Notes: "-" = only one sample (replicate) collected. Cells/L = cells per litre. µg/L = micrograms per litre. Displayed data were collected using depth-integrated (DI) sampling methods. Sampling methods employed in 2019 included both surface (S) and DI methods. See Minnow (2019a, 2020a) for results of surface phytoplankton sampling completed in 2018 and 2019. See Minnow 2020a for a comparison of results from the S and DI sampling methodologies, and for rationale regarding the selection of DI methods for ongoing phytoplankton monitoring.

Notes: "-" = only one sample (replicate) collected. Cells/L = cells per litre. µg/L = micrograms per litre. Displayed data were collected using depth-integrated (DI) sampling methods. Sampling methods employed in 2019 included both surface (S) and DI methods. See Minnow (2019a, 2020a) for results of surface phytoplankton sampling completed in 2018 and 2019. See Minnow 2020a for a comparison of results from the S and DI sampling methodologies, and for rationale regarding the selection of DI methods for ongoing phytoplankton monitoring.

Notes: Cell/L = cells per litre. µg/L = micrograms per litre. Displayed data were collected using depth-integrated (DI) sampling methods. Sampling methods employed in 2019 included both surface (S) and DI methods. See Minnow (2019a, 2020a) for results of surface phytoplankton sampling completed in 2018 and 2019. See Minnow 2020a for a comparison of results from the S and DI sampling methodologies, and for rationale regarding the selection of DI methods for ongoing phytoplankton monitoring.

[a] Summary statistics are displayed for replicated data collected in July 2019 to 2023. For results without replicates collected in June and August 2019 to 2023, see Appendix Table C.3.1.

Notes: "-" = only one sample (replicate) collected. organisms/L = organisms per litre. mg/L = milligrams per litre. Results displayed for POL-P2 (August 2019) in the table above differ from those presented in previous reports (Minnow 2020a, 2021a, 2022a) for the same sampling area and date. This discrepancy is due to an incorrect calculation for these results in the prior reporting years. Zooplankton data for area POL-P1 collected in June 2019 are not displayed. These data were presented in Minnow (2020a).

Notes: "-" = only one sample (replicate) collected. Displayed data were collected using depth-integrated (DI) sampling methods. Sampling methods employed in 2019 included both surface (S) and DI methods. See Minnow (2019a, 2020a) for results of surface phytoplankton sampling completed in 2018 and 2019. See Minnow 2020a for a comparison of results from the S and DI sampling methodologies, and for rationale regarding the selection of DI methods for ongoing phytoplankton monitoring.

Notes: Cell/L = cells per litre. µg/L = micrograms per litre. Displayed data were collected using depth-integrated (DI) sampling methods. Sampling methods employed in 2019 included both surface (S) and DI methods. See Minnow (2019a, 2020a) for results of surface phytoplankton sampling completed in 2018 and 2019. See Minnow 2020a for a comparison of results from the S and DI sampling methodologies, and for rationale regarding the selection of DI methods for ongoing phytoplankton monitoring.

[a] Summary statistics are displayed for replicated data collected in July 2019 to 2023. For results without replicates collected in June and August 2019 to 2023, see Appendix Table C.3.5.

Table C.3.6: Summary Statistics for Phytoplankton Community Metrics for Quesnel Lake at QUL-ZOO-1 (Exposed) and QUL-ZOO-7 (Reference) Areas in July, 2019 to 2023[a]

Notes: Cell/L = cells per litre. µg/L = micrograms per litre. Displayed data were collected using depth-integrated (DI) sampling methods. Sampling methods employed in 2019 included both surface (S) and DI methods. See Minnow (2019a, 2020a) for results of surface phytoplankton sampling completed in 2018 and 2019. See Minnow 2020a for a comparison of results from the S and DI sampling methodologies, and for rationale regarding the selection of DI methods for ongoing phytoplankton monitoring.

[a] Summary statistics are displayed for replicated data collected in July 2019 to 2023. For results without replicates collected in June and August 2019 to 2023, see Appendix Table C.3.5.

1.0 INTRODUCTION

1.1 PROJECT SCOPE

DWB Consulting Services Ltd. (DWB) was retained by Mount Polley Mining Corporation (MPMC) to conduct vegetation surveys along the Hazeltine Creek corridor at the Mount Polley mine (hereafter, referred to as Mount Polley), July 4-6, 2023.

This report provides a summary of the vegetation survey results for 2023, which represents Year 4 of the 5-year study.

1.2 BACKGROUND

The Hazeltine Creek corridor was impacted by a breach in the Mount Polley Tailings Storage Facility (TSF) embankment that occurred in 2014, which released tailings, supernatant, and construction materials into the creek, eroding a wide channel from the Mine Site into Quesnel Lake. Since the event, extensive remediation work has been completed along the corridor, including reconstruction of the Hazeltine Creek channel. Rehabilitation of the riparian habitat was initiated by planting native trees, shrubs, and seeds and using landscape techniques to improve site growing conditions, such as mounding soil, spreading coarse woody debris (CWD), and adding mulch. Passive sediment settling ponds were constructed near the confluence of Hazeltine and Edney Creeks to improve water quality and increase wildlife forage. However, these have since been decommissioned as part of the long-term strategy for channel reconstruction. Nest boxes were installed to increase nesting sites for secondary cavity-nesting species.

An Ecological Risk Assessment conducted for MPMC in 2019 determined that the risk to terrestrial receptors, associated with uptake in metal concentrations in the soil, was low compared to the physical disruption to soil and habitat caused by the TSF breach (Golder, 2019a); therefore, the risk of metal toxicity to wildlife through bioaccumulation was expected to be low. Following the results of the risk assessment, the British Columbia (BC) Ministry of Environment and Climate Change Strategy (ENV) requested a wildlife monitoring plan be developed and implemented as a component of the Mount Polley Comprehensive Environmental Monitoring Plan (CEMP). Golder Associates Inc. addressed the request by implementing a 5-year study that consists of vegetation and bird surveys to track ecological succession, availability of habitat for terrestrial wildlife, and bird species composition along the Hazeltine Creek corridor (Golder, 2019b). The vegetation and bird surveys are considered Phase 1 of Mount Polley's wildlife monitoring program. Phase 2 will incorporate a study design into the program that monitors mammal species, which has now been initiated at Mount Polley.

1.3 STUDY OBJECTIVE

The vegetation study was designed to track ecological succession along the Hazeltine Creek corridor and determine trends in vegetation composition, structure and function over time (Golder, 2019b). In the design, vegetation was identified as the preferred ecological component for the wildlife monitoring plan as a) vegetation is immobile and can be monitored with permanent plots and b) recolonization by plants is expected to be the dominant process during the early stages of ecological succession within the Hazeltine Creek corridor (Corridor).

1.4 STUDY SCOPE

Plots for the vegetation surveys were chosen at 30 locations within the Hazeltine Creek corridor during reconnaissance surveys conducted in July 2018 (Golder, 2019b). The 30 plots were split between six areas of the corridor, and between the different surface treatment methods (e.g., recontouring and CWD placement) used to rehabilitate the areas after being impacted by the breach. Year 1 to Year 4 of the 5-year vegetation survey program was completed by DWB between 2020 and 2023, during which time information on vegetation composition and structure was collected. A long-term trend analysis will be completed in 2025 to determine patterns in vegetation establishment and succession over time. See Section 2.0 for a description of the methods used by DWB to conduct the vegetation surveys.

In February 2021, ENV provided approval for the MPMC CEMP, dated October 31st, 2019. The CEMP approval was subject to additional requirements outlined in the approval letter. In response to the approval conditions, DWB provided a summary of action items to address the gaps between the current CEMP and the conditions identified. One such approval condition was 18b, the need to outline specific objectives and endpoints for vegetation monitoring. In response to approval condition 18b, DWB proposed the following.

To track natural ecological succession, the following three objectives and associated measures, or examples, are provided:

- Objective 1: Monitor health of tree and shrub seedlings:
    - Measures: seedling survival, seedling vigour, seedling height;
- Objective 2: Monitor the natural recruitment of native plant species:
    - Measure: native species richness;
- Objective 3: Identify, if present, any factors limiting natural recruitment of native plant species or the success of planted seedlings:
    - Examples: dense grass cover, herbivory, dense woody debris cover, compacted soil surface.

The endpoint of vegetation monitoring is reached once both of the following two objectives, and defined criteria, have been met:

- Objective 1: Vegetation cover is ‘Self-sustaining’:
    - Criteria:
        - Seedling mortality is no longer occurring or is due to natural processes, not related to any anthropogenic factors (e.g., planting/handling of seedlings, adverse soil conditions), or not occurring due to excess herbivory;
        - Vegetation cover overall remains stable or is increasing;
        - Vegetation cover is resilient (evidence suggests that cover can survive periods of drought);
        - Natural recruitment of native species is continuous (occurring annually, and expected to continue to occur); recruitment is not limited by competition from existing vegetation cover, herbivory or surface conditions (e.g., soil compaction), and
        - Vegetation cover is species diverse (not a monoculture).

- Objective 2: Vegetation cover is following the natural successional trajectory that aims to satisfy the end land use objective:
    - Criteria:
        - Vegetation cover is dominated by pioneer tree and shrub species identified as early successional species of the target ecosystem (e.g., subzone/variant); vegetation cover also consists of late successional tree and shrub species of the target ecosystem;
        - Vegetation cover does not consist of any significant cover of non-target species (e.g., invasive, agronomic, nuisance weeds); any cover of non-target species present is either declining or evidence suggests cover will decline over time, and
        - Any factors that have been identified as limiting natural succession (e.g., plant competition, surface conditions, herbivory) on reclaimed areas, or portions of reclaimed areas, have been addressed or are no longer limiting.

To meet the information criteria that would be required to identify the endpoints of vegetation monitoring, the following vegetation attributes were added to the monitoring effort, beginning in Year 2:

- Collection of species-specific counts, height and vigour both for planted and naturally recruited tree and shrubs seedlings in the non-halo plots, and
- Collection of species-specific counts (estimates) of planted tree and shrubs within halo plots (where present).

1.5 Regulatory Considerations

The creation of a quantitative wildlife monitoring study under the CEMP was a condition set by ENV under the *Environmental Management Act* Permit 11678. However, apart from the aforementioned request to develop objectives and endpoints, no holistic changes to the vegetation monitoring study were required.

1.6 Project Location

Mount Polley is located approximately 57 km (geodesic distance) northeast of Williams Lake, BC, as shown in Figure 1. From Williams Lake, the mine site is accessed by driving south on Highway 97 North and turning north just before 150 Mile House onto the Horsefly Likely Road, then driving for 4.5 km before turning west onto Likely Road. After travelling Likely Road for 64.6 km, turn south onto the Morehead-Bootjack Forest Service Road (FSR) for 14 km. Mount Polley is located at the end of the Morehead-Bootjack FSR at UTM 10 U 592897 5822603.

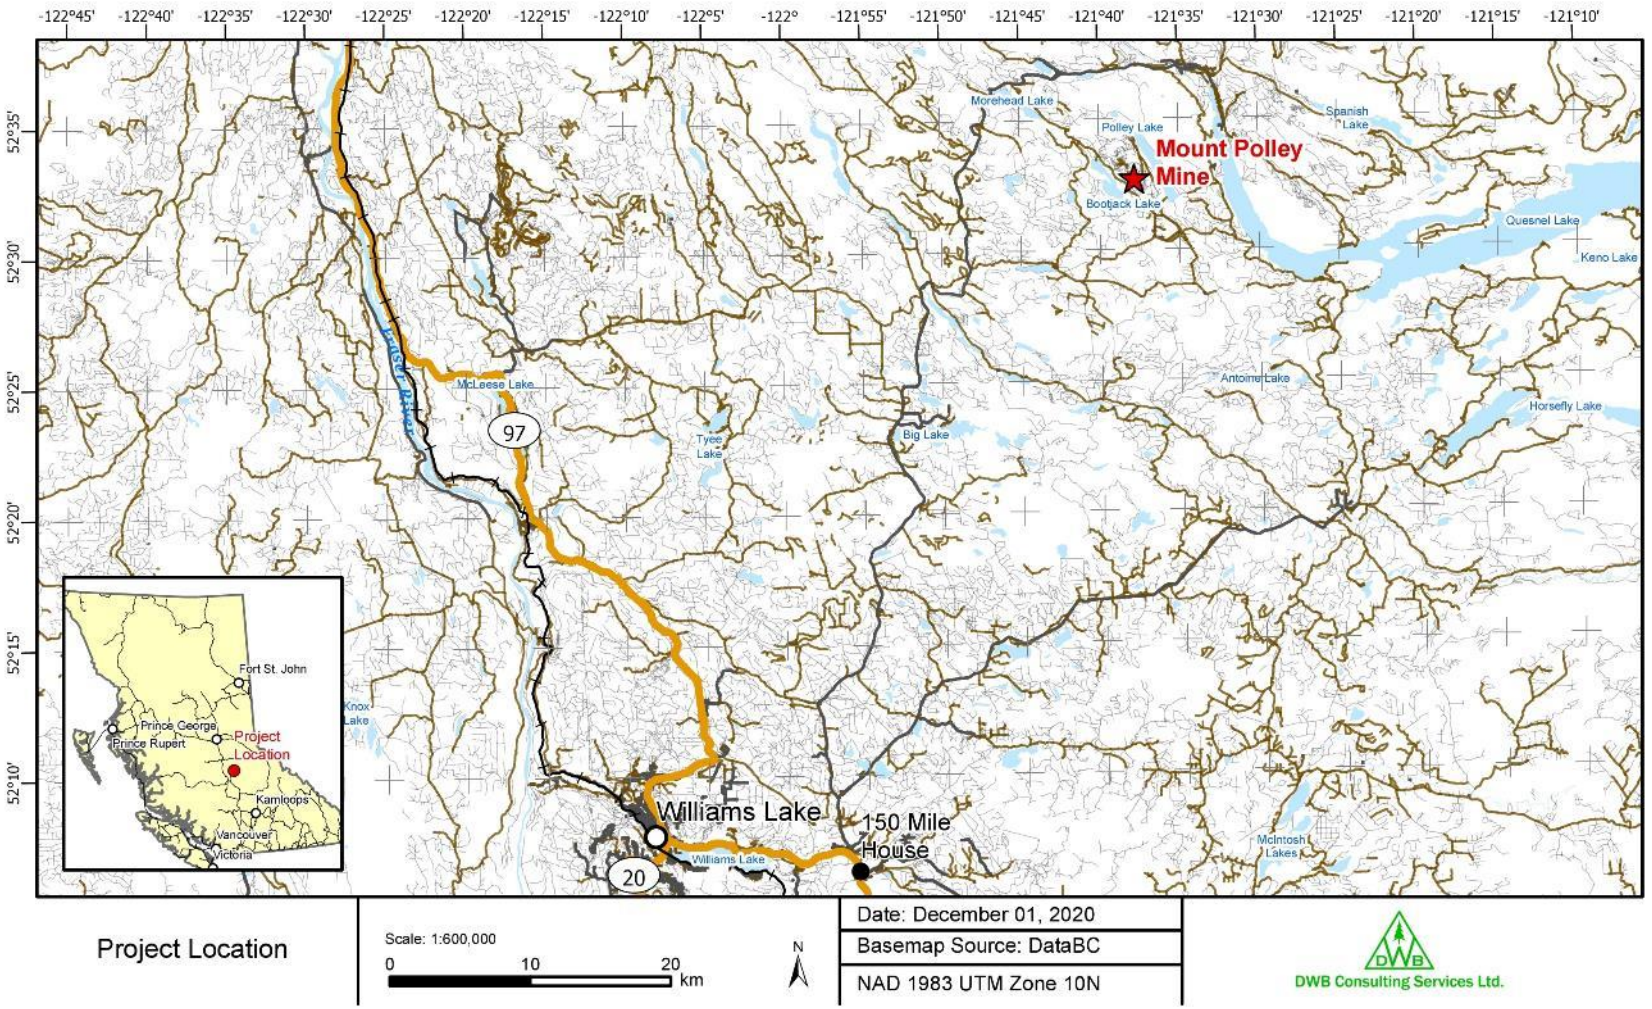

Figure 1. Location of Mount Polley mine in relation to Williams Lake, BC.

1.7 ECOSYSTEM CLASSIFICATION

Ecosystems present along the Hazeltine Creek corridor at Mount Polley include Interior Cedar Hemlock (ICH) biogeoclimatic (BEC) zone moist cool (mk3) variant and wet cool (wk2) variant. Ecosystems within mk3 variant are characterized by forest cover dominated by western redcedar (*Thuja plicata*), interior Douglas-fir (*Pseudotsuga menziesii var. glauca*) and lodgepole pine (*Pinus contorta var. latifolia*). Within the wk2 variant, forests are dominated by western redcedar and western hemlock (*Tsuga heterophylla*). Young forests within these variants are often dominated by interior Douglas-fir and/or lodgepole pine and other seral tree species that may be present including trembling aspen (*Populus tremuloides*) and paper birch (*Betula papyrifera*). Common shrubs in the forest understorey of both variants include black huckleberry (*Vaccinium membranaceum*), black gooseberry (*Ribes lacustre*), devils club (*Oplopanax horridus*), falsebox (*Pachistima myrsinites*) and oval-leaved blueberry (*Vaccinium ovalifolium*). Examples of common herbs include rose twistedstalk (*Streptopus lanceolatus*), bunchberry (*Cornus canadensis*), oak fern (*Gymnocarpium dryopteris*), three-leaved foamflower (*Tiarella trifoliata*) and twinflower (*Linnaea borealis*; Steen and Coupe, 1997).

Based on the most recent data from the Vegetation Resource Inventory (VRI; Province of BC, 2020), mature forest cover surrounding the Lower Hazeltine Creek area consists of forests dominated by hybrid white spruce (*Picea glauca x engelmannii*), paper birch, interior Douglas-fir, black cottonwood (*Populus balsamifera ssp. trichocarpa*) and western redcedar, with stand ages ranging between 31 and 261 years. Along the Upper Hazeltine Creek area, forest cover is dominated by subalpine fir (*Abies lasiocarpa*), hybrid white spruce, interior Douglas-fir, paper birch, and western redcedar with stand ages ranging between 35 to 261 years. On Polley Flats, mature forest cover along the corridor is dominated by hybrid white spruce and western redcedar with stand ages ranging between 111 to 281 years.

2.0 METHODS

2.1 SURVEY LOCATIONS

Vegetation surveys were completed at 30 plot locations within the remediated areas of the Hazeltine Creek corridor. The plot locations, and their relation to the treatment areas and surface treatment types, are outlined in Table 1. Detailed maps showing the location of each of the plots along the Hazeltine Creek corridor are provided in Appendix A.

Table 1. Plot locations, treatment areas and surface treatment types within remediated areas located along the Hazeltine Creek corridor (Golder, 2019a).

Treatment Area	Plot Name	Location (UTMs)	Surface Treatment Type
Lower Hazeltine	22-LH-2	10U 601795 m E, 5817320 m N	Recontoured with Topsoil and CWD
	22-LH-7	10U 601036 m E, 5817197 m N	Ripped with CWD
	22-LH-8	10U 601056 m E, 5817170 m N	Ripped with CWD
	22-LH-12	10U 600846 m E, 5817308 m N	Recontoured with Topsoil and CWD
	22-LH-13	10 U 600823 m E 5817340 m N	Wood Chip Mulch with CWD
	22-LH-29	10U 601597 m E, 5817397 m N	Mounded with CWD
Lower Hazeltine – Halo	22-Halo-1	10U 601783 m E, 5817532 m N	Mounded with CWD
	22-Halo-3	10U 601998 m E, 5817327 m N	No Treatment

Treatment Area	Plot Name	Location (UTMs)	Surface Treatment Type
	23-Halo-4	10U 601884 m E, 5817258 m N	Mounded with CWD
	23-Halo-5	10U 601149 m E, 5816911 m N	Ripped with CWD
	23-Halo-6	10U 601026 m E, 5817022 m N	Ripped with CWD
	23-Halo-9	10U 601230 m E, 5817278 m N	No Treatment
	23-Halo-10	10U 601183 m E, 5817289 m N	Mounded with CWD
	23-Halo-11	10U 601043 m E, 5817336 m N	No Treatment
Upper Hazeltine	23-UH-14	10U 599560 m E, 5817265 m N	Ripped with CWD
	23-UH-15	10U 598527 m E, 5817471 m N	Recontoured with Topsoil and CWD
	23-UH-16	10U 597116 m E, 5818941 m N	Recontoured with Topsoil and CWD
	23-UH-20	10U 596133 m E, 5819800 m N	Mounded with CWD
	23-UH-21	10U 596118 m E, 5819986 m N	Mounded with CWD
	23-UH-30	10U 597410 m E, 5818656 m N	Recontoured with Topsoil and CWD
Upper Hazeltine – Halo	23-Halo-17	10U 596950 m E, 5819168 m N	No Treatment
	23-Halo-18	10U 596824 m E, 5819215 m N	Mounded with CWD
	23-Halo-19	10U 596017 m E, 5819901 m N	Mounded with CWD
Polley Flats	23-PF-23	10U 595860 m E, 5820214 m N	Soil placed with CWD
	23-PF-25	10U 595897 m E, 5820424 m N	Soil Placed with CWD
	23-PF-26	10U 595677 m E, 5820432 m N	Mounded with CWD
	23-PF-27	10U 595552 m E, 5820478 m N	Soil Placed with CWD
	23-PF-28	10U 595383 m E, 5820357 m N	Soil Placed with CWD
Polley Flats - Halo	23-Halo-22	10U 595961 m E, 5820175 m N	Mounded with CWD
	23-Halo-24	10U 595966 m E, 5820403 m N	No Treatment

Note that in 2023, it became apparent that the treatment designation for Halo plot 11 was not accurate as the area within this plot has not received any surface treatment and remains relatively undisturbed by the tailings breach event. Therefore, for the Year 4 analysis, and future analyses, the Halo plot 11 surface treatment type designation has been revised to “No Treatment”.

2.2 Survey Methods

The methods used in the 2022 study were adapted from methods outlined in the following documents: *Field Manual for Describing Terrestrial Ecosystems* (BC MOF and MOE, 2010) and *Mount Polley Mine - Detailed Study Design for Terrestrial Wildlife Monitoring* (Golder, 2019a). In addition, beginning in Year 2, additional monitoring criteria, based on specific objectives and endpoints for vegetation monitoring (additional requirement 18b of the CEMP approval), were added to the data collection.

A total of 30 vegetation monitoring plots were established at the approximate locations where plots were initially established in 2018 (Golder, 2019a). The monitoring plots were established with a radius of 5 m (78.54 m^2). A wooden stake was permanently installed at the centre of each plot, and during the assessment of the plot, flagging was temporarily installed at the perimeter of the plot in each of the four cardinal directions. A photograph was taken of the plot area from approximately 7 m south of the centre (north-facing view).

Site characteristics and vegetation performance metrics were collected from each of the monitoring plots. Information collected included the following:

- Slope and aspect;
- Percent cover of surface substrates (organic matter, decaying wood, rocks, bedrock, water, mineral soil and tailings);
- Percent cover by vegetation layer (tree, shrub, herb, moss and terrestrial lichen);
- Species-specific counts, height and vigour for both planted and naturally recruited tree and shrub seedlings in the non-halo plots (added to the data collection beginning in Year 2);
- Species-specific counts (estimates) of planted tree and shrubs within halo plots (where present; added to the data collection beginning in Year 2);
- List of plant species present;
- Percent cover by plant species and for each vegetation layer in which the species was present;
- Presence/absence of invasive plant species;
- Grass cover and tree/shrub seedling vigour (including seedling mortality), and
- General notes on plot condition.

Grass cover vigour was assessed based on the density of grass cover established within the plot (i.e., dense grass cover was identified as high vigour). Tree and shrub seedling vigour was based on individual plant health and was assessed visually, primarily relying on colour (e.g., presence of brown or red needles, evidence of yellowing/chlorosis), but also integrated crown volume, and needle size and density. Photographs showing examples of the various classes of vigour for planted conifers are provided in Figure 2.

Moss and lichen, some herbaceous perennial taxa (e.g., Asteraceace, *Carex sp.*) and willows (*Salix sp.*) were not always identified to species, but instead to family or genus, due to a lack of identifiable features (e.g., germinant stage, no inflorescence developed) and/or time constraints.

Within each plot, the percent cover of vegetation types (e.g., trees, shrubs, herbs), was evaluated independently of the total sum of individual species percent cover. This approach was used as no vegetation cover was identified to species within the plot (e.g., mosses and lichens). The species list for vegetation monitoring is considered “partial” and not “complete” (BC MOF and MOE, 2010).

During the Year 2 survey, two observations were made in regards to the efficiency and accuracy of the vegetation monitoring approach. It was determined that annual monitoring of two of the selected measures were not beneficial, and were subject to observer bias. These measures, and recommendations to revise the monitoring methodology, are provided below:

- Annual monitoring of undisturbed "No Treatment" plots (e.g., 22-Halo-17) may not be necessary, as changes in vegetation composition on an annual basis are likely smaller than what can be detected with the measures selected for vegetation monitoring. Therefore, during Year 3, and for future monitoring, it was recommended that monitoring only be completed in these plots every 3 years. However, to capture any potential changes to these plots that may occur from natural disturbance events (e.g., flooding, windstorm), each of the plots will be visited annually to check whether any disturbance occurred.

- Substrates within the treated areas were not observed to be changing significantly on an annual basis. Annual assessment of % cover for substrates may not be beneficial and subject to observer bias. Therefore, during Year 3, and for future monitoring, it was recommended that assessment of % substrates only be completed every 3 years.

		
High Vigour (hybrid white spruce)	Moderate Vigour (hybrid white spruce)	Low Vigour (subalpine fir)

Figure 2. Photos illustrating high, moderate and low vigour for conifer seedlings observed within the plots.

2.3 DATA COMPILATION

Data was compiled into spreadsheets and assessed for errors prior to summarizing. A comprehensive master copy of the data spreadsheets will be submitted with the annual report each year to be used for trend analysis in 2025.

3.0 RESULTS AND DISCUSSION

The results of the Year 4 (2023) assessment of the vegetation monitoring plots within the Hazeltine Creek corridor are summarized in Figures 3 to 10 and Tables 2 to 4. For undisturbed Halo plots, Year 2 (2021) field data has been utilized as no formal assessments of these plots were completed in Year 4. Photographs illustrating the plot areas are provided in Appendix B. Detailed tables providing all the vegetation data collected during the Year 4 survey are provided in Appendix C. Note that the results presented here are preliminary, and that a more detailed analysis of the vegetation data collected from the plots, to evaluate

ecological succession along the Hazeltine Creek corridor, will be completed following five years of monitoring in 2025.

As reported in Year 2, the average percent cover of substrate materials appears to be reflective of the treatment areas and the surface treatment types where the plots were located (Figures 3 and 4). For example, the highest average percent cover of organic matter was observed within Halo plots where disturbance from the TSF breach was minimal or absent and where surface treatments were often not applied (no treatments were applied to Halo plots 3, 9, 11, 17 and 24). As another example, the average % cover for decayed wood was highest on the plot located within the "Wood Chip Mulch with CWD" treatment, and plots located within the surface treatment "Recontoured with Topsoil and CWD" had the highest average % cover of mineral soil.

It should be noted that the average percent cover of mineral soil and tailings may be less accurate due to the difficulties interpreting the difference between the two substrates where they were both found within a plot, either mixed together, or in patches.

As there was no bedrock exposed at the surface of any of the plots, no percent cover for this substrate was recorded, and therefore, has not been reported in Figures 3 and 4.

Over time, with the natural establishment of an early successional forest and riparian vegetation cover, changes in the percent cover of some substrates are expected. As future growing seasons will lead the addition of organic material to the soil surface, from plant litter and fall die-off of herbaceous perennials, the average percent cover of organic material within treatment areas is expected to increase. In addition, with no mature tree cover to replenish CWD, the percent cover of decaying wood, particularly over the longer term (>10 years), is expected to decrease as the debris decays further and contributes organic matter to the soil surface (BC MOF, 1998).

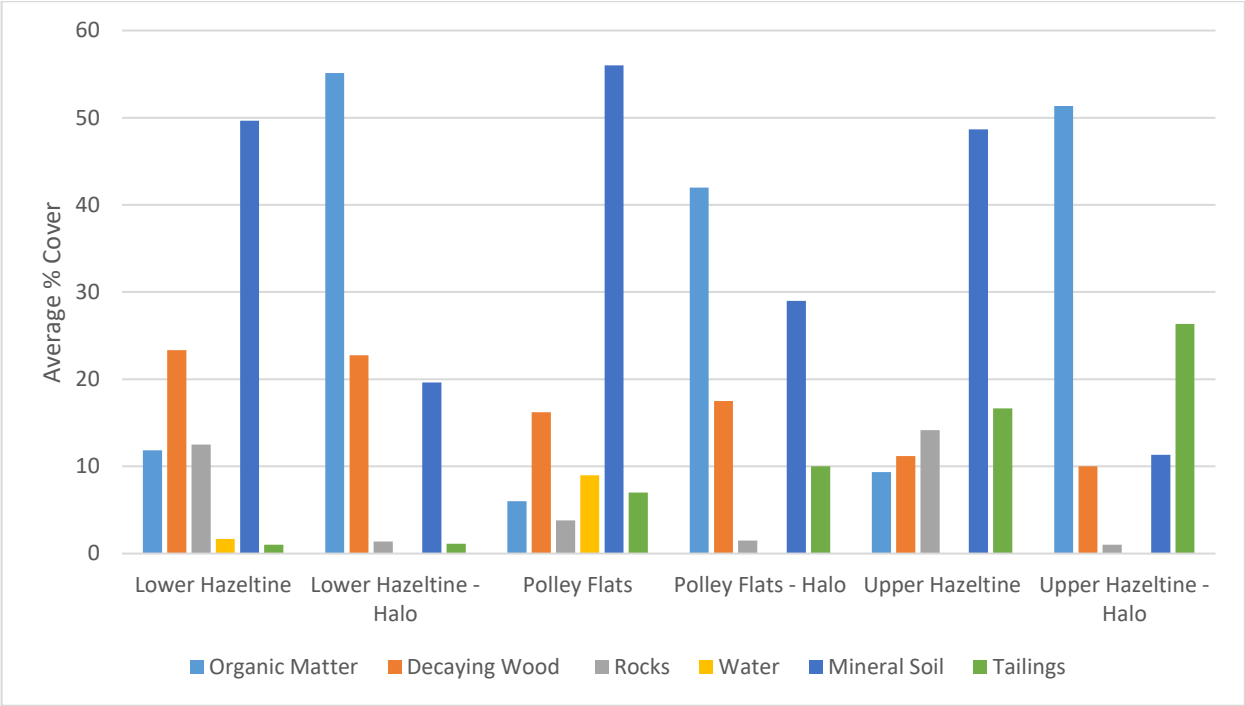

Figure 3. Average percent cover of substrate materials for each of the treatment areas.

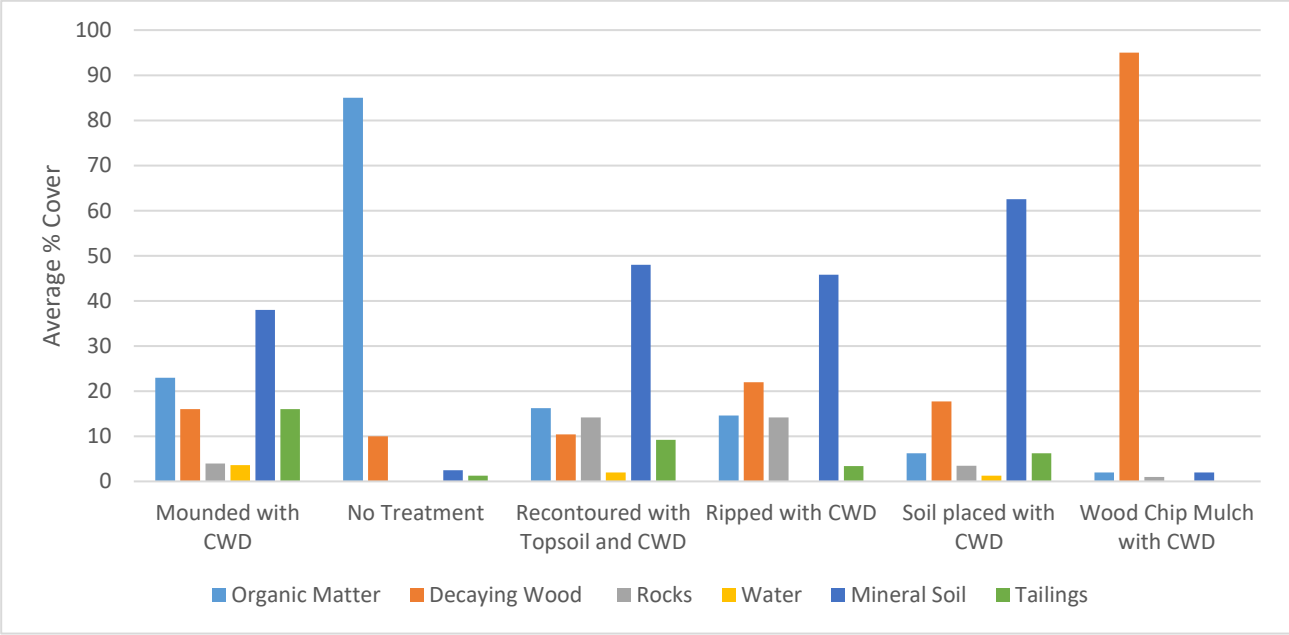

Figure 4. Average percent cover of substrate materials for each of surface treatment types.

The average percent cover for vegetation types is provided in Figures 5 and 6 and consists of data from Year 2 (no treatment plots) and Year 4 (all other plots). Average percent cover of trees was highest for halo plots (and No Treatment areas), which represents the minimally disturbed mature tree cover still present in this

zone compared to the scour areas, where little to no tree cover survived the initial breach event. Average cover for herbaceous plant cover (which includes grasses) was highest for the Polley Flats area.

The average percent cover of shrubs was high within the surface treatment "Soil Placed with CWD" in comparison to all other treatments and was lowest within no treatment areas. Soil treatments, specifically the placement of CWD, may be assisting in greater moisture retention and availability for shrubs, increasing their survival and productivity.

Very few terrestrial lichens were observed within the monitoring plots with an average percent cover of 1%. The establishment of terrestrial lichens is very slow and significant cover of this vegetation type is not expected to develop over the short term.

At present, vegetation cover within the Hazeltine Creek corridor is in the earliest stage of establishment. Pioneer herbaceous perennials and shrubs, free from competition with mature forest cover for light, and adapted to exposed conditions, are abundant (BC MOF, 1998). However, over time, the average percent cover of vegetation types is expected to change as natural succession progresses. For terrestrial and riparian areas, the average percent cover of trees, shrubs, moss and lichens is expected to increase and the average % cover of herbaceous perennials is expected to decrease (as forest cover develops from an early to mid-successional forest stage. With development of an early successional forest cover, foliage from trees and shrubs dominating the B1 layer (woody plants at 2-10 m) and B2 layer (woody plants at >2 m) will likely outcompete many of the herbaceous perennials for water and nutrients, particularly native and non-native grass species.

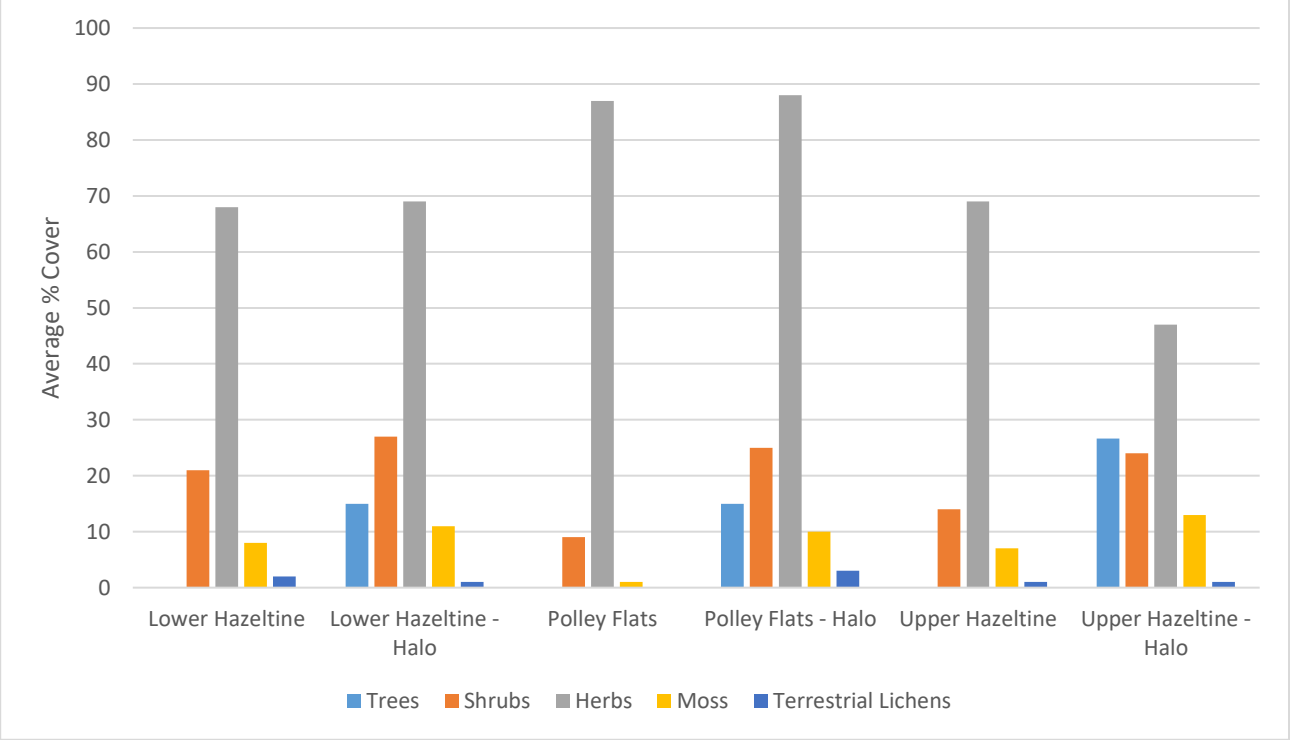

Figure 5. Average percent cover of vegetation types for each of the treatment areas.

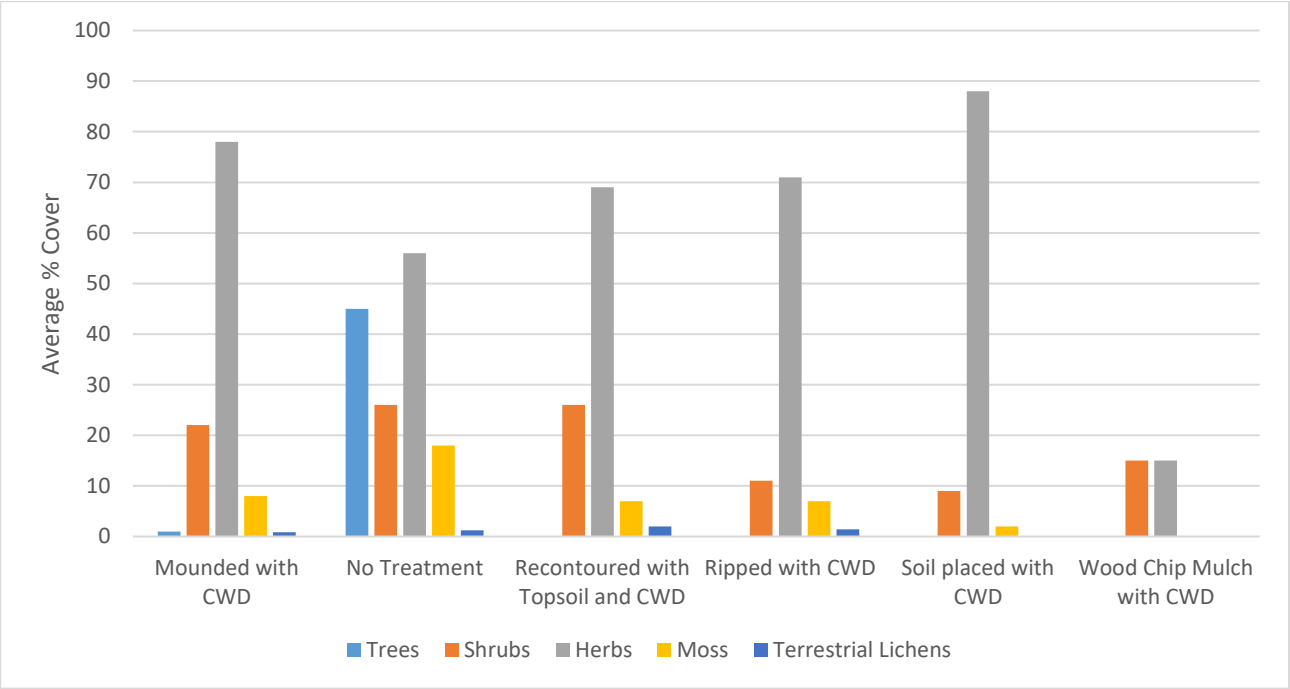

Figure 6. Average percent cover of vegetation types for each of the surface treatment types.

Species diversity, measured as the average number of species per plot is summarized in Figures 7 and 8 and consists of data from Year 2 (no treatment plots) and Year 4 (all other plots). Species diversity within the plots appeared to be higher in the Halo areas (Figure 7) and possibly the areas where no treatment was applied (Figure 8). Both of these areas appeared to have the greatest diversity of shrub and herbaceous species compared to other areas and treatments, the no treatment areas also appeared to have the greatest diversity of tree species. Species diversity was also appeared to be the lowest for all vegetation types on plots where wood chip mulch was applied (Figure 8).

Overall, plant species diversity within terrestrial areas may increase in the short term (e.g., the first few years of monitoring) but then is expected to decrease over the longer term as earlier and mid-successional forest cover establishes (BC MOF, 1998). Within riparian areas, species diversity is expected to increase over the short and long term.

The highest species diversity was observed in plot 23-Halo-17 (34 species) and the lowest species diversity was observed in plot 23-LH-7 (9 species).

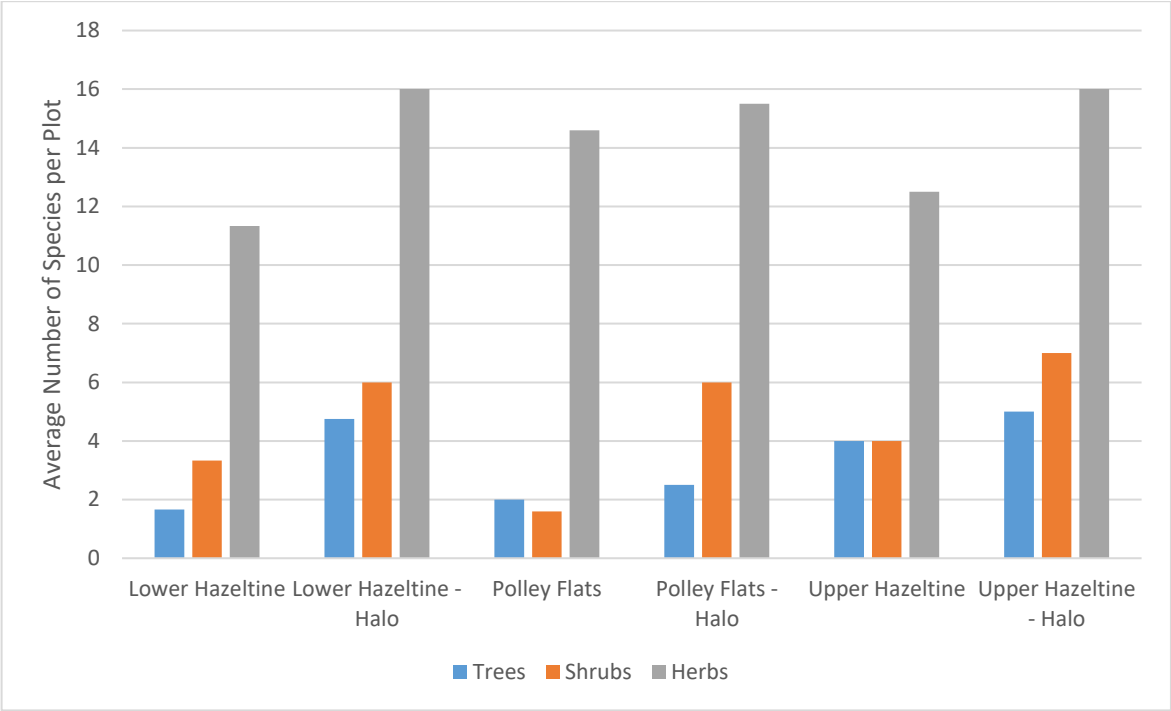

Figure 7. Average number of species per plot for each of the treatment areas.

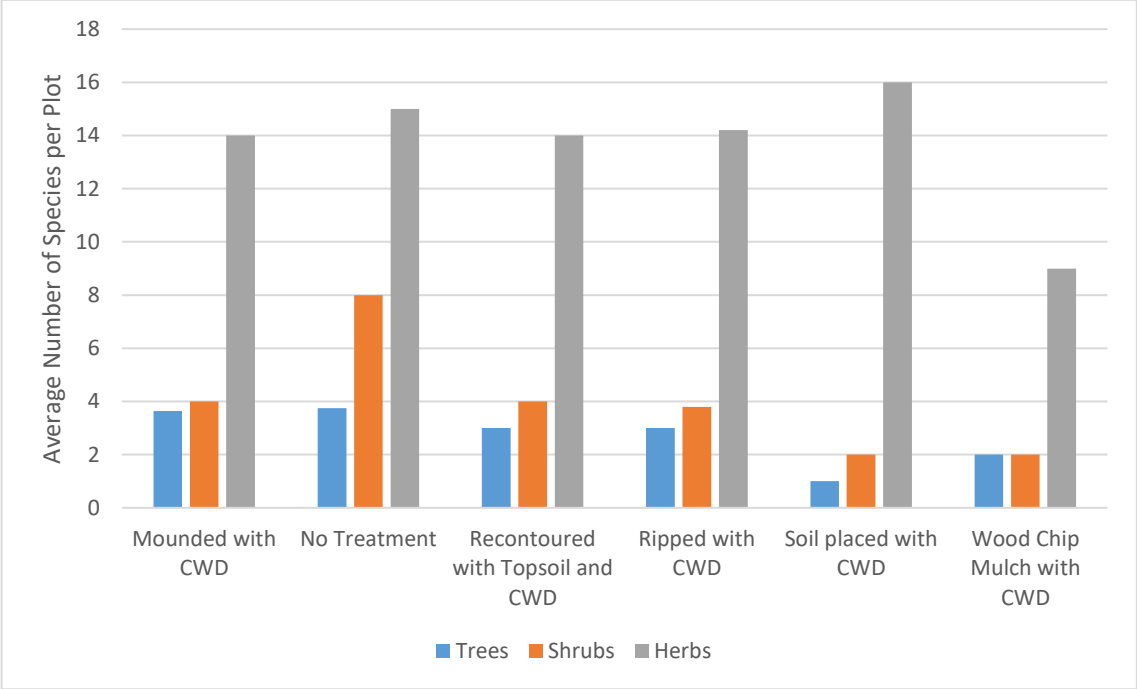

Figure 8. Average number of species per plot for each of the surface treatment types.

Tree and shrub seedling height, measured as the average height per treatment area or surface treatment type, is summarized in Figures 9 and 10. Average seedling height for deciduous trees and shrubs appeared to be the highest at Polley Flats Halo plots, coniferous tree height appeared to be highest at the Polley Flats plots. Average seedling height appeared lowest for conifers in the Lower Hazeltine area and lowest for deciduous in the Upper Hazeltine halo plots; average shrub height was lowest in the Upper Hazeltine area.

Average seedling height for deciduous trees appeared to be the highest on areas that had soil placed with CWD as well as areas that were recontoured with topsoil and CWD. Average seedling height for coniferous trees and shrubs was highest where soils where soils were placed with CWD. No deciduous trees were identified within the single plot for the wood chips mulch and CWD surface treatment. No data was collected for the No Treatment areas as planting was not completed in most areas where forest cover remained relatively undisturbed from the spill. During the Year 3 survey, it was determined that specifying between natural and planted seedlings was challenging and likely to be difficult in following years. During Year 4 surveys, all tree and shrubs were tallied together and not specified as planted versus natural. Average seedling height for deciduous and tree species was averaged across natural and planted stems during the field survey, up to a total 5 plants.

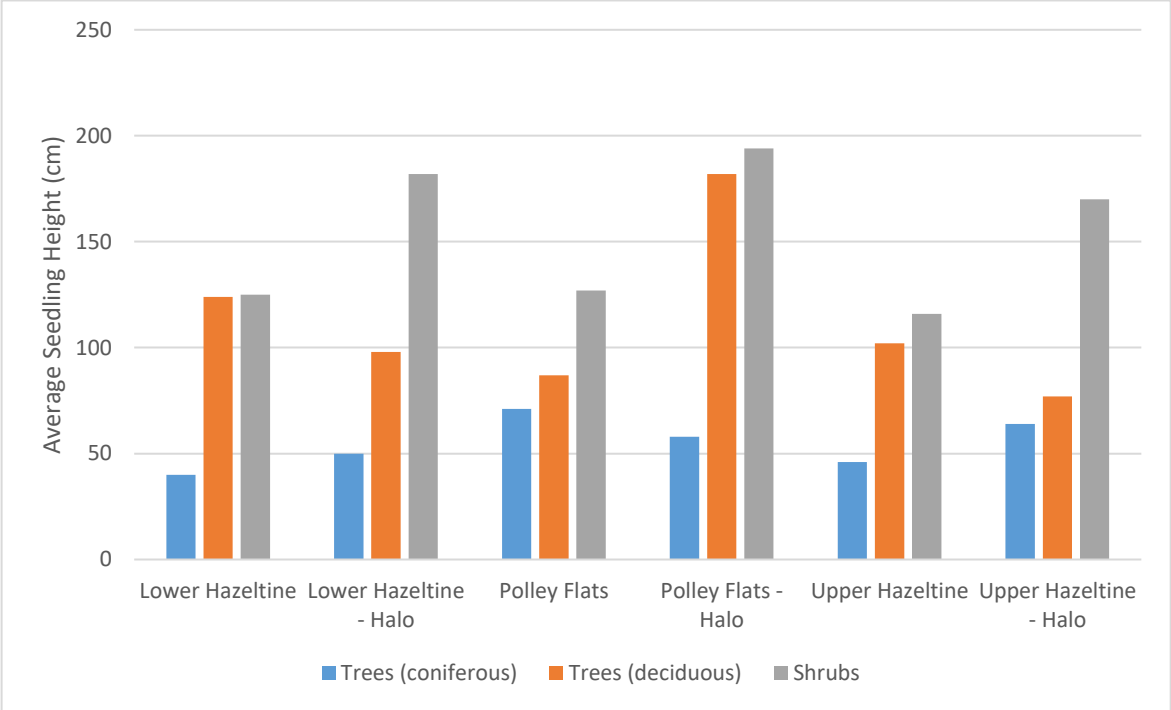

Figure 9. Average height for tree seedlings for per plot for each of the treatment areas.

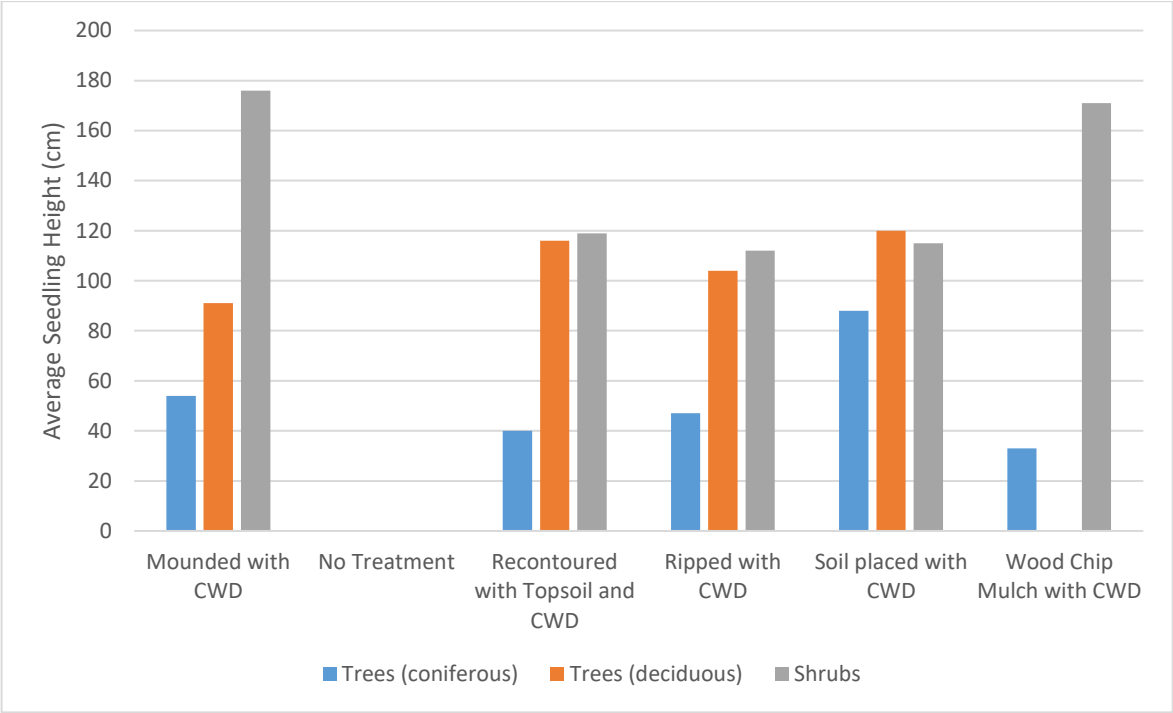

Figure 10. Average height for tree seedlings for each of the surface treatment types.

The most common tree, shrub and herb species observed within the monitoring plots have been identified as those occurring within 33% (10 out of 30) of the plots, and are listed in Table 2. Of the most common species, 14 were identified as native (6 herbs, 3 shrubs and 5 trees) and 8 species were identified as non-native. Of the most common species identified, most have naturally established (from existing seed bank or through a natural dispersal vector) on the plot, while the remainder have been established through seeding or planting. Some species, were considered as native or non-native species, as some native and non-native species present in BC belong to the same genus (e.g., *Hieracium spp.*).

Table 2. The most common plant species observed within the vegetation monitoring plots.

Vegetation Type	Common Name	Scientific Name	Percentage of Plots Observed	Native or Non-native	Seeded, Planted or Naturally Established
herb	common horsetail	*Equisetum arvense*	73	Native	Natural
	oxeye daisy	*Leucanthemum vulgare*	70	non-native	Natural
	Dandelion	*Taraxacum sp.*	60	non-native	Natural
	blue wildrye	*Elymus glaucus*	50	Native	Natural
	Fireweed	*Epilobium angustifolium*	50	Native	Natural
	creeping red fescue	*Festuca rubra*	47	non-native	Natural
	bluejoint reedgrass	*Calmagrostic canadensis*	47	Native	Natural
	black medic	*Medicago lupulina*	43	non-native	Natural
	yellow hawkweed	*Hieracium sp*	43	native or non native	Natural
	Kentucky bluegrass	*Poa pratensis*	43	non-native	Seeded
	sweet-scented	*Galium triflorum*	37	Native	Natural

	bedstraw				
	White sweet clover	*Melilotus albus*	37	non-native	Natural
	purple-leaved willowherb	*Epilobium ciliatum*	37	Native	Natural
	Timothy	*Phleum pratense*	33	non-native	Seeded
	Birdsfoot trefoil	*Lotus corniculatus*	33	non-native	Natural
shrub	Sitka alder	*Alnus viridis ssp. sinuata*	100	Native	Natural and Planted
	willow	*Salix sp.*	83	Native	Natural and Planted
	red raspberry	*Rubus idaeus*	67	Native	Natural and Planted
tree	black cottonwood	*Populus balsamifera ssp. trichocarpa*	87	Native	Natural and Planted
	hybrid white spruce	*Picea glauca x engelmannii*	83	Native	Natural and Planted
	western redcedar	*Thuja plicata*	53	Native	Natural and Planted
	Interior Douglas-fir	*Pseudotsuga menziesii var. glauca*	43	Native	Natural and planted
	Lodgepole pine	*Pinus contorta var. latifolia*	43	Native	Natural and Planted

*Although creeping red fescue and the clover varieties were not included in the grass seed mixes applied to the site between 2015 and 2017, their prevalence at the site, and being that it is a non-native agronomic legume, suggests it may have been introduced from the soil that was applied to the reclaimed areas.

It is important to note that seed for agronomic grass and legume species were not applied to the reclaimed areas of Hazeltine Creek during remediation/reclamation efforts. It is suspected that the presence of these species within the remediated areas is the result of the application of various soils that were sourced from and/or mixed with soils once seeded with these species during forestry and mining erosion and sediment control activities (e.g., roadside seeding).

The overall vigour of seeded grass cover and planted seedlings (where installed) was assessed in each of the plots and the results are summarized in Table 3. Seeded grass vigour ranged from low to high, with a majority of plots identified as high vigour. Planted seedling vigour also ranged from low to high, with a majority of planted identified as moderate or moderate to high vigour.

Tree and shrub species appeared to have moderate to high vigour across all species; however, Sitka alder vigour ranged from low to moderate across the plots.

During Year 4, tree and shrub seedling mortality within the monitoring plots appeared to be low; however, natural ingress is contributing to the overall total stems recorded within each plot. It was difficult to discern between planted and naturally established seedlings at this point in the monitoring program, and as a result, the number of planted seedlings that have died can only be broadly estimated. Plot 23-PF-23 had obvious mortality of almost all planted stems and no natural ingress observed.

Table 3. Seeded grass cover and planted seedling vigour observed within monitoring plots.

Plot	Location	Surface Treatment	Seeded Grass Vigour	Tree Seedling Vigour

* NA refers to Not Available, as some plots were not seeded or planted, or the evaluation of seedling and grass vigour was not completed.

Non-native plant species (excluding seeded grasses and legumes), invasive plants and noxious weeds, observed within the vegetation monitoring plots, are summarized in Table 4. Two noxious weeds, Oxeye daisy (*Leucanthemum vulgare*), Canada thistle (*Cirsium arvense*) and orange hawkweed (*Hieracium aurantiacum*), were observed within plots located in most or all of the treatment areas, with the Oxeye daisy having the greatest occurrence. One potential invasive species, thistle (*Cirsium spp.*) was also observed; however, at the time of the survey, these plants were not identified to species and therefore, their status as invasive could not be confirmed. During the 2018 reconnaissance surveys, bull thistle (*Cirsium vulgare*), an invasive plant species, was identified in six of the 30 monitoring plots; it is likely that the thistle plants observed this year are the same species. Non-native species identified, that were not intentionally introduced to the treatment areas, included dandelions (*Taraxacum sp.*).

Table 4. Non-native (excluding seeded grasses and legumes) and invasive plants and noxious weeds observed within the monitoring plots.

Common Name	Scientific Name	Status	Location(s)	Percentage of Plots Observed	Average % Cover per plot
oxeye daisy	*Leucanthemum vulgare*	Noxious Weed	Lower Hazeltine, Upper Hazeltine, Polley Flats	70	6
dandelion	*Taraxacum sp.*	Non-native	Lower Hazeltine, Upper Hazeltine, Polley Flats	60	5
thistle	*Cirsium sp.*	Invasive (Potential)	Lower Hazeltine, Upper Hazeltine, Polley Flats	33	6
Canada thistle	*Cirsium arvense*	Noxious Weed	Lower Hazeltine, Upper Hazeltine, Polley Flats	27	6
orange hawkweed	*Hieracium aurantiacum*	Noxious Weed	Lower Hazeltine	10	<1

During the surveys, general observations of vegetation condition within each of the plots were made. Notable observations are provided below:

- Amphibians, signs of ungulates (tracks and browsing signs) and birding behaviour was observed at some of the plots;
- Significant changes in herbaceous cover were observed at some of the plots; this included a mortality of species that commonly occur in hydric conditions including sedges, and common horsetail.
- Most of the trees within Plot 22-Halo-3 that were present prior to the tailings release remain standing but dead. This may be due to the limited water availability that occurred when a deep cover of tailings was applied to the surface, possibly preventing percolation/infiltration;
- Young spruce and western redcedar germinants were observed within some of the areas where wood mulch was applied as a treatment to the surface;
- Plot 23-PF-23 showed significant mortality of tree stems, on trend with what was observed in 2022.
- The percent cover and diversity of native herbaceous perennials within plot 13 is low and is suspected to be due to mulch surface treatment. Natural recruitment of herbaceous perennials and shrubs, within areas where mulch has been applied, may be reduced over the short term due to low seed receptivity of the mulch surface, and mulch depth, which may limit seed germination from the buried soil's seed bank;
- The general health of vegetation within Plot 18 appears to be negatively impacted by the tailing's substrate. Natural recruitment and succession of vegetation in this area may be limited by the fine textured nature of the tailings;
- Distinguishing between planted and naturally recruited tree and shrubs within the Plots became was notably difficult in Year 3 surveys. Natural trees and shrubs were not distinguished from planted, and so heights of all tree and shrub species were averaged across the plots.

4.0 SUMMARY

Approximately 113 species of plants were detected within the Hazeltine Creek corridor during Year 4 of the surveys, including 9 species of trees, 20 species of shrubs, approximately 84 species of herbs and an unrecorded number of moss and lichens. The results of the surveys from Year 1 to 4 will be incorporated into the final trend analysis in 2025.

Year 5 of the 5-year study will be conducted during the recommended period for vegetation surveys, which has been identified as early to early-July, 2024.

A summary of the current status of vegetation monitoring objectives and endpoints is provided in Table 5 below. As monitoring progresses, the status of these objectives will continue to be re-evaluated until monitoring endpoints have been reached.

Table 5. Summary of the current status for endpoints of vegetation monitoring.

Objective	Criteria	Results	Current Status
Objective 1: Vegetation cover is 'Self-sustaining'	Seedling mortality is no longer occurring or is due to natural processes, not related to any anthropogenic factors (e.g., planting/handling of seedlings, adverse soil conditions), or not occurring due to excess herbivory.	Tree and shrub Seedling mortality observed in Year 1 to 4 monitoring was minor.	Most seedling mortality at the site does not appear to be occurring as the result of anthropogenic factors and is expected to be a result of extreme weather conditions observed over recent years.
	Vegetation cover overall remains stable or is increasing.	Vegetation established in reclaimed areas appear stable.	Vegetation cover does not appear to be reducing over time; depending on soil conditions, some areas vegetation cover is increasing and some areas, vegetation cover remains consistent.
	Vegetation cover is resilient (evidence suggests that cover can survive periods of drought).	Vegetation observations in Year 4 show indications that vegetation was significantly impacted by the hot and dry period of the previous year.	Vegetation overall throughout the reclaimed areas appears resilient to dry periods due to species diversity.
	Natural recruitment of native species is continuous (occurring annually, and expected to continue to occur); recruitment is not limited by competition from existing vegetation cover, herbivory or surface conditions (e.g., soil compaction).	Natural recruitment of native plant species is occurring throughout the reclaimed areas. However, surface soil conditions (e.g., compaction and surface cementing) at some locations are limiting or preventing recruitment.	Recruitment is occurring and will likely continue to occur for most reclaimed areas. Further recruitment in areas where soil surface conditions are limiting will likely continue to see low or no recruitment until surface conditions change.
	Vegetation cover is species diverse (not a monoculture).	Vegetation is diverse in all reclaimed areas. Some areas were found to have significant ground cover of horsetail, but still were considered to have species diversity.	In most reclaimed areas, vegetation cover is very diverse and similar to early successional forest ecosystems.

Objective 2: Vegetation cover is following the natural successional trajectory that aims to satisfy the end land use objective	Vegetation cover is dominated by pioneer tree and shrub species identified as early successional species of the target ecosystem (e.g., subzone/variant); vegetation cover also consists of late successional tree and shrub species of the target ecosystem.	Pioneer and late successional tree and shrub species are present in all reclaimed areas.	A diversity of native tree and shrub species are well established throughout most reclaimed areas.
	Vegetation cover does not consist of any significant cover of nontarget species (e.g., invasive, agronomic, nuisance weeds); any cover of non-target species present is either declining or evidence suggests cover will decline over time.	Non-target vegetation has been identified in reclaimed areas. Invasive species or noxious weeds observed have been very limited in their distribution and cover. Agronomic grass cover has dominated some areas and is limiting or preventing the natural recruitment of native plant species.	Although some invasive plants and noxious weeds have been identified, they currently do not pose a risk to limiting natural succession. Areas dominated by agronomic grass cover have become successionally stagnant and are limiting for native plant species.
	Any factors that have been identified as limiting natural succession (e.g., plant competition, surface conditions, herbivory) on reclaimed areas, or portions of reclaimed areas, have been addressed or are no longer limiting.	Limiting factors for natural succession are still present in some reclaimed areas, including compacted ground/surface cementing, tailings substrates and dense agronomic grass/legume or herbaceous plant cover.	Limiting factors will likely remain long term unless remedial actions are taken in those areas where they are present.

4.1 Proposed Modifications and Improvements to Vegetation Monitoring

To ensure the MPMC wildlife monitoring plan is comprehensive and inclusive to the overall successional trajectory within the corridor, DWB has proposed to modify the focus of the vegetation monitoring from areas where the successional trajectory has been identified as "pursuant to the end land use objective" (i.e., endpoints) to areas where the direction and outcome of ecological succession is still to be confirmed.

The approach to this work would be to complete a mapping and field verification exercise that would identify areas that have, or have not, reached the endpoint for monitoring of ecological succession. Results from mapping and field verification would identify areas for new vegetation monitoring plots where the status and direction of ecological succession has not yet been confirmed. These new plots will allow DWB and MPMC to improve the ability to identify any limitations to ecological succession present within areas of the corridor.

Using current aerial imagery, DWB has proposed to delineate areas of homogenous vegetation cover within the Hazeltine corridor with a desktop mapping exercise. Ground verification of monitoring endpoint status will then be determined in conjunction with the annual vegetation monitoring conducted as part of the Study Design of the Wildlife Monitoring in the Hazeltine Creek.

Upon identifying the endpoint status of each of the mapped homogenous vegetation polygons, the location of vegetation monitoring plots, and frequency of monitoring of each plot, would be re-evaluated. For vegetation plots located in areas where the monitoring endpoint has been reached, the frequency of monitoring for these plots is recommended to be reduced to every 3 to 5 years (depending on annual climate variations or the occurrence of ground disturbance). For polygons where the monitoring endpoint has not been reached, the establishment of new vegetation plots will be considered to improve identification of limitations to ecological succession.

Potential areas in which new vegetation plots would be considered include:

- Recently disturbed and/or newly planted areas (e.g., Lower Hazeltine);
- Areas with growth limitations to vegetation (e.g., tailings substrate, compacted soil); or
- Areas not yet represented by a plot.

Any new plots that would be established would be monitored annually using the same criteria as identified in the Study Design for Wildlife Monitoring. Monitoring of these plots would be completed for a 5-year period, or until the monitoring endpoints have been reached.

An increased cost will be associated with establishment of completing this work as part of the Wildlife Monitoring Program. However, the proposed modifications to vegetation monitoring is predicted to result in a long-term cost savings through:

- Reduction in the frequency of monitoring for existing and new vegetation plots from annually to every 3-5 years, and
- Reduction in the total area in which vegetation monitoring will be required.

In addition, the cost of completing ground verification of endpoint status will be minimal as field work can be conducted in conjunction with the annual vegetation monitoring.

5.0 CLOSURE

This report was created for the exclusive use of MPMC and was completed in accordance with generally accepted biological principles and practice. No other warranty, expressed or implied, is made.

OQM | Organizational Quality Management Program

Executive Summary

DWB Consulting Services Ltd. conducted avian point count surveys from June 20 – 25, 2023, at Mount Polley Mine. The surveys were conducted as part of Year 4 of the mine's 10-year terrestrial wildlife monitoring program. The objective of the program is to monitor rehabilitation and reclamation initiatives that were completed for the Hazeltine Creek corridor to assess whether ecological succession is on track to support local wildlife populations after a tailings breach impacted the reach in 2014.

Point count surveys were conducted by four experienced surveyors in groups of two across 15 plots for five key study areas along the Hazeltine Creek corridor and 12 plots across Reference areas representative of Young and Mature Forest unimpacted by the 2014 tailings breach. Within the Hazeltine Creek corridor, four of the study areas (Lower Hazeltine – Quesnel Lake, Lower Hazeltine – CWD, Upper Hazeltine, Polley Flats) represent areas where rehabilitation treatments were previously applied, while the fifth study area (Lower Hazeltine – Halo Zone) represents an area where mature trees and native vegetation survived the breach.

A total of 61 avian species were detected within the Hazeltine Creek corridor, 29 species in Young Forest, and 36 species in Mature Forest when including detections between 0 – 100 m of plot center and flyovers. When analyzing the number of species detected within 0 – 50 m of plot center across all study areas in the Hazeltine Creek corridor, species richness was significantly higher in Lower Hazeltine – CWD and significantly lower in the Upper Hazeltine and Polley Flats study areas. A higher percentage of exposed ground in the Upper Hazeltine and Polley Flats plots may be a proxy indicator of underdeveloped vegetation cover or soil substrate capable of supporting invertebrate communities that would provide food to birds. However, future surveys and analysis are required to determine if this hypothesis has merit.

The relative mean abundance was estimated for 16 species within the Hazeltine Creek corridor, five species within Young Forest areas, and seven species within Mature Forest areas. Of these species, song sparrow had the highest abundance estimate in the Hazeltine Creek corridor and was influenced by study area, having a notably higher estimate in Polley Flats and a lower estimate in Upper Hazeltine. Orange-crowned warbler and Swainson's thrush demonstrated the highest mean abundance values in Young Forest plots, while varied thrush and Hammond's flycatcher had the highest mean abundance in Mature Forest areas; however, variability for the Reference area results was high.

Species resource preferences and habitat characteristics of survey plots were summarized to help interpret survey results and to use in future years for multi-year analyses, including comparison of species assemblages between study areas. Incidental observations, particularly evidence of avian breeding behaviour and presence of species at-risk, were also documented. Overall, results in Year 4 suggest that the reclaimed sites are attracting bird species we would expect to see on landscapes dominated by early pioneering vegetation species and are providing at least some support for actively breeding birds. Future survey years will incorporate invertebrate sampling and multi-year analyses (Years 5 and 10) to provide supplementary information on habitat and resource availability in the reclaimed areas and assess whether the objectives and benchmarks of the Mount Polley Mine wildlife monitoring program are being met.

APPENDIX A MAPS OF SURVEY LOCATIONS

APPENDIX B SURVEY PLOT PHOTOGRAPHS

1.0 INTRODUCTION

1.1 PROJECT SCOPE

DWB Consulting Services Ltd. (DWB) was retained by Mount Polley Mining Corporation (MPMC) to conduct bird surveys in 2023 along the Hazeltine Creek corridor at Mount Polley Mine (hereafter, referred to as Mount Polley) and Reference areas by conducting standardized point count surveys at established plot locations. Avian point count surveys are part of a terrestrial wildlife monitoring program to assess the progress of ecological succession in response to reclamation initiatives completed along the Hazeltine Creek corridor after a tailings breach in 2014 (DWB 2021; Section 1.2). The first year of bird surveys occurred in 2020 using the methods outlined in the *Mount Polley Mine - Detailed Study Design for Terrestrial Wildlife Monitoring* (Golder 2019a). Updates to the overarching terrestrial monitoring program were proposed in the *Updated Scope for the Terrestrial Wildlife Monitoring Plan for the Hazeltine Creek Corridor* (DWB 2021; hereafter, referred to as the Wildlife Monitoring Plan). Updates included increasing the program lifespan to 10 years, incorporating additional terrestrial ecosystem performance indicators, and outlining various benchmark indicators to assess the effectiveness of reclamation (DWB 2021; see Section 1.3).

The changes to the original monitoring plan were in response to recommendations from two oversight committees: the Mount Polley Government to Government Technical Working Group, (representing the local Xatśūll [Soda Creek] and T'exelc [Williams Lake] First Nations, the BC Ministry of Environment and Climate Change Strategy [BC ENV]), and the Habitat Remediation Working Group (representing Xatśūll, T'exelc, BC ENV, as well as MPMC technical experts, BC Ministry of Forest Lands and Natural Resource Operations and Rural Development [BC FLNRORD], and the Department of Fisheries and Oceans Canada [DFO]). The recommendations from these committees were stipulated by BC ENV as conditions for the approval of the 2019 Comprehensive Environmental Management Plan (CEMP). The CEMP is a permit requirement under *Environmental Management Act* Authorization 11678.

This report presents Year 4 of the bird survey results. The Wildlife Monitoring Plan is a long-term project which will develop a multi-year dataset (DWB 2021). Multi-year analyses are planned for Years 5 and 10 of the study, which will compare the results to the benchmark indicators for breeding birds outlined in the Wildlife Monitoring Plan.

1.2 BACKGROUND

The Hazeltine Creek corridor was impacted by a breach in the Mount Polley tailings storage facility embankment in 2014, which released tailings, supernatant, and construction materials into Hazeltine Creek and the downstream Edney Creek and Quesnel Lake. Since the event, extensive remediation work has been completed along the corridor, including reconstruction of Hazeltine and Edney Creeks, and the shoreline of Quesnel Lake. Rehabilitation of riparian habitat was initiated by planting native trees, shrubs, and graminoids, and using landscape techniques to improve site growing conditions, such as mounding soil, spreading coarse woody debris (CWD), and adding mulch. Riparian vegetation planting and installation of habitat features favourable to birds, such as vertical CWD tree perches and nest boxes, were completed at several of the sites.

An Ecological Risk Assessment was conducted for MPMC in 2019 (Golder 2019b). The results determined that the risk of metal uptake by terrestrial receptors from contaminated soil and sediment was low compared to the ecological risk posed by the physical disruption to soil, vegetation, and riparian habitat (Golder 2019b). Therefore, The Wildlife Monitoring Plan was developed with a focus on rehabilitation of

physical habitat attributes, since the risk of metal toxicity to terrestrial wildlife through bioaccumulation and biomagnification was designated as low.

1.3 Study Objective

Breeding migratory birds are informative indicators of habitat availability, since different species and groups rely on different habitats to support breeding, nutrition, and territory acquisition (Mac Nally 1997, Hanson et al. 2009, O'Brien and Dawson 2016). Birds are also an efficient wildlife group to survey and can indicate when ecological succession is progressing to a more mature state (Block 1987, Schieck and Song 2006, Hawkes 2021). The MPMC Terrestrial Wildlife Monitoring Program was initially designed to facilitate trend analysis over a 5-year period (Golder 2019a). However, the scope of the program was updated in October 2021 to increase the monitoring period to 10-years and include other study elements, such as reference sites, mammals, population metrics, and benchmarks (DWB 2021). Reference sites representative of young and mature forest stages was established in 2022 outside the boundaries of the mine site and were surveyed for the first year in 2023.

In accordance with the current Wildlife Monitoring Plan, ecological succession along the Hazeltine Creek corridor will be considered on a trajectory that is successfully supporting breeding birds if the relative abundance of bird species, species richness, and/or species diversity on the reclaimed sites are:

- Similar to the reference sites, **and/or**
- Higher on the reclaimed sites where improvements to facilitate vegetation regrowth and habitat complexity have been applied for a longer duration of time, indicating that these reclaimed sites will have a higher likelihood of success, **and/or**
- Higher in year 10 when compared to previous years, indicating that habitat availability for breeding bird populations has improved, particularly for species that occupy habitats in early- to mid-successional stages.

Alternatively, avian community composition may demonstrate a transition from an early-successional to mid-successional assemblage of avian species, a mid-successional to a mature-successional assemblage of avian species, or a transition in community composition that is similar to the reference sites.

To address the recommendations provided by the Government to Government Technical Working Group, Reference sites representative of young and mature forest stages were selected outside the boundaries of the mine and field-verified in late summer of 2022. Therefore, Year 4 of the program (2023) represents the first year of surveys completed at the Reference sites. The Reference sites will be considered representative of early- to mid-successional and mature-successional avian communities.

1.4 Applicable Regulations

No permit was required to complete the bird point count surveys; however, a number of overarching regulations apply to birds in Canada and British Columbia (BC). Most bird species are protected under the Canada *Migratory Birds Convention Act* (MBCA; S.C. 1994, c. 22), which prohibits harm and disturbance to most bird species and nests that are occupied by birds and/or viable eggs. Bird species that are not regulated under the MBCA (e.g., raptors) still have similar protection under the BC *Wildlife Act* (R.S.B.C. 1996, c. 488, s. 34). In addition, nests belonging to certain species are protected year-round regardless of occupancy. Under Schedule 1 of the Canada *Migratory Birds Regulations* (SOR/2022-105), nests belonging to 18 species, including pileated woodpecker and great blue heron, are protected indefinitely on the landscape unless determined to be unoccupied for a certain period of time (36 months for pileated woodpecker and 24 months for great blue heron).

Under the BC *Wildlife Act*, nests belonging to eagles, peregrine falcons, gyrfalcons, ospreys, herons, and burrowing owls are protected year-round regardless of occupancy. Nests protected year-round under statute must not be removed without federal or provincial authorization.

Some avian species have additional protection under the Canada *Species at Risk Act* (SARA; S.C. 2002, c. 29), particularly if designated as *Threatened* or *Endangered*. Additional prohibitions under SARA also apply to the 'residence' of the *Threatened* or *Endangered* species, which is sometimes species dependent. Federal prohibitions under the MBCA and SARA are applicable on all lands in Canada for birds, including private and provincial crown land.

1.5 PROJECT LOCATION

Mount Polley is located approximately 57 km (geodesic distance) northeast of Williams Lake, and 8 km south of Likely, BC, at the end of the Morehead-Bootjack Forest Service Road (FSR) at UTM 10 U 592897 m E, 5822603 m N (Figure 1). The project area is within the Interior Cedar Hemlock, Quesnel wet cool variant (ICHwk2) biogeoclimatic zone, which encompasses an elevation range of 725-1250 m and is characterized by cool wet winters, warm moist to dry summers, and a mean annual precipitation of 842 mm (Steen and Coupé 1997).

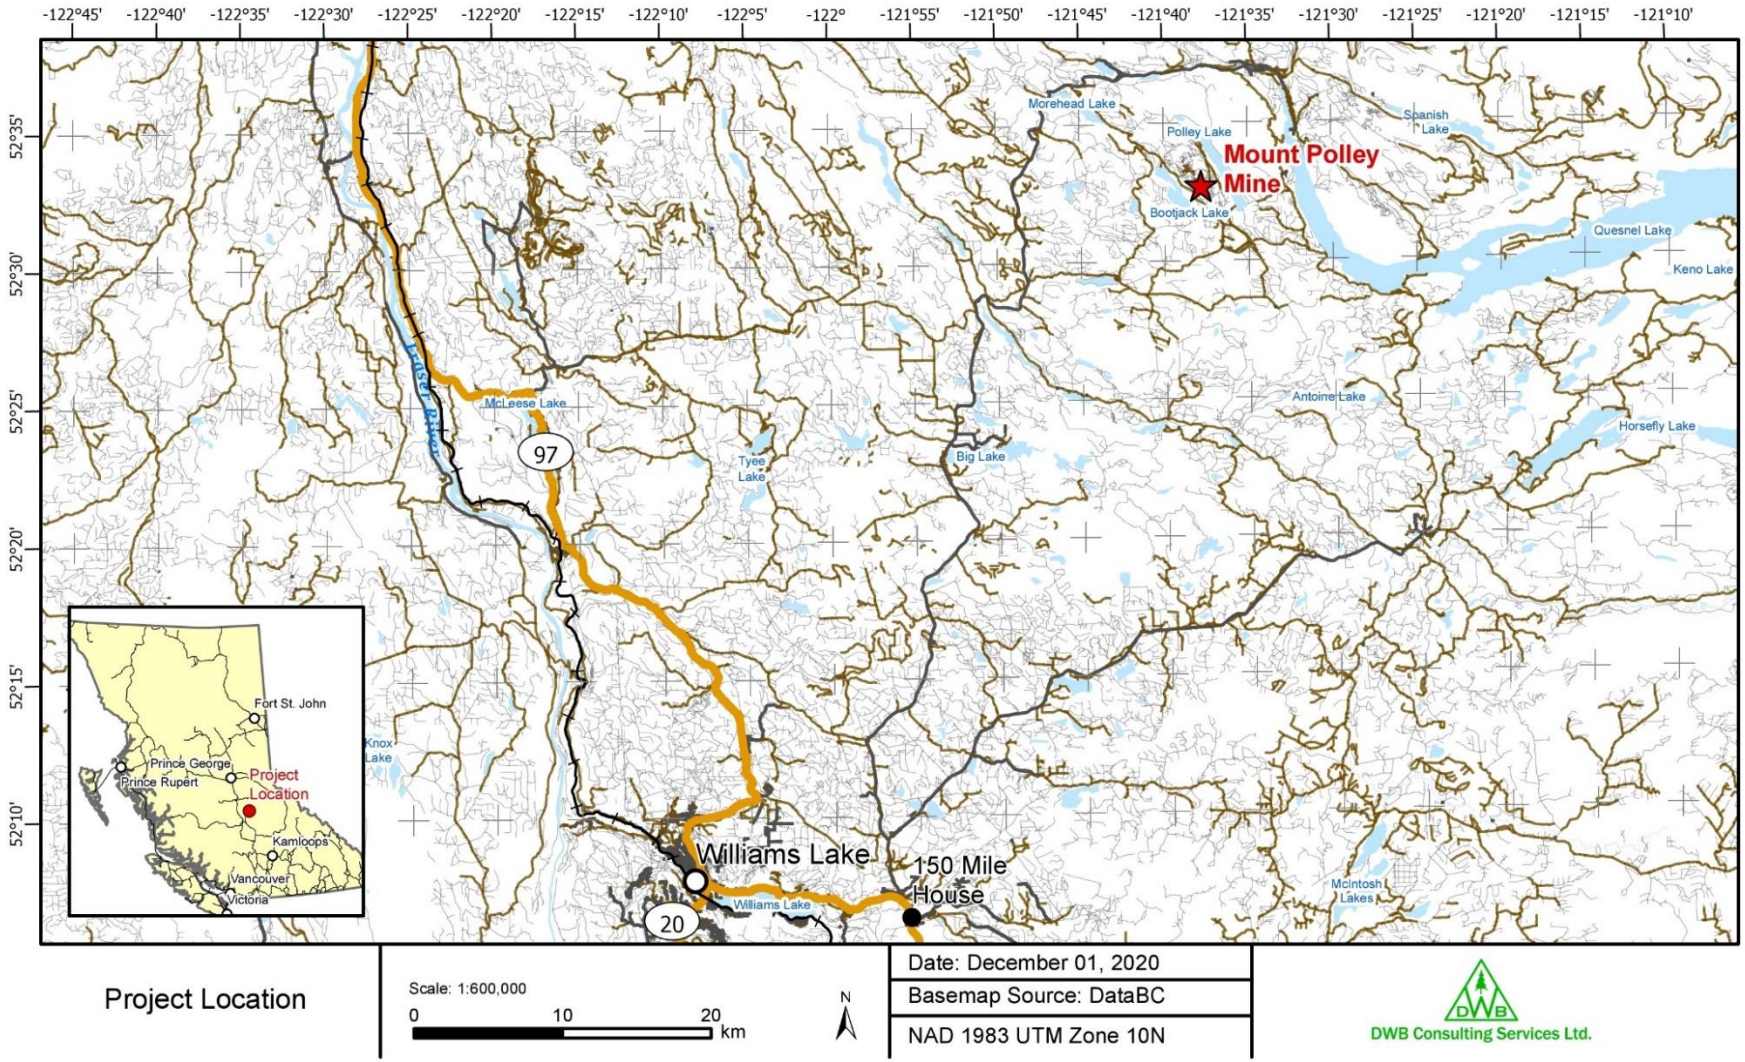

Figure 1. Location of Mount Polley Mine in British Columbia, Canada

2.0 METHODS

Survey methods were based on the initial study design summarized in the *Mount Polley Mine - Detailed Study Design for Terrestrial Wildlife Monitoring* (Golder 2019a) and updated in the Wildlife Monitoring Plan (DWB 2021). Point count surveys were conducted to meet provincial standards described in *Inventory Methods for Forest and Grassland Songbirds* (RIC 1999).

2.1 POINT COUNT SURVEYS

2.1.1 Plot Locations

Avian point count stations were established at 15 plots within the Hazeltine Creek corridor. Each plot was 100 m radius in size and spaced a minimum of 200 m from other plots to meet the assumption of independence (RIC 1999). Plots were established in five study areas along the Hazeltine Creek corridor that had been functionally impacted by the breach, including Lower Hazeltine, Upper Hazeltine, and Polley Flats (Table 1; Appendix A). Lower Hazeltine was further separated into three zones to account for differences in vegetation. *Lower Hazeltine – Quesnel Lake* represented the nearshore area adjacent to Quesnel Lake where some mature trees remained intact post-breach and where CWD treatments had been applied, *Lower Hazeltine – Halo Zone* represented an area where the majority of mature trees present prior to the breach were still intact and no treatments had been applied, and *Lower Hazeltine – CWD* represented an area primarily absent of mature trees and where CWD treatments had been applied. Each of the five study areas contained three plots for conducting point count surveys.

Table 1. Locations of avian point count survey plots according to study areas located within the Hazeltine Creek corridor

Study Area	Plot Name	UTM Locations	Rehabilitation Treatment Type
Lower Hazeltine – Quesnel Lake	BBS01	10U 601729 m E, 5817535 m N	Mounded with CWD
	BBS02	10U 601586 m E, 5817399 m N	Mounded with CWD
	BBS12	10U 601789 m E, 5817363 m N	Recontoured with topsoil and CWD
Lower Hazeltine – Halo Zone	BBS03	10U 602060 m E, 5817382 m N	**No treatments applied** – mature trees that were present prior to the breach remained intact
	BBS04	10U 601790 m E, 5817157 m N	
	BBS13	10U 601987 m E, 5817223 m N	
Lower Hazeltine - CWD	BBS05	10U 601239 m E, 5817098 m N	Recontoured with topsoil and CWD
	BBS06	10U 601011 m E, 5817000 m N	Ripped with CWD
	BBS14	10U 601092 m E, 5817321 m N	Added wood chip mulch with CWD; mounded with CWD
Upper Hazeltine	BBS07	10U 599371 m E, 5817367 m N	Mounded with CWD
	BBS08	10U 598204 m E, 5817648 m N	Recontoured with topsoil and CWD
	BBS15	10U 596877 m E, 5819176 m N	Mounded with CWD
Polley Flats	BBS09	10U 595938 m E, 5820037 m N	Ripped with CWD
	BBS10	10U 595743 m E, 5820153 m N	Mounded with CWD
	BBS11	10U 595856 m E, 5820385 m N	Soil placed with CWD

In 2022 (Year 3), a total of 18 plots were established in Reference areas adjacent to nearby watercourses that were representative of early-successional and mature forest. Being well outside the boundaries of the mine site, the locations of the Reference areas had not been directly impacted by the tailings breach in 2014; however, most of the Reference area locations had been affected by historical silviculture practices, as is common to the region. Reference areas were categorized into two groups: Young Forest and Mature Forest. Young Forest areas were characterized by forest stands approximately 15-years old that had been replanted as part of silviculture practices. Plots were established in stands that contained diverse shrub layers and native plant communities, where possible, so that reasonable comparisons between Young Forest and the Hazeltine Creek Corridor could be made over time. The Mature Forest habitat was characterized by forest stands approximately 127 – 135 years old. Age class was determined using BC Vegetation Resource Inventory (VRI) data (Province of BC 2023).

Table 2. Plot locations for avian point count surveys in study areas located within reference areas outside the boundaries of the Hazeltine Creek Corridor and Mount Polley Mine site

Study Area	Plot Name	Location (UTMs)	Adjacent Riparian Feature
Mature Forest	BBS16	10U 580145.97 m E, 5820274.04 m N	Miles Creek
	BBS17	10U 579878.99 m E, 5820118.04 m N	Miles Creek
	BBS18	10U 579802.02 m E, 5820447.99 m N	Miles Creek
	BBS19	10U 583414.98 m E, 5822481.05 m N	Jacobie Creek
	BBS20	10U 583235.01 m E, 5822314.99 m N	Jacobie Creek
	BBS21	10U 582941.03 m E, 5822431.04 m N	Jacobie Creek
	BBS22	10U 589345.97 m E, 5824429.03 m N	Morehead Creek
	BBS23	10U 589624.01 m E, 5824430.00 m N	Morehead Creek
	BBS24	10U 589771.00 m E, 5824608.05 m N	Morehead Creek
Young Forest	BBS25	10U 580852.01 m E, 5826802.00 m N	Warren Creek
	BBS26	10U 581062.02 m E, 5826850.98 m N	Warren Creek
	BBS27	10U 581015.01 m E, 5826657.95 m N	Warren Creek
	BBS28	10U 581557.97 m E, 5821448.98 m N	Miles Creek
	BBS29	10U 581389.01 m E, 5821186.05 m N	Miles Creek
	BBS30	10U 581087.02m E, 5821284.95 m N	Miles Creek
	BBS31	10U 580763.97 m E, 5822726.96 m N	Jacobie Creek
	BBS32	10U 581144.03 m E, 5822802.00 m N	Jacobie Creek
	BBS33	10U 581370.01 m E, 5822912.00 m N	Jacobie Creek

Refer to Appendix A for a map of all survey plot locations across the different study areas. At a regional level, bird species can be influenced by elevation, vegetation characteristics, and forest age. Therefore, Table 3 summarizes these features between survey plots.

Table 3. Comparison of regional habitat characteristics between all study area and plot locations

Study Area	Plot Name	BEC Zone[a]	Elevation (m)	Forest Age Class[b] (Years)	Description
Lower Hazeltine Creek – Quesnel Lake	BBS01	ICHwk2	731	34	Reclaimed after tailings breach.
	BBS02	ICHwk2	731	124

(a) Biogeoclimatic Ecosystem Classification, including Interior Cedar Hemlock Quesnel Wet Cool (ICHwk2), Interior Cedar Hemlock Horsefly Moist Cool (ICHMK3), and Sub-boreal Spruce Horsefly Dry Warm (SBSdw1).

(b) Age class was determined using 2023 BC Vegetation Resource Inventory (VRI) data

Five plots in each References area type were surveyed in 2023, including BBS19 – 24 (Mature Forest) and BBS25 – 30 (Young Forest). Within 50 m of each point count plot center, physical and biotic habitat characteristics were documented to support the analyses of successional status and verify that plots accurately represented the characteristics of the study areas. Vegetation characteristics are described in greater detail in Section 2.3. Photographs showing vegetation characteristics from each cardinal direction of the plot center are in Appendix B.

For a formal, quantitative assessment of the progress of planting and vegetation succession along the Hazeltine Creek corridor, refer to the *Mount Polley Mine - Terrestrial Wildlife Monitoring: Vegetation Surveys, Year 4* (DWB 2023a).

2.1.2 Bird Counts

Auditory and visual counts of birds were conducted from June 20 – 25, 2023, which is within the recommended window for peak detection of songbird activity (May 1 – July 10; RIC 1999). Surveys were conducted within the first four hours after sunrise when singing rates are highest (RIC 1999) by four experienced observers working in teams of two. Plots were surveyed for a total of five minutes each day by one of the two survey teams using the unreconciled double-observer method (Riddle et al. 2010). The unreconciled double-observer method provides estimates of detection probability and abundance without requiring surveyors to match their individual observations; this differs from the independent double-observer method where matching observations between observers is required (Riddle et al. 2010). During the five-minute survey period, the total number of individual birds detected was recorded according to whether they could be heard or visually observed within the following horizontal distance categories:

- 0 – 50 m from plot center,
- 50 – 100 m from plot center,
- >100 m from plot center (outside of plot),
- Flying over plot

A total of three surveys were completed for each plot over six consecutive days to capture variation in survey conditions and associated bird activity, as well as chance observations. Poor weather conditions, such as cold temperatures (<3°C), persistent precipitation in the form of snow or rain, and high winds (Beaufort Scale >2 or >12 km/hr) reduces bird activity and can compromise the ability of the surveyor to detect species (RIC 1999); however, weather conditions remained favourable during the survey period. To reduce potential surveyor bias that could impact the probability of species detection, surveyor crews alternated plots daily.

Bird species were recorded as incidental observations if they were identified outside of the 5-minute point count survey sessions. Although incidental observations were not used in final analyses, these observations were informative for confirming presence of avian species and breeding behaviours that were present in study areas, but not always detectable through point count surveys (e.g., waterfowl, raptors), as well as identifying the presence of species at risk (Section 4.0). Evidence of breeding could include persistent territorial alarm-calling, adults carrying food in beak indicative of nestling provisioning, adults on nests or entering tree cavities, or observations of juveniles that had recently fledged (Section 3.4).

2.2 Data Analyses

The results of point count surveys were used to determine the following metrics:

- **Species Richness** – the total number of bird species detected within each study area,
- **Species Relative Abundance** – an estimate of the mean number of individuals per species utilizing each study area,
- **Community Composition** – the presence of a particular assemblage of species that share similar preferences for habitat and resources within each study area.

Species richness, relative abundance and community composition are quantifiable means of measuring changes in avian populations and communities, which will improve interpretability when comparing survey results to the benchmarks of the Wildlife Monitoring Plan (DWB 2021). Only data collected from 0

– 50 m of plot center were used in analyses because this area was considered the most representative of the reclaimed site features.

2.2.1 Species Richness

A generalized linear model with a Poisson distribution was analyzed in R v 4.2.3 (R Core Team 2023) using the 'lme4' package (Bates et al. 2015) to determine if there was a statistically significant difference in species richness between study areas. Linear models attempt to describe a relationship between a variable of interest (e.g., species richness) and predictor/explanatory variable(s) (e.g., study area/time) by fitting a straight line to the observed data (Agresti 2015). The model was assessed for overdispersion and collinearity using the 'Performance' package (Lüdecke et al. 2021) to ensure Poisson model assumptions were met. Parameter estimates were calculated using Maximum Likelihood Estimation and results were considered significant when the p-value was less than 0.05. Sampling variation and precision was represented by ± 1 standard error (SE) with a 95% confidence interval.

2.2.2 Species Relative Abundance

Species abundance across all plots and study areas were estimated by analyzing point count data in the program PRESENCE v 2.13.47 (Hines 2023) using the Royle Biometrics option, which also calculates the probability that a species will be detected by surveyors (Royle 2004). Although some studies have found that zero-inflated Poisson and negative binomial distributions are a better fit for modelling species where overdispersion is present in the dataset, a simple Poisson N-mixture model was chosen to better accommodate small sample sizes. Only species that were detected a minimum of fives times across all plots were included in the analyses. The number of times a bird was detected by surveyors was assumed to have included repeat counts of the same individuals over the survey period, since many songbirds establish territories during breeding.

Abundance and the probability of detection can be influenced by a number of environmental and survey factors. For example, a greater number of individuals and species are more likely to be detected in the first few hours after sunrise compared to late morning or afternoon (Ralph et al. 1993, RIC 1999). Species detection may also be affected by surveyor experience and physical ability (e.g., some surveyors have difficulty detecting the higher frequency of golden-crowned kinglets). To account for this type of variation, a number of independent variables (hereafter, referred to as explanatory variables) anticipated to influence species detection were assessed in the models. Study area was included in the models for the Hazeltine Creek corridor as the primary predictor of interest of avian abundance (Table 4). A predictor variable was not included in the model for the Reference areas.

Table 4. Model variables anticipated to influence estimates of abundance and detection probability of avian species during point count surveys from June 20 – 25, 2023

Parameter Tested	Variable Category[(a)]	Variable Type[(b)]	Description
Study Area	Predictor	Qualitative	The five study areas associated with the Hazeltine Creek corridor (see Table 1). A predictor was not included in the models for the Reference areas.
Time	Explanatory	Quantitative	The start time of each point count survey conducted for each plot located in the Hazeltine Creek corridor and Reference areas.

Parameter Tested	Variable Category[(a)]	Variable Type[(b)]	Description
Observer	Explanatory	Qualitative	A unique identifier associated with each surveyor who performed the point count survey for plots in the Hazeltine Creek corridor and Reference areas.
Temperature	Explanatory	Quantitative	The ambient air temperature at the start of each day for plots in the Hazeltine Creek corridor and Reference areas.
Edges	Explanatory	Quantitative	Distance between plot center and nearest edge of adjacent forest habitat for plots in the Hazeltine Creek corridor. For Mature Forest Reference areas, this value represents the nearest distance from plot center to the edge of the forest before the habitat transitions to early-successional habitat or main roads that fragment the forest stand. Values were measured from satellite imagery.

(a) For this analysis, the Predictor variable is defined as the variable of primary interest (Study Area) in regards to its direct influence on species mean relative abundance. The Explanatory variable is defined as a variable anticipated to have an influence on the detection probability for each species and, therefore, an indirect influence on mean relative abundance that is unrelated to Study Area.

(b) Qualitative variables were analyzed as categories, while quantitative variables were analyzed as either discrete or continuous numerical data.

Survey number (i.e., Survey Visit), which was included as an explanatory variable in 2022 (Year 3), was removed for the 2023 (Year 4) analysis (DWB 2023b). Air temperature at the start of each day was used in the analysis for 2023 instead of the air temperature at the start of each point count survey used in the analysis for 2022 (DWB 2023b); this was due to the daily air temperature results having fewer missing data points.

A total of 10 models were considered for each species detected in plots within the Hazeltine Creek corridor and a total of 5 models were considered for each species detected in Reference area plots. Only species that had cumulative counts of five or greater across all plots during the survey period were analyzed for mean abundance. Overall, a total of 47 species were included in the analysis for mean abundance; however, final results were only presented for 16 species within the Hazeltine Creek corridor and 11 species within the Reference areas after excluding species with highly variable results (i.e., the standard error was greater than the mean estimate).

The model that best represented the dataset for each species was chosen using Akaike's Information Criterion corrected for small sample sizes (AICc). AICc ranks the relative performance of multiple models of the same data set by using the maximum likelihood estimation as a measure of fit, and penalizes more complex models with a higher number of parameters (Burnham and Anderson 1998). In AICc, the lowest score is assigned to the best performing model; however, models with low scores of two AICc units of difference or less are considered equally superior (Burnham and Anderson 1998). Precision of the results were represented by ± 1 standard error (SE) with a 95% confidence interval.

2.2.3 Community Composition

One of the long-term goals of the program is to assess whether changes in community composition (i.e., species assemblages) occur in the reclaimed areas of the Hazeltine Creek corridor over time. Therefore, species included in the analysis of abundance were categorized according to specific habitat types and resources. The habitat and resource categories are summarized in Table 5.

Table 5. Categories assigned to avian species based on habitat and resource preferences

Category	Sub-Category	Description
Vegetation Structural Stage	Herb (SS2)	Habitat that consists of an early successional stage or herb community (SS2) that could be dominated by forbs, graminoids, aquatic plants, or dwarf shrubs.
	Shrub (SS3)	Habitat that consists of an early successional stage or shrub community, including low shrubs (<2 m tall) and tall shrubs (2 - 10 m tall).
	Pole/Sapling (SS4)	Habitat characterized by (typically) young trees (usually > 15-20 years old) greater than 10 m tall, and which are often densely stocked and have overtopped shrub and herb layers.
	Young Forest (SS5)	Habitat characterized by young forest where thinning is starting to occur and which is potentially 30 - 80 years of age, depending on the species.
	Mature Forest (SS6) Old Forest (SS7)	Habitat characterized by mature trees (80 - 140/250 years, depending on disturbance type) where the shrub and herb understories have become well developed (SS6). Old forest contains stands of old trees with complex structure (SS7).
Habitat Type	Riparian	Areas characterized by watercourses.
	Shrub	Areas characterized by shrub communities.
	Grassland	Areas characterized by early- to late-successional grassland species.
	Conifer	Forest stands dominated by conifer tree species.
	Deciduous	Forest stands dominated by deciduous tree species.
	Mixed Forest	Forest stands comprised of mixed conifer and deciduous tree species.
	Open	Areas dominated by herbs, low shrubs, or exposed ground.
Nest Site	Tree	Builds nests in the branches, or against the trunk, of trees.
	Shrub	Builds nests in early- to late-successional shrubs.
	Ground	Builds nests on the ground.
	Burrows	Builds nests in excavated burrows of embankments or wherever small crevices can be found.
	Cavities	Builds nests in excavated cavities of trees or nest boxes.
Foraging Area	Aerial	Primarily forages for food in the air.
	Foliage	Primarily forages for food in the leaves, needles, and branches of trees.
	Riparian	Primarily forages over watercourses.
	Ground	Primarily forages on the ground.

Category	Sub-Category	Description
	Low Vegetation	Primarily forages in low-growing shrubs.
	Canopy	Primarily forages in the crowns of trees.
Food Types	Invertebrates	Has a generalist diet comprised of a broad group of terrestrial and/or aquatic invertebrates.
	Arthropods	Primarily subsists on arthropods, such as insects and spiders.
	Adult Aquatic Insects	Primarily targets flying insects that have an aquatic larval stage.
	Floral Nectar, Fruit	Has a more specialized diet consisting of nectar from flowering plants (floral nectar) or fruit.
	Seeds	Subsist on seeds as a large portion of their diet.

The categories for structural stages were based on the definitions provided in the *Field Manual for Describing Terrestrial Ecosystems 2nd Edition* (Province of BC 2010). Food categories were simplified to represent broad food groups, from the most diverse options (invertebrates) to narrower food groups (seeds, fruits, adult aquatic insects). Food type categories were assigned to a species based on the primary diet relied upon during the breeding season.

2.3 PLOT HABITAT CHARACTERISTICS

Functional habitat characteristics were documented within 0 – 50 m of each point count survey plot to track plot vegetation over time and assess whether it may be influencing avian species richness, abundance, and community composition. However, these attributes will not be included in analyses until future years. Observations were collected from plot center once during the survey period (June 20 – 23, 2023) and included the following information:

- **Habitat Type** – percent of open versus forested landscape.
- **Vegetation Composition** – grasses, forbs, and shrubs documented to genus and species, where possible.
- **Forest Composition** – trees documented to genus and species, where possible.
- **Forest Cover** – percent of total forest cover overlapping plots when compared to open herb and shrub habitat, including trees that provide canopy coverage; however, this category excludes saplings in the reclaimed plots and is not representative of percent canopy cover.
- **Vegetation Cover** – percent of total vegetation cover that includes moss, herbs, and shrubs less than 2 meters high.
- **Exposed Ground** – percent of plot area that is absent of vegetation growth, including exposed soil, mineral, or mulch.
- **Coarse Woody Debris (CWD)** – percent of plot area on top of the ground that is comprised of CWD material.
- **Adjacent Watercourse** – watercourses close enough to be observed from plot center.

Percent forest cover was added as its own separate assessment category for the 2023 surveys. For the purpose of these assessments, vegetation cover includes the B2 Vegetation Layer (under 2 meters; Province of BC 2010) as well as moss and herbs. Undisturbed, adjacent forest habitat overlapped with some of the plots within the Hazeltine Creek corridor, particularly in the Upper Hazeltine area where the

reclaimed corridor is narrow. The Lower Hazeltine – Halo Zone area is also characterized by mature trees that survived the breach and, therefore, had higher forest coverage compared to the other study areas at the start of the monitoring program. No reclamation treatments have been applied to the Lower Hazeltine – Halo Zone area; instead, the existing understory vegetation has regenerated naturally.

3.0 RESULTS

3.1 SPECIES RICHNESS

When considering all avian species detected within 0 – 100 m of plot center and flyovers during surveys, a total of 61 species were detected within the Hazeltine Creek corridor, 36 species were detected within mature forest reference plots, and 29 species were detected within young forest reference plots. Within the Hazeltine Creek corridor, these detection numbers include a greater number of species found outside of the reclaimed sites since the reclaimed sites are primarily represented by 0 – 50 m of plot center.

When focusing the detection numbers to 0 – 50 m of plot center, the highest number of detections within the Hazeltine Creek corridor occurred in the Hazeltine Creek – CWD study area (21 species) compared to 20 species in the Young Forest study area and 27 species in the Mature Forest study area (Figure 2).

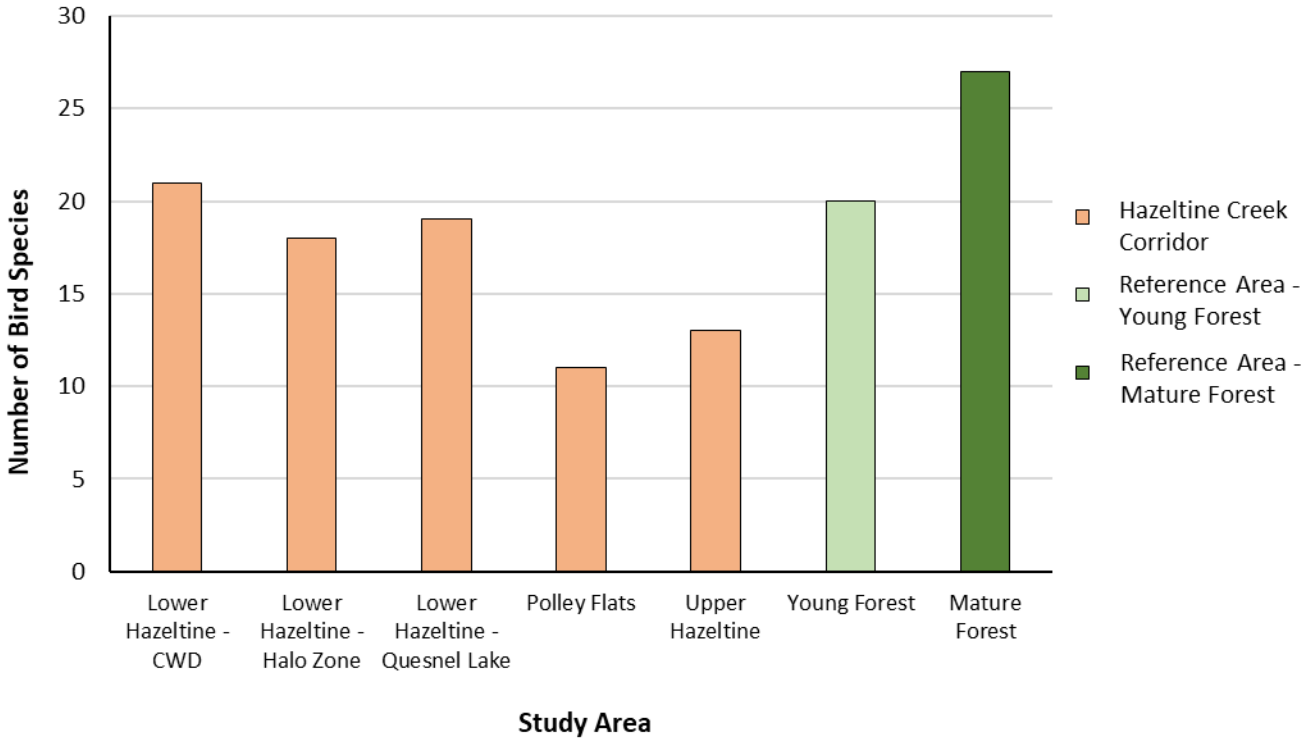

Figure 2. The total number of bird species detected during avian point surveys from June 20 – 25, 2023, within 0 – 50 m of plot center across different study areas that included the Hazeltine Creek corridor and Reference areas

The number of bird species detected was significantly higher for Lower Hazeltine – CWD (χ^2 = 26.3, P < 0.001, Estimate = 1.66 ± 0.148), and significantly lower for Polley Flats (χ^2 = 26.3, P = 0.005, Estimate = -0.662 ± 0.236) and Upper Hazeltine (χ^2 = 26.3, P = 0.001, Estimate = -0.816 ± 0.248) when compared to the other Hazeltine Creek corridor study areas and Reference areas. Differences in the number of species detected was not statistically significant between the Lower Hazeltine – Halo Zone (χ^2 = 26.3, P = 0.553, Estimate = 0.114 ± 0.192), Lower Hazeltine – Quesnel Lake (χ^2 = 26.3, P=0.548, Estimate = -0.122 ± 0.204),

Young Forest (χ^2 = 26.3, P = 0.253, Estimate = -0.201 ± 0.176), or Mature Forest (χ^2 = 26.3, P = 0.280, Estimate = -0.189 ± 0.175).

One of the survey crews in Year 4 trended towards having higher detection rates compared to the other crew in Year 4 and this difference approached significance (χ2 = 26.3, P = 0.063, Estimate = 0.196 ± 0.105).

3.2 Species Relative Abundance

3.2.1 Hazeltine Creek Corridor

Mean abundance was estimated for a total of 16 species identified within the Hazeltine Creek corridor during surveys (Table 6).

Table 6. Estimates of mean abundance (λ) for bird species detected during point count surveys within the Hazeltine Creek corridor from June 20 – 25, 2023, within 0 – 50 m from plot center

Species	Parameter Assumptions (Variables)[a]	Study Area Differences[b]	Total Cumulative Count[c]	Mean Abundance (λ)	Standard Error (±)

(a) The effect of a variable (in brackets) on mean abundance (λ) and the probability of detection (r) for that species. For example, survey start time may influence the probability of detection for some species, as represented by r(time). In some cases, no variables were found to influence mean abundance or the probability of detection, as represented by λ(.) or r(.). See Section 2.2.2 for definitions of the variables. Some species had more than one set of models that best explained the mean abundance results (e.g., American redstart) based on the principles of Akaike's Information Criterion (AIC).

(b) Results according to study area within the Hazeltine Creek corridor if study area had an influence on mean relative abundance (λ); otherwise, this column is not applicable (n/a).

(c) The total number of detections across all survey plots for that species during the survey period (June 20 – June 25) that were analyzed in the model to determine mean abundance (λ).

Only species that had a minimum of five detections across the survey period, and that had abundance estimates with reasonable variability (i.e., in this case, standard error < abundance estimate) were included in the final results (Table 6). Different study areas within the Hazeltine Creek corridor had an influence on mean abundance for song sparrow, with the highest abundance estimate for this species observed in Polley Flats (λ = 5.43, ± 3.93). Mean abundance for song sparrow was lower in Upper Hazeltine (λ = 0.597, ± 0.684) and undetectable in the Lower Hazeltine – Halo Zone (detections = 0).

Ambient temperature at the beginning of the day, survey start time, and distance between plot center and forest edge had an influence on the probability of detection for some species in the Hazeltine Creek corridor (Table 6). Higher temperatures at the start of the day were associated with a higher probability of detection for American redstart and a lower probability of detection for song sparrow. Point count surveys that occurred later in the morning were associated with a lower probability of detection for Hammond's flycatcher, but a higher probability of detection for MacGillivray's warbler, ruby-crowned kinglet, red-winged blackbird, and warbling vireo.

Increased distances between the edge of mature forest and survey plot center were associated with an increase in the probability of detection for American redstart, American robin, and yellow warbler, but a decrease in the probability of detection for cedar waxwing, orange-crowned warbler, and savannah sparrow. Detection probability of Lincoln's sparrow was higher for two individual surveyors, each of whom was on at least one of the two crews (Table 6).

Figure 3 summarizes the mean relative abundance of bird species consistently detected over a three-year period within the Hazeltine Creek corridor between 2021 and 2023.

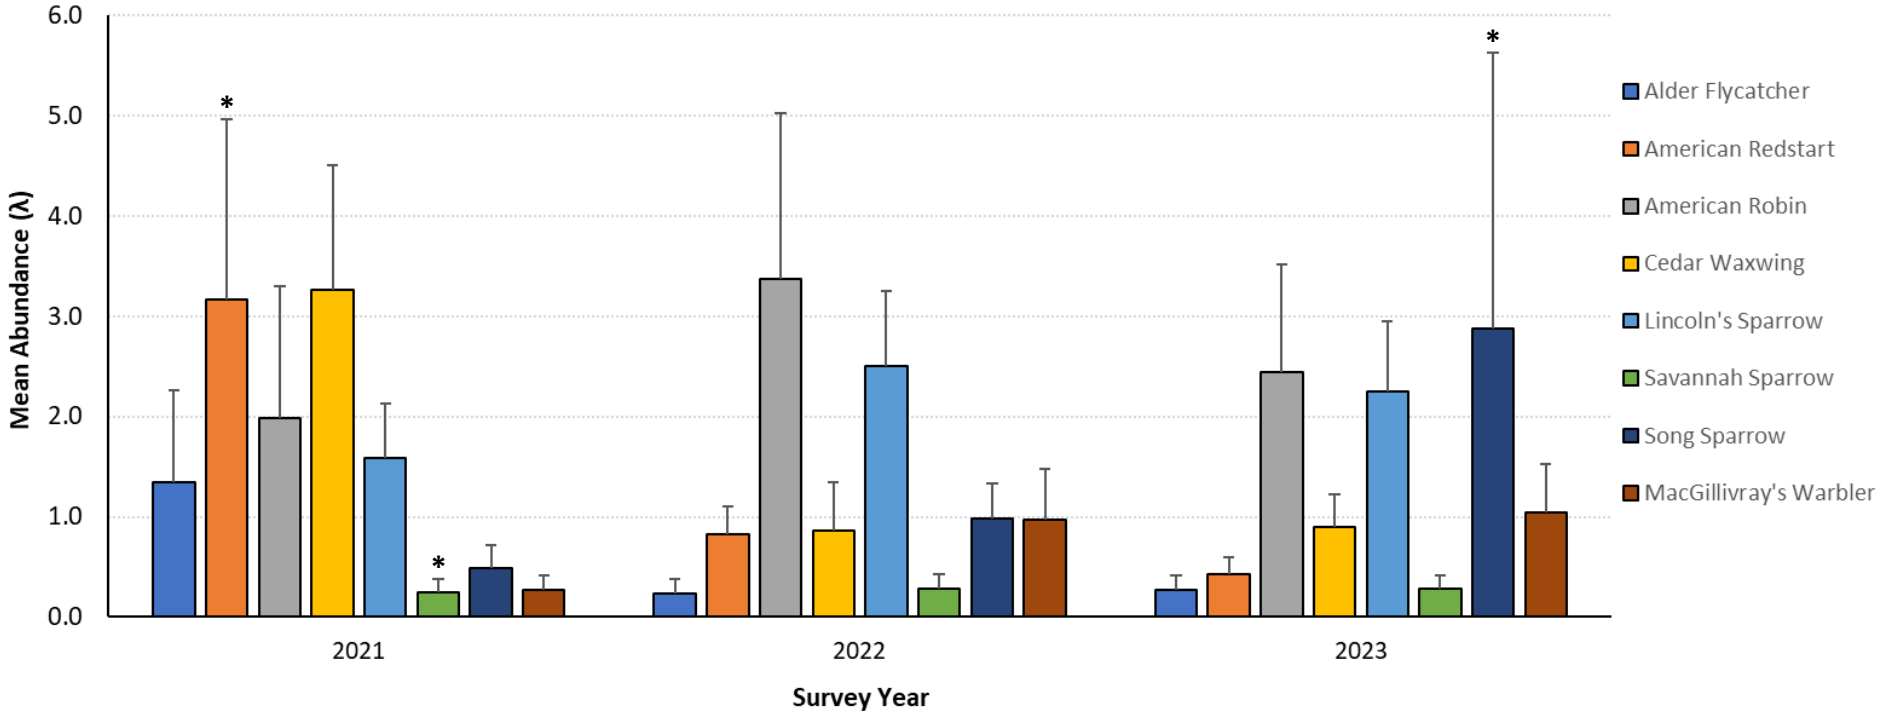

Figure 3. Mean abundance of bird species consistently detected within 0 – 50 m of plot center during point count surveys from 2021 – 2023 within the Hazeltine Creek corridor across all study areas; the error bars represent standard error (±) of the results. For years where a species had notable differences in abundance between the five Hazeltine Creek study areas (*), the mean abundance across all study areas was used. Abundance was not estimated in 2020, but will be included in the multi-year analysis of abundance for Year 5 of surveys

3.2.2 Reference Areas

Mean abundance was calculated for 11 species within the Reference areas, including 5 species in Young Forest and 7 species in Mature Forest (Table 7). Several explanatory variables influenced the probability of detection in both reference study areas. In Mature Forest plots, higher temperatures at the start of the day were associated with a higher probability of detection for Hammond's flycatcher and a lower probability of detection for warbling vireo. In Young Forest plots, higher temperatures at the start of the day were associated with a lower probability of detection for orange-crowned warbler and Swainson's thrush.

Survey start time also influenced detection probability for some species. Surveys that occurred later in the morning in Mature Forest plots were associated with a lower probability of detection for golden-crowned kinglets and pacific wren, and a higher probability of detection for northern waterthrush. In Young Forest plots, surveys that started later in the morning were associated with a higher probability of detection for orange-crowned warbler and a lower probability of detection for Swainson's thrush and warbling vireo.

Distance to forest edge influenced detection probability as well, but for fewer species, and only in Young Forest Reference areas. For example, an increase in distance between mature forest edge and plot center was associated with a lower probability of detection for chipping sparrow and a higher probability of detection for orange-crowned warbler in Young Forest Reference areas.

Table 7. Estimates of mean abundance (λ) for bird species detected during point count surveys in the Reference areas from June 20 – 25, 2023, within 0 – 50 m from plot center

Species	Young Forest				Mature Forest			
	Parameter Assumptions (Variables)[a]	Sample Size[b]	Mean Abundance (λ)	Standard Error (±)	Parameter Assumptions (Variables)[a]	Sample Size[b]	Mean Abundance (λ)	Standard Error (±)

(a) The effect of a variable (in brackets) on mean abundance (λ) and the probability of detection (r) for that species. For example, survey start time may influence the probability of detection for some species, as represented by r(time). In some cases, no variables were found to influence mean abundance or the probability of detection, as represented by λ(.) or r(.). See Section 2.2.2 for definitions of the variables. Some species have more than one set of models that best explain the mean abundance results (e.g., American redstart) based on the principles of Akaike's Information Criterion (AIC).

(b) The total number of detections across all survey plots for that species during the survey period (June 20 – 25, 2023) that were analyzed in the model to determine mean abundance (λ).

3.3 COMMUNITY COMPOSITION

The majority of species identified within the Hazeltine Creek corridor were those that typically utilize early successional herb (SS2) and shrub habitat (SS3); however, a few species typically associated with mature forest habitat, such as ruby-crowned kinglet and Hammond's flycatcher, were also detected within the Hazeltine Creek corridor which may be due to mature forest overlapping with some of the reclaimed survey plots (Table 8).

Table 8. Habitat and resource associations for 24 species identified within the Hazeltine Creek corridor, as well as Young and Mature Forest Reference areas, during point count surveys from June 20 – 25, 2023, within 0 – 50 m from plot center

Species (citation)	Vegetation Structural Stage[(a)]	Habitat Type	Nest Site	Foraging Area	Broad Diet (preferred food types)
Alder Flycatcher (Lowther 2020)	SS3	riparian, shrub	shrubs	aerial, foliage	arthropods (insects)
American Redstart (Sherry et al. 2020)	SS3, SS5, SS6	deciduous forest	shrubs	ground, foliage, canopy	arthropods (insects)
American Robin (Vanderhoff et al. 2020)	SS3, SS4, SS5	riparian, open, mixed forest	ground, shrub, tree	ground, foliage, canopy	fruit, arthropods (insects)
Cedar Waxwing (Witmer et al. 2020)	SS3, SS5	riparian, open, shrub, conifer, mixed forest	shrub, tree	riparian, shrubs, foliage	fruit, arthropods (insects with an aquatic life stage)
Chipping Sparrow (Middleton 2020)	SS2, SS3, SS5	conifer forest, shrub	shrub, tree	ground, low vegetation	seeds, arthropods (insects)
Golden-crowned Kinglet (Swanson et al. 2020)	SS6, SS7	conifer forest	tree	canopy	arthropods
Hammond's Flycatcher (Sedgwick 2020a)	SS6, SS7	conifer or mixed forest	tree	aerial	arthropods (insects)
Lincoln's Sparrow (Ammon 2020)	SS2, SS3	riparian, shrub	ground	ground, low vegetation	arthropods
MacGillivray's Warbler (Pitocchelli 2020)	SS3, SS5	riparian, shrub	ground	ground, low vegetation	arthropods (insects)
Magnolia Warbler (Dunn and Hall 2020)	SS4, SS5, SS6	conifer forest	tree	foliage	arthropods
Northern Flicker (Wiebe and Moore 2023)	SS2, SS3, SS4, SS5, SS6, SS7	open, mixed forest, forest edges, grassland	tree cavity	ground	arthropods (ants)

Species (citation)	Vegetation Structural Stage[a]	Habitat Type	Nest Site	Foraging Area	Broad Diet (preferred food types)
Northern Waterthrush (Whitaker and Eaton 2020)	SS3, SS5, SS6, SS7	riparian, shrub, conifer forest, mixed forest	ground	ground, low vegetation, riparian	arthropods (insects)
Orange-crowned Warbler (Gilbert et al. 2020)	SS3, SS5	open, mixed forest, deciduous forest, conifer forest edges, shrub	ground	shrubs, foliage	arthropods (insect larvae)
Pacific Wren (Toews and Irwin 2020)	SS6, SS7	riparian, conifer forest, mixed forest	tree, ground, cavities	ground	invertebrates
Red-winged Blackbird (Yasukawa and Searcy 2020)	SS3	riparian	shrub	low vegetation, riparian	arthropods (insects), seeds
Ruby-crowned Kinglet (Swanson et al. 2021)	SS5, SS6, SS7	conifer forest, mixed forest	tree	foliage	arthropods
Savannah Sparrow (Wheelright and Rising 2020)	SS2	open, grassland	ground	ground, low vegetation	arthropods (insects)
Song Sparrow (Arcese et al. 2020)	SS3, SS5, SS6	riparian, mixed forest, shrub	ground, shrub	ground, low vegetation	seeds, arthropods (insects), small invertebrate groups
Swainson's Thrush (Mack and Yong 2020)	SS4, SS5, SS6, SS7	conifer forest	shrub	ground, low vegetation	arthropods (insects)
Varied Thrush (George 2020)	SS6, SS7	conifer forest	tree, shrub, ground	ground	arthropods
Warbling Vireo (Gardali and Ballard 2020)	SS5, SS6, SS7	riparian, deciduous forest	shrub, tree	foliage	arthropods (insects)
White-throated Sparrow (Falls and Kopachena 2020)	SS3, SS5, SS6	deciduous forest, mixed forest	ground	ground, low vegetation	arthropods (insects), fruits, seeds
Willow Flycatcher (Sedgwick 2020b)	SS3	riparian, shrubs	shrub	foliage	arthropods (insects)

Species (citation)	Vegetation Structural Stage[(a)]	Habitat Type	Nest Site	Foraging Area	Broad Diet (preferred food types)
Yellow Warbler (Lowther et al. 2020)	SS3	shrub	shrub, tree	foliage	arthropods (insects)

(a) *Based on the Field Manual for Describing Terrestrial Ecosystems 2nd Edition* (Province of BC 2010), where SS2 represents predominantly herb habitat, SS3 represents shrub habitat, SS4 represents pole/sapling forest, SS5 represents young forest, SS6 represents mature forest, and SS7 represents old growth forest.

Warbling vireo was detected in all three study areas (Hazeltine Creek corridor, Young Forest, and Mature Forest) during the survey period, as represented by Figure 4.

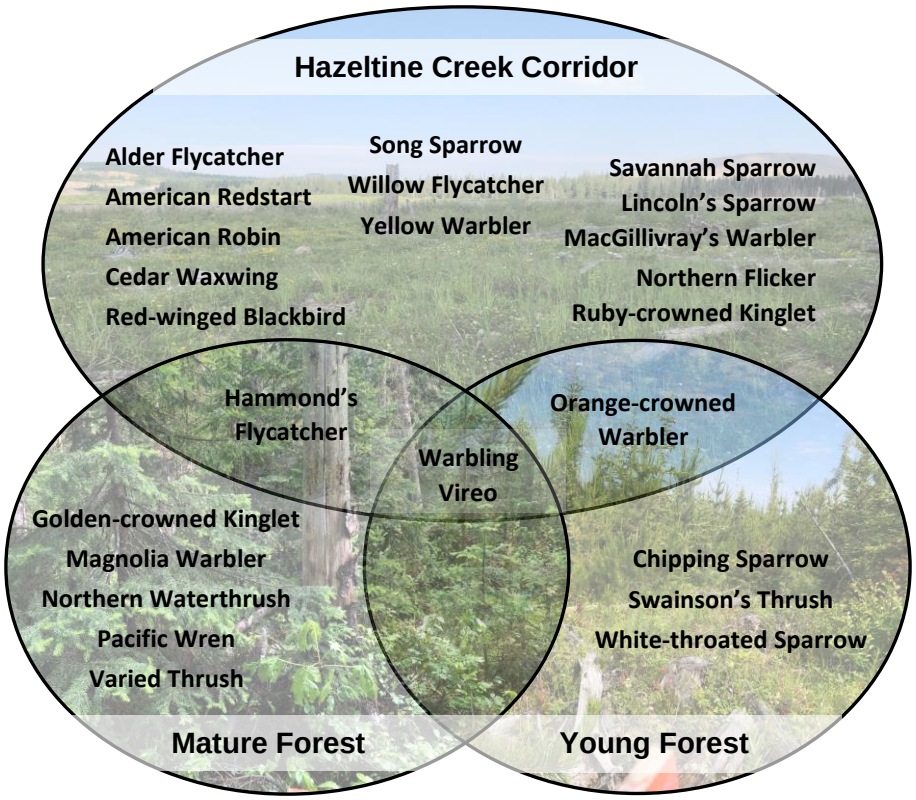

Figure 4. Bird species detected during point count surveys conducted from June 20 – 25, 2023, across three study areas representative of different habitat characteristics; overlapping circles represent detections that occurred in more than one study area (e.g., Hammond's flycatcher was detected in the Mature Forest and the Hazeltine Creek corridor, while warbling vireo was detected within all three study areas)

Chipping sparrow, Swainson's thrush, and white-throated sparrow were only detected in the Young Forest survey plots (Figure 4); these species may be valuable indicators of ecological progression in the Hazeltine Creek corridor as the vegetation within the reclaimed areas mature over time. It is important to note that Table 8 and Figure 4 do not represent every single species detected within each study area, but rather the species that could be included in the analysis for abundance based on sample size (>5 detections) and the reliability of the estimates (i.e., with reasonable variability; see Section 3.2).

3.4 BREEDING OBSERVATIONS

A total of 15 actively breeding species were observed across all study areas as incidental observations (outside of survey point count surveys) in Year 4, including 13 species within the Hazeltine Creek corridor, 3 species within the Young Forest areas, and 1 species within the Mature Forest areas (Table 9).

Table 9. Evidence of breeding documented within the Hazeltine Creek corridor and Reference areas between June 20 – 25, 2023

Species	Study Area[(a)]	Closest Plot Location	Breeding Evidence
American Robin	UH	BBS08	Adults observed displaying territorial behaviour (Chasing after Eastern Kingbird).
Belted Kingfisher	LH-CWD	N/A	Adult observed carrying food from Quesnel Lake up Hazeltine Creek. Breeding suspected in steep soft banks.
Bufflehead	LH-QL	BBS01	Adult female observed checking out various cavities is cottonwood snags.
Canada Jay	LH-HZ	BBS13	Adult pair observed.
Chipping Sparrow	REF-YF	Between BBS25-BBS27	Adult observed carrying food and alarm calling.
	REF-YF	BBS30	Adult pair observed alarm calling persistently.
	REF-YF	BBS30	Adults observed carrying food and alarm-calling within 50 m of BBS30.
Common Merganser	LH-QL	BBS01	Adult male and female observed checking out various cavities in cottonwood snags.
Dark-eyed Junco	REF-YF	BBS14	Nestlings heard. Adult observed flying up from grass. Observed within 50 m of BBS14.
	LH-CWD	BBS30	Adults observed displaying defensive behaviour and territorial calling.
Killdeer	PF	N/A	Adult observed displaying broken wing behaviour.
Lincoln's Sparrow	UH	BBS08	Adults observed consistently and persistently calling at this location over multiple survey sessions.
	PF	BBS11	Adults observed carrying food within 50 m of BBS11.
	UH	BBS15	Adult observed persistently calling over multiple survey sessions.
Northern Flicker	LH-QL	BBS01	Adult observed feeding young at cavity nest in tree snag.
	LH-QL	BBS01	Active cavity nest observed within 100m of BBS01.
Savannah Sparrow	PF	BBS10	Adult observed territorial alarm-calling.

Species	Study Area[(a)]	Closest Plot Location	Breeding Evidence
	PF	BBS11	Adults observed territorial alarm-calling persistently.
Spotted Sandpiper	PF	N/A	Adult observed hovering and alarm-calling.
	LH-QL	Between BBS01-BBS02	Adult observed displaying broken wing behaviour.
Spruce Grouse	REF-YF	Between BBS25-BBS27	Female adult observed displaying territorial behaviour.
	REF-MF	Between BBS19-BBS21	Female adult observed displaying territorial behaviour.
Tree Swallow	LH-CWD	BBS06	Observed nesting in birch snag cavity located within 50 m of BBS06.
	PF	BBS09	Observed using nesting box within 50 m of BBS09.
	PF	BBS10	Two nest boxes confirmed to be in use (3 After Hatch Year and 1 Second Year female).
Wilson's Snipe	PF	BBS11	Adults observed circling around plot. Adult pair observed calling.
	PF	N/A	Flushed adult. Adult observed alarm-calling.

(a) Within the Hazeltine Creek corridor, study area includes Polley Flats (PF), Upper Hazeltine (UH), Lower Hazeltine – CWD (LH-CWD), Lower Hazeltine – Quesnel Lake (LH-QL), and Lower Hazeltine – Halo Zone (LH-HZ), while the Reference areas are represented by Young Forest (REF-YF) and Mature Forest (REF-MF). Some species were observed in multiple study areas.

Northern flicker have been observed using the retained dead-standing trees at advanced stages of decay for two years in a row within the Hazeltine Creek corridor (Figure 5).

Figure 5. Female northern flicker attending to a tree nest cavity with nestlings present; photo was captured by Jesse Lewis at Plot BBS01 in the Lower Hazeltine – Quesnel Lake study area during the survey period June 20 – 25, 2023

3.5 PLOT HABITAT CHARACTERISTICS

Habitat characteristics were documented within 0 – 50 m for each point count survey plot in Year 4 (Table 10)

Table 10. Habitat characteristics documented for each point count survey plot from June 20 - 23, 2023, within 0 – 50 m from plot center

Vegetation characteristics will be included in the multi-year analysis for species abundance in Year 5 to determine if there are any associations between vegetation cover and species richness and abundance.

4.0 SPECIES AT RISK

A total of four species detected during point count surveys are designated as species at risk (BC CDC 2024). Table 12 summarizes species observed during 2023 surveys that are identified as a species of conservation concern in BC, or as an at-risk species requiring additional legal protection under the Canada *Species at Risk Act* (SARA) or the BC *Forest and Range Practices Act* (FRPA).

Table 12. Species identified during surveys in 2023 that are recognized as an at-risk species by the British Columbia (BC) Conservation Data Centre (CDC), or identified as an at-risk species requiring additional legal protection under the Canada *Species at Risk Act* (SARA) or the BC *Forest and Range Practices Act* (FRPA)

Common Name (scientific name)	BC CDC Designation[(a)]	SARA (Year of Designation)[(b)]	FRPA (Yes/No)[(c)]	Observation Location
Barn Swallow (*Hirundo rustica*)	Yellow	Threatened (2017)	not applicable	Lower Hazeltine – Halo Zone
Killdeer (*Charadrius vociferus*)	Blue	not applicable	not applicable	Lower Hazeltine – Quesnel Lake, Polley Flats
Olive-sided flycatcher (*Contopus cooperi*)	Yellow	Special Concern (2023)	not applicable	Polley Flats
Sandhill Crane	Yellow	not applicable	Yes	Reference Area – Young Forest

(a) Conservation status designated by the British Columbia Conservation Data Centre, which include Yellow (Not-at-Risk), Blue (Special Concern), or Red (Endangered).

(b) At-Risk category designated under the Canada *Species at Risk Act,* which may include Special Concern, Threatened, or Endangered.

(c) Confirmation (Yes or No) of whether a species is identified as a species at risk under the British Columbia *Forest and Range Practices Act* (FRPA).

All species in Table 12 are common to the region and typically breed during the spring and summer months. Barn swallow nests occur almost exclusively on anthropogenic structures and have additional protection when defined as a 'residence' under SARA. This period occurs from May 1st or the date when adults are first seen building or occupying the nest, whichever is earlier, to August 31st or the date when a bird is last seen at the nest, whichever is later (Government of Canada 2019). Species listed under FRPA, such as sandhill crane, may have specific management requirements during forest and range activities which may be included as conditions for any authorizations under FRPA.

5.0 DISCUSSION

When accounting for all species detected during point count surveys in Year 4 within the Hazeltine Creek Corridor (0 – 100 m and flyovers), a total of 61 species were detected, which is higher compared to Year Year 1 (54 species), Year 2 (60 species), and Year 3 (52 species), excluding incidental observations. Inter-annual variation is to be expected and these totals are not necessarily attributable to site-specific characteristics. For the Reference areas, a total of 29 species were detected within Young Forest and 36 species within Mature Forest, (including all species detected within 0 – 100 m of plot center and flyovers). Lower species counts were anticipated for the Mature Forest plots, since mature structural forest stages tend to support a unique community of bird species rather than just higher numbers of species. Detections within 50 – 100 m of plot center were also expected to be lower for the Mature Forest plots due to the increased challenges of accurately detecting and identifying species in enclosed forest stands.

An analysis of species richness within 0 – 50 m of plot center revealed a notably higher species count in the Lower Hazeltine – CWD study area for a second year in a row, as well as notably lower species counts in the Upper Hazeltine and Polley Flats study areas (Figure 2). Habitat characteristics may account for these differences. The Upper Hazeltine and Polley Flats study areas had a higher percentage of exposed ground compared to the other study areas, including Lower Hazeltine – CWD (Table 10). Exposed ground may be a proxy for undeveloped vegetation cover or undeveloped soil substrate capable of supporting invertebrates that are an important food resource for birds. Inclusion of habitat characteristics in Year 5 of analysis will directly assess the role of vegetation cover and other habitat features on the number of species present in the reclaimed areas.

Although a higher total number of species were detected in Mature Forest plots, there was no significant difference in species richness between the Reference areas (including Young Forest), Lower Hazeltine – Halo Zone, or the Lower Hazeltine – Quesnel Lake study areas after accounting for surveyor detection ability in the 2023 models (Figure 2). However, the Reference areas will likely require an increase in sampling effort to improve sample size before meaningful assertions can be made.

Within the Hazeltine Creek corridor, relative mean abundance was highest for song sparrow, particularly in the Polley Flats and Lower Hazeltine – Quesnel Lake study areas in 2023 (Table 6). Furthermore, song sparrow abundance estimates have consistently increased within the Hazeltine Creek corridor since 2021 (Figure 3), though it is important to highlight that the standard error for song sparrow was high in 2023 and, therefore, the result should be interpreted with caution. Overall, species that demonstrated the highest mean abundance estimates across all survey plots were those that typically use habitat in early successional stages dominated by herb and shrub vegetation cover for nesting and foraging (Table 8).

Based on incidental observations, it was determined that 13 species were actively breeding within Hazeltine Creek corridor study areas in 2023 (Table 9). This included several cavity-nesting species, such as northern flicker, bufflehead, common merganser and tree swallow, suggesting that the standing trees at later stages of decay that have been retained in the Hazeltine Creek corridor are providing breeding habitat for cavity nesters.

Although evidence of breeding may be an indicator that the reclaimed sites are providing sufficient resources in terms of nesting habitat and food availability, additional evidence is required to be able to infer habitat quality. For example, birds may select breeding territories based on other selection pressures early in the season before peak insect emergence occurs (Abrahams 1986, Turner and McCarty 1998). Sampling of terrestrial invertebrates is currently scheduled for Years 5 and 10 of the Wildlife Monitoring Plan (DWB 2021). Invertebrate sampling will provide additional evidence for whether the reclaimed sites

are supporting invertebrate communities, and thereby potential food resources, for birds utilizing these areas.

Orange-crowned warbler and Swainson's thrush demonstrated the highest mean abundance values in Young Forest plots, while varied thrush and Hammond's flycatcher had the highest mean abundance in Mature Forest areas (Table 7). The mean abundance estimates for species within the Reference areas were subject to a high degree of variability and a number of species had to be removed from the final results due to high standard errors (i.e., standard error > mean abundance estimate). Therefore, the Reference area results would likely benefit from greater survey effort to increase sample size, as well as the inclusion additional explanatory variables (covariates) in the models that could improve interpretability for these sites.

Inclusion of the Reference plots in 2023 was beneficial for highlighting differences in species composition between the study areas (Figure 4). Three species that were only identified within the Young Forest plots, including chipping sparrow, Swainson's thrush, and white-throated sparrow, may be useful future indicators of ecological succession within the Hazeltine Creek corridor. Future models that assess changes in species assemblages between the Reference areas and Hazeltine Creek corridor should also account for broader regional differences, such as elevation and BEC zone, when making these comparisons.

6.0 CLOSURE

Overall, Year 4 results suggest that the reclaimed sites along the Hazeltine Creek corridor are attracting avian species that typically utilize early successional habitats dominated by herbaceous plants and shrubs. Surveyors also confirmed that some species were actively nesting within the reclaimed areas, which suggests these areas provide some support for breeding birds. Lower Species richness in Polley Flats and Upper Hazeltine may be attributed to underdeveloped vegetation and soil cover; therefore, these attributes should continue to be closely monitored in future years. Reference areas representative of different stages of successional maturity that were not impacted by the tailings breach were included in the analyses for Year 4. Results comparing the Hazeltine Creek corridor and Reference areas provide some preliminary insight on differences in species composition that will be beneficial in future years of comparison between study areas.

Year 5 of the study is planned for 2024 and will continue to incorporate the Reference areas. Multi-year analyses that explore differences in species abundance and community composition over time is planned for Years 5 and 10 of the study. Multiple years of survey data will also improve sample size for analysis of population metrics and assist in detecting annual variation in avian species using the reclaimed sites over time. Future survey years will also incorporate invertebrate sampling (Years 5 and 10) to provide additional information on habitat and resource availability in the reclaimed areas and allow for a comparison of potential food resources between reclaimed areas and reference areas. Species richness and abundance estimates have provided quantifiable metrics for understanding and monitoring avian populations and communities along the reclaimed areas of the Hazeltine Creek corridor. Future years will continue to provide information that will ensure the objectives and benchmarks of the Wildlife Monitoring Plan are being met.

Executive Summary

In 2022, wildlife cameras were deployed in the Hazeltine Creek corridor and nearby reference areas as part of Mount Polley's Mammal Monitoring Plan. The work represented the second year of wildlife camera surveys at Mount Polley Mine; reference areas were included for the first time in 2022 to allow a comparison of wildlife detections between rehabilitated and reclaimed sites of the Hazeltine Creek corridor, and areas off the mine site not impacted by the 2014 tailings storage facility breach. The work was performed as part of Year 4 of the mine's 10-year terrestrial wildlife monitoring program and overarching reclamation research program.

Within the Hazeltine Creek corridor, four of the study areas (Polley Flats, Upper Hazeltine, Lower Hazeltine – CWD and Lower Hazeltine – Quesnel Lake) represent areas where rehabilitation treatments have been applied, while the fifth (Lower Hazeltine – Halo Zone) represents an area where mature trees survived the breach and native vegetation has naturally reestablished. Young and mature reference areas are considered representative of early- and mature-successional forest conditions, respectively.

For large mammals, seven cameras were deployed in the Hazeltine Creek corridor, and six in nearby reference areas (three in young forest and three in mature forest). The goal of large mammal camera deployments was to maximize detections of large- and medium-sized mammal species within the Hazeltine Creek corridor to confirm species composition and presence, and determine which areas and features are being used within the reclaimed sites relative to reference areas. A total of 33 cameras were deployed for small mammals, including 15 in Hazeltine Creek and 18 in reference areas. The goal of the small mammal deployments was to compare relative abundance and species composition of small mammals between the Hazeltine Creek corridor and nearby reference areas, and between the study areas within the Hazeltine Creek corridor. Standardized capture rates (catch-per-unit-effort) were calculated from independent species detections and used as a proxy for species abundance to allow comparisons of small mammal detections between areas.

Mule deer, moose, coyote, and black bear were the four most frequently detected species on large mammal cameras, making up 74% of all detections. Other species detected less frequently included lynx, wolves, mink, river otter, beaver, red squirrel, northern flying squirrel and chipmunk. Species composition was nearly identical between Hazeltine Creek and the reference areas. Detections of river otter, mink and grizzly bear occurred in Hazeltine Creek, but not in the reference areas. Wolves were detected on large mammal cameras for the first time in 2022, both in the Hazeltine Creek corridor and the reference areas. With respect to the large mammal monitoring benchmark, observations of adults feeding, traveling and accompanied by young-of-the-year suggest reclaimed areas of the Hazeltine Creek corridor may be providing required resources for large mammal species.

There were 5963 independent wildlife detections across all small mammal cameras, with 8 species of small mammal making up the majority of detections (94.2%). Deer mice, voles and shrews were the three most frequently detected species, while red squirrel, northern flying squirrel, yellow-pine chipmunk, snowshoe hare and jumping mice made up the remainder. Small mammal species composition was identical between the Hazeltine Creek corridor and reference areas for small mammal groups.

Mean capture rates for deer mice were not significantly different between the Hazeltine Creek corridor and references areas, but mean captures rates for voles, shrews, red squirrels, and northern flying squirrel

were all significantly higher in reference areas compared to the Hazeltine Creek corridor. For both voles and shrews, mean captures rates were significantly higher in both young and mature reference areas compared to Hazeltine Creek. In contrast, mean capture rates for red squirrels and northern-flying squirrels – two predominantly arboreal species – were significantly lower in Hazeltine Creek and young references areas compared to mature references areas. For yellow-pine chipmunks, jumping mice and snowshoe hares, average capture rates were higher in Hazeltine Creek and young references areas, compared to mature sites, though differences were not statistically significant.

The 2022 results appear to highlight the disparity in responses of different small mammal groups to disturbed forest environments. Habitat generalist species, such as deer mice, had relative abundance levels that were comparable between the Hazeltine Creek corridor and nearby reference areas, as well as between study areas in the Hazeltine Creek corridor. In contrast, species that are more dependant on intact forest environments (southern red-backed vole, red squirrel, northern flying squirrel) and/or moist ground conditions and cover (*Sorex* shrew species), were less abundant in the Hazeltine Creek corridor. Further analyses that incorporate habitat characteristics are needed to address potential influence of habitat conditions on small mammal relative abundance. Since small mammal populations vary year-to-year, it is also important to sample over multiple years to assess long-term trends.

Overall, remote cameras were effective at detecting target small mammal groups in the Mount Polley study areas. Due to the non-invasive and cost-effective nature of this sampling technique, the same design and sampling procedures are recommended for future years. Deer mice, voles, shrews red squirrels and northern flying squirrels have the potential to act as 'index' groups for long term monitoring of small mammals. The relatively high capture rates of these groups will permit statistically meaningful comparisons between the Hazeltine Creek corridor and reference areas in future years, as well comparisons of relative abundance between years. Deer mice are considered habitat generalists; however, voles, shrews, red squirrels and northern flying squirrels have more specialized habtiat requirements that are characteristic of early-successional or mature forest environments, and therefore, may be good indicators of ecological succession and post-disturbance recovery.

1.0 INTRODUCTION

1.1 PROJECT SCOPE

DWB Consulting Services Ltd. (DWB) was retained by Mount Polley Mining Corporation (MPMC) to report on mammal monitoring at the Mount Polley Mine (hereafter, Mount Polley) conducted in 2022. Mammal monitoring is part of the mine's terrestrial wildlife monitoring program which was developed to assess the progress of ecological succession in the Hazeltine Creek corridor following the tailings breach in 2014 (DWB 2021; Section 1.21). A formal mammal monitoring program in the Hazeltine Creek corridor began in 2021 to help track the success of remediation work that was completed after the corridor was impacted by the 2014 tailing storage breach. This plan involved a combination of remote wildlife cameras, as well as incidental staff observations, to document the presence, abundance and spatial distribution of mammal species in the Hazeltine Creek corridor.

The first year of wildlife camera-based monitoring occurred in 2021 and focused exclusively on large and medium-sized mammals (hereafter, large mammals) in the Hazeltine Creek corridor (DWB 2022). In 2022, six reference areas were established outside the mine site to compare abundance and species composition of large and small mammals within the Hazeltine Creek corridor. In addition, a formal study was established to examine abundance and distribution of small mammals within the Hazeltine Creek corridor, as well as between hazeltine creek and nearby reference areas. The focus of this report is to summarize the results of wildlife camera deployments in 2022.

1.2 BACKGROUND

1.2.1 Tailings Facility Breach and Reclamation

The Hazeltine Creek corridor was impacted by a breach in the Mount Polley tailings storage facility embankment in 2014, which released tailings, supernatant, and construction materials into Hazeltine Creek, as well as Edney Creek and Quesnel Lake, located further downstream. Since the event, extensive remediation work has been completed along the corridor, including reconstruction of Hazeltine Creek, Edney Creek and the shoreline of Quesnel Lake. Rehabilitation of riparian habitat was initiated by planting native trees, shrubs, and graminoids, and using landscape techniques to improve site growing conditions, such as mounding soil, spreading coarse woody debris (CWD), and adding mulch. Planting of riparian vegetation and installation of habitat features favourable to birds, such as vertical CWD tree perches and nest boxes, were also completed at several of the sites.

1.2.2 Mammal Monitoring Program

An Ecological Risk Assessment was completed for MPMC in 2019 (Golder 2019a). The results determined that the risk of metal uptake by terrestrial receptors from contaminated soil and sediment was low compared to the ecological risk posed by the physical disruption that the tailings breach caused to soil, vegetation, and riparian habitat (Golder 2019a). Therefore, The Wildlife Monitoring Plan was developed with a focus on rehabilitation of physical habitat attributes, since the risk of metal toxicity to terrestrial wildlife through bioaccumulation and biomagnification was designated as low.

The large mammal camera program was initiated in 2021 and was guided by the *Mammal Monitoring Plan for the Hazeltine Creek Corridor* (DWB 2020; referred to as the 2020 Mammal Monitoring Plan). The

2020 Mammal Monitoring Plan was designed as an addition to Mount Polley's prior terrestrial wildlife monitoring program (Golder 2019b). The addition of mammal monitoring was implemented in response to a request to incorporate one into the program by the Mount Polley Government to Government Technical Working Group (hereafter, Technical Working Group), which represented the local Xatśūll [Soda Creek] and T'exelc [Williams Lake] First Nations, as well as the BC Ministry of Environment and Climate Change Strategy [BC ENV]).

The 2020 Mammal Monitoring Plan focused exclusively on large and medium-sized mammal groups, and was not designed to assess population metrics, such as relative abundance, or provide a complete inventory of large mammal species within the Hazeltine Creek corridor. However, information collected from remote cameras will supplement the results of other studies in the updated plan (birds, small mammals) and provide stronger evidence that reclamation initiatives are supporting wildlife populations (DWB 2021).

The 2020 Mammal Monitoring Plan, in combination with incidental wildlife observations identified by Mount Polley staff, are also intended to meet the objectives outlined in Section 6.17 of the Comprehensive Environmental Management Plan (CEMP; MPMC 2019), by documenting wildlife sightings, evidence of wildlife presence, and wildlife behaviour on the mine site and adjacent areas. Therefore, this report is designed to fulfill requirements under Section 3.2.6 of Permit 11678 and Section 9.4 of the CEMP (MPMC 2019) by summarizing the results of the mammal monitoring in 2022.

Results of the Mammal Monitoring Plan are also intended to support the objectives of the *Updated Scope for the Terrestrial Wildlife Monitoring Plan for the Hazeltine Creek Corridor* (DWB 2021), which was developed to expand on the original wildlife monitoring program by incorporating additional feedback provided by the Technical Working Group. The Updated Plan will use the remote camera data to confirm the presence and identity of small and large mammals in the Hazeltine Creek corridor and as evidence that the reclaimed features in the corridor are attractive for the purposes of breeding, foraging, travel, and/or shelter (DWB 2021).

1.2.3 Inclusion of Small Mammal Monitoring

The small mammal monitoring program was initiated in 2022 and involved the deployment of remote cameras in the Hazeltine Creek corridor, as well as nearby reference areas (see Section 2.2). The goal of the small mammal study was to compare relative abundance and species composition of target small mammal groups between the restored areas of the Hazeltine Creek corridor and nearby references areas. This program was developed to address gaps in the 2020 Mammal Monitoring Plan identified by the Mount Polley Technical Working Group, who identified that the original plan did not include provisions to address small mammal communities in the Hazeltine Creek corridor. Remote cameras were selected as the preferred method of data collection instead of live trapping. Though live trapping was initially suggested as the preferred a sampling method for small mammals by the Technical Working Group, remote cameras were selected as they required less frequent maintenance by field staff (live traps have to be checked daily) and they pose little to no risk of injury or death to target small mammal species.

1.3 Study Objectives

As part of the *Updated Scope for the Terrestrial Wildlife Monitoring Plan for the Hazeltine Creek Corridor* (DWB 2021), benchmarks were identified for key biological (wildlife) performance indicator groups as a

means to track progression of ecological succession in the Hazeltine Creek corridor and to assess the success of reclamation treatments applied in different areas of the corridor aimed at increasing availability of wildlife habitat. The benchmarks for indicator groups relevant to this report (large and small mammals) are listed in Table 1).

The objective of the wildlife monitoring program is to complete a quantifiable study that will provide the following evidence at the end of the program:

1. Ecological succession is actively occurring in the Hazeltine Creek corridor in response to reclamation initiatives.

2. Wildlife is utilizing the available habitat on the reclaimed sites.

3. The habitat on the reclaimed sites is capable of supporting important wildlife life-history functions, such as breeding, foraging, and establishing territories. Direct measures of wildlife status and trends will be used to assess the dynamics of wildlife and relevant fauna that were chosen as performance indicators for this study.

Table 1. Benchmarks for large and small mammals developed for the wildlife monitoring program.

Indicator Group	Benchmark(s)	Relevant Literature
Large Mammals	Large mammals are being detected on the reclaimed sites and are using the reclaimed features for foraging, hunting, travel, and shelter.	*Rovero et al. 2013*
Small Mammals	The relative abundance **and/or** species richness on the reclaimed sites: • Is similar to the results of the reference sites, particularly the reference sites that are examples of mid-successional habitat, **and/or** • Is higher on the reclaimed sites where amendments and improvements have been applied for a longer duration of time, indicating that these reclaimed sites will have a higher likelihood of success, **and/or** • Is higher in Year 10 when compared to previous years, indicating that small mammal populations have improved.	*Hawkes and Gerwing 2019* *Pearce and Venier 2005* *Rowe and Terry 2014*

2.0 METHODS

2.1 STUDY AREAS

Cameras for large and small mammals were deployed across five study areas within the Hazeltine Creek corridor and at six reference areas west of the Mount Polley Mine in 2022. The Hazeltine Creek corridor is defined as the boundaries of disturbance that resulted from the tailings embankment breach in 2014. Disturbed areas have been subject to various post-breach habitat restoration and reclamation efforts, such as channel reconstruction, riparian re-vegetation, and application of stockpiled topsoil with surface treatment landscape techniques to improve site growing conditions (Table 2). The Hazeltine Creek corridor has been partitioned into five study areas based on distance from the tailings storage facility, existing vegetation structure, and the types of rehabilitation treatments applied following the breach event. The Hazeltine Creek study areas and associated reclamation treatments are listed in Table 2.

Table 2. Study areas and associated reclamation treatments in Hazeltine Creek corridor.

Study Area	Area (ha)	Rehabilitation Treatment Applied
Polley Flats	45	• Ripped with CWD • Mounded with CWD • Placement of soil with CWD
Upper Hazeltine	61	• Mounded with CWD • Recontoured with topsoil and CWD
Lower Hazeltine - CWD	25	• Recontoured with topsoil and CWD • Ripped with CWD • Mounded with CWD • Added wood chip mulch with CWD
Lower Hazeltine – Quesnel Lake	19	• Mounded with CWD • Recontoured with topsoil and CWD
Lower Hazeltine – Halo Zone	26	• Halo – Pre-breach vegetation is still intact

Reference sites were included in the study design in 2022 to allow a comparison of large and small mammal detections between disturbed areas of the Hazeltine Creek corridor and nearby areas not disturbed by the 2014 tailings breach. Both young and mature forest stands were selected for reference areas to represent a natural gradient of forest succession. Mature forest areas are intended to represent undisturbed forest conditions, while young forest areas are meant to represent similar habitat conditions that may be present following 10+ years of vegetation regrowth in Hazeltine Creek. However, most of the reference area locations have experienced silviculture practices in the past.

Reference areas were selected prior to camera deployment in spring 2022 and included three mature forest areas and three young forest areas (Table 3). Potential reference areas were selected that were outside the immediate influence of the tailings breach, but close enough to the mine site to allow efficient collection of data and camera maintenance by field crews. Areas were selected that were adjacent to

stream features to emulate the layout of the Hazeltine Creek corridor and attempt to capture riparian influences. Age of mature and young forest reference sites were determined by consulting the "Leading Species Age" attribute (PROJ_AGE_1) in the most current version of the provincial Vegetation Resource Inventory (VRI; Province of BC 2022). The target age range of young forest areas was 13-15 years, while target mature forest areas ranged from 47-172 years (Table 3).

A total of 11 potential reference area polygons were delineated in the spring of 2022 before camera deployment. A field reconnaissance was performed at each potential site to assess suitability. The final six areas were selected based on verification of forest maturity criteria, as well as ease of access for field crews. References areas had to have reasonable to access to allow camera maintenance checks to occur over a period of 3-4 days, every 2-3 weeks (Section 2.3). Reference site polygons selected as final study areas were comparable in size (range: 13 -33 ha) to the Hazeltine Creek study area polygons (range: 19-61 ha; Tables 2 and 3).

Young forest reference areas all consisted of regenerating timber harvest blocks (stand age 13-15 y), with lodgepole pine (*Pinus contora*) as the dominant or leading species. Young forest areas included Warren Creek, Miles Creek and Jacobie Creek. Mature forest areas included a mix of conifer tree species including white spruce (*Picea glauca*), subalpine fir (*Abies lasiocarpa*), Douglas fir (*Pseudotsuga menziesii*), western red cedar (*Thuja plicata*), as well as deciduous species such as trembling aspen (*Populus tremuloides*) and balsam poplar (*Populus balsamifera*). Stand age and tree species composition of each reference area are summarized in Table 3. Maps showing location of study areas are provided in Appendix A.

Table 3. Stand age and tree species composition of six reference areas established in 2022. Tree species in bold indicate leading or dominant species.

Study Area	Reference Area Type	Area (ha)	Stand Age * (years)	Tree Species* Composition	Adjacent Watercourse
Morehead Mature	Mature Forest	26	47-127	**White Spruce** Subalpine Fir Western Red Cedar Douglas Fir Trembling Aspen	Morehead Creek

2.2 WILDLIFE CAMERA DEPLOYMENT

2.2.1 Large Mammal Cameras

The goal of the large mammal monitoring plan was to maximize the number of detections of large- and medium-sized mammal species to determine which species are present and assess which areas and features within the reclaimed corridor are being used. A *deployment site* refers to a location where a remote camera was installed to collect data. A *deployment period* refers to a distinct time period that a camera is active and collecting photos. This period usually corresponds to the time interval between a camera being deployed and activated, and the time it becomes inactive.

A total of seven cameras were installed by Mount Polley staff in the Hazeltine Creek corridor. Cameras were allocated among the five Hazeltine study areas based on total area, with the largest study area (Upper Hazeltine) having the most cameras (3). One camera was deployed in each of the other four study areas. Large mammal cameras remained active throughout the year; therefore, the start of the sampling period was considered to be January 1, 2022. Six cameras were also deployed in the reference areas (one in each of the six study areas). Reference area cameras were deployed on July 21 and 22, 2023, as soon as the reference sites had been established.

A single deployment period (Deployment 1) was defined for large mammal cameras, corresponding with the date cameras were initially deployed at a site (start date) and the date taken as the end of the annual sampling period (end date; Table 4). The end date for Deployment 1 was taken as December 31, 2022. Although cameras were turned off for short periods when they were maintained and/or moved, this time was assumed to have been negligible (i.e., < 1 day). Therefore, when determining sampling effort (number of days camera was active at a deployment location), data were treated as if cameras had been continuously active.

Large mammal cameras were not rotated among different deployment sites in 2022. The cameras had been rotated to different locations in 2021 to test different areas and habitats of the Hazeltine Creek corridor to assess where cameras would be most effective at capturing different mammal species (DWB 2022). For 2022, cameras remained at the same deployment sites year-round in areas expected to result in the highest number of detections for the largest number of mammal species (Rovero et al. 2013). The only exception was the camera in the Lower-Hazeltine-Quesnel Lake study area, where the camera was moved between two sites. The camera was first moved from on May 25, 2021, from the LHQ05-A to LHQ05-B. This was done to avoid rising springtime water levels from Quesnel Lake. The LHQ05-B deployment site was located 75 m south of the lakeshore. The camera was returned to its original location (LHQ05-A) on November 9, 2022. Camera deployment maps are provided in Appendix A and deployment data are provided in Appendix C.

Mount Polley used Reconyx Hyperfire 2 Covert cameras. Large mammal cameras were programmed prior to deployment in the field with the following settings: three pictures per trigger, one second pause between pictures, no delay between triggers, high PIR sensitivity, day and night operation, optimized shutter, and 16:9 wide resolution. Cameras were visited approximately every month to conduct maintenance checks, during which time memory cards were checked and images were downloaded.

Table 4. Start and end dates for a single deployment period (Deployment 1) for large mammal cameras in 2022.

Area Type	Number of Cameras	Start Date	End Date	Survey Effort per camera (days)
Hazeltine Creek Corridor	7	2022-01-1	2022-12-31	364
Reference Young	3	2022-07-22	2022-12-31	162
Reference Mature	3	2022-07-21	2022-12-31	163

2.2.2 Small Mammal Cameras

Between July 18-22, 2022, a total of 33 wildlife cameras were installed at pre-selected deployment sites in the Hazeltine Creek corridor (15 cameras) and reference areas (18 cameras), with three cameras placed in each study area. Small mammal camera sites were selected randomly using the random points tool in QGIS, and were selected to be a minimum of 200 m from adjacent cameras, and at least 50 m from study area polygon boundaries to reduce edge effects.

Cameras were installed approximately 50-70 cm above the ground and angled downward to target a ground-level field of view (Figure 1). Camera sites were baited with a mixture of peanut butter and oats. Bait was placed within a metal tea infuser to prevent degradation and consumption by target and non-target mammal species. The bait holder was secured to ground using two 4-inch vegetation staples. Vegetation was cleared from the ground-level field of view to reduce the incidence of false camera triggers. Cameras were programmed to take 5 photo per trigger and have a 1-minute "quiet" period before the camera could be triggered again. The PIR sensitivity was initially set to 'high' for all cameras, but was changed to "medium-high" during the first maintenance check to reduce incidences of false detections (see Section 2.5 for more details).

Maintenance visits were conducted at each camera site approximately every 2-3 weeks. During maintenance visits, SD cards were replaced with new (empty) cards and the bait at each site was refreshed. Cameras were also repositioned if they had been mis-directed during the previous deployment period. Any new vegetation growth was also removed from the camera's field of view to reduce false detections. During each camera check, a *Field Data Collection Sheet* was filled out that detailed the nature of the visit and any changes to the camera deployment site. An example Data Collection Sheet is provided in Appendix B and detailed camera deployment data are provided in Appendix C. All camera data collection methods were consistent with the guidelines provided in the *BC Wildlife Camera Metadata Protocol* (RISC 2019).

Five deployment periods (D1 – D5) were defined for small mammal cameras corresponding to the period between camera maintenance visits when the bait was refreshed (Table 5). However, the deployment period lengths varied for each camera site (see Section 2.5). Detailed deployment histories for each camera and deployment period are provided in Appendix C.

Small mammal groups targeted by cameras included mice, voles, shrews, jumping mice, squirrels and chipmunks and lagomorphs (rabbits and hares). A list of small mammal species potentially occurring in Mount Polley study areas is provided in Table 6. Identification of small mammal species is discussed in more detail in Section 2.4. Since small mammal cameras were baited with food, a General Wildlife Permit was required for camera deployment. All work was performed in accordance with the conditions in General Wildlife Permit number WL22-747312.

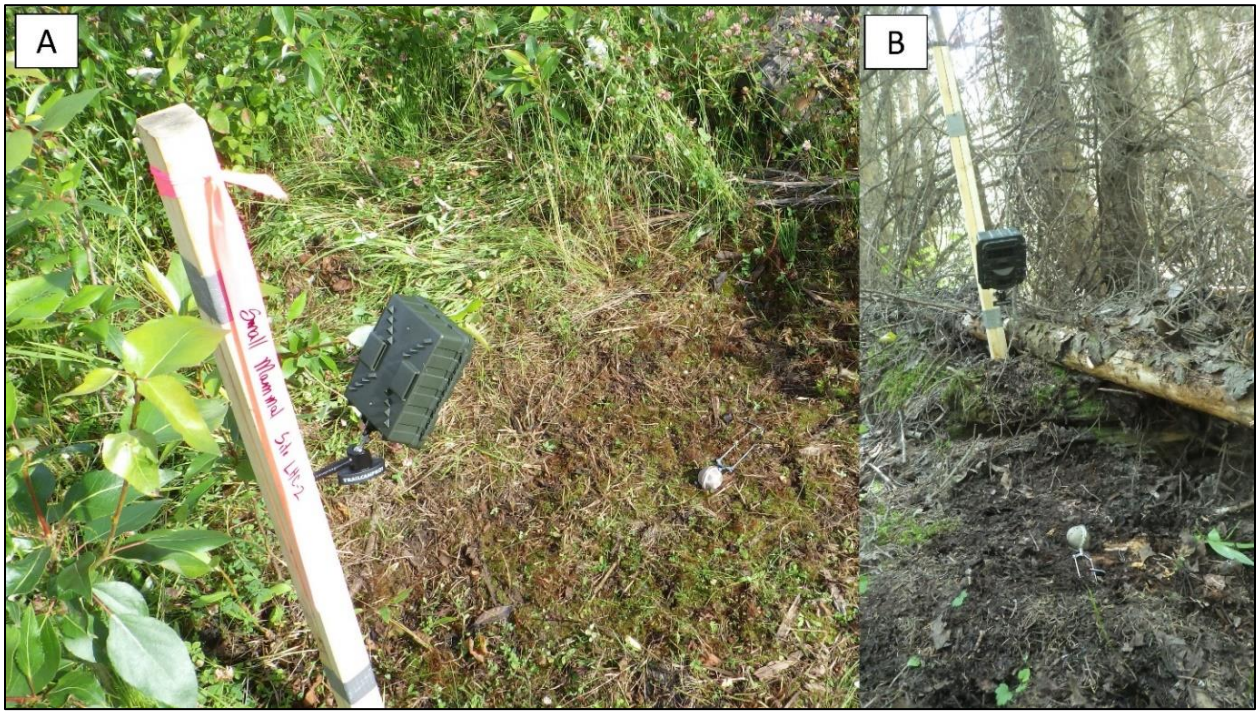

Figure 1. Example of small mammal camera deployment set-ups at (A) Lower Hazeltine-Cwd in the Hazeltine Creek corridor and (B) the Morehead-Mature reference area.

Table 5. Approximate deployment periods* for the small mammal cameras in 2022.

Deployment	Start Date	End Date	Days
D1	18-Jul-22	11-Aug-22	24
D2	11-Aug-22	01-Sept-22	21
D3	01-Sept-22	22-Sept-22	21
D4	22-Sept-22	17-Oct-22	25
D5	17-Oct-22	2-Nov-22	16
Total			**107**

* Start and end dates reflect the approximate period between camera maintenance checks when bait was refreshed, but not necessarily when each camera was active. Detailed deployment histories for each camera site are provided in Appendix C.

2.3 IMAGE REVIEW

All images were reviewed by Mount Polley Environmental staff. Large mammal images were reviewed manually without the aid of wildlife camera process software. Small mammal images were reviewed using Timelapse® software (Greenberg 2022) which allows for the efficient processing of wildlife camera

images. A custom template was developed for image processing and training was provided to the Mount Polley image review team on use of Timelapse® software and on small mammal species identification. Data collection categories collected for each image included site ID, deployment ID, study area, species present, total number of individuals, life stage (adult or juvenile), and activity (feeding on bait, traveling etc.). Reviewers also documented when cameras were mis-aligned (no longer pointed at bait or target feature) or when the bait was removed. This allowed for the removal of such images from final analyses (see Section 2.5).

At the onset of the mammal monitoring program in 2021, images from large mammal cameras were reviewed manually. Images were viewed using a generic image viewer (e.g., Window Photo Viewer) and data was manually entered into a custom excel spreadsheet. Data were entered into this spreadsheet on an ongoing basis following collection of the memory cards from each camera maintenance visit. The use of Timelapse® was first incorporated into the methods in the Fall of 2022 after the small mammal cameras had been removed. For this reason, only the six large mammal cameras in the reference sites were processed with Timelapse® software for 2022.

2.3.1 Species Identification

Small mammals observed in images were identified to species or genus, where possible. Identification of small mammals was limited to physical features visible in photographs. The majority of detections of deer mice, voles, shrews and jumping mice tended to occur at night. Reconyx Hyperfire 2 cameras use an Infrared (IR) flash which results in black and white nighttime photos. Therefore, identification based on fur color was not possible for many images.

Several vole and shrew species are potentially present in the Mount Polley study areas. In total, four species of vole and five species of shrew may be present (Table 6). Potential vole species may include southern red-backed vole, meadow vole, long-tailed vole and western heather vole. Southern red-backed voles have a distinctive red-orange median stipe on the dorsal fur (pelage) that separates them from other species (Nagorsen 2005). This feature, however, was only visible in daylight images. Due to the majority of vole detections occurring at night (usually around dusk or dawn), not all voles could be confidently identified to species. Therefore, all vole detections were grouped as “voles”.

Similarly, the five species of shrew potentially present are nearly impossible to confidently identify without examination of dentitions and/or measurements of skull size and other body size measurements (Nagorsen and Panter 2024). Fur color (pelage) can sometimes be used help differentiate species, but this tends to vary regionally for many species (Nagorsen and Panter 2024). Based on this uncertainty, all shrew detections were classified as “shrews”.

Jumping mice were easily distinguished from deer mice and other small mammals due to their very long, thin tail and distinct dorsal band of dark grey fur that was clearly visible even in black and white photos. The two species of jumping mice potentially present in the area, the western jumping mouse (*Zapus princeps*) and the meadow jumping mouse (*Zapus hudsonius*), are nearly indistinguishable from photographs alone. For this reason, all jumping mouse detections were classified as “jumping mice”.

Yellow-pine chipmunks (*Neotamias amoenus*) and least chipmunks (*Neotamias minimus*) are the two chipmunk species potentially present in the Mount Polley study areas. The two species have overlapping ranges and nearly identical physical features and vocalizations, making them very difficult to tell apart

(Reid 2006). However, since least chipmunks tend occupy more rugged, montane habitats at higher elevations (Reid 2006, Nagorsen 2005), all chipmunks were assumed to be yellow-pine chipmunks.

Table 6. Target small mammal species* potentially present in the Mount Polley study areas.

Family	Common Name	Scientific Name	Note on Identification
Muridae (Mice and Voles)	North American Deer Mouse	*Peromyscus maniculatus*	*Easily identified in images*
	Southern Red-backed Vole	*Clethrionomys gapperi*	*Not able to confidently identify all images to species*
	Meadow Vole	*Microtus pennsylvanicus*	
	Long-tailed Vole	*Microtus longicaudus*	
	Western Heather Vole	*Phenacomys intermedius*	*All detections classified as "voles"*
Dipodidae (Jumping Mice)	Western Jumping Mouse	*Zapus princeps*	*Cannot differentiate two species from photos. All detections classified as "jumping mice*
	Meadow Jumping Mouse	*Zapus hudsonius*	
Soricidae (Shrews)	Cinerus/Masked Shrew	*Sorex cinerus*	*Cannot confidently separate species from photos*
	Dusky Shew	*Sorex monticolus*	
	Western Water Shrew	*Sorex navigator*	
	Western Pygmy Shew	*Sorex eximius*	
	Vagrant Shrew	*Sorex vagrans*	*All detections classified as "shrews"*
Sciuridae (Squirrels and Chipmunks)	Yellow-Pine Chipmunk	*Neotamias amoenus*	*All detections assumed to be yellow-pine chipmunks based on habitat preference*
	Least Chipmunk	*Neotamias minimus*	
	American Red Squirrel	*Tamiasciurus hudsonicus*	*Easily identified in images*
	Northern Flying Squirrel	*Glaucomys sabrinus*	*Easily identified in images*
Leporidae (Hares and Rabbits)	Snowshoe Hare	*Lepus americanus*	*Easily identified in images*

* Based on range maps in Reid (2006), Nagorsen (2005), Nagorsen and Panter (2024).

2.4 Data Quality Control

Image data collected by Mount Polley Environmental staff was provided to DWB for further review. All Timelapse® files were initially examined by DWB to ensure completeness and accuracy of data, and that all deployment sites and deployment periods were accounted for. For large mammals, the species category was reviewed for consistency in labeling. Since large mammal images for 2022 were reviewed manually (i.e., not using Timeplase software), species identification labels were occasionally inconsistent (e.g., use of capitalization, species names). These were corrected in a modified spreadsheet. Behaviours of species observations were also converted to standardized "behaviour codes" to be consistent with BC Provincial Wildlife Data Standards and Wildlife Data Submission Templates (Province of BC 2024). Following verification of Timelapse data files, data were exported as .csv files for further analysis.

2.5 STATISTICAL ANALYSIS

All data were imported into R (version 4.2.1; R Core Team 2022). Both large and small mammal datasets were filtered to only include images with wildlife detections. The small mammal dataset was further filtered to remove images where the camera was knocked out of position (not pointed at bait) or where the bait was no longer present (i.e., removed by wildlife). In some cases, entire deployment periods for some camera sites were dropped if the bait was poorly positioned (i.e., out from frame or only partially visible). In other cases, only certain portions of a deployments were dropped, such as the time following a camera becoming misdirected following wildlife interference. All data from Deployment 1 were excluded from small mammal analyses since the PIR sensitivity was changed from 'high' to 'med-high' in Deployments 2 to 5 to reduce false detections. This was performed to ensure consistency in the data being compared.

For both small and large mammal datasets, we calculated the number of independent detections for each species and camera deployment site. An *independent image series* (also known as an *independent detection*) was defined as a series of consecutive images from a deployment site assumed to have the same unique individual or group of individuals of a particular species. For large mammals, images separated by 1-hour or more were considered independent detections, while for small mammals the minimum time interval for independent detections was set at 30-minutes. The *minimum group size* was assigned to each independent image series, which was defined as the minimum number of unique individuals present in an independent image series. This allowed for an accurate determination of the total number of independent detections across all images.

For both large and small mammal cameras, survey effort (number of days a camera was active at a site) varied among camera deployment locations and study areas. In the case of large mammal cameras, variation in survey effort was due to a full year (January to December 2022) of deployment for cameras in the Hazeltine Creek corridor, while reference site cameras were only deployed from July to December, 2022. For small mammal cameras, survey effort for each deployment and camera deployment site varied due to exclusions of certain data from final analyses (see below). To address variation in survey effort among camera sites, all independent detections were combined at each camera site and converted to "Catch per Unit Effort (CPUE)" by dividing the total number of independent detections for each species at a camera site, by the total number of days the camera was active, and multiplying by 100. This resulted in a standardized detection rate metric of "detections per 100 traps days" and allowed for a standardized comparison of wildlife detections among locations.

For the purposes of statistical analysis, individual camera deployment sites were considered independent sampling units. For large mammal cameras, there was typically only one camera per study area (except for Upper Hazeltine, which had three). For large mammal cameras**,** statistical comparisons were only performed for the species with the highest number of detections. All other large mammal data are summarized by the number of independent detections for each species, as well as a comparison of mean capture rates between Hazeltine Creek and reference areas for the most frequently detected species (see below). Small mammal detections from large mammal cameras (e.g., squirrels, chipmunks) were also included in the large mammal detection summary results, since they made up a notable portion of total detections.

For small mammal cameras, mean capture rates were compared statistically between the Hazeltine Creek corridor (all study areas combined) and young and mature reference areas. Mean capture rates for each species were also compared among the five study areas of the Hazeltine Creek corridor. Mean capture rates were compared among areas using one-way ANOVA, with mean capture rates log-transformed to meet assumptions of linear regression (normality and homoscedasticity); normality was tested for each species and study area using Shapiro Wilks tests, and homoscedasticity (equal variances among groups) was tested with Fligner-Killeen tests. Fligner-Killeen tests are used as a non-parametric test for homoscedasticity of group variances when data are non-normally distributed or when problems related to outliers in the dataset cannot be resolved. Where data did not meet assumptions of linear regression, non-parametric Kruskal-Wallis tests were used to compare mean capture rates of a species. Statistically significant differences among individual groups were assessed using Tukey's Pairwise comparison tests. Statistical significance was set at $p < 0.05$.

3.0 RESULTS

3.1 SAMPLING EFFORT

3.1.1 Large Mammals

Large mammal cameras in the Hazeltine Creek corridor were deployed throughout the year in 2022, with a total sampling effort at each deployment site of 364 days (Figure 2). The Upper Hazeltine study area had collectively more sampling effort (1092 days) than the other four Hazeltine Creek study areas (364 days each), since it had three cameras deployed, rather than one. The 364 days of sampling effort for the Lower Hazeltine-Quesnel Lake study area was split between the alternative site (LHQ05-B; 312 days) and the original site LHQ05-A (52 days). Cameras deployed in the reference areas (one per study area) were deployed mid-summer (July 21 or 22) and, therefore, had either 162 or 163 days of sampling effort.

Sampling effort was approximately 2.6-times greater in the Hazeltine Creek corridor (2548 days) than the references areas (974 days). Deployment dates and sampling effort of large mammal cameras are provided in Table C2, Appendix C.

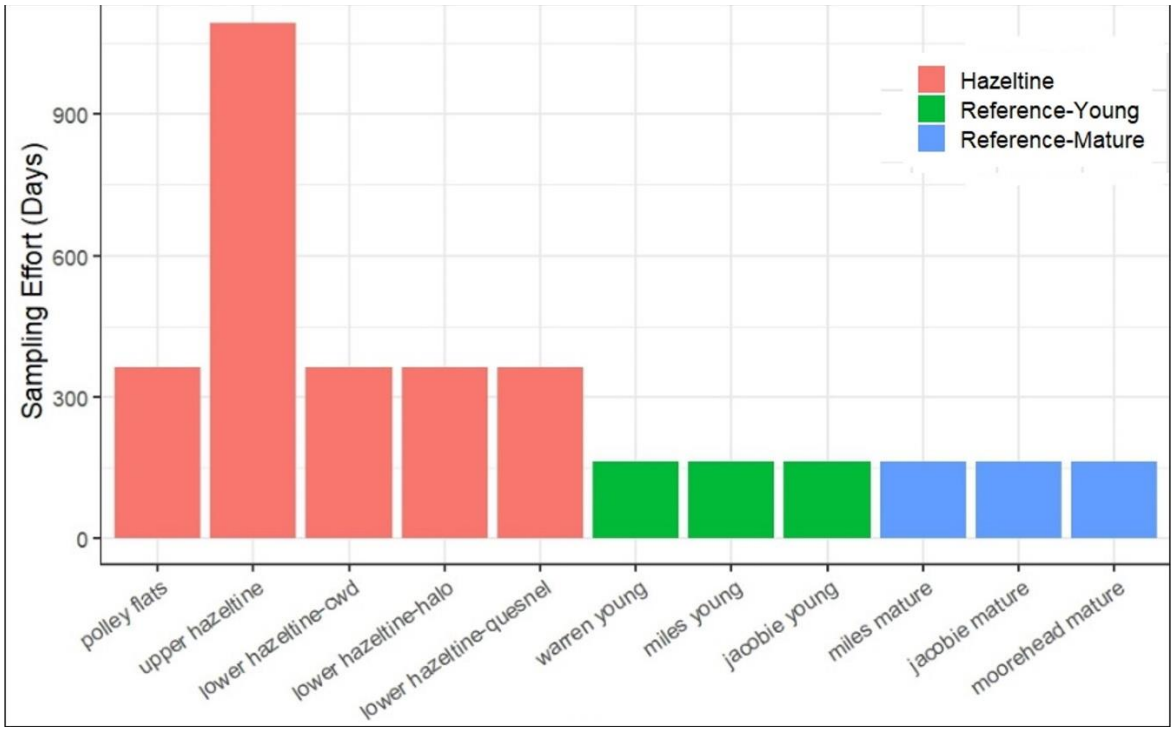

Figure 2. Sampling effort for study areas in the Hazeltine Creek corridor and nearby reference areas.

3.1.2 Small Mammals

A total of 2130 days of sampling effort was used across all small mammal camera sites and study areas (Table 7). Sampling effort was approximately twice as high in the Hazeltine Creek study areas (1057 days) compared to the young and mature forest reference areas (456 and 617 days, respectively). Sampling effort for each camera site and deployment period is provided in Appendix C.

Table 7. Sampling effort for small mammal cameras in the Hazeltine Creek corridor and nearby reference areas.

Area Type	Study Area	Deployment*

3.2 LARGE MAMMALS

3.2.1 Detection Summary

There was a total of 395 independent mammal detections across all cameras in the Hazeltine Creek corridor and reference sites (Table 8). Hazeltine Creek sites made up the highest proportion of total detections (297 detections; 75.1%), while the young and mature reference areas had 32 and 66 total detections which accounted for the remaining 24.9% of detections (Table 8). Domestic cows made up nearly 40% of the total detections, with most being detected in the Upper Hazeltine study area (250 individuals). Since cows were not a target species, they were excluded from the total detections to avoid inflating detections.

Among large mammal species, mule deer were the most frequently detected species overall (36.2% of total detections), followed by moose (14.7%), coyotes (12.9%), black bears (10.1%), lynx (4.0%) and wolves (3.3%). Red squirrels and chipmunks were two small mammal species that accounted for 12.6% and 2.5% of total detections, respectively. Other species that were detected less frequently included otters, mink, northern flying squirrel, beavers and snowshoe hare. Species composition was nearly identical between Hazeltine Creek and reference areas. Otter, mink and grizzly bear were the only large mammal species detected in Hazeltine Creek, but not in the reference areas.

Table 8. Independent wildlife detections* from large mammal cameras in study areas of Hazeltine Creek corridor and nearby reference areas.

Group	Species	Polley Flats	Upper Hazeltine	Lower Hazeltine-Cwd	Lower Hazeltine-Halo	Lower Hazeltine-Quesnel Lake	Hazeltine Total	Reference Young	Reference Mature	TOTAL (ALL AREAS)

* Sampling effort varies between study areas

3.2.2 Comparison with Reference Areas

Species composition was similar between Hazeltine Creek sites and reference areas. Three species that were only detected in Hazeltine Creek were otters, mink and grizzly bear. Otters and mink - both semi-aquatic weasels - were only detected in the Hazeltine Creek-Quesnel Lake study area (Table 8). There were no camera sites in the young or mature references areas that targeted large lakes or wetlands, which may explain the absence of these two species from reference area detections.

Among the four most frequently detected large mammal species, average detection rates for both mule deer and coyote were higher in the Hazeltine Creek and young forest reference areas, compared to mature reference areas (Figure 3; Table 9). In contrast, average detection rates for moose were higher in the Hazeltine Creek and mature reference areas compared to the young reference area. Black bear detection rates were similar between Hazeltine Creek and references areas, although detection rates were more variable between camera sites in Hazeltine Creek. None of the differences in mean capture rates were statistically significant for any species (Table 9).

Table 9. Results of one-way ANOVA or Kruskal-Wallis tests comparing mean Catch Per Unit Effort (CPUE) between Hazeline Creek and reference areas for four most frequently detected large mammal species in 2022. P-values in bold indicate a significant difference among areas at α = 0.05.

Species	Mean CPUE			$F_{-2, 11}$ (X^2)	P
	Hazeltine	Reference Young	Reference Mature		
Mule Deer	4.11 ± 4.14	2.86 ± 3.94	1.63 ± 0.70	0.486	0.628
Moose	1.84 ± 1.44	0.20 ± 0.35	1.63 ± 1.41	1.955	0.188
Black Bear*	1.11 ± 1.50	0.82 ± 0.35	0.61 ± 0.61	0.417	0.8116
Coyote	1.43 ± 1.96	1.64 ± 2.32	0	0.842	0.457

* Non-parametric Kruskal-Wallis test performed and X^2 test statistic reported instead of F-statistic (ANOVA).

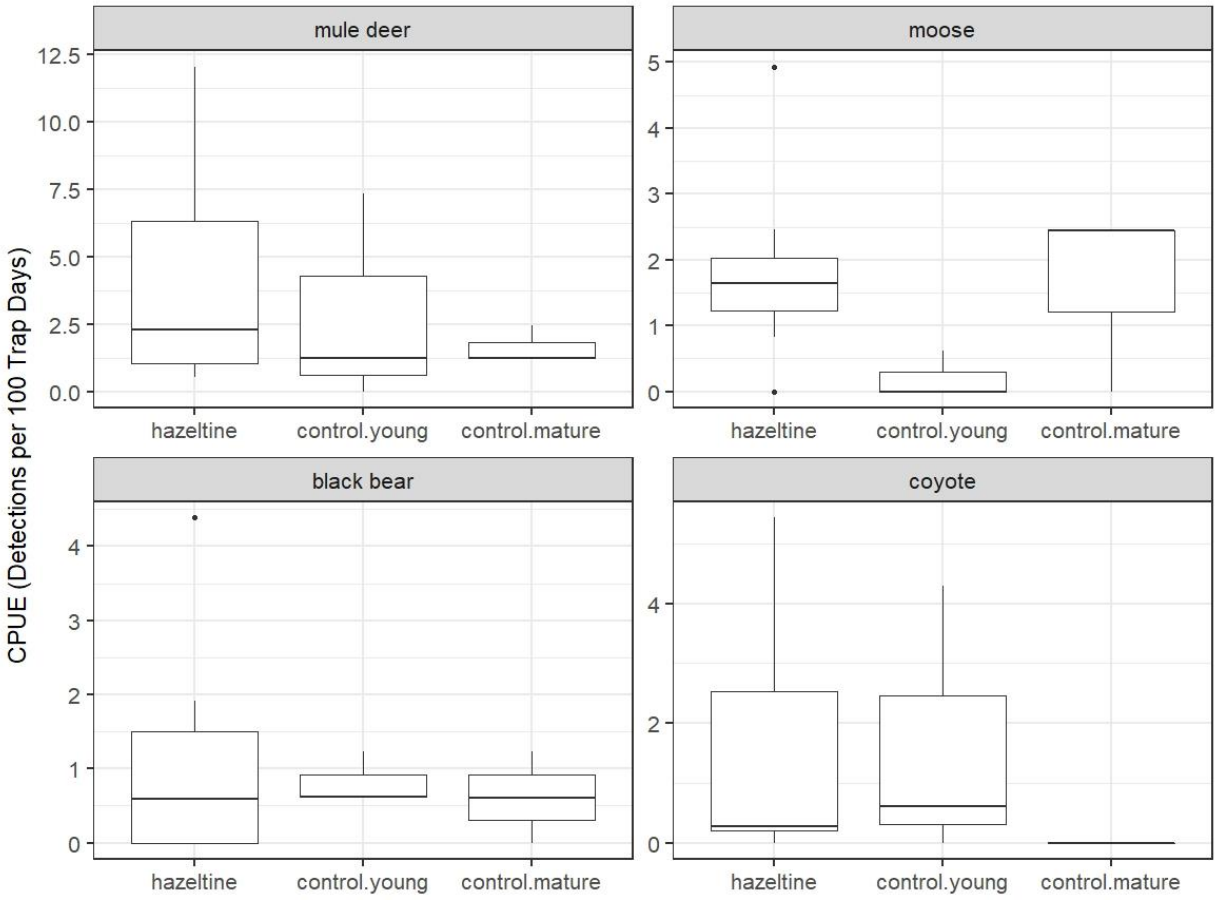

Figure 3. Comparison of mean capture rates (CPUE) between sites in Hazeltine Creek and nearby reference areas for the four most frequently detected large mammal species in 2022. Error bars represent ± standard deviation.

3.3 SMALL MAMMALS

3.3.1 Detection Summary

There was a total of 5963 independent wildlife detection events from small mammal cameras across all 33 small mammal cameras, with all target small mammal species detected on cameras (Table 10). Small mammals accounted for the majority of detections (5617 detections; 94.2%). The three most frequently detected small mammal species were deer mice, with 2400 independent detections, followed by voles and shrews, at 1979 and 725 independent detections, respectively (Table 10). Other common small mammal species detected included red squirrel (257), northern flying squirrel (127), yellow-pine chipmunk (116), and snowshoe hare (59). Jumping mice had the lowest number of detections, with 50 independent detections.

Several other non-target mammal and non-mammal species were detected on small mammal cameras. The four most common were birds (primarily passerines), coyote, black bears, short-tailed weasels and grouse. Black bears and coyotes were frequently observed investigating and often removing the bait from camera sites. Other species detected included domestic cows, deer (unknown species), moose, striped skunk, lynx, and American marten (Table 10). Species composition was identical between Hazeltine Creek and reference areas for target small mammal groups. For other species, striped skunk and American

marten were only detected in the Hazeltine Creek corridor, though detections were very low for both species.

Table 10. Summary of independent wildlife detections* for small mammal cameras in 2022.

3.3.2 Comparison with Reference Areas

Mean captures rates for deer mice were twice as high in Hazeltine Creek sites and mature reference areas than in young reference areas, though the difference was not statistically significant (Table 11; Figure 4). There were, however, statistically significant differences between Hazeltine Creek and references areas for voles, shrews, red squirrels and northern flying squirrels (Table 11). For both voles and shrews, mean captures rates were significantly higher in both young and mature reference areas compared to Hazeltine Creek. For voles, capture rates were approximately three-times higher in mature and young references areas compared to Hazeltine Creek, while mean shrew capture rates were 12-15-times higher in young and mature reference areas (Table 11; Figure 4).

In contrast, mean capture rates for red squirrels and northern-flying squirrels – two predominantly arboreal species – were significantly higher in mature reference areas compared to Hazeltine Creek and young reference areas. For yellow-pine chipmunks, jumping mice and snowshoe hares, average capture rates were higher in Hazeltine Creek and young references areas, compared to mature sites. Differences in mean capture rates for were not statistically significant for jumping mouse and snowshoe hare were

not statistically significant. Differences were not significant for yellow-pine chipmunks, but only marginally (p=0.06; Table 11).

Table 11. Results of one-way ANOVA and Kruskal-Wallis tests comparing mean Catch Per Unit Effort (CPUE) between Hazeline Creek and reference areas for eight small mammal groups detected in 2022. P-values in bold indicate a significant difference among areas at α = 0.05.

Species	Hazeltine	Mean CPUE Reference Young	Reference Mature	$F_{-2, 29}$ (χ^2)	P
Deer Mouse	120.0 ± 99.1	46.5 ± 55.7	92.4 ± 101.9	1.754	0.191
Vole	37.2 ± 87.5	114.3 ± 88.4	98.1 ± 65.5	8.325	**<0.01**
Shrew*	3.55 ± 4.39	45.1 ± 47.24	55.0 ± 48.9	13.88	**<0.01**
Red Squirrel*	0.51 ± 1.13	2.64 ± 3.09	27.9. ± 17.4	57.23	**<0.01**

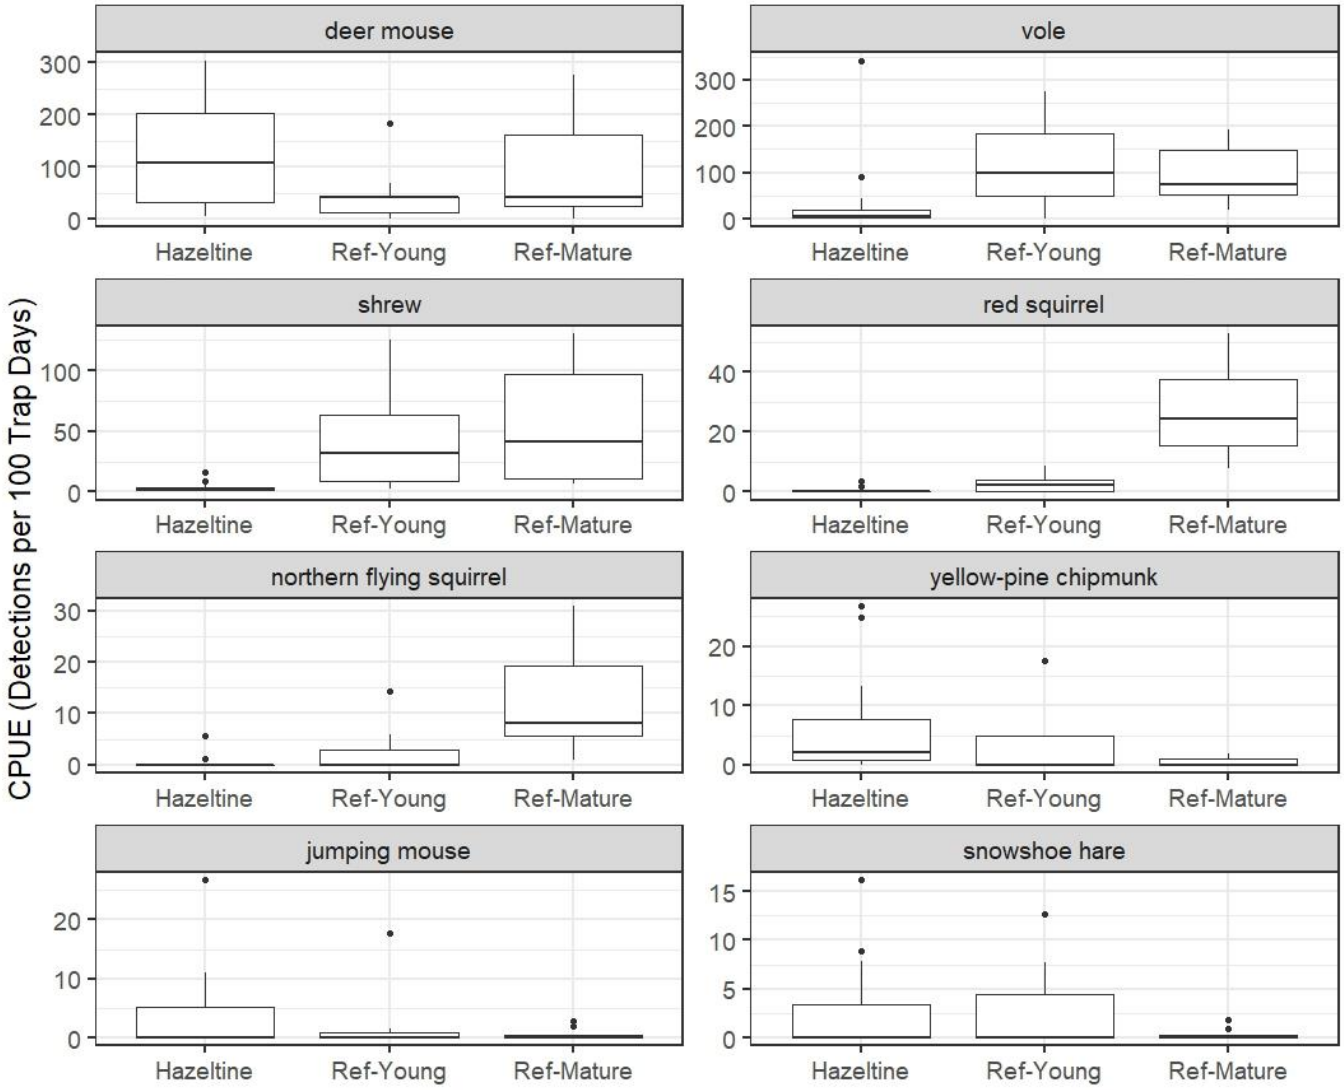

Figure 4. Comparison of mean capture rates (CPUE) between Hazeltine Creek Corridor (Hazeltine) and reference areas (Ref-Young and Ref-Mature) for eight small mammal species detected on wildlife cameras in 2022. Error bars represent ± standard deviation.

3.3.3 Hazeltine Creek Study Areas

There were no significant differences in mean capture rates among study areas of Hazeltine Creek for most small mammal species (Table 12). The one exception was jumping mice, where mean capture rates were significantly higher in Lower Hazeltine-Cwd compared to all other study areas (Figure 5; Table 12).

Mean capture rates for deer mice were relatively consistent across study areas, although slightly higher in Polley Flats, Upper Hazeltine, and Lower Hazeltine-Cwd (Figure 5; Table 12). Mean captures rates for voles, red squirrels and northern flying squirrels were all higher in the Lower Hazeltine-Quesnel Lake and Lower Hazeltine-Halo study areas, while capture rates for shrews were highest in Lower Hazeltine-Cwd, as well as the latter two study areas. There were no detections for red squirrels and northern flying squirrels in Polley Flats, Upper Hazeltine or Lower-Hazeltine-Cwd. Snowshoe hare and yellow-pine chipmunks both had the highest detection rates in the Lower-Hazeltine Halo study areas.

A table of independent detections across the Hazeltine Creek study areas for each species is provided in Appendix D.

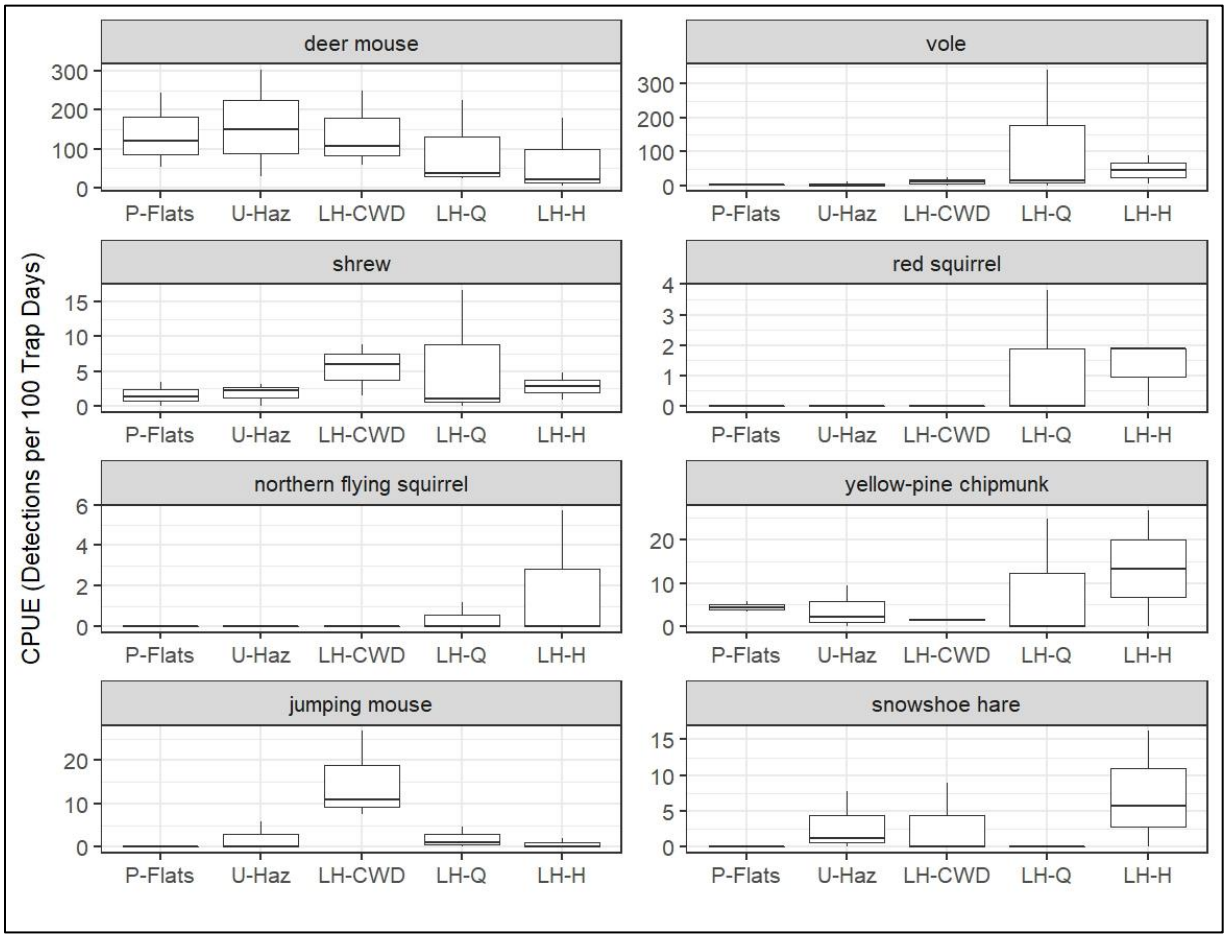

Figure 5. Mean capture rates of small mammal species among five study areas of the Hazeltine Creek corridor in 2022, including Polley Flats (P-Flats), Upper Hazeltine (U-Haz), Lower Hazeltine-Cwd (LH-CWD), Lower Hazeltine-Quesnel Lake (LH-Q) and Lower Hazeltine-Halo Zone (LH-H). Error bars represent ± standard deviation.

Table 12. Results of one-way ANOVA or Kruskal-Wallis tests comparing mean Catch Per Unit Effort (CPUE) between study areas in the Hazeltine Creek corridor for small mammal groups detected in 2022. P-values in bold indicate a significant difference among study areas at α = 0.05.

Species	Polley Flats	Upper Hazeltine	Lower Hazeltine-Cwd	Lower Hazeltine-Quesnel	Lower Hazeltine-Halo	$F_{4, 10}$	P
Deer Mouse	138.4 ± 96.4	160.0 ±138.0	138.0 ± 99.6	95.1 ± 113.4	68.2 ± 96.3	0.685	0.618
Vole	2.67 ± 1.40	4.96 ± 6.86	12.6 ± 12.7	119.0 ± 192.9	46.7 ± 41.9	1.19	0.373
Shrew	1.64 ± 1.76	1.82 ± 1.64	5.49 ± 3.71	5.93 ± 9.31	2.86 ± 1.90	0.523	0.721

3.4 Species at Risk

Mammal species were classified as a species at risk if they fell into one of the following three categories:

1. A species listed on Schedule 1 of Canada's *Species at Risk Act* (SARA) as 'Endangered', 'Threatened' or 'Special concern'. Prohibitions that protect these species under SARA will specifically apply to 'Endangered', 'Threatened', or 'Extirpated' species on federal lands, or lands under the authority of the Minister of Environment.
2. A species listed under Schedule 1 of the Category of Species at Risk, under the BC *Forest and Range Practices Act* (FRPA). Additional management strategies to protect the habitat of these species are required during forest and range activities on crown land. The list also includes species whose populations are not presently at peril but whose habitat may be at an increased risk of impact from harvesting activities (e.g., elk)
3. A species listed by the BC Conservation Data Centre (CDC) as Blue-listed (Special Concern) or Red-listed (Endangered/Threatened). The conservation status of species listed by the CDC are based on the consensus of the scientific community; however, not all of the species listed by CDC are protected under federal or provincial legislation.

In total, one species-at-risk was detected from remote wildlife cameras deployed in 2022 (Table 12). A single grizzly bear was detected in Upper Hazeltine on July 17, 2022.

Table 13. Species-at-risk observed at Mount Polley Mine in 2022 as detected from wildlife cameras.

Species	SARA[1]	BC CDC[2]	BC FRPA[3]	Detection Date(s)	Detection Time (24hr)	Study Area	Site ID
Grizzly Bear	Special Concern	Blue	Listed (2004)	17-Jul-2022	21:23	Upper Hazeltine	UH15

1- Canada's *Species at Risk Act* (SARA), where species may be categorized as Special Concern, Threatened, Endangered or Extirpated. Species with 'No Status' are not protected under the act.

2 - British Columbia Conservation Data Centre (BC CDC), where species are classified by the scientific community as either Yellow (secure), Blue (special concern), or Red (threatened/extirpated).

3 - British Columbia *Forest and Range Practices Act* (BC FRPA), where species are appended to a single species at risk list by the Minister of Environment. Species with 'No Status' are not on the list.

4.0 DISCUSSION

4.1 LARGE MAMMALS

4.1.1 Species Detections

A total of 395 independent wildlife detections were documented on large mammal cameras in 2024 across all deployment sites in the Hazeltine Creek corridor and the reference areas. Of these detections, 297 were from the Hazeltine Creek corridor, while 32 and 66 were detected in young and mature reference areas, respectively.

Large mammal detections consisted of 16 mammal species (not including domestic cows) in both the Hazeltine Creek corridor and reference areas in 2022. In comparison, 2021 saw a total of 383 independent detections of 14 mammal species (excluding cows) in the Hazeltine Creek corridor alone (DWB 2022). Species composition among large mammal detections was similar in the Hazeltine Creek corridor between 2021 and 2022; wolverine and cougar were the only large mammal species detected in Hazeltine Creek in 2021 that were absent from the 2022 detections. Wolves were a new species detected in 2022. Mule deer, moose, black bear and coyote were the four most frequently detected species in both years.

Reference areas were included for the first time as part of the mammal monitoring program in 2022, which allowed for a comparison of wildlife detections between sites in the Hazeltine Creek corridor that had been impacted by the 2014 tailings breach and reference areas off the mine site that were unimpacted. Overall, species composition was similar between Hazeltine creek and the reference areas. Only a few species, including river otter, mink and grizzly bear, were solely detected in the Hazeltine creek corridor and not the reference areas. Similarly, the same four species that made up the majority of the Hazeltine Creek corridor detections (mule deer, black bear, coyote and moose) were also the majority of detections in the reference areas.

Camera deployment locations targeted several habitat features that were part of reclamation efforts following the 2014 tailings breach event, including CWD piles and areas of planted vegetation. One of the objectives of the Mammal Monitoring Plan was to assess whether reclaimed features, such as reconstructed stream channels, CWD, and vegetation were used by resident mammal species for breeding, feeding, travel, and/or shelter. The range of mammal species and life stages observed across study areas and deployment locations, as well as many of the specific behaviours documented, suggest reclaimed features are supporting at least some of the life history requirements of resident mammal

populations. Some examples include observations of mule deer and moose feeding on native shrubs and grasses in many of the reclaimed areas, suggesting planted vegetation may be providing food for these species. Further, the observation of adults accompanied by young-of-the-year (e.g., bear cubs, deer and moose calves) in many areas suggests that these areas may be providing required resources (e.g., food, shelter) for both adults and their young. However, presence of specific wildlife at a location does not necessarily indicate that they are utilizing resources there. For example, some species may be using certain areas for foraging, but not breeding, while other individuals may just be passing through during seasonal migrations or daily movements.

4.1.2 Update to Sampling Approach

In 2021, large mammal cameras were rotated between multiple deployment sites in the Hazeltine Creek corridor with the goal to maximize the number of detections of as many mammal species as possible, and to identify areas with high wildlife activity (DWB 2022). In contrast, cameras deployed in 2022 remained stationary throughout the annual sampling period, aside from the large mammal camera in the Lower Hazeltine-Quesnel Lake study area, which was moved to an alternative location to avoid rising springtime water levels. It is recommended that in all subsequent years, cameras remain in the same deployment locations throughout the year to allow consistency in comparisons between locations within and among sampling years.

4.2 Small Mammals

4.2.1 Comparison with Reference Areas

The assemblage of small mammal species was identical between Hazeltine Creek corridor and both young and mature reference areas. However, there were distinct differences in relative abundance for several small mammal groups between these areas. While deer mouse capture rates were not significantly different between the Hazeltine Creek corridor and reference areas, they were twice as high in Hazeltine Creek and mature reference areas, compared to young forest reference sites. In contrast, voles, shews, red squirrels, and northern flying squirrels all showed significantly higher capture rates in one or both the reference areas compared to the Hazeltine Creek corridor. These patterns may highlight the variation in habtiat preferences and responses to disturbance displayed by these species.

Both deer mice (*Peromyscus maniculatus*) and red squirrels (*Neotamias amoenus*) are considered habtiat generalists, and are capable of occupying a variety of habitats in clearcut or disturbed environments (Sullivan and Sullivan 2018). Capture rates of deer mice were similar between Hazeltine Creek sites and mature reference areas, highlighting the versatility in habitat use by this species. Red squirrels, however, were more abundant in young and mature reference areas compared to Hazeltine Creek, which is consistent with this species' requirement for mature and immature trees for nesting and food (Nagorsen 2005). Though red squirrels are usually most abundant in mature spruce and pine forests, some studies in the BC Interior have found that managed and mature lodgepole pine forests supported similar densities (Sullivan and Moses 1986; Nagorsen 2005). Population fluctuations in this species are tightly associated with food availability, primarily conifer cone crops (Nagorsen 2005).

Northern flying squirrels - another arboreal species - demonstrated a similar pattern as red squirrels, with the exception that mean capture rates were significantly higher only in mature reference areas compared to the Hazeltine Creek corridor and young reference areas. This again, likely reflects this species' requirement for mature forest environments. Though often considered a mature forest-specialist, Northern flying squirrels have been known to inhabit both young and mature forests, depending on the

region (Nagorsen 2005). Northern flying squirrels have two essential habitat requirements: tree cavities for den sites and abundance of lichens and truffles for food (Nagorsen 2005).

Voles and shrews also had significantly higher capture rates in both young and mature reference areas compared to the Hazeltine Creek corridor. The vole and shrew species potentially present in the Mount Polley study areas all differ in their ecology, habtiat requirements and responses to habitat disturbance. Among these species, southern red-backed voles (*Clethrionomys gapperi*) - which are thought to make up the majority of vole detections in our study areas - are usually considered a closed-canopy, mature forest-dependant species, often associated with moist forest conditions, abundant shrub cover, and downed woody debris of varying levels of decay (Sullivan and Sullivan 2018; Nagorsen 2005). Previous studies have shown their abundance declines sharply immediately following timber harvesting, and may take several decades to return to pre-harvest (mature forest) levels (Sullivan et al. 2010; Fuller et al. 2004). However, populations may remain at 'mature forest levels' if microhabitat conditions are retained, such as woody debris cover and availability of food sources including fruit-bearing woody shrubs (Boonstra and Krebs 2012).

Shrews are primarily insectivores, and so population responses to forest cover loss or habtiat disturbance may be less pronounced than other herbivorous or omnivorous small mammal groups (Fisher and Wilkinson 2005). Most shrew species do, however, require hydric or mesic ground conditions and are typically associated with ground litter and shrub cover (Fisher and Wilkinson 2005). Cinerus shrews - one of the most common and widespread species in BC - are known to occupy a variety of terrestrial habitats, except areas with little to no vegetation cover. Thick leaf litter in damp forests may represent favored habitat for this species, although they appear to be adaptable to major successional disturbances (BC CDC 1996; Stevenson et al. 1998). Other shrew species of the genus *Sorex* occupy various habitats ranging from fields to moist conifer forests (Sullivan and Sullivan 1982).

4.2.2 Hazeltine Creek Study Areas

The observed patterns in relative abundance of small mammals among the study areas of the Hazeltine Creek corridor appeared to mirror those observed between the Hazeltine Creek corridor and reference areas. Mean capture rates for deer mice were relatively consistent across study areas, which reflects this species' role as a habitat generalist. The mean capture rates were higher for voles, shrews, red squirrels and northern flying squirrels in the lower Hazeltine - Quesnel Lake and Lower Hazeltine - Halo study areas. Shrew capture rates were also higher in Lower-Hazeltine-Cwd study area, in addition to Lower Hazeltine-Quesnel Lake and Lower Hazeltine-Halo. However, these results were not statistically significant; significant differences may be detected in future years for these species as the reclaimed sites continue to develop and mature.

The Lower Hazeltine-Halo study area represents the only area of the Hazeltine Creek corridor where forest vegetation was not lost during the breach in 2014. As such, this area like provides distinct forest habtiat conditions not found in the other four study areas and may explain the higher capture rates for voles, shrews, squirrels and northern flying squirrels. The Lower Hazeltine-Quesnel Lake area also had higher detections for these species, which may be due to the area's proximity to Quesnel Lake, wetlands present in the study area, or nearby forest cover in the Lower Hazeltine-Halo study area (see maps in Appendix A). Mean capture rates of some these species (vole, shrew, northern flying squirrel) in Lower Hazeltine-Quesnel were, however, marked by a high degree of variability; therefore, caution should be exercised when interpreting these results (see Section 4.3.3).

Jumping mice were the only small mammal species to show a significant difference among Hazeltine Creek study areas. Jumping mice captures rates were significantly higher in the Lower Hazeltine-Cwd, with this study area accounting for 27 of 39 (69.2%) jumping mouse detections in the Hazeltine Creek corridor. The reason for this difference is unknown. Jumping mice represented the least frequently detected small mammal in the 2022 study and is often rare in other small mammal trapping studies (Jung and Powell 2011). Both the western and meadow jumping mouse is associated with grassy habitats and dense riparian vegetation surrounding streams and wetlands (Nagorsen 2005). The most productive environments for western jumping mouse tend to be moist meadows with abundant forbs. Habitat features present in the Lower Hazeltine-Cwd study area may be particularly favourable for jumping mice; however, additional sampling years and further analysis are required to address this question (see Section 4.3.1)

4.3 LIMITATIONS

4.3.1 Habitat Relationships

The small mammal data in 2022 were treated at a relatively broad scale through comparisons of relative abundance (standardized capture rates) between the study areas of Hazeltine Creek corridor, as well as between the Hazeltine Creek corridor and nearby references areas. We were able to show that relative abundance of some small mammal groups (deer mice), was comparable between Hazeltine Creek corridor sites and the reference areas, while other species (voles, shrews, red squirrels, northern flying squirrels) displayed lower capture rates in Hazeltine Creek relative to the reference areas. Although the mechanisms underlying these patterns can be speculated from known habtiat requirements and previous research on target small mammal species, additional study and analysis is required to explore potential relationships between species relative abundance and habitat variables. For example, the inclusion of habitat data such as coarse woody debris (CWD), understory vegetation cover, and presence and abundance of food sources (vegetation, invertebrates), into single- and multi-year analyses may improve understanding of observed abundance patterns.

4.3.2 Abundance Indices

We used standardized capture rates ('catch per unit effort', CPUE) to compare relative abundance of small mammals among study areas. This allowed for a standardized comparison that accounted for unequal sampling effort across study area. The standardized measures of CPUE provide a proxy or surrogate for wildlife populations (Allen et al. 2020). These measures, however, should not be considered measures of true abundance or population size, which typically require the capture and recapture of marked (or identifiable) individuals over repeated sampling sessions to provide population estimates (Manning and Goldberg 2020). Other methods are also available that allow abundance estimates and detection probabilities to be estimated using repeated measures of unmarked individuals, such as N-mixture models (Dénes et al. 2015).

4.3.3 Imperfect Detection

It is important to recognize that not all species and life stages are detected with equal probability. Wildlife surveys, including those using remote cameras, experience imperfect detection when some species or life stages evade discovery despite being present in a study area (Anderson 2001, Mackenzie et al. 2005). Imperfect detection can occur at the scale of the individual deployment location or within the context of the larger study area that the deployment location is selected to represent (Burton et al. 2015). For example, species or individuals may not be detected when they move through a camera's detection zone, or they may be occupying a larger study area but not use or move through the camera deployment location. This phenomenon can hinder inferences (interpretations of data) regarding wildlife populations

and communities within study areas if appropriate sampling and analytical methods are not implemented (Burton et al. 2015).

4.3.4 Variabilities in Detections Among Camera Sites

Detection histories among cameras at deployment sites were marked by occasional outliers (sites with particularly high capture rates). For example, 287 of the 497 vole detections (57.8%), and 14 of 42 shrew detections (33.3%) in the Hazeltine Creek corridor came from a single camera site (LHQ3) in the Lower Hazeltine-Quesnel Lake study area (Table D4, Appendix D). Such 'hotspots' are not uncommon in small mammal live trapping and other wildlife count-based surveys. A few sites marked by very high captures have the potential to inflate the average capture or detection rates for an area. This effect becomes more pronounced in areas with small sample size (i.e., number of camera sites). For example, each study area of the Hazeltine Creek corridor had three small mammal cameras (sampling unit replicates), therefore a single "high capture" camera site may inflate the mean of this area considerably and may misrepresent the overall abundance of a species in area.

The reason for such spatial variation in wildlife detections is uncertain and may represent true ecological patterns (e.g., spatial heterogeneity of good habtiat, wildlife travel corridors). In this study, outliers were retained in analyses in order to maintain sample sizes within study areas. However mean capture rates with high variability (standard deviation), should be interpreted with caution. Additional years of sampling at the same sites will help determine if such hotspots experience the same repeated patterns.

4.3.5 Inter-annual Population Changes

Small mammal populations are expected to vary year-to-year (Nagorsen 2005), and many species even experience regular inter-annual population cycles. For this reason, it is essential to sample over multiple years to assess long-term trends. Meadow voles, for example, frequently show two-to-four-year population cycles; however, the presence of these cycles can vary geographically, with some populations only showing year-to-year variation in abundance (Nagorsen 2005). Southern red-backed voles are one of the few vole species that do not undergo regular population cycles in North America, though populations do vary year-to-year (Boonstra and Krebs 2006). The 2022 year was the first year of the small mammal study, which represents Year-3 of the wildlife monitoring timeline described in the *Updated Scope for the Terrestrial Wildlife Monitoring Plan for the Hazeltine Creek Corridor* (DWB 2021). Small mammal sampling is scheduled to occur in 2023, 2024, 2026 and 2029, which corresponds to Years-4, 5, 7 and 10, of the wildlife monitoring timeline, respectively.

4.4 Camera Deployment Methods

4.4.1 Positioning of Cameras

In 2022, the 'walk test' function was used on all wildlife cameras to ensure cameras were directed at the appropriate target. This feature uses a red light on the camera to indicate when the camera is triggered and to assist in aiming the camera at a target feature. Since small mammal cameras were positioned close to the ground, the bait holder was occasionally out of position (i.e., partially or fully out of frame). As a result, small mammals coming to the bait site would trigger the camera, but would result in images where the individual was only partially visible in the frame or not visible at all (Figure 6). Although images are often captured of the individual passing through the camera's field of view, many images are missed when the animal approaches the bait from the 'invisible' side, or when the animal is investigating or feeding at the bait holder. These image sets were subsequently excluded from later analyses since the data were not comparable to images where the bait was properly positioned.

Reconyx Hyperfire 2 cameras do not have a viewing screen to allow the user to see the exact field of view when they are deploying a camera. For standardized comparisons, it is essential that the field of view is consistent among camera sites, with the bait properly positioned near the center of the frame. An SD card reader will be used in future years to ensure the bait holder is correctly positioned at all camera sites during deployments.

Figure 6. Comparison good (A) and poor (B) positioning of the bait holder at small mammal camera sites.

5.0 CLOSURE AND RECOMMENDATIONS

Large mammal cameras in 2022 resulted in a similar number of detections as 2021, with species composition being similar between the Hazeltine Creek corridor and nearby reference areas. Though the large mammal program is not intended to provide population estimates for any species, 2022 data shows that some species are using reclaimed sites in the Hazeltine Creek corridor for travel and foraging, and that large mammal communities detected in Hazeltine Creek are similar in species composition to those detected at reference areas. Future years of sampling will benefit from maintaining the same deployment sites throughout the survey period.

Relative abundance of most small mammal groups was lower in the Hazeltine Creek corridor compared to reference areas, with significant differences observed for voles, shrews, red squirrels and northern flying squirrels. Further, many small mammals associated with intact forest and associated ground conditions (e.g., woody debris, shrubs, litter layer, ground moisture) were more abundant in the Lower Hazeltine-Halo and Lower Hazeltine-Quesnel Lake study areas, compared to Polley Flats, Upper Hazeltine and Lower Hazeltine-Cwd. Additional years of sampling are needed to examine long-terms trends in small mammal abundance, as well as analyses that incorporate habitat variables to explore potential relationships between species relative abundance and habitat features present in reclaimed sites of the Hazeltine Creek corridor and the reference areas.

Overall, remote cameras were effective at detecting target small mammal groups in the Mount Polley study areas. Due to the non-invasive and cost-effective nature of this sampling technique, the same design and procedures should continue in future years after incorporating the recommendations and lessons learned. Deer mice, voles, shrews red squirrels and northern flying squirrels have the potential to act as ‘index’ groups for long term monitoring of small mammals. The relatively high capture rates of these groups will permit statistically meaningful comparisons between the Hazeltine Creek corridor and reference areas in future years, as well comparisons of relative abundance between years. Deer mice are considered habitat generalists; however, voles, shrews, red squirrels and northern flying squirrels have more specialized habtiat requirements that are characteristic of early-successional or mature forest

environments and, therefore, may be good indicators of ecological succession and post-disturbance recovery.

Appendix B
Example Field Data Collection Form

Wildlife Camera Field Collection Form

Survey Name:	Small Mammals	**Crew:**	SS, MR
Study Area:	Lower Hazeltine - CWD		
Deployment Location ID:	LHC3	**Camera ID:**	LHC3
Date:	09-Aug-2022	**Deployment Time (24-HR):**	12:27
Station Coordinates:	Same as previous		
Station Features/ Habitat Type:	Thick grass and shrub habitat, forbs	**Purpose of Visit:** Select all that apply	☐ Camera Deployment ☑ Site Check/Maintenance ☑ Data Collection/Download ☐ Camera Removal ☐ Other (Describe below)
Target Habitat Feature(s)	☐ Game Trail ☐ Human Trail ☐ Road ☐ Feeding Area ☐ Rubbing Post ☐ Wetland ☐ Stream ☐ River ☐ Lake Shore ☐ Other (Describe Below) Reclaimed thick grass and shrub habitat, forbs **Distance from Target Feature (m)** 0.70m		
Station Photos Numbers: [minimum four photos – N, S, E, W]	Site- 3124 N- 3120 E -3121 S -3122 W -3123		
Visibility (m)	0.70 m	**Camera compass direction**	Same as Previous
Camera Make and Model:	Reconnyx Hyperfire 2	**SD Card ID:**	LHC3-A Swapped w/ LHC3-B

Camera Attached to: ☐ Tree ☑ Post ☐ Other
Security Box ☐ Y ☑ N
Security Cable ☐ Y ☑ N

Camera Settings:
☐ Video. Length of Video _____
☐ Time Lapse Photos Length of Interval _____
☑ Remote Photos # photos per burst 5

PIR Sensitivity ☐ Low ☐ Medium ☐ High ☑ Med-High

Time Lag Between Photo Burst
☐ No delay
☑ Delay. Give time length in seconds 30 sec

Walk Test Performed ☑ Y ☐ N

Camera Active When You Left? ☑ Y ☐ N

Additional Comments

Lot's of false detections despite vegetation being cleared prior, no log cover. Batteries full, PIR sensitivity changed to Med-High.
- bait refreshed

Appendix C
Camera Deployment History and Sampling Effort

Table C1. Site coordinates and deployment data for large mammal cameras in Hazeltine Creek corridor and nearby reference areas in 2022

Study Area Type	Study Area	Site ID	Latitude	Longitude	Bearing	Camera Height (m)	Target Feature
Hazeltine Creek	Polley Flats	PF04	52.527650	-121.587605	225	----	Creek/CWD

Table C3. Site coordinates and deployment data for small mammal cameras deployed in Hazeltine Creek corridor and nearby reference areas in 2022.

Study Area	Area Type	Site ID	Latitude	Longitude	Bearing	Camera Height (m)	Distance to Target (m)	Site Description
Polley Flats	Hazeltine	PF-1	52.526706	-121.590545	6	0.5	0.7	Adjacent to piece of large woody debris, 18m from a wetland
Polley Flats	Hazeltine	PF-2	52.524583	-121.591564	6	0.46	0.7	Adjacent to pieces of large woody debris (dead logs)
Polley Flats	Hazeltine	PF-3	52.524469	-121.585959	6	0.4	0.7	Adjacent to pieces of large woody debris (dead logs).
Upper Hazeltine	Hazeltine	UH-1	52.514201	-121.573200	285	0.5	0.7	Immediately adjacent to woody debris piles
Upper Hazeltine	Hazeltine	UH-2	52.501725	-121.556028	348	0.5	0.7	Adjacent to piece of large woody debris. Pointed in direction of adjacent uphill slope
Upper Hazeltine	Hazeltine	UH-3	52.520407	-121.581862	352	0.5	0.65	Abundant high shrub cover in area
Lower Hazeltine-Cwd	Hazeltine	LHC-1	52.496666	-121.513502	358	0.5	0.7	Adjacent to pieces of large woody debris (dead logs).
Lower Hazeltine-Cwd	Hazeltine	LHC-2	52.496124	-121.510009	13	0.6	0.7	Vegetated slope, uphill of stream (Hazeltine Creek). Scattered woody debris nearby
Lower Hazeltine-Cwd	Hazeltine	LHC-3	52.494121	-121.513416	320	0.59	0.7	Vegetated upland area between Hazeltine and Edney Creeks. Thick shrub cover in surrounding area.
Lower Hazeltine-Quesnel	Hazeltine	LHQ-1	52.496826	-121.503370	356	0.5	0.7	Uphill of wetland on plateau with woody debris, small shrubs and exposed mineral soil and rock material
Lower Hazeltine-Quesnel	Hazeltine	LHQ-2	52.498457	-121.502818	347	0.5	0.75	Upslope from Quesnel Lake and site channel plateau. Vegetated with shrubs and covered in mulch and woody debris
Lower Hazeltine-Quesnel	Hazeltine	LHQ-3	52.497087	-121.500068	322	0.56	0.74	Upland from Edney Creek. Vegetated with grass and shrubs and some woody debris
Lower Hazeltine-Halo	Hazeltine	LHH-1	52.494934	-121.495686	334	0.55	0.7	Placed on old ditch road. Early (immature) forest with sparse understory vegetation and little woody debris
Lower Hazeltine-Halo	Hazeltine	LHH-2	52.495334	-121.493143	347	0.59	0.75	Mature forest with cedar, birch, and spruce. Sparse understory vegetation, some woody debris
Lower Hazeltine-Halo	Hazeltine	LHH-3	52.496527	-121.498187	22	0.62	0.7	Located on an old (grown-in) access road. Forest clearing with some mature shrubs and trees.
Jacobie-Young	Reference.Young	JC-1	52.548635	-121.808822	353	0.7	0.7	Young forest, lodgepole pine plantation. Bait attached opposite side of partially buried log.

Study Area	Area Type	Site ID	Latitude	Longitude	Bearing	Camera Height (m)	Distance to Target (m)	Site Description
Jacobie-Young	Reference.Young	JC-2	52.549244	-121.803572	13	0.4	0.66	Young forest, lodgepole pine plantation. Bait attached at base of stump.
Jacobie-Young	Reference.Young	JC-3	52.550145	-121.799949	292	0.5	0.7	Young forest, lodgepole pine plantation. Bait attached to partially buried log.
Miles-Young	Reference.Young	MA-1	52.535679	-121.804434	333	0.5	0.7	Young forest, lodgepole pine plantation.
Miles-Young	Reference.Young	MA-2	52.53464	-121.800180	36	0.22	0.7	Young forest, lodgepole pine plantation. Bait attached to log on ground.
Miles-Young	Reference.Young	MA-3	52.536951	-121.797527	22	0.35	0.67	Young forest, lodgepole pine plantation. Bait attached to log on ground.
Warren.Young	Reference.Young	WA-1	52.583902	-121.804272	323	0.3	0.5	Young forest, lodgepole pine plantation. Bait placed on top of decaying stump.
Warren.Young	Reference.Young	WA-2	52.585605	-121.803459	47	0.2	0.56	Young forest, lodgepole pine plantation. Lots of exposed sun. Lots of grasses removed.
Warren.Young	Reference.Young	WA-3	52.585238	-121.806510	1	0.3	0.7	Young forest, lodgepole pine plantation. Bait attached to log on ground.
Jacobie.Mature	Reference.Mature	JA-1	52.546064	-121.769913	342	0.4	0.6	Mature Forest upslope and south of Jacobie Creek
Jacobie.Mature	Reference.Mature	JA-2	52.544637	-121.772732	305	0.43	0.6	Mature Forest upslope and south to Jacobie Creek
Jacobie.Mature	Reference.Mature	JA-3	52.545624	-121.775911	336	0.34	0.65	Mature Forest north of Jacobie Creek. Approximately 60m east of wetland.
Miles. Mature	Reference.Mature	MI-1	52.526671	-121.818554	338	0.55	0.6	Mature forest adjacent to Miles Creek. Adjacent to potential game trail.
Miles. Mature	Reference.Mature	MI-2	52.525382	-121.822704	305	0.47	0.7	Mature forest, shaded canopy in trees. Minimal understory vegetation. Evidence of small mammal presence (burrows).
Miles. Mature	Reference.Mature	MI-3	52.528202	-121.823732	19	0.52	0.7	Mature forest, some woody debris on ground, camera between two trees
Morehead. Mature	Reference.Mature	MO-1	52.562533	-121.682029	16	0.4	0.65	Mature forest west of Morehead Creek
Morehead. Mature	Reference.Mature	MO-2	52.562536	-121.677857	294	0.4	0.7	Mature forest west of Morehead Creek. Large woody debris (blowdown) and wet area/ephemeral draw about 5 m from camera site.
Morehead. Mature	Reference.Mature	MO-3	52.564235	-121.675589	331	0.45	0.67	Mature forest northeast of Morehead Creek. Wet habtiat immediately south of camera site. Bait attached to well-decayed log.

Table C4. Deployment histories and sampling effort for small mammal cameras deployed in the Hazeltine Creek corridor and nearby reference areas. 'Check date' refers to date cameras were visited for maintenance during each deployment period. 'End date' refers to the actual deployment end date for each camera. 'End dates' in red font indicate where deployment periods were shortened (or dropped) due to bait being removed or camera being misdirected, removed or damaged by wildlife. 'Retain data' (yes/no) indicates which data were retained for final analyses. "Reason' indicates why data were excluded or deployment end date was modified.

Study Area	Area Type	Site ID	Deployment Period	Deployment ID	Start Date	Check Date	End Date	Days	Retain Data	Photos Processed	Reason

Appendix D
Summary of Wildlife Detections

Table D1. Summary of independent wildlife detections for large mammal cameras deployed in study areas of the Hazeltine Creek corridor in 2022. One camera was deployed in each study area, except Upper Hazeltine (three cameras deployed). Camera site IDs are listed below study area names in brackets

Species	Polley Flats (PF04)	Upper Hazeltine (UH06	UH07	UH15)	Lower Hazeltine-Cwd (LHC02)	Lower Hazeltine - Quesnel Lake (LHQ05-A	LHQ05-B)	Lower Hazeltine-Halo (LHH03)	Total
Beaver	2	---	---	---	---	---	---	---	2
Black Bear	7	---	---	16	3	---	2	5	33
Chipmunk	10	---	---		---	---	---	---	10
Cow	6	32	98	120	---	---	---	---	256
Coyote	13	1	1	10	---	---	17	1	43
Deer, unidentified	---	---	---		---	---	2	---	2
Grizzly Bear	---	---	---	1	---	---	---	---	1
Lynx	12	---	---	1	---	---	---	---	13
Mink	---	---	---		---	---	1		1
Moose	3	9	5	19	6	1	---	6	49
Unidentified Rodent	2	---	---	---	---	---	---	---	2
Mule Deer	3	4	2	10	22	1	28	49	119
Otter	3	---	---	---	---		5	---	8
Red Squirrel	---	---	---	---	---	---	1	---	1
Snowshoe Hare	---	---	---	---	---	---		1	1
Wolf	1	6	---	---	---	---	---	5	12
Total	**62**	**52**	**106**	**177**	**31**	**2**	**56**	**67**	**553**

Table D2. Summary of independent wildlife detections for large mammal cameras deployed in reference areas in 2022. One camera was deployed in each study area (Site ID is shown in brackets). One large camera was deployed per reference area.

	Reference Young			Reference Mature			
Species	Warren Young (LM1)	Miles Young (LM2)	Jacobie Young (LM3)	Jacobie Mature (LM4)	Miles Mature (LM5)	Moorehead Mature (LM6)	Total
Black Bear	2	1	1	---	1	2	7
Cow	---	10	---	---	4	---	14
Coyote	1	7	---	---	---	---	8
Moose	---	---	1	---	4	4	9
Mule Deer	---	2	14	4	2	2	24
Northern Flying Squirrel	---	---	---	1	---	---	1
Red Squirrel	---	---	---	45	---	---	45
Wolf	---	---	---	---	---	1	1
Total	**3**	**23**	**16**	**50**	**11**	**9**	**112**

Table D3. Summary of independent wildlife detections for small mammal cameras deployed in study areas of the Hazeltine Creek corridor in 2022 (summarized by study area). Three cameras were deployed in each study area. See Table D4 for summary of detections at each camera deployment site.

	Species	Polley Flats	Upper Hazeltine	Lower Hazeltine-Cwd	Lower Hazeltine-Halo	Lower Hazeltine-Quesnel	Total

2023 Water Quality Comparison and Water Balance Calibration (WSP)

(Electronic format only)

TECHNICAL MEMORANDUM

DATE March 25, 2024 **Reference No.** CA002057.4505-030-TM-Rev0-31241

TO Mount Polley Mining Corporation

FROM Steve Mitchell, Alison Snow, and Lee Nikl **EMAIL steve.mitchell@wsp.com; alison.snow@wsp.com; lee.nikl@wsp.com**

COMPARISON OF WATER QUALITY MODEL PREDICTIONS AND 2023 MEASURED CONCENTRATIONS – MOUNT POLLEY MINE

1.0 INTRODUCTION

This technical memorandum presents a comparison of water quality data from monitoring programs that were conducted at the Mount Polley Mine (Mine) in 2023 to the water quality model predictions from the Water Management Plan Report (Golder 2020). The Water Management Plan Report was required as part of the *Environmental Management Act* (EMA) Permit 11678 dated April 7, 2017 (the Permit).

The site wide water quality model (SWWQM) was updated as part of the most recent Springer Pit Expansion Length of Mine Water Management Plan (WMP) that was submitted to Mount Polley Mining Corporation (MPMC) in November 2023 (WSP 2023a). However, the 2023 WMP was still in the review process at the time of the submission of this technical memorandum. Therefore, the water quality results from the 2023 WMP were not used as the model predictions that were compared to monitoring data in this technical memorandum. Instead, predicted concentrations from the 2020 WMP were compared to monitoring data (Golder 2020). Future annual comparisons to measured concentrations will use most recent WMP water quality predictions.

The site wide water balance model is updated annually to reflect minor changes to site conditions, as part of the annual water balance calibration exercise (WSP 2024). Because the water balance updates are minor, it is considered appropriate to compare water quality data from monitoring programs in 2023 to the 2020 WMP Report model predictions to validate the model.

Concentrations are measured at several locations throughout the mine site and in the receiving environment by Mount Polley staff according to the Permit (MPMC 2019). The three locations that are relevant to verifying predictions and permit compliance are:

- E1a, the TSF supernatant pond.
- E19, the Perimeter Embankment Till Borrow Pond (PETBP) which is upstream of the WTP.
- HAD-3, the outlet from the WTP (i.e., end-of-pipe).

Concentrations measured at E1a and E19 were compared to water quality model predictions during the operations period. Future annual concentrations measured at HAD-3 were compared to Permit limits.

The purpose of this technical memorandum is to complete a post-audit or validation of the water quality model results from the 2020 WMP Report (Golder 2020), and to evaluate whether the model predictions were:

a) underestimates

b) accurate

c) overestimates (conservative)

In general, a consistent underestimate would indicate a need to re-calibrate the model before further use. Accurate results indicate no need for further model calibration. Overestimates with regards to a given water quality constituent indicate that the model is adequate for risk assessment, but mine water management decisions based on these results should consider the conservative nature of the model. Previous validation of the water quality modelling predictions against the 2022 monitoring data determined that no model re-calibration was required in 2023 (WSP 2023b).

2.0 COMPARISON OF MODELLED AND MEASURED CONCENTRATIONS

Measured concentrations of the eighteen water quality constituents that have characteristic limits in Section 1.2.3 of the Permit are plotted in Figures 1 to 18. Each of these plots shows the following information on a logarithmic scale (base = 10):

- **Box and whisker plots:** the range of measured concentrations in 2023, the median concentration, and the 5th and 95th percentile concentrations.
- **Model predictions:** median and 95th percentile water quality model predictions at E1a and E19 during the operations period (2023 to 2030).
- **Permit limits**: the limits that apply to HAD-3.

The comparisons (Tables 1, 2, and 3) show that measured concentrations are below model predictions and Permit limits, with the exceptions noted below.

- At the TSF supernatant pond (E1a), measured concentrations were below the predicted concentrations for most of the parameters except for total arsenic (median and 95th percentile) and sulphate, nitrite and total phosphorus (95th percentile) (Table 1).
- At the PETBP upstream of the WTP (E19), measured concentrations were below the predicted concentrations for most of the parameters except for sulphate, total iron and total zinc (95th percentile) (Table 2).

For the instances where the measured values were higher than model results (sulphate, nitrite, total phosphorus, total arsenic, total iron and total zinc), the measured values were within about 20% of the model results (except for sulphate, total arsenic and total zinc), which is reasonably accurate for a water quality model post-audit and within the relative percent difference (RPD) that is commonly used for analytical duplicate acceptability. The model is likely predicting future concentrations as well as can be expected, given the inherent uncertainty involved in measuring water concentrations and predicting future water management conditions. Further calibration is therefore not warranted at this time.

The 95th percentile of sulphate in monitoring data at E1a from 2023 was more than 20% greater than the maximum predicted concentration during operations in the TSF due to higher measured concentrations from October to November 2023 (Table 1). The median of sulphate concentrations in monitoring data at E1a was lower than the maximum of predicted concentrations. Measured sulphate concentrations were also below effluent limits at HAD-3 (Table 3). Therefore, recalibration of the model is not warranted at this time.

The 95th percentile of total arsenic in monitoring data at E1a from 2023 was more than 20% greater than the maximum predicted concentration during operations due to higher measured concentrations from October to November 2023 (Table 1). The median of total arsenic concentrations in monitoring data at E1a was within 20% of the maximum of the median predicted concentrations. Measured total arsenic concentrations were also below effluent limits at HAD-3 (Table 3). Therefore, recalibration of the model is not warranted at this time.

The 95th percentile of total zinc in monitoring data at E19 from 2023 was more than 20% greater than the maximum predicted concentration during operations in the PETBP (Table 2). The higher 95th percentile of measured total zinc concentrations was due to a single sample taken on June 13 with an elevated total zinc concentration of 0.033 mg/L. All other measured total zinc concentrations in 2023 were less than 0.022 mg/L. The median of total zinc concentrations in monitoring data at E19 was within 20% of the maximum of the median predicted concentrations. Measured total zinc concentrations were also below effluent limits at HAD-3 (Table 3). Therefore, recalibration of the model is not warranted at this time.

Table 1: Predicted and Measured Concentrations in the Tailings Storage Facility Supernatant Pond

Parameter	Units	Operations		E1a	
		Maximum of Median Predicted Concentrations	Maximum of 95th Percentile Predicted Concentrations	Median	95th Percentile

2023 SITE WIDE WATER BALANCE MODEL UPDATE AND CALIBRATION – MOUNT POLLEY MINE

1.0 INTRODUCTION

Mount Polley Mining Corporation (MPMC) retained WSP Canada Inc. (WSP) to provide water balance modelling services to update and calibrate the Site Wide Water Balance Model (SWWBM) in support of MPMC's 2023 Annual Report. This exercise is a requirement of Section 4.2.1 (f) of MPMC's Discharge Permit 11678, issued under the *Environmental Management Act* and most recently amended through a Consent Order on December 31, 2020 (BC ENV 2020).

The SWWBM was developed using GoldSim™, a highly graphical software package for carrying out dynamic, probabilistic simulations to support decision-making (GoldSim 2018). GoldSim™ is frequently used to evaluate water management alternatives, perform sensitivity analyses, and conduct mass balance simulations.

The SWWBM was developed as part of the Mount Polley Mine Resumed Operations and Closure Water Management Plan Permit Amendment Application and Technical Assessment Report (Golder 2016a) to model water management across the site (e.g., runoff, water transfers, and storage). The details of the SWWBM were first presented in the Mount Polley Mine Water Balance report (Golder 2016b).

On May 26, 2019, Mount Polley Mine (the Mine) entered a care and maintenance phase. On June 1, 2022, the Mine resumed operations under the current EMA Permit 11678. Mining and tailings deposition occurred throughout 2023.

WSP updated the SWWBM in March 2023 to calibrate water volumes, water levels and discharges in the Tailings Storage Facility (TSF) for the period from January 1, 2022 to December 31, 2022 (WSP 2023a). An updated Water Balance Report was presented in 2023 (WSP 2023b) as part of the Water Management Plan for the Springer Expansion Life-of-Mine update (WSP 2023c).

This technical memorandum describes updates to the SWWBM to reflect site conditions in 2023, and calibration to measured water levels in the TSF for the period from January 1, 2023 to December 31, 2023. A summary of the model updates, the assumptions made in the calibration process, a discussion of the calibration results, and the end-of-year water balance for the Mine, is included in this document.

2.0 MODEL UPDATE

2.1 Data Received

MPMC provided WSP with measured data from site (MPMC 2024a). The following data were received from MPMC (2024a):

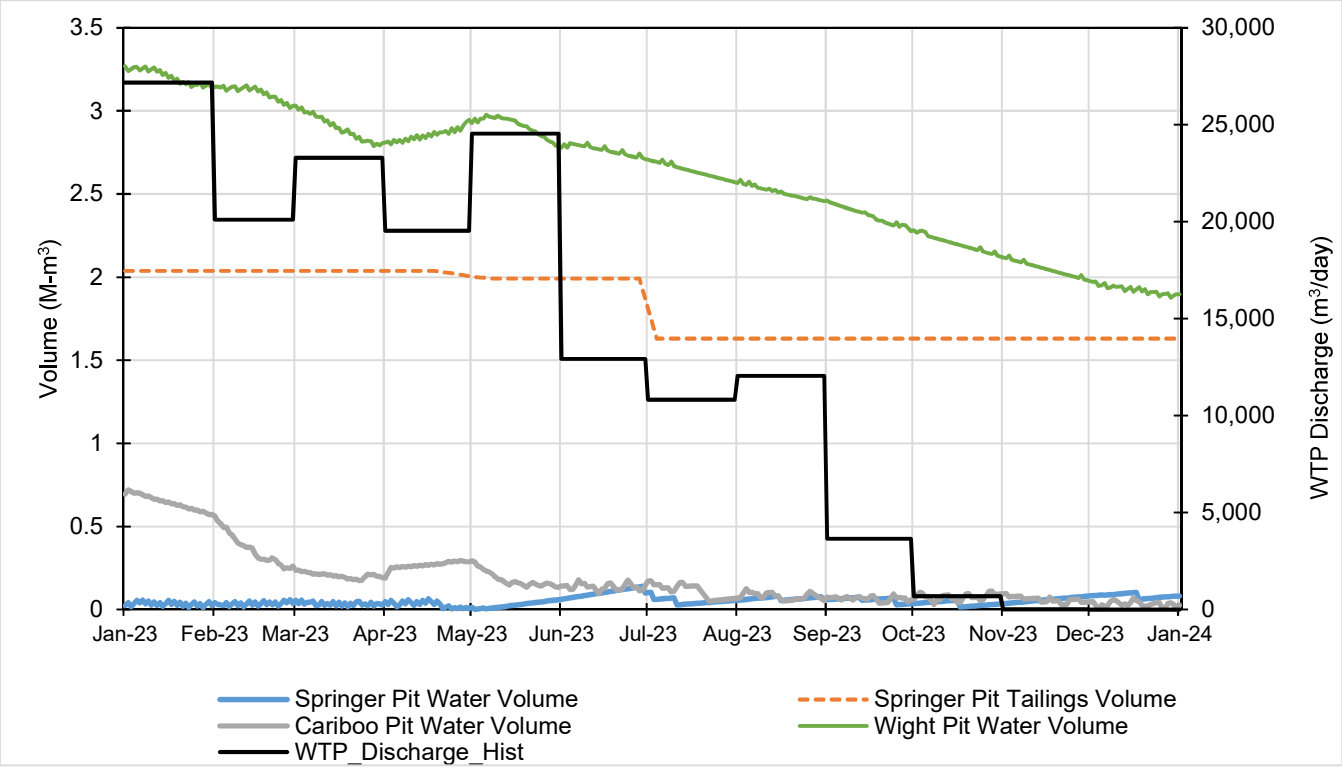
- "Snow Pack 2023.xlsx" Periodic snowpack measurements (snow water equivalent [SWE] in cm).
- "TSF Water Balance Jan 24, 2023 v3.xlsx" Periodic Springer Pit, Cariboo Pit and Wight Pit water level measurements in 2023 (m, mine grid).
- "2023 all weather station data.xlsx" Q1 to Q4 2023 climate data from site – including rainfall (mm), daily temperature (ºC) and evaporation (mm).
- "HMI WTP 2023 Total.xlsx" Monthly discharge of treated water (m^3) through the water treatment plant (WTP).
- "Weekly TSF Reports.pdf" TSF reclaim pond water level measurements (m, tailings grid) and Springer Pit remaining tailings (M-m^3) throughout 2023
- "2023 DSI Report Data Request.msg" Tailings deposited in the TSF throughout 2023 (tonnes).

2.2 Summary of Model Updates

Through discussions with MPMC, the SWWBM was updated to reflect site water management operations for the period of January 1, 2023 to December 31, 2023. The model updates were as follows:

- Tailings discharge from the ore processing plant to the TSF throughout 2023.
- Discharge to the environment through the WTP was updated. The volume of WTP discharge saw a significant decline beginning in September 2023. This decrease occurred because the WTP has been offline since September 13, 2023, as water has been redirected from Wight Pit to TSF (MPMC 2024a). Monthly discharge volumes through the WTP are shown on Figure 1.
- Water from Wight Pit was transferred to the WTP via Long Ditch for treatment and discharge in 2023. A time series plot of the modelled total water volume in Wight Pit is shown in Figure 1.
- Water from Springer Pit was transferred to the WTP via West Ditch for treatment and discharge throughout 2023. A time series plot of the modeled total water volume in Springer Pit is shown in Figure 1.
- Water from Cariboo Pit was transferred to the WTP via West Ditch for treatment and discharge throughout 2023. A time series plot of the modeled total water volume in Cariboo Pit is shown in Figure 1.

Additional details related to use of available surveys are provided in the following section.



Note: The primary y-axis unit (M-m3) denotes millions of cubic meters.

Stored water volume = surface water volume + voids water volume

Figure 1: Springer, Cariboo, Wight Pits Volumes and WTP Discharge Flow Rate

2.3 Site Surveys

2.3.1 TSF

Topographic surveys of the TSF were conducted by MPMC on October 30, 2023. A bathymetric survey within the TSF was conducted on August 25, 2023. The storage-elevation curve was developed using the combined bathymetry and topography, and it is used in the SWWBM to infer the TSF free water volume from measured water level data, recognizing that the surfaces described are a triangulation of a bathymetry survey (tailings surface under water) and a topographic survey (tailings surface above water). The triangulation of survey points near the transition between water and land, as well as the use of different dates for the Topographic and Bathymetric Surveys, introduce uncertainty into the resulting storage-elevation curves. However, the accuracy is considered acceptable for the required resolution of the model results.

Storage-elevation curves for the TSF up to a dam crest elevation of 974 m developed from the August 25, 2023 TSF survey were used in support of the free water volumes projection affected by tailings deposition after the survey date of October 30, 2023. Storage-elevation curves were used to model the facilities with linear interpolation throughout 2023.

2.3.2 Springer-Cariboo

A bathymetric and topographic survey of Springer-Cariboo Pit was conducted by MPMC on January 25, 2024, indicating that the Springer and Cariboo pits were divided up to the saddle level (approximate elevation of 964 m), and then combined from that level upward. Based on the recorded pit elevation data from MPMC (MPMC 2024a) and the fact that the Springer Pit was completely dewatered as of April 18, 2023 (MPMC 2024b), the Springer Pit and Cariboo Pit should be considered as separate reservoirs for modeling purposes in 2023. Storage-elevation curves for Springer Pit and Cariboo Pit were generated individually to infer the free water volumes within the pits from measured water level data in the SWWBM.

Springer Pit storage-elevation curves based on the bathymetric and topographic survey on November 7, 2019 were utilized in the model until April 18, 2023. These were then projected to the Springer Pit storage-elevation curve based on the January 25, 2024 survey. Projected storage-elevation curves were used to model the facilities with linear interpolation. Tailings were excavated during the calibration period, it is assumed that the excavation is reflected in the survey data. Figure 1 shows a time series plot of Springer Pit tailings volume.

Cariboo Pit storage-elevation curves (dated January 30, 2023, refer to MPMC 2023) were utilized until the end of 2022. These were then projected to the Cariboo Pit storage-elevation curve based on the January 25, 2024 survey. Projected storage-elevation curves were used to model the facilities with a daily linear interpolation between dates, throughout 2023.

2.3.3 Wight Pit

Wight Pit storage-elevation curves (dated March 1, 2022; MPMC 2022) were provided by MPMC. The curves include underground workings and pore space assumptions. Measured water level data from MPMC were used to infer the water volumes in the pit based on the storage-elevation curves provided.

3.0 MODEL CALIBRATION

3.1 Overview

The SWWBM was calibrated by adjusting outflows of the reservoirs and comparing modelled water levels to measured water levels recorded at the TSF. The TSF temporarily retains high runoff inflows experienced during freshet and storm events. The resulting modelled water levels in the TSF are the balance of site-wide inflows and outflows, including pumping to and from the pits and the booster station, which are temporary storage locations for surplus water on site.

An input climate dataset was generated (Section 3.2) and seasonal runoff coefficients were used during freshet (Section 3.3) to better represent measured site runoff conditions (i.e., reduction in measured snowpack depth) in 2023 and to facilitate the calibration.

3.2 Climate Data

A climate dataset at the Mine for 2023 was generated and used to represent site climatic conditions for the calibration.

The dataset consisted of the following:

- January through December rainfall data from MPMC.

- Freshet (March through April) snowmelt as determined from decreases in snowpack SWE depth recorded at the Mine.

3.3 Runoff Coefficients

Runoff coefficients in the SWWMB are adjustable loss parameters that translate measured climate trends and ground conditions into estimates of modelled runoff. Model performance from historical climate data for the year 2023 supported the delineation of runoff coefficients into two distinct seasonal climate periods:

- Freshet (March to June; inclusive) – Highest runoff coefficients to represent expected higher soil moisture content, and therefore greater runoff.
- General (January to February; inclusive and July to December; inclusive) – Mid range coefficients to represent soil moisture contents for intermittent runoff events. A 30% increase to the general coefficients is applied to the subsequent month if the previous month had a cumulative rainfall plus snowmelt depth greater than 50 mm.

The seasonal runoff coefficients defined for the catchment types remained unchanged from those used in the 2022 SWWBM calibration and are listed in Table 1.

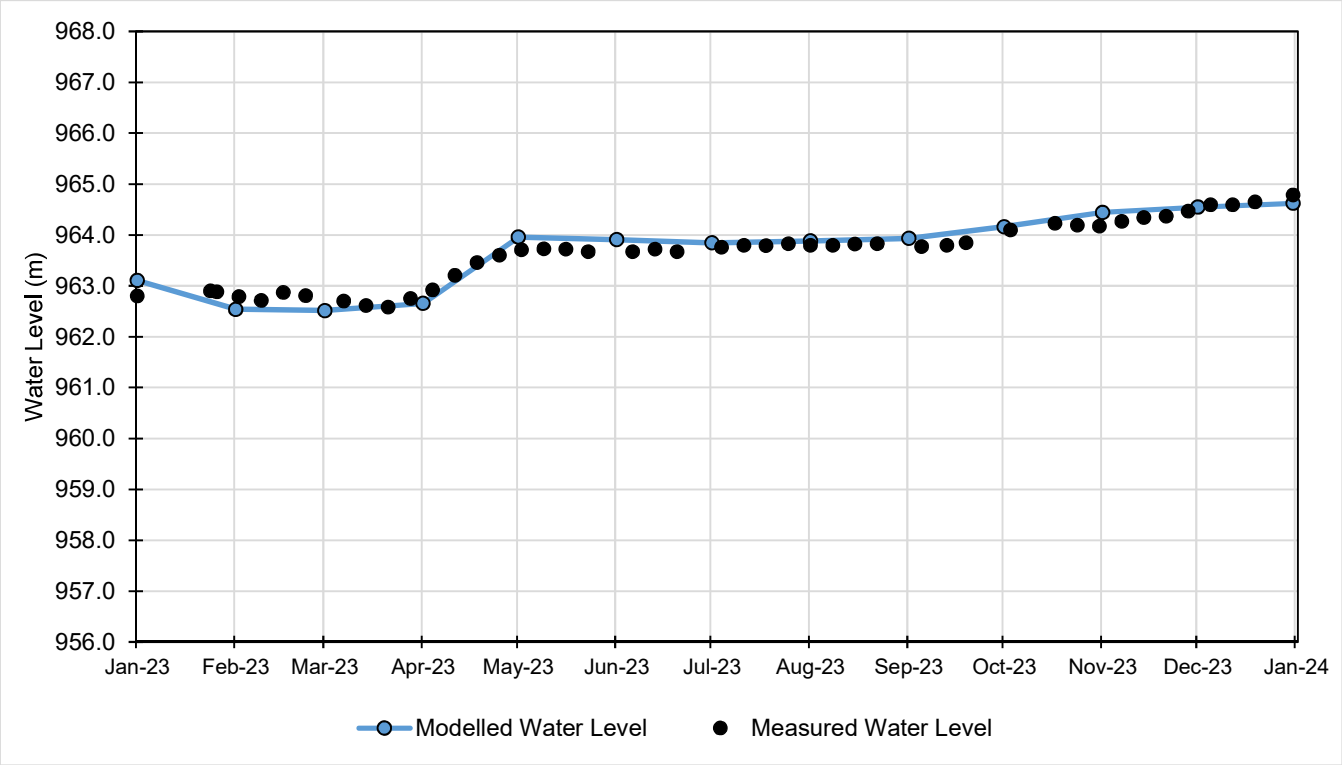
Table 1: Seasonal Runoff Coefficients

Catchment Type	General	Freshet
Exposed tailings	0.6	0.9
Disturbed areas	0.3	0.9
Rock disposal site areas	0.1	0.6
Open pits	0.75	0.9
Undisturbed catchments	0.4	0.42
Haul roads and access roads	0.15	0.9
Mill site area	0.1	0.1

Source: Golder 2020

4.0 CALIBRATION RESULTS

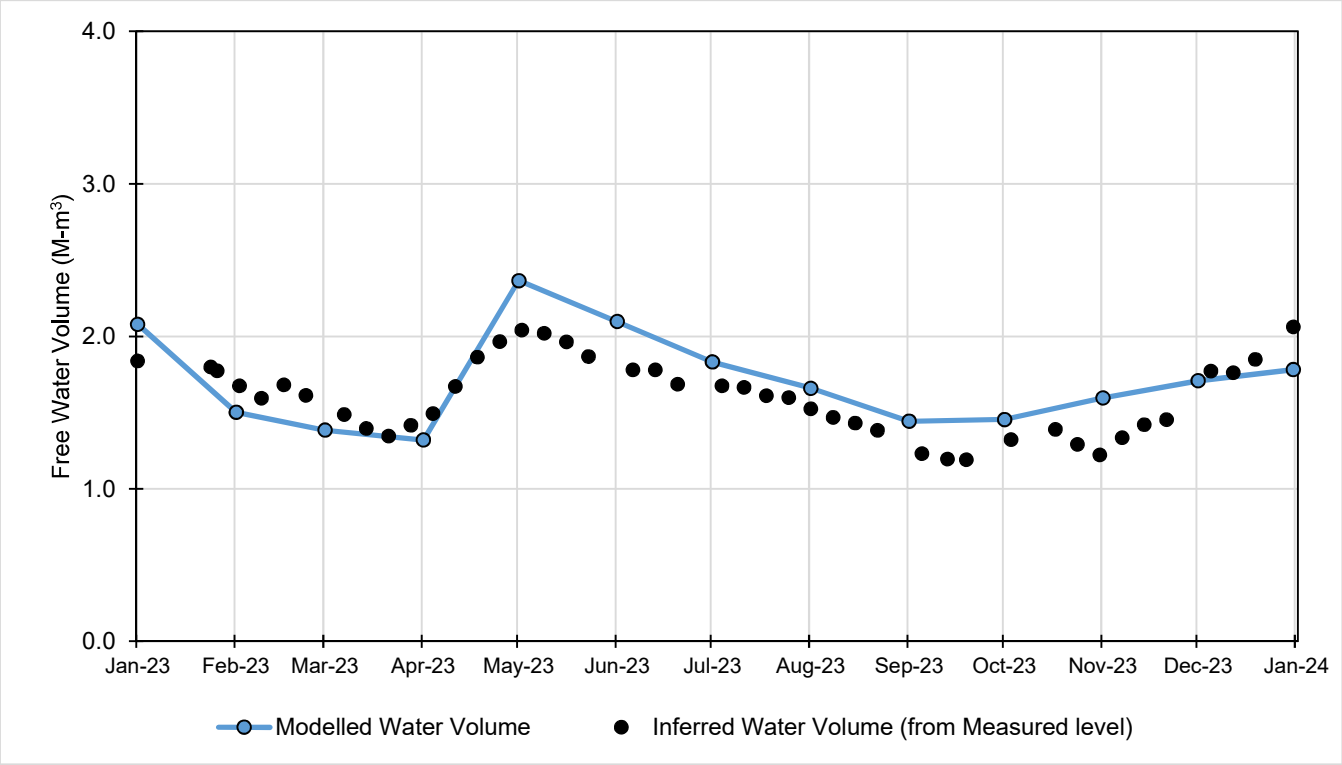
Figure 2 shows the modelled and measured water levels within the TSF for the 2023 calibration period. The modeled water levels were estimated from the modeled volume estimated using the storage-elevation storage curves. The average difference between modelled and measured water levels is approximately 0.14 m, which is considered acceptable for the purposes of the calibration exercise.



Note: Last measured water level occurred on 31 December 2023.

Figure 2: Water Levels in the TSF

Figure 3 shows the modelled free water volume in the TSF along with the inferred free water volume from measured water levels. The measured water levels were converted to an inferred water volume using the storage-elevation curves described in Section 2.3.



Note: Last measured water level occurred on December 31, 2023. The y-axis unit (M-m^3) denotes million cubic meters.

Figure 3: Free Water Volume in the TSF

Figure 2 and Figure 3 indicate that the model is reasonably calibrated and there is general alignment between measured free water levels and the inferred free water volume in the TSF. Differences between modelled and measured values may have several explanations:

- Variability in runoff coefficient throughout the year.
- Uncertainties in the climate data (e.g., snowpack surveys can miss intermittent snowmelt if conducted infrequently and the use of composite datasets may over or under-estimate actual conditions).
- Uncertainties in the TSF bathymetric survey (e.g., the transition between exposed tailings surface [i.e., beach] and free water can be complex).
- Uncertainties associated with the tie-in of the October 30, 2023 TSF storage curve with those utilized in the 2022 calibration, specifically referring to the projected storage curves from the 2020 TSF survey to the 987 m dam crest elevation.
- Uncertainties related to the projection of the Cariboo Pit storage curve from 2022 Calibration to the January 25, 2024 survey could lead to a situation where less storage capacity is modeled for the Cariboo Pit. Consequently, the volumes for the TSF and other pits may over estimated.
- Potential inaccuracies in water level measurements.

- Potential inaccuracies and/or missing WTP discharge data. The TSF weekly report noted that WTP ceased operations after September 13, 2023. However, there were still low volumes of WTP discharge recorded in October and November 2023. Additionally, the WTP discharge data are available for only 6 days in December 2023 (MPMC 2024a).
- Potential differences between modeled water transfer rates and actual transfers on site.
- There were minor discrepancies in the tailings deposition data between TSF Water Balance Spreadsheet and 2023 DSI Report data request (MPMC 2024a). WSP proceeded with tailings production umbers from the 2023 DSI Report data request to ensure consistency with the data used in the DSI.

The modelled results for the 2023 SWWBM calibration provide a reasonable approximation of site conditions and are considered suitable for water management planning.

5.0 END-OF-YEAR WATER BALANCE

Table 1 presents End of Year (EoY) modelled site water balance from 2017 through 2023. The modelled balance is the net storage of free water volume (total water) on site and net annual inflow. Storage locations include the TSF, pits, sumps, and ponds.

Table 2: EoY Modelled Site Water Balance Volume

Date	Total Water on Site[(a)(b)] (M-m^3)	Annual Water Net Inflow[(c)] (M-m^3)
December 31, 2017	6.0	4.6
December 31, 2018	3.9	5.3
December 31, 2019	3.8	6.4
December 31, 2020	8.2	9.5
December 31, 2021	7.5	6.1
December 31, 2022	6.0	6.4
December 31 ,2023	4.0	5.6

(a) End of year sum of water in TSF, pits, sumps, and ponds.
(b) Includes Wight Pit stored water volume.
(c) Net Inflows = Direct Precipitation + Runoff + Baseflows + Groundwater Inflow - Evaporation - Groundwater Outflow (for calendar year).

6.0 RECOMMENDATIONS

Based on the results of the 2023 SWWBM calibration, the following recommendations are provided to enable more robust water balance modelling:

- Increase the frequency of periodic snowpack measurements in the spring and fall seasons to generate more representative snowmelt data (e.g., in case mid-season snowmelt occurs outside of the freshet period).
- Record both snowfall and rainfall data measurements in the winter to produce more representative climate data (only rainfall and snowpack is recorded currently).

- Conduct both topographic and bathymetric surveys in spring and fall annually to achieve a more precise TSF storage curve progression.
- Review and validate available flow data on site to supplement the calibration of the SWWBM.
- Refine the runoff coefficients as part of future model updates.
- Refine the catchment areas to confirm various land types annually, thereby enhancing the precision of runoff estimations in the model through future updates.

7.0 CLOSURE

This technical memorandum summarizes the SWWBM calibration and end-of-year water balance for the model run period January 1, 2023 to December 31, 2023 (inclusive). The reader is referred to the Study Limitations section, which follows the text and forms an integral part of this memorandum.

We trust that this technical memorandum satisfies your current requirements. Please contact the undersigned should you have any questions.

PRELIMINARY FIELD RECONNAISSANCE OF THE SPRINGER PIT EXPANSION AND TAILINGS STORAGE FACILITY FOUNDATION AREA

1.0 INTRODUCTION

At the request of the Mount Polley Mining Corporation (Mount Polley), WSP Canada Inc. (WSP) conducted a preliminary field reconnaissance (PFR) of the Springer Pit Expansion and Tailings Storage Facility (TSF) Foundation Preparation area within the Mount Polley mine site, near Likely, BC (the Project area).

The Springer Pit Expansion consists of the proposed extension to the existing Springer Pit itself, north and northwest of the existing pit, a Potentially Acid Generating rock (PAG) Stockpile to the northwest of the pit, and a Rock Disposal area (with associated haul road) in the south portion of the expansion area. The TSF Foundation Preparation area involves the raising of interim buttress' along the northeast and southeast sides of the tailings pond. The PFR was undertaken to refine our understanding of archaeological potential within the overall Project area, focussing on the specific areas to be developed for both the Springer Pit Expansion and TSF Foundation Preparation area, and to inform future archaeological work.

The PFR was conducted on October 5 and 6, 2023 by Chris Dodd (WSP), Glen Dixon (Xatśūll First Nation), and Demetrius George (Williams Lake First Nation), during which portions of the Project area were subject to pedestrian survey and ground surface inspection. One area of high archaeological potential (AOP) was recorded during the PFR along Bootjack Creek in the Rock Disposal area. Additional archaeological survey along Bootjack Creek and south from Bootjack Creek is also required to determine if further AOPs are present (see Section 4.0). Areas subject to PFR were prioritized based on those portions of the Project area that were to be developed soonest, including the location immediately north of the existing Springer Pit as well as the TSF Foundation Preparation area.

2.0 BACKGROUND

2.1 Previously Registered Archaeological Sites

There are no registered archaeological sites within the Project area, however three are located within 5 km, including: FdRj-4, an isolated stone artifact identified on the north bank of Bootjack Creek, approximately 450 m east and downstream from Bootjack Lake and 540 m southwest of the Springer Pit Expansion area; FdRj-5, a subsurface stone artifact scatter on the north bank of Bootjack Creek approximately 50 m east and downstream from Bootjack Lake and 620 m southwest of the Springer Pit Expansion area; and archaeological site FdRk-2, a buried stone artifact scatter on a terrace overlooking a small pond, approximately 3.3 km northwest of the Springer Pit Expansion area.

2.2 Previous Archaeological Assessments

Five archaeological assessments have previously been conducted at the Mount Polley mine site, three of which directly overlap or bound the Springer Pit Expansion area, as described below.

Points West Heritage Consulting first conducted a heritage resource overview assessment (HROA) in 1989 at the mine site (Points West 1989). The HROA focused on the proposed impacts at the time, which partially overlap the Project area. PFR was conducted during the HROA but was limited to the east and south edges of Bootjack Lake, as well as the access road connecting the mine to Likely Road. The majority of the 1989 study area was classified as having low archaeological potential, with some areas classified as having low-moderate archaeological potential (along the access road but outside the Project area) and one area classified as having moderate archaeological potential at the south end of Bootjack Lake (also outside the Project area).

I.R. Wilson Consultants Ltd. (I.R. Wilson) conducted an AIA in 1996 for a proposed pump station and water pipeline (I.R. Wilson 1996). The pump station is located on the west shore of Polley Lake and the water pipeline extends southwest from the lake, then south along the east edge of the Springer Pit Expansion area until intersecting with the TSF Foundation Preparation area. Subsurface testing was undertaken at the substation location, however no archaeological materials were identified. The water pipeline crossing at Bootjack Creek was described as another area that may have archaeological potential. However, upon inspection the site was found to be hummocky and ultimately not requiring further archaeological assessment. No archaeological sites were identified along the water pipeline route.

I.R. Wilson conducted a PFR in 2004 for newly proposed developments at the mine site, including what is described as the northeast zone, an access road leading south from this area, and a proposed dump location at the south end (I.R. Wilson 2004). These areas are located along the west side of Polley Lake along its northern half, with the proposed dump area entering the Springer Creek Expansion area. No areas of archaeological potential or archaeological sites were identified during the PFR.

3.0 PRELIMINARY FIELD RECONNAISSANCE METHODS

PFR was conducted using both pedestrian and vehicular survey and focussed both on landforms that typically correlate with archaeological site locations and those areas deemed to be least disturbed. Pedestrian survey was conducted at intervals of 5 m to 50 m, searching for surface expressions of archaeological sites (e.g., artifacts and features), culturally modified trees (CMTs) and landforms with potential for the presence of buried archaeological materials (i.e., AOPs). Survey coverage was recorded using a recreational grade GPS with accuracy of ±4 m. Features such as terrain, forest cover, hydrology, and previous disturbance were documented and photographed.

4.0 RESULTS

4.1 Springer Pit Expansion Area

The northwest portion of the Project area, where the PAG stockpile is proposed, is characterized by an existing rock disposal area with moderate to steeply sloping terrain leading northwest and west down from the base of the existing stockpile. A large, levelled landing has been built into this slope at the extreme northwest corner (Attachment 1: Photo 1). Within the Springer Pit expansion area, terrain is undulating and rocky with a rocky hill and ridge that extends south between the proposed PAG stockpile and existing Springer Pit (Attachment 1: Photo 2). This undulating rocky terrain has very limited soil development and has been subject to previous disturbance, either from mining exploration activities or previous logging. As a result, all treed areas are second growth and largely comprised of spruce and subalpine fir. These areas are all considered to have low archaeological potential given the sloping and rocky terrain and no immediately available water sources.

The southern rock disposal area extends south from an existing rock disposal area through moderately sloping terrain with a south aspect leading towards Bootjack Creek, with the eastern edge within gently to moderately sloping terrain leading towards Polley Lake. This area north of Bootjack Creek has been heavily disturbed from past mining activities and is considered to have low archaeological potential given the sloping terrain.

The Bootjack Creek ravine leads east through the southern portion of the proposed rock disposal area with gently sloping to level terrain located between the ravine and the existing tailings pond to the south (Attachment 1: Photo 3). A secondary, shallower drainage channel was observed in this area south of Bootjack Creek. The majority of this portion of the rock disposal area has also been previously logged and largely consists of second growth spruce, subalpine fir, trembling aspen, alder, and cottonwood with the areas immediately adjacent to the ravine having some larger old-growth tree pockets present, including western redcedar. One area of high archaeological potential (AOP), consisting of a 20 × 8 m level bench, was observed along the north edge of the Bootjack Creek ravine (Attachment 1: Photo 4); additional AOPs may be present along the edge of the ravine. The area south of Bootjack Creek may is also considered to have archaeological potential given the presence of a secondary drainage. Both areas require additional archaeological survey to confirm if additional AOPs, surface expressions of archaeological sites, or CMTs are present.

4.2 TSF Foundation Preparation Area

The proposed interim raised buttress' along the northeast and southeast edges of the existing tailings storage facility were subject to PFR. The entirety of these areas are heavily disturbed. The southeast buttress' are located between the existing TSF foundation and Gavin Lake Road in undifferentiated terrain with large artificial berms throughout (Attachment 1: Photo 5). The northeast buttress' are located adjacent the existing TSF foundation within undifferentiated and low-lying poorly drained terrain, in the south, and artificially built-up areas to the north (Attachment 1: Photo 6). No evidence of previously existing landforms that may have once contained archaeological potential were observed and the entire area is considered to have low archaeological potential given the generally undifferentiated or low-lying terrain and extent and degree of previous disturbance.

5.0 RECOMMENDATIONS

Further archaeological assessment is recommended along and south of the Bootjack Creek ravine within the southern rock disposal location in the Springer Pit Expansion area. This additional assessment should consist of a systematic survey of this area and be conducted under a *Heritage Conservation Act* Section 12.2 Inspection Permit which will allow for subsurface testing of any identified AOPs and recording of any archaeological sites that might be identified. No further archaeological assessment is recommended for the remainder of the proposed southern rock disposal area, the PAG stockpile, or the Springer Pit expansion itself.

No further archaeological assessment is recommended within the TSF Foundation Preparation area.

6.0 CLOSURE

We trust this technical memorandum provides you with the information you require at this time. Should you have any questions regarding the contents of this document, or require any further information, please do not hesitate to contact the undersigned.

Executive Summary

Mount Polley Mining Corporation (MPMC) retained SRK Consulting (Canada) Inc. (SRK) to prepare a report summarizing and describing the metal leaching and acid rock drainage (ML/ARD) monitoring activities carried out during 2022. These activities are required as part of MPMC's Mines Act Permit M-200 (EMLI 2020), which requires the implementation of the ML/ARD Procedure Manual (most recent version: MPMC 2022b) and Water Management Plan (Golder 2021).

This document was prepared by SRK as a stand-alone report to be appended to MPMC's Annual Reclamation Report (ARR). It was prepared using information and data obtained by MPMC and includes interpretation of data collected in 2023.

SRK concluded the program is delivering data that are informing current and future waste rock and tailings management. In 2023, MPMC fulfilled all monitoring commitments as established by the Permit, the ML/ARD Procedure Manual, and the Water Management Plan except the following:

- No samples of co-disposed tailings collected in 2023 were sent to external laboratories for further analyses in 2023. Samples from May, July and August were sent in early 2024. The target frequency was once per month.

Conclusions of the waste rock monitoring program are:

- Approximately one quarter of production pit blast hole samples collected in 2023 from the Springer Pit were classified as PAG (26%). This is consistent with past results showing Springer Pit rock as dominantly NAG with some PAG components.
- In 2023, one placed waste rock sample in the SERDS was classified as PAG after placement. It is likely that this is a reflection of small-scale variation in the material. No further action was taken by MPMC after PAG identification. In the SERDS, excess NP is available for neutralization from surrounding NAG material with greater NP/AP values. As a result, SRK concludes the risk of ARD developing from this material is low.
- Trace element concentrations show that waste rock from 2023 was within historical ranges and averages are similar or lower. More variability as shown by the spread of quartiles is apparent for selenium content.

The tailings monitoring program indicated:

- Monthly tailings composite results from 2023 showed the weighted annual average NP/AP was 9.9 and are consistent with past results, showing tailings are generally NAG.
- Monthly tailings composite trace element concentrations show that tailings from 2023 are within historical ranges and averages are similar or lower except for average molybdenum and selenium content, which were above historical averages but within the historical ranges.
- Tailings co-disposed with waste rock in the SERDS in 2023 were dominantly NAG, with one sample classified as PAG. In the SERDS, excess NP is available for neutralization from surrounding NAG material with greater NP/AP values. As a result, SRK concludes the risk of ARD developing for the co-disposed tailings is low.

The Water Treatment Plant (WTP) waste monitoring program indicated:

- All WTP waste sediment samples collected in 2023 were classified as NAG except for the February sample which could not be classified because there was no TIC result.
- All WTP waste sediment samples collected in 2023 contained high aluminum content, which is a result of the addition of aluminum polychloride coagulant added as a reagent in the WTP. Selenium content is also slightly elevated compared to Mount Polley waste rock and tailings (for comparison, maximum concentration measured between 1998 to 2023 in waste rock is 9.5 mg/kg and in tailings is 8.9 mg/kg).
- Shake flask extraction results in 2023 showed that major cations were dominated by calcium and major anions were dominated by sulphate. Trace element concentrations were highest for aluminum, copper, manganese, molybdenum, and selenium, and other trace elements had concentrations that were low or below the detection limit.

The results of the seepage and contact water monitoring show the following:

- Seepage from the waste rock dumps shows the influence of waste rock leaching and indicates sulphide oxidation is occurring. Chemistry remains circumneutral to slightly alkaline at all sites, indicating pH buffering by calcium and magnesium-bearing carbonate minerals is ongoing. These pH conditions limit the mobility of most trace elements except oxyanions such as selenium.
- Seepage has been mostly stable for key parameters (pH, sulphate, copper, and selenium) over the monitoring period except for the localized influence of sulphuric acid waters likely originating from oxidation of the elemental sulphur pile. The acidity has been neutralized by reaction with carbonate and silicate minerals in the waste rock. Still, it resulted in depressed pH and the occasional breakthrough of acidic waters to waste rock seeps at the toe of the NEZ Dump. The removal of the elemental sulphur pile in 2018 seems to have arrested the downward trend in pH and upward trend in copper. Diversion and management of water from NEZ Seep1 and NEZ Seep 2 has been effective at improving water chemistry downstream.
- Stable or decreasing trends in nitrate, ammonia, and nitrite concentrations are consistent with continued flushing of explosives residuals from the pit walls and waste rock seepage during mining activities in 2023.
- Seepage from the tailings embankment indicates concentrations for parameters of interest were similar from 2022 to 2023, with some exceptions including increasing sulphate and molybdenum. These increases may be the result of flushing of oxidation products as the water level rises.
- No results from the non-contact water ditches were available in 2023 because conditions were dry during attempted sampling events.

1 Introduction

Mount Polley Mining Corporation (MPMC) retained SRK Consulting (Canada) Inc. (SRK) to prepare a report summarizing and describing the metal leaching and acid rock drainage (ML/ARD) monitoring activities carried out during 2023. These activities are required as part of MPMC's Mines Act Permit M-200 (EMLI 2023), which requires the implementation of the ML/ARD Procedure Manual (most recent approved version: MPMC 2022) and Water Management Plan (Golder 2021).

This document was prepared by SRK as a stand-alone report to be appended to MPMC's Annual Reclamation Report (ARR). It was prepared using information and data obtained by MPMC and is the deliverable for Task 110 of SRK Project CAPR003074.

2 Background

2.1 Site Overview and History

Mount Polley Mining Corporation (MPMC), a wholly owned subsidiary of Imperial Metals Corporation, has been operating the Mount Polley Mine (MPM), located approximately 56 km northeast of Williams Lake and approximately 15 km southwest of the community of Likely in British Columbia, Canada, since 1996. MPMC recovers copper and gold from porphyry-style mineralization by open pit and underground mining. The plant is capable of processing 22,000 t/d of ore using standard mineral flotation technology.

Figure 1 shows the mine site layout. Full scale mining began in the Cariboo Pit by mining high oxide and high gold parts of the ore body then transitioning to the Bell Pit in 1999. Mining was suspended in 2001 due to unfavorable market conditions. The mine re-opened in 2005 after a three-and-a-half-year care-and-maintenance period. The following zones have been mined since 2005:

- Completed mining and backfilling of the Bell Pit.
- Completed mining and backfilling of the small Southeast Zone and Pond Zone Pits.
- Completed mining and flooding of the Wight Pit (Northeast Zone).
- Completed mining of the Boundary Pit.
- Completed permitted mining and flooding of Northeast Zone underground (access from the Wight Pit).

In August 2014, mining was suspended due to the breach of the tailings dam. Mining restarted in 2015 with tailings being deposited in the Springer Pit. In 2016, tailings were deposited in the Tailings Storage Facility (TSF) following reconstruction of the dam.

In May 2019, mining was again suspended due to unfavourable market conditions, but mining operations restarted in November 2021 and milling operations resumed in June 2022. Active mining is currently focussed on the Cariboo and Springer Pits (which will merge to a single pit).

Upon completion of mining, the Springer-Cariboo Pit will be backfilled by rock from the Temporary Northwest (NW) PAG Stockpile and allowed to flood. The Tailings Storage Facility (TSF) will be decommissioned with a minimal water cover.

Between August 2015 and June 2016, tailings were deposited into the Springer Pit after the TSF breach. One third of these tailings were removed in 2018 and 2019 by dredging and placed in the TSF. The remaining 3.5 Mt of tailings will be co-disposed with waste rock in the SERDS. SERDS co-disposal operations began in May 2023 and will continue in 2024.

Figure 1: Mount Polley Mine Site Layout

2.2 Geological Setting

The Mount Polley deposit is classified as an alkalic porphyry copper gold deposit (BC MINFILE No. 093A 008). With the exception of the distinctive small Pond Zone, it has been mined from several mineralized zones which have the following common features:

- The host rock for porphyry mineralization is the Mount Polley Intrusive Complex (MPIC) which intruded into Nicola Group Volcanics (Figure 2). The intrusion is primarily monzonite to monzo-diorite in composition. Smaller phases vary in composition from diorite to syenite.
- Mineralization is associated with magmatic-hydrothermal breccias. Alteration and mineralization occurs in the matrix of the breccias, and in veins and swarms distributed around the breccias. BX1 is the main host for the bulk of the mineralization at MPM which is mined in the Cariboo and Springer Pits (Figure 2). BX1 is characterized by alteration which resulted in the strongest destruction of both primary and breccia textures. Breccia bodies BX2 host satellite mineralization in the Southeast Zone, Wight Pit, and Boundary Zone. BX2 is less intensively altered and original textures are more apparent. BX3 is unmineralized and has not been mined.
- Alteration at MPM is classified as potassic (sodic and calcic) with salmon-pink potassium feldspar as the main alteration mineral. Biotite is less common. Sodic alteration is defined by albite and calcic alteration (actinolite, diopside, epidote, clinozoisite, and sporadic andraditic garnet). Calcite is pervasive. Alteration is zoned with the strongest calcic-potassic alteration in the core associated with BX1. Nicola Group rocks and fringing MPIC rocks are propylitically-altered and characterized by stronger epidote and pyrite.
- Like other alkalic porphyry deposits (e.g., Copper Mountain, Brenda), MPM lacks the strong hydrothermal alteration zoning that is commonly observed in calc-alkalic porphyry deposits (e.g., Highland Valley Copper, Island Copper, Gibraltar). In particular, phyllic alteration is absent at MPM. A common feature of calc-alkalic porphyry deposits is often a pronounced pyritic halo that surrounds the copper mineralization and is associated with phyllic and propylitic alteration. At MPM, discontinuous pyritic zones are present but do not appear to be mineralization halos. MPM geological staff identified a pyritic zone in the south wall of the Springer Pit which extends into the adjacent Cariboo Pit. Samples from Bell Pit blast holes collected in the early years of operations were identified as being from a Pyrite Zone but the location of this feature is not known.
- Sulphide mineralization consists mainly of chalcopyrite ($CuFeS_2$) and pyrite (FeS_2), with lesser bornite (Cu_5FeS_4), covellite (CuS), and digenite (Cu_9S_5). Bornite is relatively more abundant in the Northeast and Boundary Zones.
- Carbonate mineralization is principally calcite, with occurrences of malachite ($Cu_2CO_3(OH)_2$) formed as a natural weathering product. Iron carbonates have not been reported.
- A significant portion of the copper at the MPM is not associated with sulphides (upwards of 50% in the upper portions of each pit). This fraction has been termed ‘copper oxide’ by MPM personnel and is associated primarily with chrysocolla ($(Cu,Al)_2H_2Si_2O_5(OH)_4 \cdot nH_2O$) and malachite ($Cu_2CO_3(OH)_2$) in equal proportions (Henry 2009). SRK (2015b) has shown that chlorite is a significant host for copper. It is assumed that chlorite formed hydrothermally and incorporated

copper as part of the mineralizing event rather than due to weathering. Suarez et al. (2009) found that the form of copper in chlorite at the Aguablanca Ni-Cu-PGE Sulfide Deposit was native copper between silicate layers rather than as a substitution in the crystal lattice. The mineral is suspected to have formed during hydrothermal alteration rather than by natural weathering processes. It is not known whether this same form of copper is also present at MPM.

The small Pond Zone is andradite-clinopyroxene-magnetite skarn mineralization occurring at the contact between a diorite to monzodiorite intrusion and Nicola Group volcanic rocks of andesite to basalt composition. It appears to be linked to the presence of a limestone unit in the Nicola Group.

From an ML/ARD perspective, a significant feature of the Mount Polley mineralization is the lack of reported arsenic, lead, and zinc minerals which are commonly associated with porphyry deposits elsewhere in British Columbia and globally. Since arsenic, zinc, and associated cadmium are relatively mobile under non-acidic conditions, the lack of the minerals hosting these elements indicates that potential for leaching concerns is lower than other porphyries. Based on the copper sulphide and copper oxide dominated mineralogy, the primary metal leaching concern is expected to be for copper.

In addition, the lack of a distinctive pyrite halo means that pyrite abundance is lower than other porphyry deposits and ARD potential is expected to be lower.

Figure 2: Geological Map of the Mount Polley Mine

2.3 ML/ARD Management

2.3.1 Classification of Mine Waste

According to the *Mines Act* Permit M-200 (referred to as the M-200 Permit in this document), potentially acid generating (PAG) and ML materials are defined as:

- Neutralization potential (NP) is calculated using total inorganic carbon (TIC).
- Acid potential (AP) is calculated using total sulphur.
- All waste rock, quarry rock, borrow materials, and tailings are classified as PAG if they have an NP/AP ratio of less than 2.0.
- Borrow material or waste rock containing soluble metal levels (as determined by the shake flask test) higher than the receiving water objectives are defined as having potential for metal leaching.

2.3.2 Mine Waste Rock and Tailings Management

The M-200 Permit specifies the following requirements for waste management:

- Waste Rock
  - PAG waste rock can only be disposed in the Cariboo, combined Cariboo/Springer, Wight, and Southeast Zone pits, where it will be submerged permanently beneath a water cover.
  - A maximum of 62 million tonnes of PAG waste rock can be stored in the Temporary NW PAG Stockpile.
  - Isolated pockets of PAG materials (less than 1,000 tonnes) may be blended with non-Pag materials within the waste rock dumps, at a minimum non-PAG:PAG ratio of 20:1.
- Quarry Rock
  - Quarry rock can be used as construction material if the non-PAG and classified as not potentially metal leaching.
- Tailings
  - PAG tailings may not be used in dam construction.
  - Cyclone tailings must have an NP/AP ratio greater than 2.0.
  - Cycloned tailings may be used for construction of the following TSF components:
    - The upstream and downstream faces of the Perimeter Embankment.
    - The upstream side of the Main Embankment.
    - The maintenance of a till core in the Perimeter and Main Embankments.
  - About 3.5 Mt (2.2 Mm^3) of the remaining tailings deposited in the Springer Pit between August 2015 and June 2016 can be co-disposed with waste rock in the SERDS.

2.4 Conditions in 2023

Mining occurred in the Springer Pit in 2023, with milling of fresh and stockpiled ore and tailings being deposited in the TSF. Tailings previously deposited in the Springer Pit between August 2015 and June 2016 were co-disposed with waste rock in the SERDS between May and December 2023. Further details of disposal procedures are described in SRK (2022c) and summarized in Section 2.6. Environmental management and monitoring in 2023 followed guidelines and procedures in the 2019 Comprehensive Environment Management Plan (approved on February 10, 2021).

As described in MPMC (2024), the average annual precipitation in the Mount Polley Mine area is approximately 622 millimetres (mm/yr).

MPMC maintains two automated HOBO weather stations to collect climate data for the site and in 2023, 581 mm of precipitation was recorded: 337 mm as rain and 224 mm as snow water equivalent.

The average monthly air temperature at Mount Polley Mine in 2023 ranged from an average monthly low of -6.2˚C in February to 29˚C in August. In 2023, weather generally was drier and warmer than average and was consistent with regional trends with respect to drought conditions. Drought conditions persisted throughout 2023 at Mount Polley Mine.

2.5 Water Treatment Plant

As described in MPMC (2022), the Water Treatment Plant (WTP) at Mount Polley Mine removes suspended solids using Veolia ACTIFLO® water treatment technology prior to discharge. The feed water is dosed with an aluminum polychloride coagulant and a polymer to create floc particles. Microsand is added to ballast the flocculants, which settle and create a sludge. The clarified water is discharged, and the sludge is separated from the microsand, which is recycled in the process. The sludge is discharged into the TSF.

The plant operated continuously most of 2023, but was run on an as-needed basis near the end of the year.

2.6 SERDS Co-Disposal

Between August 2015 and June 2016, tailings were deposited into the Springer Pit after the TSF breach. Ore sources for the tailings included the Cariboo Pit and Wight Pit underground. Ore was processed using the previous milling process: comminution followed by froth flotation. Approximately one third of the tailings were removed in 2018 and 2019 by dredging and placed in the TSF. About 3.5 Mt (2.2 Mm^3) of tailings remained and in 2023, co-disposal of these tailings with waste rock in the SERDS was started on May 8, 2023. The tailings removal strategy involves placing waste rock on top of tailings and shoveling the mixture (10% waste rock, 90% tailings) into haul trucks which are later disposed as a mixture in the SERDS (SRK 2022c).

3 Monitoring Commitments Assessment

Table 1, Table 2, and Table 3 summarize the monitoring commitments as established by the Permit, the ML/ARD Procedure Manual, and the Water Management Plan. The tables also indicate the degree to which MPMC met its monitoring commitments in 2023. Figure 3 shows rock disposal sites and the PAG stockpile, as well as representative seep monitoring locations summarized in Table 2. Figure 4 and Figure 5 show the contact water and seepage monitoring locations summarized in Table 2 and Table 3, respectively.

Mount Polley Mine also operates kinetic tests on waste rock and tailings in support of long-term waste management planning and water quality prediction. The kinetic tests were performed for various activities, including permitting of mining the Wight Pit and lowering of the NP/AP criterion (waste rock humidity cells), reclamation activities (waste rock columns), and long-term kinetic testing of tailings collected from Hazeltine Creek following the TSF breach (tailings humidity cells and columns).

In 2023, MPMC complied with most monitoring commitments for managing of ML/ARD potential. Five of eight required samples of co-disposed tailings collected for trace element content and pore water chemistry were missed in 2023. The purpose of these analyses is to inventory geochemical characteristics of the co-disposed tailings, so the missed analyses are not significant from an environmental standpoint.

Table 1: ML/ARD Sampling Commitments

Material Type/Facility	Component	Purpose	Sampling Method	Total S	Total C	Element Scan[1]	Shake Flask Extraction Test[1]	Water Sample[1]	Tonnage Mined (t)	Target Frequency	Target Number of Samples	Number of Samples Collected	Percent Complete
Waste Rock/In-Pit	Areas of known NAG waste rock	To confirm material is NAG and provide information for source terms	Composite sample of blasthole cuttings	X	X	-	-	-	8,176,980	1 in 40,000 t			
	Areas of known PAG waste rock or suspected PAG/NAG waste rock boundaries	To define PAG/NAG boundaries and PAG material	Composite sample of blasthole cuttings	X	X	-	-	-	3,789,784	1 in 20,000 t	599[2]	675	>100%
	Drill pulp samples	Additional source of data for site geochemical models	Random selection of an existing blasthole composite sample	-	-	X	-	-	-	Monthly	12	25	>100%
Waste Rock/Waste Rock Dump	NAG waste rock dump	As QA/QC to confirm waste is being appropriately characterized and handled	Composite Sample of active crest	X	X	-	-	-	-	Weekly when NAG material is actively mined	52	52	100%
Ore/In-Pit	Ore to be temporarily stockpiled rather than processed immediately	To classify material as NAG or PAG	Composite sample of blasthole cuttings	X	X	-	-	-	10,700	1 in 20,000 t	1	14	>100%
Tailings/TSF	Processed tailings	To classify material as NAG or PAG To support development of site geochemical models	Monthly composite sample of tailings produced from processing plant	X	X	X	-	-	-	Monthly when ore processing occurs	12	12	100%
SERDS Co-Disposal Tailings	Tailings disposed in the SERDS co-disposal facility	To confirm material is NAG	Grab samples collected during deposition	X	X	-	-	-	-	Weekly when deposition occurs	33	141	>100%
		To characterize material from ML/ARD perspective	Grab samples collected during deposition			X	-	X[3]	-	Monthly when deposition occurs	8	3	38%
Water Treatment Plant Waste/WTP	Water Treatment Plant waste	To support development of site geochemical models To characterize material from ML/ARD perspective	Composite sample from wastewater exited the WTP prior to disposal to TSF	-	-	X	X	X	-	Quarterly	4	5	>100%

Notes:

[1] Analysis conducted at an external laboratory.

[2] Tonnage was not provided by MPMC based on proximity to NAG/PAG boundaries. Assumed target frequency of 1 in 20,000 t for both components to assess compliance.

[3] Pore water sample.

Table 2: Mount Polley Mine Contact Water Sampling Monitoring Locations

Station Name	EMS Code	Description	Drainage	Permit[1]	Analytical Sampling Frequency	Samples in 2023	Percent Complete

4 Methods

4.1 Overview

Chemical analysis is either carried out by MPMC's on-site laboratory or external laboratories. Operational monitoring of ARD potential is carried out by the on-site laboratory (Section 4.3). Confirmatory analyses for the on-site lab as well as additional geochemical studies, such as humidity cell tests (HCTs) and water sampling, are analyzed at external laboratories (Section 4.4).

In this report, all laboratory results have been rounded to two significant figures to reflect analytical uncertainty. When results are less than detection limits, the detection limit was used for calculations.

4.2 Sample Acquisition

4.2.1 Solid Samples

Blast Hole Samples

Blast hole samples drilled for production are sampled by MPMC personnel. Testing for waste classification consisted of ABA analysis in the on-site laboratory as described in Section 4.3. MPMC carried out testing on 979 samples in 2023. The methodology for drilling to waste segregation and characterization is described in MPMC (2022b).

Two random blast hole samples were selected each month when mining and submitted to an external laboratory for trace element analysis, as described in Section 4.4.

Placed Rock Samples

Sampling of placed rock samples followed procedures outlined in *MPMC-SOP-016: ABA and Soil Sampling* (MPMC 2021). Testing on placed rock samples was carried out in the on-site laboratory as described in Section 4.3. In 2023, 52 samples were tested.

Tailings Samples

Tailings monthly composite samples are collected by MPMC personnel and comprise weighted shift composite samples. Testing consists of ABA analysis in the on-site laboratory as described in Section 4.3 and trace element analysis at an external laboratory, as described in Section 4.4. Monthly samples were collected in 2023 (twelve samples total).

SERDS Co-Disposal Samples

MPMC staff collected co-disposed tailings samples in accordance to sampling procedures outlined in *MPMC-SOP-016: ABA and Soil Sampling* (MPMC 2021). In 2023, 141 samples were collected

between May and December, at a frequency of approximately daily when tailings are deposited. This exceeds the recommended frequency of once per week for the time period.

Three samples collected in May, June, and August 2023 were sent to the external laboratory for analysis of trace elements and porewater but results were not available at the time of reporting. The required frequency is once per month for these analyses.

Kinetic Testing Samples

Waste rock samples selected for humidity cell testing as part of past geochemical testing programs were drill core samples selected to evaluate oxidation rates for typical and elevated sulphide concentrations. One sample from the Pond Zone, two samples from the Springer Deep Zone, and two samples from the WX Zone are continuing.

Waste rock and tailings samples collected for the waste rock columns were collected by Mount Polley site personnel.

The tailings samples were collected from Hazeltine Creek following the TSF breach and were selected to represent visually distinctive tailings materials (magnetite sand and grey tailings). The samples are dominated by tailings solids but also contained native materials (mineral and organic soils, and glacial sediments entrained in the debris flow). The samples characterize weathering behaviour for a range of sulphur concentrations which align with typical characteristics of tailings in the TSF.

4.2.2 Water Samples

MPMC staff were responsible for the collection of samples and submission to the analytical laboratory (ALS Environmental in Burnaby, BC). MPMC managed the 2023 data. SRK assumes that all water quality results have undergone Quality Assurance/Quality Control (QA/QC) as outlined in MPMC's QA/QC Manual and has not performed additional QA/QC.

4.2.3 Water Treatment Plant Waste Samples

Water samples were collected at the discharge pipe outflow.

Composite sediment samples were collected from the sludge pile adjacent to the WTP. In 2023, five samples of WTP wastewater and six sediments samples were collected at a frequency of approximately once per quarter.

4.3 On-Site Laboratory

4.3.1 Analytical Procedures

Static testing of all solid monitoring samples consists of ABA analysis by means of total carbon and total sulphur determination by induction furnace combustion using a LECO CS230CSH. Any other

analyses used to inventory waste characteristics rather than make operational management decisions are performed off-site.

4.3.2 Quality Control and Quality Assurance

4.3.3 Off-Site Confirmatory Analysis

4.4 External Laboratories

Additional studies are performed off-site at either Bureau Veritas (waste rock kinetic tests), formerly Maxxam Analytics (Burnaby, BC) or ALS Environmental (Burnaby, BC).

4.4.1 Static Testing

Static testing consisted of:

- Acid Base Accounting (ABA):
  - Paste pH
  - Total sulphur and total carbon (by Leco)
  - Sulphate sulphur (HCl leach), sulphide sulphur (by difference)
  - Total inorganic carbon (HCl leach, evolved CO_2 analysed by Leco)
  - Modified Sobek NP
- Elemental analysis (aqua regia digest followed by ICP-MS multi-element scan)
- Shake Flask Extraction (SFE) conducted on select WTP sediment samples.

4.4.2 Kinetic Testing

Leachates from kinetic testing are analyzed for:

- pH, conductivity, oxidation-reduction potential (ORP),
- Total acidity (HCTs only), total alkalinity, sulphate, chloride (newest HCTs and columns only), fluoride (newest HCTs and columns only), nitrate (columns only), and
- Dissolved metals (multi-elemental ICP-MS).

4.4.3 Water Samples

Water samples are collected from waste rock and tailings embankment seepage, and sumps and ditches in the water management infrastructure around the mine site. Analytical parameters and parameters of interest (indicated by an 'X') are in Table 4. Parameters of interest (POIs) have been chosen based on discharge permit limits (ENV 2022). Samples were analyzed for general parameters,

organic carbon, anions, nutrients, and total and dissolved elements. Field pH and conductivity were recorded for all stations in-situ at the time of sampling.

Table 4: Summary of Analytical Parameters and Parameters of Interest

Parameter	Unit	POI
Field Parameters		
Field pH	pH unit	x
Field Specific Conductivity	µS/cm	
Field Temperature	°C	
Field Turbidity	NTU	
Physical Parameters

Uranium (U)	mg/L	
Vanadium (V)	mg/L	
Zinc (Zn)	mg/L	x

4.5 Data Interpretation Methods

4.5.1 Sulphur Species and Acid Potential

Total sulphur is assumed to be a proxy for sulphide sulphur because other sulphur forms (including sulphate) are rare at Mount Polley Mine (SRK 2023). Therefore, acid potential (AP) is calculated as follows:

$$AP\ (kg\ CaCO_3/t) = Total\ Sulphur\ (\%) \times 31.25$$

4.5.2 Neutralization Potential

Total carbon is assumed to be a proxy for reactive carbonate minerals. The assumption is described in SRK (2023) and is supported by the observed dominance of calcite, the lack of reported iron carbonate at Mount Polley, and the strong correlation and equivalence of total carbon and total carbonate. Therefore, neutralization potential from total inorganic carbon (NP*) is calculated as follows:

$$NP^*\ (kg\ CaCO_3/t) = Total\ Carbon\ (\%) \times (1000/12)$$

4.5.3 Acid Rock Drainage Potential

Calculated NP*/AP ratios indicated future potential for ARD as sulphides oxidize with time. The NP_{TIC} represented calcium carbonate that contributes to neutralization and the AP represented acid potential measured from the sulphide content of the sample.

A NP*/AP greater than 2 indicated negligible potential for ARD (non-PAG or NAG), whereas a NP*/AP equal to or less than 2 indicated the material had potential to generate ARD (PAG).

4.5.4 Metal Leaching Potential

Trace element concentrations provide an indication of the degree to which rock may contain elevated concentrations. Results were compared to the Mount Polley waste rock and tailings database.

4.5.5 Interannual Trends in Water Chemistry

A visual qualitative review of time trends in concentrations was conducted for contact water and seepage monitoring locations. In addition, a statistics review was conducted to compare concentrations in 2023 to historical concentrations. A sample was considered to have a significant increase in a parameter concentration in 2023 if the 2023 dataset's lower 95% confidence limit was higher than the historical dataset's upper 95% confidence limit. A sample was considered to have a significant decrease in a parameter concentration in 2023 if the 2023 dataset's upper 95% confidence limit was less than the historical dataset's lower 95% confidence limit.

4.5.6 PHREEQC Modelling Methods for Water Chemistry

Saturation Indices (SI) for gypsum ($CaSO_4 \cdot 2H_2O$), calcite ($CaCO_3$), malachite ($Cu_2CO_3(OH)_2$), tenorite (CuO), and calcium molybdate ($CaMoO_4$) were modelled using PHREEQC with the minteq.v4 database to indicate possible constraining minerals. Concentrations that were below the detection limit were modelled using the detection limit concentration. An SI value of zero conventionally indicates that the mineral is at equilibrium (neither forming nor dissolving). However, this might change due to dilution, dissolution of other minerals, and changes in the gas' phases. No SI reference values have been established for Mount Polley, so it was assumed that samples with an SI below -0.5 indicated under-saturation, values between -0.5 and 0.5 indicated near equilibrium, and values above 0.5 indicated super-saturation.

5 Data Quality Review

5.1 Solids

5.1.1 In-House Quality Control

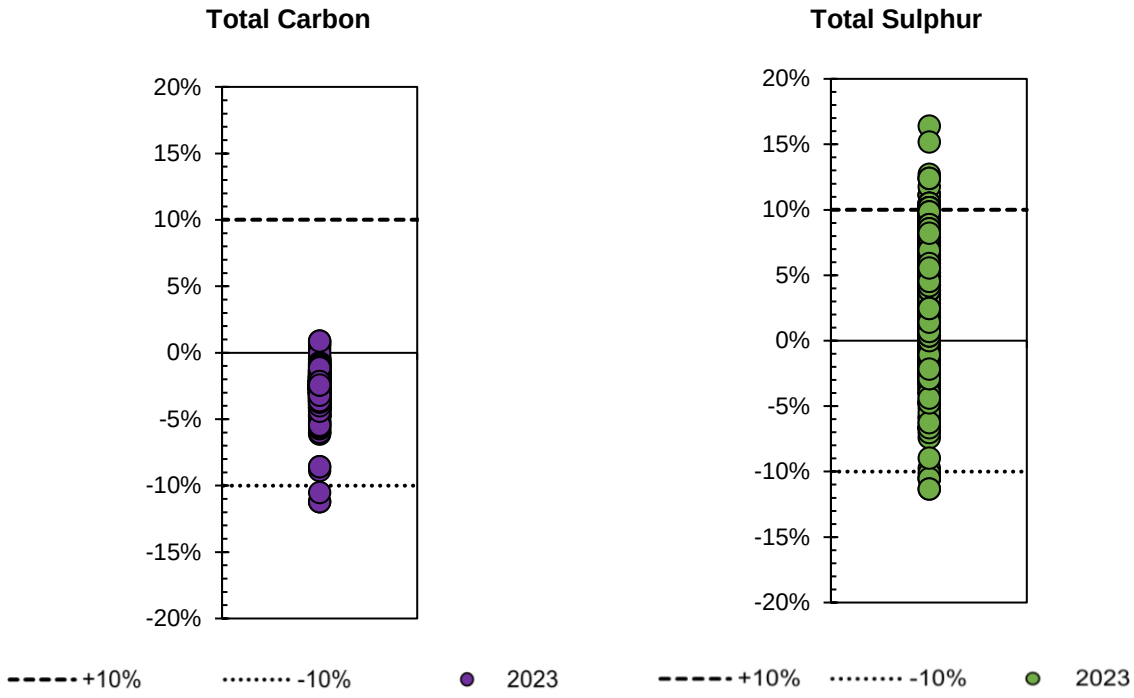
The on-site laboratory QAQC at Mount Polley includes testing blank samples and samples of one reference material. Blank samples are considered to meet QAQC standards if results are less than 2 times the detection limit of the analysis. The Certified Reference Material (CRM) standard is 0.79% total carbon and 0.28% total sulphur. CRMs are considered to meet QAQC standards if results are within tolerance limits of 0.71 to 0.87% and 0.25 and 0.31% for total carbon and total sulphur, respectively.

In 2023, a total of 3,326 solids samples in 258 sample trays (i.e., batches) were analysed at the on-site laboratory for ML/ARD monitoring, which consisted of the following:

- 1,108 blast hole rock samples, including two field duplicates, and 127 on-site laboratory duplicates.
- 23 tailings samples, including 11 on-site laboratory duplicates.
- 54 placed waste rock samples, including one field duplicate and one on-site laboratory duplicate.
- 177 samples of tailings collected during SERDS co-disposal, including 36 on-site laboratory duplicates.
- 774 blank samples.
- 1,033 samples of one CRM (NBM-1).
- 157 samples that were not reported, as they are not part of the monitoring commitments.

Blank samples are prepared using no sample and run with only combustible reagents through the LECO furnace. All blank samples were at or below detection for total carbon and total sulphur, meeting QAQC standards. The CRM sample failed on two analyses for total carbon (0.2% of CRM samples) and on 14 analyses for total sulphur (1.4% of CRM samples). In general, total carbon results trended lower than the CRM (Figure 6). No trend was evident for total sulphur results. These failed analyses impacted 11 of 258 sample trays. Four of the failed sample trays were flagged by the laboratory technician but were not reanalyzed, while six of the failed trays were not flagged. The six trays that were not flagged had total sulphur values measured at 0.32%. Field duplicates are discussed in their respective QA/QC sections below.

Figure 6: Variation of Total Carbon (Left) and Total Sulphur (Right) CRM Results Compared to CRM Standard Concentration



Sources: https://srk.sharepoint.com/sites/NACAPR003074/Deliverables/2023_MLARD_Annual_Report/020_Tables/[Onsite-Lab-QAQC_Table_CAPR002434_Rev00_KWJ.xlsx]

In 2023, 23 samples analyzed by the on-site laboratory were selected and sent to an external ISO certified commercial laboratory for analysis. Blast hole rock and tailings samples were sent to ALS Laboratories in Burnaby, BC for confirmatory analysis of total carbon and total sulphur. Total sulphur and total carbon analysis were determined using a Leco furnace. The results between the on-site (X_{int}) and external (X_{ext}) laboratories were compared using a relative percent difference (RPD), calculated as follows:

$$RPD = \frac{X_{int} - X_{ext}}{(X_{int} + X_{ext})/2} \times 100\%$$

SRK applied an RPD acceptance criterion of ±20% for both total carbon and total sulphur.

Raw results are included in Appendix A.

Blast Hole Rock Samples

Eleven blast hole rock samples were sent off site to ALS for confirmatory analysis in 2023. Figure 7 shows the distribution of total carbon and total sulphur RPDs between the on-site and off-site laboratories for the 11 samples.

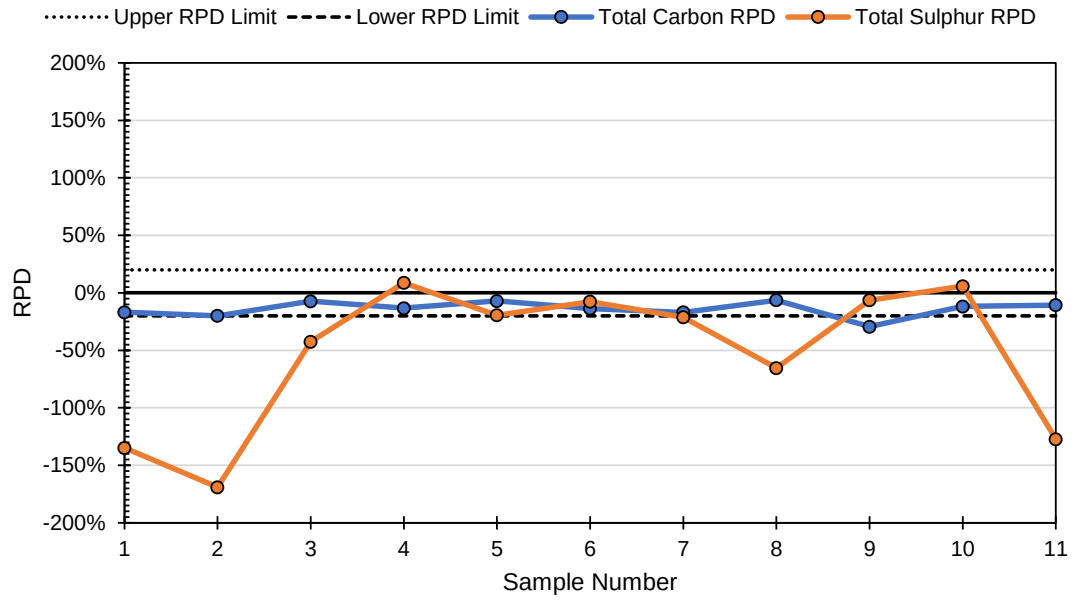
One of the 11 samples was outside of the ±20% RPD acceptance criterion for total carbon. All samples showed lower concentrations of total carbon from the on-site laboratory results in comparison to the off-site laboratory results.

Six samples were outside of the 20% RDP acceptance criteria for total sulphur with large variability. All failing samples showed lower concentrations of total sulphur from the on-site laboratory results in comparison to the off-site laboratory results. Five of these six samples (numbers 1, 2, 3, 8, and 11 in Figure 7) had off-site laboratory results that were less than 10 times the detection limit (0.01% for both on-site and off-site laboratories) and is likely the reason for these RPDs being outside the acceptance criteria. The remaining sample with an RPD outside of the acceptance criteria was close to passing (-21% RPD). The RPD for when total sulphur results were greater than 10 times the detection limit ranged between -21% to 9%.

Figure 8 compares the NP/AP calculated using on-site laboratory results and external laboratory results for these samples. No samples were misclassified as PAG or non-PAG. SRK considers discrepancies within $\pm$20% RPD as acceptable when total sulphur and total carbon values are greater than 10 times the detection limit.

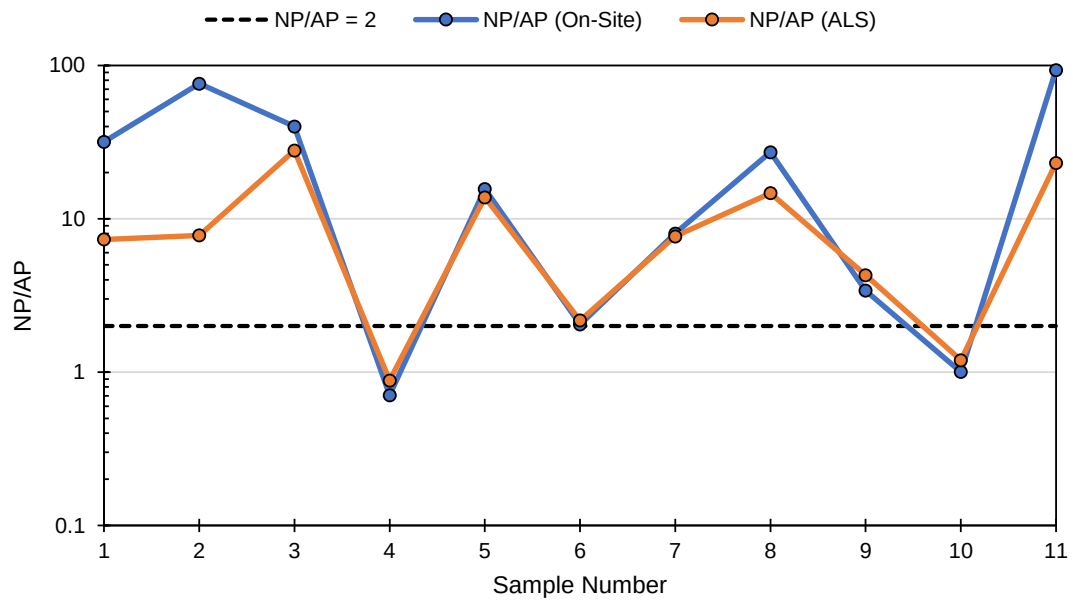
MPMC did not provide SRK with details about how it handled laboratory results that were outside of its acceptance criteria in 2023.

Figure 7: Relative Percent Difference of On-Site and External Lab Duplicates for Total Carbon and Total Sulphur Analyses for Waste Rock Samples



Sources: https://srk.sharepoint.com/sites/NACAPR003074/Deliverables/2023_MLARD_Annual_Report/020_Tables/[Onsite-Lab-QAQC_Table_CAPR002434_Rev00_KWJ.xlsx]

Figure 8: NP/AP of On-Site and External Lab Duplicates for Waste Rock Samples



Sources: https://srk.sharepoint.com/sites/NACAPR003074/Deliverables/2023_MLARD_Annual_Report/020_Tables/[Onsite-Lab-QAQC_Table_CAPR002434_Rev00_KWJ.xlsx]

Tailings Samples

Twelve tailings samples were sent off site to ALS for confirmatory analysis in 2023. Five of the 12 samples (42%) were outside of the 20% RPD acceptance criteria. All five of the failing samples showed lower concentrations of total carbon from the on-site laboratory results in comparison to the off-site laboratory results (Figure 9).

Eight samples (67%) were outside of the 20% acceptance criteria for total sulphur. Similar to total carbon, all of the failing samples showed lower concentrations of total sulphur from the on-site laboratory results in comparison to the off-site laboratory results.

Based on these results, SRK considers the on-site laboratory may be underreporting total carbon and total sulphur results of tailings samples. Figure 10 compares the NP/AP calculated using on-site laboratory results and external laboratory results for these samples. No samples were misclassified as PAG or non-PAG based on-site data.

MPMC did not provide SRK with details about how it handled laboratory results that were outside of its acceptance criteria in 2023.

5.1.2 QAQC Recommendations

Based on the review of the on-site laboratory QAQC results, the following recommendations have been made:

- The frequency of in-house duplicates and off-site confirmatory analysis is too low for blast hole and placed material samples. Both should be performed on 10% of all samples until acceptable performance is achieved, after which 5% will be appropriate. In 2023, a sufficient number of in-house duplicates were analyzed for blast hole and tailings samples, as well as off-site confirmatory samples for tailings. The other datasets were not sufficient to determine if the on-site laboratory is performing acceptably.
- CRM and blank analysis can be reduced to 5% of samples.

5.1.3 External Quality Assurance

All static testing coordinated by SRK undergoes SRK's internal QA/QC check composed of:

- For ABA testing:
  - For pH, lab duplicates should be within ±0.5 difference pH unit.
  - Total carbon should be equal to or higher than total inorganic carbon.
  - Sulphate should not exceed total sulphur. Sulphide is determined by difference.

  - Comparison between Total S-Leco and S-ICP should have RPD within ±20%.
  - NP does not exceed maximum NP indicated by acid strength and acid volume indicated by fizz.
  - Negative NP has paste pH below 5.
  - For laboratory duplicates RPD better than ±30% except within 10 times of detection limit (DL).
  - Standard reference materials should be within ±20%.
  - Lab blank should be under 2 times the DL.
- For elemental analysis:
  - Lab blank should be under 2 times the DL.
  - For lab duplicates samples over 10 times the DL, RPD within ±20%.
  - Standard reference materials should be within ±20%.
- For shake flask extraction:
  - Lab blank should be under 2 times the DL.
  - For lab duplicates samples over 10 times the DL, RPD within ±20%.
  - Standard reference materials should be within ±20%.

Results that do not pass the quality checks are evaluated and if considered necessary submitted for re-analysis. QA/QC of external laboratory results are discussed in their respective sections in Section 5.

The quality of all laboratory humidity cell and column data are regularly assessed for:

- Ion charge balance calculations with a target balance of less than ±10%.
- Off-trend spikes in the data that may indicate issues with the sampling or analysis.
- Contamination of the deionized water used for the test.

Results that do not pass the quality checks are evaluated, and if detected within the respective holding time, are submitted again for analysis.

Spikes in the data are flagged and reanalyzed. The value is either replaced by the reanalyzed concentration or confirmed. When a spike is confirmed, the lab is asked to identify potential issues that may have led to the spike in concentration. These causes are documented and if possible, amended. Parameter concentrations that show consistent fluctuations at concentrations near the detection limit are considered effects of analytical uncertainty.

5.2 Waters

SRK has assumed that the database of water quality results received from MPMC are of acceptable quality.

6 Blast Hole Monitoring

6.1 QA/QC

In 2023, two field duplicates of blast hole samples were collected and analysed at the on-site laboratory for total sulphur and total carbon. RPD values were calculated between the parent and duplicate sample, and RPD values were 1.2% and 5.1% for total carbon and both 0% for total sulphur. All RPD values were within the 10% RPD acceptance criteria.

Trace element concentrations of blast hole samples were analyzed at ALS Environmental in Burnaby, BC in 2023. QA/QC for these analyses are summarized in Table 5. SRK considered all results acceptable for this assessment.

Table 5: QA/QC for Blast Hole Samples Analyzed in External Laboratory

QC Test	n	SRK QC Criteria	Results
Physical Tests (Matrix: Soil/Solid)			
Lab Duplicate	5	For any samples, +/- 0.5 difference pH unit.	All Passed
Laboratory Control Sample (1:2 soil:water)	5	Within specified tolerance ranges.	All Passed
Reference Material (1:2 soil:water)	5	Within specified tolerance ranges.	All Passed
Organic / Inorganic Carbon (Matrix: Soil/Solid)			
Method Blank for Total Carbon	5	<2X detection limit (DL)	All Passed
Lab Duplicate	5	>10X DL, RPD better than +/- 20%	All Passed
Laboratory Control Sample for Total Carbon	5	Within specified tolerance ranges.	All Passed
Reference Material for Total Carbon	5	Within specified tolerance ranges.	All Passed
Inorganics (Matrix: Soil/Solid)			
Method Blank for Total Sulfur	5	<2X detection limit (DL)	All Passed
Lab Duplicate for Total Sulfur	5	>10X DL, RPD better than +/- 20%	All Passed
Laboratory Control Sample for Total Sulfur	5	Within specified tolerance ranges.	All Passed
Reference Material for Total Sulfur	5	Within specified tolerance ranges.	All Passed
Metals (Matrix: Soil/Solid)			
Method Blank	6	<2X detection limit (DL)	All passed.
Lab Duplicate	6	>10X DL, RPD better than +/- 20%	All passed.
Laboratory Control Sample	6	Within specified tolerance ranges.	All passed.
Reference Material	6	Within specified tolerance ranges.	All passed.

6.2 Monitoring of ARD Potential

Table 6 summarizes the tonnage of low grade ore (LGO) and waste rock stockpiled in 2023. Raw blast hole sampling data are provided in Appendix B.

Summary statistics of the ABA data for ore and LGO in 2023 are provided in Table 7 and Table 8. On average, ore and LGO are NAG. Table 9 shows summary statistics for waste rock in 2023. Of the 675 waste rock samples collected in 2023, 497 (74%) were classified as NAG while the remainder were PAG. Results are consistent with past results (e.g., SRK 2015a, SRK 2016, SRK 2023a) that showed Springer Pit rock as dominantly NAG with some PAG components (Figure 11). In 2023, 8 blasthole samples were not classified according to ore, LGO, and waste.

Table 6: Waste Rock and Low Grade Ore Stockpiled in 2023

6.3 Monitoring of Trace Element Concentrations

As described in SRK (2023b), when compared to the global average for igneous rocks (Price 1997), some rocks (greater than 75% of samples) at Mount Polley Mine have concentrations an order of magnitude higher for antimony, arsenic, copper, molybdenum, selenium, and silver. Copper concentrations correlate with selenium concentrations.

Summary statistics of these trace element concentrations as well as POIs identified in Section 4.4.3 of drill hole waste rock samples collected in 2023 are provided in Table 10. Box-and-whisker plots comparing these elements to previous trace element waste rock data are provided in Figure 12. Results from 2023 are within historical ranges and averages in 2023 are also similar compared to historical averages. More variability as shown by the spread of quartiles is apparent for selenium content.

Table 10: Select Trace Element Concentrations of Blast Hole Waste Rock Samples in 2023

Year	Statistic	Aluminum	Arsenic	Cadmium	Copper	Iron	Mercury	Molybdenum	Selenium
		%	mg/kg	mg/kg	mg/kg	%	mg/kg	mg/kg	mg/kg

7 Waste Rock Monitoring

7.1 QA/QC

QA/QC of ABA parameters analyzed at the on-site lab is described in Section 4.3.2.

In 2023, one field duplicate sample was collected during placed waste rock monitoring. This sample was analyzed at the on-site laboratory for total carbon and total sulphur, and the calculated RPD values were 9.7% and 16%, respectively. The total sulphur RPD value was outside of the 10% RPD acceptance criteria and may reflect small-scale variability during sample collection.

No analyses for placed waste rock samples were completed at external laboratories.

7.2 Confirmatory Sampling

In 2023, 52 confirmatory samples of placed waste rock were collected and analyzed for total sulphur and total carbon (Table 11). Raw results are provided in Appendix C. These samples were collected from the active dump crest on the South East Rock Disposal Site (SERDS) and locations where rock was being used as construction material, including road and TSF dam construction. MPMC indicated that NAG waste rock was mined for 52 weeks in 2023 and MPMC collected weekly samples, resulting in full compliance for confirmatory sampling.

One sample collected from the SERDS was classified as PAG (NP/AP = 1.5) after placement (2% of all samples) (Figure 13). The field duplicate collected was also classified as PAG (NP/AP = 1.6). Other confirmatory samples collected from the SERDS were NAG (NP/AP ranged from 4.4 to 220), so it is likely that this PAG sample was a reflection of small-scale variation in the material. No resampling was conducted, and no further action was taken by MPMC.

In the SERDS, excess NP is available for neutralization from surrounding NAG material with greater NP/AP values. As a result, SRK concludes the risk of ARD developing for this material is low.

Table 11: Summary Statistics of ABA Parameters for Placed NAG Waste Rock Samples in 2023

8 Waste Rock Kinetic Testing

8.1.1 Overview

Kinetic tests are designed to measure rates of constituent release as well as acid generation and neutralization of specific rock types representing waste rock at site. These data are inputs into determining a site-specific critical NP*/AP (NP*/AP_{crit}) value defining the threshold between PAG and NAG and estimating of the time to onset of acid rock drainage.

In 2009, a humidity cell sample from the Pond Zone was submitted for an acid-leaching procedure to remove carbonate and evaluate the reactivity of silicate minerals (Table 12). In 2022, four humidity cells samples were specifically selected to represent future waste rock that would be generated by mining the Springer Deep and WX Zones, which represent the source of waste rock for the remaining mine life (Table 12). Samples were selected by SRK from the drill hole database to represent upper range sulphur content for the dominant rock types in both zones. The tests were initiated on August 5, 2022.

Columns 1, 2 and, 3 were set-up by Mount Polley Mine in January 2012 to evaluate the effect of reduction in infiltration into waste rock. MPMC personnel independently designed the program and selected samples.

Notes:

[1] Rock types for some humidity cells were not recorded. PPp = Plagioclase porphyry, Bx = Breccia, DI = Diorite, Monz = Monzonite, FBXm = Monzonite breccia.

8.1.2 Determination of Critical NP*/AP

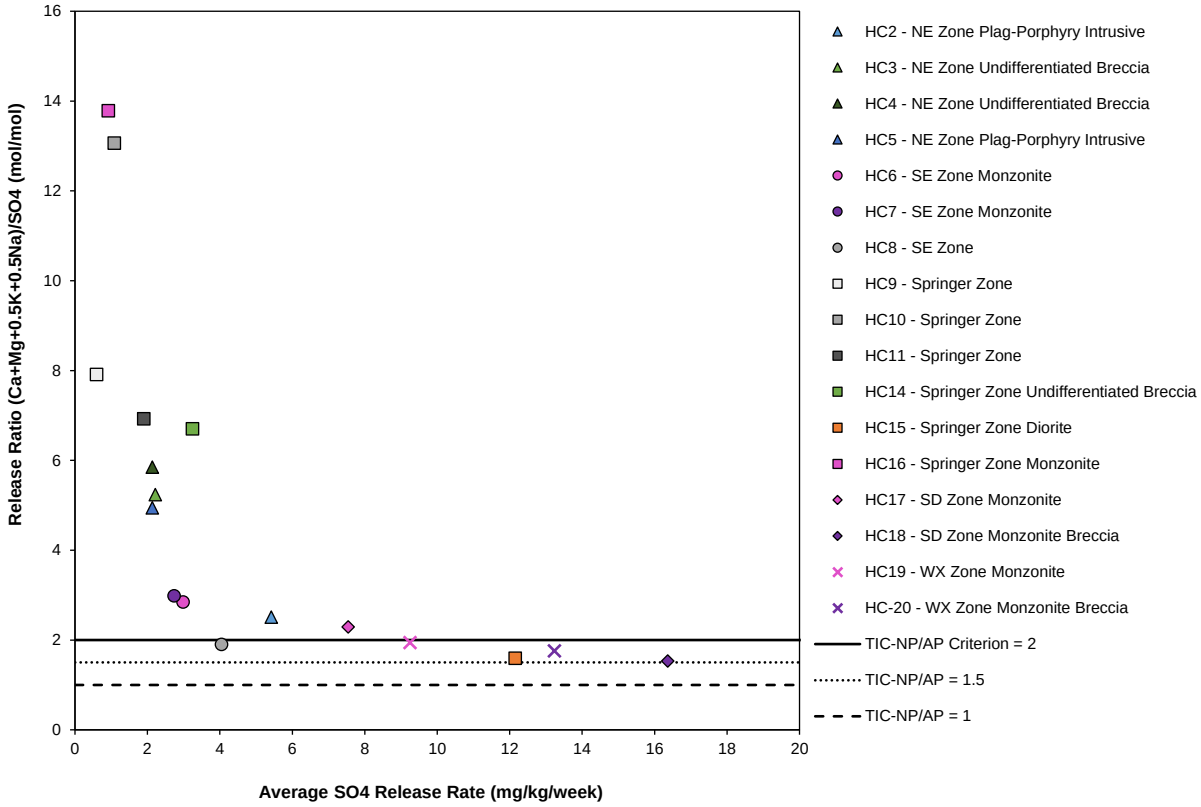
The current operational NP*/AP for classifying waste rock as NAG (or non-PAG) is specified in the Permit as 2. However, the critical NP*/AP ratio ($NP*/AP_{crit}$) was developed using data from humidity cell tests in SRK (2023b), which recommended defining $NP*/AP_{crit}$ of 1.6 based on available data. $NP*/AP_{crit}$ was derived from the comparison of cation release ratios and sulphate release rates.

Cation release ratios reflect carbonate dissolution, while sulphate release rates reflect sulphide oxidation. The trend of these data approaches a cation release ratio value between 1 and 2 and none of these cells have generated acid thus far. Relative rates expressed as the molar ratio of the stable release rates of the four cations to sulphate [$(Ca+Mg+0.5Na+0.5K)/SO_4$] mol/mol were used directly to estimate the NP/AP_{crit} for the waste rock. These ratios were compared to sulphate release rates from the HCTs to differentiate between dissolution of carbonates by sulphuric acid (from pyrite oxidation) and by carbonic acid (formed by carbon dioxide dissolved in the deionized water). The consideration of Na and K reflects the potential for Ca and Mg liberated by carbonate dissolution to exchange with Na and K in phyllosilicates. The release rate for Na and K are halved to account for their lower charge. Inclusion of Na and K also limits the possibility of under-stating carbonate mineral utilization thereby resulting in a lower $NP*/AP_{crit}$.

At low oxidation rates (lower sulphate release), the dominant process in the test is assumed to be dissolution of carbonates by carbonic acid and the $(Ca+Mg+0.5Na+0.5K)/SO_4$ ratio is high. As the influence of sulphide oxidation increases (shown by increase in sulphate release), the $(Ca+Mg+0.5Na+0.5K)/SO_4$ ratio greater reflects the interaction of sulphuric acid with carbonates which is the expected dominant process at full scale in waste rock dumps.

A lack of testing on samples with high oxidation rates hampered previous estimations of $NP*/AP_{crit}$ (SRK 2016). The initiation of the four HCTs in 2022, which had run for 48 weeks at the time of reporting in SRK (2023), all have higher oxidation rates than previous HCTs and were used to define the $NP*/AP_{crit}$ of 1.6. Figure 14 compares the cation release ratio compared to the oxidation rate, updated using the most recent data (68 weeks at the time of reporting for the four HCTs initiated in 2022). SRK recommends updating the $NP*/AP_{crit}$ to 1.5 based on the more recent data.

Figure 14: Cation Release Ratio versus Oxidation Rate



Sources: https://srk.sharepoint.com/sites/NA1CM017.011/Internal/!020_Project_Data/030_Lab Data/Kinetic Data/Calculations/[Mt_Polley_HCT_WR_Outcomes_1CM017.011_rtc_rev00.xlsx]

8.1.3 Delay to Onset of Acid Generation

Following the same method used in SRK (2016) and SRK (2023), the straight-line average of the correlation between initial NP*/AP (i.e., at time = 0, NP^*/AP_0) and calculated time for the onset of acidification (t_{onset}, in years) for all humidity cells from MPM was updated using NP^*/AP_{crit} of 1.5:

$$t_{onset} = 74 \times \left(\frac{NP^*}{AP}\right)_0$$

The equation indicates that a sample with NP/AP of 1 might be expected to generate acid in 74 years. The calculated lower 95% confidence on the 74 years coefficient was 64 years.

This is similar to the result of the calculation presented in SRK (2023), where the coefficient was 63 years, and supports the general finding from the kinetic testing is that acidification of PAG materials at MPM will take on the order of decades to centuries to develop. This is consistent with the widespread pH neutral weathering conditions at MPM in both natural and mined materials. Initial mining at Mount Polley was 25 years ago but waste rock has not acidified.

8.1.4 Status Update on Continuing Tests and Recommendations

An update on the status of the waste rock test work along with recommendations for continuation or termination is discussed below, which includes:

- A rock sample from the Pond Zone which was leached to remove carbonate neutralization potential and observed to understand the chemistry of acidic water.
- Two rock samples each from the Springer Deep Zone and WX Zone.
- Three waste rock columns investigating the effects of infiltration reductions.

Pond Zone Humidity Cell

HC-13 has now operated for about 15 years. Despite removal of carbonate minerals, the lowest pH shown by the sample was 4.5 and for about 3 years, pH has steadily increased and has reached 5 in most recent measurements (Figure 15). Oxidation rate (as shown by sulphate release) has decreased as pH increased and reflects ongoing depletion of sulphide. Metal concentrations are low and continue to decrease.

The test has yielded data on the role of silicates in consuming acid which was the original objective. As recommended in the previous 2022 annual report, the test can therefore be stopped.

Springer Deep and WX Zone Humidity Cells

All four tests yielded non-acidic leachate (pH 7.1 to 8.3) from weeks 0 to 68 (Figure 21) and showed stabilizing weathering rates after 16 to 24 weeks for most major and trace elements following an initial flush of accumulated weathering products, including sulphate (Figure 21).

Because these tests represent the source of waste rock for the remaining mine life, SRK recommends continuing these cells to carry on refining NP^*/AP_{crit} and time to onset of acid generation estimation.

Waste Rock Columns

Columns 1, 2 and 3 were set-up by Mount Polley Mine in January 2012 to evaluate the effect of reduction in infiltration into waste rock:

- Column 1 is the base case and consists of crushed rock with low potential to generate acid.
- Column 2 contains the same material as Column 1, but the water application rate is 50% of Column 1.
- Column 3 contains the same material as Column 1 and a tailings layer, and the water application rate is the same as Column 1.

The tests have been running for twelve years.

Since the tests are intended to evaluate reduction in loadings due to the effect of infiltration rates and possibly oxygen entry, results are presented as release rates (in mg/kg/week) rather than concentrations.

All tests have yielded pHs between 7.8 and 8.3 with Column 1 yielding pHs at the low end of the range. Sulphate releases rates are now similar for all three columns and continue to show the same declining trend as observed in previous years (Figure 17).

Copper release rates were declining but in the past years have stabilized, except in Column 2 (Figure 17). Release rates increased in 2023 for Column 2 but, as previously reported, this column continues to have the lowest release rates because it contains waste rock and has a higher pH than Column 1. Column 3 has highest release rates perhaps due to the presence of tailings with their greater weathering surface area but has converged with Column 1 in the past years.

The results appear generally stable and currently indicate low levels of weathering activity. As recommended in the previous 2022 annual report, the tests can therefore be stopped.

9 Tailings Monitoring

9.1 QA/QC

No field duplicates for tailing samples were collected in 2023.

Trace element concentrations of tailings samples were analyzed at ALS Environmental in Burnaby, BC. QA/QC for these analyses are summarized in Table 13. SRK considered all results acceptable for this assessment.

Table 13: QA/QC for Tailings Samples Analyzed in External Laboratory

Notes:

[1] Duplicate results outside ALS Data Quality Objective (DQO), due to sample heterogeneity. Results passed SRK's QC criteria.

9.2 Monitoring of ARD Potential

In 2023, 5,900,000 t of tailings were deposited into the TSF. Total carbon ranged from 0.25% to 0.41% while total sulphur ranged from 0.06% to 0.18% (Table 14). Results from 2023 had a weighted annual average NP/AP of 8.6 and are consistent with past results (SRK 2023), showing tailings are generally not PAG (Figure 18). All tailings composite samples collected in 2023 were classified as NAG.

Table 14: ABA Parameters of Monthly Tailings Composite Samples in 2023

Month	Tonnage	Total Carbon	Total Sulphur	NP	AP	NP/AP	Classification
	t	%	%	kg $CaCO_3$/t	kg $CaCO_3$/t	-	-

9.3 Monitoring of Trace Element Concentrations

Trace element concentrations identified in Section 6.3 for waste rock were also compared to tailings samples. Summary statistics of these trace element concentrations for tailings composite samples collected in 2023 are provided in Table 15 and lab reports are provided in Appendix D. Box-and-whisker plots comparing these elements to previous trace element tailings data are provided in Figure 19. Results from 2023 are within historical ranges and averages are roughly equivalent to 2022 (Table 15). Results from recent tailings (2021 and later) are also within historical ranges and averages were similar or lower except for molybdenum and selenium content, which were above their respective historical averages but within historical ranges (Figure 19).

Table 15: Select Trace Element Concentrations of Tailings Samples in 2023

Month	Aluminum	Arsenic	Cadmium	Copper	Iron	Mercury	Molybdenum	Selenium

9.4 Tailings Co-Disposed in SERDS

9.4.1 QA/QC

QA/QC of ABA parameters analyzed at the on-site lab is described in Section 4.3.2.

No field duplicates were collected in 2023 and samples were not sent for analysis at external laboratories.

9.4.2 Monitoring of ARD Potential

In 2023, 955,000 t of tailings were co-disposed with NAG waste rock into the SERDS. ABA results are summarized in Table 16 and raw data are presented in Appendix E. Total sulphur ranged from 0.04% to 0.7% with a mean of 0.15%, while total carbon ranged from 0.18% to 0.66% with a mean of 0.32% (Table 16). One tailings sample was classified as PAG (NP/AP = 1.5) after disposal (0.7% of all samples) (Figure 20). In the SERDS, excess NP is available for neutralization from surrounding NAG material with greater NP/AP values. As a result, SRK concludes the risk of ARD developing for the co-disposed tailings is negligible.

Table 16: Summary Statistics of ABA Parameters for SERDS Co-Disposal Tailings Samples in 2023

Statistic	Total Sulphur	Total Carbon	AP	NP	NP/AP
(n = 141)	%	%	kg $CaCO_3$/t	kg $CaCO_3$/t	-

9.4.3 Monitoring of Trace Element Concentrations

No samples of co-disposed tailings were analysed for trace element concentrations in 2023 so trace element concentrations could not be assessed, resulting in a non-compliance.

9.5 TSF Breach Tailings Kinetic Tests

9.5.1 Overview

An update on the status of the TSF breach tailings sample kinetic test work is discussed in the following subsections, which includes:

- Two humidity cells containing tailings released by the TSF breach.
- Three columns containing tailings released by the TSF breach.

9.5.2 Humidity Cells

Two humidity cells (HC-3, HC-4) containing “grey” tailings released during the dam breach and a method blank have now been operating for eight years. HC-3 contains more sulphur than HC-4 (0.33% and 0.08% pyrite, respectively). Both samples are classified as non-acid generating due to NP*/AP ratios well above 2. Copper and selenium concentrations are higher in HC-3 likely due to its higher sulphide content.

Both tests have consistently yielded pHs between 7 and 8 though declining pH has been observed in the last four years which has also been observed in the blank test (Figure 21).

Both tests have shown steadily declining sulphate concentrations for several years. HC-3 has yielded higher sulphate concentrations consistent with its higher sulphide content. About 45% and 30%, respectively of the initial sulphur inventory has been leached. Selenium concentrations correlate with sulphide content. Generally, HC-3 leachates have higher selenium concentrations than in HC-4 leachates, but HC-3 concentrations have continued to decrease and are now similar to HC-4 concentrations.

Although HC-3 has higher sulphide and copper than HC-4, HC-4 leaches higher copper concentrations. This has been attributed to the higher dissolved organic carbon (DOC) in leachates from HC-4 (2 mg/L) compared to HC-3 (1 mg/L) which may form humic complexes with copper, increasing its solubility. DOC concentrations have increased to about 2 mg/L in HC-3, but copper concentrations have remained steady.

Other parameters continue to decline or have remained stable. There have been no new emerging trends for other parameters in 2023.

SRK recommends continuation of these tests because sulphate continues to decline.

9.5.3 Columns

Three columns are being operated on two samples of “magnetite sand” (coarser tailings, Col-1 and Col-2) and one sample of “grey tailings” (finer tailings, Col-3). Col-3 contains the same material as HC-3 described above. Sulphur content is similar to the humidity cells and all three samples are classified as non-acid generating. A method blank is being run in parallel with the tailings columns. The tests have been operating for eight years.

The tests have continually yielded non-acidic leachates (pHs near 8) though pHs have declined in the past five years as the pH of the blank test has declined (Figure 22). Sulphate release for all three columns is now similar, though Col-1 is yielding slightly higher sulphate perhaps due to its higher sulphide content.

In 2023, selenium leaching for Col-1 continued a slow declining trend. Col-2 increased sharply from 0.005 mg/L to greater than 0.01 mg/L in 2020, but decreased and stabilized at release rates below 0.005 mg/L from 2022 onwards. Col-3 had oscillating selenium rates in previous years but was stable in 2023 at approximately 0.002 mg/L.

Copper concentrations in leachates from the two magnetite sand columns followed a smooth declining trend which has stabilized at approximately 0.004 and 0.002 mg/L for Col-1 and Col-2 respectively. In contrast, copper leaching has stabilized for Col-3 at higher concentrations than the sand columns (about 0.007 mg/L). As observed for the humidity cell tests, the higher copper leaching from Col-3 appears to be correlated with the higher DOC in leachates for this column.

As recommended in the 2020 annual report, SRK recommends continuation of Magnetite Sand Column 1 and Grey Tailings Column 3 to allow comparison of differences in copper leaching, and termination of the Magnetite Sand Column 2.

10 Water Treatment Plant Waste

10.1 QA/QC

In 2023, six water treatment waste sediment samples were analyzed for ABA and trace element concentrations, and three samples were analyzed for SFE at ALS Environmental in Burnaby, BC. No field duplicates were collected. QA/QC for these analyses are summarized in Table 17. One blank sample failed for nitrate according to SRK's QA/QC criteria and rechecks are currently ongoing at ALS at the time of reporting. SRK considered all results acceptable for this assessment.

Table 17: QA/QC for Water Treatment Waste Samples Analyzed in External Laboratory

10.2 Monitoring of ARD Potential

All required ABA parameters were available for the WTP samples, except for TIC for the sample collected in February 2023. Table 18 summarizes the ABA results for samples collected in 2023 and raw data are presented in Appendix F.

Paste pH measurements exceeded 7.5 for 2023 samples and total sulphur ranged from 0.23% to 0.64% with a mean of 0.44%. All samples were classified as NAG on the basis of TIC-NP/AP except for the February sample which could not be classified because there was no TIC result.

Table 18: ABA Results for WTP Waste Sediment Samples Collected in 2023

Date	Paste pH	Total Carbon	Total Inorganic Carbon	Total Sulphur	NP[1]	AP	NP/AP	Classification

10.3 Monitoring of Trace Element Concentrations

Table 19 summarizes select element concentrations following aqua regia digest for samples collected in 2023. Lab reports are provided in Appendix E. High aluminum content is a result of the addition of aluminum polychloride coagulant added as a reagent in the WTP. Selenium content (ranging from 5.2 to 22 mg/kg with a mean of 11 mg/kg) is also slightly elevated compared to Mount Polley waste rock and tailings (for comparison, maximum concentration measured between 1998 to 2023 in waste rock is 9.5 mg/kg and in tailings is 8.9 mg/kg). Concentrations for other trace constituents were similar to or lower than Mount Polley waste rock and tailings.

Table 19: Select Trace Element Content of WTP Waste Sediment Samples Collected in 2023

Date	Aluminum	Arsenic	Cadmium	Cobalt	Copper	Iron	Manganese	Mercury	Molybdenum	Selenium
	%	mg/kg	mg/kg	mg/kg	mg/kg	%	mg/kg	mg/kg	mg/kg	mg/kg
14-Feb-23	10	15	0.62	14	1200	1.4	740	0.10	26	16
14-Mar-23	14	30	0.64	15	2000	1.8	670	0.12	32	22
23-Mar-23	10	34	0.52	17	1300	2.3	1300	0.10	25	12
16-May-23	7.2	23	0.37	21	780	3.2	930	0.14	10	5.2

10.4 Shake Flask Extraction

Table 20 summarizes select SFE constituent concentrations for samples collected in 2023. Lab reports are provided in Appendix E.

Major cations were dominated by calcium (range of 410 to 460 mg/L) with lesser sodium, magnesium, and potassium (range of 8.6 to 80 mg/L for all three parameters). Major anions were dominated by sulphate (range of 1,000 to 1,300 mg/L), which was over one order of magnitude higher than total alkalinity, chloride, and fluoride (range of 0.52 to 96 mg/L for all three parameters). The sample collected in March 2023 had notably higher total ammonia (by one order of magnitude) and nitrate concentrations than other WTP samples. Metals concentrations were highest for aluminum, copper, manganese, molybdenum, and selenium. Aluminum is high due to the addition of aluminum polychloride coagulant to the WTP. Other metals identified as having elevated solids concentrations had SFE concentrations that were near or below the analytical detection limit.

Table 20: Select Leachable Constituent Concentrations of WTP Waste Sediment Samples Collected in 2023

11 Seepage and Contact Water Monitoring

11.1 Waste Rock Seepage

11.1.1 Conceptual Geochemical Model

NAG Waste Rock

Processes in NAG waste rock under non-acidic conditions include:

- Oxidation of sulphides (pyrite, chalcopyrite, and bornite) to release iron, acidity, sulphate, and trace elements contained in the sulphides. Copper is expected to be primarily released by oxidation of chalcopyrite and bornite. Iron released by oxidation of sulphides replaces pyrite and other sulphides as solid iron (III) oxyhydroxides. Iron concentrations in the drainage are expected to be at or near detection limits.
- The oxidation reaction is exothermic (releases heat) and is expected to result in average internal temperatures that are higher than ambient average temperatures. During winter, internal temperatures will be higher than ambient temperatures.
- Due to the temperature difference in winter, air will move by advection through the waste rock by convection. Cold air will be drawn in through coarser materials at the base formed by end-dumping. The heated air will exit the dump at a higher elevation. This process is expected to result in deep penetration of oxygen and generally an over-supply of oxygen for oxidation of sulphides.
- Neutralization of acidity produced by the oxidation reaction will be by reaction with calcium carbonate minerals or mixing with alkaline waters resulting in neutral to basic pHs. The pH of contact waters will be determined by the partial pressure of carbon dioxide in pore gases (lower pH with higher CO_2).
- For non-PAG waste rock the neutral pH weathering environment will result in precipitation of metals as various secondary minerals, including gypsum ($CaSO_4 \cdot 2H_2O$), metal oxides (tenorite - CuO), metal carbonates (malachite – $Cu_2CO_3(OH)_2$), and metal silicates (e.g., chrysocolla). Adsorption to secondary oxides will also occur. The resulting concentrations of metals (principally copper) in contact waters will be controlled by the relatively low solubility of the secondary minerals and the tendency to be adsorbed at these pHs.
- Selenium and molybdenum originate from oxidation of pyrite, but form oxyanions that are mobile at the expected pH. The concentrations of these trace elements are expected increase.
- There is a hydraulic lag between when waste is placed, and its signature appears at monitoring locations.

Due to the solubility control exerted by secondary minerals, contact water chemistry is expected to be constrained so that chemical loadings are directly proportional to infiltrating water volume. Sulphate is expected to increase as new waste is added but will be constrained by gypsum solubility.

Elevated sulphate and metal concentrations at NEZ Seep 1 and NEZ Seep 2 since 2014 were believed to be influenced by elemental sulphur stockpile oxidation and leaching. The stockpile was stored on the East RDS near the leach pad until its removal in 2018.

PAG Waste Rock

Segregated and exposed ex-pit PAG waste rock is present in the Temporary NW PAG Stockpile located adjacent to the Springer Pit. PAG rock at MPM is not defined by a particular rock type but is associated with pyrite halos formed by hydrothermal alteration. Sulphide content is higher than NAG waste rock.

Due to the higher sulphide content of PAG waste rock, the overall oxidation rate of PAG waste rock is expected to be greater than NAG waste rock. However, before acidification occurs, PAG and NAG weathering conditions are expected to be similar with secondary minerals exerting solubility controls. For example, the solubility of sulphate is expected to be controlled by gypsum which will be similar regardless of the sulphide oxidation rate.

Acidification is expected to take decades to progress with early contact waters remaining basic and having metal concentrations controlled by the solubility of secondary minerals. The timeframe for acidification effects is expected to be on the order of decades.

Co-Disposed Waste Rock and Tailings

As described in SRK (2022c), the geochemical weathering processes described above for waste rock will occur in tailings with the following exceptions:

- Tailings are much finer than waste rock and therefore will present a much greater surface area for reactions potentially resulting in higher chemical release rates than waste rock.
- The dominant mechanism for delivery of oxygen to sulphide mineral reaction sites is diffusion rather than advection.
- The rate of diffusion depends in the particle size distribution, the degree of saturation and the rate of oxidation. At some depth into tailings, oxygen concentrations are too low for oxidation to occur.
- For tailings containing sulphur concentrations near 0.1%, the expectation is that oxidation of tailings will occur to tens of metres in depth.

Based on SRK's understanding of the approach used to place tailings in the SERDS, the tailings will complete fill the voids in waste rock. Compared to the conceptual models for waste rock and tailings:

- The geochemical processes occurring in waste rock and tailings will also occur in the mixture.
- The presence of fine-grained material in the waste rock voids will prevent oxygen movement into the waste rock by advection. As with tailings, air entry by diffusion is expected to become the dominant control.
- Initial drainage will be dominated by drain down of water contained in the tailings. Contact water chemistry will be reflected in longer term seepage.

Nitrogen Leaching

Nitrogen leaching originates from explosives residuals rather than mineral weathering. Since the rock does not generate leachable nitrogen, the leaching of residuals provides a flush of nitrogen which occurs with water contact. It is expected that the load of nitrogen flushed is greatest initially then decaying in proportion to the remaining soluble nitrogen. In terms of cumulative leaching, a newly constructed waste rock dump would be expected to show increasing loads for several years then stable loads as the volume of rock added each year becomes small relative to the total volume. “Tailing off” at closure will occur. Delays and lag effects may be expected due to hydrological factors.

Downstream Contact Water

Flows from waste rock piles are collected in a series of ditches and sumps around the Mount Polley Mine site. These downstream monitoring locations show different water chemistry than the seeps that flow into them. Hypotheses to explain some of these differences include:

- Dilution from other water sources that report to the ditch/sump. Lower apparent concentrations of conservative species such as chloride and sulphate would result.
- Removal of some parameters dissolved in surface waters by attenuation processes such as precipitation and adsorption.
- Seeps exiting waste rock piles are often over pressurized with respect to CO_2, which will de-gas as it equilibrates with the atmosphere, causing the pH to increase.

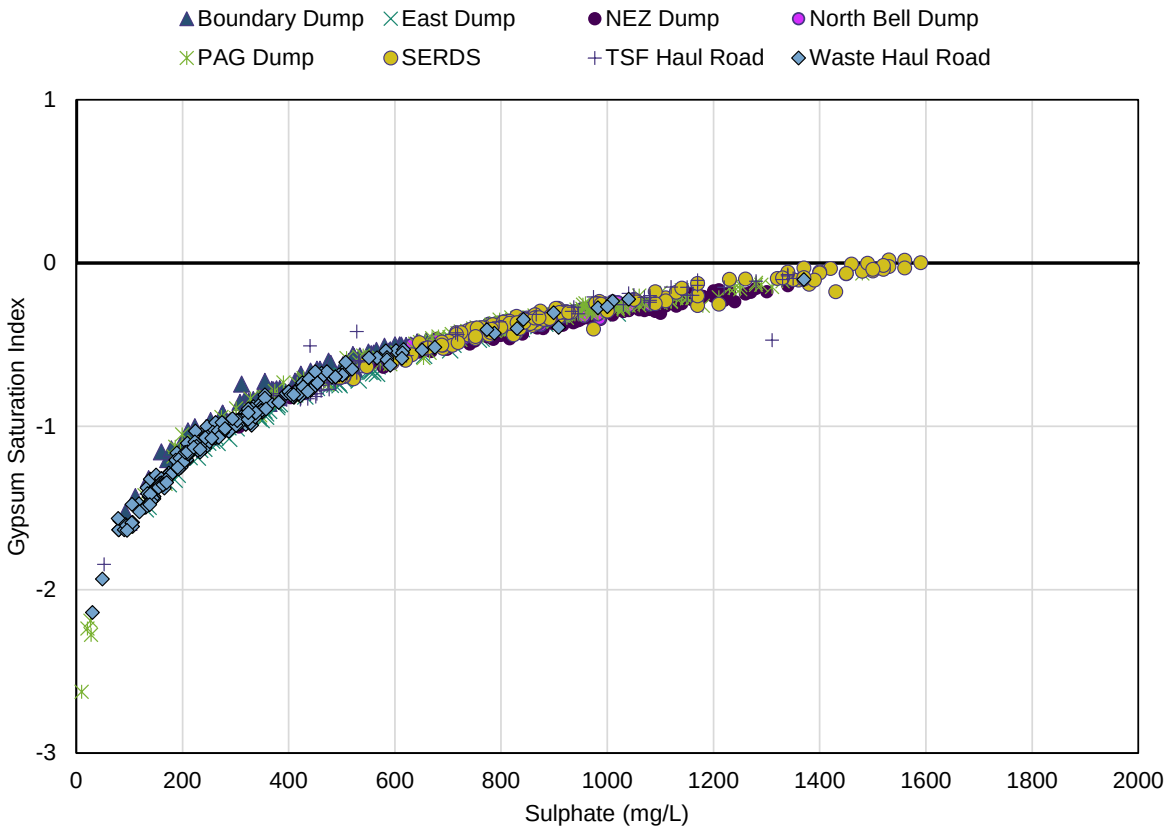
11.1.2 Solubility Controls

pH

Circumneutral to alkaline field pH values (pH above 7) dominate in seeps downstream of waste rock areas across the site (Figure 1 in Appendix G). Field pH measured in the seeps in 2023 ranged from 6.8 and 8.7. No field pH measurements showed influence by local PAG materials.

Gypsum likely controls major ion (calcium and sulphate) chemistry with pH control by dissolution of carbonate minerals. Figure 23 shows modelled calcite SI compared to modelled partial pressure of carbon dioxide (p_{CO2}). p_{CO2} above $10^{-3.4}$ atm (dashed vertical line in Figure 24) indicates CO_2 is over-pressurized, and as water equilibrates with atmospheric pressure, pCO_2 decreases along the flow path. pH will increase as a result and carbonates (such as calcite or malachite) may become oversaturated. Most seeps at Mount Polley have $p_{CO2} > 10^{-3.4}$ but no seeps show increasing p_{CO2} or metal (e.g., copper, nickel, cobalt, zinc) to sulphate ratios, both of which would be early indicators of acid generation.

Figure 23: Relationship between Gypsum ($CaSO_4 \cdot 2H_2O$) Saturation Indices and Sulphate Concentrations



Sources: https://srk.sharepoint.com/sites/NACAPR003074/Internal/!020_Project_Data/010_SRK/2023_Reporting/2_WQ Working Files/[2023_ContactWQ_CAPR002434_rev01_SJL_KWJ.xlsb]

Mineral Saturation Indices

Consistent with previous seep water chemistry interpretations (e.g., SRK 2016, SRK 2023b), saturation indices for sulphate were consistent with gypsum ($CaSO_4 \cdot 2H_2O$) as a strong solubility control for sulphate, as expected based on the conceptual model (Figure 24). Gypsum is expected to form as a secondary mineral when sulphate and acidity released by oxidation of sulphides are neutralized by reaction with carbonate minerals. Gypsum saturation indices approached zero at higher sulphate concentrations.

As previously noted in SRK (2023b), most seeps have sulphate concentrations below those required for gypsum saturation, indicating possibly that insufficient sulphate was generated by the mass of rock oxidizing. Dilution of contact waters is also commonly a factor that lowers concentrations.

Saturation indices for malachite ($Cu_2CO_3(OH)_2$) were well above zero, showing that copper concentrations were higher than would be predicted if malachite is controlling copper (Figure 25).

Tenorite (CuO) saturation indices were between zero and one at higher copper concentrations, indicating that copper oxide is more likely to control copper concentrations (Figure 26).

Consistent with findings in SRK (2023b), higher molybdenum concentrations indicate possible calcium molybdate control ($CaMoO_4$) (Figure 27). Dissolved iron and manganese concentrations remained low in waste rock seepages.

11.1.3 Nitrogen Leaching

Nitrate concentrations varied considerably by source area in 2023 (Figure 28). Distinctively higher concentrations were found for the SERDS, the Temporary NW PAG Stockpile, TSF Haul Road, and the North Bell Dump. The differences are linked to placement activity with lowest concentrations for dumps less recently active. Notably, nitrate concentrations in the North Bell Dump have continued decreasing in 2023 (Figure 29) and have significantly decreased in seepage there and from the NEZ Dump in 2023 compared to 2022 (see Section 4.5.5 for method to determine significance).

11.1.4 Interannual Trends by Area

Timeseries of POIs for all seeps are provided in Appendix G. Key interannual trends identified by area are described below:

- PAG Dump:
  - Sulphate concentrations have been increasing in the PAG Dump seeps since at least 2015 (average 700 mg/L in 2015 to 820 mg/L in 2023) as the waste rock pile continues to grow larger.
  - The increasing trend first identified in the previous year's report for dissolved aluminum continued in 2023 and was significantly higher in 2023 compared to previous years. No other parameters were significantly higher or lower in PAG Dump seepage in 2023.
- Waste Haul Road:
  - Dissolved cobalt concentrations significantly decreased again in 2023 compared to previous years. No other parameters were significantly higher or lower in Waste Haul Road seepage in 2023.
- TSF Haul Road:
  - No parameters were significantly higher or lower in TSF Haul Road seepage in 2023. The previous significant decrease of dissolved iron identified in previous reports was an artifact of changes to the detection limit.
- Boundary Dump:
  - Qualitative decreasing trends identified previously for ammonia, dissolved iron, dissolved manganese, total phosphorus, and sulphate have possibly ceased and have either plateaued or qualitatively increased in 2023 compared to 2022. Dissolved selenium also qualitatively increased in 2023.
  - Dissolved copper was significantly higher in 2023 compared to previous years while dissolved arsenic was significantly lower. No other parameters were significantly higher or lower in Boundary Dump seepage.
- North Bell Dump:
  - Dissolved selenium concentrations were significantly higher in 2023 compared to previous years, but concentrations have stabilized (annual average in 2015 was 0.052 mg/L compared to 0.084 mg/L in 2023).
  - Nitrate, dissolved calcium, and dissolved magnesium concentrations were significantly lower in 2023 compared to previous years. No other parameters were significantly higher or lower in North Bell Dump seepage.
- East RDS:

  - No parameters were significantly higher or lower in East RDS seepage in 2023 compared to previous years.
- NEZ Dump:
  - NEZ Dump 1 (NEZ Dump Seep 1 and NEZ Dump Seep 2):
    - A previously decreasing pH trend coupled with an increasing copper concentration trend appears to have plateaued after the sulphur pile removal in 2018 at NEZ Seep 1 and NEZ Seep 2 (Figure 1 in Appendix G).
    - The previously decreasing trend in field pH measurements between 2015 and 2020 (7.8 in 2015 towards 7.1 in 2020) stopped in 2021 (the average field pH in 2021 was 7.5) and was 7.7 on average in 2023. Since peaking in 2019 (average 2.3 mg/L), dissolved copper concentrations in NEZ Seep 1 and NEZ Seep 2 have decreased to an average of 0.099 mg/L in 2023 (Figure 16 1 in Appendix G). Other divalent metals (e.g., cadmium, cobalt, nickel, zinc) showed similar decreases and sulphate decreased to an annual average of 700 mg/L in 2023 from a peak of 1100 mg/L in 2017.
    - Compared to previous years, chloride, fluoride, nitrate, sulphate, dissolved cadmium, dissolved calcium, dissolved cobalt, dissolved coper, dissolved magnesium, dissolved manganese, dissolved nickel, dissolved selenium, and dissolved zinc concentrations were significantly lower in 2023 at NEZ Dump Seep 1 and 2. Total alkalinity, pH, and dissolved molybdenum were significantly higher in 2023 at these two seeps.
  - NEZ Dump 2 (remaining NEZ Dump seeps):
    - Nitrate, dissolved cadmium, and dissolved zinc concentrations were significantly lower in 2023 compared to previous years. No parameters were significantly higher.
- SERDS:
  - The increasing trend first identified in the previous year's report for dissolved aluminum continued in 2023 and the concentrations were significantly higher in 2023 compared to previous years. Dissolved zinc concentrations were significantly lower in 2023 compared to previous years.
  - Annual average sulphate concentrations decreased to 850 mg/L in 2023 compared to 1000 mg/L in 2021 and 950 mg/L in 2022. Dissolved selenium concentrations averaged 0.11 mg/L in 2023 compared to 0.15 mg/L in 2021 and 0.14 mg/L in 2022.
  - The influence of co-disposed tailings in the SERDS is not reflective in the water chemistry in 2023. The influence of drain down of water contained in the tailings is not evident in the seepage from the SERDS and TSS has not significantly increased in 2023 compared to previous years (Figure 5 in Appendix G).

11.2 Pit Sumps

11.2.1 Conceptual Geochemical Model

Pit Walls

Exposed pit walls remain in the Springer-Cariboo Pit, Wight Pit, and Boundary Pit. All other pits have been backfilled resulting in pit wall reactive surfaces becoming part of the backfill.

Pit walls are composed of fractured walls and rubble resulting from over-blast and physical weathering. Localized wall failures will contribute additional talus. Reactive surface area for pit walls is contained primarily in the broken rock rather than fractured walls.

Pit walls are assumed to perform the same as waste rock dumps composed of PAG and NAG waste but flow paths are much shorter. During flooding of pit walls, accumulated soluble weathering products will be flushed into pit walls. Following submergence, oxidation of walls is effectively stopped due to reduction in availability of oxygen. Highwalls above final flood levels continue to weather.

Direct precipitation (rain and snow) will dilute the pit sump. Surface water and groundwater that flows into the pit will also influence the water chemistry in the sump.

Nitrogen Leaching

Nitrogen is the same as described in Section 11.1.1 for waste rock. Sump waters from open pits indicate leaching from pit walls.

11.2.2 Overview

Currently, the Wight Pit is flooded and the Cariboo Pit is partially flooded. Both are storing water from other sources on site. Cariboo Pit has been flooded since March 2019, although it is currently being pumped down. Wight pit has been flooded since May 2021. Springer Pit was flooded in 2014 and tailings were deposited between August 2015 and June 2016. Springer Pit is now dewatered, but tailings still remain at the lower elevations and dewatering wells were installed in 2022 to remove pore water from the tailings. Water collected from these pits is most likely not representative of seepage from the pit walls, especially when water from other site areas is stored within the pits or, in the case of Springer Pit, is influenced by tailings. Because the water quality sampled in the flooded pits does not represent pit wall seepage, water chemistry sampling results from the Cariboo, Wight, and Springer pits are not discussed further.

The Boundary Pit is also flooded but is not storing water from other sources on site and was sampled twice in 2023, once in June and once in October. No new trends were observed in 2023 except for dissolved copper concentrations, which were significantly higher in 2021 compared to previous years (average 0.036 mg/L in 2021 and 0.014 mg/L before 2021), but may be exhibiting a decreasing trend (average was 0.030 mg/L in 2023) (Figure 16 in Appendix G).

11.3 Tailings Supernatant and Tailings Embankment Seepage

11.3.1 Conceptual Geochemical Model

During operations, tailings are deposited by spigotting from the TSF embankments, resulting in tailings beaches and slimes migrating to the centre of TSF. Cycloned tailings were also used for dam construction.

Under normal operational conditions, slimes in the centre would be fully saturated and below the process pond. Due to the finger drains in the dam, the water table drops from surface at the edge of the pond in the centre of the facility to the finger drains. As a result, tailings near the embankments are partially saturated. Oxygen enters the unsaturated tailings in the beaches and embankments by diffusion resulting in near surface tailings oxidizing most rapidly and consuming oxygen. An oxygen concentration profile will be present in the tailings which decreases most rapidly near surface and eventually results in negligible oxygen concentrations at depth. It is probable that active oxidation at this stage extends no more than a few metres into the tailings.

Due to the acid-consuming characteristics of the tailings, the weathering environment is pH-basic and overall processes are comparable to NAG waste rock (Section 11.1.1). Pore water chemistry during operations is dominated by process water with less effect from weathering processes because tailings are continually deposited, resulting in re-setting of the oxidation profile.

Process water contains low levels of dissolved organic carbon from flotation process reagents (e.g., W22c, a frother that is a blend of alcohols, glycols, and pine oils, and Polyfloat 7150, a mercaptan (CH_3SH) based collector). These compounds may act as a source of reduced carbon to facilitate reductive dissolution processes in the saturated components of the tailings such as dissolution of iron oxides and release of contained trace elements. SRK (2015) assessed this susceptibility and concluded the tailings were stable under chemically-reducing conditions. However, mineral forms that could be susceptible to reductive dissolution may be present in dam construction materials (e.g., till) or in native substrates that comprise the foundation of the TSF, so slightly elevated iron and manganese concentrations in downstream monitoring locations may be observed. If reducing conditions are encountered along the flow path through the dam, species such as nitrate and selenium may be attenuated.

Following the tailings dam failure in August 2014, the water table dropped, allowing more of the tailings to become unsaturated than under operational conditions. Draindown of pore waters will have occurred allowing oxidation processes to influence pore water chemistry.

Reactivation of the tailings pond resulted in the water table rising again into the tailings. As the water table rises, oxidation products formed following partial draindown will be dissolved by process waters. Pore waters can therefore be expected to reflect a mixture of process water effects and flushing of oxidation products, though, due to the limited penetration of oxygen into the tailings, process water will dominate.

Nitrogen Leaching

Leaching of explosive residual from ore will occur due to flushing in the milling process. Tailings solids themselves will not leach nitrogen because flushing during processing is very efficient. Nitrogen leaching from the TSF will reflect the influence of process water.

11.3.2 TSF Supernatant

Since Care and Maintenance began in May 2019, acidic leachate from the heap leach pad was pumped to the TSF until milling restarted in June 2022, when it was pumped to the final tailings box. MPMC indicated that some level of treatment of the leachate was started in 2021 using NaHS. This caused the field pH to be depressed from 2019 to 2020 (average 8.2 in 2019 to 7.6 in 2020), but it has since increased (annual average > 8.0 since 2021). Associated metal concentrations also increased from 2019 to 2020, such as dissolved cadmium, dissolved cobalt, dissolved copper, and dissolved nickel. These concentrations have since decreased (cadmium, copper) or plateaued (cobalt, nickel).

Chloride concentrations at E1a show a possible decreased after 2019 once processing ceased due to care and maintenance. In 2022, chloride increased once processing restarted and continued to increase in 2023. Nitrate concentrations at E1a show a decreasing trend as the TSF volume increased from 2017 and mining ceased in 2019 (average 9.6 mg-N/L in 2017 to 0.70 mg/L-N in 2021). An increasing trend started again since mining restarted in late 2021 (average 3.3 mg-N/L in 2023). Sulphate concentrations decreased since 2017 until 2021 (average 580 mg/L in 2017 to 400 mg/L in 2021) but have increased in 2023 (average 570 mg/L), similar to the trend observed for nitrate.

11.3.3 Tailings Embankment Seepage

The water chemistry of the Tailings Embankment monitoring locations, which comprise the East Main Toe Drain (EMTD), the West Main Toe Drain (WMTD), the South Toe Drain (STD) and the Main Embankment Seepage Pond (E4), represents seepage water from the TSF.

Average field pH was significantly lower in 2023 compared to previous years at the Tailings Embankment monitoring locations (average was 7.5 in 2023 compared to an average of 7.8 in previous years). Previously identified increasing trends for sulphate and dissolved molybdenum appear to have stabilized in recent years, indicating that the solubility of secondary minerals may be controlling concentrations.

Figure 30 shows the relationship between sulphate and the saturation index for gypsum at the Tailings Embankment monitoring locations compared to the seepage monitoring locations. Similarly, Figure 31 shows the relationship between dissolved molybdenum and $CaMoO_4$. The relationships for the Tailings Embankment monitoring locations are shifted downwards, although this is more obvious for the molybdenum and calcium molybdate relationship and indicates the solubility control is different in the Tailings Embankment seepage than waste rock seepage. At higher molybdenum concentrations, calcium molybdate does not approach zero for tailings monitoring locations like it does in some waste rock seeps.

11.4 Non-Contact Water

Gavin's Ditch, the TSF Clean Water Ditch and the Wight Pit Clean Water Ditch were not sampled in 2023 as no flow was observed at these locations on both monitoring occasions.

11.5 Comparison to Geochemical Source Terms

11.5.1 Background

SRK (2023b) described the development of the geochemical source terms beginning with conceptual geochemical models to describe the anticipated performance of each source of contact water. The main sources of chemical load are the waste rock dumps and tailings. Numerical source terms for waste rock and tailings were developed by statistically summarizing water chemistry monitoring data for near source seeps. The higher concentrations in the monitoring datasets were assumed to

represent contact water with minimal dilution. This approach avoids the limitation of interpreting laboratory test data.

The main assumption when using monitoring data is that the wastes are geochemically stable. As discussed in Sections 5 and 9, results from monitoring of waste rock and tailings in 2023 show that wastes have similar ARD potential and trace element concentrations within historical ranges.

Numerical source terms for pit walls in SRK (2023b) were developed by scaling weathering rates from humidity cell tests and were constrained using the seepage source terms for NAG waste rock.

11.5.2 Method

SRK evaluated whether a statistically significant change in near source concentrations had occurred between data collected up to December 2022 and subsequent data collected from January 2023 to December 2023. December 2022 was the cut-off for data used by SRK (2023b). 95% confidence limits on geometric averages for the two data periods were compared. If the ranges overlapped, it was concluded that no change in near source concentrations had occurred. See Appendix H for the comparison for waste rock seepage and tailings embankment seepage, respectively. Box and whisker plots were prepared to examine the distributions in more detail for selected parameters.

For pit seepage, water chemistry from the pit lakes was compared to the pit wall source terms and was flagged if source terms from SRK (2023b) were potentially underpredicted (i.e., <10 times the monitoring results).

11.5.3 Results

Waste Rock Seepage

Table 21 summarizes findings on statistically significant changes in seepage chemistry of waste rock seeps collected up to the end of 2022 compared to samples collected in 2023. A separate source term was developed for NEZ Dump seeps that were influenced by the sulphur stockpile (i.e., NEZ Dump Seep 1 and NEZ Dump Seep 2), so the significant changes are presented separately from the other seeps. All parameters are expressed as dissolved concentrations.

The changes in seepage chemistry at NEZ Dump (Sulphur Stockpile) reflect continued improvement of water chemistry after removal of the sulphur stockpile in 2018, which previously had decreasing pH and increased concentrations of elements neutralizing sulphuric acid by reaction with calcium and magnesium carbonates and potassic silicates. The depression in pH increased the solubility of several metals (Cd, Cu, Ni, and Zn).

Table 21: Summary of Statistically Significant Changes in Waste Rock Seepage Concentrations

Seeps Included	No Change	Significant Decrease	Significant Increase
NEZ Dump Seeps Influenced by Sulphur Stockpile[1]	Conductivity, pH, Al, Sb, As, Bi, Cr, DOC, Fe, Pb, P, Ag, Sr, Tl, Sn, Ti, V	NH_3, Ba, Be, B, Cd, Ca, Cl, Co, Cu, F, Li, Mg, Mn, Ni, NO_3, NO_2, PO_4, K, Se, Si, Na, SO_4, Zn	Alkalinity, Mo, U
All other seeps	Conductivity, pH, Alkalinity, NH_3, Sb, As, Ba, B, Cd, Ca, Cl, Cr, Co, Cu, DOC, F, Fe, Pb, Li, Mg, Mn, Mo, Ni, NO_3, NO_2, P, K, Se, Si, Ag, Na, Sr, SO4, Tl, Sn, U, V, Zn	Be, Bi, PO_4, Ti	Al

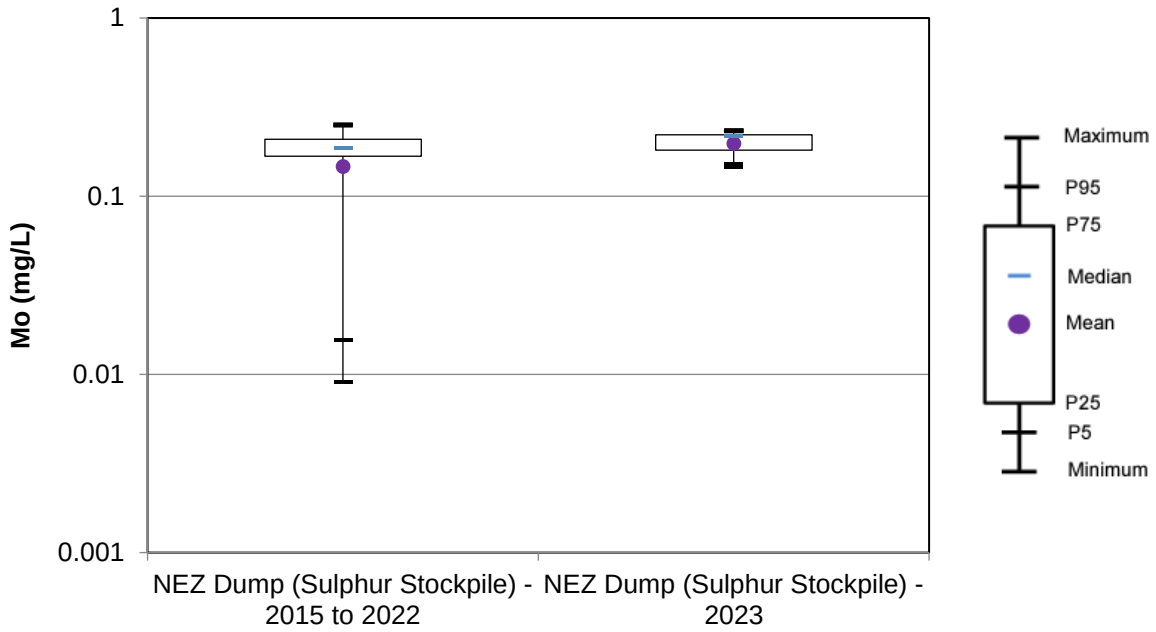
Sources: https://srk.sharepoint.com/sites/NACAPR003074/Internal/!020_Project_Data/010_SRK/2023_Reporting/2_WQ Working Files/[CW_SourceTermReview_CAPR002434_Rev02_SJL_KWJ.xlsx]

Notes:

[1] Seeps that were influenced by the sulphur stockpile were NEZ Dump Seep 1 and NEZ Dump Seep 2

While average dissolved molybdenum concentrations increased as shown in Table 22 for NEZ Dump (Sulphur Stockpile), the statistics used to define the source term (95th and 99th percentiles) did not change markedly (Figure 32).

Figure 32: Dissolved Molybdenum Concentrations Used in SRK (2023b) Compared to Concentrations from 2023 in NEZ Dump (Sulphur Stockpile) Seepages



Sources: https://srk.sharepoint.com/sites/NACAPR003074/Internal/!020_Project_Data/010_SRK/2023_Reporting/2_WQ Working Files/[CW_SourceTermReview_CAPR002434_Rev02_SJL_KWJ.xlsx]

Pit Seepage

As described in Section 11.2.2, the water quality sampled in Cariboo, Wight, and Springer pits does not represent pit wall seepage. Therefore, water quality sampling from the Cariboo, Wight, and Springer pits is not discussed further.

Screening with 2023 monitoring data highlighted strontium may be underpredicted, but no POIs were flagged as potentially underpredicted (Appendix H).

Tailings Embankment Seepage

Table 22 shows statistically significant increases for several parameters in the tailing seeps collected up to the end of 2022 compared to samples collected from 2023. Statistics for this period reflect the long-term record of monitoring before the tailings breach in August 2014, the subsequent period when the tailings were drained following the breach, and the re-activation of the TSF after the dam was reconstructed, including during and after no discharge from the mill occurred from May 2019 to June 2022 due to Care and Maintenance.

Table 22: Summary of Statistically Significant Changes in Tailings Seepage Concentrations

No Change	Significant Decrease	Significant Increase
Al, NH_3, As, B, Cd, Cr, Cu, DOC, F, Pb, Mn, PO_4, P, Se, Sn	pH, Sb, Ba, Be, Bi, Cl, Ni, NO_3, NO_2, Ag, Tl, V	Alkalinity, Ca, Co, Fe, Li, Mg, Mo, K, Si, Na, Sr, SO_4, Ti, U, Zn

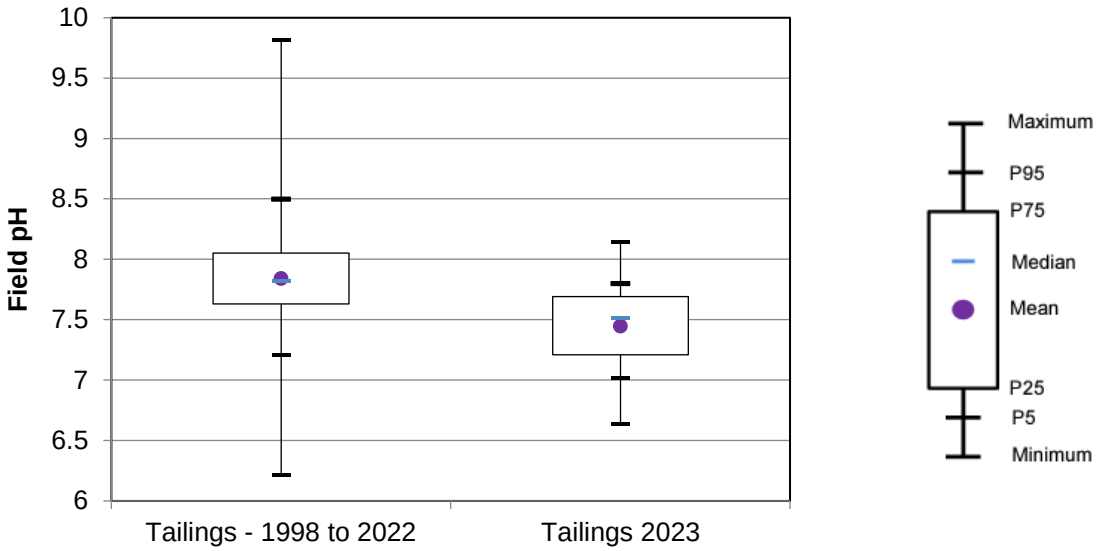
Sources: https://srk.sharepoint.com/sites/NACAPR003074/Internal/!020_Project_Data/010_SRK/2023_Reporting/2_WQ Working Files/[CW_SourceTermReview_CAPR002434_Rev02_SJL_KWJ.xlsx]

Figure 33 shows average field pH measurements of tailings embankments seepages decreased in 2023 compared to historical field pH measurements. Although the average is lower, field pH measurements in 2023 were within the historical range.

Of those parameters shown in Table 22, the more significant increases were apparent for sulphate and molybdenum. Seepage concentrations for these two parameters are correlated, which is consistent with the expectation that they both originate from the oxidation of pyrite as described in the conceptual model since molybdenite is uncommon in the mineralization at Mount Polley. Inspection of sulphate and molybdenum trends for individual seeps shows the upward trend and stabilization of the trend in recent years (see Section 11.3.2).

The extensive list of other parameters that have either increased or decreased with no obvious consistency (e.g., pH decreased but no change or decrease in most cations) suggests other factors, such as drought conditions in 2023, may have affected the seepage chemistry.

Figure 33: Field pH Measurements Used in SRK (2023b) Compared to Measurements from 2023 Tailings Embankment Seepages



Sources: https://srk.sharepoint.com/sites/NACAPR003074/Internal/!020_Project_Data/010_SRK/2023_Reporting/2_WQ Working Files/[CW_SourceTermReview_CAPR002434_Rev02_SJL_KWJ.xlsx]

12 Conclusions

SRK concluded the program is delivering data that are informing current and future waste rock and tailings management.

12.1 Monitoring Commitments

In 2023, MPMC fulfilled all monitoring commitments as established by the Permit, the ML/ARD Procedure Manual, and the Water Management Plan except the following:

- No samples of co-disposed tailings collected in 2023 were sent to external laboratories for further analyses. The target frequency was once per month.

12.2 Waste Rock Characteristics

Conclusions of the waste rock monitoring program are:

- Approximately one quarter of production pit blast hole samples collected in 2023 from the Springer Pit were classified as PAG (26%). This is consistent with past results showing Springer Pit rock as dominantly NAG with some PAG components. Trace element concentrations are within historical ranges.

12.3 Tailings Characteristics

The tailings monitoring program indicated:

- Monthly tailings composite results from 2023 showed the weighted annual average NP/AP was 9.9 and are consistent with past results, showing tailings are generally NAG. Trace element concentrations are within historical ranges.
- Results of tailings co-disposed in the SERDS in 2023 showed that samples were dominantly NAG.

12.4 Water Treatment Plant Waste Characteristics

The WTP waste monitoring program indicated:

- All WTP waste sediment samples collected in 2023 were classified as NAG except for the February sample which could not be classified because there was no TIC result.

12.5 Seepage and Contact Water Monitoring

The results of the seepage and contact water monitoring show the following:

- Seepage from the waste rock dumps shows the influence of waste rock leaching and indicates sulphide oxidation is occurring. Chemistry remains circumneutral to slightly alkaline at all sites,

indicating pH buffering by calcium and magnesium-bearing carbonate minerals is ongoing. These pH conditions limit the mobility of most trace elements except oxyanions such as selenium.

- Stable or decreasing trends in nitrate, ammonia, and nitrite concentrations are consistent with continued flushing of explosives residuals from the pit walls and waste rock seepage during mining activities in 2023.
- Seepage from the tailings embankment indicates concentrations for parameters of interest were similar from 2022 to 2023, with some exceptions including increasing sulphate and molybdenum. These increases may be the result of flushing of oxidation products as the water level rises.

13 Recommendations

The following recommendations are made:

- The frequency of in-house duplicates and off-site confirmatory analysis need to be increased for blast hole and placed material samples. Both should be performed on 10% of all samples until acceptable performance is achieved, after which 5% will be appropriate.
- CRM and blank analysis can be reduced to 5% of samples.
- As recommended in the previous annual report, Pond Zone HCT HC-13 can be stopped.
- Continuation of two humidity cell tests (HC-3, HC-4) containing “grey” tailings released during the dam breach to evaluate the role of breakdown of organic matter on metal mobility.
- As recommended in the previous annual report, the waste rock column tests Column 1, Column 2, and Column 3, can be stopped.
- Continuation of Magnetite Sand Column 1 and Grey Tailings Column 3 to allow comparison of differences in copper leaching, and termination of the Magnetite Sand Column 2.
- Because seepage from NEZ Seep 1 is not representative of seepage from the NEZ Dump, SRK recommends that an additional seep be selected from the NEZ Dump for quarterly monitoring. The selected seep should be known to have sufficient flow throughout the year. NEZ Seep 1 should continue to be monitored quarterly.

Closure

This report, Metal Leaching/Acid Rock Drainage Characterization and Monitoring Program – 2023 Annual Report, was prepared by

CERTIFICATE OF ANALYSIS

Work Order	: **VA23A5236**	Page	: 1 of 4
Client	: **Mount Polley Mining Corporation**	Laboratory	: Vancouver - Environmental
Contact	: Mr. Gabriel Holmes	Account Manager	: Can Dang
Address	: PO Box 12 Likely BC Canada V0L 1N0	Address	: 8081 Lougheed Highway Burnaby BC Canada V5A 1W9
Telephone	: 250-790-2215 ext 2171	Telephone	: +1 604 253 4188
Project	: ----	Date Samples Received	: 10-Mar-2023 10:20
PO	: 5590008044 Q2 2022	Date Analysis Commenced	: 14-Mar-2023
C-O-C number	: M0004	Issue Date	: 16-Mar-2023 14:07
Sampler	: AL		
Site	: ----		
Quote number	: Q77258 - WQ Analysis		
No. of samples received	: 1		
No. of samples analysed	: 1		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Colby Bingham	Laboratory Supervisor	Metals, Saskatoon, Saskatchewan
Maria Painchaud	Laboratory Assistant	Inorganics, Saskatoon, Saskatchewan
Milad Khani	Laboratory Analyst	Metals, Saskatoon, Saskatchewan
Xihua Yao	Laboratory Analyst	Sask Soils, Saskatoon, Saskatchewan

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

Unit	*Description*
%	percent
mg/kg	milligrams per kilogram
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical Results

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Sub-Matrix: **Soil/Solid**

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Soil/Solid**

Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well-established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be ALS long-term mean values (for empirical test methods).

Sub-Matrix:

					Reference Material (RM) Report

Colby Bingham	Laboratory Supervisor	Metals, Saskatoon, Saskatchewan
Hedy Lai	Team Leader - Inorganics	Sask Soils, Saskatoon, Saskatchewan
Milad Khani	Laboratory Analyst	Metals, Saskatoon, Saskatchewan

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

Unit	*Description*
%	percent
mg/kg	milligrams per kilogram
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percent Difference (RPD) and Data Quality Objectives
- Reference Material (RM) Report; Recovery and Data Quality Objectives
- Method Blank (MB) Report; Recovery and Data Quality Objectives
- Laboratory Control Sample (LCS) Report; Recovery and Data Quality Objectives

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Soil/Solid**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Soil/Solid**

Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well-established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be ALS long-term mean values (for empirical test methods).

Sub-Matrix:

					Reference Material (RM) Report				
					RM Target	Recovery (%)	Recovery Limits (%)		
Laboratory sample ID	Reference Material ID	Analyte	CAS Number	Method	Concentration	RM	Low	High	Qualifier
Physical Tests (QCLot: 890543)									
	RM	pH (1:2 soil:water)	----	E108	8.13 pH units	98.3	96.0	104	----
Organic / Inorganic Carbon (QCLot: 892544)									
	RM	Carbon, total [TC]	----	E351	1.4 %	100	80.0	120	----

No. of samples analysed	: 1		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Colby Bingham	Laboratory Supervisor	Metals, Saskatoon, Saskatchewan
Hedy Lai	Team Leader - Inorganics	Sask Soils, Saskatoon, Saskatchewan
Milad Khani	Laboratory Analyst	Metals, Saskatoon, Saskatchewan
Nancy Cruse	Laboratory Assistant	Inorganics, Saskatoon, Saskatchewan

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

Unit	*Description*
%	percent
mg/kg	milligrams per kilogram
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Soil/Solid**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Sub-Matrix: **Soil/Solid**

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Soil/Solid**

Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well-established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be ALS long-term mean values (for empirical test methods).

Sub-Matrix:

Maria Painchaud	Laboratory Assistant	Inorganics, Saskatoon, Saskatchewan
Milad Khani	Laboratory Analyst	Metals, Saskatoon, Saskatchewan

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

Unit	*Description*
%	percent
mg/kg	milligrams per kilogram
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Soil/Solid**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Soil/Solid**

					Laboratory Control Sample (LCS) Report

Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well-established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be ALS long-term mean values (for empirical test methods).

Sub-Matrix:

					Reference Material (RM) Report				
					RM Target	Recovery (%)	Recovery Limits (%)		
Laboratory sample ID	Reference Material ID	Analyte	CAS Number	Method	Concentration	RM	Low	High	Qualifier
Physical Tests (QCLot: 1083622)

Colby Bingham	Laboratory Supervisor	Metals, Saskatoon, Saskatchewan
Hedy Lai	Team Leader - Inorganics	Sask Soils, Saskatoon, Saskatchewan
Nancy Cruse	Laboratory Assistant	Inorganics, Saskatoon, Saskatchewan

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

Unit	*Description*
%	percent
mg/kg	milligrams per kilogram
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Nancy Cruse	Laboratory Assistant	Saskatoon Inorganics, Saskatoon, Saskatchewan

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Soil/Solid**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Sub-Matrix: **Soil/Solid**

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Soil/Solid**

Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well-established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be ALS long-term mean values (for empirical test methods).

Sub-Matrix:

Project	: ----	Date Samples Received	: 06-Sep-2023 08:15
PO	: 5590012190	Date Analysis Commenced	: 08-Sep-2023
C-O-C number	: D0118	Issue Date	: 15-Sep-2023 13:52
Sampler	: DS		
Site	: ----		
Quote number	: Q77258 - WQ Analysis		
No. of samples received	: 1		
No. of samples analysed	: 1		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Maria Painchaud	Laboratory Assistant	Inorganics, Saskatoon, Saskatchewan
Milad Khani	Laboratory Analyst	Metals, Saskatoon, Saskatchewan
Xihua Yao	Laboratory Analyst	Sask Soils, Saskatoon, Saskatchewan

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

Unit	*Description*
%	percent
mg/kg	milligrams per kilogram
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Qualifiers

Qualifier	*Description*
FR5	*As per applicable reference method(s), soil:water ratio for Fixed Ratio Leach was modified to 1:5 due to high soil organic content*

Analytical Results

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Soil/Solid**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Soil/Solid**

					Laboratory Control Sample (LCS) Report				
					Spike	Recovery (%)	Recovery Limits (%)

Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well-established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be ALS long-term mean values (for empirical test methods).

Sub-Matrix:

					Reference Material (RM) Report				
					RM Target	Recovery (%)	Recovery Limits (%)		
Laboratory sample ID	Reference Material ID	Analyte	CAS Number	Method	Concentration	RM	Low	High	Qualifier
Physical Tests (QCLot: 1128403)

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Maria Painchaud	Laboratory Assistant	Inorganics, Saskatoon, Saskatchewan
Milad Khani	Laboratory Analyst	Metals, Saskatoon, Saskatchewan
Xihua Yao	Laboratory Analyst	Sask Soils, Saskatoon, Saskatchewan

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

Unit	*Description*
%	percent
mg/kg	milligrams per kilogram
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Accreditation

Accreditation	*Description*	*Laboratory*	*Address*
A	CALA ISO/IEC 17025:2017	SK ALS Environmental - Saskatoon	819 58 Street East, Saskatoon, SK

Applicable accreditations are indicated in the Method/Lab column as superscripts.

Qualifiers

Qualifier	*Description*
FR5	*As per applicable reference method(s), soil:water ratio for Fixed Ratio Leach was modified to 1:5 due to high soil organic content*

Please refer to the General Comments section for an explanation of any result qualifiers detected.

Please refer to the Accreditation section for an explanation of analyte accreditations.

QUALITY CONTROL REPORT

Work Order	: **VA23C0882**	Page	: 1 of 10
Client	: Mount Polley Mining Corporation	Laboratory	: ALS Environmental - Vancouver
Contact	: Mr. Gabriel Holmes	Account Manager	: Can Dang
Address	: PO Box 12 Likely BC Canada V0L 1N0	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	:	Telephone	: +1 604 253 4188
Project	: ----	Date Samples Received	: 06-Sep-2023 08:15
PO	: 5590012190	Date Analysis Commenced	: 08-Sep-2023
C-O-C number	: D0119	Issue Date	: 15-Sep-2023 13:45
Sampler	: Assay lab 250-790-2215 ext 2171		
Site	: ----		
Quote number	: Q77258 - WQ Analysis		
No. of samples received	: 1		
No. of samples analysed	: 1		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percent Difference (RPD) and Data Quality Objectives
- Reference Material (RM) Report; Recovery and Data Quality Objectives
- Method Blank (MB) Report; Recovery and Data Quality Objectives
- Laboratory Control Sample (LCS) Report; Recovery and Data Quality Objectives

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Maria Painchaud	Laboratory Assistant	Saskatoon Inorganics, Saskatoon, Saskatchewan
Milad Khani	Laboratory Analyst	Saskatoon Metals, Saskatoon, Saskatchewan
Xihua Yao	Laboratory Analyst	Saskatoon Sask Soils, Saskatoon, Saskatchewan

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Soil/Solid**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Sub-Matrix: **Soil/Solid**

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Soil/Solid**

Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well-established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be ALS long-term mean values (for empirical test methods).

Sub-Matrix:

Project	: ----	Date Samples Received	: 06-Sep-2023 08:15
PO	: 5590012190	Date Analysis Commenced	: 08-Sep-2023
C-O-C number	: D0120	Issue Date	: 15-Sep-2023 13:46
Sampler	: Assay lab		
Site	: ----		
Quote number	: Q77258 - WQ Analysis		
No. of samples received	: 1		
No. of samples analysed	: 1		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Maria Painchaud	Laboratory Assistant	Inorganics, Saskatoon, Saskatchewan
Milad Khani	Laboratory Analyst	Metals, Saskatoon, Saskatchewan
Xihua Yao	Laboratory Analyst	Sask Soils, Saskatoon, Saskatchewan

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

Unit	*Description*
%	percent
mg/kg	milligrams per kilogram
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Accreditation

Accreditation	*Description*	*Laboratory*	*Address*
A	CALA ISO/IEC 17025:2017	SK ALS Environmental - Saskatoon	819 58 Street East, Saskatoon, SK

Applicable accreditations are indicated in the Method/Lab column as superscripts.

Qualifiers

Qualifier	*Description*
FR5	*As per applicable reference method(s), soil:water ratio for Fixed Ratio Leach was modified to 1:5 due to high soil organic content*

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Soil/Solid**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Sub-Matrix: **Soil/Solid**

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Soil/Solid**

Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well-established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be ALS long-term mean values (for empirical test methods).

Sub-Matrix:

					Reference Material (RM) Report				
					RM Target	Recovery (%)	Recovery Limits (%)

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Maria Painchaud	Laboratory Assistant	Inorganics, Saskatoon, Saskatchewan
Milad Khani	Laboratory Analyst	Metals, Saskatoon, Saskatchewan
Xihua Yao	Laboratory Analyst	Sask Soils, Saskatoon, Saskatchewan

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

Unit	*Description*
%	percent
mg/kg	milligrams per kilogram
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Accreditation

Accreditation	*Description*	*Laboratory*	*Address*
A	CALA ISO/IEC 17025:2017	SK ALS Environmental - Saskatoon	819 58 Street East, Saskatoon, SK

Applicable accreditations are indicated in the Method/Lab column as superscripts.

Qualifiers

Qualifier	*Description*
FR5	*As per applicable reference method(s), soil:water ratio for Fixed Ratio Leach was modified to 1:5 due to high soil organic content*

No. of samples analysed	: 1		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percent Difference (RPD) and Data Quality Objectives
- Reference Material (RM) Report; Recovery and Data Quality Objectives
- Method Blank (MB) Report; Recovery and Data Quality Objectives
- Laboratory Control Sample (LCS) Report; Recovery and Data Quality Objectives

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*

Milad Khani	Laboratory Analyst	Saskatoon Metals, Saskatoon, Saskatchewan
Xihua Yao	Laboratory Analyst	Saskatoon Sask Soils, Saskatoon, Saskatchewan

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Soil/Solid**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Soil/Solid**

Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well-established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be ALS long-term mean values (for empirical test methods).

Sub-Matrix:

					Reference Material (RM) Report				
					RM Target	Recovery (%)	Recovery Limits (%)		
Laboratory sample ID	Reference Material ID	Analyte	CAS Number	Method	Concentration	RM	Low	High	Qualifier
Physical Tests (QCLot: 1128403)									
	RM	pH (1:2 soil:water)	----	E108	8.13 pH units	101	96.0	104	----

Milad Khani	Laboratory Analyst	Metals, Saskatoon, Saskatchewan
Xihua Yao	Laboratory Analyst	Sask Soils, Saskatoon, Saskatchewan

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

Unit	*Description*
%	percent
mg/kg	milligrams per kilogram
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Accreditation

Accreditation	*Description*	*Laboratory*	*Address*
A	CALA ISO/IEC 17025:2017	SK ALS Environmental - Saskatoon	819 58 Street East, Saskatoon, SK

Applicable accreditations are indicated in the Method/Lab column as superscripts.

Qualifiers

Qualifier	*Description*
FR5	*As per applicable reference method(s), soil:water ratio for Fixed Ratio Leach was modified to 1:5 due to high soil organic content*

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Soil/Solid**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Sub-Matrix: **Soil/Solid**

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Soil/Solid**

Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well-established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be ALS long-term mean values (for empirical test methods).

Sub-Matrix:

AUG 2020 FRONT

Failure to complete all portions of this form may delay analysis. Please fill in this form LEGIBLY. By the use of this form the user acknowledges and agrees with the Terms and Conditions as specified on the back page of the white - report copy.

1. If any water samples are taken from a **Regulated Drinking Water (DW) System**, please submit using an **Authorized DW COC form**.

CERTIFICATE OF ANALYSIS

Work Order	: **VA23C0888**	Page	: 1 of 4
Client	: **Mount Polley Mining Corporation**	Laboratory	: ALS Environmental - Vancouver
Contact	: Mr. Gabriel Holmes	Account Manager	: Can Dang
Address	: PO Box 12 Likely BC Canada V0L 1N0	Address	: 8081 Lougheed Highway Burnaby BC Canada V5A 1W9
Telephone	: 250-790-2215 ext 2171	Telephone	: +1 604 253 4188
Project	: ----	Date Samples Received	: 06-Sep-2023 08:15
PO	: 5590012190	Date Analysis Commenced	: 08-Sep-2023
C-O-C number	: D0123	Issue Date	: 15-Sep-2023 13:46
Sampler	: Assay lab		
Site	: ----		
Quote number	: Q77258 - WQ Analysis		
No. of samples received	: 1		
No. of samples analysed	: 1		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Maria Painchaud	Laboratory Assistant	Inorganics, Saskatoon, Saskatchewan
Milad Khani	Laboratory Analyst	Metals, Saskatoon, Saskatchewan
Xihua Yao	Laboratory Analyst	Sask Soils, Saskatoon, Saskatchewan

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

Unit	*Description*
%	percent
mg/kg	milligrams per kilogram
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Accreditation

Accreditation	*Description*	*Laboratory*	*Address*
A	CALA ISO/IEC 17025:2017	SK ALS Environmental - Saskatoon	819 58 Street East, Saskatoon, SK

Applicable accreditations are indicated in the Method/Lab column as superscripts.

Qualifiers

Qualifier	*Description*
FR5	*As per applicable reference method(s), soil:water ratio for Fixed Ratio Leach was modified to 1:5 due to high soil organic content*

Analytical Results

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Soil/Solid**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Soil/Solid**

Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well-established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be ALS long-term mean values (for empirical test methods).

Sub-Matrix:

					Reference Material (RM) Report				
					RM Target	Recovery (%)	Recovery Limits (%)

Site	: ----		
Quote number	: Q77258 - WQ Analysis		
No. of samples received	: 1		
No. of samples analysed	: 1		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Maria Painchaud	Laboratory Assistant	Inorganics, Saskatoon, Saskatchewan
Milad Khani	Laboratory Analyst	Metals, Saskatoon, Saskatchewan
Xihua Yao	Laboratory Analyst	Sask Soils, Saskatoon, Saskatchewan

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

Unit	*Description*
%	percent
mg/kg	milligrams per kilogram
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Accreditation

Accreditation	*Description*	*Laboratory*	*Address*
A	CALA ISO/IEC 17025:2017	SK ALS Environmental - Saskatoon	819 58 Street East, Saskatoon, SK

Applicable accreditations are indicated in the Method/Lab column as superscripts.

Qualifiers

Qualifier	*Description*
FR5	*As per applicable reference method(s), soil:water ratio for Fixed Ratio Leach was modified to 1:5 due to high soil organic content*

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percent Difference (RPD) and Data Quality Objectives
- Reference Material (RM) Report; Recovery and Data Quality Objectives
- Method Blank (MB) Report; Recovery and Data Quality Objectives
- Laboratory Control Sample (LCS) Report; Recovery and Data Quality Objectives

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Xihua Yao	Laboratory Analyst	Saskatoon Sask Soils, Saskatoon, Saskatchewan

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Soil/Solid**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Soil/Solid**

Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well-established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be ALS long-term mean values (for empirical test methods).

Sub-Matrix:

Turnaround Time (TAT) Requested

- ☑ Routine [R] if received by 3pm M-F - no surcharges apply
- ☐ 4 day [P4] if received by 3pm M-F - 20% rush surcharge minimum
- ☐ 3 day [P3] if received by 3pm M-F - 25% rush surcharge minimum
- ☐ 2 day [P2] if received by 3pm M-F - 50% rush surcharge minimum
- ☐ 1 day [E] if received by 3pm M-F - 100% rush surcharge minimum
- ☐ Same day [E2] if received by 10am M-S - 200% rush surcharge.

Additional fees may apply to rush requests on weekends, statutory holidays and for non-routine tests.

Date and Time Required for all E&P TATs: dd-mmm-yy hh:mm am/pm

For all tests with rush TATs requested, please contact your AM to confirm availability.

PO	: 5590012190	Date Analysis Commenced	: 08-Sep-2023
C-O-C number	: D0125	Issue Date	: 15-Sep-2023 13:39
Sampler	: Assay lab		
Site	: ----		
Quote number	: Q77258 - WQ Analysis		
No. of samples received	: 1		
No. of samples analysed	: 1		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Maria Painchaud	Laboratory Assistant	Inorganics, Saskatoon, Saskatchewan
Milad Khani	Laboratory Analyst	Metals, Saskatoon, Saskatchewan
Xihua Yao	Laboratory Analyst	Sask Soils, Saskatoon, Saskatchewan

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

Unit	*Description*
%	percent
mg/kg	milligrams per kilogram
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Accreditation

Accreditation	*Description*	*Laboratory*	*Address*
A	CALA ISO/IEC 17025:2017	SK ALS Environmental - Saskatoon	819 58 Street East, Saskatoon, SK

Applicable accreditations are indicated in the Method/Lab column as superscripts.

Qualifiers

Qualifier	*Description*
FR5	*As per applicable reference method(s), soil:water ratio for Fixed Ratio Leach was modified to 1:5 due to high soil organic content*

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Soil/Solid**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Soil/Solid**

Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well-established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be ALS long-term mean values (for empirical test methods).

Sub-Matrix:

					Reference Material (RM) Report				
					RM Target	Recovery (%)	Recovery Limits (%)

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Maria Painchaud	Laboratory Assistant	Inorganics, Saskatoon, Saskatchewan
Milad Khani	Laboratory Analyst	Metals, Saskatoon, Saskatchewan
Xihua Yao	Laboratory Analyst	Sask Soils, Saskatoon, Saskatchewan

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

Unit	*Description*
%	percent
mg/kg	milligrams per kilogram
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Accreditation

Accreditation	*Description*	*Laboratory*	*Address*
A	CALA ISO/IEC 17025:2017	SK ALS Environmental - Saskatoon	819 58 Street East, Saskatoon, SK

Applicable accreditations are indicated in the Method/Lab column as superscripts.

Qualifiers

Qualifier	*Description*
FR5	*As per applicable reference method(s), soil:water ratio for Fixed Ratio Leach was modified to 1:5 due to high soil organic content*

QUALITY CONTROL REPORT

Work Order	: **VA23C0893**	Page	: 1 of 10
Client	: Mount Polley Mining Corporation	Laboratory	: ALS Environmental - Vancouver
Contact	: Mr. Gabriel Holmes	Account Manager	: Can Dang
Address	: PO Box 12 Likely BC Canada V0L 1N0	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	:	Telephone	: +1 604 253 4188
Project	: ----	Date Samples Received	: 06-Sep-2023 08:15
PO	: 5590012190	Date Analysis Commenced	: 08-Sep-2023
C-O-C number	: D0126	Issue Date	: 15-Sep-2023 13:39
Sampler	: Assay lab 250-790-2215 ext 2171		
Site	: ----		
Quote number	: Q77258 - WQ Analysis		
No. of samples received	: 1		
No. of samples analysed	: 1		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percent Difference (RPD) and Data Quality Objectives
- Reference Material (RM) Report; Recovery and Data Quality Objectives
- Method Blank (MB) Report; Recovery and Data Quality Objectives
- Laboratory Control Sample (LCS) Report; Recovery and Data Quality Objectives

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*

Milad Khani	Laboratory Analyst	Saskatoon Metals, Saskatoon, Saskatchewan
Xihua Yao	Laboratory Analyst	Saskatoon Sask Soils, Saskatoon, Saskatchewan

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Soil/Solid**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Soil/Solid**

Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well-established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be ALS long-term mean values (for empirical test methods).

Sub-Matrix:

Turnaround Time (TAT) Requested

☑ Routine [R] if received by 3pm M-F - no surcharges apply
☐ 4 day [P4] if received by 3pm M-F - 20% rush surcharge minimum
☐ 3 day [P3] if received by 3pm M-F - 25% rush surcharge minimum
☐ 2 day [P2] if received by 3pm M-F - 50% rush surcharge minimum
☐ 1 day [E] if received by 3pm M-F - 100% rush surcharge minimum
☐ Same day [E2] if received by 10am M-S - 200% rush surcharge.

Additional fees may apply to rush requests on weekends, statutory holidays and for non-routine tests.

Date and Time Required for all E&P TATs: dd-mmm-yy hh:mm am/pm

For all tests with rush TATs requested, please contact your AM to confirm availability.

No. of samples analysed	: 11		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Colby Bingham	Laboratory Supervisor	Metals, Saskatoon, Saskatchewan
Hedy Lai	Team Leader - Inorganics	Sask Soils, Saskatoon, Saskatchewan
Jeremy Greuel	Laboratory Assistant	Inorganics, Saskatoon, Saskatchewan
Milad Khani	Laboratory Analyst	Metals, Saskatoon, Saskatchewan

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

Unit	*Description*
%	percent
mg/kg	milligrams per kilogram
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Sampler	: Assay Lab 250-790-2215 ext 2171		
Site	: ----		
Quote number	: Q77258 - WQ Analysis		
No. of samples received	: 11		
No. of samples analysed	: 11		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percent Difference (RPD) and Data Quality Objectives
- Reference Material (RM) Report; Recovery and Data Quality Objectives
- Method Blank (MB) Report; Recovery and Data Quality Objectives
- Laboratory Control Sample (LCS) Report; Recovery and Data Quality Objectives

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Colby Bingham	Laboratory Supervisor	Saskatoon Metals, Saskatoon, Saskatchewan
Hedy Lai	Team Leader - Inorganics	Saskatoon Sask Soils, Saskatoon, Saskatchewan
Jeremy Greuel	Laboratory Assistant	Saskatoon Inorganics, Saskatoon, Saskatchewan
Milad Khani	Laboratory Analyst	Saskatoon Metals, Saskatoon, Saskatchewan

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Soil/Solid**

Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well-established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be ALS long-term mean values (for empirical test methods).

Sub-Matrix:

					Reference Material (RM) Report				
					RM Target	Recovery (%)	Recovery Limits (%)		
Laboratory sample ID	Reference Material ID	Analyte	CAS Number	Method	Concentration	RM	Low	High	Qualifier
Physical Tests (QCLot: 1245006)									
	RM	pH (1:2 soil:water)	----	E108	8.13 pH units	99.9	96.0	104	----

Appendix D. Lab Reports for Tailings Samples

CERTIFICATE OF ANALYSIS

Work Order	: **VA23A3444**	Page	: 1 of 5
Client	: **Mount Polley Mining Corporation**	Laboratory	: Vancouver - Environmental
Contact	: Mr. Gabriel Holmes	Account Manager	: Can Dang
Address	: PO Box 12 Likely BC Canada V0L 1N0	Address	: 8081 Lougheed Highway Burnaby BC Canada V5A 1W9
Telephone	: 250-790-2215 ext 2171	Telephone	: +1 604 253 4188
Project	: ----	Date Samples Received	: 15-Feb-2023 10:35
PO	: 5590012190	Date Analysis Commenced	: 18-Feb-2023
C-O-C number	: D0018	Issue Date	: 23-Feb-2023 15:19
Sampler	: ----		
Site	: ----		
Quote number	: Q77258 - WQ Analysis		
No. of samples received	: 1		
No. of samples analysed	: 1		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Alex Thornton	Analyst	Metals, Burnaby, British Columbia
Hedy Lai	Team Leader - Inorganics	Sask Soils, Saskatoon, Saskatchewan
Janice Leung	Supervisor - Organics Instrumentation	Organics, Burnaby, British Columbia
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Sam Silveira	Lab Assistant	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

Unit	*Description*
%	percent
mg/kg	milligrams per kilogram
mg/L	milligrams per litre
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical Results

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Qualifiers

Qualifier	*Description*
DUP-H	*Duplicate results outside ALS DQO, due to sample heterogeneity.*

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Sub-Matrix: **Soil/Solid**

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Soil/Solid**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Soil/Solid**

Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well-established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be ALS long-term mean values (for empirical test methods).

Sub-Matrix:

Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia
Sam Silveira	Lab Assistant	Metals, Burnaby, British Columbia
Xihua Yao	Laboratory Analyst	Sask Soils, Saskatoon, Saskatchewan

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

Unit	*Description*
%	percent
mg/kg	milligrams per kilogram
mg/L	milligrams per litre
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Soil/Solid**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Sub-Matrix: **Soil/Solid**

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Soil/Solid**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Soil/Solid**

Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well-established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be ALS long-term mean values (for empirical test methods).

Sub-Matrix:

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

Unit	*Description*
%	percent
mg/kg	milligrams per kilogram
mg/L	milligrams per litre
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Soil/Solid**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Soil/Solid**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Soil/Solid**

Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well-established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be ALS long-term mean values (for empirical test methods).

Sub-Matrix:

Turnaround Time (TAT) Requested

☑ Routine [R] if received by 3pm M-F - no surcharges apply
☐ 4 day [P4] if received by 3pm M-F - 20% rush surcharge minimum
☐ 3 day [P3] if received by 3pm M-F - 25% rush surcharge minimum
☐ 2 day [P2] if received by 3pm M-F - 50% rush surcharge minimum
☐ 1 day [E] if received by 3pm M-F - 100% rush surcharge minimum
☐ Same day [E2] if received by 10am M-S - 200% rush surcharge.

Additional fees may apply to rush requests on weekends, statutory holidays and for non-routine tests.

Date and Time Required for all E&P TATs: dd-mmm-yy hh:mm am/pm

For all tests with rush TATs requested, please contact your AM to confirm availability.

Owen Cheng		Metals, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia
Sam Silveira	Lab Assistant	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.
Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
%	percent
mg/kg	milligrams per kilogram
mg/L	milligrams per litre
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Accreditation

Accreditation	*Description*	*Laboratory*	*Address*
A	CALA ISO/IEC 17025:2017	VA Vancouver - Environmental	8081 Lougheed Highway, Burnaby, British Columbia
B	CALA ISO/IEC 17025:2017	SK Saskatoon - Environmental	819 58 Street East, Saskatoon, Saskatchewan

Applicable accreditations are indicated in the Method/Lab column as superscripts.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report
