, HAC-U (HAC-R2), HAC-R3 against pre-breach (2007) data from UHC are indicated with an * in Figure F.3.1.

[e] Spatial pairwise contrasts between HAC-R1, HAC-U (HAC-R2), and HAC-R3 in 2007 were not calculated because UHC in 2007 was used to represent pre-breach data for all three areas HAC-R1, HAC-U (HAC-R2), and HAC-R3.

[f] HAC-R2 is the alternate name used for the HAC-U sampling area for Habitat Remediation Working Group (HRWG) reporting.

[g] The two-way ANOVA (*Area*, *Year*, and *Area x Year* terms) was conducted with UHC (2007) considered as a separate area, while the temporal *post hoc* comparisons were conducted with UHC (2007) considered to be the same area as upper Hazeltine Creek areas (HAC-R1, HAC-U (HAC-R2), and HAC-R3 (see Section 4.3.3.2 for details). This difference in treatment of UHC (2007) data is the reason that *post hoc* comparisons were reported for Plecoptera (%) although the 2-way ANOVA was not significant (p > 0.1).

Table F.3.1: **Statistical Comparisons of Benthic Invertebrate Community Metrics for the Upper Hazeltine Creek (HAC-R1, HAC-U [HAC-R2], HAC-R3; Exposed), Frypan Creek (FPC-R3; Reference), and Upper Edney Creek (EDC-U; Reference) Monitoring Areas, 2007 to 2024**

P-value < 0.1.

Magnitude of Difference (MOD) < -2.

Magnitude of Difference (MOD) > 2.

Notes: "-" = no data available. nc = no comparison. ns = non-significance. nm = Contrast MODs could not be calculated because the Median Absolute Deviation (MAD) = 0. " - " = no value. EPT = Ephemeroptera, Plecoptera, Trichoptera. DW = dry weight. WW = wet weight. #/m^2 = number per square metre. g/m^2 = grams per square metre. Reference area EDC-U was not sampled in 2020 due to habitat differences (in water depth and flow) relative to the remediated areas HAC-R1, HAC-U (HAC-R2), and HAC-R3. Monitoring at area HAC-R3 was initiated in 2020. See Section 4.3 for details.

[a] Data from 2007 were used in the analyses to compare post-breach (2018 to 2024) to pre-breach conditions (2007). Post-breach data from HAC-R1, HAC-U (HAC-R2), and HAC-R3 were compared to pre-breach data from UHC, and post-breach data from EDC-U were compared to pre-breach data from UER.

[b] MCT = Measure of Central Tendency, which is the mean, geometric mean, or median depending on if analysis was conducted on untransformed, log10-transformed, or rank-transformed data.

[c] Magnitude of difference (MOD) calculated for two-way Analysis of Variance (ANOVA) as (Exposed Mean - Reference Mean)/SD (or [Mean - Baseline Mean]/SD for temporal comparisons) on the transformed scale, where SD was the pooled standard deviation of the model residuals. MOD calculated for Kruskal-Wallis (i.e., rank-transformed data) as (Exposed Median - Reference Median)/MAD, where MAD was the pooled median absolute deviation.

[d] Pairwise contrasts of post-breach (2018 to 2024) data from HAC-R1, HAC-U (HAC-R2), HAC-R3 against pre-breach (2007) data from UHC are indicated with an * in Figure F.3.1.

[e] Spatial pairwise contrasts between HAC-R1, HAC-U (HAC-R2), and HAC-R3 in 2007 were not calculated because UHC in 2007 was used to represent pre-breach data for all three areas HAC-R1, HAC-U (HAC-R2), and HAC-R3.

[f] HAC-R2 is the alternate name used for the HAC-U sampling area for Habitat Remediation Working Group (HRWG) reporting.

[g] The two-way ANOVA (*Area*, *Year*, and *Area x Year* terms) was conducted with UHC (2007) considered as a separate area, while the temporal *post hoc* comparisons were conducted with UHC (2007) considered to be the same area as upper Hazeltine Creek areas (HAC-R1, HAC-U (HAC-R2), and HAC-R3 (see Section 4.3.3.2 for details). This difference in treatment of UHC (2007) data is the reason that *post hoc* comparisons were reported for Plecoptera (%) although the 2-way ANOVA was not significant (p > 0.1).

Table F.3.1: Statistical Comparisons of Benthic Invertebrate Community Metrics for the Upper Hazeltine Creek (HAC-R1, HAC-U [HAC-R2], HAC-R3; Exposed), Frypan Creek (FPC-R3; Reference), and Upper Edney Creek (EDC-U; Reference) Monitoring Areas, 2007 to 2024

P-value < 0.1.

Magnitude of Difference (MOD) < -2.

Magnitude of Difference (MOD) > 2.

Notes: "-" = no data available. nc = no comparison. ns = non-significance. nm = Contrast MODs could not be calculated because the Median Absolute Deviation (MAD) = 0. " - " = no value. EPT = Ephemeroptera, Plecoptera, Trichoptera. DW = dry weight. WW = wet weight. #/m^2 = number per square metre. g/m^2 = grams per square metre. Reference area EDC-U was not sampled in 2020 due to habitat differences (in water depth and flow) relative to the remediated areas HAC-R1, HAC-U (HAC-R2), and HAC-R3. Monitoring at area HAC-R3 was initiated in 2020. See Section 4.3 for details.

[a] Data from 2007 were used in the analyses to compare post-breach (2018 to 2024) to pre-breach conditions (2007). Post-breach data from HAC-R1, HAC-U (HAC-R2), and HAC-R3 were compared to pre-breach data from UHC, and post-breach data from EDC-U were compared to pre-breach data from UER.

[b] MCT = Measure of Central Tendency, which is the mean, geometric mean, or median depending on if analysis was conducted on untransformed, log10-transformed, or rank-transformed data.

[c] Magnitude of difference (MOD) calculated for two-way Analysis of Variance (ANOVA) as (Exposed Mean - Reference Mean)/SD (or [Mean - Baseline Mean]/SD for temporal comparisons) on the transformed scale, where SD was the pooled standard deviation of the model residuals. MOD calculated for Kruskal-Wallis (i.e., rank-transformed data) as (Exposed Median - Reference Median)/MAD, where MAD was the pooled median absolute deviation.

[d] Pairwise contrasts of post-breach (2018 to 2024) data from HAC-R1, HAC-U (HAC-R2), HAC-R3 against pre-breach (2007) data from UHC are indicated with an * in Figure F.3.1.

[e] Spatial pairwise contrasts between HAC-R1, HAC-U (HAC-R2), and HAC-R3 in 2007 were not calculated because UHC in 2007 was used to represent pre-breach data for all three areas HAC-R1, HAC-U (HAC-R2), and HAC-R3.

[f] HAC-R2 is the alternate name used for the HAC-U sampling area for Habitat Remediation Working Group (HRWG) reporting.

[g] The two-way ANOVA (*Area* , *Year* , and *Area x Year* terms) was conducted with UHC (2007) considered as a separate area, while the temporal *post hoc* comparisons were conducted with UHC (2007) considered to be the same area as upper Hazeltine Creek areas (HAC-R1, HAC-U (HAC-R2), and HAC-R3 (see Section 4.3.3.2 for details). This difference in treatment of UHC (2007) data is the reason that *post hoc* comparisons were reported for Plecoptera (%) although the 2-way ANOVA was not significant (p > 0.1).

Table F.3.1: Statistical Comparisons of Benthic Invertebrate Community Metrics for the Upper Hazeltine Creek (HAC-R1, HAC-U [HAC-R2], HAC-R3; Exposed), Frypan Creek (FPC-R3; Reference), and Upper Edney Creek (EDC-U; Reference) Monitoring Areas, 2007 to 2024

P-value < 0.1.

Magnitude of Difference (MOD) < -2.

Magnitude of Difference (MOD) > 2.

Notes: "-" = no data available. nc = no comparison. ns = non-significance. nm = Contrast MODs could not be calculated because the Median Absolute Deviation (MAD) = 0. " - " = no value. EPT = Ephemeroptera, Plecoptera, Trichoptera. DW = dry weight. WW = wet weight. #/m^2 = number per square metre. g/m^2 = grams per square metre. Reference area EDC-U was not sampled in 2020 due to habitat differences (in water depth and flow) relative to the remediated areas HAC-R1, HAC-U (HAC-R2), and HAC-R3. Monitoring at area HAC-R3 was initiated in 2020. See Section 4.3 for details.

[a] Data from 2007 were used in the analyses to compare post-breach (2018 to 2024) to pre-breach conditions (2007). Post-breach data from HAC-R1, HAC-U (HAC-R2), and HAC-R3 were compared to pre-breach data from UHC, and post-breach data from EDC-U were compared to pre-breach data from UER.

[b] MCT = Measure of Central Tendency, which is the mean, geometric mean, or median depending on if analysis was conducted on untransformed, log10-transformed, or rank-transformed data.

[c] Magnitude of difference (MOD) calculated for two-way Analysis of Variance (ANOVA) as (Exposed Mean - Reference Mean)/SD (or [Mean - Baseline Mean]/SD for temporal comparisons) on the transformed scale, where SD was the pooled standard deviation of the model residuals. MOD calculated for Kruskal-Wallis (i.e., rank-transformed data) as (Exposed Median - Reference Median)/MAD, where MAD was the pooled median absolute deviation.

[d] Pairwise contrasts of post-breach (2018 to 2024) data from HAC-R1, HAC-U (HAC-R2), HAC-R3 against pre-breach (2007) data from UHC are indicated with an * in Figure F.3.1.

[e] Spatial pairwise contrasts between HAC-R1, HAC-U (HAC-R2), and HAC-R3 in 2007 were not calculated because UHC in 2007 was used to represent pre-breach data for all three areas HAC-R1, HAC-U (HAC-R2), and HAC-R3.

[f] HAC-R2 is the alternate name used for the HAC-U sampling area for Habitat Remediation Working Group (HRWG) reporting.

[g] The two-way ANOVA (*Area*, *Year*, and *Area x Year* terms) was conducted with UHC (2007) considered as a separate area, while the temporal *post hoc* comparisons were conducted with UHC (2007) considered to be the same area as upper Hazeltine Creek areas (HAC-R1, HAC-U (HAC-R2), and HAC-R3 (see Section 4.3.3.2 for details). This difference in treatment of UHC (2007) data is the reason that *post hoc* comparisons were reported for Plecoptera (%) although the 2-way ANOVA was not significant (p > 0.1).

Table F.3.1: Statistical Comparisons of Benthic Invertebrate Community Metrics for the Upper Hazeltine Creek (HAC-R1, HAC-U [HAC-R2], HAC-R3; Exposed), Frypan Creek (FPC-R3; Reference), and Upper Edney Creek (EDC-U; Reference) Monitoring Areas, 2007 to 2024

This difference in treatment of UHC (2007) data is the reason that *post hoc* comparisons were reported for Plecoptera (%) although the 2-way ANOVA was not significant (p > 0.1).

P-value < 0.1.

Magnitude of Difference (MOD) < -2.

Magnitude of Difference (MOD) > 2.

Notes: "-" = no data available. nc = no comparison. ns = non-significance. nm = Contrast MODs could not be calculated because the Median Absolute Deviation (MAD) = 0. " - " = no value. EPT = Ephemeroptera, Plecoptera, Trichoptera. DW = dry weight. WW = wet weight. #/m^2 = number per square metre. g/m^2 = grams per square metre. Reference area EDC-U was not sampled in 2020 due to habitat differences (in water depth and flow) relative to the remediated areas HAC-R1, HAC-U (HAC-R2), and HAC-R3. Monitoring at area HAC-R3 was initiated in 2020. See Section 4.3 for details.

[a] Data from 2007 were used in the analyses to compare post-breach (2018 to 2024) to pre-breach conditions (2007). Post-breach data from HAC-R1, HAC-U (HAC-R2), and HAC-R3 were compared to pre-breach data from UHC, and post-breach data from EDC-U were compared to pre-breach data from UER.

[b] MCT = Measure of Central Tendency, which is the mean, geometric mean, or median depending on if analysis was conducted on untransformed, log10-transformed, or rank-transformed data.

[c] Magnitude of difference (MOD) calculated for two-way Analysis of Variance (ANOVA) as (Exposed Mean - Reference Mean)/SD (or [Mean - Baseline Mean]/SD for temporal comparisons) on the transformed scale, where SD was the pooled standard deviation of the model residuals. MOD calculated for Kruskal-Wallis (i.e., rank-transformed data) as (Exposed Median - Reference Median)/MAD, where MAD was the pooled median absolute deviation.

[d] Pairwise contrasts of post-breach (2018 to 2024) data from HAC-R1, HAC-U (HAC-R2), HAC-R3 against pre-breach (2007) data from UHC are indicated with an * in Figure F.3.1.

[e] Spatial pairwise contrasts between HAC-R1, HAC-U (HAC-R2), and HAC-R3 in 2007 were not calculated because UHC in 2007 was used to represent pre-breach data for all three areas HAC-R1, HAC-U (HAC-R2), and HAC-R3.

[f] HAC-R2 is the alternate name used for the HAC-U sampling area for Habitat Remediation Working Group (HRWG) reporting.

[g] The two-way ANOVA (*Area* , *Year* , and *Area x Year* terms) was conducted with UHC (2007) considered as a separate area, while the temporal *post hoc* comparisons were conducted with UHC (2007) considered to be the same area as upper Hazeltine Creek areas (HAC-R1, HAC-U (HAC-R2), and HAC-R3 (see Section 4.3.3.2 for details). This difference in treatment of UHC (2007) data is the reason that *post hoc* comparisons were reported for Plecoptera (%) although the 2-way ANOVA was not significant (p > 0.1).

Significant correlation; p-value <0.00625 (p <0.05, Bonferroni corrected for 8 independent variables).

Notes: EPT = Ephemeroptera, Plecoptera, Trichoptera. DW = dry weight. WW = wet weight. #/m^2 = number per square metre. g/m^2 = grams per square metre. HAC-R2 is the alternate name for the HAC-U sampling area for HRWG reporting.

APPENDIX F.4
PERIPHYTON AND BENTHIC INVERTEBRATE TISSUE QUALITY

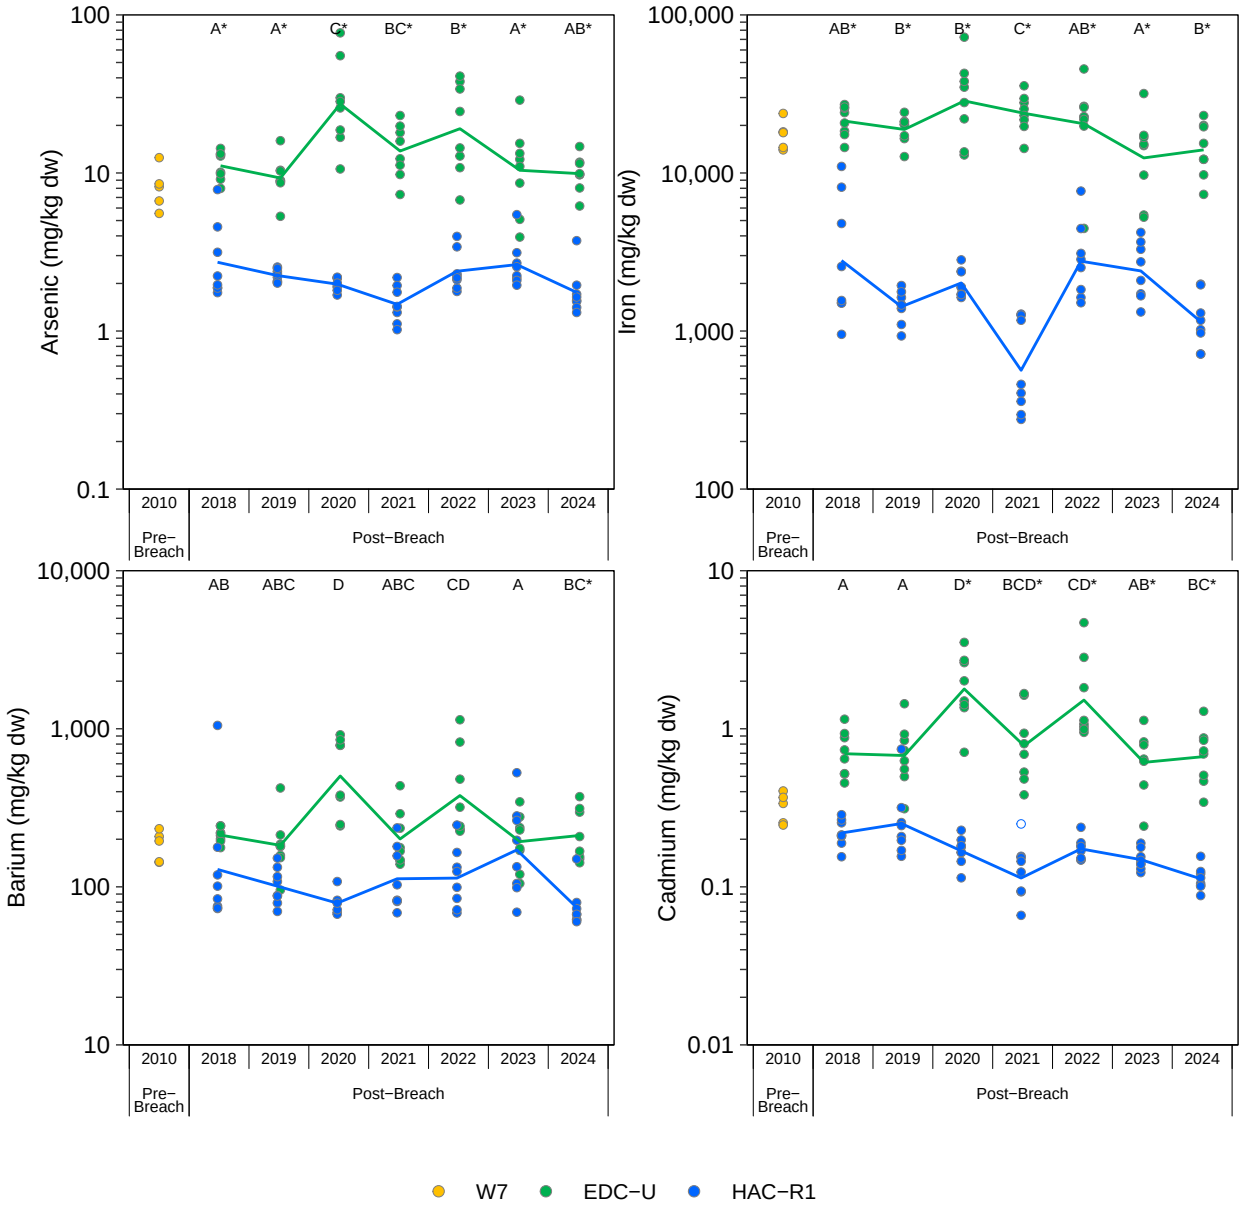

Figure F.4.1: Periphyton Tissue Primary and Secondary Analyte Concentrations with a Significant Negative Exposed − Reference Difference and a Significant Area x Year Effect for the Upper Hazeltine Creek (HAC−R1; Exposed) and Upper Edney Creek (EDC−U; Reference) Monitoring Areas, 2010 to 2024

Notes: mg/kg dw = milligrams per kilogram dry weight, <LRL = lower than the laboratory reporting limit. Green represents reference areas and blue represents exposed areas. W7 (2010) is the pre−breach equivalent of HAC−R1. Data are not available for all years within the date range identified, only years with available data are displayed and these are analyte−dependent. Concentrations <LRL are plotted as open symbols at the LRL and the open symbol represents one or more values reported <LRL. Individual samples are plotted and lines join the least−squares estimated mean values for years included in the statistical analysis (i.e., not <LRL). Statistical analyses were conducted using a two−way ANOVA with factors Area and Year. The models were fit using Maximum Likelihood Estimation with an assumed log−normal distribution. Years that share a letter (e.g., A,B,C) have ratios of concentrations (Exposed:Reference) that do not differ significantly (p−value < 0.05) among years. Letter A was assigned to the year with the highest ratio of concentrations (Exposed:Reference). Letters with a * designate years where the post−breach result differed significantly (p−value < 0.05) from pre−breach (2010) conditions. Only years with results from both reference and exposed areas are plotted.

Letters with a * designate years where the post−breach result differed significantly (p−value < 0.05) from pre−breach (2010) conditions. Only years with results from both reference and exposed areas are plotted.

Figure F.4.8: Trophic Transfer Factors for Composite−Taxa Benthic Invertebrate Tissue Primary and Secondary Analyte Concentrations with a Significant Positive Exposed − Reference Difference for the Upper Hazeltine Creek (HAC−R1; Exposed) and Upper Edney Creek (EDC−U; Reference) Monitoring Areas, 2010 to 2024

Notes: Trophic Transfer Factors (TTFs) were not calculated for analytes with results reported below the laboratory reporting limit (<LRL). Green represents reference areas and blue represents exposed areas. W7 (2010) is the pre−breach equivalent of HAC−R1. Data are not available for all years within the date range identified, only years with available data are displayed and these are analyte−dependent. Concentrations <LRL are plotted as open symbols at the LRL and the open symbol represents one or more values reported <LRL. Individual samples are plotted and lines join the least−squares estimated mean values for years included in the statistical analysis (i.e., not <LRL). Statistical analyses were conducted using a two−way ANOVA with factors Area and Year. Years that share a letter (e.g., A,B,C) have ratios of concentrations (Exposed:Reference) that do not differ significantly (p−value <0.05) among years. Letter A was assigned to the year with the highest ratio of concentrations (Exposed:Reference). Letters with a * designate years where the post−breach result differed significantly (p−value < 0.05) from pre−breach (2010) conditions. Only years with results from both reference and exposed areas are plotted.

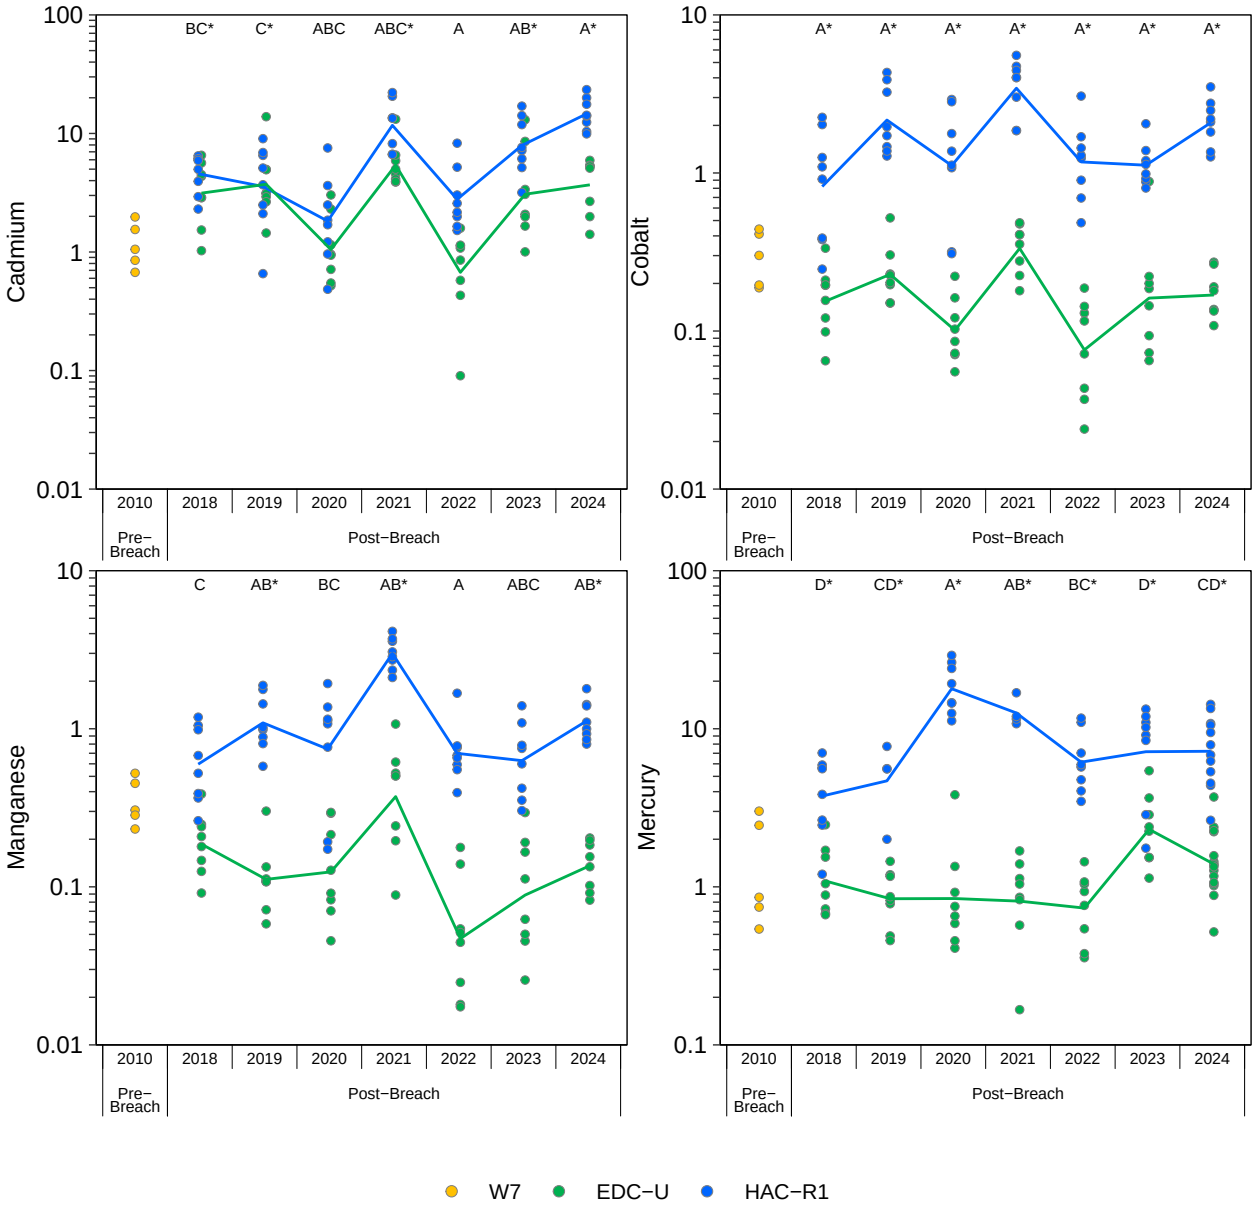

Figure F.4.8: Trophic Transfer Factors for Composite−Taxa Benthic Invertebrate Tissue Primary and Secondary Analyte Concentrations with a Significant Positive Exposed − Reference Difference for the Upper Hazeltine Creek (HAC−R1; Exposed) and Upper Edney Creek (EDC−U; Reference) Monitoring Areas, 2010 to 2024

Notes: Trophic Transfer Factors (TTFs) were not calculated for analytes with results reported below the laboratory reporting limit (<LRL). Green represents reference areas and blue represents exposed areas. W7 (2010) is the pre−breach equivalent of HAC−R1. Data are not available for all years within the date range identified, only years with available data are displayed and these are analyte−dependent. Data are not available for all years within the date range identified, only years with available data are displayed and these are analyte−dependent. Concentrations <LRL are plotted as open symbols at the LRL and the open symbol represents one or more values reported <LRL. Individual samples are plotted and lines join the least−squares estimated mean values for years included in the statistical analysis (i.e., not <LRL). Statistical analyses were conducted using a two−way ANOVA with factors Area and Year. Years that share a letter (e.g., A,B,C) have ratios of concentrations (Exposed:Reference) that do not differ significantly (p−value < 0.05) among years. Letter A was assigned to the year with the highest ratio of concentrations (Exposed:Reference). Only years with results from both reference and exposed areas are plotted.

Table F.4.1: Statistical Comparisons of Exposed - Reference Relative Differences of Periphyton Tissue Metal Concentrations for the Upper Hazeltine Creek (HAC-R1; Exposed) and Upper Edney Creek (EDC-U; Reference) Monitoring Areas, 2018 to 2024

Parameter	Data Transformation	Two-way ANOVA P-values			(Exposed – Reference) Contrasts Among Periods[a]							Magnitude of Difference in (Exposed – Reference) Relative to Baseline Period (%)[b]							Magnitude of Difference for HAC-R1 Mean Relative to EDC-U (%)[c]

Area x Year or Area P-value < 0.05.

Contrast is significant (α = 0.05) and magnitude of difference is positive.

Contrast is significant (α = 0.05) and magnitude of difference is negative.

Notes: **Bold font** = Data for either exposed or reference in the indicated year were entirely <LRL, leading to a less than accurate estimate of the mean for the <LRL result and greater uncertainty for the calculated MOD. No MOD is displayed if the comparison was not significant. "-" = no data available. ANOVA = two way analysis of variance. MLE = censored regression using maximum likelihood estimation. MOD = Magnitude of Difference. nt = not tested because all data were reported below the laboratory reporting limit (<LRL) or because there were only data for a single time period. ns = not significant. baseline= first year of data included in analysis. <LRL = greater than 50% LRL data for both areas so the time period was omitted from the analysis. Merged cells across years indicate that the Area × Year term was not significant, therefore MOD is for all years combined. Only years with samples from both reference and exposed were included in the analysis (i.e., data from HAC-R1 in 2017 were excluded). Data were analysed in units of mg/kg dry weight.

[a] Years that share a letter (e.g., A,B,C) had ratios of concentrations (HAC-R1:EDC-U) that do not differ significantly among years. Letters are assigned such that A is assigned to the year with the highest ratio of concentrations (HAC-R1:EDC-U).

[b] Magnitude of difference (MOD) calculated on backtransformed least-squares means for the observed time period as $(Exp_{observed} - Exp_{predicted})/(Exp_{predicted})\times 100\%$ where $Exp_{predicted} = Ref_{observed} + (Exp_{baseline} - Ref_{baseline})$.

[c] Magnitude of difference (MOD) calculated on backtransformed least-squares means as (Exp-Ref)/Ref x 100%.

Table F.4.2: Statistical Comparisons of Periphyton Tissue Metal Concentrations for the Upper Hazeltine Creek (HAC-R1; Exposed) Monitoring Area in Post-Breach Years (2017 to 2024) Relative to Pre-Breach Conditions (2010; W7)

Area x Year or Area P-value < 0.05.

Contrast is significant (α = 0.05) and magnitude of difference is positive.

Contrast is significant (α = 0.05) and magnitude of difference is negative.

Notes: **Bold font** = Data for either exposed or reference in the indicated year were entirely <LRL, leading to a less than accurate estimate of the mean for the <LRL result and greater uncertainty for the calculated MOD. No MOD is displayed if the comparison was not significant."-" = no data available. ANOVA = two way analysis of variance. MLE = censored regression using maximum likelihood estimation. MOD = Magnitude of Difference. nt = not tested because all data were reported below the laboratory reporting limit (<LRL) or because there were only data for a single time period. ns = not significant. baseline= first year of data included in analysis. <LRL = greater than 50% LRL data for both areas so the time period was omitted from the analysis. HAC-R2 is the alternate name for the HAC-U sampling area for HRWG reporting. Merged cells across years indicate that the Area × Year term was not significant, therefore MOD is for all years combined. Only years with samples from both reference and exposed were included in the analysis. Data were analysed in units of mg/kg dry weight.

[a] Years that share a letter (e.g., A,B,C) had ratios of concentrations (HAC-U:EDC-U) that do not differ significantly among years. Letters are assigned such that A is assigned to the year with the highest ratio of concentrations (HAC-U:EDC-U).

[b] Magnitude of difference (MOD) calculated on backtransformed least-squares means for the observed time period as $(Exp_{observed} - Exp_{predicted})/(Exp_{predicted})\times 100\%$ where $Exp_{predicted} = Ref_{observed} + (Exp_{baseline} - Ref_{baseline})$.

[c] Magnitude of difference (MOD) calculated on backtransformed least-squares means as (Exp-Ref)/Ref x 100%.

Area x Year or Area P-value < 0.05.

Contrast is significant (α = 0.05) and magnitude of difference is positive.

Contrast is significant (α = 0.05) and magnitude of difference is negative.

Notes: **Bold font** = Data for either exposed or reference in the indicated year were entirely <LRL, leading to a less than accurate estimate of the mean for the <LRL result and greater uncertainty for the calculated MOD. No MOD is displayed if the comparison was not significant. "-" = no data available. ANOVA = two way analysis of variance. MLE = censored regression using maximum likelihood estimation. MOD = Magnitude of Difference. nt = not tested because all data were reported below the laboratory reporting limit (<LRL) or because there were only data for a single time period. ns = not significant. baseline= first year of data included in analysis. <LRL = greater than 50% LRL data for both areas so the time period was omitted from the analysis. Merged cells across years indicate that the Area × Time term was not significant, therefore MOD is for all years combined. Only years with samples from both reference and exposed were included in the analysis. Data were analysed in units of mg/kg dry weight.

[a] Years that share a letter (e.g., A,B,C) had ratios of concentrations (HAC-R1:EDC-U) that do not differ significantly among years. Letters are assigned such that A is assigned to the year with the highest ratio of concentrations (HAC-R1:EDC-U).

[b] Magnitude of difference (MOD) calculated on backtransformed least-squares means for the observed time period as $(Exp_{observed} - Exp_{predicted})/(Exp_{predicted})\times 100\%$ where $Exp_{predicted} = Ref_{observed} + (Exp_{baseline} - Ref_{baseline})$.

[c] Magnitude of difference (MOD) calculated on backtransformed least-squares means as (Exp-Ref)/Ref x 100%.

Table F.4.7: Statistical Comparisons of Composite-Taxa Benthic Invertebrate Tissue Metal Concentrations for the Upper Hazeltine Creek (HAC-R1; Exposed) Monitoring Area in Post-Breach Years (2018 to 2024) Relative to Pre-Breach Conditions (2010; W7)

Area x Year or Area P-value < 0.05.

Contrast is significant (α = 0.05) and magnitude of difference is positive.

Contrast is significant (α = 0.05) and magnitude of difference is negative.

Notes: **Bold font** = Data for either exposed or reference in the indicated year were entirely <LRL, leading to a less than accurate estimate of the mean for the <LRL result and greater uncertainty for the calculated MOD. No MOD is displayed if the comparison was not significant. "-" = no data available. ANOVA = two way analysis of variance. MLE = censored regression using maximum likelihood estimation. MOD = Magnitude of Difference. nt = not tested because all data were reported below the laboratory reporting limit (<LRL) or because there were only data for a single time period. ns = not significant. baseline= first year of data included in analysis. <LRL = greater than 50% LRL data for both areas so the time period was omitted from the analysis. HAC-R2 is the alternate name for the HAC-U sampling area for HRWG reporting. Merged cells across years indicate that the Area × Time term was not significant, therefore MOD is for all years combined. Only years with samples from both reference and exposed were included in the analysis (i.e., data from HAC-U in 2015 were excluded). Data were analysed in units of mg/kg dry weight.

[a] Years that share a letter (e.g., A,B,C) had ratios of concentrations (HAC-U:EDC-U) that do not differ significantly among years. Letters are assigned such that A is assigned to the year with the highest ratio of concentrations (HAC-U:EDC-U).

[b] Magnitude of difference (MOD) calculated on backtransformed least-squares means for the observed time period as $(Exp_{observed} - Exp_{predicted})/(Exp_{predicted})\times 100\%$ where $Exp_{predicted} = Ref_{observed} + (Exp_{baseline} - Ref_{baseline})$.

[c] Magnitude of difference (MOD) calculated on backtransformed least-squares means as (Exp-Ref)/Ref x 100%.

Table F.4.10: Statistical Comparisons of Composite-Taxa Benthic Invertebrate Tissue Metal Concentrations for the Upper Hazeltine Creek (HAC-U [HAC-R2]; Exposed) Monitoring Area in Post-Breach Years (2015 to 2024) Relative to Pre-Breach Conditions (2010; W7)

Area x Year or Area P-value < 0.05.

Contrast is significant (α = 0.05) and magnitude of difference is positive.

Contrast is significant (α = 0.05) and magnitude of difference is negative.

Notes: "-" = no data available or TTF not calculated because data were reported below the laboratory reporting limit (<LRL) for either the periphyton or benthic invertebrate tissue results. ANOVA = two way analysis of variance. MOD = Magnitude of Difference. nt = not tested because TTF not calculated due to values reported below the laboratory reporting limit (<LRL) or because there were only data for a single time period. ns = not significant. baseline= first year of data included in analysis. Merged cells across years indicate that the Area × Year term was not significant, therefore MOD is for all years combined. Only years with samples from both reference and exposed were included in the analysis.

[a] Years that share a letter (e.g., A,B,C) had ratios of concentrations (HAC-R1:EDC-U) that do not differ significantly among years. Letters are assigned such that A is assigned to the year with the highest ratio of concentrations (HAC-R1:EDC-U).

[b] Magnitude of difference (MOD) calculated on backtransformed least-squares means for the observed time period as $(Exp_{observed} - Exp_{predicted})/(Exp_{predicted})\times 100\%$ where $Exp_{predicted} = Ref_{observed} + (Exp_{baseline} - Ref_{baseline})$.

[c] Magnitude of difference (MOD) calculated on backtransformed least-squares means as (Exp-Ref)/Ref x 100%.

Table F.4.12: **Statistical Comparisons of Exposed - Reference Relative Differences of Trophic Transfer Factors for Composite-Taxa Benthic Invertebrate Tissue Metal Concentrations for the Upper Hazeltine Creek (HAC-R1; Exposed) and Upper Edney Creek (EDC-U; Reference) Monitoring Areas, 2018 to 2024**

Area x Year or Area P-value < 0.05.

Contrast is significant (α = 0.05) and magnitude of difference is positive.

Contrast is significant (α = 0.05) and magnitude of difference is negative.

Notes: "-" = no data available or TTF not calculated because data were reported below the laboratory reporting limit (<LRL) for either the periphyton or benthic invertebrate tissue results. ANOVA = two way analysis of variance. MOD = Magnitude of Difference. nt = not tested because TTF not calculated due to values reported below the laboratory reporting limit (<LRL) or because there were only data for a single time period. ns = not significant. baseline= first year of data included in analysis. Merged cells across years indicate that the Area × Year term was not significant, therefore MOD is for all years combined. Only years with samples from both reference and exposed were included in the analysis.

[a] Years that share a letter (e.g., A,B,C) had ratios of concentrations (HAC-R1:EDC-U) that do not differ significantly among years. Letters are assigned such that A is assigned to the year with the highest ratio of concentrations (HAC-R1:EDC-U).

[b] Magnitude of difference (MOD) calculated on backtransformed least-squares means for the observed time period as $(Exp_{observed} - Exp_{predicted})/(Exp_{predicted})\times100\%$ where $Exp_{predicted} = Ref_{observed} + (Exp_{baseline} - Ref_{baseline})$.

[c] Magnitude of difference (MOD) calculated on backtransformed least-squares means as (Exp-Ref)/Ref x 100%

Table F.4.13: Statistical Comparisons of Trophic Transfer Factors for Composite-Taxa Benthic Invertebrate Tissue Metal Concentrations for the Upper Hazeltine Creek (HAC-R1; Exposed) Monitoring Area in Post-Breach Years (2018 to 2024) Relative to Pre-Breach Conditions (2010; W7)

Area x Year or Area P-value < 0.05.

Contrast is significant (α = 0.05) and magnitude of difference is positive.

Contrast is significant (α = 0.05) and magnitude of difference is negative.

Notes: "-" = no data available or TTF not calculated because data were reported below the laboratory reporting limit (<LRL) for either the periphyton or benthic invertebrate tissue results. ANOVA = two way analysis of variance. MOD = Magnitude of Difference. nt = not tested because TTF not calculated due to values reported below the laboratory reporting limit (<LRL) or because there were only data for a single time period. ns = not significant. baseline = first year of data included in analysis. HAC-R2 is the alternate name for the HAC-U sampling area for HRWG reporting. Merged cells across years indicate that the Area × Year term was not significant, therefore MOD is for all years combined. Only years with samples from both reference and exposed were included in the analysis.

[a] Years that share a letter (e.g., A,B,C) had ratios of concentrations (HAC-U:EDC-U) that do not differ significantly among years. Letters are assigned such that A is assigned to the year with the highest ratio of concentrations (HAC-U:EDC-U).

[b] Magnitude of difference (MOD) calculated on backtransformed least-squares means for the observed time period as $(Exp_{observed} - Exp_{predicted})/(Exp_{predicted})\times100\%$ where $Exp_{predicted} = Ref_{observed} + (Exp_{baseline} - Ref_{baseline})$.

[c] Magnitude of difference (MOD) calculated on backtransformed least-squares means as (Exp-Ref)/Ref x 100%.

Table F.4.15: **Statistical Comparisons of Exposed - Reference Relative Differences of Trophic Transfer Factors for Composite-Taxa Benthic Invertebrate Tissue Metal Concentrations for the Upper Hazeltine Creek (HAC-U [HAC-R2]; Exposed) and Upper Edney Creek (EDC-U; Reference) Monitoring Areas, 2018 to 2024**

Area x Year or Area P-value < 0.05.

Contrast is significant (α = 0.05) and magnitude of difference is positive.

Contrast is significant (α = 0.05) and magnitude of difference is negative.

Notes: **Bold font** = Data for either exposed or reference in the indicated year were entirely <LRL, leading to a less than accurate estimate of the mean for the <LRL result and greater uncertainty for the calculated MOD. No MOD is displayed if the comparison was not significant."-" = no data available. ANOVA = two way analysis of variance. MLE = censored regression using maximum likelihood estimation. MOD = Magnitude of Difference. nt = not tested because all data were reported below the laboratory reporting limit (<LRL) or because there were only data for a single time period. ns = not significant. baseline= first year of data included in analysis. <LRL = greater than 50% LRL data for both areas so the time period was omitted from the analysis. HAC-R5 and EDC-REF are the alternate names for the HAC-D and EDC-D sampling areas, respectively, for HRWG reporting. Merged cells across years indicate that the Area × Year term was not significant, therefore MOD is for all years combined. Only years with samples from both reference and exposed were included in the analysis. Data were analysed in units of mg/kg dry weight.

[a] Years that share a letter (e.g., A,B,C) had ratios of concentrations (HAC-D:EDC-D) that do not differ significantly among years. Letters are assigned such that A is assigned to the year with the highest ratio of concentrations (HAC-D:EDC-D).

[b] Magnitude of difference (MOD) calculated on backtransformed least-squares means for the observed time period as $(Exp_{observed} - Exp_{predicted})/(Exp_{predicted})\times 100\%$ where $Exp_{predicted} = Ref_{observed} + (Exp_{baseline} - Ref_{baseline})$.

[c] Magnitude of difference (MOD) calculated on backtransformed least-squares means as (Exp-Ref)/Ref x 100%.

Area x Year or Area P-value < 0.05.

Contrast is significant (α = 0.05) and magnitude of difference is positive.

Contrast is significant (α = 0.05) and magnitude of difference is negative.

Notes: **Bold font** = Data for either exposed or reference in the indicated year were entirely <LRL, leading to a less than accurate estimate of the mean for the <LRL result and greater uncertainty for the calculated MOD. No MOD is displayed if the comparison was not significant. "-" = no data available. ANOVA = two way analysis of variance. MLE = censored regression using maximum likelihood estimation. MOD = Magnitude of Difference. nt = not tested because all data were reported below the laboratory reporting limit (<LRL) or because there were only data for a single time period. ns = not significant. baseline= first year of data included in analysis. <LRL = greater than 50% LRL data for both areas so the time period was omitted from the analysis. HAC-R5 and EDC-REF are the alternate names for the HAC-D and EDC-D sampling areas, respectively, for HRWG reporting. Merged cells across years indicate that the Area × Year term was not significant, therefore MOD is for all years combined. Only years with samples from both reference and exposed were

[a] Years that share a letter (e.g., A,B,C) had ratios of concentrations (HAC-D:EDC-D) that do not differ significantly among years. Letters are assigned such that A is assigned to the year with the highest ratio of concentrations (HAC-D:EDC-D).

[b] Magnitude of difference (MOD) calculated on backtransformed least-squares means for the observed time period as $(Exp_{observed} - Exp_{predicted})/(Exp_{predicted})\times 100\%$ where $Exp_{predicted} = Ref_{observed} + (Exp_{baseline} - Ref_{baseline})$.

[c] Magnitude of difference (MOD) calculated on backtransformed least-squares means as (Exp-Ref)/Ref x 100%.

Table F.4.21: Statistical Comparisons of Composite-Taxa Benthic Invertebrate Tissue Metal Concentrations for the Lower Hazeltine Creek (HAC-D [HAC-R5]; Exposed) Monitoring Area in Post-Breach Years (2015 to 2024) Relative to Pre-Breach Conditions (2010; W11)

Area x Year or Area P-value < 0.05.

Contrast is significant (α = 0.05) and magnitude of difference is positive.

Contrast is significant (α = 0.05) and magnitude of difference is negative.

Notes: "-" = no data available or TTF not calculated because data were reported below the laboratory reporting limit (<LRL) for either the periphyton or benthic invertebrate tissue results. ANOVA = two way analysis of variance. MOD = Magnitude of Difference. nt = not tested because TTF not calculated due to values reported below the laboratory reporting limit (<LRL) or because there were only data for a single time period. ns = not significant. baseline = first year of data included in analysis. HAC-R5 and EDC-REF are the alternate names for the HAC-D and EDC-D sampling areas, respectively, for HRWG reporting. Merged cells across years indicate that the Area × Year term was not significant, therefore MOD is for all years combined. Only years with samples from both reference and exposed were included in the analysis.

[a] Years that share a letter (e.g., A,B,C) had ratios of concentrations (HAC-D:EDC-D) that do not differ significantly among years. Letters are assigned such that A is assigned to the year with the highest ratio of concentrations (HAC-D:EDC-D).

[b] Magnitude of difference (MOD) calculated on backtransformed least-squares means for the observed time period as $(Exp_{observed} - Exp_{predicted})/(Exp_{predicted}) \times 100\%$ where $Exp_{predicted} = Ref_{observed} + (Exp_{baseline} - Ref_{baseline})$.

[c] Magnitude of difference (MOD) calculated on backtransformed least-squares means as (Exp-Ref)/Ref x 100%.

Table F.4.23: Statistical Comparisons of Exposed - Reference Relative Differences of Trophic Transfer Factors for Composite-Taxa Benthic Invertebrate Tissue Metal Concentrations for the Lower Hazeltine Creek (HAC-D [HAC-R5]; Exposed) and Lower Edney Creek (EDC-D [EDC-REF]; Reference) Monitoring Areas, 2018 to 2024

Parameter	Data Transformation	Two-way ANOVA P-values			(Exposed – Reference) Contrasts Among Periods[a]							Magnitude of Difference in (Exposed – Reference) Relative to Baseline Period (%)[b]							Magnitude of Difference for HAC-D (HAC-R5) Mean Relative to EDC-D (EDC-REF; %)[c]

Area x Year or Area P-value < 0.05.

Contrast is significant (α = 0.05) and magnitude of difference is positive.

Contrast is significant (α = 0.05) and magnitude of difference is negative.

Notes: **Bold font** = Data for either exposed or reference in the indicated year were entirely <LRL, leading to a less than accurate estimate of the mean for the <LRL result and greater uncertainty for the calculated MOD. No MOD is displayed if the comparison was not significant. "-" = no data available. ANOVA = two way analysis of variance. MLE = censored regression using maximum likelihood estimation. MOD = Magnitude of Difference. nt = not tested because all data were reported below the laboratory reporting limit (<LRL) or because there were only data for a single time period. ns = not significant. baseline= first year of data included in analysis. <LRL = greater than 50% LRL data for both areas so the time period was omitted from the analysis. EDC-EXP and EDC-REF are the alternate names for the E1 and EDC-D sampling areas, respectively, for HRWG reporting. Merged cells across years indicate that the Area × Year term was not significant, therefore MOD is for all years combined. Only years with samples from both reference and exposed were included in the analysis. Data were analysed in units of mg/kg dry weight.

[a] Years that share a letter (e.g., A,B,C) had ratios of concentrations (E1:EDC-D) that do not differ significantly among years. Letters are assigned such that A is assigned to the year with the highest ratio of concentrations (E1:EDC-D).

[b] Magnitude of difference (MOD) calculated on backtransformed least-squares means for the observed time period as $(Exp_{observed} - Exp_{predicted})/(Exp_{predicted})\times 100\%$ where $Exp_{predicted} = Ref_{observed} + (Exp_{baseline} - Ref_{baseline})$.

[c] Magnitude of difference (MOD) calculated on backtransformed least-squares means as (Exp-Ref)/Ref x 100%.

Table F.4.26: **Statistical Comparisons of Exposed - Reference Relative Differences of Caddisfly Tissue Metal Concentrations for the Lower Edney Creek (E1 [EDC-EXP]; Exposed and EDC-D [EDC-REF]; Reference) Monitoring Areas, 2019 to 2024**

Area x Year or Area P-value < 0.05.

Contrast is significant (α = 0.05) and magnitude of difference is positive.

Contrast is significant (α = 0.05) and magnitude of difference is negative.

Notes: **Bold font** = Data for either exposed or reference in the indicated year were entirely <LRL, leading to a less than accurate estimate of the mean for the <LRL result and greater uncertainty for the calculated MOD. No MOD is displayed if the comparison was not significant. "-" = no data available. ANOVA = two way analysis of variance. MLE = censored regression using maximum likelihood estimation. MOD = Magnitude of Difference. nt = not tested because all data were reported below the laboratory reporting limit (<LRL) or because there were only data for a single time period. ns = not significant. baseline= first year of data included in analysis. <LRL = greater than 50% LRL data for both areas so the time period was omitted from the analysis. EDC-EXP and EDC-REF are the alternate names for the E1 and EDC-D sampling areas, respectively, for HRWG reportingMerged cells across years indicate that the Area × Year term was not significant, therefore MOD is for all years combined. Only years with samples from both reference and exposed were included in the analysis. Data were analysed in units of mg/kg dry weight.

[a] Years that share a letter (e.g., A,B,C) had ratios of concentrations (E1:EDC-D) that do not differ significantly among years. Letters are assigned such that A is assigned to the year with the highest ratio of concentrations (E1:EDC-D).

[b] Magnitude of difference (MOD) calculated on backtransformed least-squares means for the observed time period as $(Exp_{observed} - Exp_{predicted})/(Exp_{predicted})\times 100\%$ where $Exp_{predicted} = Ref_{observed} + (Exp_{baseline} - Ref_{baseline})$.

[c] Magnitude of difference (MOD) calculated on backtransformed least-squares means as (Exp-Ref)/Ref x 100%.

Contrast is significant (α = 0.05) and magnitude of difference is positive.

Contrast is significant (α = 0.05) and magnitude of difference is negative.

Notes: "-" = no data available or Trophic Transfer Factor (TTF) not calculated because > 50% analyte concentrations were below the Laboratory Reporting Limit (LRL) for either the periphyton or benthic invertebrate tissue results. ANOVA = two way analysis of variance. MOD = Magnitude of Difference. nt = not tested because all data were reported <LRL or because there were only data for a single time period. ns = not significant. baseline= first year of data included in analysis. EDC-EXP and EDC-REF are the alternate names for the E1 and EDC-D sampling areas, respectively, for HRWG reporting. Merged cells across years indicate that the Area × Year term was not significant, therefore MOD is for all years combined. Only years with samples from both reference and exposed were included in the analysis.

[a] Years that share a letter (e.g., A,B,C) had ratios of concentrations (E1:EDC-D) that do not differ significantly among years. Letters are assigned such that A is assigned to the year with the highest ratio of concentrations (E1:EDC-D).

[b] Magnitude of difference (MOD) calculated on backtransformed least-squares means for the observed time period as $(Exp_{observed} - Exp_{predicted})/(Exp_{predicted})\times 100\%$ where $Exp_{predicted} = Ref_{observed} + (Exp_{baseline} - Ref_{baseline})$.

[c] Magnitude of difference (MOD) calculated on backtransformed least-squares means as (Exp-Ref)/Ref x 100%.

Table F.4.29: **Statistical Comparisons of Exposed - Reference Relative Differences of Trophic Transfer Factors for Composite-Taxa Benthic Invertebrate Tissue Metal Concentrations for the Lower Edney Creek (E1 [EDC-EXP]; Exposed and EDC-D [EDC-REF]; Reference) Monitoring Areas, 2019 to 2024**

Area x Year or Area P-value < 0.05.

Contrast is significant (α = 0.05) and magnitude of difference is positive.

Contrast is significant (α = 0.05) and magnitude of difference is negative.

Notes: "-" = no data available or TTF not calculated because data were reported below the laboratory reporting limit (<LRL) for either the periphyton or benthic invertebrate tissue results. ANOVA = two way analysis of variance. MOD = Magnitude of Difference. nt = not tested because TTF not calculated because data were reported below the laboratory reporting limit (<LRL) or because there were only data for a single time period. ns = not significant. baseline = first year of data included in analysis. EDC-EXP and EDC-REF are the alternate names for the E1 and EDC-D sampling areas, respectively, for HRWG reporting. Merged cells across years indicate that the Area × Year term was not significant, therefore MOD is for all years combined. Only years with samples from both reference and exposed were included in the analysis.

[a] Years that share a letter (e.g., A,B,C) had ratios of concentrations (E1:EDC-D) that do not differ significantly among years. Letters are assigned such that A is assigned to the year with the highest ratio of concentrations (E1:EDC-D).

[b] Magnitude of difference (MOD) calculated on backtransformed least-squares means for the observed time period as $(Exp_{observed} - Exp_{predicted})/(Exp_{predicted}) \times 100\%$ where $Exp_{predicted} = Ref_{observed} + (Exp_{baseline} - Ref_{baseline})$.

[c] Magnitude of difference (MOD) calculated on backtransformed least-squares means as (Exp-Ref)/Ref x 100%.

APPENDIX F.5
FISH TISSUE QUALITY

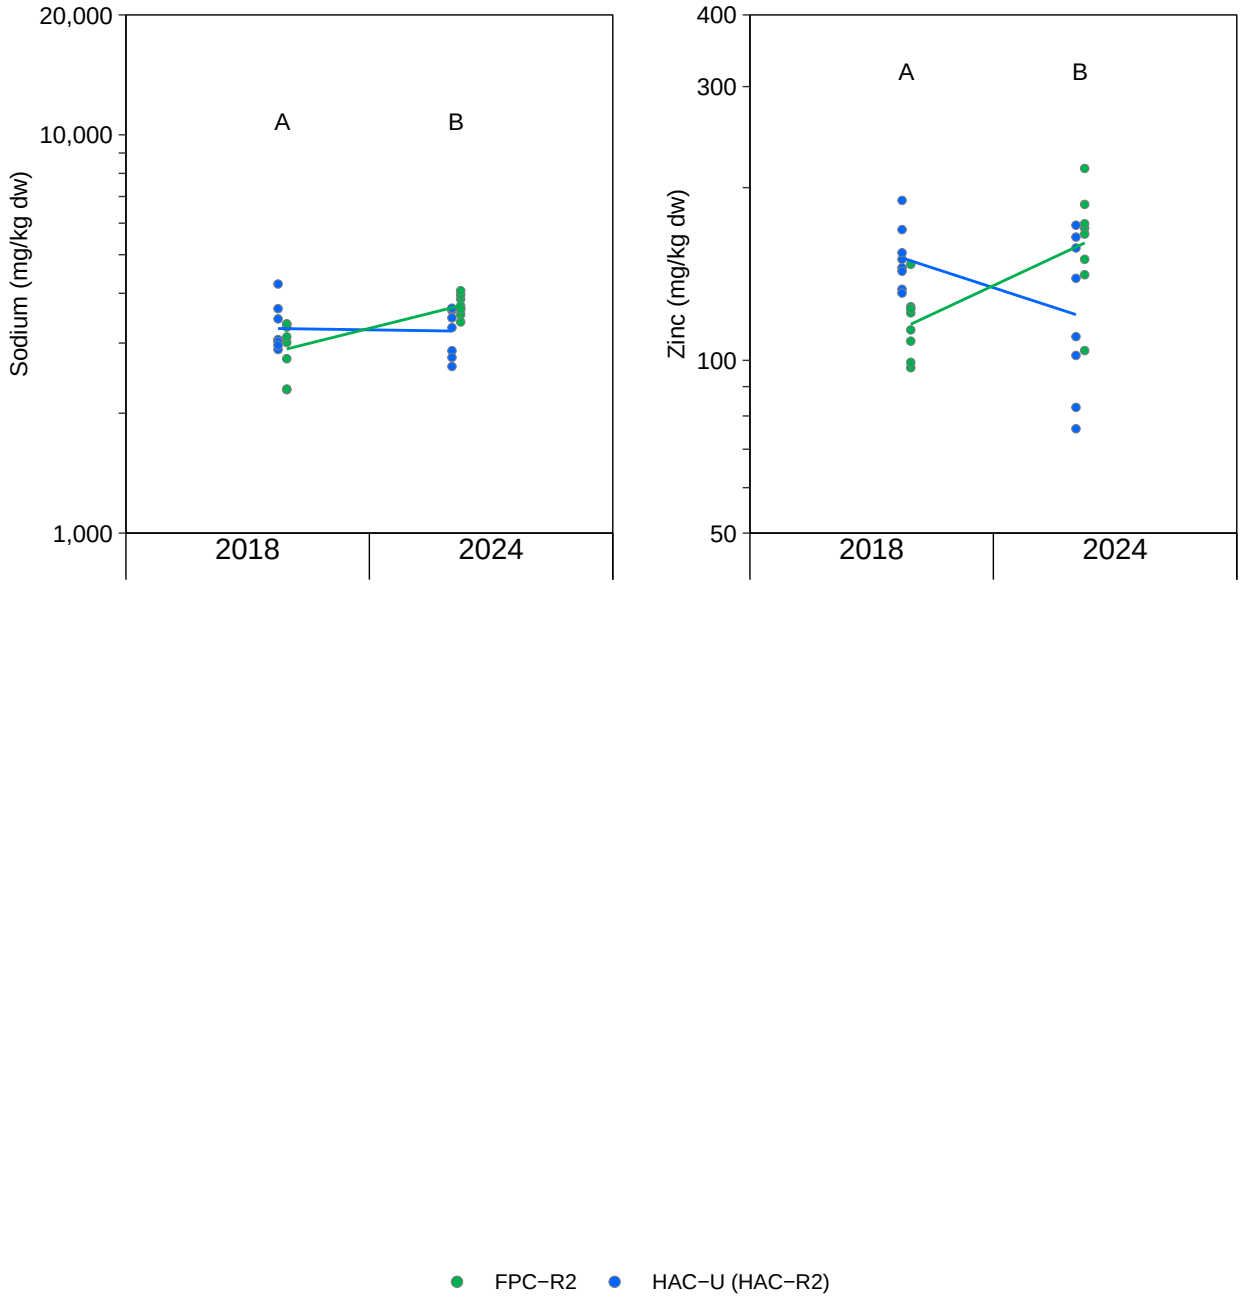

Figure F.5.1: Juvenile Rainbow Trout Whole-body Tissue Primary and Secondary Analyte Concentrations with a Significant Negative Exposed - Reference Difference and a Significant Area x Year Effect for the Upper Hazeltine Creek (HAC-U [HAC-R2]; Exposed) and Frypan Creek (FPC-R2; Reference) Monitoring Areas, 2018 to 2024

Notes: dw = dry weight. HAC-R2 is the alternate name for the HAC-U sampling area for HRWG reporting. Green represents reference data and blue represents exposed data. Rainbow trout from Upper Hazeltine Creek were collected from HAC−R1 and HAC−U (HAC−R2) in 2018 and only from HAC−U (HAC−R2) in 2024. Concentrations below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL and the open symbol represents one or more values reported below the LRL. Individual samples are plotted and lines join the least- squares estimated mean values for years included in the statistical analysis (i.e., not <LRL). Statistical analyses were conducted using a two −way ANOVA with factors Area and Year. The models were fit using Maximum Likelihood Estimation with an assumed log −normal distribution. Years that share a letter (e.g., A,B,C) have ratios of concentrations (HAC−U:FPC−R2) that do not differ significantly (p−value <0.05) among years. Letter A was assigned to the year with the highest ratio of concentrations (HAC−U:FPC−R2).

Table F.5.1: Statistical Comparisons of Exposed - Reference Relative Differences of Juvenile Rainbow Trout Whole-body Tissue Metal Concentrations for the Upper Hazeltine Creek (HAC-U [HAC-R2]; Exposed) and Frypan Creek (FPC-R2; Reference) Monitoring Areas, 2018 to 2024

Area x Year or Area P-value < 0.05.

Contrast is significant (α = 0.05) and magnitude of difference is positive.

Contrast is significant (α = 0.05) and magnitude of difference is negative.

Notes: **Bold font** = Data for either exposed or reference in the indicated year were entirely <LRL, leading to a less accurate estimate of the mean for the <LRL result and greater uncertainty for the calculated MOD**.** No MOD is displayed if the comparison was not significant. "-" = no data available or no post-hoc test conducted because of censored data, <LRL = greater than 50% laboratory reporting limit data for both stations so the time period was omitted from the analysis, nt = not tested because all data were reported below the LRL or because there were only data for a single time period, ns = not significant, baseline = first year of data included in analysis, ww = wet weight, ANOVA = analysis of variance, MLE = censored regression using maximum likelihood estimation, ANCOVA = two-way analysis of covariance using censored regression, MOD = magnitude of difference. HAC-R2 is the alternate name for the HAC-U sampling area for HRWG reporting. Data were analysed in units of mg/kg dry weight except mercury which was analysed in units of mg/kg wet weight. Merged cells across years indicate that the Area × Time term was not significant, therefore MOD is for all years combined. Only years with samples from both reference and exposed were included in the analysis.

[a] Years that share a letter (e.g., A,B,C) had ratios of concentrations (Exposed:Reference) that do not differ significantly among years. Letters are assigned such that A is assigned to the year with the highest ratio of concentrations (Exposed:Reference).

[b] Magnitude of difference (MOD) calculated on backtransformed least-squares means for the observed time period as $(Exp_{observed} - Exp_{predicted})/(Exp_{predicted})\times 100\%$ where $Exp_{predicted} = Ref_{observed} + (Exp_{baseline} - Ref_{baseline})$.

[c] Magnitude of difference (MOD) calculated on backtransformed least-squares means as (Exp-Ref)/Ref x 100%.

[d] Conducted as a two-way ANCOVA with log10(fork length) as a covariate. Because the covariate was significant, all contrasts were conducted using mean log10(fork length).

Table F.5.2: Statistical Comparisons of Juvenile Coho Whole-body Tissue Metal Concentrations for the Lower Hazeltine Creek (HAC-D [HAC-R5]; Exposed) and Lower Edney Creek (EDC-D [EDC-REF]; Reference) Monitoring Areas, 2024

(Finalized July 3, 2024)

ALS Canada Ltd.

right solutions. right partner.

CERTIFICATE OF ANALYSIS

Work Order	: **VA24B4763**	Page	: 1 of 6
Client	: **Minnow Environmental Inc.**	Laboratory	: ALS Environmental - Vancouver
Contact	: Sally Ju	Account Manager	: Can Dang
Address	: 306-885 Don Mills Road Toronto ON Canada M3C 1V9	Address	: 8081 Lougheed Highway Burnaby BC Canada V5A 1W9
Telephone	: 1-289-775-1547	Telephone	: +1 604 253 4188
Project	: 24-04- Task 5	Date Samples Received	: 21-Jun-2024 10:45
PO	: 5590017616	Date Analysis Commenced	: 22-Jun-2024
C-O-C number	: ----	Issue Date	: 03-Jul-2024 09:59
Sampler	: SJU, SLA		
Site	: ----		
Quote number	: VA24-MPMC100-007 (Minnow/Mt. Polley)		
No. of samples received	: 5		
No. of samples analysed	: 5		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Elke Tabora	Lab Analyst	Inorganics, Calgary, Alberta

Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Leon Yang	Analyst	Inorganics, Burnaby, British Columbia
Ruifang Zheng	Analyst	Inorganics, Calgary, Alberta

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	no units
µS/cm	microsiemens per centimetre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Qualifiers

Qualifier	*Description*
DLM	*Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).*

ALS Canada Ltd.

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **VA24B4763**	Page	: 1 of 19
Client	: **Minnow Environmental Inc.**	Laboratory	: ALS Environmental - Vancouver
Contact	: Sally Ju	Account Manager	: Can Dang
Address	: 306-885 Don Mills Road Toronto ON Canada M3C 1V9	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	: ----	Telephone	: +1 604 253 4188
Project	: 24-04- Task 5	Date Samples Received	: 21-Jun-2024 10:45
PO	: 5590017616	Issue Date	: 03-Jul-2024 09:59
C-O-C number	: ----		
Sampler	: SJU, SLA		
Site	: ----		
Quote number	: VA24-MPMC100-007 (Minnow/Mt. Polley)		
No. of samples received	: 5		
No. of samples analysed	: 5		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Matrix: **Water**

Evaluation: × = Holding time exceedance ; ✓ = Within Holding Time

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

EHT: Exceeded ALS recommended hold time prior to analysis.

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = QC frequency outside specification; ✓ = QC frequency within specification.

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 ALS Environmental - Vancouver	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 ALS Environmental - Vancouver	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Turbidity by Nephelometry	E121 ALS Environmental - Vancouver	Water	APHA 2130 B (mod)	Turbidity is measured by the nephelometric method, by measuring the intensity of light scatter under defined conditions.
TDS by Gravimetry	E162 ALS Environmental - Vancouver	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at 180 ± 2°C for 16 hours or to constant weight, with gravimetric measurement of the residue.
TSS by Gravimetry (Whole Bottle)	E164 ALS Environmental - Vancouver	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
Chloride in Water by IC	E235.Cl ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Sulfate in Water by IC	E235.SO4 ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Alkalinity Species by Titration	E290 ALS Environmental - Vancouver	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 ALS Environmental - Vancouver	Water	Method Fialab 100, 2018	Ammonia in water is determined by automated continuous flow analysis with membrane diffusion and fluorescence detection, after reaction with OPA (ortho-phthalaldehyde). This method is approved under US EPA 40 CFR Part 136 (May 2021)
Dissolved Organic Carbon by Combustion (Low Level)	E358-L ALS Environmental - Calgary	Water	APHA 5310 B (mod)	Dissolved Organic Carbon (Non-Purgeable), also known as NPOC (dissolved), is a direct measurement of DOC after a filtered (0.45 micron) sample has been acidified and purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO2. NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of DC (dissolved carbon) is comprised of IC (which is common), this method is more accurate and more reliable than the DOC by subtraction method (i.e. DC minus DIC).
Total Nitrogen by Colourimetry	E366 ALS Environmental - Vancouver	Water	Chinchilla Scientific Nitrate Method, 2011	Following digestion, total nitrogen is is determined colourimetrically using a discrete analyzer utilizing the vanadium chloride reduction method. This method of analysis is approved under US EPA 40 CFR Part 136 (May 2021).
Total Phosphorus by Colourimetry (0.002 mg/L)	E372-U ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Total Dissolved Phosphorus by Colourimetry (0.002 mg/L)	E375-T ALS Environmental - Calgary	Water	APHA 4500-P E (mod).	Total Dissolved Phosphorus is determined colourimetrically using a discrete analyzer after filtration through a 0.45 micron filter followed by heated persulfate digestion of the sample.
Dissolved Orthophosphate by Colourimetry (Ultra Trace Level 0.001 mg/L)	E378-U ALS Environmental - Vancouver	Water	APHA 4500-P F (mod)	Dissolved Orthophosphate is determined colourimetrically on a sample that has been lab or field filtered through a 0.45 micron membrane filter. Field filtration is recommended to ensure test results represent conditions at time of sampling.
Total Metals in Water by CRC ICPMS	E420 ALS Environmental - Vancouver	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals in Water by CRC ICPMS	E421 ALS Environmental - Vancouver	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Hardness (Calculated)	EC100 ALS Environmental - Vancouver	Water	APHA 2340B	"Hardness (as CaCO3), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Hardness (Calculated) from Total Ca/Mg	EC100A ALS Environmental - Vancouver	Water	APHA 2340B	"Hardness (as CaCO3), from total Ca/Mg" is calculated from the sum of total Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations. Hardness from total Ca/Mg is normally comparable to Dissolved Hardness in non-turbid waters.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N ALS Environmental - Vancouver	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 ALS Environmental - Vancouver	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Preparation for Dissolved Organic Carbon for Combustion	EP358 ALS Environmental - Calgary	Water	APHA 5310 B (mod)	Preparation for Dissolved Organic Carbon
Digestion for Total Nitrogen in water	EP366 ALS Environmental - Vancouver	Water	APHA 4500-P J (mod)	Samples for total nitrogen analysis are digested using a heated persulfate digestion. Nitrogen compounds are converted to nitrate in this digestion.
Digestion for Total Phosphorus in water	EP372 ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.
Digestion for Dissolved Phosphorus in water	EP375 ALS Environmental - Calgary	Water	APHA 4500-P E (mod).	Samples are filtered through a 0.45 micron membrane filter and then heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

Project	: 24-04 Task 5	Date Samples Received	: 24-Jul-2024 08:10
PO	: 5590017616	Date Analysis Commenced	: 25-Jul-2024
C-O-C number	: ----	Issue Date	: 02-Aug-2024 16:48
Sampler	: ----		
Site	: ----		
Quote number	: VA24-MPMC100-007 (Minnow/Mt. Polley)		
No. of samples received	: 3		
No. of samples analysed	: 3		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Delson Resende	Lab Assistant	Metals, Burnaby, British Columbia
Kate Dimitrova	Supervisor - Inorganic	Inorganics, Burnaby, British Columbia
Robert Nguyen	Analyst	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	no units
µS/cm	microsiemens per centimetre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Workorder Comments

Amendment (02/08/2024): This report has been amended as a result of a request to change sample identification numbers for VA24B8050-003. All analysis results are as per the previous report.

Qualifiers

Qualifier	*Description*
DLM	*Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).*

ALS Canada Ltd.

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **VA24B8050**	Page	: 1 of 15
Amendment	: 1		
Client	: **Minnow Environmental Inc.**	Laboratory	: ALS Environmental - Vancouver
Contact	: Sally Ju	Account Manager	: Can Dang
Address	: 306-885 Don Mills Road Toronto ON Canada M3C 1V9	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	: ----	Telephone	: +1 604 253 4188
Project	: 24-04 Task 5	Date Samples Received	: 24-Jul-2024 08:10
PO	: 5590017616	Issue Date	: 02-Aug-2024 16:48
C-O-C number	: ----		
Sampler	: ----		
Site	: ----		
Quote number	: VA24-MPMC100-007 (Minnow/Mt. Polley)		
No. of samples received	: 3		
No. of samples analysed	: 3		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type			Count		Frequency (%)

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 ALS Environmental - Vancouver	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 ALS Environmental - Vancouver	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Turbidity by Nephelometry	E121 ALS Environmental - Vancouver	Water	APHA 2130 B (mod)	Turbidity is measured by the nephelometric method, by measuring the intensity of light scatter under defined conditions.
TDS by Gravimetry	E162 ALS Environmental - Vancouver	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at 180 ± 2°C for 16 hours or to constant weight, with gravimetric measurement of the residue.
TSS by Gravimetry (Whole Bottle)	E164 ALS Environmental - Vancouver	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
Chloride in Water by IC	E235.Cl ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Sulfate in Water by IC	E235.SO4 ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Alkalinity Species by Titration	E290 ALS Environmental - Vancouver	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 ALS Environmental - Vancouver	Water	Method Fialab 100, 2018	Ammonia in water is determined by automated continuous flow analysis with membrane diffusion and fluorescence detection, after reaction with OPA (ortho-phthalaldehyde). This method is approved under US EPA 40 CFR Part 136 (May 2021)
Dissolved Organic Carbon by Combustion (Low Level)	E358-L ALS Environmental - Vancouver	Water	APHA 5310 B (mod)	Dissolved Organic Carbon (Non-Purgeable), also known as NPOC (dissolved), is a direct measurement of DOC after a filtered (0.45 micron) sample has been acidified and purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO2. NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of DC (dissolved carbon) is comprised of IC (which is common), this method is more accurate and more reliable than the DOC by subtraction method (i.e. DC minus DIC).
Total Nitrogen by Colourimetry	E366 ALS Environmental - Vancouver	Water	Chinchilla Scientific Nitrate Method, 2011	Following digestion, total nitrogen is is determined colourimetrically using a discrete analyzer utilizing the vanadium chloride reduction method. This method of analysis is approved under US EPA 40 CFR Part 136 (May 2021).
Total Phosphorus by Colourimetry (0.002 mg/L)	E372-U ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Total Dissolved Phosphorus by Colourimetry (0.002 mg/L)	E375-T ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Total Dissolved Phosphorus is determined colourimetrically using a discrete analyzer after filtration through a 0.45 micron filter followed by heated persulfate digestion of the sample.
Dissolved Orthophosphate by Colourimetry (Ultra Trace Level 0.001 mg/L)	E378-U ALS Environmental - Vancouver	Water	APHA 4500-P F (mod)	Dissolved Orthophosphate is determined colourimetrically on a sample that has been lab or field filtered through a 0.45 micron membrane filter. Field filtration is recommended to ensure test results represent conditions at time of sampling.
Total Metals in Water by CRC ICPMS	E420 ALS Environmental - Vancouver	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals in Water by CRC ICPMS	E421 ALS Environmental - Vancouver	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Hardness (Calculated)	EC100 ALS Environmental - Vancouver	Water	APHA 2340B	"Hardness (as CaCO3), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Hardness (Calculated) from Total Ca/Mg	EC100A ALS Environmental - Vancouver	Water	APHA 2340B	"Hardness (as CaCO3), from total Ca/Mg" is calculated from the sum of total Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations. Hardness from total Ca/Mg is normally comparable to Dissolved Hardness in non-turbid waters.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N ALS Environmental - Vancouver	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 ALS Environmental - Vancouver	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Preparation for Dissolved Organic Carbon for Combustion	EP358 ALS Environmental - Vancouver	Water	APHA 5310 B (mod)	Preparation for Dissolved Organic Carbon
Digestion for Total Nitrogen in water	EP366 ALS Environmental - Vancouver	Water	APHA 4500-P J (mod)	Samples for total nitrogen analysis are digested using a heated persulfate digestion. Nitrogen compounds are converted to nitrate in this digestion.
Digestion for Total Phosphorus in water	EP372 ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.
Digestion for Dissolved Phosphorus in water	EP375 ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Samples are filtered through a 0.45 micron membrane filter and then heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percent Difference (RPD) and Data Quality Objectives
- Matrix Spike (MS) Report; Recovery and Data Quality Objectives
- Method Blank (MB) Report; Recovery and Data Quality Objectives
- Laboratory Control Sample (LCS) Report; Recovery and Data Quality Objectives

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Delson Resende	Lab Assistant	Vancouver Metals, Burnaby, British Columbia
Kate Dimitrova	Supervisor - Inorganic	Vancouver Inorganics, Burnaby, British Columbia
Robert Nguyen	Analyst	Vancouver Metals, Burnaby, British Columbia

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Sub-Matrix: **Water**

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

CERTIFICATE OF ANALYSIS

Work Order	: **VA24B8516**	Page	: 1 of 6
Amendment	: **1**		
Client	: **Minnow Environmental Inc.**	Laboratory	: ALS Environmental - Vancouver
Contact	: Sally Ju	Account Manager	: Can Dang
Address	: 306-885 Don Mills Road Toronto ON Canada M3C 1V9	Address	: 8081 Lougheed Highway Burnaby BC Canada V5A 1W9
Telephone	: 1-289-775-1547	Telephone	: +1 604 253 4188
Project	: 24-04 Task 5	Date Samples Received	: 26-Jul-2024 10:35
PO	: 5590017616	Date Analysis Commenced	: 27-Jul-2024
C-O-C number	: ----	Issue Date	: 20-Sep-2024 11:53
Sampler	: ----		
Site	: ----		
Quote number	: VA24-MPMC100-007 (Minnow/Mt. Polley)		
No. of samples received	: 4		
No. of samples analysed	: 4		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Delson Resende	Lab Assistant	Metals, Burnaby, British Columbia
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Marianne Jensen	Analyst- General	Inorganics, Burnaby, British Columbia
Tracy Harley	Supervisor - Water Quality Instrumentation	Inorganics, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	no units
µS/cm	microsiemens per centimetre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Workorder Comments

Amendment (20/09/2024): This report has been amended as a result of a request to change sample identification numbers (IDs) received by ALS for sample ALS ID -03. All analysis results are as per the previous report.

Qualifiers

Qualifier	*Description*
DLM	*Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).*

ALS Canada Ltd.

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **VA24B8516**	Page	: 1 of 17
Amendment	: **1**		
Client	: **Minnow Environmental Inc.**	Laboratory	: ALS Environmental - Vancouver
Contact	: Sally Ju	Account Manager	: Can Dang
Address	: 306-885 Don Mills Road Toronto ON Canada M3C 1V9	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	: ----	Telephone	: +1 604 253 4188
Project	: 24-04 Task 5	Date Samples Received	: 26-Jul-2024 10:35
PO	: 5590017616	Issue Date	: 20-Sep-2024 11:50
C-O-C number	: ----		
Sampler	: ----		
Site	: ----		
Quote number	: VA24-MPMC100-007 (Minnow/Mt. Polley)		
No. of samples received	: 4		
No. of samples analysed	: 4		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Matrix: **Water**

Evaluation: × = Holding time exceedance ; ✓ = Within Holding Time

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type			Count		Frequency (%)

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 ALS Environmental - Vancouver	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 ALS Environmental - Vancouver	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Turbidity by Nephelometry	E121 ALS Environmental - Vancouver	Water	APHA 2130 B (mod)	Turbidity is measured by the nephelometric method, by measuring the intensity of light scatter under defined conditions.
TDS by Gravimetry	E162 ALS Environmental - Vancouver	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at 180 ± 2°C for 16 hours or to constant weight, with gravimetric measurement of the residue.
TSS by Gravimetry (Whole Bottle)	E164 ALS Environmental - Vancouver	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
Chloride in Water by IC	E235.Cl ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Sulfate in Water by IC	E235.SO4 ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Alkalinity Species by Titration	E290 ALS Environmental - Vancouver	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 ALS Environmental - Vancouver	Water	Method Fialab 100, 2018	Ammonia in water is determined by automated continuous flow analysis with membrane diffusion and fluorescence detection, after reaction with OPA (ortho-phthalaldehyde). This method is approved under US EPA 40 CFR Part 136 (May 2021)
Dissolved Organic Carbon by Combustion (Low Level)	E358-L ALS Environmental - Vancouver	Water	APHA 5310 B (mod)	Dissolved Organic Carbon (Non-Purgeable), also known as NPOC (dissolved), is a direct measurement of DOC after a filtered (0.45 micron) sample has been acidified and purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO2. NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of DC (dissolved carbon) is comprised of IC (which is common), this method is more accurate and more reliable than the DOC by subtraction method (i.e. DC minus DIC).
Total Nitrogen by Colourimetry	E366 ALS Environmental - Vancouver	Water	Chinchilla Scientific Nitrate Method, 2011	Following digestion, total nitrogen is is determined colourimetrically using a discrete analyzer utilizing the vanadium chloride reduction method. This method of analysis is approved under US EPA 40 CFR Part 136 (May 2021).
Total Phosphorus by Colourimetry (0.002 mg/L)	E372-U ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Total Dissolved Phosphorus by Colourimetry (0.002 mg/L)	E375-T ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Total Dissolved Phosphorus is determined colourimetrically using a discrete analyzer after filtration through a 0.45 micron filter followed by heated persulfate digestion of the sample.
Dissolved Orthophosphate by Colourimetry (Ultra Trace Level 0.001 mg/L)	E378-U ALS Environmental - Vancouver	Water	APHA 4500-P F (mod)	Dissolved Orthophosphate is determined colourimetrically on a sample that has been lab or field filtered through a 0.45 micron membrane filter. Field filtration is recommended to ensure test results represent conditions at time of sampling.
Total Metals in Water by CRC ICPMS	E420 ALS Environmental - Vancouver	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals in Water by CRC ICPMS	E421 ALS Environmental - Vancouver	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Hardness (Calculated)	EC100 ALS Environmental - Vancouver	Water	APHA 2340B	"Hardness (as CaCO3), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Hardness (Calculated) from Total Ca/Mg	EC100A ALS Environmental - Vancouver	Water	APHA 2340B	"Hardness (as CaCO3), from total Ca/Mg" is calculated from the sum of total Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations. Hardness from total Ca/Mg is normally comparable to Dissolved Hardness in non-turbid waters.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N ALS Environmental - Vancouver	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 ALS Environmental - Vancouver	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Preparation for Dissolved Organic Carbon for Combustion	EP358 ALS Environmental - Vancouver	Water	APHA 5310 B (mod)	Preparation for Dissolved Organic Carbon
Digestion for Total Nitrogen in water	EP366 ALS Environmental - Vancouver	Water	APHA 4500-P J (mod)	Samples for total nitrogen analysis are digested using a heated persulfate digestion. Nitrogen compounds are converted to nitrate in this digestion.
Digestion for Total Phosphorus in water	EP372 ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.
Digestion for Dissolved Phosphorus in water	EP375 ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Samples are filtered through a 0.45 micron membrane filter and then heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.

QUALITY CONTROL REPORT

Work Order	: **VA24B8516**	Page	: 1 of 17
Amendment	: **1**		
Client	: Minnow Environmental Inc.	Laboratory	: ALS Environmental - Vancouver
Contact	: Sally Ju	Account Manager	: Can Dang
Address	: PO Box 12 Likely BC Canada V0L 1N0	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	: ----	Telephone	: +1 604 253 4188
Project	: 24-04 Task 5	Date Samples Received	: 26-Jul-2024 10:35
PO	: 5590017616	Date Analysis Commenced	: 27-Jul-2024
C-O-C number	: ----	Issue Date	: 20-Sep-2024 11:49
Sampler	: ----		
Site	: ----		
Quote number	: VA24-MPMC100-007 (Minnow/Mt. Polley)		
No. of samples received	: 4		
No. of samples analysed	: 4		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percent Difference (RPD) and Data Quality Objectives
- Matrix Spike (MS) Report; Recovery and Data Quality Objectives
- Method Blank (MB) Report; Recovery and Data Quality Objectives
- Laboratory Control Sample (LCS) Report; Recovery and Data Quality Objectives

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Delson Resende	Lab Assistant	Vancouver Metals, Burnaby, British Columbia
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Vancouver Metals, Burnaby, British Columbia
Marianne Jensen	Analyst- General	Vancouver Inorganics, Burnaby, British Columbia
Tracy Harley	Supervisor - Water Quality Instrumentation	Vancouver Inorganics, Burnaby, British Columbia

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

Turnaround Time (TAT) Requested

☑ Routine [R] if received by 3pm M-F - no surcharges apply
☐ 4 day [P4] if received by 3pm M-F - 20% rush surcharge minimum
☐ 3 day [P3] if received by 3pm M-F - 25% rush surcharge minimum
☐ 2 day [P2] if received by 3pm M-F - 50% rush surcharge minimum
☐ 1 day [E] if received by 3pm M-F - 100% rush surcharge minimum
☐ Same day [E2] if received by 10am M-S - 200% rush surcharge.

Additional fees may apply to rush requests on weekends, statutory holidays and for non-routine tests.

Date and Time Required for all E&P TATs: dd-mmm-yy hh mm am/pm

For all tests with rush TATs requested, please contact your AM to confirm availability.

No. of samples received	: 9		
No. of samples analysed	: 9		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Dan Gebert	Laboratory Analyst	Metals, Burnaby, British Columbia
Daniel Shabestani	Lab Assistant	Metals, Burnaby, British Columbia
Kate Dimitrova	Supervisor - Inorganic	Inorganics, Burnaby, British Columbia
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Miles Gropen	Department Manager - Inorganics	Inorganics, Burnaby, British Columbia
Monica Ko	Lab Assistant	Inorganics, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	no units
µg/L	micrograms per litre
µS/cm	microsiemens per centimetre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Qualifiers

Qualifier	*Description*
DLM	*Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).*

ALS Canada Ltd.

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **VA24C0557**	Page	: 1 of 29
Client	: **Minnow Environmental Inc.**	Laboratory	: ALS Environmental - Vancouver
Contact	: Sally Ju	Account Manager	: Can Dang
Address	: 306-885 Don Mills Road Toronto ON Canada M3C 1V9	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	: ----	Telephone	: +1 604 253 4188
Project	: 24-04 Task 600	Date Samples Received	: 14-Aug-2024 08:45
PO	: 5590017616	Issue Date	: 27-Aug-2024 15:05
C-O-C number	: ----		
Sampler	: ----		
Site	: ----		
Quote number	: VA24-MPMC100-007 (Minnow/Mt. Polley)		
No. of samples received	: 9		
No. of samples analysed	: 9		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*
Laboratory Duplicates (DUP)							
Alkalinity Species by Titration	E290	1598785	1	17	5.8	5.0	✓
Ammonia by Fluorescence	E298	1600557	1	19	5.2	5.0	✓
Chloride in Water by IC	E235.Cl	1598788	1	17	5.8	5.0	✓

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 ALS Environmental - Vancouver	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 ALS Environmental - Vancouver	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Turbidity by Nephelometry	E121 ALS Environmental - Vancouver	Water	APHA 2130 B (mod)	Turbidity is measured by the nephelometric method, by measuring the intensity of light scatter under defined conditions.
TDS by Gravimetry	E162 ALS Environmental - Vancouver	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at 180 ± 2°C for 16 hours or to constant weight, with gravimetric measurement of the residue.
TSS by Gravimetry (Whole Bottle)	E164 ALS Environmental - Vancouver	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
Chloride in Water by IC	E235.Cl ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Sulfate in Water by IC	E235.SO4 ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Alkalinity Species by Titration	E290 ALS Environmental - Vancouver	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 ALS Environmental - Vancouver	Water	Method Fialab 100, 2018	Ammonia in water is determined by automated continuous flow analysis with membrane diffusion and fluorescence detection, after reaction with OPA (ortho-phthalaldehyde). This method is approved under US EPA 40 CFR Part 136 (May 2021)
Dissolved Organic Carbon by Combustion (Low Level)	E358-L ALS Environmental - Vancouver	Water	APHA 5310 B (mod)	Dissolved Organic Carbon (Non-Purgeable), also known as NPOC (dissolved), is a direct measurement of DOC after a filtered (0.45 micron) sample has been acidified and purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO2. NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of DC (dissolved carbon) is comprised of IC (which is common), this method is more accurate and more reliable than the DOC by subtraction method (i.e. DC minus DIC).
Total Nitrogen by Colourimetry	E366 ALS Environmental - Vancouver	Water	Chinchilla Scientific Nitrate Method, 2011	Following digestion, total nitrogen is is determined colourimetrically using a discrete analyzer utilizing the vanadium chloride reduction method. This method of analysis is approved under US EPA 40 CFR Part 136 (May 2021).
Total Phosphorus by Colourimetry (0.002 mg/L)	E372-U ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Total Dissolved Phosphorus by Colourimetry (0.002 mg/L)	E375-T ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Total Dissolved Phosphorus is determined colourimetrically using a discrete analyzer after filtration through a 0.45 micron filter followed by heated persulfate digestion of the sample.
Dissolved Orthophosphate by Colourimetry (Ultra Trace Level 0.001 mg/L)	E378-U ALS Environmental - Vancouver	Water	APHA 4500-P F (mod)	Dissolved Orthophosphate is determined colourimetrically on a sample that has been lab or field filtered through a 0.45 micron membrane filter. Field filtration is recommended to ensure test results represent conditions at time of sampling.
Total Metals in Water by CRC ICPMS	E420 ALS Environmental - Vancouver	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals in Water by CRC ICPMS	E421 ALS Environmental - Vancouver	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Selenium Species (SeIV, SeVI,SeCN) in Water by HPLC-ICPMS	E540 ALS Environmental - Vancouver	Water	Miekeley Spect. Acta B 60 (2005) 633-641	Instrumental analysis of Speciated Selenium (Se) is by Anion Exchange HPLC-ICPMS. Species quantified are Selenite (SeIV), Selenate (VI) and Selenocyanate (SeCN). Field filtration is recommended. Reported Total Unknown Se Species is semi-quantitative in nature and consists of a sum of all the unidentified Selenium peaks observed in the chromatogram. This included SeMet, MeSe, and DMSeO unless separately requested for identification and quantification. Undetectable unknown species indicates these other species are not present in the sample.
Dissolved Hardness (Calculated)	EC100 ALS Environmental - Vancouver	Water	APHA 2340B	"Hardness (as CaCO3), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Hardness (Calculated) from Total Ca/Mg	EC100A ALS Environmental - Vancouver	Water	APHA 2340B	"Hardness (as CaCO3), from total Ca/Mg" is calculated from the sum of total Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations. Hardness from total Ca/Mg is normally comparable to Dissolved Hardness in non-turbid waters.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N ALS Environmental - Vancouver	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 ALS Environmental - Vancouver	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Preparation for Dissolved Organic Carbon for Combustion	EP358 ALS Environmental - Vancouver	Water	APHA 5310 B (mod)	Preparation for Dissolved Organic Carbon
Digestion for Total Nitrogen in water	EP366 ALS Environmental - Vancouver	Water	APHA 4500-P J (mod)	Samples for total nitrogen analysis are digested using a heated persulfate digestion. Nitrogen compounds are converted to nitrate in this digestion.
Digestion for Total Phosphorus in water	EP372 ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Digestion for Dissolved Phosphorus in water	EP375 ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Samples are filtered through a 0.45 micron membrane filter and then heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421 ALS Environmental - Vancouver	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.
Selenium Species Preparation	EP540 ALS Environmental - Vancouver	Water	Miekeley Spect. Acta B 60 (2005) 633-641	Instrumental analysis of Speciated Selenium (Se) is by Anion Exchange HPLC-ICPMS. Species quantified are Selenite (SeIV), Selenate (VI) and Selenocyanate (SeCN). Field filtration is recommended. Reported Total Unknown Se Species is semi-quantitative in nature and consists of a sum of all the unknown peaks observed in the chromatogram.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

No. of samples analysed	: 5		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Daniel Shabestani	Lab Assistant	Metals, Burnaby, British Columbia
Kate Dimitrova	Supervisor - Inorganic	Inorganics, Burnaby, British Columbia
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Tracy Harley	Supervisor - Water Quality Instrumentation	Inorganics, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	no units
µS/cm	microsiemens per centimetre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

ALS Canada Ltd.

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **VA24C1387**	Page	: 1 of 20
Client	: **Minnow Environmental Inc.**	Laboratory	: ALS Environmental - Vancouver
Contact	: Sally Ju	Account Manager	: Can Dang
Address	: 306-885 Don Mills Road Toronto ON Canada M3C 1V9	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	: ----	Telephone	: +1 604 253 4188
Project	: 24-04 Task 7	Date Samples Received	: 21-Aug-2024 09:45
PO	: 5590017616	Issue Date	: 03-Sep-2024 10:10
C-O-C number	: ----		
Sampler	: ----		
Site	: ----		
Quote number	: VA24-MPMC100-007 (Minnow/Mt. Polley)		
No. of samples received	: 5		
No. of samples analysed	: 5		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- Matrix Spike outliers occur - please see following pages for full details.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **Water**

Analyte Group	Laboratory sample ID	Client/Ref Sample ID	Analyte	CAS Number	Method	Result	Limits	Comment
Matrix Spike (MS) Recoveries								
Dissolved Metals	Anonymous	Anonymous	Silver, dissolved	7440-22-4	E421	47.5 % MS-Ag	70.0-130%	Recovery less than lower data quality objective

Result Qualifiers

Qualifier	Description
MS-Ag	*MS-Ag: Matrix Spike recovery for silver was marginally below DQO (40 to <60%) due to its instability in the sample matrix. Silver was not detected. Reported result (< LOR) is reliable*

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Matrix: **Water** Evaluation: × = Holding time exceedance ; ✓ = Within Holding Time

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

EHT: Exceeded ALS recommended hold time prior to analysis.

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*
Laboratory Duplicates (DUP)							
Alkalinity Species by Titration	E290	1615176	1	14	7.1	5.0	✓
Ammonia by Fluorescence	E298	1614959	1	16	6.2	5.0	✓
Chloride in Water by IC	E235.Cl	1615181	1	18	5.5	5.0	✓

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 ALS Environmental - Vancouver	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 ALS Environmental - Vancouver	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Turbidity by Nephelometry	E121 ALS Environmental - Vancouver	Water	APHA 2130 B (mod)	Turbidity is measured by the nephelometric method, by measuring the intensity of light scatter under defined conditions.
TDS by Gravimetry	E162 ALS Environmental - Vancouver	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at 180 ± 2°C for 16 hours or to constant weight, with gravimetric measurement of the residue.
TSS by Gravimetry (Whole Bottle)	E164 ALS Environmental - Vancouver	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
Chloride in Water by IC	E235.Cl ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Sulfate in Water by IC	E235.SO4 ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Alkalinity Species by Titration	E290 ALS Environmental - Vancouver	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 ALS Environmental - Vancouver	Water	Method Fialab 100, 2018	Ammonia in water is determined by automated continuous flow analysis with membrane diffusion and fluorescence detection, after reaction with OPA (ortho-phthalaldehyde). This method is approved under US EPA 40 CFR Part 136 (May 2021)
Dissolved Organic Carbon by Combustion (Low Level)	E358-L ALS Environmental - Vancouver	Water	APHA 5310 B (mod)	Dissolved Organic Carbon (Non-Purgeable), also known as NPOC (dissolved), is a direct measurement of DOC after a filtered (0.45 micron) sample has been acidified and purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO2. NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of DC (dissolved carbon) is comprised of IC (which is common), this method is more accurate and more reliable than the DOC by subtraction method (i.e. DC minus DIC).
Total Nitrogen by Colourimetry	E366 ALS Environmental - Vancouver	Water	Chinchilla Scientific Nitrate Method, 2011	Following digestion, total nitrogen is is determined colourimetrically using a discrete analyzer utilizing the vanadium chloride reduction method. This method of analysis is approved under US EPA 40 CFR Part 136 (May 2021).
Total Phosphorus by Colourimetry (0.002 mg/L)	E372-U ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Total Dissolved Phosphorus by Colourimetry (0.002 mg/L)	E375-T ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Total Dissolved Phosphorus is determined colourimetrically using a discrete analyzer after filtration through a 0.45 micron filter followed by heated persulfate digestion of the sample.
Dissolved Orthophosphate by Colourimetry (Ultra Trace Level 0.001 mg/L)	E378-U ALS Environmental - Vancouver	Water	APHA 4500-P F (mod)	Dissolved Orthophosphate is determined colourimetrically on a sample that has been lab or field filtered through a 0.45 micron membrane filter. Field filtration is recommended to ensure test results represent conditions at time of sampling.
Total Metals in Water by CRC ICPMS	E420 ALS Environmental - Vancouver	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals in Water by CRC ICPMS	E421 ALS Environmental - Vancouver	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Hardness (Calculated)	EC100 ALS Environmental - Vancouver	Water	APHA 2340B	"Hardness (as CaCO3), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Hardness (Calculated) from Total Ca/Mg	EC100A ALS Environmental - Vancouver	Water	APHA 2340B	"Hardness (as CaCO3), from total Ca/Mg" is calculated from the sum of total Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations. Hardness from total Ca/Mg is normally comparable to Dissolved Hardness in non-turbid waters.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N ALS Environmental - Vancouver	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 ALS Environmental - Vancouver	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Preparation for Dissolved Organic Carbon for Combustion	EP358 ALS Environmental - Vancouver	Water	APHA 5310 B (mod)	Preparation for Dissolved Organic Carbon
Digestion for Total Nitrogen in water	EP366 ALS Environmental - Vancouver	Water	APHA 4500-P J (mod)	Samples for total nitrogen analysis are digested using a heated persulfate digestion. Nitrogen compounds are converted to nitrate in this digestion.
Digestion for Total Phosphorus in water	EP372 ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.
Digestion for Dissolved Phosphorus in water	EP375 ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Samples are filtered through a 0.45 micron membrane filter and then heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.

No. of samples analysed	: 5		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percent Difference (RPD) and Data Quality Objectives
- Matrix Spike (MS) Report; Recovery and Data Quality Objectives
- Method Blank (MB) Report; Recovery and Data Quality Objectives
- Laboratory Control Sample (LCS) Report; Recovery and Data Quality Objectives

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Daniel Shabestani	Lab Assistant	Vancouver Metals, Burnaby, British Columbia
Kate Dimitrova	Supervisor - Inorganic	Vancouver Inorganics, Burnaby, British Columbia
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Vancouver Metals, Burnaby, British Columbia
Tracy Harley	Supervisor - Water Quality Instrumentation	Vancouver Inorganics, Burnaby, British Columbia

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Sub-Matrix: **Water**

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

Qualifiers

Qualifier	Description
MS-Ag	MS-Ag: Matrix Spike recovery for silver was marginally below DQO (40 to <60%) due to its instability in the sample matrix. Silver was not detected. Reported result (< LOR) is reliable

ALS Laboratory Report VA24C1718

(Finalized September 13, 2024)

ALS Canada Ltd.

right solutions. right partner.

CERTIFICATE OF ANALYSIS

Work Order	: **VA24C1718**	Page	: 1 of 10
Amendment	: **1**		
Client	: **Minnow Environmental Inc.**	Laboratory	: ALS Environmental - Vancouver
Contact	: Sally Ju	Account Manager	: Can Dang
Address	: 306-885 Don Mills Road Toronto ON Canada M3C 1V9	Address	: 8081 Lougheed Highway Burnaby BC Canada V5A 1W9
Telephone	: 1-289-775-1547	Telephone	: +1 604 253 4188
Project	: 24-04 Task 7	Date Samples Received	: 23-Aug-2024 13:00
PO	: 5590017616	Date Analysis Commenced	: 26-Aug-2024
C-O-C number	: ----	Issue Date	: 13-Sep-2024 17:54
Sampler	: Sla RDS		
Site	: ----		
Quote number	: VA24-MPMC100-007 (Minnow/Mt. Polley)		
No. of samples received	: 6		
No. of samples analysed	: 6		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Kim Jensen	Department Manager - Metals	Metals, Burnaby, British Columbia
Miles Gropen	Department Manager - Inorganics	Inorganics, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	no units
µS/cm	microsiemens per centimetre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Workorder Comments

Amendment (13/09/2024): This report has been amended as a result of a request to change the sample collection time for, VA24C1718-001. All analysis results are as per the previous report.

ALS Canada Ltd.

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **VA24C1718**	Page	: 1 of 21
Amendment	: 1		
Client	: **Minnow Environmental Inc.**	Laboratory	: ALS Environmental - Vancouver
Contact	: Sally Ju	Account Manager	: Can Dang
Address	: 306-885 Don Mills Road Toronto ON Canada M3C 1V9	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	: ----	Telephone	: +1 604 253 4188
Project	: 24-04 Task 7	Date Samples Received	: 23-Aug-2024 13:00
PO	: 5590017616	Issue Date	: 13-Sep-2024 17:54
C-O-C number	: ----		
Sampler	: Sla RDS		
Site	: ----		
Quote number	: VA24-MPMC100-007 (Minnow/Mt. Polley)		
No. of samples received	: 6		
No. of samples analysed	: 6		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Matrix: **Water**

Evaluation: × = Holding time exceedance ; ✓ = Within Holding Time

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

EHT: Exceeded ALS recommended hold time prior to analysis.

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type			Count		Frequency (%)

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 ALS Environmental - Vancouver	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 ALS Environmental - Vancouver	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Turbidity by Nephelometry	E121 ALS Environmental - Vancouver	Water	APHA 2130 B (mod)	Turbidity is measured by the nephelometric method, by measuring the intensity of light scatter under defined conditions.
TDS by Gravimetry	E162 ALS Environmental - Vancouver	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at 180 ± 2°C for 16 hours or to constant weight, with gravimetric measurement of the residue.
TSS by Gravimetry (Whole Bottle)	E164 ALS Environmental - Vancouver	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
Chloride in Water by IC	E235.Cl ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Sulfate in Water by IC	E235.SO4 ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Alkalinity Species by Titration	E290 ALS Environmental - Vancouver	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 ALS Environmental - Vancouver	Water	Method Fialab 100, 2018	Ammonia in water is determined by automated continuous flow analysis with membrane diffusion and fluorescence detection, after reaction with OPA (ortho-phthalaldehyde). This method is approved under US EPA 40 CFR Part 136 (May 2021)
Dissolved Organic Carbon by Combustion (Low Level)	E358-L ALS Environmental - Vancouver	Water	APHA 5310 B (mod)	Dissolved Organic Carbon (Non-Purgeable), also known as NPOC (dissolved), is a direct measurement of DOC after a filtered (0.45 micron) sample has been acidified and purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO2. NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of DC (dissolved carbon) is comprised of IC (which is common), this method is more accurate and more reliable than the DOC by subtraction method (i.e. DC minus DIC).
Total Nitrogen by Colourimetry	E366 ALS Environmental - Vancouver	Water	Chinchilla Scientific Nitrate Method, 2011	Following digestion, total nitrogen is is determined colourimetrically using a discrete analyzer utilizing the vanadium chloride reduction method. This method of analysis is approved under US EPA 40 CFR Part 136 (May 2021).
Total Phosphorus by Colourimetry (0.002 mg/L)	E372-U ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Total Dissolved Phosphorus by Colourimetry (0.002 mg/L)	E375-T ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Total Dissolved Phosphorus is determined colourimetrically using a discrete analyzer after filtration through a 0.45 micron filter followed by heated persulfate digestion of the sample.
Dissolved Orthophosphate by Colourimetry (Ultra Trace Level 0.001 mg/L)	E378-U ALS Environmental - Vancouver	Water	APHA 4500-P F (mod)	Dissolved Orthophosphate is determined colourimetrically on a sample that has been lab or field filtered through a 0.45 micron membrane filter. Field filtration is recommended to ensure test results represent conditions at time of sampling.
Total Metals in Water by CRC ICPMS	E420 ALS Environmental - Vancouver	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals in Water by CRC ICPMS	E421 ALS Environmental - Vancouver	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Hardness (Calculated)	EC100 ALS Environmental - Vancouver	Water	APHA 2340B	"Hardness (as CaCO3), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Hardness (Calculated) from Total Ca/Mg	EC100A ALS Environmental - Vancouver	Water	APHA 2340B	"Hardness (as CaCO3), from total Ca/Mg" is calculated from the sum of total Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations. Hardness from total Ca/Mg is normally comparable to Dissolved Hardness in non-turbid waters.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N ALS Environmental - Vancouver	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 ALS Environmental - Vancouver	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Preparation for Dissolved Organic Carbon for Combustion	EP358 ALS Environmental - Vancouver	Water	APHA 5310 B (mod)	Preparation for Dissolved Organic Carbon
Digestion for Total Nitrogen in water	EP366 ALS Environmental - Vancouver	Water	APHA 4500-P J (mod)	Samples for total nitrogen analysis are digested using a heated persulfate digestion. Nitrogen compounds are converted to nitrate in this digestion.
Digestion for Total Phosphorus in water	EP372 ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.
Digestion for Dissolved Phosphorus in water	EP375 ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Samples are filtered through a 0.45 micron membrane filter and then heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.

QUALITY CONTROL REPORT

Work Order	: **VA24C1718**	Page	: 1 of 15
Amendment	: **1**		
Client	: Minnow Environmental Inc.	Laboratory	: ALS Environmental - Vancouver
Contact	: Sally Ju	Account Manager	: Can Dang
Address	: PO Box 12 Likely BC Canada V0L 1N0	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	: ----	Telephone	: +1 604 253 4188
Project	: 24-04 Task 7	Date Samples Received	: 23-Aug-2024 13:00
PO	: 5590017616	Date Analysis Commenced	: 26-Aug-2024
C-O-C number	: ----	Issue Date	: 13-Sep-2024 17:54
Sampler	: Sla RDS		
Site	: ----		
Quote number	: VA24-MPMC100-007 (Minnow/Mt. Polley)		
No. of samples received	: 6		
No. of samples analysed	: 6		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percent Difference (RPD) and Data Quality Objectives
- Matrix Spike (MS) Report; Recovery and Data Quality Objectives
- Method Blank (MB) Report; Recovery and Data Quality Objectives
- Laboratory Control Sample (LCS) Report; Recovery and Data Quality Objectives

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Vancouver Metals, Burnaby, British Columbia

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Qualifiers

Qualifier	Description
MBRR	Initial MB for this submission had positive results for flagged analyte (data not shown). Low level samples were repeated with new QC (2nd MB results shown). High level results (>5x initial MB level) and non-detect results were reported and are defensible

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Drinking Water (DW) Samples[1] (client use)	Notes / Specify Limits for result evaluation by selecting from drop-down below (Excel COC only)
Are samples taken from a Regulated DW System? ☐ YES ☐ NO	Regular analytes for Mt Polley Mine water sample package. Pls also report ANIONS-NH4-N-CALC-VA (Calculated nitrate nitrite)
Are samples for human consumption/ use? ☐ YES ☐ NO	~~If sample is insufficient for regular digestion and analysis, contact kbatchelar@minnow.ca to discuss analysis options (e.g., use of microdigestion and HR-ICRMS). Report in dry weight except mercury (both wet and dry).~~

PO	:	5590017616	Date Analysis Commenced	:	30-Aug-2024
C-O-C number	:	----	Issue Date	:	31-Oct-2024 11:20
Sampler	:	----			
Site	:	----			
Quote number	:	Mount Polley Standing Offer 2024			
No. of samples received	:	3			
No. of samples analysed	:	3			

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Angelo Salandanan	Lab Assistant	Metals, Burnaby, British Columbia
Kim Jensen	Department Manager - Metals	Metals, Burnaby, British Columbia
Miles Gropen	Department Manager - Inorganics	Inorganics, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key: CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
LOR: Limit of Reporting (detection limit).

Unit	*Description*
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units
µS/cm	microsiemens per centimetre
-	no units

<: less than.
>: greater than.
Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Workorder Comments

Amendment (31/10/YYYY): This report has been amended as a result of a request to change sample identification numbers for all samples. All analysis results are as per the previous report.

ALS Canada Ltd.

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **VA24C2066**	Page	: 1 of 15
Amendment	: **1**		
Client	: **Mount Polley Mining Corporation**	Laboratory	: ALS Environmental - Vancouver
Contact	: Mr. Gabriel Holmes	Account Manager	: Can Dang
Address	: PO Box 12 Likely BC Canada V0L 1N0	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	: 250-790-2215 ext 2171	Telephone	: +1 604 253 4188
Project	: 24-04 Task 5	Date Samples Received	: 27-Aug-2024 11:30
PO	: 5590017616	Issue Date	: 31-Oct-2024 11:19
C-O-C number	: ----		
Sampler	: ----		
Site	: ----		
Quote number	: Mount Polley Standing Offer 2024		
No. of samples received	: 3		
No. of samples analysed	: 3		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

EHT: Exceeded ALS recommended hold time prior to analysis.

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*
Laboratory Duplicates (DUP)							
Alkalinity Species by Titration	E290	1626883	1	16	6.2	5.0	✓

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 ALS Environmental - Vancouver	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 ALS Environmental - Vancouver	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Turbidity by Nephelometry	E121 ALS Environmental - Vancouver	Water	APHA 2130 B (mod)	Turbidity is measured by the nephelometric method, by measuring the intensity of light scatter under defined conditions.
TDS by Gravimetry	E162 ALS Environmental - Vancouver	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at 180 ± 2°C for 16 hours or to constant weight, with gravimetric measurement of the residue.
TSS by Gravimetry (Whole Bottle)	E164 ALS Environmental - Vancouver	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
Chloride in Water by IC	E235.Cl ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Sulfate in Water by IC	E235.SO4 ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Alkalinity Species by Titration	E290 ALS Environmental - Vancouver	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 ALS Environmental - Vancouver	Water	Method Fialab 100, 2018	Ammonia in water is determined by automated continuous flow analysis with membrane diffusion and fluorescence detection, after reaction with OPA (ortho-phthalaldehyde). This method is approved under US EPA 40 CFR Part 136 (May 2021)
Dissolved Organic Carbon by Combustion (Low Level)	E358-L ALS Environmental - Vancouver	Water	APHA 5310 B (mod)	Dissolved Organic Carbon (Non-Purgeable), also known as NPOC (dissolved), is a direct measurement of DOC after a filtered (0.45 micron) sample has been acidified and purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO2. NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of DC (dissolved carbon) is comprised of IC (which is common), this method is more accurate and more reliable than the DOC by subtraction method (i.e. DC minus DIC).
Total Nitrogen by Colourimetry	E366 ALS Environmental - Vancouver	Water	Chinchilla Scientific Nitrate Method, 2011	Following digestion, total nitrogen is is determined colourimetrically using a discrete analyzer utilizing the vanadium chloride reduction method. This method of analysis is approved under US EPA 40 CFR Part 136 (May 2021).
Total Phosphorus by Colourimetry (0.002 mg/L)	E372-U ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Total Dissolved Phosphorus by Colourimetry (0.002 mg/L)	E375-T ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Total Dissolved Phosphorus is determined colourimetrically using a discrete analyzer after filtration through a 0.45 micron filter followed by heated persulfate digestion of the sample.
Dissolved Orthophosphate by Colourimetry (Ultra Trace Level 0.001 mg/L)	E378-U ALS Environmental - Vancouver	Water	APHA 4500-P F (mod)	Dissolved Orthophosphate is determined colourimetrically on a sample that has been lab or field filtered through a 0.45 micron membrane filter. Field filtration is recommended to ensure test results represent conditions at time of sampling.
Total Metals in Water by CRC ICPMS	E420 ALS Environmental - Vancouver	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals in Water by CRC ICPMS	E421 ALS Environmental - Vancouver	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Hardness (Calculated)	EC100 ALS Environmental - Vancouver	Water	APHA 2340B	"Hardness (as CaCO3), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Hardness (Calculated) from Total Ca/Mg	EC100A ALS Environmental - Vancouver	Water	APHA 2340B	"Hardness (as CaCO3), from total Ca/Mg" is calculated from the sum of total Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations. Hardness from total Ca/Mg is normally comparable to Dissolved Hardness in non-turbid waters.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N ALS Environmental - Vancouver	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 ALS Environmental - Vancouver	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Preparation for Dissolved Organic Carbon for Combustion	EP358 ALS Environmental - Vancouver	Water	APHA 5310 B (mod)	Preparation for Dissolved Organic Carbon
Digestion for Total Nitrogen in water	EP366 ALS Environmental - Vancouver	Water	APHA 4500-P J (mod)	Samples for total nitrogen analysis are digested using a heated persulfate digestion. Nitrogen compounds are converted to nitrate in this digestion.
Digestion for Total Phosphorus in water	EP372 ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.
Digestion for Dissolved Phosphorus in water	EP375 ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Samples are filtered through a 0.45 micron membrane filter and then heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.

QUALITY CONTROL REPORT

Work Order	: **VA24C2066**	Page	: 1 of 14
Amendment	: **1**		
Client	: Mount Polley Mining Corporation	Laboratory	: ALS Environmental - Vancouver
Contact	: Mr. Gabriel Holmes	Account Manager	: Can Dang
Address	: PO Box 12 Likely BC Canada V0L 1N0	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	: 250-790-2215 ext 2171	Telephone	: +1 604 253 4188
Project	: 24-04 Task 5	Date Samples Received	: 27-Aug-2024 11:30
PO	: 5590017616	Date Analysis Commenced	: 30-Aug-2024
C-O-C number	: ----	Issue Date	: 31-Oct-2024 11:19
Sampler	: ----		
Site	: ----		
Quote number	: Mount Polley Standing Offer 2024		
No. of samples received	: 3		
No. of samples analysed	: 3		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percent Difference (RPD) and Data Quality Objectives
- Matrix Spike (MS) Report; Recovery and Data Quality Objectives
- Method Blank (MB) Report; Recovery and Data Quality Objectives
- Laboratory Control Sample (LCS) Report; Recovery and Data Quality Objectives

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Angelo Salandanan	Lab Assistant	Vancouver Metals, Burnaby, British Columbia
Kim Jensen	Department Manager - Metals	Vancouver Metals, Burnaby, British Columbia
Miles Gropen	Department Manager - Inorganics	Vancouver Inorganics, Burnaby, British Columbia

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Sub-Matrix: **Water**

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

No. of samples analysed	: 2		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Ilnaz Badbezanchi	Supervisor - Metals Prep & Mercury	Metals, Burnaby, British Columbia
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Miles Gropen	Department Manager - Inorganics	Inorganics, Burnaby, British Columbia
Monica Ko	Lab Assistant	Inorganics, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	no units
µg/L	micrograms per litre
µS/cm	microsiemens per centimetre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Qualifiers

Qualifier	*Description*
DLM	*Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).*

ALS Canada Ltd.

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **VA24C2329**	Page	: 1 of 14
Client	: **Minnow Environmental Inc.**	Laboratory	: ALS Environmental - Vancouver
Contact	: Sally Ju	Account Manager	: Can Dang
Address	: 306-885 Don Mills Road Toronto ON Canada M3C 1V9	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	: ----	Telephone	: +1 604 253 4188
Project	: 24-04 Task 5	Date Samples Received	: 28-Aug-2024 12:45
PO	: 5590017616	Issue Date	: 18-Sep-2024 12:56
C-O-C number	: ----		
Sampler	: ----		
Site	: ----		
Quote number	: VA24-MPMC100-007 (Minnow/Mt. Polley)		
No. of samples received	: 2		
No. of samples analysed	: 2		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Summary of Outliers

Outliers : Quality Control Samples

- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- Method Blank value outliers occur - please see following pages for full details.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **Water**

Analyte Group	Laboratory sample ID	Client/Ref Sample ID	Analyte	CAS Number	Method	Result	Limits	Comment
Method Blank (MB) Values								
Dissolved Metals	QC-1627034-001	----	Sodium, dissolved	7440-23-5	E421	0.076 B mg/L	0.05 mg/L	Blank result exceeds permitted value

Result Qualifiers

Qualifier	Description
B	*Method Blank exceeds ALS DQO. Associated sample results which are < Limit of Reporting or > 5 times blank level are considered reliable.*

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

EHTL: Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry.

EHT: Exceeded ALS recommended hold time prior to analysis.

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 ALS Environmental - Vancouver	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 ALS Environmental - Vancouver	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Turbidity by Nephelometry	E121 ALS Environmental - Vancouver	Water	APHA 2130 B (mod)	Turbidity is measured by the nephelometric method, by measuring the intensity of light scatter under defined conditions.
TDS by Gravimetry	E162 ALS Environmental - Vancouver	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at 180 ± 2°C for 16 hours or to constant weight, with gravimetric measurement of the residue.
TSS by Gravimetry (Whole Bottle)	E164 ALS Environmental - Vancouver	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
Chloride in Water by IC	E235.Cl ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Sulfate in Water by IC	E235.SO4 ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Alkalinity Species by Titration	E290 ALS Environmental - Vancouver	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 ALS Environmental - Vancouver	Water	Method Fialab 100, 2018	Ammonia in water is determined by automated continuous flow analysis with membrane diffusion and fluorescence detection, after reaction with OPA (ortho-phthalaldehyde). This method is approved under US EPA 40 CFR Part 136 (May 2021)
Dissolved Organic Carbon by Combustion (Low Level)	E358-L ALS Environmental - Vancouver	Water	APHA 5310 B (mod)	Dissolved Organic Carbon (Non-Purgeable), also known as NPOC (dissolved), is a direct measurement of DOC after a filtered (0.45 micron) sample has been acidified and purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO2. NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of DC (dissolved carbon) is comprised of IC (which is common), this method is more accurate and more reliable than the DOC by subtraction method (i.e. DC minus DIC).
Total Nitrogen by Colourimetry	E366 ALS Environmental - Vancouver	Water	Chinchilla Scientific Nitrate Method, 2011	Following digestion, total nitrogen is is determined colourimetrically using a discrete analyzer utilizing the vanadium chloride reduction method. This method of analysis is approved under US EPA 40 CFR Part 136 (May 2021).
Total Phosphorus by Colourimetry (0.002 mg/L)	E372-U ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Total Dissolved Phosphorus by Colourimetry (0.002 mg/L)	E375-T ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Total Dissolved Phosphorus is determined colourimetrically using a discrete analyzer after filtration through a 0.45 micron filter followed by heated persulfate digestion of the sample.
Dissolved Orthophosphate by Colourimetry (Ultra Trace Level 0.001 mg/L)	E378-U ALS Environmental - Vancouver	Water	APHA 4500-P F (mod)	Dissolved Orthophosphate is determined colourimetrically on a sample that has been lab or field filtered through a 0.45 micron membrane filter. Field filtration is recommended to ensure test results represent conditions at time of sampling.
Total Metals in Water by CRC ICPMS	E420 ALS Environmental - Vancouver	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals in Water by CRC ICPMS	E421 ALS Environmental - Vancouver	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Chlorophyll-a by Fluorometry	E870 ALS Environmental - Vancouver	Water	EPA 445.0 (mod)	Chlorophyll a is determined by solvent extraction followed with analysis by fluorometry using the non-acidification procedure. This method is not subject to interferences from chlorophyll b.
Dissolved Hardness (Calculated)	EC100 ALS Environmental - Vancouver	Water	APHA 2340B	"Hardness (as CaCO3), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Hardness (Calculated) from Total Ca/Mg	EC100A ALS Environmental - Vancouver	Water	APHA 2340B	"Hardness (as CaCO3), from total Ca/Mg" is calculated from the sum of total Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations. Hardness from total Ca/Mg is normally comparable to Dissolved Hardness in non-turbid waters.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N ALS Environmental - Vancouver	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 ALS Environmental - Vancouver	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Preparation for Dissolved Organic Carbon for Combustion	EP358 ALS Environmental - Vancouver	Water	APHA 5310 B (mod)	Preparation for Dissolved Organic Carbon
Digestion for Total Nitrogen in water	EP366 ALS Environmental - Vancouver	Water	APHA 4500-P J (mod)	Samples for total nitrogen analysis are digested using a heated persulfate digestion. Nitrogen compounds are converted to nitrate in this digestion.
Digestion for Total Phosphorus in water	EP372 ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Digestion for Dissolved Phosphorus in water	EP375 ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Samples are filtered through a 0.45 micron membrane filter and then heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421 ALS Environmental - Vancouver	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.
Chlorophyll-a Extraction	EP870 ALS Environmental - Vancouver	Water	EPA 445.0 (mod)	Chlorophyll-a solvent extraction.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Qualifiers

Qualifier	Description
B	*Method Blank exceeds ALS DQO. Associated sample results which are < Limit of Reporting or > 5 times blank level are considered reliable.*

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

Project	: ----	Date Samples Received	: 16-Aug-2024 10:20
PO	: 5590017616	Date Analysis Commenced	: 26-Aug-2024
C-O-C number	: ----	Issue Date	: 13-Sep-2024 18:17
Sampler	: ----		
Site	: ----		
Quote number	: VA24-MPMC100-006 (Minnow/Mt. Polley)		
No. of samples received	: 88		
No. of samples analysed	: 22		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Ghazaleh Khanmirzaei	Analyst	Metals, Burnaby, British Columbia
Hedy Lai	Team Leader - Inorganics	Inorganics, Saskatoon, Saskatchewan
Hedy Lai	Team Leader - Inorganics	Sask Soils, Saskatoon, Saskatchewan
Janice Leung	Supervisor - Organics Instrumentation	Organics, Burnaby, British Columbia
Maya Urquhart	Lab Analyst	Metals, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
%	percent
mg/kg	milligrams per kilogram
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Workorder Comments

Amendment (13/09/2024): This report has been amended and re-released to allow the reporting of additional analytical data. Includes additional Total Nitrogen and Total Sulfur analysis on bulk fraction.

PSAL:Sample:004,008,012,016,020,084 Limited sample was available for PSA (100g minimum is standard). Measurement Uncertainty for PSA results may be higher than usual.

Qualifiers

Qualifier	*Description*
FR4	*As per applicable reference method(s), soil:water ratio for Fixed Ratio Leach was modified to 1:4 due to high soil organic content.*

ALS Canada Ltd.

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **VA24C0980**	Page	: 1 of 25
Amendment	: 1		
Client	: **Minnow Environmental Inc.**	Laboratory	: ALS Environmental - Vancouver
Contact	: Sally Ju	Account Manager	: Can Dang
Address	: 306-885 Don Mills Road Toronto ON Canada M3C 1V9	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	: ----	Telephone	: +1 604 253 4188
Project	: ----	Date Samples Received	: 16-Aug-2024 10:20
PO	: 5590017616	Issue Date	: 13-Sep-2024 18:19
C-O-C number	: ----		
Sampler	: ----		
Site	: ----		
Quote number	: VA24-MPMC100-006 (Minnow/Mt. Polley)		
No. of samples received	: 88		
No. of samples analysed	: 22		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Legend & Qualifier Definitions

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Soil/Solid**

Evaluation: × = *QC frequency outside specification*; ✓ = *QC frequency within specification.*

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*
Laboratory Duplicates (DUP)							
Mercury in Sediment by CVAAS (<63 µm)	E510A	1617301	2	24	8.3	5.0	✓

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
pH by Meter (1:2 Soil:Water Extraction)	E108 ALS Environmental - Vancouver	Soil/Solid	BC Lab Manual	pH is determined by potentiometric measurement with a pH electrode at ambient laboratory temperature (normally 20 ± 5°C), and is carried out in accordance with procedures described in the BC Lab Manual (prescriptive method). The procedure involves mixing the dried (at <60 ºC) and sieved (10mesh/2mm) sample with ultra pure water at a 1:2 ratio of sediment to water. The pH is then measured by a standard pH probe.
Moisture Content by Gravimetry	E144 ALS Environmental - Vancouver	Soil/Solid	CCME PHC in Soil - Tier 1	Moisture is measured gravimetrically by drying the sample at 105°C. Moisture content is calculated as the weight loss (due to water) divided by the wet weight of the sample, expressed as a percentage.
Total Nitrogen by Combustion	E366 ALS Environmental - Saskatoon	Soil/Solid	CSSS (2008) 22.4	The sample is ignited in a combustion analyzer where nitrogen in the reduced nitrous oxide gas is determined using a thermal conductivity detector.
Total Nitrogen by Combustion (<63 µm)	E366A ALS Environmental - Saskatoon	Soil/Solid	CSSS (2008) 22.4 (mod)	The sample is ignited in a combustion analyzer where nitrogen in the reduced nitrous oxide gas is determined using a thermal conductivity detector.
Total Sulfur by high temperature combustion	E399 ALS Environmental - Saskatoon	Soil/Solid	ISO 15178:2000	Air-dried sample is ignited in a combustion analyzer where sulfur in the reduced SO_2 gas is determined using a thermal conductivity detector.
Total Sulfur by high temperature combustion (<63 µm)	E399A ALS Environmental - Saskatoon	Soil/Solid	ISO 15178:2000	Air-dried sample is disaggregated to pass a 63µm sieve. The sample is ignited in a combustion analyzer where sulfur in the reduced SO_2 gas is determined using a thermal conductivity detector.
Metals in Sediment by CRC ICPMS (<63 µm)	E440A ALS Environmental - Vancouver	Soil/Solid	EPA 6020B (mod)	Samples are sieved through a 63 um sieve, and digested with HNO_3 and HCl. This method is intended to liberate metals that may be environmentally available. Silicate minerals are not solubilized. Dependent on sample matrix, some metals may be only partially recovered, including Al, Ba, Be, Cr, Sr, Ti, Tl, V, W, and Zr. Volatile forms of sulfur (including sulfide) may not be captured, as they may be lost during sampling, storage, or digestion. Elemental Sulfur may be poorly recovered by this method. Analysis is by Collision/Reaction Cell ICPMS.
Mercury in Sediment by CVAAS (<63 µm)	E510A ALS Environmental - Vancouver	Soil/Solid	EPA 200.2/1631 Appendix (mod)	Samples are sieved through a 63 µm sieve, and digested with HNO_3 and HCl, followed by CVAAS analysis.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Particle Size Analysis (Pipette) - MMER Classification	EC184E ALS Environmental - Saskatoon	Soil/Solid	Metal Mining Technical Guidance for Environmental Effects Monitoring (2012)	The particle size determination is performed by various methods to generate a Grain Size curve. The data from the curve is then used to produce particle size ranges based on the Metal Mining Effluent Regulations (MMER) classification system for Environmental Effects Monitoring.
Total Organic Carbon (Calculated) in soil (<63 µm)	EC356A ALS Environmental - Saskatoon	Soil/Solid	CSSS (2008) 21.2	Total Organic Carbon (TOC) is calculated by the difference between total carbon (TC) and total inorganic carbon (TIC) analyzed on material passing a 63 µm sieve.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Leach 1:2 Soil:Water for pH/EC	EP108 ALS Environmental - Vancouver	Soil/Solid	BC WLAP METHOD: PH, ELECTROMETRIC, SOIL	The procedure involves mixing the dried (at <60°C) and sieved (No. 10 / 2mm) sample with deionized/distilled water at a 1:2 ratio of sediment to water.
Digestion for Metals and Mercury (63 µm Sieve)	EP440A ALS Environmental - Vancouver	Soil/Solid	EPA 200.2 (mod)	Samples are sieved through a 63 µm sieve, and digested with HNO3 and HCl. This method is intended to liberate metals that may be environmentally available.
Dry and Grind in Soil/Solid <60°C	EPP442 ALS Environmental - Saskatoon	Soil/Solid	Soil Sampling and Methods of Analysis, Carter 2008	After removal of any coarse fragments and reservation of wet subsamples a portion of homogenized sample is set in a tray and dried at less than 60°C until dry. The sample is then particle size reduced with an automated crusher or mortar and pestle, typically to <2 mm. Further size reduction may be needed for particular tests.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Soil/Solid**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Soil/Solid**
