A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Soil/Solid**

Qualifiers

Qualifier	*Description*
DUP-H	*Duplicate results outside ALS DQO, due to sample heterogeneity.*

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Soil/Solid**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Soil/Solid**

Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well-established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be ALS long-term mean values (for empirical test methods).

Sub-Matrix:

					Reference Material (RM) Report				
					RM Target	Recovery (%)	Recovery Limits (%)		
Laboratory sample ID	Reference Material ID	Analyte	CAS Number	Method	Concentration	RM	Low	High	Qualifier
Organic / Inorganic Carbon (QCLot: 928016)									
	RM	Carbon, total [TC]	----	E351	1.4 %	104	80.0	120	----
Inorganics (QCLot: 928017)									
	RM	Sulfur, total	7704-34-9	E399	0.352 %	94.3	70.0	130	----

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Alex Thornton	Analyst	Metals, Burnaby, British Columbia
Hedy Lai	Team Leader - Inorganics	Sask Soils, Saskatoon, Saskatchewan
Janice Leung	Supervisor - Organics Instrumentation	Organics, Burnaby, British Columbia
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Sam Silveira	Lab Assistant	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.
Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
%	percent
mg/kg	milligrams per kilogram
mg/L	milligrams per litre
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Accreditation

Accreditation	*Description*	*Laboratory*	*Address*
A	CALA ISO/IEC 17025:2017	VA Vancouver - Environmental	8081 Lougheed Highway, Burnaby, BC
B	CALA ISO/IEC 17025:2017	SK Saskatoon - Environmental	819 58 Street East, Saskatoon, SK

Applicable accreditations are indicated in the Method/Lab column as superscripts.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Soil/Solid**

Qualifiers

Qualifier	*Description*
DUP-H	*Duplicate results outside ALS DQO, due to sample heterogeneity.*

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Soil/Solid**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Soil/Solid**

Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well-established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be ALS long-term mean values (for empirical test methods).

Sub-Matrix:

					Reference Material (RM) Report				
					RM Target	Recovery (%)	Recovery Limits (%)		
Laboratory sample ID	Reference Material ID	Analyte	CAS Number	Method	Concentration	RM	Low	High	Qualifier
Organic / Inorganic Carbon (QCLot: 1018636)									
	RM	Carbon, total [TC]	----	E351	1.4 %	95.2	80.0	120	----
Inorganics (QCLot: 1018638)									
	RM	Sulfur, total	7704-34-9	E399	0.352 %	100	70.0	130	----

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Alex Thornton	Analyst	Metals, Burnaby, British Columbia
Janice Leung	Supervisor - Organics Instrumentation	Organics, Burnaby, British Columbia
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Sam Silveira	Lab Assistant	Metals, Burnaby, British Columbia
Xihua Yao	Laboratory Analyst	Sask Soils, Saskatoon, Saskatchewan

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.
Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
%	percent
mg/kg	milligrams per kilogram
mg/L	milligrams per litre
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Workorder Comments

Sample(s) F01: Samples Received with temperature >10 °C in Saskatoon

Qualifiers

Qualifier	*Description*
LTIS	*Limited sample available for TCLP or SPLP inorganics/SVOCs (<100g). Leachate fluid volume & sample weight were scaled down proportionately to permit analysis. Test results from modified TCLP or SPLP procedures may be unsuitable for regulatory purposes.*

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Soil/Solid**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Soil/Solid**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Soil/Solid**

Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well-established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be ALS long-term mean values (for empirical test methods).

Sub-Matrix:

					Reference Material (RM) Report				
					RM Target	Recovery (%)	Recovery Limits (%)		
Laboratory sample ID	Reference Material ID	Analyte	CAS Number	Method	Concentration	RM	Low	High	Qualifier
Organic / Inorganic Carbon (QCLot: 1050309)									
	RM	Carbon, total [TC]	----	E351	1.4 %	97.6	80.0	120	----
Inorganics (QCLot: 1050310)									
	RM	Sulfur, total	7704-34-9	E399	0.352 %	90.3	70.0	130	----

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Hedy Lai	Team Leader - Inorganics	Sask Soils, Saskatoon, Saskatchewan
Janice Leung	Supervisor - Organics Instrumentation	Organics, Burnaby, British Columbia
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Ophelia Chiu	Department Manager - Organics	Organics, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia
Sam Silveira	Lab Assistant	Metals, Burnaby, British Columbia
Tony Nguyen	Analyst	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.
Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
%	percent
mg/kg	milligrams per kilogram
mg/L	milligrams per litre
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Accreditation

Accreditation	*Description*	*Laboratory*	*Address*
A	CALA ISO/IEC 17025:2017	SK ALS Environmental - Saskatoon	819 58 Street East, Saskatoon, SK
B	CALA ISO/IEC 17025:2017	VA ALS Environmental - Vancouver	8081 Lougheed Highway, Burnaby, BC

Applicable accreditations are indicated in the Method/Lab column as superscripts.

No. of samples received	: 1		
No. of samples analysed	: 1		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percent Difference (RPD) and Data Quality Objectives
- Matrix Spike (MS) Report; Recovery and Data Quality Objectives
- Reference Material (RM) Report; Recovery and Data Quality Objectives
- Method Blank (MB) Report; Recovery and Data Quality Objectives
- Laboratory Control Sample (LCS) Report; Recovery and Data Quality Objectives

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*

Janice Leung	Supervisor - Organics Instrumentation	Vancouver Organics, Burnaby, British Columbia
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Vancouver Metals, Burnaby, British Columbia
Ophelia Chiu	Department Manager - Organics	Vancouver Organics, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Vancouver Metals, Burnaby, British Columbia
Sam Silveira	Lab Assistant	Vancouver Metals, Burnaby, British Columbia
Tony Nguyen	Analyst	Vancouver Metals, Burnaby, British Columbia

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Soil/Solid**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Soil/Solid**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Soil/Solid**

Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well-established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be ALS long-term mean values (for empirical test methods).

Sub-Matrix:

					Reference Material (RM) Report				
					RM Target	Recovery (%)	Recovery Limits (%)		
Laboratory sample ID	Reference Material ID	Analyte	CAS Number	Method	Concentration	RM	Low	High	Qualifier
Organic / Inorganic Carbon (QCLot: 1105841)									
	RM	Carbon, total [TC]	----	E351	1.4 %	99.1	80.0	120	----
Inorganics (QCLot: 1105842)									
	RM	Sulfur, total	7704-34-9	E399	0.352 %	102	70.0	130	----
Metals (QCLot: 1109801)

No. of samples analysed	: 1		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Ghazaleh Khanmirzaei	Analsyt	Metals, Burnaby, British Columbia
Janice Leung	Supervisor - Organics Instrumentation	Organics, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia
Xihua Yao	Laboratory Analyst	Sask Soils, Saskatoon, Saskatchewan

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

Unit	*Description*
%	percent
mg/kg	milligrams per kilogram
mg/L	milligrams per litre
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

No. of samples analysed	: 1		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percent Difference (RPD) and Data Quality Objectives
- Matrix Spike (MS) Report; Recovery and Data Quality Objectives
- Reference Material (RM) Report; Recovery and Data Quality Objectives
- Method Blank (MB) Report; Recovery and Data Quality Objectives
- Laboratory Control Sample (LCS) Report; Recovery and Data Quality Objectives

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Ghazaleh Khanmirzaei	Analsyt	Vancouver Metals, Burnaby, British Columbia

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Soil/Solid**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Soil/Solid**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Soil/Solid**

Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well-established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be ALS long-term mean values (for empirical test methods).

Sub-Matrix:

					Reference Material (RM) Report				
					RM Target	Recovery (%)	Recovery Limits (%)		
Laboratory sample ID	Reference Material ID	Analyte	CAS Number	Method	Concentration	RM	Low	High	Qualifier
Organic / Inorganic Carbon (QCLot: 1285759)									
	RM	Carbon, total [TC]	----	E351	1.4 %	97.6	80.0	120	----

No. of samples analysed	: 4		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Ghazaleh Khanmirzaei	Analsyt	Metals, Burnaby, British Columbia
Hedy Lai	Team Leader - Inorganics	Sask Soils, Saskatoon, Saskatchewan
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Owen Cheng		Metals, Burnaby, British Columbia
Rebecca Sit	Supervisor - Organics Extractions	Organics, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

Unit	*Description*
%	percent
mg/kg	milligrams per kilogram
mg/L	milligrams per litre
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Qualifiers

Qualifier	*Description*
LTIS	*Limited sample available for TCLP or SPLP inorganics/SVOCs (<100g). Leachate fluid volume & sample weight were scaled down proportionately to permit analysis. Test results from modified TCLP or SPLP procedures may be unsuitable for regulatory purposes.*

QUALITY CONTROL REPORT

Work Order	: **VA24A0768**	Page	: 1 of 12
Client	: Mount Polley Mining Corporation	Laboratory	: ALS Environmental - Vancouver
Contact	: Mr. Gabriel Holmes	Account Manager	: Can Dang
Address	: PO Box 12 Likely BC Canada V0L 1N0	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	:	Telephone	: +1 604 253 4188
Project	: ----	Date Samples Received	: 12-Jan-2024 10:05
PO	: 5590012190	Date Analysis Commenced	: 17-Jan-2024
C-O-C number	: A0344	Issue Date	: 22-Jan-2024 08:50
Sampler	: ---- 250-790-2215 ext 2171		
Site	: ----		
Quote number	: Q77258 - WQ Analysis		
No. of samples received	: 4		
No. of samples analysed	: 4		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percent Difference (RPD) and Data Quality Objectives
- Matrix Spike (MS) Report; Recovery and Data Quality Objectives
- Reference Material (RM) Report; Recovery and Data Quality Objectives
- Method Blank (MB) Report; Recovery and Data Quality Objectives
- Laboratory Control Sample (LCS) Report; Recovery and Data Quality Objectives

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Ghazaleh Khanmirzaei	Analsyt	Vancouver Metals, Burnaby, British Columbia
Hedy Lai	Team Leader - Inorganics	Saskatoon Sask Soils, Saskatoon, Saskatchewan
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Vancouver Metals, Burnaby, British Columbia
Owen Cheng		Vancouver Metals, Burnaby, British Columbia
Rebecca Sit	Supervisor - Organics Extractions	Vancouver Organics, Burnaby, British Columbia

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Soil/Solid**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Qualifiers

Qualifier	Description
B	Method Blank exceeds ALS DQO. Associated sample results which are < Limit of Reporting or > 5 times blank level are considered reliable.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Soil/Solid**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Soil/Solid**

Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well-established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be ALS long-term mean values (for empirical test methods).

Sub-Matrix:

					Reference Material (RM) Report				
					RM Target	Recovery (%)	Recovery Limits (%)

Turnaround Time (TAT) Requested

☑ Routine [R] if received by 3pm M-F - no surcharges apply
☐ 4 day [P4] if received by 3pm M-F - 20% rush surcharge minimu
☐ 3 day [P3] if received by 3pm M-F - 25% rush surcharge minimu
☐ 2 day [P2] if received by 3pm M-F - 50% rush surcharge minimu
☐ 1 day [E] if received by 3pm M-F - 100% rush surcharge minimu
☐ Same day [E2] if received by 10am M-S - 200% rush surcharge.

Additional fees may apply to rush requests on weekends.

Date and Time Required for all E&P TATs: dd-mmm-yy hh:mm am/pm

For all tests with rush TATs requested, please contact your AM to confirm availability.

Appendix F. Lab Reports for WTP Waste Samples

CERTIFICATE OF ANALYSIS

Work Order	: **VA23A3442**	Page	: 1 of 8
Client	: **Mount Polley Mining Corporation**	Laboratory	: Vancouver - Environmental
Contact	: Mr. Gabriel Holmes	Account Manager	: Can Dang
Address	: PO Box 12 Likely BC Canada V0L 1N0	Address	: 8081 Lougheed Highway Burnaby BC Canada V5A 1W9
Telephone	: 250-790-2215 ext 2171	Telephone	: +1 604 253 4188
Project	: ----	Date Samples Received	: 15-Feb-2023 10:35
PO	: 5590012190	Date Analysis Commenced	: 16-Feb-2023
C-O-C number	: D0044	Issue Date	: 23-Feb-2023 12:48
Sampler	: ----		
Site	: ----		
Quote number	: Q77258 - WQ Analysis		
No. of samples received	: 2		
No. of samples analysed	: 2		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Angelo Salandanan	Lab Assistant	Metals, Burnaby, British Columbia
Colby Bingham	Laboratory Supervisor	Inorganics, Saskatoon, Saskatchewan
Colby Bingham	Laboratory Supervisor	Metals, Saskatoon, Saskatchewan
Hedy Lai	Team Leader - Inorganics	Sask Soils, Saskatoon, Saskatchewan
Kate Dimitrova	Analsyt	Inorganics, Burnaby, British Columbia
Kim Jensen	Department Manager - Metals	Metals, Burnaby, British Columbia
Milad Khani	Laboratory Analyst	Metals, Saskatoon, Saskatchewan

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	no units
%	percent
µS/cm	microsiemens per centimetre
mg/kg	milligrams per kilogram
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Qualifiers

Qualifier	*Description*
DLM	*Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).*

Analytical Results

Sub-Matrix: **Soil**
(Matrix: **Soil/Solid**)

No. of samples analysed	: 2		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percent Difference (RPD) and Data Quality Objectives
- Matrix Spike (MS) Report; Recovery and Data Quality Objectives
- Reference Material (RM) Report; Recovery and Data Quality Objectives
- Method Blank (MB) Report; Recovery and Data Quality Objectives
- Laboratory Control Sample (LCS) Report; Recovery and Data Quality Objectives

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Angelo Salandanan	Lab Assistant	Vancouver Metals, Burnaby, British Columbia
Colby Bingham	Laboratory Supervisor	Saskatoon Inorganics, Saskatoon, Saskatchewan
Colby Bingham	Laboratory Supervisor	Saskatoon Metals, Saskatoon, Saskatchewan
Hedy Lai	Team Leader - Inorganics	Saskatoon Sask Soils, Saskatoon, Saskatchewan
Kate Dimitrova	Analsyt	Vancouver Inorganics, Burnaby, British Columbia
Kim Jensen	Department Manager - Metals	Vancouver Metals, Burnaby, British Columbia
Milad Khani	Laboratory Analyst	Saskatoon Metals, Saskatoon, Saskatchewan

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Soil/Solid**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Soil/Solid**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Qualifiers

Qualifier	Description
MES	*Data Quality Objective was marginally exceeded (by < 10% absolute) for < 10% of analytes in a Multi-Element Scan / Multi-Parameter Scan (considered acceptable as per OMOE & CCME).*
MS-B	*Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.*

Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well-established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be ALS long-term mean values (for empirical test methods).

Kim Jensen	Department Manager - Metals	Metals, Burnaby, British Columbia
Sam Silveira	Lab Assistant	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.
Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
%	percent
mg/kg	milligrams per kilogram
mg/L	milligrams per litre
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Workorder Comments

Due to limited sample weight available, shakeflask leaching procedure and analysis could not be performed on the sample.

Qualifiers

Qualifier	*Description*
DLA	*Detection Limit adjusted for required dilution.*
FR5	*As per applicable reference method(s), soil:water ratio for Fixed Ratio Leach was modified to 1:5 due to high soil organic content*

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Soil/Solid**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Soil/Solid**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Soil/Solid**

Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well-established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be ALS long-term mean values (for empirical test methods).

Sub-Matrix:

This report is for 1 sample of Crushed Rock submitted to our lab in Vancouver, BC, Canada on 20-MAR-2023.

The following have access to data associated with this certificate:

ALSE VANCOUVER WEBTRIEVE SOFTWARE DEVELOPMENT GROUP	CAN DANG	ALSEV DATASUBLET

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
DISP-01	Disposal of all sample fractions
LOG-21	Sample logging - ClientBarCode
PUL-31	Pulverize up to 250g 85% <75 um

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
C-CAL15	Inorganic carbon by difference	
C-IR07	Total Carbon (IR Spectroscopy)	LECO
S-IR08	Total Sulphur (IR Spectroscopy)	LECO
C-IR17	Non-Carbonate C by multiple HCl leach IR	LECO

This is the Final Report and supersedes any preliminary report with this certificate number.Results apply to samples as submitted.All pages of this report have been checked and approved for release.

Turnaround Time (TAT) Requested

☑ Routine [R] if received by 3pm M-F - no surcharges apply
☐ 4 day [P4] if received by 3pm M-F - 20% rush surcharge minimum
☐ 3 day [P3] if received by 3pm M-F - 25% rush surcharge minimum
☐ 2 day [P2] if received by 3pm M-F - 50% rush surcharge minimum
☐ 1 day [E] if received by 3pm M-F - 100% rush surcharge minimum
☐ Same day [E2] if received by 10am M-S - 200% rush surcharge.

Additional fees may apply to rush requests on weekends, statutory holidays and for non-routine tests.

Date and Time Required for all E&P TATs: dd-mmm-yy hh:mm am/pm

For all tests with rush TATs requested, please contact your AM to confirm availability.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Caitlin Macey	Team Leader - Inorganics	Inorganics, Burnaby, British Columbia
Cindy Tang	Team Leader - Inorganics	Inorganics, Burnaby, British Columbia
Ilnaz Badbezanchi	Supervisor - Metals Prep & Mercury	Metals, Burnaby, British Columbia
Kate Dimitrova	Analsyt	Inorganics, Burnaby, British Columbia
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Miles Gropen	Department Manager - Inorganics	Inorganics, Burnaby, British Columbia
Ophelia Chiu	Department Manager - Organics	Organics, Burnaby, British Columbia
Owen Cheng		Metals, Burnaby, British Columbia
Paolo Obillo	Account Manager Assistant	Internal Subcontracting, North Vancouver, British Columbia
Sam Silveira	Lab Assistant	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

Unit	*Description*
%	percent
µS/cm	microsiemens per centimetre
mg/kg	milligrams per kilogram
mg/L	milligrams per litre
mV	millivolts
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Workorder Comments

Method Spike (MS) - After adding the spike solution to VA23A6349-1, a precipitate was formed, resulting in low recoveries for Sb, As, Cr, Fe, Pb, Se, V and Zr. This issue is expected to be specific to the sample with the spiking solution, and not the sample itself (without spiking solution), as there was no visual precipitate noted. Results for VA23A6349-1 are not expected to be impacted

Qualifiers

Owen Cheng		Vancouver Metals, Burnaby, British Columbia
Paolo Obillo	Account Manager Assistant	ALS Minerals (Vancouver) Internal Subcontracting, North Vancouver, British Columbia
Sam Silveira	Lab Assistant	Vancouver Metals, Burnaby, British Columbia

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Soil/Solid**

Qualifiers

Qualifier	*Description*
DUP-H	*Duplicate results outside ALS DQO, due to sample heterogeneity.*

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Qualifier	Description
B	*Method Blank exceeds ALS DQO. Associated sample results which are < Limit of Reporting or > 5 times blank level are considered reliable.*

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Soil/Solid**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Soil/Solid**

RRQC	*Refer to report comments for information regarding this QC result.*

Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well-established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be ALS long-term mean values (for empirical test methods).

Sub-Matrix:

					Reference Material (RM) Report				
					RM Target	Recovery (%)	Recovery Limits (%)

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.
Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
%	percent
µS/cm	microsiemens per centimetre
mg/kg	milligrams per kilogram
mg/L	milligrams per litre
mV	millivolts
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Accreditation

Accreditation	*Description*	*Laboratory*	*Address*
A	CALA ISO/IEC 17025:2017	VA Vancouver - Environmental	8081 Lougheed Highway, Burnaby, BC

Applicable accreditations are indicated in the Method/Lab column as superscripts.

Qualifiers

Qualifier	*Description*
DLA	*Detection Limit adjusted for required dilution.*
DLB	*Detection Limit Raised. Analyte detected at comparable level in Method Blank.*
DLM	*Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).*
FR10	*As per applicable reference method(s), soil:water ratio for Fixed Ratio Leach was modified to 1:10 due to high soil organic content.*

Please refer to the Accreditation section for an explanation of analyte accreditations.

QUALITY CONTROL REPORT

Work Order	: **VA23B0791**	Page	: 1 of 17
Client	: Mount Polley Mining Corporation	Laboratory	: Vancouver - Environmental
Contact	: Gabriel Holmes	Account Manager	: Can Dang
Address	: PO Box 12 Likely BC Canada V0L 1N0	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	:	Telephone	: +1 604 253 4188
Project	: ----	Date Samples Received	: 17-May-2023 09:50
PO	: 5590012190	Date Analysis Commenced	: 18-May-2023
C-O-C number	: T0011	Issue Date	: 22-Jun-2023 17:21
Sampler	: DS, GH, KA 250-790-2215 ext 2171		
Site	: ----		
Quote number	: Q77258 - WQ Analysis		
No. of samples received	: 1		
No. of samples analysed	: 1		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percent Difference (RPD) and Data Quality Objectives
- Matrix Spike (MS) Report; Recovery and Data Quality Objectives
- Reference Material (RM) Report; Recovery and Data Quality Objectives
- Method Blank (MB) Report; Recovery and Data Quality Objectives
- Laboratory Control Sample (LCS) Report; Recovery and Data Quality Objectives

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Vancouver Inorganics, Burnaby, British Columbia
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Vancouver Metals, Burnaby, British Columbia
Ophelia Chiu	Department Manager - Organics	Vancouver Organics, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Vancouver Metals, Burnaby, British Columbia
Sam Silveira	Lab Assistant	Vancouver Metals, Burnaby, British Columbia
Virginia Smith	Account Manager Assistant	ALS Minerals (Vancouver) Internal Subcontracting, North Vancouver, British Columbia

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Soil/Solid**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Sub-Matrix: **Soil/Solid**

Qualifier	Description
B	*Method Blank exceeds ALS DQO. Associated sample results which are < Limit of Reporting or > 5 times blank level are considered reliable.*

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Soil/Solid**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Soil/Solid**

Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well-established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be ALS long-term mean values (for empirical test methods).

Sub-Matrix:

					Reference Material (RM) Report				
					RM Target	Recovery (%)	Recovery Limits (%)

CERTIFICATE VA23134795

Project: VA23B0791

This report is for 1 sample of Soil submitted to our lab in Vancouver, BC, Canada on 19-MAY-2023.

The following have access to data associated with this certificate:

ALSE VANCOUVER WEBTRIEVE SOFTWARE DEVELOPMENT GROUP	CAN DANG	ALSEV DATASUBLET

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
DISP-01	Disposal of all sample fractions
LOG-21	Sample logging - ClientBarCode
SCR-41	Screen to -180um and save both

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
C-CAL15	Inorganic carbon by difference	
C-IR07	Total Carbon (IR Spectroscopy)	LECO
S-IR08	Total Sulphur (IR Spectroscopy)	LECO
C-IR17	Non-Carbonate C by multiple HCl leach IR	LECO

This is the Final Report and supersedes any preliminary report with this certificate number.Results apply to samples as submitted.All pages of this report have been checked and approved for release.

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

Unit	*Description*
%	percent
µS/cm	microsiemens per centimetre
mg/kg	milligrams per kilogram
mg/L	milligrams per litre
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Qualifiers

Qualifier	*Description*
DLA	*Detection Limit adjusted for required dilution.*
FR10	*As per applicable reference method(s), soil:water ratio for Fixed Ratio Leach was modified to 1:10 due to high soil organic content.*

QUALITY CONTROL REPORT

Work Order	: **VA23B9659**	Page	: 1 of 12
Client	: Mount Polley Mining Corporation	Laboratory	: ALS Environmental - Vancouver
Contact	: Mr. Gabriel Holmes	Account Manager	: Can Dang
Address	: PO Box 12 Likely BC Canada V0L 1N0	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	:	Telephone	: +1 604 253 4188
Project	: ----	Date Samples Received	: 23-Aug-2023 16:31
PO	: 5590012190	Date Analysis Commenced	: 25-Aug-2023
C-O-C number	: D0112	Issue Date	: 06-Sep-2023 09:30
Sampler	: DS 250-790-2215 ext 2171		
Site	: ----		
Quote number	: Q77258 - WQ Analysis		
No. of samples received	: 1		
No. of samples analysed	: 1		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percent Difference (RPD) and Data Quality Objectives
- Matrix Spike (MS) Report; Recovery and Data Quality Objectives
- Reference Material (RM) Report; Recovery and Data Quality Objectives
- Method Blank (MB) Report; Recovery and Data Quality Objectives
- Laboratory Control Sample (LCS) Report; Recovery and Data Quality Objectives

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Hedy Lai	Team Leader - Inorganics	Saskatoon Sask Soils, Saskatoon, Saskatchewan

Kim Jensen	Department Manager - Metals	Vancouver Metals, Burnaby, British Columbia
Ophelia Chiu	Department Manager - Organics	Vancouver Organics, Burnaby, British Columbia
Sam Silveira	Lab Assistant	Vancouver Metals, Burnaby, British Columbia
Tony Nguyen	Analyst	Vancouver Metals, Burnaby, British Columbia
Xihua Yao	Laboratory Analyst	Saskatoon Sask Soils, Saskatoon, Saskatchewan

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Soil/Solid**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Sub-Matrix: **Soil/Solid**

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Soil/Solid**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Soil/Solid**

Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well-established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be ALS long-term mean values (for empirical test methods).

Sub-Matrix:

					Reference Material (RM) Report				
					RM Target	Recovery (%)	Recovery Limits (%)		
Laboratory sample ID	Reference Material ID	Analyte	CAS Number	Method	Concentration	RM	Low	High	Qualifier
Organic / Inorganic Carbon (QCLot: 1105841)

Turnaround Time (TAT) Requested

☑ Routine [R] if received by 3pm M-F - no surcharges apply
☐ 4 day [P4] if received by 3pm M-F - 20% rush surcharge minimum
☐ 3 day [P3] if received by 3pm M-F - 25% rush surcharge minimum
☐ 2 day [P2] if received by 3pm M-F - 50% rush surcharge minimum
☐ 1 day [E] if received by 3pm M-F - 100% rush surcharge minimum
☐ Same day [E2] if received by 10am M-S - 200% rush surcharge

Additional fees may apply to rush requests on weekends, statutory holidays and for non-routine tests.

Date and Time Required for all E&P TATs: dd-mmm-yy hh:mm am/pm

For all tests with rush TATs requested, please contact your AM to confirm availability.

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Alex Thornton	Analyst	Metals, Burnaby, British Columbia
Brieanna Allen	Production/Validation Manager	Inorganics, Burnaby, British Columbia
Cindy Tang	Team Leader - Inorganics	Inorganics, Burnaby, British Columbia
Harsha Attanayake	Laboratory Analyst	Inorganics, Burnaby, British Columbia
Janice Leung	Supervisor - Organics Instrumentation	Organics, Burnaby, British Columbia
Kaitlyn Gardner	Account Manager Assistant	Internal Subcontracting, North Vancouver, British Columbia
Kenson Lo		Metals, Burnaby, British Columbia
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Ophelia Chiu	Department Manager - Organics	Organics, Burnaby, British Columbia
Owen Cheng		Metals, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia
Sam Silveira	Lab Assistant	Metals, Burnaby, British Columbia
Tracy Harley	Supervisor - Water Quality Instrumentation	Inorganics, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

Unit	*Description*
%	percent
µS/cm	microsiemens per centimetre
mg/kg	milligrams per kilogram
mg/L	milligrams per litre
mV	millivolts
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Qualifiers

Qualifier	*Description*
DLA	*Detection Limit adjusted for required dilution.*
DLDS	*Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.*
DLM	*Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).*

QUALITY CONTROL REPORT

Work Order	: **VA23C6531**	Page	: 1 of 16
Client	: Mount Polley Mining Corporation	Laboratory	: ALS Environmental - Vancouver
Contact	: Mr. Gabriel Holmes	Account Manager	: Can Dang
Address	: PO Box 12 Likely BC Canada V0L 1N0	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	:	Telephone	: +1 604 253 4188
Project	: ----	Date Samples Received	: 03-Nov-2023 12:15
PO	: 5590012190	Date Analysis Commenced	: 04-Nov-2023
C-O-C number	: D0157	Issue Date	: 23-Dec-2023 13:38
Sampler	: DS 250-790-2215 ext 2171		
Site	: ----		
Quote number	: Q77258 - WQ Analysis		
No. of samples received	: 1		
No. of samples analysed	: 1		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percent Difference (RPD) and Data Quality Objectives
- Matrix Spike (MS) Report; Recovery and Data Quality Objectives
- Reference Material (RM) Report; Recovery and Data Quality Objectives
- Method Blank (MB) Report; Recovery and Data Quality Objectives
- Laboratory Control Sample (LCS) Report; Recovery and Data Quality Objectives

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Alex Thornton	Analyst	Vancouver Metals, Burnaby, British Columbia
Brieanna Allen	Production/Validation Manager	Vancouver Inorganics, Burnaby, British Columbia
Cindy Tang	Team Leader - Inorganics	Vancouver Inorganics, Burnaby, British Columbia
Harsha Attanayake	Laboratory Analyst	Vancouver Inorganics, Burnaby, British Columbia
Janice Leung	Supervisor - Organics Instrumentation	Vancouver Organics, Burnaby, British Columbia
Kaitlyn Gardner	Account Manager Assistant	ALS Minerals (Vancouver) Internal Subcontracting, North Vancouver, British Columbia
Kenson Lo		Vancouver Metals, Burnaby, British Columbia
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Vancouver Metals, Burnaby, British Columbia
Ophelia Chiu	Department Manager - Organics	Vancouver Organics, Burnaby, British Columbia
Owen Cheng		Vancouver Metals, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Vancouver Metals, Burnaby, British Columbia
Sam Silveira	Lab Assistant	Vancouver Metals, Burnaby, British Columbia
Tracy Harley	Supervisor - Water Quality Instrumentation	Vancouver Inorganics, Burnaby, British Columbia

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Soil/Solid**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Soil/Solid**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Soil/Solid**

Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well-established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be ALS long-term mean values (for empirical test methods).

Sub-Matrix:

Investigation Reports

(Electronic format only)

BRITISH COLUMBIA
Ministry of Environment and Climate Change Strategy

Update to Minister/End-of-Spill Report Form

Environmental Emergency Program
SpillReports@gov.bc.ca

This report template can be completed to satisfy the requirements of either the End-of-Spill Report or the Update to Minister Report. Please specify which report you are completing in section I of this form. If any of the fields of this form are not applicable to the spill for which this form is being completed, indicate 'N/A' in the field; reports with incomplete fields will be sent back to the responsible person.

End-of-Spill Report: Section 6 of the Spill Reporting Regulation outlines the requirements for the End-of-Spill Report. Responsible persons must submit a written End-of-Spill Report to the Ministry of Environment and Climate Change Strategy within 30 days following the emergency response completion date of a spill as outlined in section 6 (1) of the Spill Reporting Regulation. Responsible persons must submit a written report to the Ministry of Environment and Climate Change Strategy as soon as practicable if either of the following two conditions are present:

1. The spill entered, or was likely to enter, a body of water as defined in the Spill Reporting Regulation
2. The quantity of the substance spilled was, or was likely to be, equal to or greater than the listed quantity for the listed substance as outlined in the Spill Reporting Regulation

Update to Minister Report: Section 5 of the Spill Reporting Regulation outlines the requirements for the Update to Minister Report. Responsible persons must submit a written report to the Ministry of Environment and Climate Change Strategy as soon as practicable if any of the following three conditions are present:

1. On request of the Minister
2. At least once every 30 days after the date that the spill began
3. At any time that the responsible person has reason to believe that information previously reported in the Initial Report has become inaccurate or incomplete

Complete this form and submit it by email to SpillReports@gov.bc.ca. For additional information, please visit the British Columbia Environmental Emergency Program Report a Spill webpage.

Dangerous Goods Incident Report (DGIR) number: 230286

Section I: Type of report
Sections 5 and 6 of Spill Reporting Regulation

This form is completed to satisfy the requirements of the:

☐ Update to Minister Report ☐ End-of-Spill Report

Section II: Contact information
Section 6 (2) (a) of the Spill Reporting Regulation

Details for person filling out the report	Name of company representative: Gabriel Holmes
	Company name: Mount Polley Mining Corporation
	Email: gabriel.holmes@mountpolley.com
	Address: PO Box 12, Likely, BC, V0L 1N0
	Telephone number: 236 317 4939

Details for responsible person Same as above ☑	Name of company representative:
	Company name:
	Email:
	Address:
	Telephone number:
Details for owner of the substance spilled Same as above ☑	Name of company representative:
	Company name:
	Email:
	Address:
	Telephone number:

Section III: Timing of the spill
Section 6 (2) (b) of the Spill Reporting Regulation

Date of spill: 2023-01-21 Time of spill: 01:20 Duration of the spill (days): <1

Date reported: 2023-01-23 Emergency response completion date[1]: 2023-01-21

Section IV: Site description
Section 6 (2) (c) (d) of the Spill Reporting Regulation

Provide a description of the spill site and the sites affected by the spill. The description of the spill site may include a description of the receiving environment, the proximity to a nearby city/town/roadway, the type of vegetation in the area, how densely populated the area is, accessibility to spill site, nearby waterways, and any other defining characteristics of the area.

The spill occurred in an active mining area within Mount Polley Mine. The spilled material reported to the frozen haul road. No vegetation or soils were present. No waterways were affected.

Latitude: Degrees 52 Minutes 32 Seconds 40.537

Longitude: Degrees 121 Minutes 38 Seconds 42.356

or

Site civic address or location: Street

City Postal Code

or

DLS or BCNTS (if applicable): Site ID number (if applicable):

[1] For the definition of the *emergency response completion date*, please refer to B.C. Reg. 187/2017 Spill Reporting Regulation

Section V: Description of the source, type, and quantity of the spill
Section 6 (2) (e) (f) of the Spill Reporting Regulation

Description of the source of the spill (pipeline, rail, truck, facility, etc.):

The spill occurred from a CAT 789 Haul Truck on the Waste Haul Road near the Cariboo Pit at Mount Polley Mine.

Type of substance spilled (common name): Recochem Ethylene Glycol Antifreeze, heavy duty, 50/50 premix

United Nations (UN) number of substance spilled (if applicable): N/A

Item number from the table in the Schedule in the Spill Reporting Regulation: 13

Quantity (in litres or kilograms) of the substance spilled – if the quantity is unknown, provide a reasonable estimate and explain why the quantity is unknown and cannot be determined: ~200L based on refilled quantity

Section VI: Description of the circumstances, cause, and impacts of the spill
Section 6 (2) (g) (i) (ii) (iii) of the Spill Reporting Regulation

Provide a description of the activity during which the spill occurred (transportation, transfer of cargo, fuelling, cleaning, maintenance, etc.):

Active production hauling

Provide a description of the incident leading to the spill (tank rupture, overfill, collision, rollover, derailment, fire, explosion, etc.):

The haul truck was operating normally when the driver observed steam coming from the engine area. The driver pulled over and stopped to evaluate. It was found that antifreeze was leaking from a failed radiator hose and onto the ground.

Provide a description of the underlying cause of the spill (human error, external conditions, organizational or management failure, etc.):

Mechanical failure. Failure of radiator hose.

Section VII: Impacts to human health, the environment, and infrastructure
Section 6 (2) (g) (iv) (v) of the Spill Reporting Regulation

Describe any adverse effects of the spill on human health (please state 'N/A' if there were no adverse effects on human health): N/A

Number of people evacuated: N/A

Number of fatalities: N/A

Number of people injured: N/A

Describe any adverse impacts on infrastructure[2] (please state 'N/A' if there were no adverse impacts to infrastructure):

N/A

Impacts to water

Was there an impact to a body of water? ☐ Yes ◯ No

[2] For the definition of *infrastructure,* refer to section 91.1 of the *Environmental Management Act 2003*

Description of impact:

N/A

Describe the body of water (stream, aquifer, fish habitat, naturally formed body of water, ditch, lake, etc.):

N/A

Name of body of water: N/A

Impacts to the environment

Was there an impact on flora (vegetation)? ☐ YES ◯ NO	If yes, list the common and species names: N/A

Provide a description of the impact on flora (oiled, removed, etc.):

N/A

Was there an impact on fauna (animals)? ☐ YES ◯ NO	If yes, list the common and species names: N/A

Provide a description of impact on fauna (include injured, dead, etc.):

N/A

Was there an impact on aquatic and/or terrestrial habitats? ☐ YES ◯ NO	If yes, list the type of habitat (riparian, breeding ground, etc.): N/A

Provide a description of impact on aquatic and terrestrial habitats, including response actions taken to restore any of the impacts listed:

N/A

Section VIII: Spill response actions **Section 6 (2) (h) of the Spill Reporting Regulation**		
Action taken to comply with section 91.2 of the *Environmental Management Act 2003*	Who took the action (company, person, contractor, etc.)	Date that the action was taken (click the arrow or enter the date using the format YYYY-MM-DD)
The spill was actioned by the Pit Shifter and the response was immediate. The spill was contained and was then cleaned up as per the spill response plan	Pit Shifter Roland Mailhot and Mount Polley Mine Operations personnel	2023-01-21
The spill was reported by mine management to the environmental department as outlined in the spill response plan.	Acting Mine Manager, John Thummerer	2023-01-22
The spill was reported to EMBC.	Environmental Coordinator, Gabriel Holmes	2023-01-23

Section IX: Waste disposal (please state 'N/A' if no waste was produced) **Section 6 (2) (i) of the Spill Reporting Regulation**		
List the type of waste	Method of disposal	Location of disposal
Contaminated spill pads	Outside services	GFL
Contaminated snow and ice	Outside services	GFL

Section X: Attached reports, maps, and photographs **Section 6 (2) (j) (k) of the Spill Reporting Regulation**	
Report of results of sampling, testing, monitoring, and/or assessing carried out during spill response actions (including reports from Qualified Professionals), if applicable	Copy attached ☑
Map of the incident site and areas surrounding the incident site (required)	Copy attached ☑
Photographs of the spill (required)	Copy attached ☑

Section XI: Agencies on scene or notified **Section 6 (2) (l) (m) of the Spill Reporting Regulation**
List the names of all agencies that were at the incident site: Mount Polley Mining Corporation

List the names of other persons or agencies that were advised about the spill:

BC Ministry of Environment representatives - Taylor Strosher, Luc Lachance, Abhirosh Chandran
Public Liaison Committee Members - all members (30) were notified including Xatsull FN and Williams Lake FN, local and regional government representatives

Section XII: Additional comments

N/A

Section XIII: Verification of information provided

I confirm that the above information is true and complete.

Update to Minister/End-of-Spill Report Form

Environmental Emergency Program
SpillReports@gov.bc.ca

This report template can be completed to satisfy the requirements of either the End-of-Spill Report or the Update to Minister Report. Please specify which report you are completing in section I of this form. If any of the fields of this form are not applicable to the spill for which this form is being completed, indicate 'N/A' in the field; reports with incomplete fields will be sent back to the responsible person.

End-of-Spill Report: Section 6 of the Spill Reporting Regulation outlines the requirements for the End-of-Spill Report. Responsible persons must submit a written End-of-Spill Report to the Ministry of Environment and Climate Change Strategy within 30 days following the emergency response completion date of a spill as outlined in section 6 (1) of the Spill Reporting Regulation. Responsible persons must submit a written report to the Ministry of Environment and Climate Change Strategy as soon as practicable if either of the following two conditions are present:

1. The spill entered, or was likely to enter, a body of water as defined in the Spill Reporting Regulation
2. The quantity of the substance spilled was, or was likely to be, equal to or greater than the listed quantity for the listed substance as outlined in the Spill Reporting Regulation

Update to Minister Report: Section 5 of the Spill Reporting Regulation outlines the requirements for the Update to Minister Report. Responsible persons must submit a written report to the Ministry of Environment and Climate Change Strategy as soon as practicable if any of the following three conditions are present:

1. On request of the Minister
2. At least once every 30 days after the date that the spill began
3. At any time that the responsible person has reason to believe that information previously reported in the Initial Report has become inaccurate or incomplete

Complete this form and submit it by email to SpillReports@gov.bc.ca. For additional information, please visit the British Columbia Environmental Emergency Program Report a Spill webpage.

Section III: Timing of the spill
Section 6 (2) (b) of the Spill Reporting Regulation

Date of spill: 2023-01-21 Time of spill: 01:20 Duration of the spill (days): <1

Date reported: 2023-01-23 Emergency response completion date[1]: 2023-01-21

Section IV: Site description
Section 6 (2) (c) (d) of the Spill Reporting Regulation

Provide a description of the spill site and the sites affected by the spill. The description of the spill site may include a description of the receiving environment, the proximity to a nearby city/town/roadway, the type of vegetation in the area, how densely populated the area is, accessibility to spill site, nearby waterways, and any other defining characteristics of the area.

The spill occurred in an active mining area within Mount Polley Mine. The spilled material reported to the frozen haul road. No vegetation or soils were present. No waterways were affected.

Latitude: Degrees 52 Minutes 32 Seconds 40.537

Longitude: Degrees 121 Minutes 38 Seconds 42.356

or

Site civic address or location: Street

City Postal Code

or

DLS or BCNTS (if applicable): Site ID number (if applicable):

[1] For the definition of the *emergency response completion date*, please refer to B.C. Reg. 187/2017 Spill Reporting Regulation

Section V: Description of the source, type, and quantity of the spill **Section 6 (2) (e) (f) of the Spill Reporting Regulation**
Description of the source of the spill (pipeline, rail, truck, facility, etc.): The spill occurred from a CAT 789 Haul Truck on the Waste Haul Road near the Cariboo Pit at Mount Polley Mine.
Type of substance spilled (common name): Recochem Ethylene Glycol Antifreeze, heavy duty, 50/50 premix
United Nations (UN) number of substance spilled (if applicable): N/A
Item number from the table in the Schedule in the Spill Reporting Regulation: 13
Quantity (in litres or kilograms) of the substance spilled – if the quantity is unknown, provide a reasonable estimate and explain why the quantity is unknown and cannot be determined: ~200L based on refilled quantity

Section VI: Description of the circumstances, cause, and impacts of the spill **Section 6 (2) (g) (i) (ii) (iii) of the Spill Reporting Regulation**
Provide a description of the activity during which the spill occurred (transportation, transfer of cargo, fuelling, cleaning, maintenance, etc.): Active production hauling
Provide a description of the incident leading to the spill (tank rupture, overfill, collision, rollover, derailment, fire, explosion, etc.): The haul truck was operating normally when the driver observed steam coming from the engine area. The driver pulled over and stopped to evaluate. It was found that antifreeze was leaking from a failed radiator hose and onto the ground. The engine was stopped and response was initiated.
Provide a description of the underlying cause of the spill (human error, external conditions, organizational or management failure, etc.): Mechanical failure. Failure of radiator hose.

Section VII: Impacts to human health, the environment, and infrastructure **Section 6 (2) (g) (iv) (v) of the Spill Reporting Regulation**
Describe any adverse effects of the spill on human health (please state 'N/A' if there were no adverse effects on human health): N/A
Number of people evacuated: N/A
Number of fatalities: N/A
Number of people injured: N/A
Describe any adverse impacts on infrastructure[2] (please state 'N/A' if there were no adverse impacts to infrastructure): N/A
Impacts to water
Was there an impact to a body of water? ◯ Yes ◯ No

[2] For the definition of *infrastructure,* refer to section 91.1 of the *Environmental Management Act 2003*

Description of impact:

N/A

Describe the body of water (stream, aquifer, fish habitat, naturally formed body of water, ditch, lake, etc.):

N/A

Name of body of water: N/A

Impacts to the environment

Was there an impact on flora (vegetation)? ◯ YES ◯ NO	If yes, list the common and species names: N/A

Provide a description of the impact on flora (oiled, removed, etc.):

N/A

Was there an impact on fauna (animals)? ◯ YES ◯ NO	If yes, list the common and species names: N/A

Provide a description of impact on fauna (include injured, dead, etc.):

N/A

Was there an impact on aquatic and/or terrestrial habitats? ◯ YES ◯ NO	If yes, list the type of habitat (riparian, breeding ground, etc.): N/A

Provide a description of impact on aquatic and terrestrial habitats, including response actions taken to restore any of the impacts listed:

N/A

Section VIII: Spill response actions **Section 6 (2) (h) of the Spill Reporting Regulation**		
Action taken to comply with section 91.2 of the *Environmental Management Act 2003*	Who took the action (company, person, contractor, etc.)	Date that the action was taken (click the arrow or enter the date using the format YYYY-MM-DD)
The spill was actioned by the Pit Shifter and the response was immediate. The spill was contained and was then cleaned up as per the spill response plan	Pit Shifter Roland Mailhot and Mount Polley Mine Operations personnel	2023-01-21
The spill was reported by mine management to the environmental department as outlined in the spill response plan.	Acting Mine Manager, John Thummerer	2023-01-22
The spill was reported to EMBC.	Environmental Coordinator, Gabriel Holmes	2023-01-23

Section IX: Waste disposal (please state 'N/A' if no waste was produced) **Section 6 (2) (i) of the Spill Reporting Regulation**		
List the type of waste	Method of disposal	Location of disposal
Contaminated spill pads	Outside services	GFL
Contaminated snow and ice	Outside services	GFL

Section X: Attached reports, maps, and photographs **Section 6 (2) (j) (k) of the Spill Reporting Regulation**	
Report of results of sampling, testing, monitoring, and/or assessing carried out during spill response actions (including reports from Qualified Professionals), if applicable	Copy attached ☑
Map of the incident site and areas surrounding the incident site (required)	Copy attached ☑
Photographs of the spill (required)	Copy attached ☑

Section XI: Agencies on scene or notified **Section 6 (2) (l) (m) of the Spill Reporting Regulation**
List the names of all agencies that were at the incident site: Mount Polley Mining Corporation

List the names of other persons or agencies that were advised about the spill:

BC Ministry of Environment representatives - Taylor Strosher, Luc Lachance, Abhirosh Chandran
Public Liaison Committee Members - all members (30) were notified including Xatsull FN and Williams Lake FN, local and regional government representatives

Environmental Incident Report

Date of Incident: March 27, 2023	**Incident Reported:** March 28, 2023 **Final Report:** April 25, 2023
Incident: Lower Long Ditch Sump – Unauthorized Discharge	
Department: Technical Services/Environmental	**Supervisor:** Gabriel Holmes

BACKGROUND:

A 30" pipeline in the Mount Polley Mine site contact water collection system became obstructed and contact water spilled to the environment. A contingency pipeline at that location was engaged but was also partially obstructed by a pneumatic knife gate valve that had slowly closed from approximately 2013 to present due to depressurization of the cylinder. The contingency pipeline accommodated the flow eventually but not the initial surge of water once the pipeline was fully obstructed. The contingency pipeline was working as intended within ~6.75 hours. Increased flows were occurring in the ditch due to pumping water from the Wight Pit to supplement the onsite water treatment plant. The most recent inspection of ditch infrastructure conducted on March 8, 2023 by MPMC personnel did not identify the partially closed valve.

DESCRIPTION OF INCIDENT:

Monday March 27, 2023	
16:15	Pump watch personnel note in their daily log that the Lower Long Ditch Sump is in the "Yellow" on the gauge for visual inspections as described in the MPMC Water Management Inspection Manual and requires action.
16:30	Pump watch personnel travelled to the Wight Pit and turned off the pumps to reduce water volumes in the Long Ditch
17:20	Pump Watch personnel noted that the Upper Long Ditch Sump had very high-water level. Upon further inspections they observed the contingency Lower Long Ditch Sump was also high and that water was discharging from the sump towards the adjacent forest.
17:30	Pump Watch personnel notified the site supervisor
17:40-01:00	Site Services personnel periodically monitored the site for changes
23:00	Discharge ceased from the Long Ditch to the environment due to cessation of pumping from Wight Pit
Tuesday March 28, 2023	
06:30	MPMC Environmental coordinator notified of incident

Mount Polley Mining Corporation
an Imperial Metals company
Box 12 • Likely, BC V0L 1N0 • T 250.790.2215 • F 250.790.2613

07:00	MPMC Environmental staff inspect the site and observed a partially closed knife gate on the contingency pipeline
08:00	Site services personnel opened and chained the knife gate on the contingency pipeline
10:00	BC Spill reporting hotline was called and the spill reported. DGIR # 231129
11:34	MPMC Public Liaison Committee notified of incident
12:02	BC Ministry of Environment Environmental Compliance notified of the event
13:00	Site services suspect that the pipeline is frozen but cannot determine where the obstruction is. A steam truck is used from the downstream end to find the obstruction but was not successful.
Wednesday March 29, 2023	
09:13	Environment and Climate Change Canada notified of the incident
Thursday March 30, 2023	
14:05	Call with Deborah Portman at ECCC to discuss incident and actions taken
Friday March 31, 2023	
08:00	Site services attempt to clear the pipeline by plunging it with an excavator and hear what sounds like ice moving within most of the length of the pipeline. Not successful.
Monday April 3, 2023	
12:00	Site services determined that ~300 m of the pipeline was frozen and applied mobile heaters to the pipeline. A steam truck was also assigned to thaw the pipe
Monday April 3, 2023 – April 7, 2023	
10:00	Site services use heaters and steam truck the thaw the pipeline. Multiple holes were drilled in the pipeline to facilitate steam thawing due to the length of frozen pipe.
Friday April 7, 2023	
12:00	Long Ditch Pipeline thawed, unobstructed and operating as intended

Summary

On the evening of March 27, 2023, a 30" HDPE pipeline at the end of the Long Ditch (LD), a component of the site contact water collection system, became obstructed. The pipeline drains from the Upper Long Ditch Sump towards the Central Collection Sump (CCS). Once the pipeline was obstructed the sump water level rose and engaged the contingency system comprised of the Lower Long Ditch Sump and an additional 30" HDPE pipeline. A pneumatic knife gate valve that was installed at the inlet of the contingency pipeline

was partially closed due to the cylinder "weeping" since it was installed in 2013. The partially closed knife gate prevented the full capacity of the contingency pipeline from being engaged. The contingency pipeline had approximately 50% capacity once engaged. The water flowing down the Long Ditch overwhelmed both sumps and the partially obstructed contingency pipeline. Once full, the Lower Long Ditch Sump discharged through the overflow channel to the environment.

The high-water levels were observed by MPMC Pump Watch personnel during routine daily inspections and action was immediately taken to cease all unnecessary flow in the Long Ditch. At the time of the incident water was being pumped from the Wight Pit, which is being used for temporary surplus water storage, to the Long Ditch. The pumps were turned off reducing the flow in the ditch by greater than 50%. Pumping from the Wight Pit comprised ~60% of the total water in the ditch.

Water quality samples were taken from the sump the following day. Water quality data sets used to evaluate "typical" chemistry at the discharge location are listed below. The sample names and locations are as follows:

LD – Long Ditch Sump. Includes combined chemistry from all sources
E10 – Wight Pit pump, end of pipe pumping from the Wight Pit
JCP – Joe's Creek Pipe, end of pipe gravity fed seepage collection from the North Bell Dump

The lab reports below represent the most recent water chemistry from the sites listed above. LD was sampled on March 28, 2023, E10 was sampled on March 21, 2023, and JCP was sampled on January 18, 2023. The LD sample from March 28 represents typical combined chemistry from all sources when the Wight Pit (E10) pumps are off.

It was determined that an estimate of between **1235.8** and **2471.6 cubic meters** of water was released from the Lower Long Ditch Sump to the adjacent forest. A precise volume could not be calculated because of the short and irregular discharge conditions.

The lab reports included below represent the most recent sample results for the spill location. MPMC maintains a large data set for the Long Ditch water chemistry and can make it available upon request. Additionally, no acute toxicity samples were taken due to the short nature of the event and the lack of qualified staff on site at the time. While MPMC does not have toxicological data for the Long Ditch System, toxicological reports can be provided for the MPMC Tailings Pond Supernatant and the regularly sampled Water Treatment Plant (HAD-3). This is somewhat relevant as the Long Ditch system provides a large proportion of the of the influent water supplied to the Water Treatment Plant.

Volumetric Calculation

Flow rates were estimated using pumping rating curves from the Wight Pit pump, typical bucket flow measured rates at JCP and ocular estimates from site seepage rates. These are the best estimates based on the most recent available data. The length of time was determined to be the longest possible duration based on MPMC Pump Watch personnel's first observance of the sump being in the "yellow" zone on the sump gauge requiring immediate action. The sump discharged after the initial inspection but before the confirmation that that the sump was discharging. This assessment assumes that the contingency system was partially compromised. The contingency system accommodated ~50% of the flow.

Long Ditch Sump Discharge

A. Volume Estimates from Individual Sources in Long Ditch

Maximum Pumping Flow Rate from Wight Pit (E10) – ~ 0.0917 m3/sec (based on max. pump curve rate)
Discharge Period Duration – 24,300 seconds (6.75 hours)
Volume – 2,227.5 cubic meters

JCP Typical Flow Rate (JCP) – ~0.00404 m3/sec (average based on measured values from 2017 to present)
Discharge Period Duration – 24,300 seconds (6.75 hours)
Volume – 98.3 cubic meters

Estimated Site Seepage Flow Rate in Long Ditch (Seeps) - ~0.006 m3/sec (ocular estimate, compared to JCP flow rate with no Wight Pit pumping)
Discharge Period Duration – 24,300 seconds (6.75 hours)
Volume – 145.8 cubic meters

B. Total Volume Estimate in the Long Ditch

E10 volume 2,227.5 m3 + JCP volume 98.3 m3 + Seeps volume 145.8 m3 = 2,471.6 cubic meters
Total Volume Estimate in the Long Ditch over the Discharge Period – ~2,471.6 cubic meters

C. Volume Estimate to the Environment

Minus ~50% due to the contingency system being engaged
Total Long Ditch Volume 2,471.6 m3 – Contingency System 1,235.8 m3 = 1,235.8 cubic meters

Discharge Characteristics

The discharged substance was mine affected surface water runoff that was collected in water management infrastructure at Mount Polley Mine. The sump from which the discharge occurred serves to collect water from the east flank of the mine site and conveys it south towards the Tailings Storage Facility and the Water Treatment Plant. The discharged water flowed over the designed overflow spillway and reported to the adjacent forest. Field turbidity measurements taken the next day indicate that "typical" water in the Long Ditch has low turbidity. This indicates that very little particulate matter was being transported because of the spill.

The primary chemical constituent of concern is copper. The following charts show copper concentrations at the Long Ditch sample site (LD) and main inputs to the Long Ditch from 2021 to present. The main

inputs were pumping from the Wight Pit, sample site E10, and seepage from the North Bell Dump known as Joe's Creek Pipe or JCP. The concentrations in the tables below are compared to the BC Water Quality Guidelines and to the BC Contaminated Sites Regulation for reference.

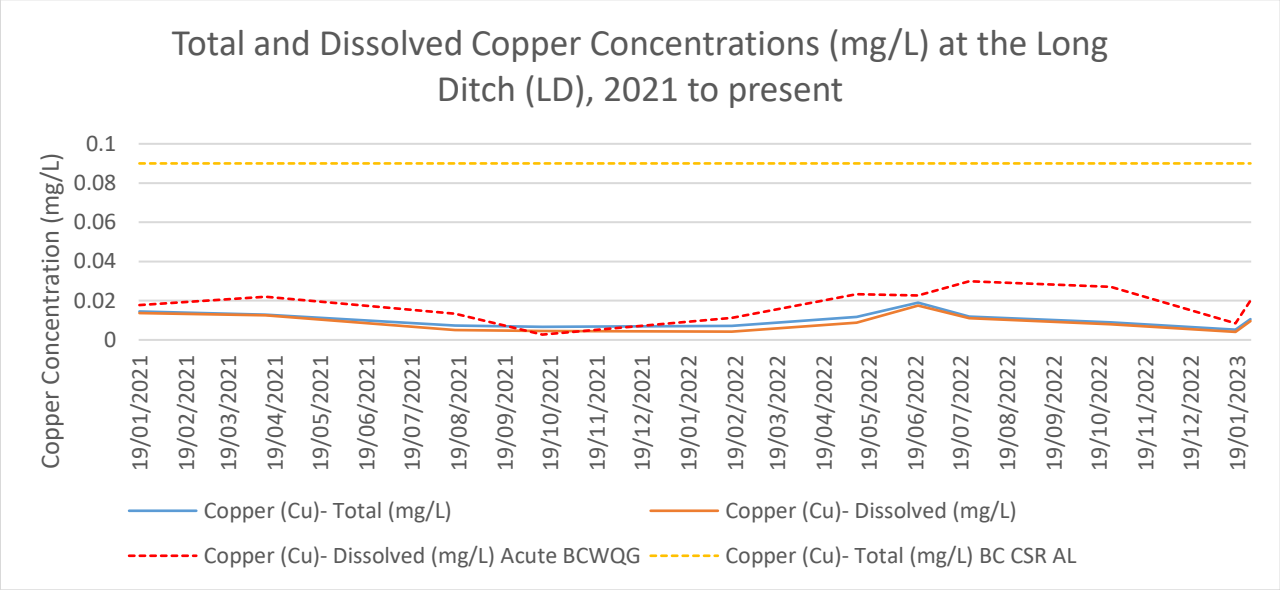

Figure 3 Copper concentrations at LD from 2021 to present compared to the BC CSR AL and the acute BCWQG. This sample site captures all inputs to the Long Ditch including the Wight Pit pumping, Joe's Creek Pipe (JCP) and all mine site seepage on the east flank of the mine.

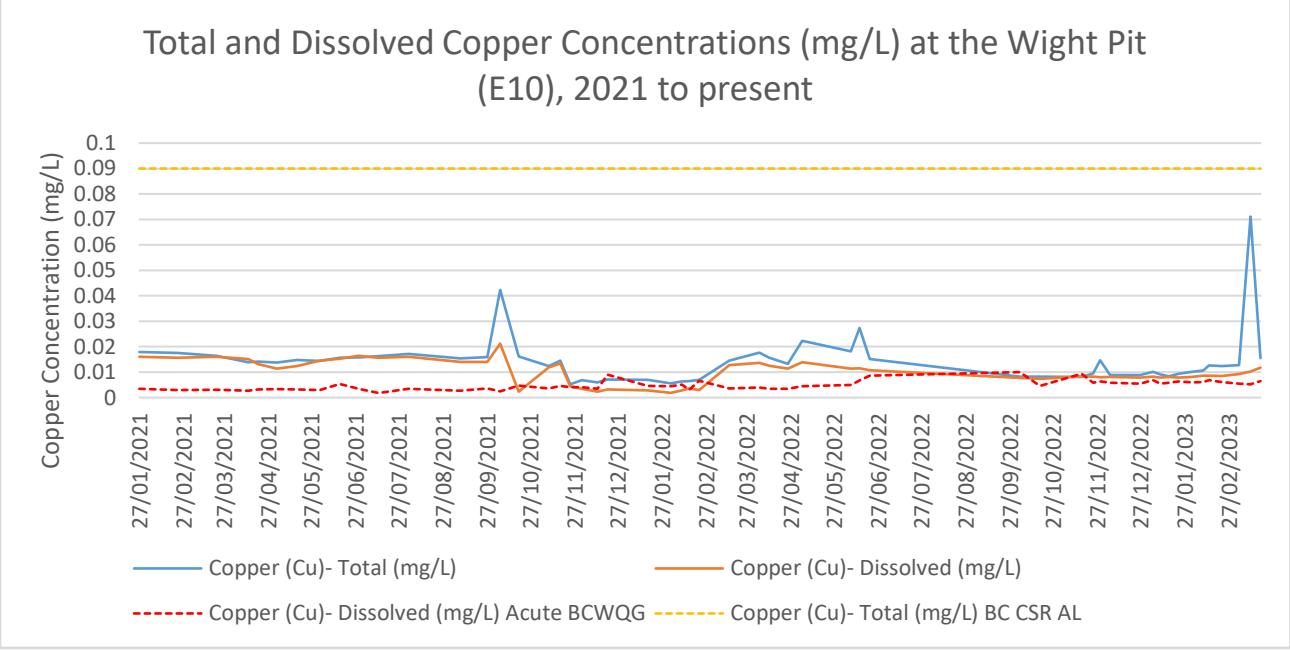

Figure 4 Copper concentrations from Wight Pit pumping (E10) from 2021 to present compared to the BC CSR AL and the acute BCWQG.

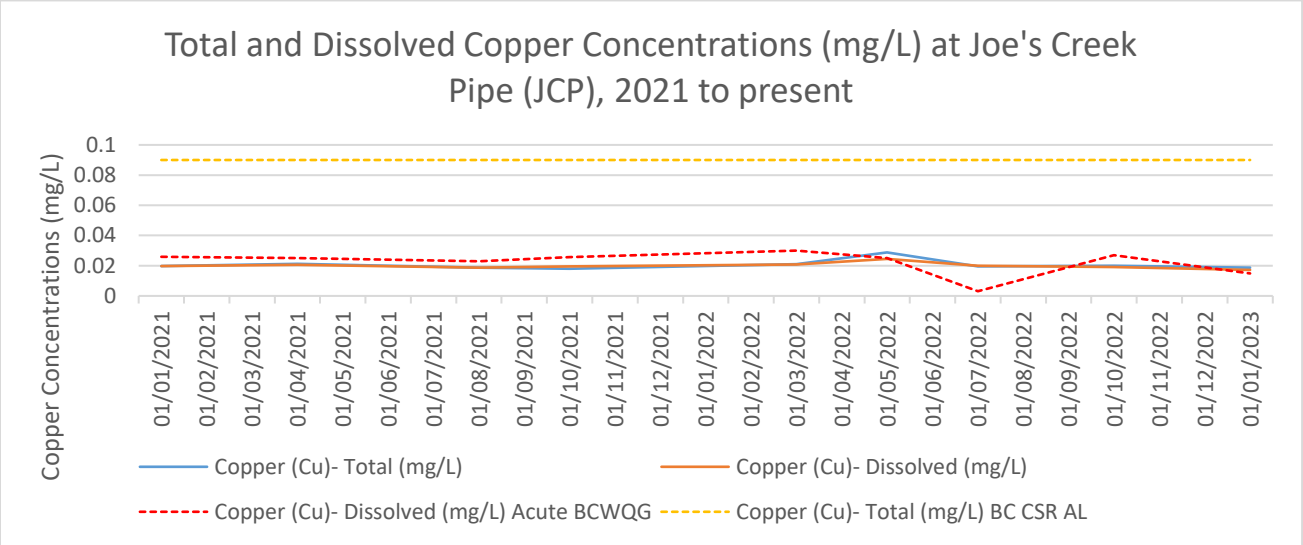

Figure 5 Copper concentrations at Joe's Creek Pipe (JCP) from 2021 to present compared to the BC CSR AL and the acute BCWQG.

Receiving Environment

Water that flowed from the Long Ditch Sump reported to the adjacent forest and then to ground. There was ~0.5-0.7 m of snow covering the ground at the time. Inspection of the site indicated the water flowed less than 300 m from the sump. No trace evidence of the discharge was observed at the nearby Polley Lake access road (Figure 2) which is located down slope of the sump. It is assumed the incident resulted in a small inundation area in the forest of less than 0.7 ha in size. Visibility in the area was severely impaired by the snow cover. No aquatic ecosystems were affected. The closest fish bearing water body is Polley Lake and it sits approximately 660 m from the Long Ditch Sump.

Physical Disturbance

No erosion was observed in the mine site infrastructure or along the flow path.

Root Cause

The underlying cause of the incident was the frozen pipeline downstream of the Long Ditch Sump. Extended sub-zero daily low temperatures were a contributing factor as was the partially closed knife gate on the contingency pipeline. The pipeline has operated as intended for ~10 years without issue with the only distinct operational change being the intermittent pumping from the Wight Pit. It appears that ice was forming inside the pipe walls for days, weeks or months leading up to March 27 when the pipeline was finally obstructed. The intermittent pumping from the Wight Pit caused water levels to rise and fall within the ditch system and within the pipeline. This may have allowed for ice buildup to occur readily within the pipe.

Future Mitigation

As part of the future mitigation strategy, MPMC will; 1) maintain on-site contingency systems and ensure the full contingency capacity is available; 2) continue routine inspections of the system; 3) continue to follow the Water Management Manual and daily check list.

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.
Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	no units

Site	: ----		
Quote number	: Q77258 - WQ Analysis		
No. of samples received	: 3		
No. of samples analysed	: 3		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percent Difference (RPD) and Data Quality Objectives
- Matrix Spike (MS) Report; Recovery and Data Quality Objectives
- Method Blank (MB) Report; Recovery and Data Quality Objectives
- Laboratory Control Sample (LCS) Report; Recovery and Data Quality Objectives

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Caitlin Macey	Team Leader - Inorganics	Vancouver Inorganics, Burnaby, British Columbia
Cindy Tang	Team Leader - Inorganics	Vancouver Inorganics, Burnaby, British Columbia
Erin Sanchez		Vancouver Metals, Burnaby, British Columbia
Kate Dimitrova	Analsyt	Vancouver Inorganics, Burnaby, British Columbia
Kim Jensen	Department Manager - Metals	Vancouver Metals, Burnaby, British Columbia

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Dan Gebert	Laboratory Analyst	Metals, Burnaby, British Columbia
Kim Jensen	Department Manager - Metals	Metals, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Inorganics, Burnaby, British Columbia
Sukhman Khosa	Lab Assistant	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	no units
µS/cm	microsiemens per centimetre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Qualifiers

Qualifier	*Description*
DLA	*Detection Limit adjusted for required dilution.*
DLM	*Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).*

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Qualifiers

Qualifier	Description
B	*Method Blank exceeds ALS DQO. Associated sample results which are < Limit of Reporting or > 5 times blank level are considered reliable.*

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Angelo Salandanan	Lab Assistant	Metals, Burnaby, British Columbia
Cindy Tang	Team Leader - Inorganics	Inorganics, Burnaby, British Columbia
Kim Jensen	Department Manager - Metals	Metals, Burnaby, British Columbia
Richard Chong		Inorganics, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	no units
µS/cm	microsiemens per centimetre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Qualifiers

Qualifier	*Description*
DLA	*Detection Limit adjusted for required dilution.*
DLDS	*Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.*
DLM	*Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).*
HTD	*Hold time exceeded for re-analysis or dilution, but initial testing was conducted within hold time.*
RRV	*Reported result verified by repeat analysis.*

QUALITY CONTROL REPORT

Work Order	: **VA23A1454**	Page	: 1 of 14
Client	: Mount Polley Mining Corporation	Laboratory	: Vancouver - Environmental
Contact	: Gabriel Holmes	Account Manager	: Can Dang
Address	: PO Box 12 Likely BC Canada V0L 1N0	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	:	Telephone	: +1 604 253 4188
Project	: ----	Date Samples Received	: 20-Jan-2023 11:40
PO	: 5590008044 Q2 2022	Date Analysis Commenced	: 20-Jan-2023
C-O-C number	: D0028	Issue Date	: 01-Feb-2023 16:08
Sampler	: DS ----		
Site	: ----		
Quote number	: Q77258 - WQ Analysis		
No. of samples received	: 8		
No. of samples analysed	: 8		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percent Difference (RPD) and Data Quality Objectives
- Matrix Spike (MS) Report; Recovery and Data Quality Objectives
- Method Blank (MB) Report; Recovery and Data Quality Objectives
- Laboratory Control Sample (LCS) Report; Recovery and Data Quality Objectives

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Angelo Salandanan	Lab Assistant	Vancouver Metals, Burnaby, British Columbia
Cindy Tang	Team Leader - Inorganics	Vancouver Inorganics, Burnaby, British Columbia
Kim Jensen	Department Manager - Metals	Vancouver Metals, Burnaby, British Columbia
Richard Chong		Vancouver Inorganics, Burnaby, British Columbia

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Sub-Matrix: **Water**

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

Environmental Incident Report

Date of Incident: March 27, 2023	**Incident Reported:** March 28, 2023 **Final Report:** April 25, 2023
Incident: Lower Long Ditch Sump – Unauthorized Discharge	
Department: Technical Services/Environmental	**Supervisor:** Gabriel Holmes

BACKGROUND:

A 30" pipeline in the Mount Polley Mine site contact water collection system became obstructed and contact water spilled to the environment. A contingency pipeline at that location was engaged but was also partially obstructed by a pneumatic knife gate valve that had slowly closed from approximately 2013 to present due to depressurization of the cylinder. The contingency pipeline accommodated the flow eventually but not the initial surge of water once the pipeline was fully obstructed. The contingency pipeline was working as intended within ~6.75 hours. Increased flows were occurring in the ditch due to pumping water from the Wight Pit to supplement the onsite water treatment plant. The most recent inspection of ditch infrastructure conducted on March 8, 2023 by MPMC personnel did not identify the partially closed valve.

DESCRIPTION OF INCIDENT:

Monday March 27, 2023	
16:15	Pump watch personnel note in their daily log that the Lower Long Ditch Sump is in the "Yellow" on the gauge for visual inspections as described in the MPMC Water Management Inspection Manual and requires action.
16:30	Pump watch personnel travelled to the Wight Pit and turned off the pumps to reduce water volumes in the Long Ditch
17:20	Pump Watch personnel noted that the Upper Long Ditch Sump had very high-water level. Upon further inspections they observed the contingency Lower Long Ditch Sump was also high and that water was discharging from the sump towards the adjacent forest.
17:30	Pump Watch personnel notified the site supervisor
17:40-01:00	Site Services personnel periodically monitored the site for changes
23:00	Discharge ceased from the Long Ditch to the environment due to cessation of pumping from Wight Pit
Tuesday March 28, 2023	
06:30	MPMC Environmental coordinator notified of incident

Mount Polley Mining Corporation
an Imperial Metals company
Box 12 • Likely, BC V0L 1N0 • T 250.790.2215 • F 250.790.2613

07:00	MPMC Environmental staff inspect the site and observed a partially closed knife gate on the contingency pipeline
08:00	Site services personnel opened and chained the knife gate on the contingency pipeline
10:00	BC Spill reporting hotline was called and the spill reported. DGIR # 231129
11:34	MPMC Public Liaison Committee notified of incident
12:02	BC Ministry of Environment Environmental Compliance notified of the event
13:00	Site services suspect that the pipeline is frozen but cannot determine where the obstruction is. A steam truck is used from the downstream end to find the obstruction but was not successful.
Wednesday March 29, 2023	
09:13	Environment and Climate Change Canada notified of the incident
Thursday March 30, 2023	
14:05	Call with Deborah Portman at ECCC to discuss incident and actions taken
Friday March 31, 2023	
08:00	Site services attempt to clear the pipeline by plunging it with an excavator and hear what sounds like ice moving within most of the length of the pipeline. Not successful.
Monday April 3, 2023	
12:00	Site services determined that ~300 m of the pipeline was frozen and applied mobile heaters to the pipeline. A steam truck was also assigned to thaw the pipe
Monday April 3, 2023 – April 7, 2023	
10:00	Site services use heaters and steam truck the thaw the pipeline. Multiple holes were drilled in the pipeline to facilitate steam thawing due to the length of frozen pipe.
Friday April 7, 2023	
12:00	Long Ditch Pipeline thawed, unobstructed and operating as intended

Summary

On the evening of March 27, 2023, a 30" HDPE pipeline at the end of the Long Ditch (LD), a component of the site contact water collection system, became obstructed. The pipeline drains from the Upper Long Ditch Sump towards the Central Collection Sump (CCS). Once the pipeline was obstructed the sump water level rose and engaged the contingency system comprised of the Lower Long Ditch Sump and an additional 30" HDPE pipeline. A pneumatic knife gate valve that was installed at the inlet of the contingency pipeline

was partially closed due to the cylinder "weeping" since it was installed in 2013. The partially closed knife gate prevented the full capacity of the contingency pipeline from being engaged. The contingency pipeline had approximately 50% capacity once engaged. The water flowing down the Long Ditch overwhelmed both sumps and the partially obstructed contingency pipeline. Once full, the Lower Long Ditch Sump discharged through the overflow channel to the environment.

The high-water levels were observed by MPMC Pump Watch personnel during routine daily inspections and action was immediately taken to cease all unnecessary flow in the Long Ditch. At the time of the incident water was being pumped from the Wight Pit, which is being used for temporary surplus water storage, to the Long Ditch. The pumps were turned off reducing the flow in the ditch by greater than 50%. Pumping from the Wight Pit comprised ~60% of the total water in the ditch.

Water quality samples were taken from the sump the following day. Water quality data sets used to evaluate "typical" chemistry at the discharge location are listed below. The sample names and locations are as follows:

LD – Long Ditch Sump. Includes combined chemistry from all sources
E10 – Wight Pit pump, end of pipe pumping from the Wight Pit
JCP – Joe's Creek Pipe, end of pipe gravity fed seepage collection from the North Bell Dump

The lab reports below represent the most recent water chemistry from the sites listed above. LD was sampled on March 28, 2023, E10 was sampled on March 21, 2023, and JCP was sampled on January 18, 2023. The LD sample from March 28 represents typical combined chemistry from all sources when the Wight Pit (E10) pumps are off.

It was determined that an estimate of between **1235.8** and **2471.6 cubic meters** of water was released from the Lower Long Ditch Sump to the adjacent forest. A precise volume could not be calculated because of the short and irregular discharge conditions.

The lab reports included below represent the most recent sample results for the spill location. MPMC maintains a large data set for the Long Ditch water chemistry and can make it available upon request. Additionally, no acute toxicity samples were taken due to the short nature of the event and the lack of qualified staff on site at the time. While MPMC does not have toxicological data for the Long Ditch System, toxicological reports can be provided for the MPMC Tailings Pond Supernatant and the regularly sampled Water Treatment Plant (HAD-3). This is somewhat relevant as the Long Ditch system provides a large proportion of the of the influent water supplied to the Water Treatment Plant.

Volumetric Calculation

Flow rates were estimated using pumping rating curves from the Wight Pit pump, typical bucket flow measured rates at JCP and ocular estimates from site seepage rates. These are the best estimates based on the most recent available data. The length of time was determined to be the longest possible duration based on MPMC Pump Watch personnel's first observance of the sump being in the "yellow" zone on the sump gauge requiring immediate action. The sump discharged after the initial inspection but before the confirmation that that the sump was discharging. This assessment assumes that the contingency system was partially compromised. The contingency system accommodated ~50% of the flow.

Long Ditch Sump Discharge

A. Volume Estimates from Individual Sources in Long Ditch

Maximum Pumping Flow Rate from Wight Pit (E10) – ~ 0.0917 m3/sec (based on max. pump curve rate)
Discharge Period Duration – 24,300 seconds (6.75 hours)
Volume – 2,227.5 cubic meters

JCP Typical Flow Rate (JCP) – ~0.00404 m3/sec (average based on measured values from 2017 to present)
Discharge Period Duration – 24,300 seconds (6.75 hours)
Volume – 98.3 cubic meters

Estimated Site Seepage Flow Rate in Long Ditch (Seeps) - ~0.006 m3/sec (ocular estimate, compared to JCP flow rate with no Wight Pit pumping)
Discharge Period Duration – 24,300 seconds (6.75 hours)
Volume – 145.8 cubic meters

B. Total Volume Estimate in the Long Ditch

E10 volume 2,227.5 m3 + JCP volume 98.3 m3 + Seeps volume 145.8 m3 = 2,471.6 cubic meters
Total Volume Estimate in the Long Ditch over the Discharge Period – ~2,471.6 cubic meters

C. Volume Estimate to the Environment

Minus ~50% due to the contingency system being engaged
Total Long Ditch Volume 2,471.6 m3 – Contingency System 1,235.8 m3 = 1,235.8 cubic meters

Discharge Characteristics

The discharged substance was mine affected surface water runoff that was collected in water management infrastructure at Mount Polley Mine. The sump from which the discharge occurred serves to collect water from the east flank of the mine site and conveys it south towards the Tailings Storage Facility and the Water Treatment Plant. The discharged water flowed over the designed overflow spillway and reported to the adjacent forest. Field turbidity measurements taken the next day indicate that "typical" water in the Long Ditch has low turbidity. This indicates that very little particulate matter was being transported because of the spill.

The primary chemical constituent of concern is copper. The following charts show copper concentrations at the Long Ditch sample site (LD) and main inputs to the Long Ditch from 2021 to present. The main

inputs were pumping from the Wight Pit, sample site E10, and seepage from the North Bell Dump known as Joe's Creek Pipe or JCP. The concentrations in the tables below are compared to the BC Water Quality Guidelines and to the BC Contaminated Sites Regulation for reference.

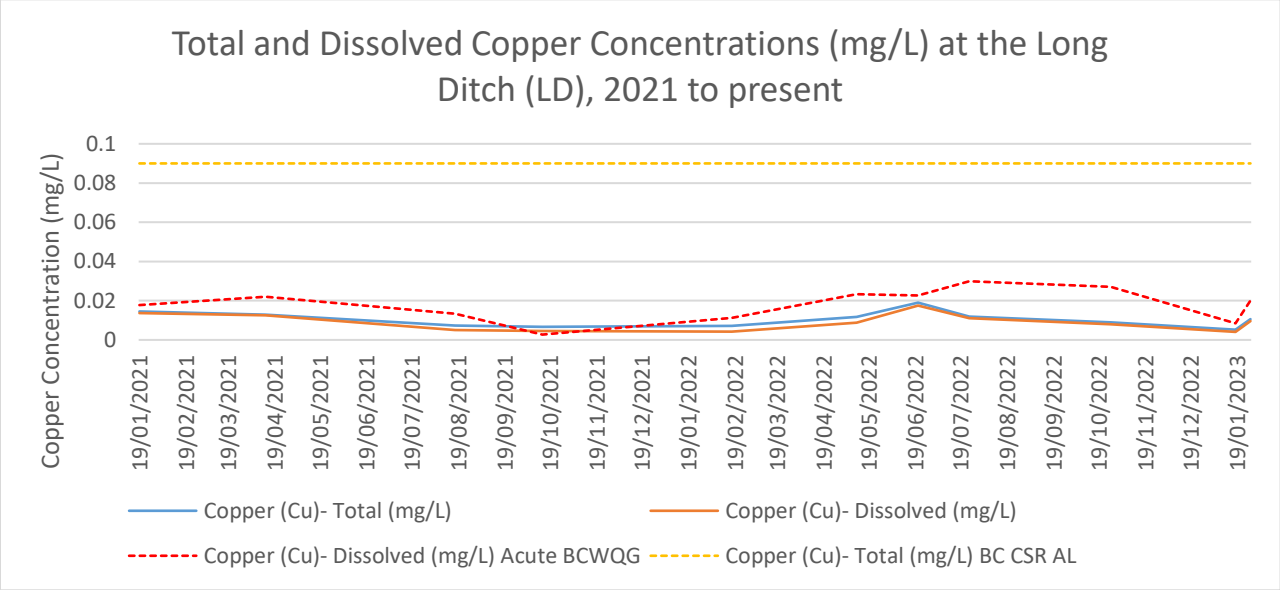

Figure 3 Copper concentrations at LD from 2021 to present compared to the BC CSR AL and the acute BCWQG. This sample site captures all inputs to the Long Ditch including the Wight Pit pumping, Joe's Creek Pipe (JCP) and all mine site seepage on the east flank of the mine.

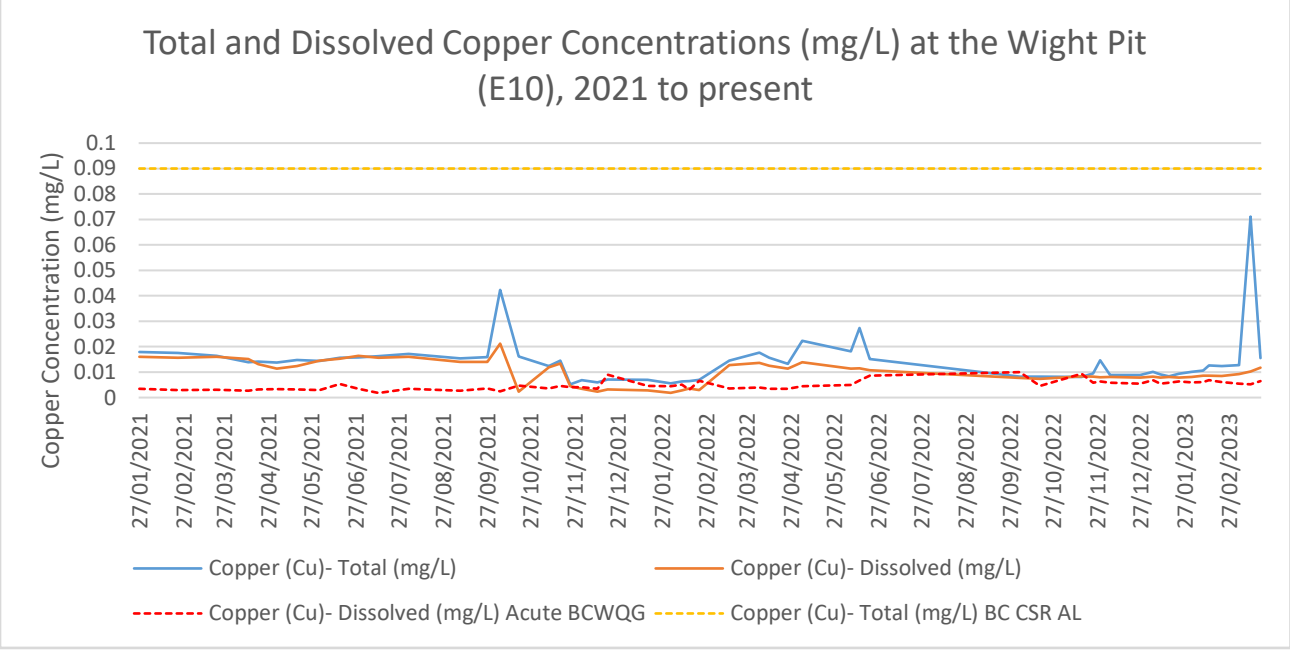

Figure 4 Copper concentrations from Wight Pit pumping (E10) from 2021 to present compared to the BC CSR AL and the acute BCWQG.

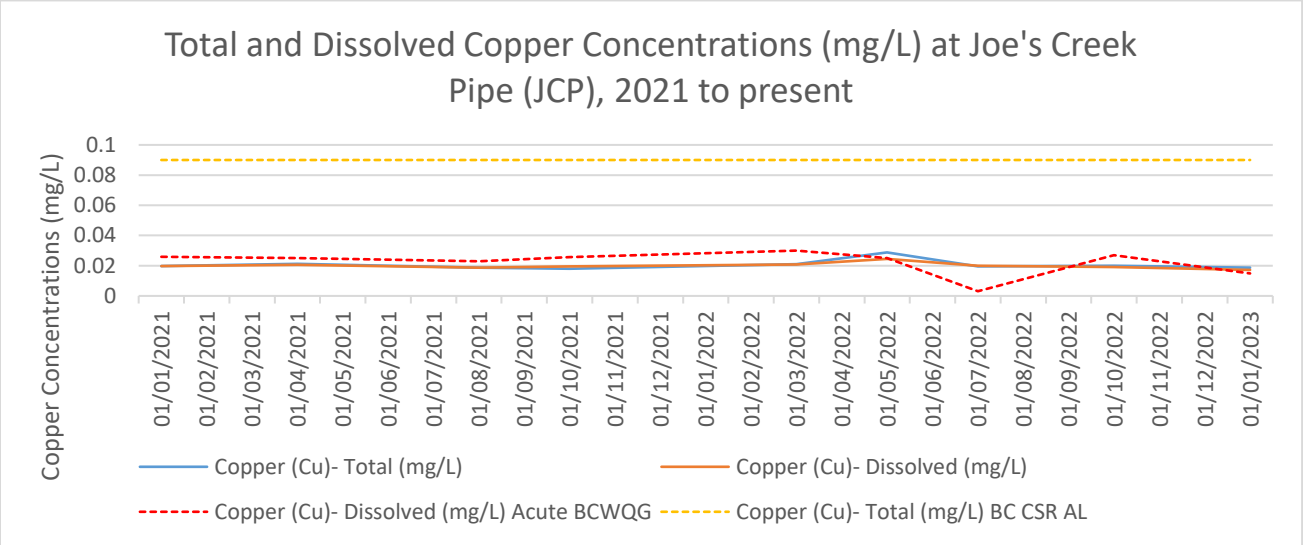

Figure 5 Copper concentrations at Joe's Creek Pipe (JCP) from 2021 to present compared to the BC CSR AL and the acute BCWQG.

Receiving Environment

Water that flowed from the Long Ditch Sump reported to the adjacent forest and then to ground. There was ~0.5-0.7 m of snow covering the ground at the time. Inspection of the site indicated the water flowed less than 300 m from the sump. No trace evidence of the discharge was observed at the nearby Polley Lake access road (Figure 2) which is located down slope of the sump. It is assumed the incident resulted in a small inundation area in the forest of less than 0.7 ha in size. Visibility in the area was severely impaired by the snow cover. No aquatic ecosystems were affected. The closest fish bearing water body is Polley Lake and it sits approximately 660 m from the Long Ditch Sump.

Physical Disturbance

No erosion was observed in the mine site infrastructure or along the flow path.

Root Cause

The underlying cause of the incident was the frozen pipeline downstream of the Long Ditch Sump. Extended sub-zero daily low temperatures were a contributing factor as was the partially closed knife gate on the contingency pipeline. The pipeline has operated as intended for ~10 years without issue with the only distinct operational change being the intermittent pumping from the Wight Pit. It appears that ice was forming inside the pipe walls for days, weeks or months leading up to March 27 when the pipeline was finally obstructed. The intermittent pumping from the Wight Pit caused water levels to rise and fall within the ditch system and within the pipeline. This may have allowed for ice buildup to occur readily within the pipe.

Future Mitigation

As part of the future mitigation strategy, MPMC will; 1) maintain on-site contingency systems and ensure the full contingency capacity is available; 2) continue routine inspections of the system; 3) continue to follow the Water Management Manual and daily check list.

Update to Minister/End-of-Spill Report Form

Environmental Emergency Program
SpillReports@gov.bc.ca

This report template can be completed to satisfy the requirements of either the End-of-Spill Report or the Update to Minister Report. Please specify which report you are completing in section I of this form. If any of the fields of this form are not applicable to the spill for which this form is being completed, indicate 'N/A' in the field; reports with incomplete fields will be sent back to the responsible person.

End-of-Spill Report: Section 6 of the Spill Reporting Regulation outlines the requirements for the End-of-Spill Report. Responsible persons must submit a written End-of-Spill Report to the Ministry of Environment and Climate Change Strategy within 30 days following the emergency response completion date of a spill as outlined in section 6 (1) of the Spill Reporting Regulation. Responsible persons must submit a written report to the Ministry of Environment and Climate Change Strategy as soon as practicable if either of the following two conditions are present:

1. The spill entered, or was likely to enter, a body of water as defined in the Spill Reporting Regulation
2. The quantity of the substance spilled was, or was likely to be, equal to or greater than the listed quantity for the listed substance as outlined in the Spill Reporting Regulation

Update to Minister Report: Section 5 of the Spill Reporting Regulation outlines the requirements for the Update to Minister Report. Responsible persons must submit a written report to the Ministry of Environment and Climate Change Strategy as soon as practicable if any of the following three conditions are present:

1. On request of the Minister
2. At least once every 30 days after the date that the spill began
3. At any time that the responsible person has reason to believe that information previously reported in the Initial Report has become inaccurate or incomplete

Complete this form and submit it by email to SpillReports@gov.bc.ca. For additional information, please visit the British Columbia Environmental Emergency Program Report a Spill webpage.

Section III: Timing of the spill
Section 6 (2) (b) of the Spill Reporting Regulation

Date of spill: 2023-01-21 Time of spill: 01:20 Duration of the spill (days): <1

Date reported: 2023-01-23 Emergency response completion date[1]: 2023-01-21

Section IV: Site description
Section 6 (2) (c) (d) of the Spill Reporting Regulation

Provide a description of the spill site and the sites affected by the spill. The description of the spill site may include a description of the receiving environment, the proximity to a nearby city/town/roadway, the type of vegetation in the area, how densely populated the area is, accessibility to spill site, nearby waterways, and any other defining characteristics of the area.

The spill occurred in an active mining area within Mount Polley Mine. The spilled material reported to the frozen haul road. No vegetation or soils were present. No waterways were affected.

Latitude: Degrees 52 Minutes 32 Seconds 40.537

Longitude: Degrees 121 Minutes 38 Seconds 42.356

or

Site civic address or location: Street

City Postal Code

or

DLS or BCNTS (if applicable): Site ID number (if applicable):

[1] For the definition of the *emergency response completion date*, please refer to B.C. Reg. 187/2017 Spill Reporting Regulation

Section V: Description of the source, type, and quantity of the spill **Section 6 (2) (e) (f) of the Spill Reporting Regulation**
Description of the source of the spill (pipeline, rail, truck, facility, etc.): The spill occurred from a CAT 789 Haul Truck on the Waste Haul Road near the Cariboo Pit at Mount Polley Mine.
Type of substance spilled (common name): Recochem Ethylene Glycol Antifreeze, heavy duty, 50/50 premix
United Nations (UN) number of substance spilled (if applicable): N/A
Item number from the table in the Schedule in the Spill Reporting Regulation: 13
Quantity (in litres or kilograms) of the substance spilled – if the quantity is unknown, provide a reasonable estimate and explain why the quantity is unknown and cannot be determined: ~200L based on refilled quantity

Section VI: Description of the circumstances, cause, and impacts of the spill **Section 6 (2) (g) (i) (ii) (iii) of the Spill Reporting Regulation**
Provide a description of the activity during which the spill occurred (transportation, transfer of cargo, fuelling, cleaning, maintenance, etc.): Active production hauling
Provide a description of the incident leading to the spill (tank rupture, overfill, collision, rollover, derailment, fire, explosion, etc.): The haul truck was operating normally when the driver observed steam coming from the engine area. The driver pulled over and stopped to evaluate. It was found that antifreeze was leaking from a failed radiator hose and onto the ground. The engine was stopped and response was initiated.
Provide a description of the underlying cause of the spill (human error, external conditions, organizational or management failure, etc.): Mechanical failure. Failure of radiator hose.

Section VII: Impacts to human health, the environment, and infrastructure **Section 6 (2) (g) (iv) (v) of the Spill Reporting Regulation**
Describe any adverse effects of the spill on human health (please state 'N/A' if there were no adverse effects on human health): N/A
Number of people evacuated: N/A
Number of fatalities: N/A
Number of people injured: N/A
Describe any adverse impacts on infrastructure[2] (please state 'N/A' if there were no adverse impacts to infrastructure): N/A
Impacts to water
Was there an impact to a body of water? ◯ Yes ◯ No

[2] For the definition of *infrastructure,* refer to section 91.1 of the *Environmental Management Act 2003*

Description of impact:

N/A

Describe the body of water (stream, aquifer, fish habitat, naturally formed body of water, ditch, lake, etc.):

N/A

Name of body of water: N/A

Impacts to the environment

Was there an impact on flora (vegetation)? ◯ YES ◯ NO	If yes, list the common and species names: N/A

Provide a description of the impact on flora (oiled, removed, etc.):

N/A

Was there an impact on fauna (animals)? ◯ YES ◯ NO	If yes, list the common and species names: N/A

Provide a description of impact on fauna (include injured, dead, etc.):

N/A

Was there an impact on aquatic and/or terrestrial habitats? ◯ YES ◯ NO	If yes, list the type of habitat (riparian, breeding ground, etc.): N/A

Provide a description of impact on aquatic and terrestrial habitats, including response actions taken to restore any of the impacts listed:

N/A

Section VIII: Spill response actions **Section 6 (2) (h) of the Spill Reporting Regulation**		
Action taken to comply with section 91.2 of the *Environmental Management Act 2003*	Who took the action (company, person, contractor, etc.)	Date that the action was taken (click the arrow or enter the date using the format YYYY-MM-DD)
The spill was actioned by the Pit Shifter and the response was immediate. The spill was contained and was then cleaned up as per the spill response plan	Pit Shifter Roland Mailhot and Mount Polley Mine Operations personnel	2023-01-21
The spill was reported by mine management to the environmental department as outlined in the spill response plan.	Acting Mine Manager, John Thummerer	2023-01-22
The spill was reported to EMBC.	Environmental Coordinator, Gabriel Holmes	2023-01-23

Section IX: Waste disposal (please state 'N/A' if no waste was produced) **Section 6 (2) (i) of the Spill Reporting Regulation**		
List the type of waste	Method of disposal	Location of disposal
Contaminated spill pads	Outside services	GFL
Contaminated snow and ice	Outside services	GFL

Section X: Attached reports, maps, and photographs **Section 6 (2) (j) (k) of the Spill Reporting Regulation**	
Report of results of sampling, testing, monitoring, and/or assessing carried out during spill response actions (including reports from Qualified Professionals), if applicable	Copy attached ☑
Map of the incident site and areas surrounding the incident site (required)	Copy attached ☑
Photographs of the spill (required)	Copy attached ☑

Section XI: Agencies on scene or notified **Section 6 (2) (l) (m) of the Spill Reporting Regulation**
List the names of all agencies that were at the incident site: Mount Polley Mining Corporation

List the names of other persons or agencies that were advised about the spill:

BC Ministry of Environment representatives - Taylor Strosher, Luc Lachance, Abhirosh Chandran
Public Liaison Committee Members - all members (30) were notified including Xatsull FN and Williams Lake FN, local and regional government representatives

Section XII: Additional comments

N/A

Section XIII: Verification of information provided

I confirm that the above information is true and complete.

Appendix 1 Laboratory Reports – ALS

1 Background

On December 1, 2022 Mount Polley Mining Corporation (MPMC) received an amendment to Permit 11678 issued by the BC Ministry of Environment and Climate Change Strategy (MoE) under the BC *Environmental Management Act* (*EMA*) to discharge treated mine effluent into Quesnel Lake. Section 1.2.5 of the amended *EMA* Permit 11678 outlines the permitted characteristics of the treated discharge and this is summarized in Table 1 below.

Table 1 EMA Permit 11678 treated effluent compliance limits

Parameter	**Treatment Plant Outlet** (1)	**Edge of Quesnel Lake IDZ** (1)(2)(3)
Rainbow Trout 96hrLC50	50 % Mortality in 100% effluent	-
Daphnia Magna 48hrLC50	50 % Mortality in 100% effluent	-
pH	< 9.5 and >6.0 pH units	-
Total Suspended Solids	30 mg/L, and 15 mg/L Monthly Average	-
Total Sulfate	1,100 mg/L	218 mg/L
Total Ammonia (as N)	1.3 mg/L	0.18 mg/l as N
Total Nitrate (as N)	34.0 mg/L	3.0 mg/l as N
Total Nitrite (as N)	0.78 mg/L	0.02 mg/L as N
Total Phosphorus	90.0 µg/L	10.0 µg/L
Fluoride	17.0 mg/L	1.0 mg/L
Total Arsenic	28 µg/L	5.0 µg/L
Total Chromium	4 µg/L	1 µg/L
Total Copper	33 µg/L	2.2 µg/L (30-day rolling average)
Total Iron	1.0 mg/L	1.0 mg/L
Dissolved Iron	0.35 mg/L	0.35 mg/L
Total Manganese	3.4 mg/L	0.84 mg/L
Total Molybdenum	0.36 mg/L	0.05 mg/L
Total Silver	0.24 µg/L	0.05 µg/L
Total Selenium	75 µg/L	2 µg/L
Total Zinc	59 µg/L	7.5 µg/L
Dissolved Aluminum	0.75 mg/L	0.05 mg/|
Dissolved Cadmium	0.34 µg/L	0.13 µg/L

(1) All values are maximum values from grab samples unless otherwise specified.

(2) Only applies while discharging directly to Quesnel Lake.

(3) The "Edge of the Quesnel Lake IDZ" is a point located 100m from the Quesnel Lake outfall, represented by site QUL-58 mid and/or near bottom samples, or alternative location approved by the Director.

2 Incident and Response Timelines

On June 6, 2023, MPMC Environmental Department staff collected routine water samples at the discharge point of the Water Treatment Plant (WTP) into Quesnel Lake, identified as QUL-58, and referenced as E304876. This data was reviewed by MPMC staff on June 19, 2023 at approximately 9:00am. At this time, it was confirmed that the sample results for total phosphorus at QUL-58-AP (above plume) and QUL-58-MP (mid plume) were 0.0378 mg/L and 0.0126 mg/L, respectively, both of which exceeded the *EMA* Permit 11678 edge of Quesnel Lake Initial Dilution Zone (IDZ) limit of 0.010 mg/L. MPMC staff notified the

Director and site management, and put the WTP into recirculation mode immediately. These elevated total phosphorus concentrations initiated a Level 3 Trigger: Exceedance of Receiving Environment Trigger Levels- Monitoring and Response as per the MPMC 2022 Annual Discharge Plan (ADP), Section 5.1.2.1.

Samples were collected at QUL-58 and the background site QUL-2a (E303020) on June 19, 2023 and priority service was requested from the lab. A sample was also collected from the WTP before it was put into recirculation on June 19, 2023. The results from the samples collected on June 19, 2023 were received by email on June 21, 2023 and reviewed by MPMC. The sample results indicated total phosphorus concentrations of 0.0036 mg/L at QUL-58-AP and 0.0029 mg/L at QUL-58-MP, which are below the permit limit of 0.010 mg/L. The samples collected at QUL-2a, also yielded total phosphorus concentrations less than the permit limit. Modelled QUL-58 data was compared to the receiving environment trigger levels with no exceedances identified. The Director was notified via email on June 21, 2023 and the WTP resumed normal operation in accordance with the ADP on June 22, 2023.

Table 2 Summary of samples taken

Samples	Date Sample Taken	Date ALS Received	Date of ALS Report	Phosphorus Edge of IDZ Permit Limit Met
HAD-3	Jun 6, 2023	Jun 7, 2023	Jun 14, 2023	Yes
E19	Jun 6, 2023	Jun 7, 2023	Jun 14, 2023	Yes
QUL-58	Jun 6, 2023	Jun 7, 2023	Jun 14, 2023	No (QUL-58-AP [0.0378 mg/L], QUL-58-MP [0.0126 mg/L])
HAD-3	Jun 13, 2023	Jun 14, 2023	Jun 22, 2023	Yes
E19	Jun 13, 2023	Jun 14, 2023	Jun 22, 2023	No
HAD-3	Jun 19, 2023	Jun 20, 2023	Jun 21, 2023	Yes
E19	Jun 19, 2023	Jun 20, 2023	Jun 21, 2023	Yes
QUL-58	Jun 19, 2023	Jun 20, 2023	Jun 21, 2023	Yes

3 Investigation into cause

Sampling events with total phosphorus results above the permit limit of 0.010 mg/L are provided in Table 3 below. The IDZ permit limit of 0.010 mg/L came into effect on April 7, 2017. The British Columbia Water Quality Guidelines for total phosphorus are 0.005 mg/L to 0.015 mg/L.

Table 3 Total phosphorus results at QUL-58 above 0.010 mg/L

Date	Depth	Result (mg/L)	Permit Applicable
May 17, 2016	QUL-58-Mid	0.011	No
March 6, 2017	QUL-58-AT	0.0128	No
March 6, 2017	QUL-58-BT	0.049	No
March 6, 2017	QUL-58-B	0.015	□o
May 29, 2017	QUL-58-S	0.05	No*
May 13, 2018	QUL-58-S	0.013	No*
February 26, 2019	QUL-58-Mid	0.011	Yes
February 26, 2019	QUL-58-B	0.012	Yes
March 3, 2019	QUL-58-S	0.016	No*
July 9, 2019	QUL-58-S	0.0107	No*
July 9, 2019	QUL-58-AT	0.0134	No*
July 25, 2019	QUL-58-AT	0.0129	No*
June 9, 2020	QUL-58-S	0.0107	No*
June 29, 2020	QUL-58-AT	0.0137	No*

June 29, 2020	QUL-58-B	0.0125	Yes
June 6, 2023	QUL-58-AP	0.0378	No*
June 6, 2023	QUL-58-MP	0.0126	Yes

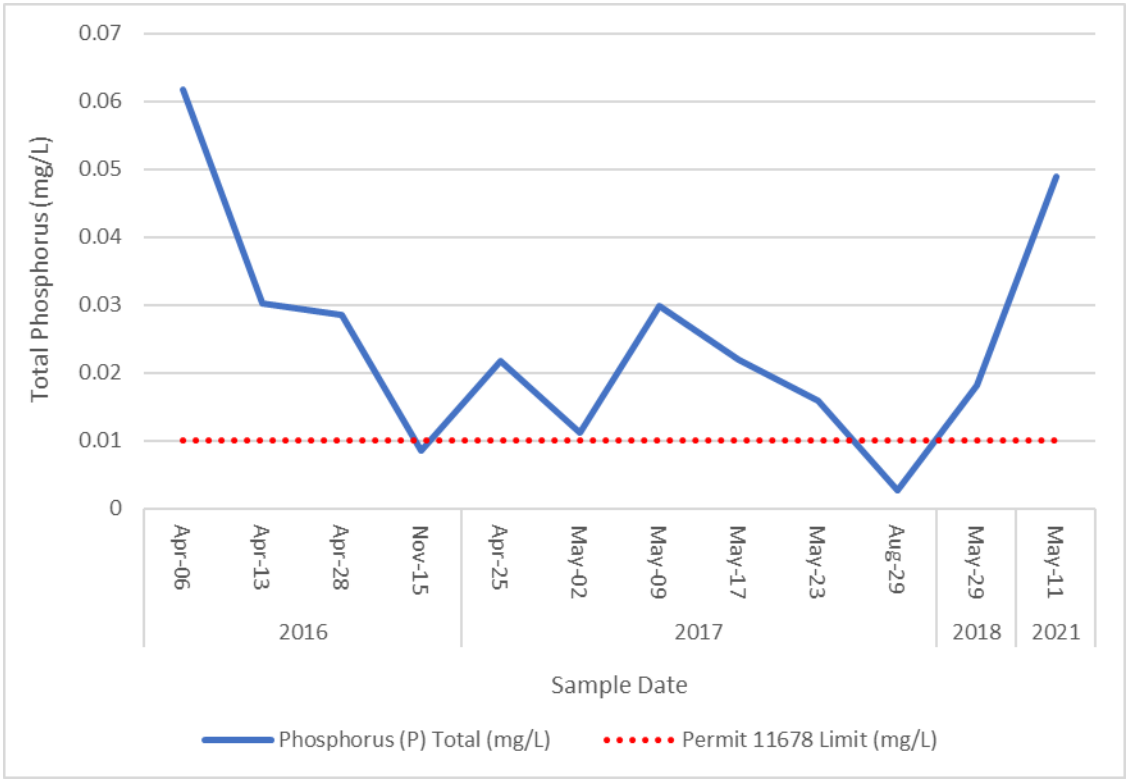
*Permit 11678 stipulates that the edge of Quesnel Lake IDZ is represented by site QUL-Mid and/or near bottom samples; therefore, the limits provided under Condition 1.2.5 Table 1 of the permit do not apply to sample sites QUL-58-S, QUL-58-AT and QUL-58-AP.

In the *Permit 11678- Total Phosphorus Exceedance at QUL-58, February 26, 2019- Follow Up Report* previously submitted to ENV, it was noted that investigations from 2016 and 2017 revealed that the elevated phosphorus in Quesnel Lake was the result of an equipment cleaning agent containing phosphate. The cleaning agent was replaced with a non-phosphate cleaner. It was also noted in the February 26, 2019 follow up report that the elevated total phosphorus concentrations in Quesnel Lake in 2018 were suspected to have been from Hazeltine and Edney Creeks.

Total phosphorus data from 2019 to 2023 supports the belief that the higher concentrations of phosphorus in Quesnel Lake are coming from Hazeltine and Edney Creeks as shown in Figure 2 below. Four of the 6 total phosphorus concentrations recorded at EDC-01 (Edney Creek outlet) in 2019 and 2020 were above the permit limit with an average of 0.0177 mg/L. The outlet of Edney Creek changed from EDC-01 to EDC-01a in 2021. Seventeen of the 29 total phosphorus concentrations recorded at EDC-01a in 2021-2023 were above the permit limit with an average of 0.0136 mg/L. The outlet of Hazeltine Creek to Quesnel Lake changed from HAC-12 to HAC-01c in 2018 and the WTP was no longer discharging into Hazeltine Creek. The maximum concentration of total phosphorus at HAC-01c in 2019 and 2020 was 0.041 mg/L in May 2020 and the average was 0.018 mg/L. The outlet of Hazeltine Creek to Quesnel Lake changed from HAC-01c to HAC-08 in 2021. Eighteen of the 28 total phosphorus concentrations recorded at HAC-08 in 2021-2023 were above the permit limit with an average of 0.0146 mg/L. The maximum concentration of total phosphorus at HAC-08 was 0.0435 mg/L in August 2022.

Historical total phosphorus data from Horsefly River from 2016 to 2021 also indicates that higher concentrations of phosphorus in Quesnel Lake are the result of tributary inputs to the lake. Ten of the 12 total phosphorus concentrations recorded at HOR-2 (Horsefly River outlet) were above the permit limit with an average of 0.025 mg/L (Figure 1).

Figure 1. Total phosphorus results from the Horsefly River from 2016-2021

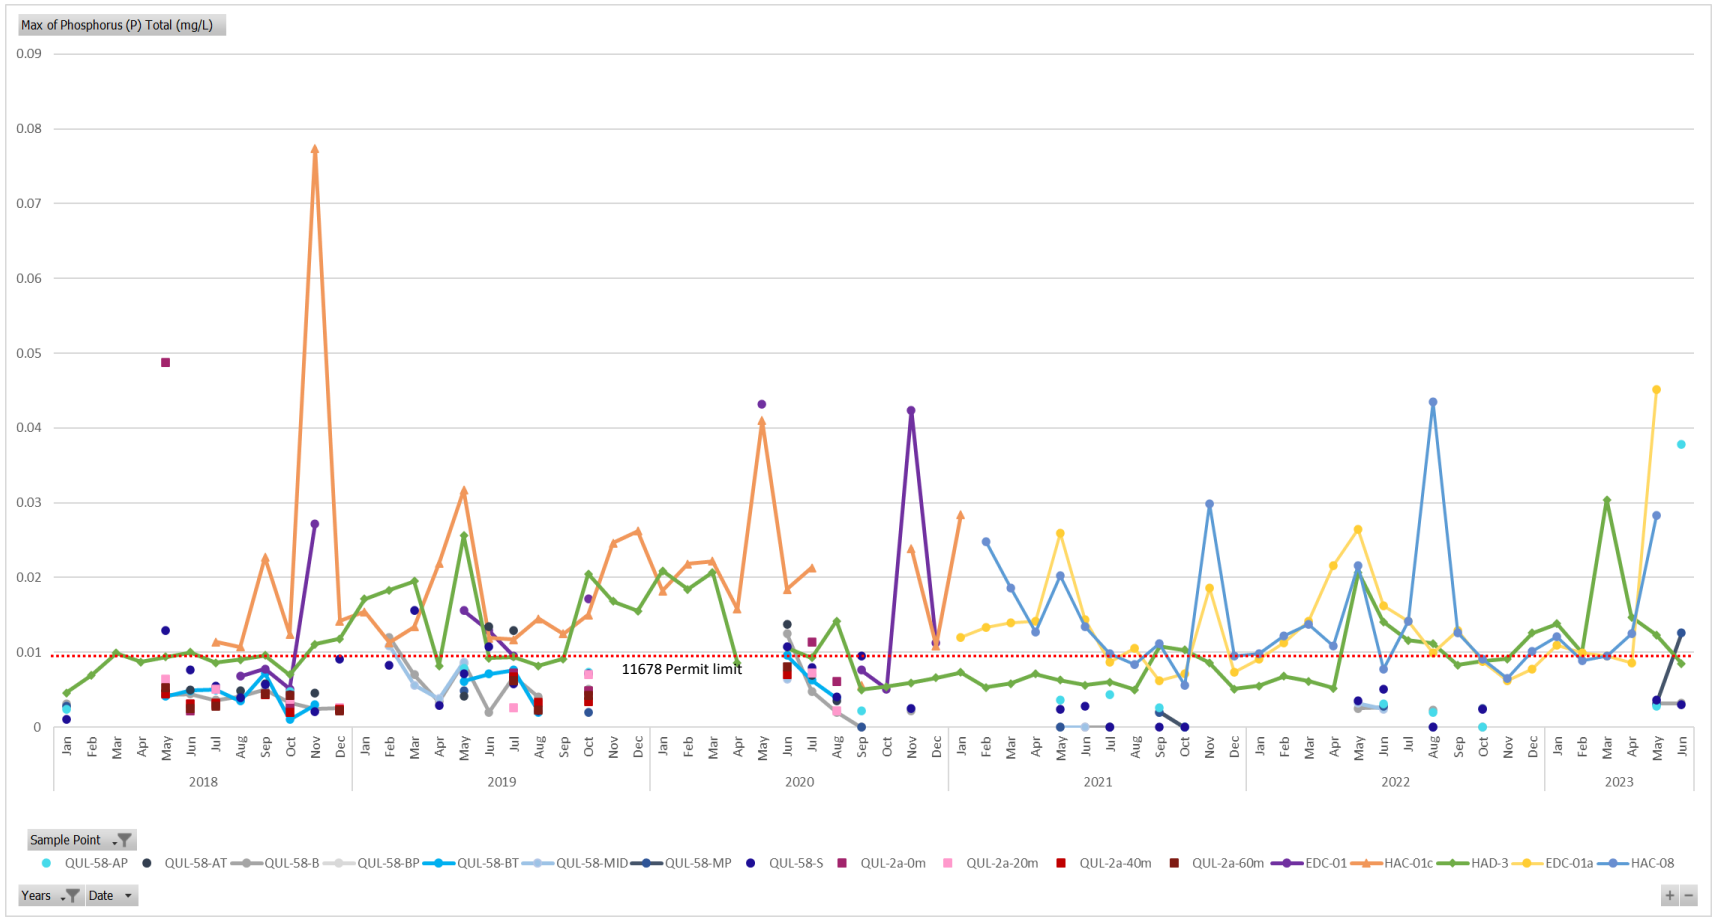


HAD-3 total phosphorus concentrations fluctuated above and below 0.010 mg/L from 2018 to 2023 with an overall maximum of 0.0305 mg/L in May 2023, and averages of 0.0093 mg/L in 2019, 0.0104 mg/L in 2020, 0.0069 mg/L in 2021, 0.010 mg/L in 2022 and 0.015 mg/L in 2023.

HAD-3 results were above 0.010 mg/L when total phosphorus at the IDZ was above the permit limit, except at the time that the July 9 and 25, 2019, June 9, 2020 and June 6, 2023 Quesnel Lake samples were collected.

MPMC will continue to monitor total phosphorus concentrations of the effluent at the discharge point and at the Quesnel Lake IDZ.

Figure 2. Total phosphorus results from QUL-58, HAD-3 and the outlets of Hazeltine and Edney Creeks from 2018-2023



4 Summary of Actions Taken

Date	Action Taken
Jun 6, 2023	HAD-3, E19 and QUL-58 samples collected.
Jun 19, 2023	QUL-58 results from the Jun 6, 2023 sample were above the permit limit for total phosphorus. The Director was notified and the WTP was put into recirculation. HAD-3, E19 and QUL-58 samples collected.
Jun 21, 2023	QUL-58 results from the Jun 19, 2023 sample were below the permit limit for total phosphorus. The Director was notified and the WTP resumed normal operation on Jun 22, 2023.

5 Key Findings

- Total phosphorus exceedances of the permit limit at QUL-58 may be the result of higher total phosphorus inputs from tributaries of the lake including Hazeltine and Edney Creeks, and the Horsefly River.

6 Recommendations

- Continue routine monitoring of the influent to, and effluent from, the WTP.
- Continue to review water quality results.
- Discuss water management with WTP operators.

Angelo Salandanan	Lab Assistant	Metals, Burnaby, British Columbia
Brieanna Allen	Production/Validation Manager	Inorganics, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	no units
µS/cm	microsiemens per centimetre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Qualifiers

Qualifier	*Description*
DLM	*Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).*
RRV	*Reported result verified by repeat analysis.*

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Sub-Matrix: **Water**

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

Turnaround Time (TAT) Requested

☑ Routine [R] if received by 3pm M-F - no surcharges apply
☐ 4 day [P4] if received by 3pm M-F - 20% rush surcharge minimum
☐ 3 day [P3] if received by 3pm M-F - 25% rush surcharge minimum
☐ 2 day [P2] if received by 3pm M-F - 50% rush surcharge minimum
☐ 1 day [E] if received by 3pm M-F - 100% rush surcharge minimum
☐ Same day [E2] if received by 10am M-S - 200% rush surcharge.

Additional fees may apply to rush requests on weekends, statutory holidays and for non-routine tests.

Date and Time Required for all E&P TATs: dd-mmm-yy hh:mm am/pm

For all tests with rush TATs requested, please contact your AM to confirm availability.

C-O-C number	: D0098	Issue Date	: 14-Jun-2023 18:03
Sampler	: DS, KA		
Site	: ----		
Quote number	: Q77258 - WQ Analysis		
No. of samples received	: 5		
No. of samples analysed	: 5		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Brieanna Allen	Production/Validation Manager	Inorganics, Burnaby, British Columbia
Cindy Tang	Team Leader - Inorganics	Inorganics, Burnaby, British Columbia
Kim Jensen	Department Manager - Metals	Metals, Burnaby, British Columbia
Sukhman Khosa	Lab Assistant	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	no units
µS/cm	microsiemens per centimetre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Qualifiers

Qualifier	*Description*
RRV	*Reported result verified by repeat analysis.*

QUALITY CONTROL REPORT

Work Order	: **VA23B2768**	Page	: 1 of 14
Client	: Mount Polley Mining Corporation	Laboratory	: Vancouver - Environmental
Contact	: Gabriel Holmes	Account Manager	: Can Dang
Address	: PO Box 12 Likely BC Canada V0L 1N0	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	:	Telephone	: +1 604 253 4188
Project	: ----	Date Samples Received	: 07-Jun-2023 11:00
PO	: 5590012190	Date Analysis Commenced	: 07-Jun-2023
C-O-C number	: D0098	Issue Date	: 14-Jun-2023 18:03
Sampler	: DS, KA 250-790-2215 ext 2171		
Site	: ----		
Quote number	: Q77258 - WQ Analysis		
No. of samples received	: 5		
No. of samples analysed	: 5		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percent Difference (RPD) and Data Quality Objectives
- Matrix Spike (MS) Report; Recovery and Data Quality Objectives
- Method Blank (MB) Report; Recovery and Data Quality Objectives
- Laboratory Control Sample (LCS) Report; Recovery and Data Quality Objectives

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Brieanna Allen	Production/Validation Manager	Vancouver Inorganics, Burnaby, British Columbia
Cindy Tang	Team Leader - Inorganics	Vancouver Inorganics, Burnaby, British Columbia
Kim Jensen	Department Manager - Metals	Vancouver Metals, Burnaby, British Columbia
Sukhman Khosa	Lab Assistant	Vancouver Metals, Burnaby, British Columbia

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Sub-Matrix: **Water**

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

Project	: ----	Date Samples Received	: 14-Jun-2023 12:00
PO	: 5590012190	Date Analysis Commenced	: 15-Jun-2023
C-O-C number	: T0016	Issue Date	: 22-Jun-2023 15:29
Sampler	: KA		
Site	: ----		
Quote number	: Q77258 - WQ Analysis		
No. of samples received	: 2		
No. of samples analysed	: 2		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Angela Ren	Team Leader - Metals	Metals, Burnaby, British Columbia
Angelo Salandanan	Lab Assistant	Metals, Burnaby, British Columbia
Miles Gropen	Department Manager - Inorganics	Inorganics, Burnaby, British Columbia
Sukhman Khosa	Lab Assistant	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	no units
µS/cm	microsiemens per centimetre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Accreditation

Accreditation	*Description*	*Laboratory*	*Address*
A	CALA ISO/IEC 17025:2017	VA Vancouver - Environmental	8081 Lougheed Highway, Burnaby, BC

Applicable accreditations are indicated in the Method/Lab column as superscripts.

Qualifiers

Qualifier	*Description*
DLM	*Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).*
DTC	*Dissolved concentration exceeds total. Results were confirmed by re-analysis.*

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Sub-Matrix: **Water**

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

Turnaround Time (TAT) Requested

☑ Routine [R] if received by 3pm M-F - no surcharges apply
☐ 4 day [P4] if received by 3pm M-F - 20% rush surcharge minimum
☐ 3 day [P3] if received by 3pm M-F - 25% rush surcharge minimum
☐ 2 day [P2] if received by 3pm M-F - 50% rush surcharge minimum
☐ 1 day [E] if received by 3pm M-F - 100% rush surcharge minimum
☐ Same day [E2] if received by 10am M-S - 200% rush surcharge.

Additional fees may apply to rush requests on weekends, statutory holidays and for non-routine tests.

Date and Time Required for all E&P TATs: dd-mmm-yy hh:mm am/pm

For all tests with rush TATs requested, please contact your AM to confirm availability.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Angelo Salandanan	Lab Assistant	Metals, Burnaby, British Columbia
Kate Dimitrova	Analsyt	Inorganics, Burnaby, British Columbia
Kim Jensen	Department Manager - Metals	Inorganics, Burnaby, British Columbia
Kim Jensen	Department Manager - Metals	Metals, Burnaby, British Columbia
Tracy Harley	Supervisor - Water Quality Instrumentation	Inorganics, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	no units
µS/cm	microsiemens per centimetre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Please refer to the Accreditation section for an explanation of analyte accreditations.

QUALITY CONTROL REPORT

Work Order	: **VA23B3865**	Page	: 1 of 14
Client	: Mount Polley Mining Corporation	Laboratory	: Vancouver - Environmental
Contact	: Gabriel Holmes	Account Manager	: Can Dang
Address	: PO Box 12 Likely BC Canada V0L 1N0	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	:	Telephone	: +1 604 253 4188
Project	: ----	Date Samples Received	: 20-Jun-2023 13:35
PO	: 5590012190	Date Analysis Commenced	: 20-Jun-2023
C-O-C number	: F0569	Issue Date	: 21-Jun-2023 17:21
Sampler	: AN, GH 250-790-2215 ext 2171		
Site	: ----		
Quote number	: Q77258 - WQ Analysis		
No. of samples received	: 8		
No. of samples analysed	: 8		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percent Difference (RPD) and Data Quality Objectives
- Matrix Spike (MS) Report; Recovery and Data Quality Objectives
- Method Blank (MB) Report; Recovery and Data Quality Objectives
- Laboratory Control Sample (LCS) Report; Recovery and Data Quality Objectives

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Angelo Salandanan	Lab Assistant	Vancouver Metals, Burnaby, British Columbia
Kate Dimitrova	Analsyt	Vancouver Inorganics, Burnaby, British Columbia

Kim Jensen	Department Manager - Metals	Vancouver Metals, Burnaby, British Columbia
Tracy Harley	Supervisor - Water Quality Instrumentation	Vancouver Inorganics, Burnaby, British Columbia

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

Turnaround Time (TAT) Requested

☐ Routine [R] If received by 3pm M-F - no surcharges apply
☐ 4 day [P4] If received by 3pm M-F - 20% rush surcharge minimum
☐ 3 day [P3] If received by 3pm M-F - 25% rush surcharge minimum
☐ 2 day [P2] If received by 3pm M-F - 50% rush surcharge minimum
☑ 1 day [E] If received by 3pm M-F - 100% rush surcharge minimum
☐ Same day [E2] If received by 10am M-S - 200% rush surcharge.

Additional fees may apply to rush requests on weekends, statutory holidays and for non-routine tests.

Date and Time Required for all E&P TATs: dd-mmm-yy hh:mm am/pm

For all tests with rush TATs requested, please contact your AM to confirm availability.

Sampler	: GH		
Site	: ----		
Quote number	: Q77258 - WQ Analysis		
No. of samples received	: 2		
No. of samples analysed	: 2		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Angelo Salandanan	Lab Assistant	Metals, Burnaby, British Columbia
Kate Dimitrova	Analsyt	Inorganics, Burnaby, British Columbia
Kim Jensen	Department Manager - Metals	Inorganics, Burnaby, British Columbia
Kim Jensen	Department Manager - Metals	Metals, Burnaby, British Columbia
Tracy Harley	Supervisor - Water Quality Instrumentation	Inorganics, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	no units
µS/cm	microsiemens per centimetre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Accreditation

Accreditation	*Description*	*Laboratory*	*Address*
A	CALA ISO/IEC 17025:2017	VA Vancouver - Environmental	8081 Lougheed Highway, Burnaby, BC

Applicable accreditations are indicated in the Method/Lab column as superscripts.

Qualifiers

Qualifier	*Description*
DLA	*Detection Limit adjusted for required dilution.*
DLM	*Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).*

Project	: ----	Date Samples Received	: 20-Jun-2023 13:35
PO	: 5590012190	Date Analysis Commenced	: 20-Jun-2023
C-O-C number	: F0568	Issue Date	: 21-Jun-2023 17:22
Sampler	: GH 250-790-2215 ext 2171		
Site	: ----		
Quote number	: Q77258 - WQ Analysis		
No. of samples received	: 2		
No. of samples analysed	: 2		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percent Difference (RPD) and Data Quality Objectives
- Matrix Spike (MS) Report; Recovery and Data Quality Objectives
- Method Blank (MB) Report; Recovery and Data Quality Objectives
- Laboratory Control Sample (LCS) Report; Recovery and Data Quality Objectives

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Angelo Salandanan	Lab Assistant	Vancouver Metals, Burnaby, British Columbia
Kate Dimitrova	Analsyt	Vancouver Inorganics, Burnaby, British Columbia
Kim Jensen	Department Manager - Metals	Vancouver Inorganics, Burnaby, British Columbia
Kim Jensen	Department Manager - Metals	Vancouver Metals, Burnaby, British Columbia
Tracy Harley	Supervisor - Water Quality Instrumentation	Vancouver Inorganics, Burnaby, British Columbia

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Sub-Matrix: **Water**

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

Ministry Inspection Reports

Date	Inspection #	Order #	Due Date	Status	Request #	Due Date	Status	Warning #	Due Date	Status	Advisories #	Response Date	Responsible for Resoonse	
12-Jan-23	201588	201588-S1-O1	25-Jan-23	**Closed**									Mine Ops	Overhanging frost layers at the face.Inspector had discussion with mine ops general foreman.
		201588-S1-O2	02-Feb-23	**Closed**									Mine Ops	Traffic control signage is required leaving the Springer Pit to connect to the main haulage road.
		201588-S1-O3	02-Feb-23	**Closed**									Mine Ops	Roll out berm required at the potential run out zone that connects to the haulage road.
		201588-S1-O4	02-Feb-23	**Closed**									Site Services	Large overhang of ice on the warehouse admin building.
		201588-S2-O5	02-Feb-23	**Closed**									Mine Maintenance	Drill press needs to be anchored to the floor.
		201588-S2-O6	02-Feb-23	**Closed**									Mine Maintenance	Waste materials containing solvents, grease, paints, or other flammable substances shall be stored in appropriate covered containers while awaiting disposal.
								201588-S2-W1	02-Feb-23	**Closed**			Mine Maintenance	Grinder found with guarding removed.
								201588-S2-W2	02-Feb-23	**Closed**			Mine Maintenance	Safety chains not in place at acetylene storage.
					201588-S2-R1	02-Feb-23	**Closed**						Jim Hjelden	The Ministry is requesting a copy of MP lock out procedure.
					201588-S2-R2	02-Feb-23	**Closed**						Richard Tuohey	The Ministry is requesting a copy of MP traffic control procedure.
28-Mar-23	204284	204284-S1-O1	24-Apr-23	**Closed**									Darcy Hannas	Guarding missing on new filter press.
28-Mar-23	204147				204147-S1-R1	12-Apr-23	**Closed**						Ed McManus	The Ministry is requesting an up-to-date electrical single-line diagram of the mines electrical distribution system for review.
					204147-S2-R2	12-Apr-23	**Closed**						Ed McManus	The Ministry is requesting the ground-grid Ground Potential Rise test procedure for review.
27-Apr-23	205631	205631-S2-O1	15-Jun-23	**Closed**									Environment	DSI recommendation 2021DSI-01 indicates that MPMC has not followed the EoR's recommendations datine to 2020 - a contravention of Permit M-200 clause C.1.(c)
											205631-S1-A1	**17-May-23**	Environment/TSF	MP is to consult with EoR and determine the TSF pond QPO values the would trigger a Reportable Incident - the trigger levels should be included in the next update to the OMS, TARP, and EPRP.
27-Apr-23	205650	205650-S1-O1	05-Jun-23	**Closed**									Mill Maintenance	Install swing gates in accordance with ANSA14.3-1992.
		205650-S1-O2	15-May-23	**Closed**									Site Services	Hydrocarbon spills at light and heavy vehicle fuel docks.
		205650-S1-O3	15-May-23	**Closed**									Site Services	Housekeeping at heavy vehicle fuel dock.
16-May-23	206519										206519-S1-A1	**N/A**	N/A	No Orders Issued, report signed and returned.
12-Jun-23	208361	208361-S1-O1	27-Jun-23	**Closed**									James Grondines	Toyota Forklift inside warehouse has the wrong size fire extinguisher.
		208361-S1-O2	05-Jul-23	**Closed**									James Grondines	Monthly checks are not being completed on the fire extinguisher installed inside the warehouse.
		208361-S1-O3	27-Jun-23	**Closed**									James Grondines	Used hazardous waste oil bins in Yard 1 laydown were not labeled.
		208361-S1-O4	04-Jun-23	**Closed**									James Grondines	One hazardous waste oil bin fork slots were broken creating a potential tip over and spill hazard.
		208361-S1-O5	27-Jun-23	**Closed**									James Grondines	Compressed gas cylinders (propane tanks) were laying on the ground and not in proper storage area.
		208361-S1-O6	27-Jun-23	**Closed**									Site Services	There is a hydrocarbon spill to be cleaned up in yard #2
		208361-S1-O7	27-Jun-23	**Closed**									All Depts.	Many pieces of Mobile equipment over 7000kg during the inspection were found not equipped with wheel chocks.
								208361-S1-W1	**N/A**				James Grondines	Fibre Webbing Slings found that are in service were frayed and damaged.
								208361-S1-W2	**N/A**				Mine Maintenance	Mechanics found working on a piece of equipment did not have locks with tags in place
19-Jun-23	208476	208476-S1-O1	17-Jul-23	**Closed**									Mill Maintenance	Outside of the crusher operator room, Inspector Bolen noted a ladder that that appeared to lead up to a working platform that was more than 1 m above floor grade. This working platform appeared to lack standard guardrails. This is a contravention to the HSRC Section 4.1.8(1)
		208476-S1-O2	17-Jul-23	**Closed**									Mill Operations	In the lower level of the crusher building, Inspector Bolen noted a crane logbook that was not being examined, dated and signed, at least weekly, by the supervisor to ensure the required entries have been made. This is a contravention to the HSRC Section 4.18.6(3).
		208476-S1-O3	17-Jul-23	**Closed**									Mill Operations	In the motor storage warehouse outside of the new lunchroom in the shop, Inspector Bolen noted that this area was extremely cluttered and that there was no path to provide a quick and unimpeded access to the emergency exit. This is a contravention to the HSRC Section 4.1.4(3a)
		208476-S1-O4	24-Jul-23	**Closed**									Mill Maintenance	In the crusher building, Inspector Bolen noted vehicle support stands that did not appear to have the rated load capacity marked on them. This is a contravention to the HSRC Section 4.12.12
05-Jul-23	209195	209195-S1-O1	05-Jul-23	**Closed**									General Manager	Develop a safe working plan to upright an overturned water truck.
27-Jul-23	210956				210956-S1-R1	**Closed**							Safety	Copy of the record of thermal stress training/discussion that was provided to crews
					210956-S2-R2	**Closed**							Mine Maintenance	Description of how waste oil/water in the shop floor drain/catchment is managed so as to prevent environment contamination.
		210956-S4-O1	29-Nov-23	**Closed**									Mine Maintenance	Blind side camera on shovel not operational.
		210956-S6-O2	29-Nov-23	**Closed**									Mine Maintenance	Effective housekeeping program for air conditioning unit.
		210956-S7-O7	29-Nov-23	**Closed**									Mine Maintenance	Repair drill A/C.
04-Oct-23	215253	215253-S1-O1	10-Nov-23	**Closed**									Mill Maintenance	Guarding around bull gears on mills.
		215253-S1-O2	10-Nov-23	**Closed**									Electrical	MCC rack loader past annual inspection date.
		215253-S1-O3	27-Oct-23	**Closed**									Mill Ops	Housekeeping around mill area.
		215253-S1-O4	27-Oct-23	**Closed**									Mill Ops	Crane logbook missing supervisor signature.
		215253-S1-O5	12-Dec-23	**Closed**									Mill Maintenance	Bump-stops on vertical doors.
		215253-S1-O6	10-Nov-23	**Closed**									Mill Maintenance	Head and tail pulleys require guarding improvements.
		215253-S1-O7	20-Oct-23	**Closed**									Mill Ops	Decanted liquid with no label - mag plant.
		215253-S1-O8	10-Nov-23	**Closed**									Mill Ops	Monorail does display safe working load - mag plant.
								215253-S1-W1	10-Nov-23	**Closed**				Lifting device with no established load rating.
								215253-S1-W2	27-Oct-23	**Closed**			Mine Maintenance	Angle grinder with modified guard - weld shop.
18-Oct-23	216375	216375-S1-O1	15-Nov-23	**Closed**									Safety	Monthly fire extinguisher inspections - mine rescue and administration
											216375-S1-A1	15-Nov-23	Safety	ERP annual testing - **CLOSED**
22-Nov-23	218014	218014-S1-O1	15-Dec-23	**Closed**									Site Wide	Implement an effective housekeeping program. Fire extinguisher beside door in the tool crib area with debris on/near the landing below.
		218014-S1-O2	15-Dec-23	**Closed**									Mill Operations	Portable eye wash stations.
		218014-S1-O3	15-Dec-23	**Closed**									Site Wide	Implement an effective housekeeping program. Life ring on a walkway, not hung up.
								218014-S1W1	N/A	**Closed**			Mill Maintenance	Sling with signs of damamge - removed during tour.
								218014-S2-W2	N/A	**Closed**			Mill Maintenance	Shelf in front of electrical panel. Removed on the same day as the tour, photos were sent to EMLI.
								218014-S2-W3	N/A	**Closed**			Mill Maintenance	Tagout barrier missing from D-bank. Deficiency was rectified at the time of inspection.
		218014-S2-O4		**Closed**									Site Wide	Implement an effective housekeeping program.
		218014-S2-O5		**Closed**									Site Wide	Implement an effective housekeeping program. Steel platform uneven with floor creates a tripping hazard.
22-Nov-23	218024	218024-S1-O1										01-Apr-24	Safety	Workplace monitoring program.
		218024-S1-O2										05-Jan-24	Safety	Interim exposure plan - mag plant.
		218024-S1-O3										05-Jan-24	Safety	Hearing conservation program.
		218024-S1-O4										05-Jan-24	Safety	Worker observed not wearing HPD. assumed to be not wearing respiratory protection (reso pro not required when using portable hand grinder).
12-Dec-23	219135	219135-S1-O1	26-Jan-24	**Closed**								26-Jan-24	Electrical	Fire stop in mag plant.

Ministry Inspection Reports

Date	Inspection #	Order #	Due Date	Status	Request #	Due Date	Status	Warning #	Due Date	Status	Advisories #	Response Date	Responsible for Response	Description
05-Oct-22	197466	197466-S1-O1	31-Mar-24	Open									Safety	Written MSD prevention program and an action plan for implementation.
22-Nov-23	218024	218024-S1-O1	01-Apr-24	Open									Safety	Current WMP and results of the program shall be available to the inpsector

21-Feb-24	221028	221028-S1-O1	01-Apr-24	Open									Mill Maintenance	Secure shelf in pump rebuild area
		221028-S1-O2	01-Apr-24	Open									Supply Chain	Access/egress in warehouse 1
		221028-S1-O3	01-Apr-24	Open									Mine Maintenance	Contractor service truck (Clauson Equipment Services Ltd) requires NDT testing on the crane
		221028-S1-O4	01-Apr-24	Open									Mill Operations	Replace single-walled fuel tank with double-walled or provide a containment for single-walled tank in con shed. Placard required
21-Feb-24	221033	221033-S1-O1	12-Mar-24	Open									Mill Maintenance	Repair cable on hydraulic motor for thickner and stop/start station in basement
											221033-S1-A1	Open	Mill Maintenance	Marking of electrical distribution area

Date	Permit	Type	Requirement/Description	Compliance	Findings/Details	Response/Action	Status
16-May-23	M-200	Geotechnical Inspection #206904	Order 206904-S1-O1	Out	The previous DSR report was submitted in 2017. A new DSR report was required by March 31 2023. A new DSR report has not been submitted. This is a contravention of HSRC 10.4.5 and HSRC 10.5.4.	MPMC retained Tetra Tech to produce the 2022 DSR as per the code. The report was finalized and was submitted to EMLI.	Complete
24-May-23	M-200	Geotechnical Inspection #206622	Advisory 1	N/A	The Mill Site Sump is located on the Mill Site and includes a dam approximately 4 m in height. MPM is planning to decommission the dam. Potential Permitting requirements for the decommissioning of the structure were discussed. EMLI recommends that MPM complete a self assessment to determine if the activity is substantial and if a notice of departure from approval is required (per 10.1.18 of the Code).	Manager's Response from June 23, 2023: Mount Polley Mine submitted a self assessment on June 6, 2023. An NoD letter was received from Sean Shaw, and the work was determined to be "non-substantial" and can proceed.	Complete
24-May-23	M-200	Geotechnical Inspection #206622	Advisory 2	N/A	During the review of the "2022 Pit Slope and Waste Rock Dump Slope Stability Review" report, EMLI noted that the Northeast Dump and Bell Dump were not addressed in the report. Per Condition B.4.(d)(i), MPM must ensure that the 2023 annual report documenting the review of waste dump design and stability performance includes all dumps within the MPM Permitted Mine Area by March 31, including the Northeast Dump and Bell Dump.	Include Northeast Dump and Bell Dump in 2023 annual reporting.	Incomplete
24-May-23	M-200	Geotechnical Inspection #206622	Advisory 3	N/A	SERDS Co-Disposal Facility: Tailings excavated from SPP are being placed in SERDS Co-disposal Facility. MPM is exploring options for reconfiguring the design of the tailings cells. EMLI recommends that MPM complete a self assessment to determine if the activity is substantial and if a notice of departure from approval is required per 10.1.18 of the Code.	Complete a self assessment to determine if reconfiguring the design of the tailings cells is substantial and a notice of departure from approval is required.	Incomplete
24-May-23	M-200	Geotechnical Inspection #206622	Advisory 4	N/A	The Wight Pit is currently being used for water storage. MPM advised EMLI that the underground workings are submerged under water at the base of the Wight Pit. EMLI recommends that if MPM is not planning to carry out underground work in the near future, consideration be given to requesting that permit conditions associated with underground mining be removed from the Permit as a Permit Amendment.	Manager's Response from June 23, 2023: Mount Polley Mine is currently evaluating its mine plan as it relates to underground mining. As part of this evaluation, MPM is considering potential underground mining options and as such does not intend to apply for a permit amendment associated with the removal of conditions associated with the underground at this time.	Complete
24-May-23	M-200	Geotechnical Inspection #206622	Order 1	Out	B.2(d)(i) The Permittee must ensure an annual review and inspection of the underground workings is undertaken, and observations and recommendations made during the review and inspection are summarized in a report. The Permittee must submit this report to the Chief Inspector by March 31 of the year following the review and inspection. The report required in Permit Condition B.2.(d)(i) was not submitted for the 2022 calendar year.	Manager's Response from June 23, 2023: The underground workings are accessed via a portal in the Wight Pit that has been flooded and inaccessible since 2019, making it unsafe to access the workings for inspection. MPM plans to apply for a variance requesting that it be exempt from Permit Condition B.2.(d)(i) while the pit remains unsafe to access the underground working in order to avoid administrative non-compliances with M-200. As stated in response to Advisory 4, MPM is currently reviewing its mine plan as it relates to underground mining and does not intend to apply for a permit amendment to remove the underground conditions from M-200 at this time.	Complete
24-May-23	M-200	Geotechnical Inspection #206622	Order 2	Out	S.10.4.4(d)- The 2022 "Annual Mine Managers Summary Report to the Chief Inspector" did not include a schedule for completion all DSI recommendations, or a commitment to complete the work as per the schedule provided in the DSI. Per Section 10.4.4(d) of the Code, the Mine Manager is to provide a schedule for completion all DSI recommendations.	Manager's Response from June 23, 2023: MPMC will resubmit the Annual Mine Manager's Summary report with a schedule for completion and commitment to complete all DSI recommendations.	Complete- amended report from Jun 20, 2023 submitted with Manager's Response on June 23, 2023
24-May-23	M-200	Geotechnical Inspection #206622	Order 3	Out	S.10.4.2(1)(c)- The 2022 report of activities of the Independent Tailings Review Board established under 10.4.2 (1) (c) of the Code did not include signed acknowledgement by the members of the Board, confirming that the report is a true and accurate representation of the Reviewers. Per Section 10.4.4(c)(iv) of the Code, the Mine Manager is to provide signed acknowledgement by the members of the Independent Tailings Review Board, confirming that the document "Mount Polley Mine Independent Tailings Review Board - Annual Report 2022," is a true and accurate representation of the Reviewers.	Manager's Response from June 23, 2023: MPMC will submit a signed acknowledgement letter by the IERP.	Complete- signed letter submitted with Manager's Response on June 23, 2023
26-Jul-23	M-200	Reclamation Inspection #210491	Advisory 210491-S1-A1	N/A	MPMC indicated that biosolids stockpile remains in place and that the material is still viable for use. The materials in the current stockpile are planned for use on the TSF. MPMC is considering bringing in additional biosolids material and placing it in a new stockpile on the ERDS. MPMC adived that the importation of any new materials and creation of new stockpile may require approval from EMLI as per the recently publishd Guidance on Approval of Imported Materials on a Mine Site.	MPMC will receive EMLI approval prior to importation of new materials.	N/A
26-Jul-23	M-200	Reclamation Inspection #210491	Request 210491-S1-R1	N/A	MPMC submitted a compliance status report as part of the 2022 Annual Reclamation Report. The report included a summary of recent inspections and associated orders. During the inspection, EMLI requested to view a copy of the mines compliance tracking table with all conditions of the M-200 permit. The table was presented upon request. MPMC indicated that they are currently in the process of updating the tracking table to reflect a few additional permit conditions associated with recent amendments. MPMC indicated that there are several permit conditions that they are concerned about and requested EMLI provide clarification. In addition, the mine indicated that the present system of reusing permit condition numbers in permit amendments makes it difficult for the mine to track permit conditions. MPMC enquired whether EMLI has considered the use of unique permit condition numbering. Once update of the tracking table is complete, EMLI requests that the tracking table be shared with EMLI and that any permit conditions of concern be flagged for review.	MPMC is currently updating and reviewing the tracking table. MPMC will submit the table to EMLI in the Manager's response for this inspection	Complete.
26-Jul-23	M-200	Reclamation Inspection #210491	Advisory 210491-S2-A2	N/A	EMLI enquired about the monitoring of vegetation metal uptake at the mine site. Mr. MPMC indicated that monitoring programs have occurred in the past, the last program having occurred in 2017. MPMC is reminded that monitoring of metal uptake is a requirements of the M-200 permit, linked to condition C.13(n) and C.14 (Ecological Risk Assessment). MPMC is advised that monitoring of metal uptake should continue over the life of the mine.	MPMC will follow the M-200 permit requirement and re-initiate the metal uptake monitoring	Incomplete but will resume in 2024 in accordance with workplans

26-Jul-23	M-200	Reclamation Inspection #210491	Advisory 210491-S3-A3	N/A	Soil stockpiles were incidentally observed on the drive to the Wight Pit and to and from the TSF. EMLI noted that stockpiled materials are windrowed adjacent to road, the tailings pipeline and at the foot of some dumps, including the North East Zone (NEZ) Dump. None of the soil stockpiles observed were identified with signage and EMLI observed that one stockpile had been disturbed during recent upgrade of the tailings pipeline. It was discussed that other than the environmental department, who has a good understanding of where the soil resources are located, that other site personnel are not aware of the location or value of these materials. EMLI expressed concern over the location of soil stockpiles at the foot of the NEZ dump, noting that if operational staff are not aware of the presence of soil resources, that the materials could be buried and lost during dump resloping.MPMC indicated that the main operational soil stockpiles are signed, but the smaller ones are not. MPMC is reminded that Condition C.8(g) requires that soil stockpiles are clearly marked to ensure they are protected during construction and mine operations. Additional signage is needed to ensure that all soil resources are appropriately identified at the mine site.	MPMC has ordered additional signage for all soil stockpiles and will be put in place once received	Incomplete, 30 signs are mounted on posts but have yet to be distributed. Distribution will occur once the snow is gone
26-Jul-23	M-200	Reclamation Inspection #210491	Advisory 210491-S4-A4	N/A	On the drive to the North Bell Dump, EMLI viewed the mill stockpile. At the time of inspection, the stockpile water vaporizer, installed to control dust, was not in use and issues with fugitive dust were observed. MPMC indicated that water trucks are used on a daily basis to control dust and that a dust suppressant has been applied to the Bootjack Road (mine access).	MPMC will follow the Fugitive Dust Management Plan. Spray bars are active on the conveyor belts which provide dust control on the mill stockpiles.	Complete
30-Aug-23	M-200	Geoscience Inspection #213574	None	N/A	The inspection provided an overview of geoscience related projects and activities at Mount Polley Mine	No response/action required.	N/A

1 INTRODUCTION

The following describes the Reclamation Research Program (the Program) for the Mount Polley Mining Corporation (MPMC) at the Mount Polley Mine (the Facility), which is located approximately 100 km northeast of the city of Williams Lake, British Columbia (BC), near the town of Likely, BC.

1.1 OBJECTIVE

The main objective of the Program, along with progressive reclamation, is to meet and/or inform the objectives of the Mine Reclamation and Closure Plan (RCP). These activities, and their relationship to the RCP, are identified in Figure 1-1.

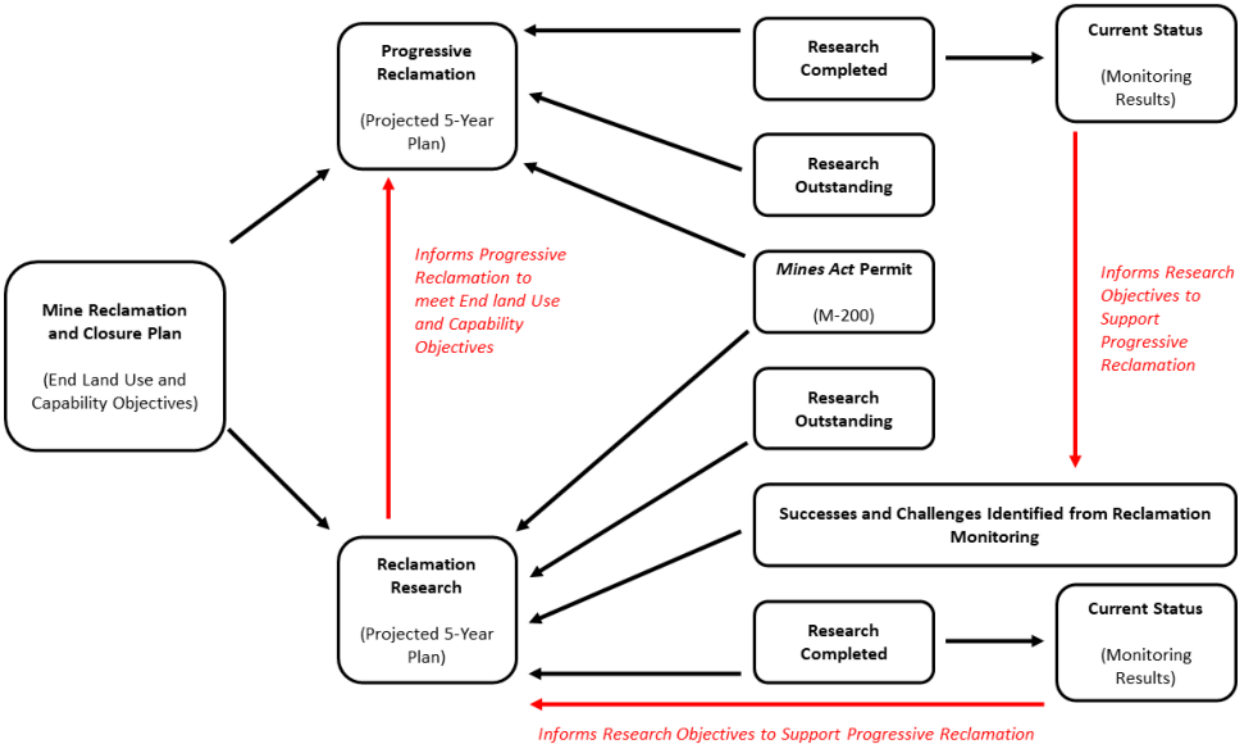

Figure 1-1. Diagram Illustrating Mine Reclamation Activities and their Relationships.

Further to the main objective, the purpose of the Program is to:

- Summarize progressive reclamation completed at the Facility to date;
- Summarize reclamation research completed at the Facility to date and identify where research requirements identified in the *Mines Act* Permit are being met;
- Identify reclamation research gaps (outstanding) based on the requirements identified in the *Mines Act* Permit No. M-200;

- Demonstrate where and how reclamation research aims to inform progressive reclamation practices that will meet the end land use and capability objectives;
- Provide a projected 5-year plan for addressing research gaps identified, and
- Provide a plan for monitoring existing ongoing and future research projects.

1.2 PERMIT REQUIREMENTS

Reclamation activities at the Facility are regulated by the Ministry of Energy, Mines and Low Carbon Innovation (EMLI) *Mines Act* Permit M-200 (Amendment date December 10, 2020) (the Permit).

As per Section D.14 of the Permit, the Facility is required to conduct reclamation research throughout the lifetime of the Facility. A Reclamation Research Program (the Program), outlining a plan that aims to satisfy the requirements outlined in this section of the Permit, must be prepared and submitted to the Chief Inspector by May 31 2021. A detailed summary of the Program will be provided within the Annual Reclamation Report and the Mine Plan and Reclamation Program Updates.

The ongoing reclamation research program requirements identified in the Permit along with reference to applicable sections of this document, and sections of the RCP, are summarized in Table 1-1.

Table 1-1 Permit M-200 Section D.14 Reclamation Research Requirements (a-m), Reference to Applicable Sections of the Program in the Current Document and the RCP, and Completion Status of Conditions.

Permit Condition Number	Condition	Applicable		Permit Condition Status (Initiated, Planned/Ongoing, Completed)
		Section(s) of Research Program	Section(s) of the RCP[1]	
a	The Permittee shall submit to the Chief Inspector by May 31, 2021, a Reclamation Research Program that includes details for achieving the research requirements outlined in this permit with a schedule for implementation and description for how results will be utilized and reported.	N/A	N/A	Completed
b	The Permittee shall ensure a detailed summary of all research being conducted under this section is provided in the Annual Reclamation Report and the Mine Plan and Reclamation Program Updates, including description of activities, results, and outcomes.	N/A	N/A	Initiated/Ongoing
c	The Permittee shall conduct research to inform closure water management strategies and identify post-closure maintenance and contingency requirements.	6.1.4, 7.1, 8.0	1.1.4, 2.4, 3.0, 4.3.6, 4.3.7, 4.3.8, 5.2, 6.9, 7.3, 7.4	Initiated/Planned
d	The Permittee shall conduct research to determine the viability of revegetation with native plant species, including culturally important species.	6.1.1, 6.2.2, 6.2.3, 7.2, 7.3, 8.0	3.0, 5.5, 5.6, 7.5	Initiated/Ongoing
e	The Permittee shall conduct research intended to develop an end land use plan for the post-closure landscape represented in the mine disturbance footprint that is based on pre-mining ecosystems and habitats. Where a discrepancy in the comparative areas represented by ecosystem types is identified, the Permittee shall develop mitigation options.	Table 6-13	3.0 and 5.3 and Appendix B	Completed
f	The Permittee shall, at a minimum 60 days prior to the start of construction, complete mitigation planning procedures for pre-mining habitats (terrestrial and aquatic) identified in the permit boundary (Figure 1-1) that are predicted to be lost or substantially changed (physically or functionally) due to direct mining activities or subsidence. Contingency plans shall be developed as part of this mitigation planning process that can be implemented in the event	9.0	5.4.2, 5.5.2, 5.9, 6.4.2	Refer to Section 5.9 of the RCP for details;

	that on-site mitigation options are deemed to not be feasible based on ongoing monitoring and research results.			
g	The Permittee shall conduct research intended to inform design of and to test potential mitigation options for restoring ecosystems and habitats that are predicted to be affected by mining activities.	6.0, 7.0, 8.0	3.0, 4.3, 5.0, 6.0, 7.0	Initiated/Ongoing
h	The Permittee shall establish test plots that will be used to evaluate the reclamation approaches and prescriptions applied to confirm that ecological trajectories consistent with the land use and capability targets are being achieved.	6.0, 7.0, 8.0	3.0, 4.3, 5.0, 6.0, 7.0	Initiated/Ongoing
i	The Permittee shall conduct research to inform the development of a soil replacement plan that is designed to achieve land capability and end land use objectives. If a shortfall of soil volumes is anticipated, the Permittee shall develop contingency plans, including the identification of potential sources of borrow material for use in reclamation. The Permittee must collect information on potential borrows including location, size, and soil characterization.	6.1.1, 6.1.2, 6.2.4, 6.2.5, 7.4, 7.5, 8.0	1.4.3, 3.0, 4.3.3, 5.4	Initiated/Ongoing
j	The Permittee shall conduct research to inform reclamation prescriptions for the TSF, such that it will meet end land use and land capability objectives.	6.2.6, 7.6, 8.0	1.2.2, 4.3.4, 5.1.4, (TSF specific); 2.4, 3.0, 4.3, 5.0, 6.9, 7.0	Planned
k	The Permittee shall conduct research to assess decompaction methodologies to ensure that the severity of compaction that exists prior to commencing reclamation activities is effectively addressed in a manner intended to achieve end land use objectives and erosion control.	6.2.7, 7.7, 8.0	1.4.3, 3.0, 5.4, 6.0, 7.5.1	Planned
l	The Permittee shall conduct geomorphic landform and run-off modeling assessments in order to identify opportunities to shape landforms in a manner that optimizes surface water pathways and soil moisture regimes, reduces infiltration through spoil materials, and enhances erosion control and habitat function and connectivity.	6.1.5	1.4.2, 2.4, 3.0, 4.3.5, 5.1, 5.2, 6.0, 7.2, 7.4	Completed
m	The Permittee shall develop and implement a monitoring program designed to evaluate the success of revegetation, habitat restoration, soil development, and erosion control. The Permittee shall include in this program ecosystem-specific sampling parameters and performance criteria, which the Permittee shall base on pre-mining ecosystem benchmarks.	8.0	3.0, 7.0	Ongoing/Planned

n	The Permittee shall develop and implement a monitoring program for evaluating metal uptake in exposed terrestrial and aquatic ecosystems, which specifies sampling requirements and performance criteria. Where harmful levels are found, the Permittee shall take any corrective action necessary to mitigate to ensure levels are safe for plant and animal life.	8.0	3.0, 4.3.3, 7.5.2	Planned
o	The Permittee shall undertake study programs to evaluate the cumulative effects of fertilization on total nutrient loading and impacts to receiving waters.	6.2.9, 7.9, 8.0	3.0	Initiated/Planned

[1]*Mine Reclamation and Closure Plan (RCP), Dated January 2017 (MPMC, 2017).*

2 FACILITY DESCRIPTION

As shown in Figure 1-2, the Facility can be separated into:

- The Tailings Storage Facility (TSF) and surrounding areas;
- The crusher and mill processing site; and
- The operations areas (i.e., open pits, waste rock dumps, stockpiles, roads, etc.) and surrounding areas.

The Facility has been in Care and Maintenance since May 31, 2019. Care and Maintenance operations are focused on general site maintenance, predominantly ensuring that all pumps, sumps and water management systems are functioning properly. Eleven full time employees work in 4 shifts including day shifts and night shifts.

All environmental monitoring and samplings as per all permits and Comprehensive Environmental Monitoring Plan (CEMP) will be followed during this temporary care and maintenance period.

2.1 TSF AND SURROUNDING AREAS

The TSF consists of tailings material and a single embankment made up of three dams: the Main Embankment, the Perimeter Embankment, and the South Embankment. During the TSF dam failure which occurred on August 4, 2014, water (both supernatant and interstitial) was released from the TSF, resulting in much of the tailings within the TSF being exposed to the elements (i.e., no longer submerged).

The breach of the Facility TSF resulted in the deposition of tailings between Polley Lake and Hazeltine Creek (known as the Polley Flats). Polley Flats covers an approximately 900 m long section of Hazeltine Creek south of Polley Lake. Prior to the breach, the area immediately south of Polley Lake included a wetland. The materials deposited in the Polley Flats are observed to include the following:

- Tailings (sandy silt or silty sand, and clay-textured material);
- Dam construction materials (gravel, rock fill and glacial till);
- Organic matter transported by the tailings flow (including trees and wood debris); and
- Re-worked organic and inorganic materials from the wetland.

Note that this Program only address areas covered within the M-200 Permit and does not include areas disturbed by the tailings breach.

2.2 CRUSHER AND MILL PROCESSING SITE

The crusher and mill area includes the crusher and mill building, the coarse ore pile, the tertiary pile, the fine ore (mill feed) pile, and the pebble pile (Figure 1-2). No crushing operations are conducted during Care and Maintenance period.

2.3 PITS AND SURROUNDING AREAS

No mining activities are being conducted during Care and Maintenance period. Open pits include Cariboo and Springer Pits and waste rock dumps include the Temporary North West (NW) Potentially Acid Generating (PAG) Stockpile, North East Zone (NEZ) Rock Dump and the South East Rock Dump (SERD).

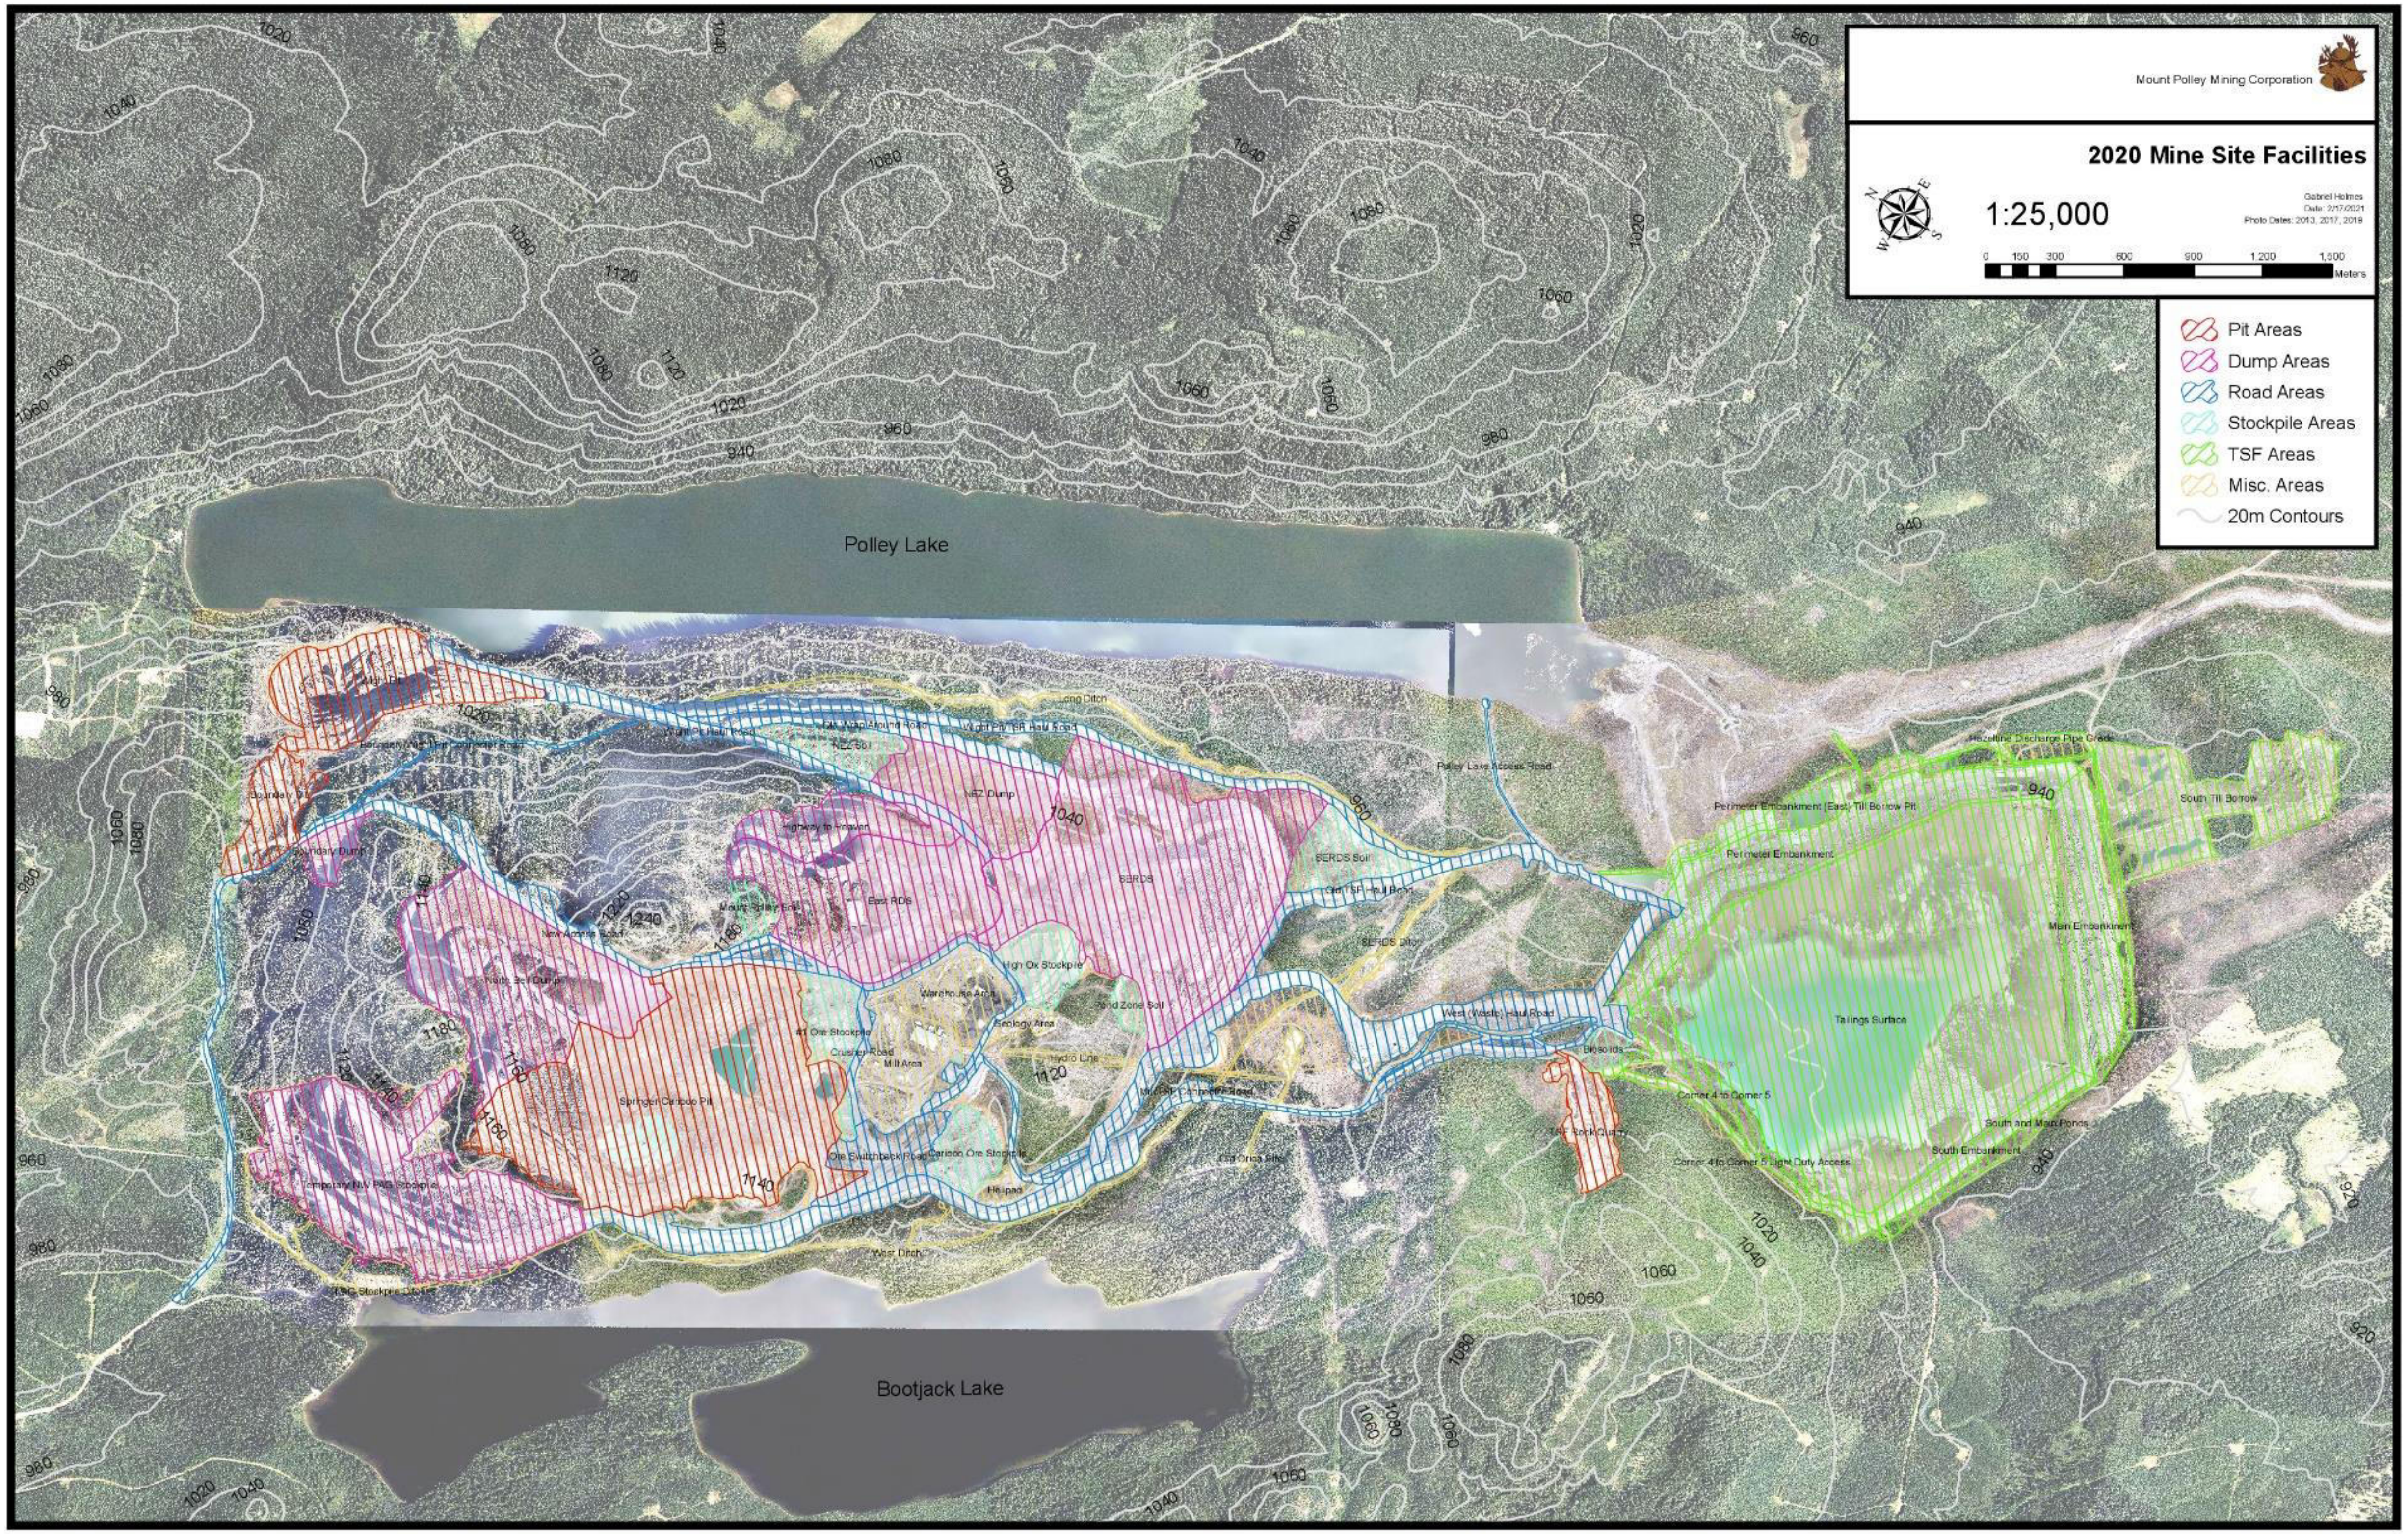

Figure 1-2. Mine Site Facilities.

2.4 METEOROLOGY

The Facility has two meteorological monitoring stations on site that have been operating since 2012 (see Figure 1). The first station (Station #1) is located southwest of the Polley Mountain summit, at an elevation of 1,171 metres above sea level (masl) near the Mill Site. The second station (Station #2) is located northwest of the TSF, along the access road to the old rock quarry. Station #2 is located atop a topographical rise at an elevation of 964 masl. The two stations are approximately 3.5 km apart, with an elevation difference of approximately 200 m. These stations monitor and record rainfall, temperature, relative humidity, wind speed, wind direction, and solar radiation every 5 minutes. From 1995 to 2012, a single meteorological station located beside the crusher building, northwest of the TSF, was in operation which monitored rainfall and temperature only.

3 BEST AVAILABLE TECHNOLOGY

Good engineering practice typically requires a project to follow the requisite engineering design process for the selection and progressive refinement of options. The project progresses from a pre-concept phase for the identification of multiple treatment options, through concept, pre-feasibility and feasibility phases to project execution. Generally, the engineering studies performed for each of the aforementioned project phases are supported by test work that progresses from proof-of-concept and detailed bench-scale testing to pilot-scale and demonstration-scale test work. A generic model for such a project development framework is provided in Figure 1-3 below. This framework also approximates the sequence of steps outlined in BC ENV's Best Available Technology (BAT) policy (BC ENV 2015).

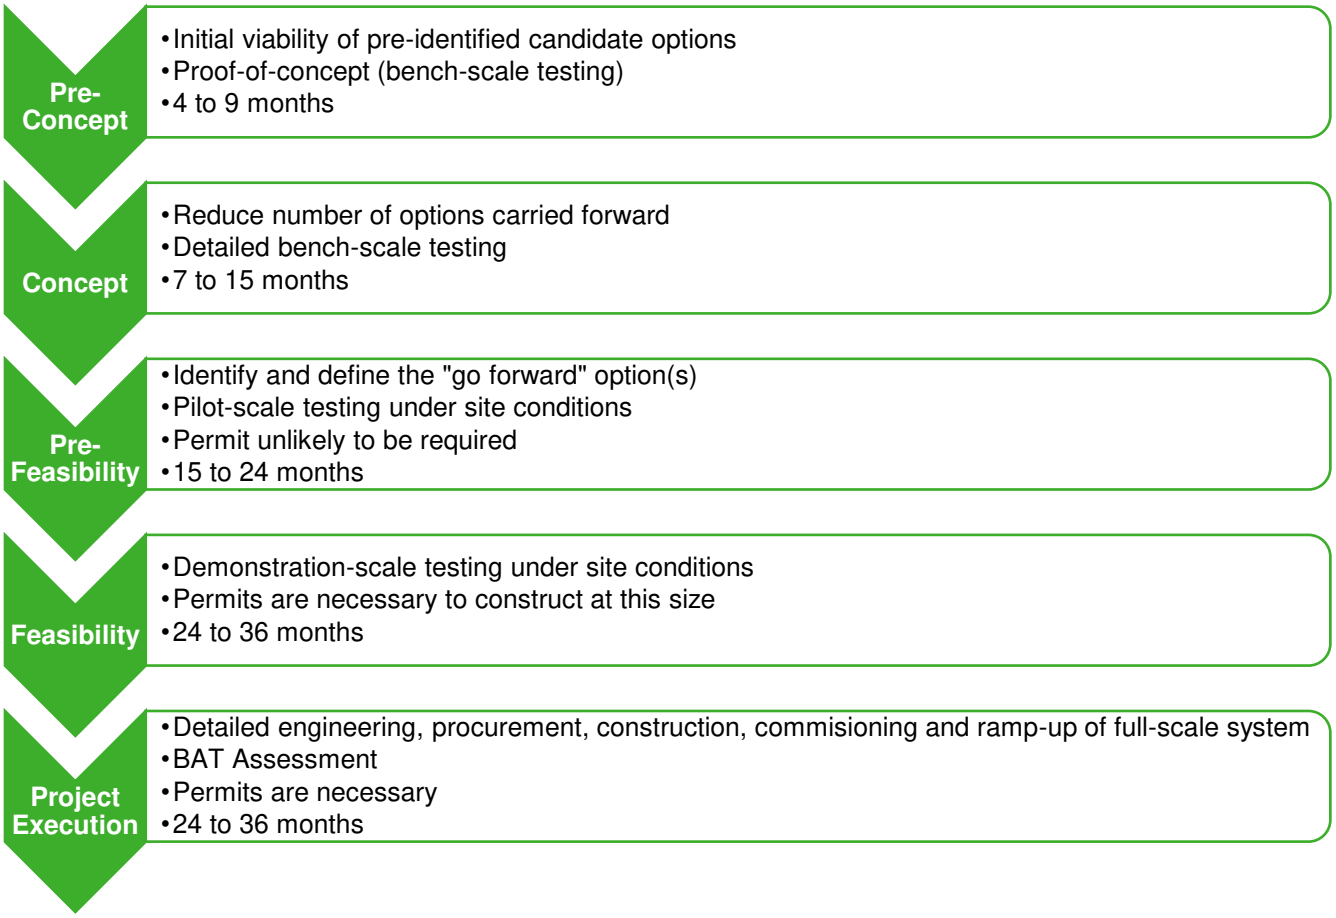

Figure 1-2. Project Development Framework.

A decision-making process will be completed at the end of each phase of the BAT policy to determine if the next subsequent phase will be pursued for that particular research project. There is potential for a project to be put on hold whilst other technologies or concepts are reviewed using this BAT policy.

4 LAND USE CAPABILITY CRITERIA AND END LAND USE PLAN

4.1 LAND CAPABILITY CRITERIA

MPMC plans to re-establish a sustainable, diverse, functional landscape that, on a property average basis, is greater than or equal to the capability that existed prior to mining. By restoring functional, locally common ecosystems to the reclaimed landscape, similar land uses will be available as were present prior to disturbance at the Facility. This will involve mimicking natural systems wherever possible by:

- Creating natural looking, irregular landforms;
- Restoring effective drainage patterns;

- Replacing soil to the depth that mimics natural conditions based on elevation, slope, and aspect (i.e., biogeoclimatic zone (BEC) site series); and
- Revegetating each area of the site with locally common, native vegetation appropriate to the target site series (See Table 4-1), that can be expected to thrive on each polygon.

This, in turn, will result in equivalent land capability.

By planning for multiple end land use objectives occurring in the same areas, the result is a more holistic approach to reclamation planning and prescription development. The entire process can also be quantitatively assessed by measuring reclaimed areas and comparing them to pre-existing ecosystem conditions or relative local benchmarks, if pre-existing ecosystem community data is not available.

Success criteria may include parameters such as:

- Landform stability;
- Erosion control;
- Visual and functional integration into the surrounding environment;
- Establishment of self-sustaining native vegetation consistent with target site series;
- Vegetation quality; and
- Presence of culturally important and rare or listed species.

The general approach for measuring reclamation success is described in Section **Error! Reference source not found.** of the RCP (MPMC 2017). In this Program, Section 8.0 outlines a specific progressive reclamation and reclamation research monitoring plan that provides detailed criteria and measures that will aid in the identification of successful reclamation.

4.2 END LAND USE PLAN

The End Land Use Plan for the Mine, presented in Table 4-1, shows how ecosystems are grouped into ecosystem categories. End land use objectives are then assigned for each ecosystem and they are defined across a range of structural stages.

The End Land Use Plan is a long-term plan that is designed to adapt to the changing conditions in vegetation communities for the different ecosystems that are targeted. The end land use objectives are predicted for structural stages such as mature and old growth forests. The structural and compositional characteristics of these stages occur up to 250 years post-closure in some ecosystems. While it will be difficult to remove all uncertainty when working with such timelines, the long-term ecological trajectories that will guide the end land use objectives into the future can be evaluated.

Figure 4-11 shows how the target ecosystems are planned to be distributed over the closure landscape. These ecosystems were distributed using GIS to divide the landscape into polygons that are separated by slope, aspect, elevation, slope position, and substrate type. **Error! Reference source not found.** shows the predicted distribution of vegetation types on the closure landscape as compared to pre-disturbance conditions.

Table 4-1. End Land Uses by Site Series and Structural Stage.

5 SUMMARY OF PROGRESSIVE RECLAMATION

Progressive reclamation activities were first initiated at Mount Polley Mine in 1998 and have been utilized, throughout the life of the mine, as large-scale research projects, with outcomes influencing future reclamation plans and prescriptions. Table 5-1 provides a summary of all areas that have been progressively reclaimed to date and highlights the total areas that have been re-contoured, have had fertilizer or biosolids applied, and have been seeded and/or planted. These areas are shown in Figure 5-1. Note that the figure and tables do not include areas that were seeded for sediment retention and prevention of invasive species establishment, but may be disturbed again in the future.

Table 5-1. Summary of Completed Progressive Reclamation at Mount Polley Mine.

Acronyms and Abbreviations: WHR: Waste Haul Road. NEZ: North East Zone; NBD: North Bell Dump; RDS: Rock Disposal Site.

Reclamation on the East Rock Disposal Site (RDS) commenced as part of a research trial in 1998-2000, and larger scale research projects were implemented on the Northeast Zone (NEZ) Dump in 2010 and on the North Bell Dump (NBD) in 2013-2014 (in partnership with Metro Vancouver).

Progressive reclamation of the NBD, Boundary Dump, Highway to Heaven, East RDS, Waste Haul Road (WHR), and Helipad parcels has been initiated in recent years, and vegetation assessments were carried out in 2015.

Detailed prescriptions for progressive reclamation activities completed are provided in Appendix A. A summary of the research components included in these activities are provided in Section 6.1 of this report.

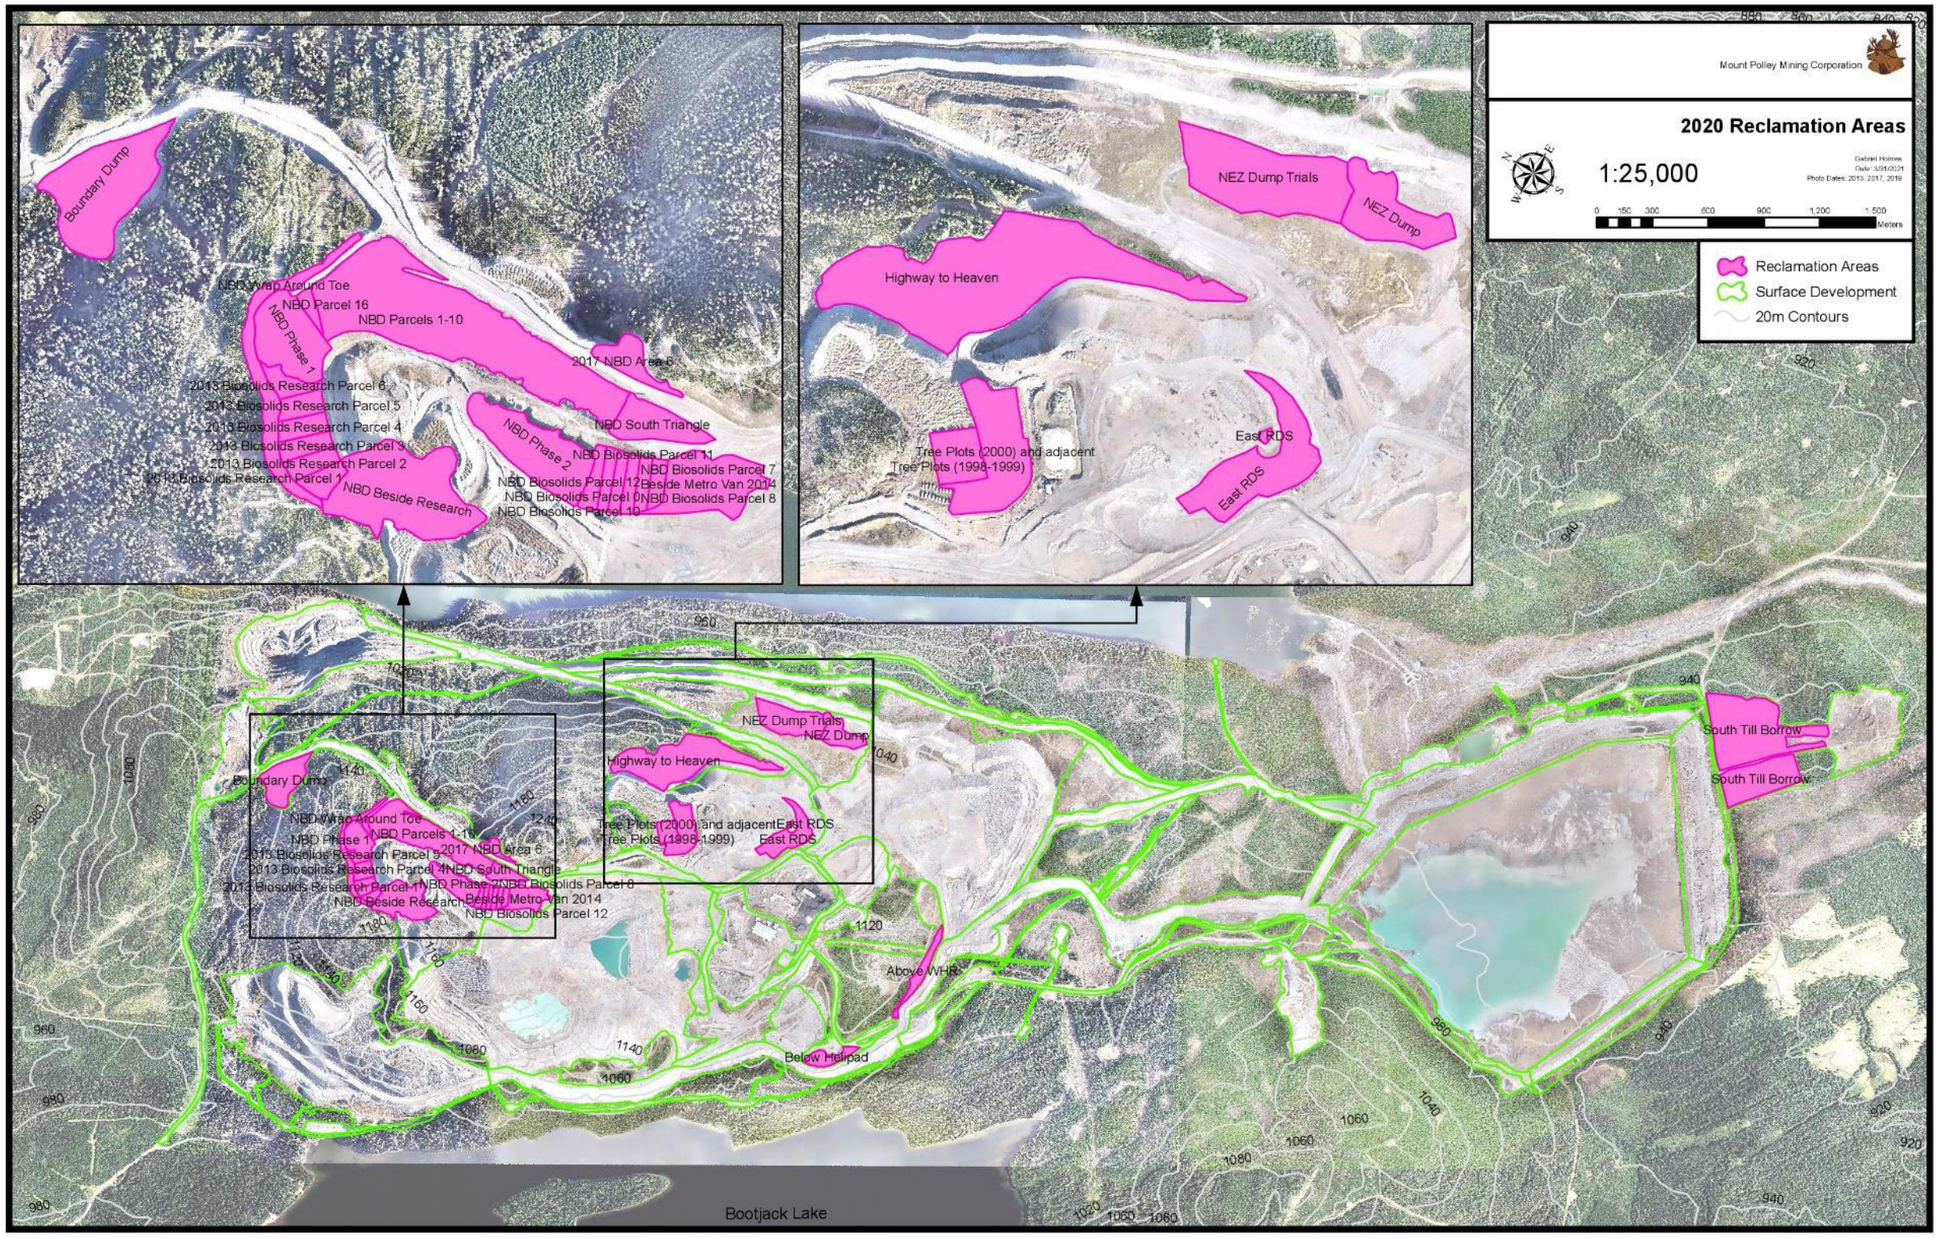

Figure 5-1. Progressive Reclamation Areas at Mount Polley Mine.

5.1 LESSONS LEARNED

Lessons learned from the implementation and monitoring of progressive reclamation activities provide guidance for future reclamation activities. Reclamation treatments that have been shown to be successful are likely be continued as further areas are reclaimed. In contrast, treatments that have shown to unsuccessful, or have had unintended results, can either be discontinued, or re-evaluated through design and implementation of research that may test potential alternative treatments. The sections below provide a summary of successful and unsuccessful progressive reclamation treatments.

5.1.1 *Successful Treatments*

The following treatments implemented during reclamation activities have been shown as those that lead to the most successful outcomes:

- Timely establishment of overstory vegetation (e.g., trees and shrubs composing of >25 % of total vegetation cover within 5-10 years) has been shown to reduce the establishment of, and over time outcompete, invasive and non-native species;
- Establishment of trees and shrubs has been the most successful when species are prescribed based on their adaptation to site-specific conditions; specifically, hot, dry conditions on south and west facing slopes or very wet conditions (riparian and wetlands);
- A minimum soil depth for successful establishment of tree and shrub seedlings has been identified as 25-30 cm with performance (survival and productivity) increasing up to depths of 65 cm;
- The use of tea bag fertilizers for planted tree and shrub seedlings has shown to increase the survival of some tree species (i.e., Douglas-fir and Lodgepole pine), but do not appear increase seedling productivity;
- Seeding of grasses and forb species at low application rates (e.g., 20-40 kg/ha), and utilizing mixes that include a diversity of native species, results in the establishment of ground cover that provides adequate erosion control, but does not appear to compete with tree and shrub seedlings or inhibit the natural establishment of native species (e.g., raspberry, elderberry, cottonwood, and willow);
- Direct placement of stripped soil is the most effective way to maintain soil nutrients, soil biota and the native plant seed bank. Natural establishment of native species from direct placement can often fully, or partially, negate the need for seeding to establish vegetation cover;
- Vegetation establishment has been shown to be more successful on reclamation areas where surface soil preparation has included:
    - surface roughening (i.e., ripping and mounding);
    - surface application and/or incorporation of coarse woody debris (CWD) (e.g., 20-40 m^3/ha), and

- Light application and incorporation of biosolids (e.g., 50-75 dT/ha).

- Semi-passive and passive water treatments (e.g., Annual Anaerobic Biological Reactor) have shown to be effective at improving water quality parameters by lowering the concentrations of trace metals and nutrients, especially sulphate, nitrate, selenium, and molybdenum.

5.1.2 *Unsuccessful Treatments*

The following treatments implemented during reclamation activities have been shown as those that lead to the least successful outcomes:

- Seeding at high application rates has been shown to develop vegetation cover that is competitive with tree and shrub seedlings and can prevent the natural dispersal of native seed from reaching the soil surface, potentially resulting in a creation of a successionally stagnant plant community;

- Delayed establishment of vegetation cover on reclaimed areas (i.e., one growing season or more) can increase the likelihood of invasive and non-native plant introduction to the site;

- Vegetation establishment is the least successful on reclaimed areas where no stockpiled soils are applied (e.g., planted or seeded directly into glacial till, tailings, or waste rock); and

- Heavy applications of biosolids or tailings (as soil amendments) to areas reclaimed with stockpiled soils, or use of these materials as growth mediums alone, can result in poor vegetation establishment due to potential toxic soil conditions (e.g., high ammonia or copper concentrations).

6 SUMMARY OF RECLAMATION RESEARCH

6.1 COMPLETED OR ONGOING

An overview of ongoing or completed reclamation research at MPMC is provided Table 6-1. Detailed summaries of each research project, including treatments applied, results and discussion and recommendations and provided in Sections 6.11, 6.12 and 6.13. Much of the completed or ongoing research has been as part of progressive reclamation activities (i.e., most progressive reclamation activities were treated as larger research projects). For locations of the research projects, refer to Figure 5-1.

6.1.1 *Soil Amendments & Revegetation: Research Requirements (i), (g), (h), (i), (o)*

6.1.1.1 NBD Soil Amendment Applications

The NBD Research includes the Metro Vancouver Research Parcels 1-6 and 7-12, the South Triangle, Phase 1 and Phase 2, Parcels 1-10, Beside Research, and Wrap Around Toe.

6.1.1.1.1 Metro Vancouver Research Parcels 1-6 and 7-12

Description: The purpose of the Metro Vancouver research trials at the NBD was to determine the effectiveness of utilizing biosolids as a soil amendment for reclaiming areas that need to be reforested. Additionally, the trial was designed to test different grass and forb seed mixtures to assess their ability to protect the site from erosion and invasive plant species while not competing with the establishment of tree and shrub seedlings. There were 12 test parcels divided into two groups, parcels 1-6 on the North side of the dump and 7-12 on the South side of the dump (McDougall, 2014). Table 6-2 provides the details of the trial treatments.

Soil testing was done on the biosolids due to concerns identified in previous trials (in the 1990s) that they would increase ammonia and ammonium rates. It was determined that while ammonia and ammonium rates were slightly higher than compared to soils without biosolids, the higher concentrations had a negligible effect on plant health (Onyejekwe, 2015).

Treatments:

Table 6-2. Trial Plot Prescriptions in the North Bell Dump.

Parcel	Soil Application[1]	Ground Cover[2]	Tree/Shrubs (stems per ha = sph)
1 and 7	Till	None	• Lodgepole Pine and Douglas-fir:7 0/30 at 1600 sph • Black cottonwood: 200 sph • Paper birch: 50 sph • Trembling aspen: 50 sph • Sitka alder: 200 sph • Saskatoon: 50 sph • Prickly rose: 50 sph • Scoulers willow: 50 sph
2 and 8	Till + Biosolids	Forb mixture • 35 g fireweed = 75 g/ha • 500 g lupine = 1 kg/ha • 52.9 g; Dryas drummondii = 113 g/ha • 2.3 kg mix of june grass, yarrow, pearly everlasting = 4.9 kg/ha	
3 and 9	Till + Biosolids	Fireweed (35 g) = 75 g/ha	
4 and 10	Till + Biosolids	none	
5 and 11	Till + Biosolids	Grass mixture @ 5 kg/ha	
6 and 12	Till + Biosolids	Grass mixture @10 kg/ha	

[1]Glacial till was applied to a depth of 20 cm; biosolids were applied at a rate of 110 dt/ha
[2]Grass mixture consisted of junegrass, tickle grass, mountain brome, native red fescue, Rocky Mountain fescue, blue wild rye, bluebunch wheatgrass, lupine, and fireweed. Forb mixture consisted of junegrass, white yarrow, pearly everlasting, lupine, fireweed, and yellow mountain avens

Results and Discussion: The most significant difference between the two parcel groups was that parcels 7-12 had less invasive plant species throughout. It was suspected that the higher amount of invasive plants observed in parcels 1-6, was due to the timing of seeding. Seeding has

usually been done in the fall and has had the greatest success, but due to heavy snowfall in the fall of 2013, seeding of parcels 1-6 was postponed until June of 2014. As a result, the invasive species in the stockpiles of glacial till may have had time to become well established before the native seed mixture was applied and began to germinate.

The results of both of these trials demonstrated the need for application of both soil and biosolids for successful establishment of grass, shrubs, and trees. The survival rate of trees and shrubs was relatively consistent across the parcels with the exception of the control parcels (1 and 7) which had no biosolids applied. The controls had only 2% ground cover and the shortest and least vigorous seedlings. Seeding with a mix of native grasses resulted in the highest percentage of cover (up to 90%) as compared to seeding with a forbs mixture or just fireweed (10-20% cover). Birch, saskatoon, and black huckleberry had the lowest survival rates on all sites. The limiting factors for growth on all sites were nutrient deficiency, drought, and harsh winters due to lack of cover. These factors are expected to decrease the vigour of the plants rather than cause widespread mortality. Of the forb's seeded, yarrow was the most established and vigorous. In parcels 7-12, some of the biosolids were not mixed in well and caused some minor damage to the tips of the foliage.

Recommendations: Future reclamation projects should include incorporations of both glacial till and biosolids to achieve the best results. Mixing of the two materials should be done thoroughly to avoid potential harmful effects to planted or seed vegetation from ammonia and ammonium concentrations in the biosolids. All sites should have continued monitoring.

Initiation Date: 2012

Most Recent Monitoring Date: 2015

6.1.1.1.2 South Triangle

Description: The South Triangle consists of 1.3 hectares of land on the South end of the NBD. In 2012 this area was recontoured and a 30 cm layer of soil was applied.

Treatment: The area was hydroseeded with a native grass seed mixture at 35 kg/ha. In 2013, Sitka alder seedlings were planted at a rate of 800 stems per hectare (sph) and black cottonwood at 1000 sph. In 2014, lodgepole pine was planted at 1400 sph and Douglas-fir at 600 sph. Additionally, soopolallie seedlings were planted in 2014 in a 100-stem trial plot (RCP, Table 4-2).

Results and Discussion: There were some limiting growth factors in the first few years on this site, including nutrient deficient soils, drought, and high exposure to wind and sun on the slope. By the fall of 2014 very little ground cover had established and consisted mostly of scattered grasses. Of the shrubs planted, alder had established the best and was the most vigorous. Conifer survival was excellent but overall conifer performance was moderate. (GH, 2014).

Recommendations: It was recommended that the site be assessed again in 2015 to see how the tree seedlings survived their first winter.

Initiation Date: 2011

Most Recent Monitoring Date: 2014

Title	Author	Year
Mine Closure Plan (RCP) Table 4-2	MPMC	2017
MPMC Survival Survey Summary	Gabriel Holmes	September 2014

6.1.1.1.3 Phase 1 and Phase 2

Description: In 2012 a mix of biosolids and overburden was applied to three one-hectare areas around NBD. The objective of this work was to evaluate the use of biosolids as an amendment to soil for use in reclamation. The biosolids: overburden mix ratio was 1:3. The purpose of the mixture was to ensure that the resulting soils met the standards of the Organic Matter Recycling Regulation (OMRR). The Regulation monitors the intake of contaminated soil, toxicity to soil invertebrates and plants, livestock ingesting soil fodder, and major microbial functional impairment (Sylvis, 2012).

Treatment: Phase 1, established in 2012, covered a total area of 2.21 ha. Glacial till was applied to a depth of 20 cm and biosolids were applied at a rate of 138 dt/ha. The area was then hand seeded with a mixture of native grasses and forbs at a rate of 35 kg/ha. Following seeding, the area was planted with black cottonwood, paper birch, trembling aspen, Sitka alder, saskatoon, prickly rose and Scoulers willow. Two tree species, lodgepole pine and Douglas-fir, were also planted at a planting density of 1190 sph and 510 sph, respectively (RCP, Table 4-2).

Phase 2 was also established in 2012. It covered a total area of 2.87 ha. Glacial till was applied to a depth of 20 cm and biosolids were applied at a rate of 135 dt/ha. The area was then hand seeded with a mixture of native grasses and lupine at 35 kg/ha. Then it was planted with black cottonwood, paper birch, trembling aspen, Sitka alder, saskatoon, prickly rose and Scoulers willow. Two tree species, lodgepole pine and Douglas-fir, were also planted at a density of 1190 sph and 510 sph respectively (RCP, Table 4-2).

Both Phase 1 and Phase 2 experienced high conifer seedling mortality shortly after planting due to drought. Drought conditions were found to be persistent as a result of high grass competition on relatively shallow soils resulting in low moisture retention capability.

Recommendations: Addition planting of early successional shrub and trees seedlings should be completed at both of these sites in the future.

Mount Polley 2012 Biosolids Reclamation Program	Sylvis	June 2012

6.1.1.1.4 Parcels 1-10

Description: Parcels 1-10 were established in 2011. They covered approximately 11 ha with soil at a depth of 20 cm, biosolids at a rate of 122 dry tons/ha and some CWD.

Treatment: The parcels were hydroseeded with a mixture of wood fibre mulch and native grasses at 30kg/ha with the exception of parcel 10 which was hand seeded at 35 kg/ha. The parcels were planted with a mix of shrubs, deciduous trees and coniferous trees (Table 6-3). The shrubs and deciduous trees were planted in 2013 and the conifers in 2014.

Table 6-3. Deciduous and Coniferous Seedlings Planted in Parcels 1-10 in the North Bell Dump in 2013 and 2014, respectively.

Seedling Species	Seeding per Hectare
Black cottonwood	60
Paper birch	34
Trembling aspen	34
Sitka alder	172
Saskatoon	34
Prickly rose	34
Scoulers willow	79
Soopolallie	100 stem trial plot
Lodgepole pine	1075
Douglas-fir	451
Western red cedar	54
Hybrid spruce	54

In 2013 survival rates were identified as poor for shrub and deciduous species and replanting was done in 2014.

Results and Discussion: Not available

Recommendations: Consider planting additional early successional shrub and tree seedlings in the future.

Initiation Date: 2011

Most Recent Monitoring Date: 2014

6.1.1.1.5 Beside Research

Description: This is a 2 ha area located next to Metro Vancouver's research trial plots 1-7.

Treatments: In 2012, direct placement of stripped soil materials was applied to the surface at a thickness of 20 cm, with some CWD mixed throughout it. The area was left to monitor for natural growth from the directly placed soils considering the potential for an intact residual natural seed bank.

Results and Discussion: Not Available

Recommendations: A seeding application of native grasses and forb's should be added if needed. Consider planting additional early successional shrub and tree seedlings in the future.

Initiation Date: 2012

6.1.1.1.6 Wrap Around Toe

Description: This is a 1.8 ha area at the north end of the NBD where the disturbed land meets with the naturally forested land.

Treatments: In 2012 the area was recontoured and glacial till was applied to the surface at 6 cm deep. The area was hand seeded with a mix of native grasses (no information on the contents of the mixture) at 15 kg/ha (RCP, Table 4-2)

Results and Discussion: Not Available

Recommendations: Monitor the natural establishment of vegetation.

Initiation Date: 2012

North Bell Dump Wrap Around Toe	Gabriel Holmes	2013

6.1.1.2 East RDS Tree Plots est. 1998, 1999 & 2000

Description: In 1998, a reclamation research project was initiated for testing the methods, materials and protocols for achieving end-land-use objectives for rock disposal sites. Additional test plots were added in 1999 and 2000. Test plots were established to evaluate the following variables:

- Depth of topsoil required to establish a suitable growth medium;
- Essential ecosystem components to re-establish a forested ecosystem;
- Requirements, if any, of soil amendments;
- Suitability of tailing as a growth medium;
- Suitability of recolonization of disturbed areas by native species;
- Metal uptake by vegetation; and
- Suitability of tree species for reclamation objectives.

Treatments: In April of 1998, nine test plots (8 treatments and 1 control), approximately 195 m^2, were established that had variable soil treatments (Table 6-5; Test Plots A-Ia). Each block was separated from adjacent blocks by 3 m of non-treated area. Monitoring of planted seedlings was conducted in each test plot in the fall of 1998 and included observations of plant vigor, total height, leader height, stem diameter and mortality. Protective tubing (Vexar tubing) was installed around planted seedlings in the trials to prevent them from being browsed.

In 1999, the reclamation research program was expanded from the 1998 study to include five additional plots (Table 6-5; Test Plots Ib-M). These plots were prepared (soil ripped, topsoil placed, seedlings planted) in May and June of 1999. Each new block was separated from adjacent blocks by 3 m of non-treated area. In June and July, protective tubing was removed from the 1998 seedlings, biosolids were broadcasted over the 1998 plots, and the 1999 plots were grass seeded. In the fall of 1999, all plots were monitored for tree growth and survival.

In 2000, 13 additional plots were added to the reclamation research program (Table 6-4; Test Plots N-Z). These additional plots were established northeast (12 plots) and adjacent to (1 plot) the 1998 plots. Contouring of the additional plots and topsoil and biosolid placement was completed in May and June of 2000. Trees were planted and the plots were seeded (hydroseeded or dry seeded) in June and July of 2000. In the fall of 2000 all plots (1998, 1999 & 2000) were monitored for tree growth and survival including total height, leader height, stem diameter, plant vigour and mortality.

Table 6-4. Test Plots Established in 1998 (A-Ia), 1999 (Ib-M), and 2000 (N-Z) in the East Rock Disposal Site.

Z	20 cm soil, 20 cm dump fines, seeded domestic grass	2000	

Note: All plots planted with 2000 st/ha, with a species target mixture, were 70% Lodgepole pine and 30% Douglas-fir.

A report from 2014 reviewed tree growth and survival, in plots established in 1998, 1999 and 2000, including productivity and mortality rates as they relate to soil depth, soil amelioration, and revegetation.

In 2015 rooting depth, root density of a fir and a pine, and assessments of the surface soil layer were assessed on 16 of the tree trial plots.

Results and Discussion: Tree monitoring and measurements were conducted in each test plot in the fall of 1998 which included observations of seedling vigor, total height, leader height, stem diameter and mortality. Results suggest 1) mortality was high within plots that lacked soil additions, 2) soil depths did not have an observable difference on growth variables, and 3) seedling growth was higher in plots with increased soil depth and fertilization.

In the fall of 1999, the plots were monitored for tree growth and survival. Results indicate that a positive response in tree growth (i.e., tree height, leader growth, caliper) was seen with fertilization and increasing soil depth in the 1998 plots. It is suggested that 15 cm of soil is sufficient to establish tree seedlings. Tree mortality was high in areas with no soil additions (control areas). No differentiation was observed in tree growth between 40-60 cm of soil depth or with biosolids treatments. Results from the 1999 plots suggest that tree growth increases with increased soil depth and with a mixture of soil, tailings, and biosolids.

In the fall of 2000 all plots (1998, 1999 & 2000) were monitored for tree growth and survival including seedling vigor, total height, leader height, stem diameter and mortality. Results from the 1998 plots indicates that trees have high morality (63-75%) and poor growth when planted directly into waste rock with no soil amendments; similar responses were found with Douglas-fir and Lodgepole pine. Improved growth, survival and vigour was observed with increased soil depth up to 40 cm; soil amendments alone to 25 cm in depth did not meet growth expectations. There was an indication that biosolid amendments can significantly improve tree growth but no differences were observed between 75 or 150 dT/ha. Although a positive growth response was seen initially with tea bag fertilization, plots with tea bag amendments did not show significant differences from leader height in other plots without tea bag amendments.

Results from data collected in 2000, from the 1999 plots, indicated no significant difference in growth between the plots; however, general trends show that increased soil depth up to 40 cm improves tree vigour. Plot M (20 cm soil, 20 cm tailing, 75 T/ha biosolids) was removed from the study due to the high mortality of tree seedlings as a result of heavy grass competition.

Only mortality and seedling vigour was recorded for tree seedlings planted in 2000. Mortality was high for seedlings planted with no soil amendments. Although survival was generally better in plots with soil amendments added, high mortality was observed in plots with only biosolid amendments, which literature suggests may be attributed to ammonia toxicity.

A report from 2014 reviews monitoring (2001, 2006, 2012) of tree growth and survival, in plots established in 1998, 1999 and 2000, including productivity and mortality rates as they relate to soil depth, soil amelioration, and revegetation.

Soil Depth: Results show that a minimum amount of soil, 15 cm, on the rock disposal sites is required for tree productivity and survival; biosolids or hydroseeding alone is not adequate for tree growth. Although significant differences were found between shallow (15 to 30 cm) and

deeper (40-65 cm) soils, significant differences were not found within these groupings. Seed mixtures did not influence tree growth.

Soil Amelioration: Results from additions of soil amendments demonstrate that tea bags did not have a lasting effect on any growth parameter but did improve initial tree survival for both Douglas-fir and Lodgepole pine. Additions of biosolids had inconsistent results throughout the 1998, 1999 and 2000 trials with significant growth increases seen in the 1998/1999 trials, no significant differences seen between 75 and 150 dT/ha in the 1998/1999 trials, negative effects of biosolid treatments on the 2000 trials, and increased mortality in both Douglas-fir and Lodgepole pine with 150 dT/ha.

Revegetation: Revegetation was completed with a custom Facility blend (20-40 kg/ha) dry seeded or hydroseeded, and a native-based blend (40 kg/ha) that was dry seeded. Excluding plot M, graminoids and forb's did not result in growth competition for seedlings. It is suggested to use a seed mix with greater proportions of native seed to promote biodiversity and long-term soil productivity.

The 2015 report overviewed results of rooting depth, root abundance and size, and composition and depth of surface materials.

Rooting Depth: Rooting depth was observed in waste rock, overburden, biosolids, tailings, and along slopes. Results suggest that root growth is poor in waste rock (i.e., small and poorly developed) but did extend up to 30 cm in depth. Additions of overburden, biosolids and tailings appeared to improve root growth. Results suggest that a minimum rooting depth of 25-30 cm is required to prevent roots extending into waste rock, positive root growth seen with additions of biosolids combined with 15 cm of overburden, tailings was an amendable growth material, and that slope did not have an effect on rooting depth.

Root Abundance and Size: No significant differences were identified in root abundance or size with overburden depth, slope, sampling depth, or between tree species.

Composition and Depth of Surface Materials: Little to no surface materials (e.g., organic litter, bryophytes, lichen) was not present in control plots of waste rock, as expected. Plots that were amended with overburden showed some surface development, which consisted of ≤1 cm of needles and moss, commonly observed on the forest floor of early successional forest stands. Surface materials on biosolid amended soils consisted of 2-3 cm of organic layer and a 3-10 cm of organic layer on plots where biosolids were applied to the surface (not mixed in).

Recommendations: The 2014 report recommends that future reclamation work should use a minimum of 40 cm of soil with light additions of biosolids (50-75 dT/ha) and seed (5-10 kg/ha). The seed applied should consist of grasses and forbs that are low-growing and non-competing. Application of CWD at a rate of 20-40 m^3/ha is also recommended. This report also outlines future study recommendations, which are included in Section 6.2.

The 2015 report recommends that although trees should not be planted directly onto waste rock, waste rock does not appear to be a physical or chemical barrier to root growth. Results suggest

that biosolids, overburden and tailings can be used as soil amendments and should be applied at a minimum of 15-30 cm in depth.

6.1.1.3 NEZ Dump Seed Plot Success Analysis 2010-2015

Description: The NEZ Dump is an 80 ha area, adjacent to, and west of, Polley Lake. In September 2010, revegetation reclamation research was initiated on a 5 ha section of the NEZ dump within the eastern aspect to determine seed plot success under various soil treatments and seeding and fertilization rates.

Treatments: Three treatment units were established, 2a, 2b1 and 2b2, to test for re-vegetation success under various soil, fertilization, seeding and planting treatments (Table 6-5). The soil treatments consisted of an application of 0.4 m of glacial till, followed by application of biosolids (application rate not identified) onto 2b1 and 2b2. Each treatment unit was seeded with a native grass and forb mix which included eight grasses (mountain brome, native red fescue, rocky mountain fescue, wheatgrass-blue bunch, blue wild rye, June grass and tickle grass) and two forb's (fireweed and lupine). In 2012, all treatment areas were planted with trees and shrubs including Lodgepole pine, Douglas-fir, paper birch, trembling aspen, black cottonwood, Sitka alder, saskatoon, wood rose, and willow. Additionally, there were nine small hand seeded plots established in 2010 on each treatment unit to determine the success of each species.

Table 6-5. North East Zone Dump Reclamation Treatment Parameters in 2010 and 2012.

Treatment Unit	Area (Ha)	Seed Mixture	Seed Rate (kg/ha)	Fertilizer (kg/ha)	Biosolid Applied	Species Planted
2a	2.5	Native	45	283	No	Lodgepole pine, Douglas-fir, paper
2b1	1.25	Native	34	0 (2010)	Yes	

				100 (2012)		birch, trembling aspen, black cottonwood, Sitka alder, Saskatoon, wood rose, willow (in 2012)
2b2	1.25	Native	34	71	Yes	

Seed plot success was monitored in 2011, 2012 and 2015. All areas were irrigated in 2013 and 2014.

Results and Discussion: Results from the 2015 monitoring determined that ground cover (i.e., grass, moss, herbs) in all units was high (>90%) except in areas that did not receive adequate glacial till (< 0.4 m). Plant growth was consistently greater at the bottom of the hill and within contoured and ridged areas on all sites. Ground cover with biosolid applications had denser, taller and more vigorous growth. Areas with biosolids and greater soil depths had low tree and shrub survival but had greater stem height and vigor. Trees with biosolid treatment in shallow soil had higher survival rates and lower vigor. Areas with no biosolids resulted in lower than average growth rates compared to areas with biosolids applications.

Most deciduous stems planted in 2012 (i.e., birch, alder and Saskatoon), did not survive to 2015. The planted willow, cottonwood, and prickly rose, showed greatest success in all the units. Lodgepole pine had higher survival rates than Douglas-fir. A review of the nine small treatment areas, in 2012, showed that june grass and tickle grass had the smallest percent cover. The tall grasses, like rocky mountain fescue and bluebunch wheatgrass, had the highest percent cover. Raspberry, elderberry and black gooseberry naturally established on all three units. Fireweed successfully covered about 5% of all three units and lupine had reduced to 1% coverage.

Reclamation research trials at the NEZ determined that soil application at depths of ≥ 0.4 m results in the greatest revegetation success. It was suggested that the application of 71 kg/ha of fertilizer is ideal, that allows adequate nutrients for tree growth while subsequently preventing growth of a dense ground cover that can reduce seedling survival. Results suggest that planting success can be achieved with Lodgepole pine, black cottonwood, willow and prickly rose; however, other species should also be planted to promote biodiversity. Cottonwood is actively establishing on the treatment units as a result of planting seedlings and natural establishment. Cottonwood appears to be sensitive to heavy grass cover and can withstand shallow (< 40 cm) ground cover.

Recommendations: Routine assessments of ground cover and survivorship of tree, shrub and ground vegetation should be conducted in all three units, ideally in the summer for best identification conditions. To reduce heavy grass cover that competes with seedling establishment, new reclamation sites should have low application rates of fertilizer and biosolids and reduced grass/forb seeding rates. Hydroseeding is recommended for seed application as it may provide result in a more homogenous establishment of grass/forb cover and provide erosion control and suppression of invasive species; however, hand-seeding will suffice when hydroseeding is not practical. It is recommended to apply CWD and create hummocks and depressions to produce microsite habitats that provide shade and moisture, which may promote natural establishment of native tree and shrubs.

6.1.2 *Soil Stability: East RDS: Research Requirements (i), (g), (h), (i), (o)*

Description: MPMC retained Golder Associates Ltd. (Golder) in 2018 to conduct soil cover assessments to aid in the closure design for the RCP. The main objective of the work was to assess whether cover systems, constructed from on-site materials, could be expected to reduce deep percolation and water infiltration. Deep percolation is defined as water that infiltrates waste rock below the soil cover and fine waste rock (the active zone). Soil cover assessments were completed through modelling soil-atmospheric conditions using climate data, from the on-site weather station, and specific characteristics of cover materials, gathered through borrow source investigation and laboratory testing. This model predicted the water balance potential for the cover materials based on laboratory-measured hydraulic properties and site-specific weather data. Results of modelling suggest that cover over waste rock could reduce deep percolation of precipitation from 30% to 5-15%, depending on cover thickness. The results also suggested that tailings could be used for cover.

In 2019, Golder designed a soil cover test plot to assess the effectiveness of various soil covers in reducing deep percolation into waste rock. These test plots will provide data to support the cover model and site-wide mine water balance model (MWBM) that show additions of soil cover can reduce infiltration of atmospheric water and mass loading of constituents (accumulation of mobile metals in water; Golder 2018).

Treatments: Four test plots (TP1-TP4) with variable thickness of glacial till, fine waste rock, waste rock and tailings will be created as determined from the cover model (Table 6-6). Potential locations for test plots include the southern portion of the East RDS (Location 1; preferred site), a low grade ore stockpile east of the Leach Pad (Location 2) and the southwest portion of the NBD (Location 3).

Table 6-6. Descriptions of Four Test Plots to be established in Location 1, 2 or 3.

Test Plot	Material	Layer Thickness (m)	Estimated depth of Deep Percolation (Golder 2018b)	Comments
TP1	Glacial Till	0.1	200 mm/year	Control Plot
	Fine Waste Rock	0.5		
	Waste Rock	2.4		
TP2	Glacial Till	0.5	75 mm/year	

	Fine Waste Rock	0.5		Direct comparison to TP3 with a 1 m thick cover.
	Waste Rock	2.0		
TP3	Glacial Till	1.0	50 mm/year	Direct comparison to TP2 with a 0.5 m thick cover.
	Fine Waste Rock	0.5		
	Waste Rock	1.5		
TP4	Glacial Till	0.3	40 mm/year	Direct comparison to TP3 with a 1 m thick cover.
	Tailings	0.7		
	Fine Waste Rock	0.5		
	Waste Rock	1.5		

All test plots should be seeded with the Facility native grass or seed mix to prevent invasive species infestation, but at application rates that do not create competitive vegetation cover for planted trees and shrubs. No fertilizers or biosolids should be used on the plots and woody species will be removed to allow for more accurate comparisons of ground percolation.

Data collected from each test plot will include depth of deep percolation, surface runoff, soil water content, soil suction, and soil temperatures. Climate conditions including air temperature, precipitation (snow and rain), relative humidity, solar radiation, wind speed and direction will be recorded from the on-site weather station. A field camera installed near the test plots will provide real-time images of test plot conditions (i.e., run-off events, snow accumulation, snow melt).

Models indicated that it will take roughly one year of exposure for the soil cover and waste rock to be conditioned to the site. It is expected that deep percolation will be lower in the first year of monitoring and that vegetation will take a few years to establish cover.

Monitoring of the test plots was designed to be completed over a 5 year period; however, instrumental equipment used in the study could withstand over 10 years of data collection. Results of the study should provide quantifiable evidence to support the cover and water balance models. Supporting data should also facilitate provisioning of a vegetation growth medium, reducing infiltration into waste rock storage facilities, improve quality of surface run-off, and limit the mass loading of constituents to passive or semi-passive water treatment facilities.

Results and Discussion: N/A, test plots have not yet been established.

Recommendations: N/A, test plots have not yet been established.

Initiation Date: 2018

Most Recent Monitoring Date: N/A, test plots have not yet been established.

6.1.3 *Metal Uptake in Vegetation 1989-2015: Research Requirements (n)*

Locations: Springer Cariboo Pit, Mill Site, TSF, East RDS Plots, NBD Parcels 1-10, NEZ Dump

Project Names: Mount Polley Mining Corporation Vegetation Metal Survey (2007), Summary: Vegetation Metal Uptake Monitoring at Mount Polley (2011), 2012 MPMC Vegetation Metal Uptake Monitoring, Vegetation Metal Uptake Monitoring Plan (2015), Development of a Molybdenum Screening Value for the Impact Assessment (2016).

Description: Reclamation research at MPMC has included several interrelated studies regarding metal uptake in soils and vegetation to determine if metal concentrations were within acceptable limits for human health, wildlife and livestock health, and the environment. Baseline data was collected in 1989, 1995 and 2006 in the Central and West Pits (now known as the Cariboo and Springer Pits, the Mill Site, and the TSF); additional plots were added in 2006 for increased baseline data set (Table 6-7). In addition to baseline data collection, the research program has monitored metal uptake in vegetation, metal concentrations in soil stockpiles as well as trace element monitoring in soils amended with biosolids. Vegetation metal uptake monitoring was completed within reclaimed areas in 1996, 2007, 2012 and 2014 on various types of vegetation (i.e., grass, legumes, and shrub species potentially foraged by cattle and wildlife).

Abbreviations and Acronyms: RDS: Rock Disposal Site; NBD: North Bell Dump; NEZ: North East Zone.

Acceptable limits of heavy metals in vegetation have not yet been established for ungulate and herbivore consumption, therefore, a risk assessment approach was used to evaluate the potential risk of heavy metals to browsing animals. However, a critical threshold, or safety threshold, for the ratio of copper (Cu) and Molybdenum (Mo) (Cu:Mo) has been established as 2:1; samples with ratios below 2:1 are expected to cause Cu deficiencies in livestock (Miltmore and Mason 1971).

Treatments: In 1989, vegetation samples were collected and analyzed to establish a baseline level of metals within vegetation. Sites were selected from areas where mineral outcrops existed or were shallow and in areas immediately upslope of mineral outcrops. These locations included the "West" Springer Pit (site 1 & site 2), the "Central" Bell Pit (site 3), the NEZ Dump (site 4) and west of the Boundary Zone (site 5). Species and locations selected for sampling are included in Table 6-8. Metals analyzed included Arsenic (As), Cadmium (Cd), Chromium (Cr), Cobalt (Co), Copper (Cu), Iron (Fe), Lead (Pb), Manganese (Mn), Mercury (Hg), Molybdenum (Mo), Nickel (Ni), Silver (Ag) and Zinc (Zn).

In 1995, vegetation samples were collected and analyzed to establish a baseline level of metals in vegetation likely to receive metal inputs from waste rock dumps, tailings areas, or the mill site (Table 6-9). Sites selected for analysis included tailings north (the northern perimeter of the tailings area), mill south (southern perimeter of the mill site), and central pit (the eastern perimeter of the central pit) (Table 6-9). Metals analyzed included Arsenic (As), Copper (Cu), Lead (Pb), Molybdenum (Mo), Selenium (Se), and Zinc (Zn).

In 1996, vegetation samples were collected to determine metal uptake within vegetation. Five sites were selected for sampling including the tailings area, mill area, southeast dump, open pit, and the north dump (access was blocked in the north dump which prevented sampling this year). Sites selected for sampling all had adjacent areas which will remain vegetated throughout the Facility life. Species selected for sampling are included in Table 6-10. Metals analyzed included Arsenic (As), Copper (Cu), Lead (Pb), Molybdenum (Mo), Selenium (Se), and Zinc (Zn).

In 2006, a study was conducted to determine metal uptake in red clover on plots established in 1998 and 1999. Plots established in 1998/1999 were part of reclamation research that sought to determine the methods, materials and protocol for achieving land use objectives for wildlife and forestry. Research plots established in 1998/1999 in the East RDS, had a total of 36 plots with 12 treatments (e.g., additions of biosolids or tailings to soil). In 2006, red clover was the only vascular vegetation established on the plots, and therefore was the only vegetation sampled for metal analysis. Red clover samples were analyzed for 26 elements and compared, where possible, to the 1989 and 1995 baseline metal analysis. The 26 elements analyzed in 2006 include Aluminum (Al), Antimony (Sb), Arsenic (As), Barium (Ba), Beryllium (Be), Bismuth (Bi), Cadmium (Cd), Calcium (Ca), Chromium (Cr), Cobalt (Co), Copper (Cu), Iron (Fe), Lead (Pb), Lithium (Li), Magnesium (Mg), Manganese (Mn), Mercury (Hg), Molybdenum (Mo), Nickel (Ni), Selenium (Se), Strontium (Sr), Thallium (Tl), Tin (Sn), Uranium (U), Vanadium (V), Zinc (Zn), and Cu:Mo ratios. Cu:Mo ratios are ideally 2:1.

In 2012, vegetation samples were collected to determine metal uptake within vegetation, using a repeatable methodology (to ensure replication in future assessments) (Table 6-11). Three sites were selected for sampling including the NEZ Dump (est. in 2010 as a reclamation site), the NBD (est. in 2011 as a reclamation site), the East RDS tree research plots, and several new sample locations representative of unaffected forest sites.

Table 6-11. Species Sampled in 2012 for Metal Analysis.

Species	Latin Name
Mountain Brome	*Bromus carinatus*
Native Red Fescue	*Festuca rubra*
Rocky Mountain Fescue	*Festuca saximontana*
Bluebunch Wheatgrass	*Pseudoroegneria spicata*
Blue Wildrye	*Elymus glaucus*
June Grass	*Koeleria macrantha*
Tickle Grass	Agrostis scabra
Fireweed	*Chamaenerion angustifolium*
Lupine	*Lupinus* spps.

Metals analyzed included Aluminum (Al), Antimony (Sb), Arsenic (As), Barium (Ba), Beryllium (Bi), Boron (B), Cadmium (Cd), Calcium (Ca), Cesium (Cs), Chromium (Cr), Cobalt (Co), Copper (Cu), Gallium (Ga), Iron (Fe), Lead (Pb), Lithium (Li), Magnesium (Mg), Manganese (Mn), Molybdenum (Mo), Nickel (Ni), Phosphorus (P), Potassium (K), Rhenium (Re), Rubidium (Rb), Selenium (Se), Sodium (Na), Strontium (Sr), Tellurium (Te), Thallium (Tl), Thorium (Th), Tin (Sn), Titanium (Ti), Uranium (U), Vanadium (V), Yttrium (Y), Zinc (Zn), and Zirconium (Zr).

In 2014, composite vegetation samples were collected from four of the baseline sites, two new control sites (north and southeast of the Facility) and within the East RDS research tree plots.

Metals analyzed included Aluminum (Al), Antimony (Sb), Arsenic (As), Barium (Ba), Beryllium (Bi), Bismuth (Bi), Boron (B), Cadmium (Cd), Calcium (Ca), Cesium (Cs), Chromium (Cr), Cobalt (Co), Copper (Cu), Iron (Fe), Lead (Pb), Lithium (Li), Magnesium (Mg), Manganese (Mn), Molybdenum (Mo), Nickel (Ni), Phosphorus (P), Potassium (K), Rubidium (Rb), Selenium (Se), Sodium (Na), Strontium (Sr), Tellurium (Te), Thallium (Tl), Tin (Sn), Uranium (U), Vanadium (V), Zinc (Zn), and Zirconium (Zr).

Results & Discussion: The baseline assessment in 1989 determined that the Cu:Mo ratio in clover and bluegrass was elevated above the 2:1 safety threshold in Sites 1 & 2.

Results of the 1995 assessment suggest that the Cu:Mo ratio in pumpbelly brome, red clover and timothy (from Tailings North) were elevated above the 2:1 safety threshold.

Results from the 1996 assessment show that metal levels were elevated from the 1995 baseline vegetation results. Several species contained high molybdenum concentrations with elevated levels of arsenic and zinc seen in some samples.

Results from the 2006 assessment suggest that all metals tested, except for Mo and Cr, were near or below analytical detection levels and are assumed to be non-toxic to human health, wildlife health, and the environment. Molybdenum foliar levels, ranging from 8-53 mg/kg between plots, were double the mean baseline values. Previous research has suggested that cattle toxicity can occur at 6 mg/kg of Mo; therefore, levels of Mo in some plots may pose a concern to wildlife health. Results of Cu to Mo ratio (Cu:Mo) suggest that plots in 1998 appear to have adequate Cu:Mo, whereas the 1999 plots had low values of Cu and high values of Mo, resulting in ratios below the minimum 2:1. Low Cu and high Mo is likely the result of a high soil pH, as Cu is more soluble in lower pH soil and Mo is more soluble in high pH soil. Chromium levels exceeded baseline data, however, acceptable limits for ungulate consumption of Cr and all other metals are unknown. Results of metal analysis in plots with biosolid and tailings amendments suggest that biosolids appear to be beneficial to Mo and Cu:Mo ratios within soils/vegetation, whereas additions of tailings appear to elevate pH which leads to reduced solubility of Cu and increased solubility of Mo that leads to potential toxicity.

Results from the 2012 assessment show that elevated levels of cadmium, manganese, molybdenum (and the Cu:Mo), selenium, thallium, and zinc were found within the sampled vegetation as compared to the control.

Results from the 2014 assessment were not available.

Recommendations: Several recommendations have been suggested for the assessment of vegetation metal uptake at the Facility including:

- Establish control sites for sampling and collect and analyze baseline data, prior to disturbance, to accurately monitor changes as a result of disturbance and trends over time;

- Establish sampling sites in areas that are likely to be less affected disturbance;
- For sampling, it is suggested to select one 20 m^2 sample plot every two hectares, to a maximum of 10, and to sample areas with known mineralization;
- Collect composite samples (to mimic animal browsing) and species-specific sampling including fireweed, rye grass, and red clover;
- Continue monitoring of vegetation metal uptake in established sites every 5 years, ensuring sample size is adequate for statistical analysis;
- Conduct foliar analysis of foliage (summer) and stems (winter) of deciduous and coniferous trees. Species recommended for sampling include Sitka alder, willows, and Lodgepole pine; and
- Consider conducting soil nutrient and heavy metal analysis using the BC Ministry of Environment *Overview of Contaminated Sites Soil Task Group Procedures for the Derivation of Soil Quality Matrix Standards for Contaminated Sites* or the *Canadian Soil Quality Guidelines for Protection of Environmental and Human Health.*

6.1.4 *Water Management Strategies: Research Requirement (c)*

6.1.4.1 Water Management Plan

Location: Permitted Mine Area

Project Name: Water Management Plan for Mount Polley Mine

Description: In 2015, the RCP was updated and outlined the intention to use the Veolia's Actiflo water treatment technology for short-term water management and that upon closure, a passive treatment system is preferred.

In 2016, Mount Polley submitted a Technical Assessment Report (TAR) to the ministry that outlined a long-term Water Management Plan (WMP) to define water management practices to prevent year-over-year accumulation of contact water at the Facility and to mitigate the potential for unplanned and/or non-compliant release to the environment. This report included an assessment of effluent discharges during operations, impacts to receiving environments, and investigations into preferred discharge location (i.e., Polley Lake outlet, Hazeltine Creek at the mouth, Bootjack Lake outlet, Edney Creek at the mouth, Quesnel River at Likely, the pipeline to Quesnel River, or the pipeline to Quesnel Lake). A memorandum was also created in 2016 that identified key locations suitable for decentralized treatment at source or candidates for direct discharge with minimum treatment.

In 2017, a draft water treatment update to the RCP was created to i) identify preliminary location for passive/semi-passive treatments at closure, ii) identify locations for direct release, iii) identify constituents of concern (COCs) and potential constituents of concern (COPCs), iv) conduct assessment of active and passive technologies and determine location suitability based on results, and v) develop a schedule for water treatment systems)

In 2020, the WMP was revised to meet conditions of Permit 11678. This plan reviews baseline information at the Facility and outlines water management and treatment for the Facility's operational periods from January 2023 to December 2031; the WMP did not address water management during closure or post-closure.

In 2021, a report was created which outlined updates to the water balance model and calibration.

Results/Discussion:

Results from the 2016 TAR suggest:

- Quesnel River at Likely would have sufficient hydrological capacity to provide appropriate dilution rates (2015 study) and that the pipeline to Quesnel Lake, commissioned in 2017, provides the best option for discharge for the remainder of operations (2016 study);
- The discharge rate into Quesnel Lake is within the permitted flow rate (average 0.33 m^3/s) and that the Permit allows an instantaneous flow rate of 0.60 m^3/s for downdrawing the TSF during freshet conditions;
- Where practical, reduce the volume of non-contact water collected on site by diverting it away from the mine-impacted areas;

- Treat and discharge surplus water to reduce accumulation year to year and ensure infrastructure is in place to withstand 1:200-year flow volume;
- Maintain a minimum and maximum pond volume of 1 M-m^3 and 1.7 M-m^3, respectively, in the TSF, and;
- Maintain a minimum 100 m long beaches at the TSF.

Results from the 2017 report:

- Identified 3 potential location suitable for passive/semi-passive treatments at closure (NW Sump, 9K Sump, and South Toe Drain);
- Identified the COCs and COPCs within these locations;
- Determined that passive technology compares favourably to other treatment technologies;
- Proposed a decentralized treatment option, identified the NW Sump as the most favourable location for a pilot study, and;
- Provided a preliminary implementation schedule.

The 2020 WMP overviewed historical baseline information that was summarized for input into modelling of water balance and water quality. Baseline information included:

- Geology (regional and deposit);
- Metal leaching/ acid rock drainage geochemistry;
- Climate and Hydrology including: Temperature, Precipitation, Evaporation, Site Drainage and Surface Hydrology, Pit Ground Hydrology (Springer and Cariboo Pits, Wight Pits, Boundary Pit), and Seepage from the TSF, and;
- Water Quality from: Quesnel Lake, Bootjack Lake, Polley Lake, and Hazeltine Creek.

Water management and treatment reviewed in the 2020 WMP describes is shown visually in Figure 6-1.

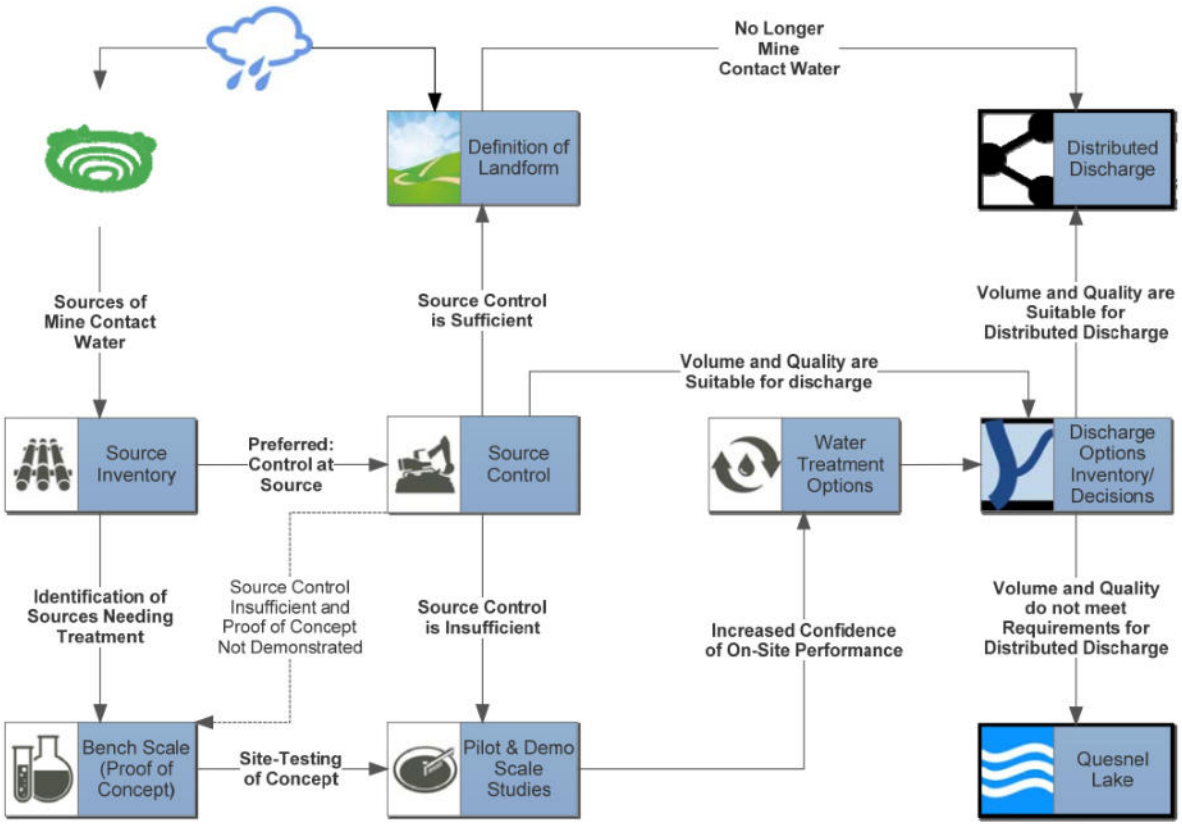

Figure 2-1. Water Management Framework (Golder 2020).

Source Inventory and control (and landform definition), water balance and water quality modelling, discharge options, restorations of watercourses, water treatment technology and scheduling, and potential revisions to the water management plan are described in detail below.

Source inventory: A source inventory of areas identified to generate contact water has been created at the Facility which includes information on location, modelled or measured flow and water quality, and current on-site collection or discharge locations. This database is regularly updated.

Source control: Source control is the method of reducing volumes of mine contact water (i.e., runoff from a reclaimed landform without containing mining materials) as a method for managing water quantity and quality. Non-contact water is currently managed at the Facility through a system of channels that diverts water away from mine infrastructure. Contact water (i.e., waste rock contact water, pit wall runoff, TSF, disturbed/undisturbed runoff, and groundwater inflow) is currently managed with a water treatment plant and conveyed to the TSF or the Perimeter Embankment Till Borrow Pond to be re-used during operations.

Landform Definition: Mount Polley has investigated methods of diverting and discharging water off-site without treatment through literature review (i.e., water management approaches in the USA and Australia), landform criteria identification, and a theoretical impact assessment.

Literature review suggests that successful landform creation has been achieved when i) it is geotechnically stable under long-term conditions, ii) water discharged from the landform does not have negative impacts to downstream habitats, iii) erosion rates are similar to surrounding natural areas, and iv) the landform supports the end land use function. The theoretical impact assessment determined that there is substantial potential to increase the sustainability of water management at closure by reducing the volume of water that requires treatment through creation of suitable landforms, as defined above, upon closure.

Modelling: The water balance at the Facility was, and is continuously, determined through observable data and utilizing modelling software (GoldSim) that incorporates site drainage, surface hydrology, pit groundwater hydrology, seepage calculations, site climate data and climate change predictions. Results from water balance model simulation suggest: average/mean annual discharger from 2023-2029 will be 4.2 M-m^3; TSF storage limit from 2030-2031 will be 984 m and additional dam raises will be required prior to resuming operations; and the maximum annual discharge rate is approximately 10 M-m^3 in 2031. Passive mode of the Water Treatment Plan equates to an average mean annual discharge of 0.33 m^3/s. Note that these results are based on a series of assumptions that will need to be confirmed.

Water quality modelling was also conducted using the GoldSim model software. Results from water quality model simulation suggest that total copper and selenium were the only modelled parameters in the Perimeter Embankment Till Borrow Pond that exceeded proposed effluent discharge limits of 0.033 mg/L and 0.075 mg/L. Note that these results are based on a series of assumptions that will need to be confirmed.

Discharge Options: Discharge locations for contact water will be determined through the BAT for water treatment, results of water quantity and quality, and the ability of the receiving waterbodies to assimilate discharge. Treated and non-contact water will be discharged into site watercourses as per Permit conditions. Previous studies (Golder 2015; 2016) have determined that the pipeline to Quesnel Lake, commissioned in 2015, provides the best option for discharge for the remainder of operations.

Watercourse Restoration: Restoration of any watercourse at the Facility will be under the supervision of a habitat biologist (RPBio) and a river engineer (PEng).

Water Treatment Technology & Schedule: Several water treatment options are being investigated at the Facility for operational and closure including Operational technology (Actiflo water treatment system, TMT (trimercaptotriazine) treatment, and lime treatment) Closure/Post-closure technology (Biochemical Reactor System, Packed Bed Reactor System, Saturated Rock Fill System, Submerged Sand Reactor, Pit Lake Treatment System, and Constructed Wetland Treatment System). Two of these water treatment options have been implemented and several others are under consideration; see Table 6-14 for an inventory of the water treatment technologies and development stages. See Section 4.7.2 of the Golder 2020 Water Treatment Plan for detailed descriptions of these water treatment technologies.

Water Management Plan Revisions: Changes to the current water treatment may be required based on trigger events during operations at the Facility. Mount Polley has outlined potential revisions to the water management plan based on potential triggers in Table 6-12.

Table 12. Revision Process to the Water Management Plan under Potential Trigger Scenarios.

Revision Trigger	Applicable Regulatory Body and Permit	WMP Update	Anticipated WMP Update Submission (Revision Trigger + X months)	Additional Notes
Mine plan update: a change to the permitted mine plan or implementation schedule that results in modifications to the water management systems.	MEMPR; M-200 EMA; PE-11678	Full update	10 months	Update to water balance (including water quality model) and implementation schedule. Updates to groundwater/hydrogeological models may be required.
Tailings Storage Facility: a change to the permitted configuration (i.e., dam crest elevation, water storage volume, or tailings volumes) of the TSF that impacts water storage and discharge requirements.	MEMPR; M-200 EMA; PE-11678	Full update	6 months	Update to water balance (including water quality model) and implementation schedule. Updates to groundwater/hydrogeological models may be required.
Catchment areas: change in the site footprint of more than 10% increase or decrease in runoff volume attributed to changes in the permitted and modified mine areas.	MEMPR; M-200 EMA; PE-11678	Partial update	3 months	Update will be composed of a calibration and sensitivity exercise on the existing water balance (including water quality model). Updates to groundwater/hydrogeological models may be required.
Requirement to update WMP by the Engineer of Record or the Independent Engineering Review Panel.	MEMPR; HSRC	Level of update depends on requirement of Engineer of Record or Independent Engineering Review Panel	6 months	To be determined; however, it may include an update to water balance (including water quality model) and implementation schedule. Updates to groundwater/hydrogeological models may be required.
Requirement to update the WMP by the Statutory Decision Maker of MEMPR or BC ENV	MEMPR; M-200 EMA; PE-11678	Level of update depends on requirement of statutory decision maker	6 months	To be determined; however, it may include an update to water balance (including water quality model) and implementation schedule. Updates to groundwater/hydrogeological models may be required.

WMP = Water Management Plan; TSF = Tailings Storage Facility; EMA = *Environmental Management Act*; MEMPR = Ministry of Energy, Mines, and Petroleum Resources; HSRC = Health, Safety and Reclamation Code for Mines in British Columbia; BC ENV = British Columbia Ministry of Environment and Climate Change Strategy.

Closure and post-closure water management will aim to return the pre-mining drainages back to their natural watersheds (i.e., to Bootjack Lake, Polley Lake, and Hazeltine Creek). Where natural drainage restoration is not feasible, hydraulic engineering design principles (Chow 1959) will be utilized to create self-sustaining features.

The 2021 report outlines updates to the Site Wide Water Balance Model that reflect site water management in 2020. Updates to the model included:

- No tailings were discharged from the ore processing plant to the TSF;
- No dredging operations occurred in the Springer Pit;
- Water was transferred from the TSF to the Cariboo and Springer pits to manage above average freshet flows;
- Increased runoff coefficients to account for above average precipitation in 2020, and;
- Updated the discharge to the environment through the water treatment plant.

Recommendations: Recommendations from the TAR (2016), WMP (2020) and the model update (2021) include:

- Continue with the current WMP, using the existing water management infrastructure (i.e., collection ditches, pipes, sumps, pumps) with some modifications (see Golder 2020 WMP);
- Continuing research and updating of hydrologic data including climate and weather data, along with climate change impact predictions, to maintain current information for water balances calculations and water management plan requirements;
- Research and analyze low-flux cover options and parameters to inform planning efforts and runoff modelling;
- Implement revisions to the WMP as per Table 6-12, as required;
- Ensure measured water levels capture key calibration points;
- Install flow monitoring stations in major drainage ditches to reduce uncertainty in baseflow and runoff volumes to the TSF;
- Increase frequency and period of spring and fall snowpack measurements;
- Provide winter snowfall and rainfall data to increase accuracy of climate data, and;
- Continue refinement of runoff coefficients for future modelling.

6.1.4.2 Water Treatment Systems

Location: Mine site and surrounding waterbodies

Project Name: Annual Anaerobic Biological Reactor Review (2014), Mount Polley Mining Annual Reclamation Report (2017), Mount Polley Mine Long Term Water Management Plan Permit Amendment Application under the Environmental Management Act (2016), Draft Water Treatment Update to Reclamation and Closure Plan (2017), Water Treatment and Discharge Program Progress Report #6 (2020), Water Treatment and Discharge Program Progress Report #7 (2020)

Description: As per Permit 11678, MPMC must undertake a BAT assessment when developing water treatment and discharge technologies at the Facility. Typical project phases to develop a water treatment system includes a pre-concept, concept, pre-feasibility, feasibility, and project execution phases; details and timelines for each of these phases can be found in Table 6-13.

Table 13. Typical Phase of Development for Water Treatment Systems.

Project Phase	Description	Timeline
Pre-Concept	• Initial viability of pre-identified candidate options • Proof-of concept (bench scale testing)	4-9 months
Concept	• Reduce number of options carried forward • Detailed bench-scale testing	7-15 months
Pre-Feasibility	• Identify and define the “go forward” option(s) • Pilot-scale testing under site conditions • Permit unlikely to be required	15-24 months
Feasibility	• Demonstrate feasibility at larger scale (order of magnitude scale up) • Done under site conditions • Permits are necessary to construct at this size	24-36 months
Project Execution	• Detailed engineering design, procurement, construction, commissioning and ramp up at full-scale • BAT assessment	24-36 months

The Facility is in the pre-concept and concept phases for various water treatment technologies including:

- Bio-chemical reactors (BCR);
- Packed Bed Reactor (PBR);
- Pit lake treatment;
- Saturated rock fill (SRF);

- Saturated sand filter (SSF);
- Anaerobic bio-reactor (ABR);
    - In conjunction with Genome BC and UBC Microbiology, the Facility developed and built an on-site semi-passive wastewater treatment system, the Anaerobic Biological Reactor (ABR), in 2009. The objective of the ABR was to passively lower trace metal and nutrient concentrations through microbial activity in a designed anaerobic wetland environment. Water sampling was conducted from 2011 to 2014 at the pond inflow (ABR-IN), outflow (ABR-OUT), and at four sites within the pond itself (ABR-Interface-1 through -4). Sampling included collection of water samples for ex-situ elemental analysis, and in-situ measurements of water quality including pH, conductivity, temperature, and dissolved oxygen through the water column. This process was found to be effective at lowering trace metals and sulphate, but the program was discontinued following the 2014 tailings facility breach.
- Wetland treatment (constructed wetlands treatment system (CWTS)); and
- Active treatment (i.e., TMT addition to the water treatment plan).

Treatments: Two of the water treatment options have been implemented and several others are under consideration; see Table 6-14 for an inventory of the water treatment technologies and development stages.

Table 14. Revision Process to the Water Management Plan under Potential Trigger Scenarios.

Stage of Development / Water Treatment Technology Option	Targeted COCs	Proof-of-Concept Bench-Scale Testing	Detailed Bench-scale Testing	Pilot-Scale Testing	Demonstration-Scale Testing	Project Execution	Deliverables Submitted	Potential Next Steps	Timeframe to Implemented Technology
Operations									
Actiflo water treatment system	TSS					WTP in operation	▪ Bench- and full-scale testing of Actiflo WTP	▪ Not applicable	Not applicable
TMT treatment	Dissolved copper						▪ Bench- and full-scale testing of TMT dosing	▪ Detailed bench-scale test work	6 to 9 years
Lime treatment	Dissolved copper						▪ Not applicable	▪ Not applicable	
Closure/Post-closure									
Biochemical reactor (BCR)	Selenium, nitrate						▪ Concept design ▪ Proof-of-concept bench-scale tests	▪ Detailed bench-scale test work	6 to 9 years
Packed bed reactor (PBR)	Selenium, nitrate						▪ Concept design ▪ Proof-of-concept bench-scale tests	▪ Detailed bench-scale test work	6 to 9 years
Saturated rock fill (SRF)	Selenium, nitrate						▪ Concept design	▪ Proof-of-concept bench-scale tests (underway)	6 to 10 years
Submerged sand reactor (SSR)	Selenium, nitrate						▪ Screening analysis	▪ No further work	Not applicable
Pit lake treatment	Selenium, nitrate						▪ Concept design ▪ Proof-of-concept bench-scale tests	▪ In situ (pilot) study	5 to 8 years
Constructed wetland treatment system (CWTS)	Selenium, nitrate						▪ Concept design ▪ Bench-scale testing	▪ On-site pilot-scale testing (underway) ▪ On-site demonstration-scale test work	5 to 8 years

Eliminated/Rejected Partially eliminated Under consideration Implemented

COC = contaminant of concern; TSS = total suspended solids; WTP = water treatment plant.

Short descriptions of these water treatment technologies are provided below (detailed descriptions of water treatment technologies can be found in Section 4.7.2 of the Golder 2020 Water Treatment Plan.

BCR: The BCR is a passive treatment technology that consists of a lined pond filled with submerged organics substrate media mix. Additions of the organic substrates provide nutrients and carbon sources for biological activity. Selenium is dissolved and retained in the BCR. This treatment technology requires downstream water treatment. A conceptual design for the BCR was developed in 2016 and a bench-scale test was implemented in 2019 in the NW Sump.

PBR: The PBR is similar to the BCR but the substrate is inert (to support microorganisms) and has additions of liquid nutrient and carbon sources to promote biological activity. This treatment technology also requires downstream water treatment. Bench-scale testing was completed for PBR in the NW Sump water in 2019.

Pit Lake Treatment: Stored water within pits may be used to reduce contaminates of potential concern (i.e., copper and selenium) through natural settling and bio-chemical processes. A pilot

study was developed for Cariboo Pit which included a phased application of a carbon source to the water to enhance microbial reduction of selenite and selenite. In 2017 a preliminary assessment of in situ lake treatments was conducted (Golder 2017). In 2019, a bench-scale testing of the in situ pit lake treatment was conducted in the NW Sump. In 2020, an in situ treatment of Cariboo pit water was implemented.

ABR: The ABR is an artificial wetland intended to support microorganisms in anoxic water conditions (especially sulphate reducing bacteria), with the aim of lowering trace metals and sulphate concentrations in discharge water. The wetland has a layered design, consisting (from bottom to top) of organic material, rock fill, and water and is approximately 5 m deep, 85 m wide, and 100 m long (Figure 6-2). Water is pumped into one side of the system through perforated pipes at the bottom of the organic layer, from the East Main Toe Drain (MTD), which collects seepage through the Main Embankment of the TSF. After passing through the ABR, treated water flows out the opposite side, passing through a polishing pond before returning to the Main Embankment Seepage Collection Pond (MESCP).

Treatments were continuously improved while the ABR was functioning. In 2011, inflowing water was heated 20°C to encourage microbial activity. In October 2012, a berm was constructed around the water inflow system to increase retention and the organic material was refreshed. In 2013, booms were installed as wind barriers. Further plans existed to install a cover over the pond, but were not implemented. In 2014, a plan was in place to change the feed water of the ABR from the MTD to the MESCP, to allow water with higher metals content to pass through the ABR. From fall 2009 to the summer of 2014, approximately 50 to 100 gallons per minute were pumped into the ABR.

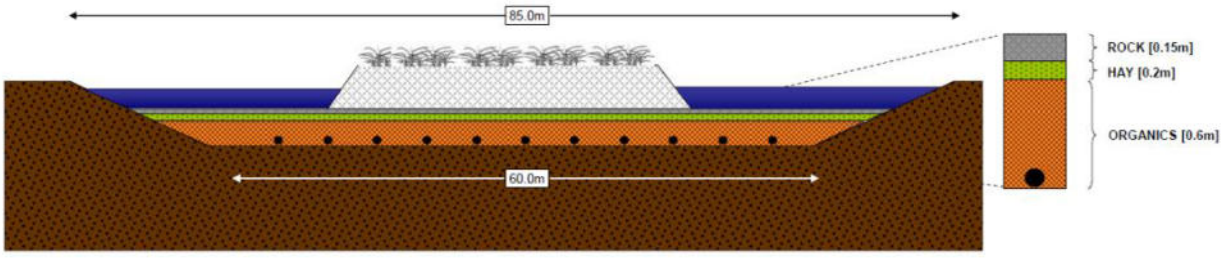

Figure 6-3. Side view of the ABR, showing size and layering of the designed wetland. Figure extracted from Appendix O of the Reclamation Closure Plan "Annual Anaerobic Biological Reactor Review 2014" (2017).

SRF: The SRF is a new technology that is similar to the pit lake treatment and PBR in that it uses water volume at the Facility for treatment and biological treatment for contaminant removal (similar to pit lake treatment), but uses a mined-out open pit as a bioreactor versus the constructed bioreactor in PBR. A proof-of-concept bench-scale study was conducted in 2020 Burnaby by Golder that used samples of waste rock and site water from the Facility.

SSR: The SSR is similar in concept to the SRF but uses tailings as a substrate to provide an energy source for biological reactions.

CWTS: The constructed wetland tailings system (CWTS) is a passive water treatment system is being investigated by Ensero Solutions Inc through a phased approach study. In 2020, an on-site pilot scale CWTS was commissioned and microbial and chemistry sampling was conducted and evapotranspiration and detritus accretion studies were started. Subsequent monitoring will be conducted in the future. Results are not yet available.

Active Treatments: In 2020, a TMT dosing field trial was tested for enhancing copper removal in the Actiflo water treatment plan during freshet.

Results and Discussion:

BCR/PBR: BCR and PBR treatments were successful in removing nitrate (complete or near complete removal), removed high concentrations of selenium, and significant removal of sulphate. It was suggested to use the removal rates for future evaluation of the BCR technology.

Pit Lake Treatments: The pit lake treatment removed complete or near complete nitrate. Selenium was removed in open and closed cells, with better removal in open cells. Results from Cariboo Pit treatments are not yet available.

ABR: The ABR was found to be effective at improving water quality parameters by lowering the concentrations of trace metals and nutrients, especially sulphate, nitrate, selenium, and molybdenum (Table 6-15). Post-treatment water was consistently found to be below BC Water Quality Guidelines for Aquatic Life (BC WQG) for all parameters except for sulphate (Table 6-15).

Table 6-15. Percent Change in Elemental and Nutrient Concentrations between Inflowing (ABR-IN) and Outflowing Water (ABR-OUT) from 2010 to 2014.

	Percent decrease between inflow and outflow					
Parameter (mg/L)	**2010**	**2011**	**2012**	**2013**	**2014 (N=21)**	**Inter-annual average**
Sulphate (Dissolved)	14.9	-6.0	12.3	12.9	7.9	8.4
Nitrate (N)	98.4	97.9	92.1	97.9	87.5	94.8
Phosphorus (Total)	0.0	42.9	-2.2	-487.7	-48.8	-99.2
Aluminum (Dissolved)	12.0	19.6	-20.7	-44.4	10.9	-4.5
Arsenic (Total)	-32.2	22.8	34.6	-48.1	37.4	2.9
Cadmium (Total)	26.2	63.8	55.7	61.0	80.5	57.4
Copper (Total)	-23.3	50.9	33.9	64.7	80.8	41.4
Iron (Total	-929.3	-119.6	-8.9	-102.9	-64.0	-244.9
Lead (Total)	-5.2	91.3	87.1	51.8	-9.5	43.1
Magnesium (Total)	3.0	-8.2	1.8	-6.2	1.0	-1.72
Manganese (Total)	-13.3	28.5	-7.6	-133.3	6.3	-23.9
Molybdenum (Total)	29.7	25.3	28.4	53.4	46.3	36.6
Nickel (Total)	-230.4	54.8	66.1	-20.1	20.9	-21.7
Selenium (Total)	70.7	44.8	60.7	84.7	70.6	66.3
Zinc (Total)	34.8	44.9	32.1	86.1	70.2	53.6

Note that Negative Values Indicate an Increase in Concentration. Samples were Collected Monthly During Operational Periods of the ABR, starting in 2014, and were Analysed by ALS Laboratories in Burnaby. Where Values are Below Method Detection Limit (MDL), Percent Changes are Calculated from MDL/2. Data Presented was Amalgamated from Appendix O of the RCP "Annual Anaerobic Biological Reactor Review 2014" (2017).

- Sulphate: Sulphate levels at ABR-OUT were consistently lower than levels at ABR-IN, with an inter-annual average decrease 8 %, with an average outflow value of 475 mg/L in 2014. Outflowing values for sulphate often exceeded the hardness-corrected BC WQG of 429 mg/L.

- Phosphorus (Total): ABR-OUT reported consistently higher values of total phosphorus than ABR-IN, with an average increase of 99 %, to an average outflow value of 0.049mg/L in 2014. This increase in phosphorus is examined below.

- Copper (Total): Copper levels were consistently lower at ABR-OUT than ABR-IN, resulting in an average decrease of 0.0047 mg/L (81 %). All results were below the BC WQG.

- Iron (Total): Iron concentrations were consistently lower at ABR-IN than ABR-OUT. An average increase of 0.029 mg/L (64 %) was observed. This effect is explained in greater detail below.

- Molybdenum (Total): Molybdenum concentrations were consistently lower at ABR-OUT than at ABR-IN, with an average decrease of 46 %. All results were below the BC WQG.

The increase in phosphorus and iron is believed to be a result of sedimentary iron reducing in anoxic conditions, and forming soluble complexes, especially with hydrogen sulphide (a desired product of sulphate reduction). Phosphorus is commonly bound to iron in sediment, and is also released in soluble form as a result, raising the soluble concentrations of both phosphorus and iron. Lowering sulphate concentrations in the ARB relies on anoxic conditions and releases hydrogen sulphide, producing conditions in which iron and phosphorus can mobilize from sediment. This is an effect that future research on anaerobic bioreactors could address.

Although the ARB was found to lower sulphate loads, the program was not effective at maintaining post-processed water below the BC WQG. Testing of the water column at ABR-Interface sites between 2011 and 2014 indicates that the water column was not consistently anoxic, especially in the summer. Oxygenated conditions do not allow for microbially-mediated sulphate reduction, and may allow reoxygenation of sulphur compounds to take place. Covering or enclosing the reactor, or otherwise ensuring anoxic conditions throughout the water column, should improve the sulphate reduction performance. Improvements to the ABR were planned but were not implemented.

SRF: Results of the proof-of-concept bench-scale study of the SRF demonstrated:

- Nitrate was reduced below the detection limit;

- Selenium was successfully removed in some cases;

- Aeration and settling cells were effective polishing units by lowering BOD total organic carbon and sulphide;

- Flows above the design flow rate reduced effectiveness of polishing;

- Higher levels of copper, cadmium and redox sensitive species (i.e., arsenic, iron, and manganese) were identified in the effluent, and
- Results were reproducible. Additional results are to be made available in 2021.

SSR: It was suggested to remove SSR as a treatment option based on literature review, historical evaluation of water quality monitoring data which showed the TSF does not treat COCs to appropriate levels, low hydraulic conductivity of the tailings, limited flexibility to modify the TSF, TSF design complications, and challenges with obtaining permit amendments.

Pit Lake Treatments and CWTS: These treatments are within the pre-concept and concept phases and results are not yet available.

Active Treatments: Results from the addition of TMT suggest that dissolved copper concentrations were consistently reduced between 4 and 6 µg/L but that the water treatment plan was unable to meet the dissolved copper permit requirements even with additions of TMT.

Recommendations:

Passive or semi-passive wastewater treatment has been identified as an objective for reclamation under the Long Term Water Management Plan (Golder, 2016). The ABR pilot project may represent a cost-effective and semi-passive option for wastewater treatment at the Facility. If the Facility decides to continue with the ABR or a similar system, it is recommended to assess the continual improvements made to the system during its 2009-2014 lifespan:

- Test the influence of heating inflowing water above ambient temperatures, possibly from 7°C to 20°C, as the system was upgraded to do in 2011;
- Review existing data on the relative performance of Phase I (2009-2011) and Phase II (2012-2014) of the ABR, to help assess the influence of renewal of the organic layers and addition of berms around the inflow system to increase retention;
- Develop a cover or wind barrier system, attempted in 2013 and 2014, and test dissolved oxygen values in the water column to ensure the barrier is effective at maintaining anoxic conditions in the bioreactor;
- Develop a trial to test the effect of higher metal (especially iron) content on passive reactor performance. The ABR was operated using input water containing 0.015-0.15 mg/L of total iron, which is believed to be too low. Using different types of mine contact water, or even adding iron, could improve bioreactor performance;
- Test improvements to the bioreactor system that can prevent mobilization of phosphorus and iron, possibly by using different kinds of substrate that are lower in these elements, or altering the composition of inflowing water such as with increased iron as mentioned in the prior bullet.

In 2017, Golder initiated an investigation for passive water treatment (the Draft Water Treatment Update to Reclamation and Closure Plan), and while still ongoing, has tentatively accomplished the following:

- Identified the NW Sump, 9K Sump, and South Toe Drain locations as potentially suitable for full-scale, passive/semi-passive treatment at closure and identified the constituents of concern and constituents of potential concern for these sites;
- Conducted a technology assessment that confirmed passive treatment technology compares favorably against other treatment technologies;
- Identified the NW Sump as one suitable location to construct and operate a pilot-scale passive/semi-passive system;
- Provided a preliminary implementation schedule for the bench-, pilot-, and full-scale systems, and input requirements and outcomes associated with the design, construction, and operation tasks of each;
- Developed a contemplated passive system which would consist of a sedimentation pond, biochemical reactor, sulphide polishing cell, subsurface constructed wetland, free water surface constructed wetland, and aeration cascade;
- Retained Contango Strategies Ltd. (Contango) to conduct a supporting preliminary assessment of passive treatment potential at the Facility and potential conceptual designs, with a focus on treatment wetlands. An onsite pilot scale constructed wetland treatment system was constructed in 2018.

The process of assessing and planning a future passive treatment facility is still ongoing. . More detail on the ongoing process can be found in the Water Management Plan (Mine Operations; Golder, 2020).

6.1.5 *Geomorphic Landform and Run-off Modeling: Research Requirement (I)*

Location: Permitted Mine Area

Project Name: Geomorphic Slope Design Guidance for Mount Polley Mine

Description: Geomorphic Slope Guidance Document (Golder 2019) provides direction for grading and landforms to create a more natural restorative closure land surface. This guidance document includes grade and length recommendations, along with comprehensive reviews of pre-mine and current topography, soil mapping, and high-resolution air photos. This resulted in proposed closure grading and runoff catchment areas along with discharge planning. The document states that significant effort in terms of grading would be required to achieve a more natural closure land surface.

The water balance (RCP Appendix F) aligns with the closure grading and runoff catchment mapping recommendations of the Geomorphic Slope Guidance Document.

Refer to Section 5.2.1 of RCP for sediment retention and erosion control planning information.

Recommendations:

- Further research is required to determine the desired application and effects of low-flux cover.
- Continue surveying and modelling to determine appropriate runoff routing in order to re-instate natural drainage patterns appropriately.
- Conduct study of effort required to achieve desired closure grading.

Initiation Date: 2018

Mount Polley Mine Water Balance Model: Closure and Reclamation	Golder	2017

6.2 OUTSTANDING

6.2.1 *Vegetation: Research Requirement (d)*

Description: As per requirement d, MPMC is obligated to conduct research to determine the viability of revegetation with native and cultural important plant species.

Overview of Past Work at Mount Polley: Selection of species for revegetation at the Facility has included those determined to be early successional species within the region, species identified from the baseline vegetation assessments, and species identified as culturally important from FN consultation. Vegetation identified from baseline assessments and specific site-series are shown in Table 6-16. Site-specific reclamation prescriptions of grasses and forb's, deciduous and coniferous trees species, and shrub species, for the Facility are provided in Table 6-17 and are based on site-specific BEC zones (site series), and geographic topography.

Table 6-15. Summary of Vegetation within the Interior Cedar Hemlock (ICH) Moist Cool (mk) Variants (01-07 & non-forested sites) Summarized by Literature (Steen 1989) and Field Based Assessments at the Facility.

Site Series		Moisture	Vegetation identified by site series (Steen 1989)	Vegetation identified from field surveys	Additional information from 2019 RCP.
Zonal	ICHmk03 /01	Mesic, submesic	Western red cedar, subalpine fir, falsebox, black huckleberry, bunchberry round-leaved violet, rosy twistedstalk, red stemmed feathermoss.	Western red cedar, Douglas-fir, subalpine fir, black cottonwood, Sitka alder, Douglas maple, Scouler willow, Bebbian willow, red elderberry, black huckleberry, black twinberry, various willows, thimbleberry, western mountain ash, prickly currant, wild red raspberry, fireweed, bluejoint, Solomon's seal, twinflower, and bunchberry.	Selectively logged in 1970s to remove mature Douglas-fir and Western red cedar.
Xeric to Subxeric	ICHmk03 /02	Xeric, Subxeric	Douglas-fir, western red cedar, Saskatoon, soopolallie, pussytoes, wild strawberry, white hawkweed, juniper haircap moss, lichens.	Lodgepole pine, Douglas-fir, occasional black cottonwood. Tall shrub understory: subalpine fir seedlings. Low shrub understory consisted of black huckleberry, birch-leaved spiraea, falsebox, prickly rose, prince's pine. Herb layer (>1%) consisted of twinflower, white hawkweed, and hear-leaved arnica.	Moss species found in this area included red stemmed feather moss, juniper hair cap moss, and dog's tongue lichen.
	ICHmk03 /03		Douglas-fir, western red cedar, Saskatoon, soopolallie, rough-leaved ricegrass, wavy-leaved moss, Peltigera sp. Mosses not forming-carpet-like ground cover.	Patchy western red cedar, subalpine fir, black cottonwood, alder, and willow. Understory consisted of western mountain-ash, Saskatoon, wild rose, and willows.	An 03 site, west of the mill, was selectively logged in the 1970s, which removed mature Douglas-fir and Western red cedar. Greater diversity was found in 03 site series than 02. Fair to good development was seen of bear's hair and witches' hair lichens.
Mesic to Moist Nutrient Rich	ICHmk03 /04	Subhygric, mesic	Western red cedar, falsebox, devils club (≤ 10% cover), foamflower, oak fern (average cover 30%), leafy mosses, red-stemmed feather moss.	Western red cedar, hybrid spruce, subalpine fir. Tall shrub understory consisted of included black cottonwood seedlings, aspen poplar, Sitka alder, Douglas maple, Scouler willow, Bebbian willow. Low shrub understory consisted of thimbleberry, black huckleberry, oval-leaved blueberry, red elderberry, black twinberry, black gooseberry, wild raspberry. Oak fern, lady fern, false Solomon's-seal, star-flowered Solomon's-seal, rosy twisted stalk, bunchberry, fireweed, and one-leaved foamflower.	Many sites within 04 and 05 have been selectively logged and slash-burned creating atypical vegetation growth. Early stage successional areas were dominated by black cottonwood, alder, willows, fireweed, pearly everlasting, dandelion and various grasses, legumes, and weeds. Mature 04/05 site series often dominated by low-palatability plants but had abundant arboreal lichens (witches' hair, bear's hair).
	ICHmk03 /05	Subhygric	Hybrid white spruce, subalpine fir, thimbleberry, black twinberry, red-osier dogwood, fringed aster, sweet-cicely, ragged moss. Shrubs diverse and abundant up to 70%.		
Moist, Very Rich	ICHmk03 /06	Subhydric, mesic	Hybrid white spruce, subalpine fir, devil's club (up to 40% cover), black gooseberry, lady fern, oak fern, enchanter's nightshade, and stream violet, leafy mosses.	Hybrid spruce, western red cedar. Understory consisted of devil's club (up to 40%), oak fern, spiny wood-fern, lady fern, foamflower, false Solomon's seal, rosy twisted stalk, and clasping twisted stalk.	
	ICHmk03 /07	Hygric	Hybrid white spruce, western red cedar, red-osier dogwood, black twinberry, devil's club (10% cover), horsetails, soft-leaved sedge, American brooklime, leafy mosses, and ragged moss. Thallose liverworts in depression and moss layer diverse	Hybrid white spruce, black cottonwood, horsetails, sedges, and red-osier dogwood.	Site series 07 was not found in the mine development area.
Organic Non-Forested (e.g., wetland)	Non-forested	Subhydric	Hybrid white spruce and lodgepole pine; when found trees stunted. Scrub birch, Labrador-tea, hardhack, sedges, and sphagnum mosses.	Scrub birch, Sitka alder, Labrador-tea, hardhack, and willows.	Vegetation present around the pond south-west of the TSF includes poor-fen sphagnum, common green sphagnum, narrow-leaved cottongrass, Labrador-tea, buck-bean, narrow-leaved sundew, bog laurel, sphagnum mosses. Shrub wetland northeast of the pond was dominated by hardhack, Sitka alder, and tall willows.

[1]Later successional species will be considered for planting after establishment of primary canopy; shrub species will be selected for each site based on research and availability.
[2]Refer to Figure 6-3 for descriptions of soil profiles.
[3]Conifer species are planted at roughly uniform density.
[4]Deciduous tree and shrub species are planted at roughly uniform density except higher biodiversity islands can be established in occasional depressions that retain water and nutrients.

A site-specific native grass and forb seed mixture was developed for the Facility and is summarized in Table 6-18.

Table 6-17. Mount Polley Native Species Grasses and Forb's Seed Mix.

Species	**% by weight**	**% by seed count**
Mountain brome	20	8.61
Native red fescue	10	17.81
Rocky mountain fescue[1]	15	28.94
Bluebunch wheatgrass[1]	25	10.76
Blue wildrye[1]	25	3.34
Junegrass[1]	3	17.81
Ticklegrass	1	11.87
Big leaf lupine	0.97	0.07
Fireweed	0.03	0.81

[1]Forage species.

MPMC undertook Aboriginal engagement, with the Xatśūll and T'exelcemc FN, to identify and incorporate culturally important species into planting trials. Over 25 species were identified, however, some species were dismissed from use because they were non-native and were not documented by the baseline studies. Table 6-19 lists culturally important species and results from planting trials, if implemented.

Table 6-19 also overviews the results of the MPMC revegetation research trials (i.e., vegetation success) at the Facility. Results from these trials allow an opportunity to improve site-specific reclamation knowledge and allow refinement and adjustment of revegetation prescriptions.

Ongoing research is also continuing to refine vegetation species selection including grass and forb's trials, culturally important species trials, trials related to increase deciduous tree and shrub diversity, and to conduct seed collections used for future reclamation.

Table 6-18. Summary of Culturally Important Species, Identified by FN groups, and Non-Culturally Important Species including Location and Planting Results, if Planted.

	Species Common Name	**Latin Name**	**Location of Trial**	**Results**	**Additional Information**
Culturally Important Species	Lodgepole Pine	*Pinus contorta*	NBD, East RDS, NEZ Dump	Successful establishment and growth at most sites, and in most moisture regimes.	
	Western redcedar	*Thuja plicat*	NBD	Poor growth and establishment.	This late successional species planted at limited areas at the Facility. Additional planting of this species at reclamation sites may be required if natural establishment does not occur.
	Balsam fir	*Abies balsamea*	N/A	N/A	Species only present east of the Rocky Mountains.
	Paper Birch	*Betula papyrifera*	NBD, East RDS, NEZ Dump	Moderate performance, best growth at moist sites.	
	Black huckleberry	*Vaccinium membranaceum*	NBD- Metro Vancouver Research Parcel	Poor establishment and growth.	
	Blueberry	*Vaccinium myrtillodies*	N/A	N/A	Not yet planted at the Facility and difficult to establish. Determine viability based on Black huckleberry performance.
	Highbush cranberry	*Viburnum edule*	N/A	N/A	Not document in baseline survey; consider plan.
	Raspberry	*Rubus idaeus*	NEZ Dump	Strong natural establishment observed.	
	Saskatoon	*Amelanchier alnifolia*	NBD, East RDS, NEZ Dump	Moderate performance.	
	Red elderberry	*Sambucus racemose*	NEZ Dump	Natural establishment observed.	Incorporations into revegetation being considered
	Wild strawberry	*Fragaria virginiana*	N/A	N/A	If seed source is found, will incorporate into revegetation prescriptions.
	Soapberry (soopolallie)	*Shepherdia canadensis*	NBD– Parcels 1-10, South Triangle, Metro Van Research Parcel	Poor-good growth and performance.	
	Cow parsnip	*Heracleum lanatum*	N/A	N/A	Expected to naturally establish.
	Common juniper	*Juniperus communis*	NBD– Metro Van Research Parcel	Performed well on hot, dry sites. Non-native plant to area.	
	Kinnikinnick	*Arctostaphylos uva-ursi*	NBD – Dry site	Trials are planned, but plant or seed source unavailable.	
	Falsebox	*Paxistima myrsinites*	N/A	N/A	Expected to naturally establish in late stages of succession in moist areas.
	Labrador tea	*Ledum groenlandicum*	N/A	N/A	Consider incorporations in non-forested organic sites (wet).
	Devil's Club	*Oplopanax horridus*	N/A	N/A	Expected to naturally establish in late stages of succession in established conifer forests.
	Yarrow	*Achilles millefolium*	NBD, East RDS	Successful establishment and growth at most sites, and in most moisture regimes.	

	Species Common Name	**Latin Name**	**Location of Trial**	**Results**	**Additional Information**
	Tiger lily	*Achilles millefolium*	N/A	N/A	Not documented in baseline survey.
	Wild potatoes	*Lilum columbianum*	N/A	N/A	Not documented in the baseline survey. Additional consulting is also required for this survey.
	Mosses	Moss spp.	N/A	N/A	Expected to naturally establish in late stages of succession in moist areas.
	Fiddlehead ferns	Fern spp.	N/A	N/A	Expected to naturally establish in late stages of succession in moist areas.
Species Identified as not Culturally Important	Douglas-fir	*Pseudotsuga menziesii*	NBD, East RDS, NEZ Dump	Successful establishment and growth at most sites, and in most moisture regimes.	
	Black cottonwood	*Populus trichocarpa*	NBD, NEZ Dump	Successful establishment in sites with adequate soil additions.	
	Trembling aspen	*Populus tremuloides*	NBD, NEZ Dump	Successful establishment in sites with adequate soil additions.	
	Prickly rose	*Rosa acicularis*	NBD	Poor growth and establishment.	
	Scoulers willow	*Salix scouleriana*	NBD	Poor growth and establishment.	
	Willow	*Salix* spp.	NEZ Dump	Successful establishment.	
	Alder	*Alnus* spp.	NBD, NEZ Dump	Variable gowth, (best establishment and most vigorous at NBD, no survival at NEZ Dump).	
	Sitka alder	*Alnus rubra*	NBD, NEZ Dump	Successful establishment in sites with adequate soil additions.	
	Hybrid white spruce	*Picea glauca x engelmannii*	NBD	Poor growth and establishment.	
	Wood rose	*Rosa woodsii*	NEZ Dump	Successful establishment.	
	Black Gooseberry	*Ribes lacustre*	NEZ Dump	Natural establishment observed.	
	Forb mix: fireweed, lupine, dryas drummondii, june grass, yarrow, pearly everlasting		NBD, NEZ Dump	Low cover (10-20%). Yarrow most established and vigorous. Fireweed successful in the NEZ Dump. Lupine low success in the NEZ Dump.	
	Grass mix: junegrass, ticklegrass, mountain brome, native red fescue, rocky mountain fescue, blue wild rye, bluebunch wheatgrass,		NBD, NEZ Dump	NBD: High rates of cover (up to 90%). NEZ Dump tall grass (e.g., rocky mountain fescuse, bluebunch wheatgrass) had higher cover than lower grasses.	

	Species Common Name	Latin Name	Location of Trial	Results	Additional Information
	lupine, fireweed, yellow mountain avens.				

Note: Tan cells indicate species that have been actively planted at the Facility; white cells indicate species that will naturally establish or species that will not be used in reclamation prescriptions.
Abbreviations and Acronyms: NBD: North Bell Dump; RDS: Rock Disposal Site; NEZ: North East Zone.

Recommendations from Past Work at Mount Polley: MPMC recommends to continue monitoring vegetation in reclamation areas to determine success of planted and naturally establishing vegetation (Appendix J of the 2019 RCP "Vegetation Assessment Results"). Monitoring of grass/forb trials, culturally important species trials, and deciduous tree and shrub trials should be used to refine vegetation prescriptions for future reclamation areas. Results from monitoring should also be used to assess the need for planting trees and shrubs.

It is recommended to continue collection of seeds from a variety of native plant species naturally occurring at the Facility for future use in reclamation.

MPMC recommends considering an annual groundcover species (e.g., fall rye) to provide short-term erosion and sediment control and organic matter inputs. An annual groundcover species, or seed mix, would not compete with trees and shrubs and could provide a more successful approach to establishing natural forest cover by removing competitive grass cover from areas where native shrub and trees are planted.

It is recommended to continue FN engagement and community-based monitoring throughout reclamation planning as well as expanding culturally important planting trials where possible. For example, the wild potato was identified in the RCP as culturally important, but has yet to be planted at the Facility.

Application from the RCP: The RCP outlines the following methods to select species for reclamation while considering the reclamation objective of meeting end land use targets:

1. Determine local species for each site series that was present prior to development;
2. Review government regulations for reforestation guidelines and dominant overstory and understory species for each site series;
3. Determine commercially available species;
4. Liaison with FN and local communities to determine species that are culturally important and support target wildlife species;
5. Use commercially available species that meet the cultural and wildlife targets;
6. Monitor species planted or seeded within each site series to determine performance;
7. Select species for reclamation to incorporate well-performing species;

8. Investigate local seed sourcing;

9. Incorporate refined prescriptions into future reclamation to develop best practices for establishment of high priority target species; and

10. Continually adapt reclamation prescriptions from new information gathered.

Revegetation prescriptions at the Facility have been developed to mimic natural successional trajectories while meeting land use objectives, as outlined in the RCP (2019). End land use objectives include supporting wildlife values, commercial forestry, and livestock grazing. Successional trajectories of the mine site begin with ground cover establishment (i.e., to prevent ESC issues and invasive plant introduction), followed by planting deciduous trees and shrubs (i.e., promotes wildlife/biodiversity and reduces ESC issues and invasive plant introductions), planting early seral stage conifers (e.g., Lodgepole pine and Douglas-fir), and finally the natural establishment of climax woody species (e.g., Western redcedar, subalpine fir, and hybrid spruce). Site-specific planting trials will provide additional information in regards to successful species within areas of the Facility that can be incorporated into established revegetation prescriptions used during site-wide reclamation (Table 6-20).

Table 6-19. Site-Specific Reclamation Revegetation Prescriptions.

Location	**Revegetation Prescription**
Power Lines	Plant trees and shrubs only, as ground cover already exists.
Pits: Exposed pit faces	Leave unvegetated due to safety issues (i.e., steep terrain and poor access) as permitted under Section 10.7.13 of the *Health and Reclamation Code for Mines in British Columbia.* If access allows, a native grass and forb seed mixture will be broadcasted and hand planted with species that will grow on colluvial venners and steep dry sites (e.g., Lodgepole pine, black cottonwood, Sitka alder, and common juniper).
Ramps	Rip and revegetate with species outlined in 02 site series.
Flooded pits	Consider planting duckweed, pond weed, yellow pond lily, water sedge, beaked sedge, common cattail, river horsetail, and bull rush to increase aquatic species habitat.
Stockpiles	Create mosaic of forested site types based on slope, aspect and substrate type.
Roads	For areas of light Use: preserve roads required for monitoring; roadsides will be seeded with native grass/forb mixture; plant roads according to appropriate site series. Plant haul Roads (e.g., WHR, Tailings Access Road, New Access Road, Wight Pit Haul Road, Wight TSF Haul Road, Old TSF Haul Road): with vegetation appropriate to site series.
TSF	Create a patchy mosaic of deciduous trees and shrub thickets. Low-lying areas should be revegetated with deciduous species including black cottonwood, willow (plugs, wattles or live stakes), Sitka alder, and red osier dogwood. Plant aquatic plants including water sedge, beaked sedge, common cattail, river horsetail, yellow pond lily, and narrow-leaved bur-reed.
Till Borrow Pits	Monitor planted areas.

	Site series 02, 03: plant species according Table 6-16. Site series 01, 05, and 07: plant deciduous including black cottonwood, willow (plugs, wattles, or live stakes), Sitka alder, and red-osier dogwood. Can collect water sedge, beaked sedge, common cattail, river horsetail, yellow pond lily, and narrow leaved bur-reed.

Similar Research outside of Mount Polley: Since MPMC has already developed an extensive research program that targets site-specific species for revegetation, literature review outside of MPMC is not required.

6.2.2 *Ecosystem Restoration: Research Requirement (g)*

Description: As per requirement g, the Permittee shall conduct research intended to inform design of and to test potential mitigation options for restoring ecosystems and habitats that are predicted to be affected by mining activities.

Overview of Past Work at Mount Polley: N/A. Research involving heat or cover treatments for controlling competitive grass cover and invasive plants not yet been completed at the Facility.

Recommendation from Past Work at Mount Polley: N/A

Application from the RCP: The RCP does not contain suggestions for cover treatments during planting.

Similar Research Outside of Mount Polley: It has been shown that non-target vegetation, such as grasses and forb's, can rapidly occupy rooting space and lead to reduced growth of target vegetation (Bockstette et al. 2017). Cover treatments, such as woven landscape fabric or polyethylene film, has been shown to be effective at suppressing growth of non-target or invasive species while significantly increasing growth and survival of target species (Appleton et al. 1990; Martin et al. 1991; Feldman et al. 2000; Musselman et al. 2009; DWB 2020). Polyethylene is inexpensive but requires repeated annual material and labour costs (laying down, removal and disposal), can reduce plant water access, can create oxygen deficiencies, and can create buildup of carbon dioxide from the plastic (Appleton et al. 1990; Feldman et al. 2000). Conversely, landscape fabric only requires a single installation, is permeability for water and air movement and long-term soil fertility can be maintained under landscape fabric through fertilization, additions of soil amendments, and moving landscape fabric every few years (Appleton et al. 1990; Feldman et al. 2000). It has been shown that spun-bound nonwoven fabric is superior to meshed non-woven fabric in reducing non-target species growth (Martin et al. 1991).

6.2.3 *Soil: Research Requirement (i)*

Description: As per requirement i, MPMC will conduct research to inform the development of a soil replacement plan that is designed to achieve land capability and end land use objectives. The ability of vegetation establishment and success is often an indication of successful soil replacement. In addition, the measurable variables of end land use objectives are defined by establishment of an old growth forest (Table 5-1 "End Land Use by Site Series and Structural Stage" of the RCP).

Overview of Past Work at Mount Polley: Soils at the Facility are salvaged and either immediately used for on-site reclamation purposes or are stored for future use, as requirement under the BC *Mines Act* and Permit-200 (stated within the Soil Management Plan, Appendix U of the RCP).

The Soil Management Plan also includes practices that have been, and will be, implemented during soil replacement which include reducing compaction when re-applying soils by conducting works under ideal moisture conditions, reducing/eliminating traffic on soils applied for reclamation, increasing microtopography while applying soils for reclamation, and using CWD to increase habitat diversity

Previous research conducted at the Facility that can inform the development of a soil replacement plan has included test plots in the East RDS (Section 6.1.1), soil stability modelling and design creation (Section 6.1.2), and tree trials in the NBD (Section 6.1.1). In order to have successful revegetation establishment, results from this research suggest using a minimum of 25-40 cm of soil, applying light additions of biosolids (50-75 dT/ha), and seeding (5-10 kg/ha) with seed that is low-growing and non-competing of grass and forbs. Results also suggest that CWD (20-40 m^3/ha) can be used to increase soil complexity and create microsite habitats for vegetation establishment.

Although the Facility currently has sufficient soil volumes for reclamation, if insufficient soil is available contingencies will be explored to ensure adequate volumes. These may include additions of soil amendments, borrowing glacial till material from current borrow areas around the TSF, mixing tailing with till and locating other sources of reclamation soil (on or off site).

Recommendations from Past work at Mount Polley: Outstanding recommendations were identified from previous research projects at the Facility to inform the soil replacement plan.

Research conducted on the 1998, 1999 and 2000 tree trials within the East RDS suggests:

- Maintaining monitoring of the tree trials in the East RDS (ideally up to 50 years);
- Conducting soil nutrient, heavy metal and soil physical property measurements on tree foliage;
- Determining tree nutrient and heavy metal levels in foliage;
- Measure vegetation biomass on the trial plots (to help correlation to soil and ecosystem productivity); and
- Initiate a trial in the TSF to determine the most appropriate soil cover profile for this area.

Research conducted in the NEZ Dump from 2010-2015 suggests a few recommendations for soil improvements including:

- Applying low rates of fertilizer and biosolids, and reduced application rates for grass and forb seed mixes to reduce the risk of establishing competitive vegetation cover; and

- Applying CWD to produce microsite habitats and provide a diversity of shade and moisture surface conditions that will promote natural establishment of native tree and shrubs.

A variety of reclamation research trials that involved testing various soil covers within the NBD include the Metro-Vancouver Research Parcels 1-6 and 7-12, the South Triangle, Phase 1 and Phase 2, Parcel 1-10, the Beside Research, and the Wrap Around Toe. Below is a summary of recommendations from this research:

- Metro-Vancouver Research Parcels 1-6 and 7-12: Monitoring is recommended for these parcels. Future reclamation projects should include applications of glacial till and biosolids to soils for best results. It was recommended that till and biosolids are mixed thoroughly to avoid harming the foliage on the seedlings;

Other recommendations from previous research include:

- Implementing the soil stability design based on the soil stability modelling created by Golder (See Section 6.1.4).

Application from the RCP: The RCP (2017) has recommendations for soil profile designs and soil amendment prescriptions in Section 5.4.1.1 and Section 5.4.1.2, respectively. Although soil profile designs, based on site series (See Figure 6-3 below), are informed by previous research, effectiveness of these designs should be tested in order to determine if successful land capability and land-use objectives can be met. Test plots have been established within site series 01 and 06, in the East RDS, and site series 01, 02 and 04, in the NBD, which suggests that proposed soil profiles should hold validity, although, vegetation success could be measured to determine the large-scale effectiveness of these profiles. No data exists pertaining to proposed soil profiles within site series 05, non-forested areas, and the TSF, which indicates the need for test plots within these areas.

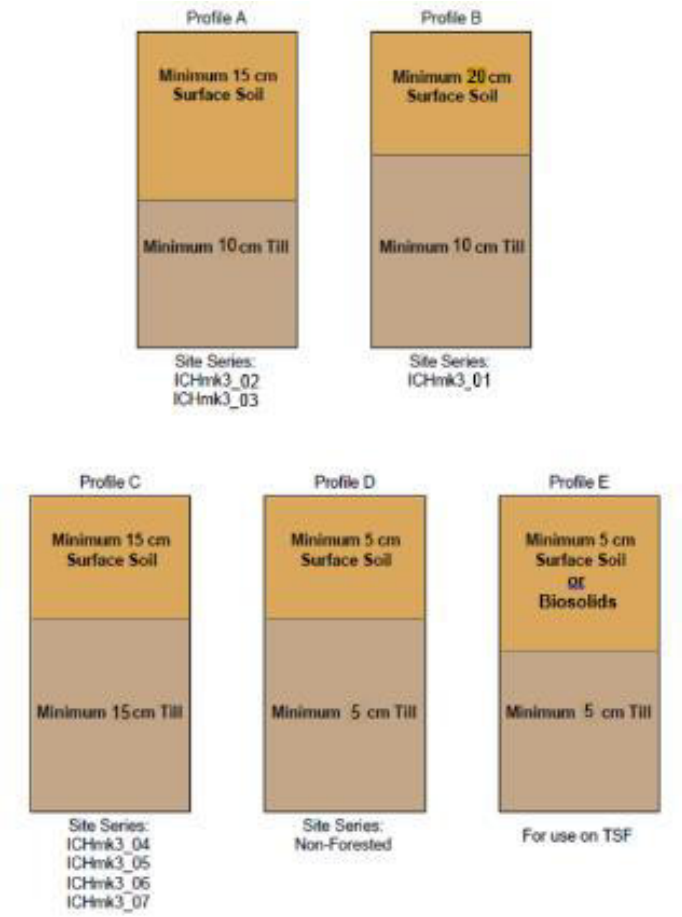

Figure 6-4. Proposed Reclamation Soil Profiles extracted from the 2018 RCP.

Similar Research Outside of Mount Polley: Research outside of the Facility has also shown improvements in soil composition with additions of soil amendments (Sims et al. 1984; Montgomery 2007; Pascualt et al. 1999; Stewart et al. 2000; Straker et al. 2003; Larney and Angers 2012).

Desulphurized tailing (or non-acid generating sand), combined with fertilizer, has also been shown to be a suitable amendment to mine soils that can increase the volume available for reclamation (Carson et al. 2014).

Incorporation of CWD into soils has also been shown to improve soil quality, aid in erosion control, enhance diversity, and function in a long term storage of organic matter (Kwak et al. 2015; Pinno and Gupta 2018). There is also evidence that CWD can increase plant cover and create microsites (Brown and Naeth 2013), improve soil microbial communities (Kwak et al. 2015; Kwak et al. 2016) and improve soil chemical and physical properties (Brown and Naeth 2013, Kwak et al. 2015).

CWD or other wood alternative materials (e.g., wood chips at a low application rate) can also be used as an alternative to grass seeding/cover, as previous planting trials at the Facility indicated that extensive grass cover has impeded tree and shrub establishment (Sanborn et al. 2004; Breton et al. 2016; Klimek et al. 2020). Wood materials can reduce root competition from

competing grass cover and can reduce damage to seedling by indirect wildlife browsing on grass cover. Wood chips applications have also been shown to be an effective amendment for areas of steep slope conditions because they stay in place (Breton et al. 2016).

6.2.4 *Soil and Invasive Species: Research Requirement (i)*

Description: In addition to Section 6.1.1, which outlines additional research required for a soil replacement plan to achieve land capability and end land use objects, a specific request by the ministry was provided to ensure invasive plants identified on stockpiled biosolids were properly managed prior to moving materials.

Overview of Past Work at Mount Polley: N/A. Research involving treatment of invasive plants has not yet been completed at Mt Polley.

Recommendation from Past Work at Mount Polley: N/A

Application from the RCP: The Invasive Plant Management Plan for the Facility, Appendix V of the RCP, outlines a control program to prevent the introduction and spread of invasive plants and manage invasive plants found at the site.

Similar Research Outside of Mount Polley: Development of successful treatments for invasive plants has previously been established through scientific investigation of plant response to various treatment regimes, including those invasive species that occur within the Cariboo Chilcotin region (Inada 1973; Horowitz 1980; Horowitz et al. 1983). Recommended treatment options for species that occur within the Cariboo Chilcotin region, which may occur at the Facility, are listed in Table 6-21. These species are managed by the Chilcotin Invasive Plant Committee.

Table 6-20. Invasive Species Profiles and Recommended Treatment Options within the Cariboo-Chilcotin Invasive Plant Committee Management Area from 2020.

Species	Type	Recommended Treatment Option						
		Deadheading, hand pulling	Herbicide	Mowing	Bio-control	Digging	Cutting	Covering
Baby's Breath	Perennial	X	X					
Black Henbane	Annual or biennial	X	X					
Blueweed	Biennial		X			X		
Caraway	Biennial	X	X

Note: Other treatment options exist should other jurisdictions prefer alternative treatments. Check with the local government to confirm correct treatment for the plant and area of concern.

6.2.5 *Reclamation Prescription for the TSF: Research Requirement (j)*

Description: As per requirement j, MPMC shall conduct research to inform reclamation prescriptions for the TSF, such that it will meet end land use and land capability objectives. The TSF areas include the tailings surface, the roadways, the embankments, spillway, dam wall, etc.

Overview of Past Work at Mount Polley: An abundance of previous research has been conducted at the Facility pertaining to partial reclamation of the tailings beach, the use of tailings as a soil amendment, and the rehabilitation of Hazeltine Creek following the 2014 breach of the TSF and subsequent tailings spill.

At the Facility, site staff noted growth of volunteer grass species on the site tailings beach areas in the spring and summer months of 2002. Growth was attributed to the combination of nutrients present in the tailings surface from manure of cattle that grazed in the area, and native seeds blown onto the beach from the surrounding areas.

During a care and maintenance period from 2002 to 2004, a typical grass seed mixture was applied across 8 ha of the northeast TSF beach area (Section 4.3.2.4 of the RCP). Although a formal vegetation assessment was not completed, photos of revegetation success were taken. Photo documentation revealed some success of revegetation on the tailings beach; however, growth was limited by the fine textured tailings that remain saturated for long periods.

Tree plot trials within the East RDS, established in 1998, 1999, and 2000, showed that additions of tailings as an amendment to mine soils can be beneficial for tree growth and that rehabilitation efforts on the TSF (using the reverse approach) could be successful (Appendix K of the RCP; Section 7.1.1.2).

Following the TSF embankment breach, rehabilitation of terrestrial ecosystems impacted along the Hazeltine Creek channel was initiated and is actively underway (McMahen and Hughes 2016). This area is being remediated as per the Remediation Plan (Golder, 2019) and is outside the scope of this Plan, reclamation monitoring results and field observations from this area may provide specific recommendations for reclamation of the tailings in the TSF at closure, as well as information on success of revegetation efforts.

MPMC has partnered with Thompson Rivers University and the University of British Columbia on two research projects regarding the impacts of tailings downstream of the TSF, along Hazeltine Creek. These projects use genomics to assess the role of wetlands and riparian soils in tailings reclamation. Metagenomics will assess baseline microbial soil communities in reference and impacted riparian areas following the TSF embankment breach, which will allow monitoring of these communities over time. In addition, soil microbial communities and soil chemistry will be assessed in established bioaugmentation plots, which incorporate combinations of straw, wood chips, and a sulphate reducing microbial inoculum, as well as different mixing treatments. Results from this project will provide insight into potential techniques for reclamation of the tailings in the TSF at closure.

MPMC is also working with the University of British Columbia to assess reclamation techniques for rehabilitating soil biological communities, with the goal of improving vegetation establishment.

Native soil transfers as a microbial inoculum and method of improving soil physical and chemical properties have been tested in field and greenhouse trials. Potential additive benefits of site preparation and spatial forest legacies are also being evaluated in the field. Trials are being carried out for tailings and glacial till (subsoil) substrates, with applicability to future reclamation of the TSF and till-capped waste dumps.

Some preliminary observations of seedling establishment and survival during annual vegetation monitoring within reclaimed areas of Hazeltine Creek suggests that where soil and tailings have been thoroughly mixed (admixture), seedlings survival is moderate to high; however, where seedlings have been planted on surfaces that contain only tailings, signs of low seedling vigour, and increased seedling mortality, are evident (per comms. Allan Carson, DWB).

Recommendations from Past Work at Mount Polley: Recommendations from the East RDS tree trial plots, and preliminary observations of seedling survival within tailings impact soils in Hazeltine Creek suggest testing the design of admixing mine soils and tailings to create a suitable medium for plant growth (Section 7.1.1.2; See Appendix K of the RCP).

Application from the RCP: The TSF will remain a permeant structure which has been designed to meet applicable long-term geotechnical stability. At closure, the TSF configuration will include a small permanent pond and wetland area, and a spillway for water level control of the pond. The RCP outlines general reclamation options including creation of a mosaic of forested and wetland habitats (Section 6.10 of the RCP). The RCP suggests that a patchy mosaic of deciduous trees and shrubs be planted in upland portions of the tailings beaches, and deciduous, including black cottonwood, willow, and Sitka alder be planted in wetter low-lying areas.

Similar Research Outside of Mount Polley: Copper mines, such as Mt. Polley, often produce tailings that contain high concentrations of sulphides (Carson et al. 2014). Desulphurisation, or treatments of tailings to remove excessive sulphides, are often performed to create materials that are suitable for use as soil amendments; these materials can be used when soil supply is limited, or as a soil cap to cover sulphidic tailings surfaces (Sjoberg et al. 2003; Carson et al. 2014).

Plant establishment and growth can be limited by nutrient availability in mine tailings, specifically plant available forms of nitrogen (Hossner and Hons 1992; Carson et al. 2014). However, additions of soil amendments, such as fertilizers or biosolids which provide sources of deficient nutrients, have been shown to improve vegetation establishment and growth on tailings surfaces (Hossner and Hons 1992; Gardner et al. 2012).

6.2.6 *Soil Decompaction: Research Requirement (k)*

Description: As per requirement k, MPMC is required to assess decompaction methodologies to ensure that the severity of compaction that exists prior to commencing reclamation activities is effectively addressed in a manner intended to achieve end land use objectives and erosion control.

Overview of Past Work at Mount Polley: Much of the soil application done by MPMC on the mine site and in the breach affected areas is applied with a "rough and loose" target. This has been accomplished using techniques including mechanical mounding, ripping and windrowing. Surficial roughening at the site also has the added benefit of reducing soil erosion potential. Formal research involving compaction assessments has not yet been completed at the Facility.

Recommendations from Past Work at Mount Polley: N/A, research involving compaction assessments has not yet been completed at the Facility.

Application from the RCP: The Soil Management Plan for the Facility, Appendix U of the RCP, outlines several practices that aim to reduce compaction during soil handling and management. Some of these measures for soil salvaging and application include minimizing equipment use on soils (i.e., working systematically and planning access routes to reduce number of passes over soils), roughing the surfaces (i.e., ripping trenching, mounding, mechanical screefing (Appendix C within Appendix U of the RCP)), handling soil in a loose friable state (i.e., not handling soil under exceptionally wet or dry conditions that may degrade its physical structure), ceasing soil handling during high wind events, and scheduling activities to avoid wet and dry months.

Similar Research Outside of Mount Polley: Ample literature exists that shows soil compaction has a negative effect on vegetation growth and survival. Measurements of vegetation success is a quantitative method to determine effectiveness of soil decompaction (Josiah 1986; BC Ministry of Agriculture, 1990; Bockstette et al. 2017; Angel et al. 2018; BC Ministry of Energy, Mines & Petroleum Resources, 2019). It is imperative to decompact soils prior to planting to improve soil physical properties and improve vegetation success. Methods of site preparation, or decompaction, have been successful with a bulldozer fitted with a winged subsoiler or straight ripper shank, or an excavator (Natural Resources Canada, 2016; Table 6-22). A winged subsoiler is a class of tillage equipment that is specifically designed for decompaction without inverting the topsoil that can be used on a wide range of soil types (Natural Resources Canada 2016). An excavator can decompact soils either through a standard mounding technique (i.e., digging a hole and placing soil adjacent) or a rough and loose mounding technique (i.e., digging a hole and placing soil within and adjacent to the hole) (Natural Resources Canada, 2016).

Table 6-21. Soil Decompaction Techniques and Appropriate Site Conditions for Use (Natural Resources Canada, 2019).

Technique	Equipment	Moisture	Clay content	Seasonality	Pattern
Winged subsoiler	Dozer or excavator attachment	Med-very dry	All	Part frozen to unfrozen	Creates straight and overlapping passes (>60 cm deep). Technique does not invert topsoil. Do not use on wet sites.
Straight ripper shank	Dozer attachment	Dry	Low	Frozen to unfrozen	Overlap passes and cross-rip on highly compact soils.
Standard mounding	Excavator	Dry-very wet	All	Frozen to unfrozen	Soil is placed adjacent to excavated hole. Plant on microsite mounds.

Rough and loose mounding	Excavator	Dry-very wet	All	Frozen to unfrozen	Soil is placed adjacent to and within excavate hole.

Incorporations of CWD into compacted soils has also been shown to aid in erosion control, enhance diversity, and function in long term storage of organic matter (Pinno and Gupta 2018). There is also evidence that CWD can increase plant cover, increase microsite diversity (Brown and Naeth 2013), improve soil microbial communities (Kwak et al. 2015a; Kwak et al. 2016) and improve soil chemical and physical properties (Brown and Naeth 2013, Kwak et al. 2015b).

Soil surface sealing, or surface compaction, can occur with the kinetic energy of raindrops that destroys soil aggregates through concomitant compaction, stalking, chemical and physical dispersion and soil particle movement (Armenise et al. 2018). Surface soil sealing is a result of the infilling of fine soil material which can significantly reduce porosity and water infiltration, which in turn, limits vegetation growth (Armenise et al. 2018). Soil with higher concentrations slit and very fine sand particles, low organic matter content and poor structure will have higher incidences of soil sealing, poor drainage, puddling, and higher rates of erosion (Wall et al. 2002; Armenise et al. 2018; Table 6-23). If surface sealing occurs, this can create areas that are inhospitable for seed establishment.

Table 6-22. Variables that Affect the Erodibility of a Soil (Wall et al. 2002).

Variable	**Effect on Erosion**
Soil Texture	Erosion increases with silt and very fine sand particles.
Organic Matter Content	Soils with high organic matter content are more erosion resistant, as they hold more water.
Structure	Soils that do not break down easily are more erosion resistant
Permeability	Soils with better infiltration will have less runoff and less erosion (e.g., medium to coarse sand).
Seasonality	Soils most susceptible in the spring, especially during thaw conditions (i.e., fully saturated soils over frozen soils with low permeability). Soils less erodible in the fall during typically drier conditions.

Soil decompaction success is often measured by soil physical and chemical characteristics and vegetation success (Josiah 1986). Soil characteristics can be observational from test pits or measured in bulk density, volumetric water content, total porosity, available water capacity and penetrometer measurements (Josiah 1986; Angel et al. 2018). Vegetation success can be measured in survival and mortality rates, total plant height, percent cover, and basal stem diameter (Josiah 1986).

6.2.7 *Fertilizer and Biosolids Application: Research Requirement (o)*

Description: As per requirement o, MPMC is required to undertake study programs to evaluate the cumulative effects of fertilization on total nutrient loading and impacts to receiving waters.

Overview of Past Work at Mount Polley: Fertilizer, 18-19-18 NPK, has been applied at the Facility in the South Triangle (NBD), WHR, the East RDS Tree Plot, and NEZ Dump. However,

fertilizer use has been discontinued based on sustainability concerns. Biosolids from Metro-Vancouver, have been applied at the Facility in the NBD (Metro Vancouver Research Parcels 1-6 and 7-12; Phase 1 and 2; Parcel 1-10), the East RDS Tree Plots, and the NEZ Dump. Application of biosolids was, and must be, conducted under the supervision of a qualified professional to oversee appropriate management practices.

As per the 2019 CEMP, the Facility maintains eight hydrology monitoring stations, as required by the M-200 permit, which monitor surface and ground water chemistry parameters. Results of these analyses are submitted to the Director (ENV Statutory Decision Maker) every month that discharge occurs. Water sample parameters that are required to determine impacts of fertilizers/biosolids on receiving waters include temperature, pH, nitrate, nitrite, and ammonia (MPMC Environmental Department 2019). The CEMP does not include a schedule for monitoring receiving waters prior to, or following, the application of fertilizer or biosolids to an area.

Recommendations from Past Work at Mount Polley: N/A, research involving impacts to receiving waters from fertilizer/biosolids has not yet been completed at Mt Polley.

Application from the RCP: The 2019 RCP states that water quality monitoring is required to determine the long-term chemical stability of mine contact water and to verify model predictability that can be used for water management planning.

Water treatment summaries are found in the RCP, including Appendix G (RCP Water Modelling Report) and Appendix H (Draft Water Treatment Update to the Reclamation and Closure Plan) which outline water management strategies related to treatment and monitoring of contact water at the Facility.

Similar Research Outside of Mount Polley: Fertilizer provides inputs of essential nutrients (e.g., nitrogen, phosphorous, and potassium) that can be effective at promoting vegetation growth. Retention of nitrogen following fertilization is largely related to the nutrient uptake capacity of the present vegetation (Winkler 1986) and the top organic soil layers (Flint et al. 2008). As such, reduced vegetation cover will lead to increases in soil moisture and temperature, increased microbial activity and decreased nitrogen uptake (Winkler 1986).

Indirect fertilization inputs to watercourses, in the forms of nitrite, nitrate and ammonia, can be toxic to freshwater fish and other aquatic animals such as invertebrates and amphibians (Lewis and Morris 1986; Jensen 2003; Camargo et al. 2005). Toxicity occurs through active transport of nitrite, nitrate, and ammonia across gills which can cause mortality from compromised blood oxygen transport; ammonia can also impair growth, stamina, swimming ability and metabolism (Lewis and Morris 1986; Jensen 2003; Camargo et al. 2005). Nitrogen based compounds are regulated under the BC WQG that provides short-term maximum (i.e., 96 hrs) and long term-term averages (i.e., 5 samples over 30 days) for human health (i.e., drinking water) and freshwater aquatic life (Table 6-24).

Table 6-23. Ministry of Environment Guidelines for Nitrite, Nitrate and Ammonia, Found in Fertilizer, for the Protection of Human Health and Freshwater Aquatic Life (Ministry of Environment 2019).

Parameter	**Maximum values for Human Health (i.e., drinking water)**	**Maximum Values for Freshwater Aquatic Life (mg/L)**		
Nitrite	1.0 mg/L	**Chloride**	**Short Term**	**Long Term**
		<2	0.06	0.02
		2-4	0.12	0.04
		4-6	0.18	0.06
		6-8	0.24	0.08
		8-10	0.30	0.10
		>10	0.60	0.20
Nitrate	10.0 mg/L	-	**Short Term**	**Long Term**
		-	32.8	3.0
Ammonia	No current guidelines	**pH @ 20°C**	**Short Term**	**Long Term**
		7.0	19.2-23.2	1.22-2.08
		9.0	0.752-0.703	0.102-0.135

Note: When nitrate and nitrite are present, total nitrate-nitrogen plus nitrite-nitrogen should not exceed the nitrate BC WQG (Ministry of Environment, 2019). Short Term is Defined by samples collected in the first 96 hrs following a treatment; Long Term is Defined as 5 Samples collected over 30 Days following treatment.

Previous research has indicated that cold weather conditions reduce the likelihood of nitrite release into streams (Anderson 2002) and that nitrate accumulation is rare (Smith et al. 1997). Most studies have indicated that values of nitrate accumulation are well below the maximum threshold, under the water quality guidelines, and slightly increase during the first major storm or snowmelt (Eremko, 1987, 1990).

Biosolids applications have the potential to release organic and metal contaminants to surface and groundwater (Stehouwer et al. 2006); rates of release will be dependent on contaminates present (and their concentrations), microbial decomposition and vitalization, and uptake of plants (Haynes et al. 2009; LRCS 2016). Some of these contaminants can bind to soil, dissolved aluminum, ferric oxides or organic matter (McBride et al. 1997). Potential for ground and surface water contamination is highest immediately after land application, with high concentrations of soluble organic matter levels, and during significant rainfall events (Haynes et al. 2009). Soil permeability, soil depth, slope and aspect can also affect soil contamination of water. Even at low levels, these organic contaminates in biosolids can pose a risk to aquatic organisms (Arnold et al. 2014; Jones et al. 2004; Wu et al. 2015), although very limited field-based research has been completed to date. However, previous research has indicated low metal leaching following modest biosolids application (Gottschall et al. 2012; Hanief et al. 2015; Joshua et al. 1998; Rostago and Sosebee 2001).

7 PROJECTED 5-YEAR RECLAMATION RESEARCH PLAN

The projected 5-year plan for reclamation research at the Facility will include the challenges identified from progressive reclamation works (Section 5.1.2) and outstanding reclamation research requirements (Section 6.2) and are summarized in Table 7-1. Detailed descriptions of proposed projects are provided in Sections 7.1 to 7.8. While these projects are designed to fill in gaps in existing research, they are currently only at the proposal stages and not all of the final design work has been completed. As such, some of the proposed projects may be changed or eliminated based on the outcomes of the final design work. An initiation date for the projected 5-year reclamation research plan has not yet been determined but a tentative schedule for the research projects is provided in Section 7.9.

Table 7-1. Summary of Ongoing and Future Reclamation Research at the Facility and their Relevance to Permit Conditions.

Permit Condition	Permit Condition Status (Incomplete, Partially Completed or Completed)	Ongoing or Future	Projects	Description	Location	End Land Use	Informs progressive Reclamation
a	Incomplete	N/A	N/A	N/A	N/A	N/A	N/A

Abbreviations and Acronyms: RDS: Rock Disposal Site; RCP: Mine Reclamation and Closure Plan; NBD: North Bell Dump; TSF: Tailings Storage Facility; NEZ: North East Zone, WHR: Waste Haul Road.

7.1 WATER MANAGEMENT STRATEGIES AND POST-CLOSURE MAINTENANCE AND CONTINGENCY REQUIREMENTS: RESEARCH REQUIREMENT (C)

Description: The Permittee shall conduct research to inform closure water management strategies and identify post-closure maintenance and contingency requirements.

Rationale: Ensure that water management outcomes align with the objectives detailed in the Water Management Plan, and conform to BC WQG.

Approach: Passive and semi-passive wastewater treatment development is ongoing. Several water treatment systems are being investigated at the Facility and are in the pilot testing stage or under current development (See Section 6.1.4 for details). The following recommendations are in reference to all water management at the Facility including current and proposed treatment systems.

Step 1: Continue to assess and update mine hydrology models (if deemed necessary) to establish a water balance and a discharge inventory. Continue utilizing the two existing meteorological stations on the mine site, in conjunction with the existing network of gauges, weirs, and wells in use. Assessments and modelling should focus on understanding quantity, location, and flow of water on site, to inform discharge and treatment options. Long-term data sets are of greater use to adaptive management than short-term ones, so whenever possible, continue with established regimens to generate hydrological data that reflects the changes from operation, to care and maintenance, to closure, and reclamation. Particular attention should be paid to peak flows during freshet, which have the potential to overwhelm water management systems.

Continue to assess on-site mine contact water bodies (i.e., TSF South Toe Drain, pit lakes, sumps, ditches) and identify substances deleterious to human or aquatic life. Research at the Facility has already identified potentially deleterious substances (e.g., trace metals and metalloids (such as copper, selenium, molybdenum), soluble nutrients/ions (e.g., such as phosphate, nitrate) and body-specific contaminants of concern and contaminants of potential concern (Golder 2017; Golder 2020; Appendix H of the RCP); this data should be collated.

Continue pilot-scale studies at the Facility for water treatment systems to fruition to determine BAT.

Step 2: Develop a maintenance sampling schedule for passive and semi-passive treatments from historical sampling results, under the discretion of a qualified professional. Five years of data from initiation of a water treatment system should provide the systems that are the BAT for post-closure maintenance.

Step 3: Develop a contingency plan for water management in the event that the BAT water treatment system under-perform or if unprecedented changes occur to the Facility's water balance, in the post-closure environment. Potential trigger scenarios and subsequent actions are summarized in Section 6.1.4.

Step 4: Monitor and record maintenance efforts for water management infrastructure. This information can be used to develop closure and post-closure maintenance requirements and cost models.

Location: NW Sump, 9K Sump, South Toe Drain, Bootjack Lake, Edney Creek, pit lakes.

Timing: Timing of implementation and monitoring of water treatment systems will be dependent on the phase of development for each water treatment system. Monitoring should continue for active water treatment systems and for pilot studies until sufficient data exists to determine whether or not the system can be incorporated into the Facility's long-term water management plan as a BAT.

Duration: Year 1-5: Annual monitoring to inform post-closure plans.

General Cost (e.g., low cost ($10,000-$30,000), high cost ($100,000 or more)): High. It is recommended to collect and analyze 12-20 water samples per month over the entire five-year period. However, as sampling can be incorporated into existing monitoring programs costs may not increase the gross budget for water quality monitoring.

Future Application as a Part of RCP: Recommendations from this five year plan would be relevant to the RCP, as sampling techniques and locations could be kept continuous post-closure, and passive treatment is planned to continue in perpetuity.

7.2 SPECIES-SPECIFIC PLANTING TRIALS: RESEARCH REQUIREMENT (D)

Description: Planting trials to test specific species or compositions for specific site conditions.

Rational: Establishing revegetation trials within areas lacking revegetation trials will inform future revegetation prescriptions on a site-specific basis and meet end land use objectives, as defined in Table 5-1 of the RCP.

Approach: Step 1: All recommendations from existing trials should be applied to new trial areas, where practical (Section 6.1.1). For all areas where trials have not yet been established, determine appropriate locations for test trials.

Step 2: Establish planting trials within each area that includes the appropriate revegetation prescriptions based on the site-specific reclamation planting prescriptions (Table 6-15; Table 6-16), the site-specific grass/forb mixture (Table 6-17), and culturally important species (Table 6-16). In addition, detailed progressive reclamation prescriptions should be considered from the RCP (Table 4-2). Appropriate soil amendments should be added to ensure successful vegetation establishment (Figure 6-3 in Section 6.2.4). It is recommended to reference the latest version of site-series information for the Cariboo region from "A Field Guide to Forest Site Identification and Interpretation for the Cariboo Forest Region" (Steen and Coupe 1997).

Step 3: Monitor vegetation success on a consistent basis, as completed within historical trial areas. Metal uptake in vegetation and soils should also be monitored within newly established test plots.

Step 4: Use results gathered from monitoring (i.e., species-specific success) to refine vegetation selection in future reclamation areas.

Step 5: Continue consultation with FN for knowledge exchange.

Location: Location of new revegetation trials will be based on areas that currently lack trials (e.g., the TSF). Monitoring will be conducted on established trial areas.

Timing: Year 1: Establish new trial areas for revegetation, applying vegetation prescriptions based on site-series and land use objectives, including culturally important species.

Year 2-4: Vegetation monitoring should be completed annually at similar times of the year during the growing season to provide data that meets the assumptions for statistical analyses.

Duration: Monitoring of revegetation success should be completed annually for at least five years post-planting. Ideally vegetation monitoring should continue until the natural successional trajectory that aims to satisfy the end land use objectives has clearly been established.

General Cost (e.g., low cost ($10,000-$30,000), high cost ($100,000 or more)): Low, generally pertains to continued monitoring of established research trials.

Future Application as a Part of RCP: Results from the revegetation prescription trials should provide strong evidence to inform future species selection, including culturally important species, for site-specific areas at the Facility.

7.3 Methods for Reducing High Competing Grass Cover: Research Requirement (G)

Description: Use of landscape fabric when planting tree and shrub seedlings in highly competitive grass/forb cover.

Rational: Using landscape fabric to suppress competitive grass/forb cover, in combination with planting native trees and shrubs, will contribute to meeting the end land use objectives, as defined in Table 5-1 of the RCP.

Approach: Step 1: Determine areas that have highly competitive and/or successional stagnant grass cover throughout the Facility for selection of cover treatment sampling sites. Areas of highly competitive cover can be generally defined as those with ≥ 40 % grass cover or areas where grass cover appears to be sod forming and is preventing natural of native seed from natural dispersal vectors (e.g., wind, animals). Sites selected for cover treatments should consider the area required for cover as materials for treatment are costly.

Step 2: Establish cover treatments at a control site and sampling sites in areas with highly competitive grass cover. At sampling sites, begin by removing the grass cover and then installing landscape over the exposed soil. Alternative, to test a reduced effort approach, one additional treatment to consider would be testing the installation of landscape fabric directly over grass cover (no grass removal).

Step 3: Cut small holes in the landscape fabric and plant seedlings or live stakes from species that are appropriate for the sample area site series at evenly spaced intervals. If planted during hot and dry conditions, supplement seedlings and live stakes with water to reduce mortality rates.

Step 4: Vegetation monitoring should be conducted annually to assess the survival and growth rates of seedlings and/or live stakes. Monitoring of control sites and treatment sites can be compared to determine success of cover treatments.

Location: Use of landscape fabric should only be used in small areas when doing island restoration, such as heavily grassed areas that are successionally stagnant. A site assessment will be required to determine locations.

Timing: Year 1: Establish cover treatments and apply appropriate vegetation prescriptions based on site-series and land use objectives.

Year 2-4: Monitor success of cover treatments annually, during the growing season, at similar times of the year to meet assumptions for statistical analyses.

Duration: Monitoring the success of the cover treatment should be completed annually for at least five years post-planting to ensure target vegetation is well established. Re-planting and removal of non-target vegetation may be required in areas with extensive non-target growth. Ideally vegetation monitoring should continue until the criteria for vegetation monitoring (see Section 8.1) are met.

General Cost (e.g., low cost ($10,000-$30,000), high cost ($100,000 or more)): Cost will dependent on the area size of cover treatment.

Future Application as a part of RCP: Results from cover treatments will determine success of target species with cover treatments, effectiveness of cover treatments at reducing non-target vegetation, and determine if location has an effect on cover treatments.

7.4 SOIL REPLACEMENT PLAN: RESEARCH REQUIREMENT (I)

Description: Conduct research to inform the development of a soil replacement plan.

Rational: Performing research for the soil replacement will inform land use and land capability objectives, as defined in Table 5-1 of the RCP.

Approach: Step 1: All recommendations for existing sites at the Facility should be applied to test plots, where practical (See Section 6.2.4). For areas where test plots have not yet been established (i.e., site series 05, non-forested sites, and the TSF), determine appropriate locations for test plots.

Step 2: Create test plots within site series 05, non-forests sites, and the TSF using a variety of the best soil prescriptions using information from previous research at the Facility and recommendations from the 2018 RCP (Figure 5-3 from the 2018 RCP “Proposed Reclamation Soil Profiles; Table 7-2).

Table 7-2. Soil Replacement Recommendations based on Previous Research and the 2018 RCP.

Previous Research Recommendations		**2018 RCP Recommendations**
NBD	• Use a combination of glacial till and biosolids for soil amendments • Ensure biosolids are mixed thoroughly to reduce harm to seedlings	East RDS Tree plots	• Use a minimum of 40 cm of soil • Use light additions of biosolids (50-75 dT/ha) and seed (5-10 kg) • Seed should be low growing and non-competing of grass and forbs • Add CWB at 20-40 m^3/ha • Do not plant trees directly into waste rock • Use 15-30 cm of soil amendments (i.e., biosolids, overburden or tailings) over waste rock	
NEZ	• Apply low rates of fertilizer, biosolids, and seed • Add CWD (to create microsites)	

Abbreviations and Acronyms: RCP: Mine Reclamation and Closure Plan; NBD: North Bell Dump; RDS: Rock Disposal Site; NEZ: North East Zone; CWD: Coarse Woody Debris.

Step 3: Test plots should be seeded and planted with species outlined in Table 4-2 “Detailed Progressive Reclamation Prescriptions”. This table outlines grass seed mixes, shrub and deciduous species, and conifer tree prescriptions for specific areas around the Facility based on the end land use objectives.

Step 4: Success of soil replacement prescriptions can be determined through vegetation monitoring. Monitoring should be conducted on a consistent basis, as completed within historical test plots at the Facility through vegetation monitoring and soil analysis. Metal uptake in vegetation and soils should also be monitored within newly established test plots.

Qualitative and Quantitative Measures: Success of soil prescriptions can be assessed with soil and vegetation measurements through vegetation monitoring. Qualitative data may include describing soil and vegetation conditions. Quantitative may include vegetation measurements (i.e., percent cover, total tree and shrub height, seedling vigor, grass cover vigor, and mortality rates) and heavy metal analysis (See Section 6.1.3 for metals to analyze).

Location: In addition to established research plots, test plots should be established within site series 05, non-forested areas and the TSF.

Timing: Year 1: Establish new test plots including incorporations of soil amendments, mixing of soils, and vegetation planting during non-frozen conditions. Vegetation should be selected based on site-series and end land use objectives.

Year 2-4: Complete annual vegetation monitoring at similar times of the year during the growing season to provide data that meets the assumptions for statistical analyses. In addition, complete annual metal uptake analysis of soil and vegetation.

Duration: Frequent and successional monitoring of vegetation will determine the effectiveness of the soil replacement prescriptions. Longer periods of vegetation monitoring will provide additional evidence of the success of soil prescriptions. Recommendations from the 2018 RCP suggest monitoring vegetation success at the Facility for up to 50 years post-closure.

General Cost (e.g., low cost ($10,000-$30,000), high cost ($100,000 or more)): Cost should be generally low as most test plots have already been established. Costs will mainly be attributed to monitoring vegetation success.

Future Application as a part of RCP: Results from the soil replacement research should provide strong support for selecting the appropriate soil cover for various locations at the Facility.

7.5 MANAGEMENT FOR INVASIVE PLANTS: RESEARCH REQUIREMENT (I)

Description: Soils contaminated with invasive plants at the Facility require management during stockpiling and prior to use.

Rational: Management of invasive plants falls within requirement i, as part of the soil replacement plan, to ensure reclaimed areas are designed to achieve land capability and end land use objectives (i.e., free of invasives).

Approach: Step 1: Conduct a survey to inventory the invasive plants present at the Facility. Prior to field assessments, a desktop review could be conducted to pre-determine areas of high potential for invasive plants, such as high traffic areas, road right-of-ways, disturbed areas, and areas with poor vegetation cover. Investigation will be required to determine the invasive plant management strategies and priority ranking by the Cariboo-Chilcotin Invasive Plant Committee to inform management and treatment at the Facility.

Following the desktop review, field surveys should be completed. As per the recommendations of the *Invasive Alien Plants Pest Management Plan (IAPP) for Provincial Crown Lands in Central and Northern British Columbia* (MFLNRO 2015) information recorded during surveys included the date, species, UTM (Universal Transverse Mercator) coordinates, location description, estimation of distribution and density, distance to sensitive areas, soil texture and photos. It is recommended that invasive plant survey and inventory information be documented using the *IAPP Site & Invasive Plant Survey Record* and submitted into IAPP to add to the regional inventory.

Step 2: *Treatments*: Appropriate authorities will be consulted to determine control and monitoring measures of invasive plant species found at the Facility. If control of an invasive plant is required, treatment options and timing windows will be established that include consideration of the invasive plant species, site conditions and infestation size. Treatment of invasive plants may include mechanical or chemical control methods.

Prevention

Throughout closure and reclamation activities at the Facility, preventing the introduction of invasive plants, and quickly responding to the initial spread will be the most effective and cost-efficient method to managing invasive plants. Best managed practices outlined in Appendix V of the RCP should be followed including minimizing disturbance, seeding disturbed and/or stockpiled soil with quickly establishing seed mix, limiting vehicle and foot access through areas of infestations, and training personnel on identification and prevention methods.

Mechanical

Mechanical treatment methods can be used where invasive plants have low distribution/density because treatment is simple, effective, and eliminates the potential negative effects of chemical treatment. Mechanical treatment methods are often used in specific locations of an invasive plant infestation where herbicide is not permitted or practical; for example, near riparian habitat or other environmentally sensitive features. Types of mechanical treatment methods include hand pulling, digging/excavating, cutting, mowing, mulching, controlled burning, tilling, dead-heading, and covering/smothering. Mechanical treatments can be costly and labour intensive due to repeated monitoring requirements.

Mechanical treatment options can be limited by safety issues (i.e., burning can pose risk to workers and environment), timing windows (i.e., mowing must occur prior to seed dispersal), cost (i.e., mechanical treatment may be labour intensive; follow-up treatments may be required throughout the growing season and can be required for a consecutive 3-5 years to ensure effective treatment), and effectiveness (i.e., mowing is not effective on smaller invasive plant species; digging/dead-heading/mowing is not effective on species that grow from adventitious root buds or rhizomes.

If mechanical treatment does occur, appropriate disposal of all plant material and propagules is required. This includes placing invasive plants into dark plastic bags and bringing bags to a landfill that has a designated area for invasive plant species. Invasive plant species must not be composted. It is recommended that mechanical treatment of invasive plants is documented using the *Invasive Plant Chemical and Mechanical Treatment Record* and submitted into the IAPP to add to the regional inventory (BC MOFR 2010).

Chemical

Chemical treatment includes fertilizers and herbicides. Fertilizers can be used to increase the competitive ability of native plant species and out-compete invasive plants. Herbicides, although effective, should be used as a last resort and may not be permitted for use at the Facility (i.e., FN input).

If herbicide use is required, the Facility must obtain a certified applicator that is licensed for chemical applications. Selection and application of approved herbicide will be performed in compliance with BC's *Integrated Pest Management Act* (Province British Columbia 2003). When possible, chemical spot-treatment will be used rather than broadcast spraying to reduce negative impacts to the surrounding environment. It is recommended that application information be documented using the BC Ministry of Forests, Lands and Natural Resource Operations *Invasive*

Plant Chemical and Mechanical Treatment Record and be submitted into IAPP (MOFR 2010). In addition, herbicides will not be used under the following conditions:

- Invasive plants are within a Pesticide Free Zone (PFZ), such as near a water source or well,
- Invasive plants are within coarse textured soils that would reduce effectiveness of herbicide,
- Invasive plant treatment is occurring under inappropriate weather conditions (e.g., persistent precipitation, wind >8 km/hr, temperature >28 °C,
- Residual herbicides may not be used within 10 m of water source and 30 m from well,
- Non-residual herbicides may not be used within 1 m of water source or well,
- Residual herbicides may not be used within a gravel pit,
- Residual herbicides with the active ingredient 24-D may not be used on areas that fall within Ministry of Transportation and Infrastructure (MOTI) jurisdiction.

Step 3: *Monitor*: Monitoring should be conducted on a consistent basis to determine effectiveness of invasive species treatments. Treatment success will be determined through visual assessments including recording occurrences of new propagules and status of any plant material that had been previously mechanically or chemically treated (e.g., status of plants that were dead-headed or sprayed with herbicide).

Location: Treatment of invasive plants will be based on locations of infestations.

Timing: Survey and treatments of invasive plants should be completed prior to reclamation activities, including, but not limited to, the transport of contaminated soil, and during non-frozen conditions.

Year 1: Survey for invasive plants and record areas of infestation. If possible, treat infestations prior to seeding and during the current year.

Year 2-4: Monitor treatment areas from Year 1. Conduct annual surveys and subsequent treatments, as required.

Duration: Survey, treatment, and monitoring for invasive plants should be completed within the same year. Surveys and follow-up treatments should be completed for invasive species prior to production of seeds, typically within late spring/early summer. Follow-up treatment methods should be implemented for invasive species identified prior to plants going to seed. Monitoring of invasive species should occur no sooner than two weeks post-treatment.

General Cost (e.g., low cost ($10,000-$30,000), high cost ($100,000 or more)): General cost will be dependent on species identified (including priority), infestation area size, density, and distribution as well as effectiveness of control methods.

Future Application as a part of RCP: Treatment and management strategies have been established for invasive species in the Cariboo-Chilcotin region which should be followed during reclamation activities at the Facility. Results from the survey of invasive plants at the Facility will identify areas and potential activities of concern that may require management during ongoing reclamation. In addition, treatment methods and their effectiveness will be documented at the Facility which can be used to manage any future establishment of invasive species.

7.6 RECLAMATION PRESCRIPTION FOR THE TSF: RESEARCH REQUIREMENT (J)

Description: Conduct research to inform reclamation prescriptions for the TSF.

Rational: Research surrounding the TSF will inform and ensure that reclamation prescriptions applied will successfully meet end land use and land capability objectives.

Approach: Research trials have not yet been established in any area surrounding or within the TSF. Trials should be established near and within the TSF that include water management strategies and post-closure requirements, soil amendment additions, metal uptake analysis, and revegetation prescriptions.

Step 1: *Tailings Properties:* Physical and chemical properties of the tailings will be evaluated to identify any adverse substrate characteristics prior to initiating revegetation trials (Hossner and Hons, 1992).

Step 2: *Soil Amendment Additions*: Test plots should include a control and treatment plots, on the TSF beach, stockpiled tailings, and surrounding areas. Treatment plots will include the proposed reclamation soil profiles suggested within the RCP for use on the TSF and potentially test the use of hydraulically applied biotic soil amendment (BSM; e.g., Profile ProGanics Biotic Soil Media) to the tailings surface. Proposed soil profiles from the RCP include 1) a 5 cm biosolids application to the surface (admixing) with 5 cm of glacial till, and 2) a 5 cm soil application (admixing) with 5 cm of till. In addition, to facilitate planting of trees and shrubs on the upper portions of the beach, a soil profile of 10cm of soil admixed with 10cm of biosoilds and placed ontop of 5cm of till, could be tested. Treatments could also potentially include the admixing of biosolids and soil directly into the surface of the tailings.

Step 3: *Revegetation Prescriptions*: Revegetate all test plots with appropriate revegetation prescriptions based on the site-specific reclamation planting prescriptions (Table 6-15; Table 6-16) and the site-specific grass/forb mixture (Table 6-17).

Step 4: *Monitoring*: Monitor vegetation establishment and growth in all test plots on an annual basis using parameters outlined in Section 8.0. Monitor metal uptake in vegetation and soils, ensuring sample size of data collected is adequate for statistical analysis. Vegetation sampling for metal analysis will be conducted using the repeatable methodology established in test plots in the NBD in 2012 and will be collected in composite samples, to mimic animal browsing, for species-specific sampling (e.g., fireweed, rye grass, red clover). Soil nutrient and heavy metal analysis will be conducted using the BCMOE *Overview of Contaminated Sites Soil Task Group Procedures for the Derivation of Soil Quality Matrix Standards for Contaminated Sites* or the *Canadian Soil Quality Guidelines for Protection of Environmental and Human Health.*

Vegetation monitoring results will be used to inform best soil amendment prescriptions and will refine vegetation prescriptions for larger reclamation areas of the TSF.

Location: The TSF beaches, stockpiled tailings and surrounding area.

Timing: Year 1: Test tailings surface of physical and chemical properties. Establish test plots on the TSF beach and surrounding area with various soil amendment and planting prescriptions.

Year 2-4: Monitor vegetation growth at similar times of the year during the growing season to provide data that meets the assumptions for statistical analyses. Monitor for heavy metal uptake annually.

Duration: Establishment, soil amendment additions and revegetation of test plots within the TSF could be completed within one summer. Monitoring success of soil cover with vegetation measurements, and analysis of metal uptake in vegetation should be completed for at least 5 years post-trial establishment.

General Cost (e.g., low cost ($10,000-$30,000), high cost ($100,000 or more): High

Future Application as a part of RCP: Research will determine the best approach to developing a suitable medium for plant growth on the beaches of the TSF. Test plots should be established to evaluate a few potential plant mediums to determine the best design. Evaluation would include monitoring of plant performance, physical and chemical properties of tested mediums and metal uptake for plants. The most effective and safe approach could then be implemented on a larger scale as a second stage and, if deemed successful, could be utilized to reclaim the remaining areas of the TSF beaches. Developing a suitable medium will require improvements to the texture and nutrient availability of tailings by incorporation of a soil amendment and surface preparation.

7.7 Assessment of Soil Decompaction Methodologies: Research Requirement (K)

Description: Assess methodologies of decompaction to determine effectiveness.

Rational: Measuring decompaction methodologies prior to and during reclamation will inform land use objectives and erosion control measures during reclamation activities.

Approach: Step 1: Determine severity of compaction throughout the Facility through selection of compaction sampling sites. Compaction severity should be determined on a scale of low to high based on observations of areas with visible compaction and by digging test pits in areas of visible compaction; test pits will provide an area for compaction depths. Low compaction areas can be characterized as cleared areas that have experienced minor equipment access and high compaction areas would be characterized as with areas with repeated high traffic (e.g., road right of ways) and areas with high surface run off as a result of fine soil surface sealing. Emphasis should be placed on testing surfaces where different types of equipment have travelled. For example, large rock trucks, with their weight and size, compact soils very well, whereas light vehicles or equipment contribute much less impact to soil compaction. In addition, soil compaction can also differ between areas where wheeled or tracked equipment have passed, as wheeled

equipment results in greater compaction. Areas of high surface sealing should also be identified. Multiple sites of compaction testing may be required depending on the variability of soil compaction.

Non-disturbed baseline measurements (i.e., undisturbed soils outside of the active mine site) should be collected to inform end land use compaction criterion for areas of planned decompaction.

Step 2: It will be necessary to ascertain the types of equipment available at the Facility to determine which decompaction methodologies can be applied at the site. Types of decompaction include ripping, trenching, mounding and mechanical screefing. Details of these techniques are provided in Appendix U of the RCP).

Step 3: Each available methodology for decompaction should be applied to several test plots that represent variable severities of compaction to determine effectiveness of methodology (e.g., apply rip trenching to low and high compaction areas). Test plots should also have woody debris or wood chip incorporations into the soil to determine effectiveness on decompaction (should create microsites).

Step 4: After decompaction of soils and woody material placement, test plots should be seeded and planted with species outlined in Table 4-2 “Detailed Progressive Reclamation Prescriptions”. This table outlines grass seed mixes, shrub and deciduous species, and conifer tree prescriptions for specific areas around the Facility based on the end land use objectives.

Step 5: Success of decompaction methodologies should be monitored on a consistent basis to determine the appropriate decompaction methodology for each soil type (i.e., low or high compaction). Success of decompaction can be determined by vegetation measurements (i.e., grass growth success, growth of shrub & tree seedlings (i.e., tree survival, total height, basal stem diameter, and mortality rates) and soil physical properties (i.e., bulk density, volumetric water content, total porosity, and available water capacity).

Effectiveness of decompaction methodologies and woody material incorporation will be determined by bulk density and vegetation measurements, including survivorship, percent cover, and tree height.

Qualitative and Quantitative Measures: Success of decompaction methodologies should be assessed based on soil and vegetation measurements through visual observations and digging test plots (soil) and vegetation monitoring. Qualitative data may include recording type of decompaction, collecting UTMs, photographing test pits and describing soil and vegetation conditions. Quantitative may include soil measurements (i.e., bulk density, volumetric water content, total porosity, available water capacity) and vegetation measurements (i.e., percent cover, total tree and shrub height, seedling vigor, grass cover vigor, and mortality rates).

Location: Location of sampling sites for compaction will be pre-determined based on severity of soil compaction. Compaction severity should be determined on a scale of low to high based on observations of areas with visible compaction and measurements of compaction depths. Low compaction areas might be characterized as cleared areas that have experienced minor

equipment access whereas high compaction areas would be areas with repeated high traffic (e.g., road right of ways) and areas with high surface run off. Multiple sites of compaction testing may be required depending on the variability of soil compaction.

Non-disturbed baseline measurements (i.e., undisturbed soils outside of the active mine site) should be collected to inform end land use compaction criterion for areas of planned decompaction.

Timing: Year 1: Determine compaction severity and establish control and sample sites at the Facility. Decompact areas with various methodologies, place soil additions (i.e., biosolids, CWD), and apply appropriate vegetation prescriptions based on site-series and land use objectives.

Year 2-4: Monitor decompaction success annually through vegetation measurements and soils physical characteristics.

Duration: Baseline data collection and establishment of test plots could be completed within one summer. To determine success of decompaction methodologies, soil and vegetation data should be completed up to 5 years post-decompaction. Results from this monitoring duration would illustrate the superior decompaction methodology for each type of soil compaction.

General Cost (e.g., low cost ($10,000-$30,000), high cost ($100,000 or more)): Low

Future Application as a part of RCP: Results from the decompaction research should confirm the appropriateness decompaction methodologies for various soil compaction severities. As such, future decompaction reclamation activities should base decompaction method selection from results of this research.

7.8 Cumulative Effects of Fertilization and Biosolids Application on Total Nutrient Loading and Impacts to Receiving Waters Research Requirement (o):

Description: Determine the cumulative effect of fertilization on total nutrient loading to receiving waters.

Rational: Measuring total nutrient loading will reveal whether fertilization (i.e., fertilizer and biosolids) has a negative impact on receiving waters and provide evidence to justify mitigation measures, if required. It should be noted that fertilizer has been used in very limited quantities at the Facility and has been discontinued based on sustainability concerns.

Approach: Step 1: Sample locations to monitor surface, ground and contact water where fertilization or biosolid treatments have already been applied at the Facility or where applications are planned (MPMC Environmental Department 2019). Select control sampling sites outside the zone of influence (i.e., upstream of the treatment areas), and treatments sampling sites within the zone of influence (i.e., downstream of treatment areas). Sampling within treatment sites should focus on low velocity flows or areas of pooling water (i.e., settling areas, depositional banks).

Step 2: Water quality sampling should be completed within 96 hrs post-treatment for short-term effects, and for at least five days within the subsequent 30 day period post-treatment, for long-

term effects. Sampling protocols should follow established methods within the MPMC 2019 CEMP (MPMC Environmental Department 2019). Water quality sampling should including testing for temperature, pH, nitrite, nitrate and ammonia.

Step 3: Collect air temperature and precipitation data throughout the duration of the monitoring.

Step 4: Complete statistical analysis from water samples and climate data to determine if levels of nitrate, nitrite and ammonia are within acceptable limits for human health and the environment under the 2019 BC WQG (Ministry of Environment 2019). Climate data can be used to inform spikes in contaminants.

Qualitative and Quantitative Measures: Effects of fertilizer loading on receiving waters should be assessed based on quantitate water quality measurements. Qualitative information collect could consist of UTMs and photographs of testing locations. Field measurements of quantitative parameters should include temperature, pH, and conductivity. Triplicate samples for laboratory analysis should be collected to test for of nitrite, nitrate, and ammonia concentrations.

Location: Within areas where fertilizer or biosolids have been applied or are planned to be applied.

Timing: Year 1: Water quality testing for nutrient loading is time sensitive. Testing should be conducted prior to fertilization treatments, to determine baseline measurements, within 96 hrs following fertilization, to determine short-term impacts, and from at least five days within the subsequent 30 day period following treatment for long-term impacts.

Year 2-4: Sampling of water quality should continue on an annual basis to observe changes in the concentrations of nitrite, nitrate and ammonia over time following application.

Duration: Data collection should be completed after every application of fertilizer, within 96 hrs for short-term fertilization measurements and for at least five days within the subsequent 30 day period for long-term fertilization measurements; therefore, duration of sampling will be dependent on number of fertilization applications.

General Cost (e.g., low cost ($10,000-$30,000), high cost ($100,000 or more)): High

Future Application as a part of RCP: Results from fertilization/biosolid testing will determine if there are negative impacts to the receiving waters surrounding the Facility from their application. If negative impacts are identified, mitigation measures should be implemented.

Recommendations from this five year plan would be relevant to the RCP, as sampling techniques and locations could be kept continuous post-closure, and passive treatment is planned to continue in perpetuity.

7.9 SCHEDULE

Research projects described in the above sections will be implemented based on project specific timelines that are required to obtain relevant reclamation information prior to mine closure. A tentative schedule for research projects is suggested in Table 7-3.

Table 7-3. Tentative Schedule for Research Projects in the Projected 5-year Reclamation Research Plan.

Task	Duration	Start	Finish	Year 1	Year 2	Year 3	Year 4	Year 5	Year 6	Year 7	Year 8	Year 9	Year 10 (mine closure)
Water Management Strategies and Post-Closure Maintenance and Contingency Requirements: Research Requirement (c)	Year 1-Year 10	Year 1	Year 10[1]	Dependent on water management system									
Species-Specific Planting Trials: Research Requirement (d)	Year 1 - Year 10	Year 1	Year 10	Establish New Test Plots	Continue Current Monitoring			Establish Test Plots surrounding the TSF	Monitor				
Methods for Reducing High Competing Grass Cover: Research Requirement (g)	5 year period	Any year	5 years from initiation	As required									
Soil Replacement Plan: Research Requirement (i) **does not include TSF	5 year periods	Year 1	Year 10	Establish Test Plots within areas that do not have plots	Monitor								
Management for Invasive Plants: Research Requirement (i)	As needed	Year 1	Year 10	Survey & Treat	Monitor treatment effectiveness, retreat as required								
Reclamation Prescription for the TSF: Research Requirement (j)	5 year period	5 years prior to mine closure	Year 10					Establish Test Plots	Monitor				
Assessment of Soil Decompaction Methodologies: Research Requirement (k)	5 year period	5 years prior to mine closure	Year 10					Determine Areas of Severe Compaction & Establish Test Plots	Monitor				
Cumulative Effects of Fertilization and Biosolids Application: Research Requirement (o)	Up to 30 days	Prior to application of fertilizer/biosolids	Up to 30 days post-treatment	As required									

Note: current mine closure date estimated to be 2031.
[1]Passive water treatments and watercourse restorations may not have a finish date.

8 RECLAMATION RESEARCH MONITORING PLAN: RESEARCH REQUIREMENT (M & N)

This section has been developed to meet monitoring requirements for all progressive reclamation and reclamation research projects. This includes research requirements as outlined in “m” and “n”, which require development of ecosystem-specific sampling parameters, performance criteria, and benchmarks as well as the evaluation of habitat restoration, soil development, and erosion control. The primary goal of this monitoring plan is to provide criteria and measures for each sampling parameter that can be used to determine whether reclamation activities are successful.

Monitoring results will be compared against regulatory guidelines, where applicable, and against comparable benchmark ecosystems where no guidelines exist. Monitoring parameters and criteria will continue to evolve and improve through the ongoing incorporation of new information, technology, and stakeholder input.

8.1 SAMPLING PARAMETERS, CRITERIA AND MEASURES

Table 8-1 summarizes the sampling parameters, criteria and measures for reclamation monitoring. Current and future monitoring to determine the success of reclamation research or progressive reclamation activities will be completed on individual land parcels at the Facility (MPMC, 2017) using the following approach:

1) Sampling parameters will be selected for each monitoring effort based on the nature of the reclamation research or progressive reclamation works;

2) Develop a project-specific monitoring plan criteria and measures outlined for each of the relevant sampling parameters.

3) Reclamation will be identified as successful when all criteria identified for each sampling parameter are met;

Table 4. Sampling Criteria and Measures of Monitoring at the Facility.

Sampling Parameter	Criteria	Measures
Landform Function	Landforms have geotechnical stability.	• Visually inspect presence/absence of subsidence, erosion, deposition of sediment in low-lying areas, ponding, gullying, riling or slumping, including bank stability around watercourses and waterbodies; ○ No evidence of surface instability have been observed; • No mass movement has occurred or is anticipated to occur;

	Landscape enhancements are appropriate to the ecosystem and increase the diversity of the landscape.	• Observe utilization of landscape enhancement features (e.g., large rocks, CWD) by vegetation and wildlife. Confirm whether:
		  ○ Vegetation is naturally establishing on landscape enhancement features;
		  ○ Wildlife is utilizing landscape enhancement features as forage/hunting, breeding or denning habitat;
		• Landscape enhancements provide microsite diversity for the natural establishment of native plant species and wildlife;

Soil	Metal concentrations are within acceptable limits for human health, wildlife and livestock health, and the environment or are below concentrations observed from baseline (pre-disturbance) sampling.	• Monitor metal concentrations in applied soils and amendments and compare to baseline conditions and/or acceptable limits;

	Soil conditions are analogous to the pre-existing landform and soil moisture regime.	• Physical and chemical properties of applied soils and amendments are analogous to conditions estimated to have been present prior to disturbance. Properties assessed may include:
		  ○ Physical Properties: Depth, texture, bulk density, organic matter content and surface compaction;
		  ○ Chemical Properties:
		• Applied soils and amendments are stable and are not subject to instability or mass movement (refer to Section 6.1.2);
		• Applied soils and amendments do not provide adverse conditions that would significantly limit, or completely prevent, the establishment of planted, seeded or naturally establishing vegetation;

		○ Example for biosolid application (ammonium and ammonia concentrations); • Where completed, assess the success of decompaction with soil & vegetation measurements. ○ Measurements may include bulk density, volumetric water content, total porosity, and available water capacity and vegetation measurements may include percent cover, total tree & shrub height, seedling vigor, grass cover vigor, and morality rates;
	Soils provide an adequate medium for plant growth.	• Vegetation establishment is not limited by any physical or chemical soil conditions; • Natural establishment of native plant species is occurring; • Soil surface has the following features: ○ Diverse microtopography that provides a range of moisture conditions and features the establishment of naturally dispersed native seed; ○ Loose and uncompacted; ○ Organic matter is present;
Vegetation	Metal concentrations are within acceptable limits for human health, wildlife and livestock health, and the environment.	• Monitor metal uptake in vegetation. Refer to Section 6.1.3;
	Vegetation cover is 'self-sustaining'.	• Confirm if significant seedling mortality is occurring. Mortality may be due to natural processes (e.g., excess herbivory), or anthropogenic factors (e.g., planting/handling of seedlings, adverse soil conditions); • Monitor vegetation cover; cover should be stable or increasing; • Confirm that natural recruitment of native species is not limited; ○ recruitment may be limited by competition from existing vegetation cover, herbivory or surface conditions (e.g., soil compaction); • Monitor species diversity of vegetation cover. Cover should be diverse and not a monoculture;
	Vegetation cover is following the natural successional trajectory that aims to satisfy the end land use objective.	• Confirm that vegetation cover is dominated by pioneer tree and shrub species identified as early successional species of the target ecosystem (e.g., subzone/variant); ○ e.g., species diversity & abundance, % cover, tree and shrub seedling height, density & vigour;

		• Confirm that vegetation cover consists of late successional tree and shrub species of the target ecosystem; • Confirm that vegetation cover does not consist of any significant cover of non-target species (e.g., invasive, agronomic, nuisance weeds); • Confirm that any cover of non-target species present is either declining or, evidence suggests that non-target species cover will decline over time; • Identify factors limiting natural succession on reclaimed areas, or portions of reclaimed areas (e.g., plant competition, surface conditions, herbivory), and, confirm that these factors have been addressed and will no longer limiting;
Water Quality	Post-treatment water is consistently found to meet BC Water Quality Guidelines (Ministry of Environment 2019).	• Regularly monitor water quality parameters. Analyse water sample data to determine whether all levels are within acceptable limits for human health and the environment;

8.2 MONITORING SCHEDULE & SURVEY PERIOD

Monitoring should occur annually for at least 5 years following the initiation of any research projects, or until criteria for each relevant sampling parameter identified, have been met.

Monitoring should occur in the summer or fall under non-frozen conditions. Seasonal considerations should also be considered prior to monitoring (i.e., conduct measurements at similar times of year for sound statistical analysis, identify noxious plants prior to seed dispersal to reduce propagation).

9 ADAPTIVE MANAGEMENT STRATEGY: RESEARCH REQUIREMENT (F)

Long-term monitoring and maintenance activities are planned to continue until the Facility is ready for certification. If monitoring identifies negative impacts, contingency plans will be implemented that may include activities such as soil and/or amendment application, soil decompaction, landform stability works, infill planting, fertilization, mulching, noxious plant control and pest control. This adaptive management strategy is illustrated in Figure 8-1. Specific contingency plans related to soil, reclamation materials, and the Springer Pit can be found in Section 5.9 of the RCP (MPMC, 2017).

Figure 8-1. Adaptive Management Cycle extracted from the 2018 RCP.

ABSTRACT

Beneficial soil microbes, such as mycorrhizal fungi and nitrogen-fixing bacteria, can improve plant nutrient acquisition and increase plant resilience to stressors. Yet, the waste materials left behind following major disturbances, such as mining, have negligible biological activity and fresh topsoil availability for reclamation is often limited. We tested if small-volume additions of native forest topsoil can improve early seedling survival and growth, and promote colonization of beneficial root symbionts. In a greenhouse experiment, we grew seedlings representing different functional groups in tailings and glacial-till overburden from the Mount Polley Mine, Canada. We applied 5 % (38 mL) and 25 % (188 mL) forest-soil additions for comparison with tailings/overburden controls and reference forest soil. The experiment was replicated with sterilized soil to isolate the biological effects of the forest soil from the physical and chemical effects. Willow (*Salix scouleriana*) and spruce (*Picea engelmannii* x *glauca*) seedling survival and growth increased with proportion of forest soil, which corresponded with increased ectomycorrhizal fungal colonization. Forest soil additions benefited seedlings grown in both overburden and tailings, with ~200 mL (25 %) forest soil additions generally supporting initial seedling growth comparable to seedlings grown in reference forest soil. Alder (*Alnus viridis*) showed minimal benefit from forest soil additions, likely due to a lack of nitrogen-fixing bacteria in the forest soil, highlighting the importance of matching the plant and microbial communities of the soil donor site with the target plant species. Differential results among plant species in sterilized soil indicated that plants exhibiting greater dependence on microbial symbionts (spruce and alder), benefited from the biological component of the inoculum, while willow, an early successional species with low mycorrhizal dependence, benefited from the physical and chemical properties of the forest soil. This research showed that targeted additions of small volumes of topsoil from native ecosystems can improve initial seedling survival and growth, and promote recovery of limiting soil microbial communities, making it a promising approach for mine reclamation when topsoil availability is limited.

1. Introduction

Mining causes severe disturbances to terrestrial ecosystems. To reclaim mining areas, topsoil that was salvaged prior to the mining disturbance is typically spread on reclamation areas as a growing medium for revegetation. Compared to mine waste materials, the physical and chemical properties of topsoil, such as greater organic matter content and nutrient availability, are more suitable for plant growth (Tordoff et al., 2000). An additional benefit of local topsoil over mine wastes and other soil amendments is that it contains native plant propagules and soil organisms, which can support the establishment of native plant species and increase the diversity, abundance and activity of soil microbes (Boldt-Burisch and Naeth, 2017; Macdonald et al., 2015; Moynahan et al., 2002). Topsoil applications promote the colonization of plant roots by microbial mutualists, such as mycorrhizal fungi and nitrogen (N)-fixing bacteria, which form symbioses with roots and improve plant access to nutrients and soil resources in exchange for photosynthates (Smith and Read, 2008). These mutualisms can increase plant resilience to environmental stressors such as drought, herbivory, nutrient deficiencies and elevated levels of metals or salt (Johnson et al.,

Received 10 November 2021; Received in revised form 16 July 2022; Accepted 25 July 2022

2016), making them of particular importance for seedling establishment in harsh, low-nutrient mine reclamation environments. A lack of mycorrhizal fungi and N-fixing bacteria can limit the recovery of ecosystems following disturbances (Mueller et al., 2019; Nara, 2006; Seeds and Bishop, 2009), suggesting that revegetation without re-establishing the soil microbial community may reduce restoration success (Koziol et al., 2018).

Applications of local topsoil to reclamation substrates inoculate native microbes, which have been shown to benefit plant growth more than foreign or commercial inoculants (Ji et al., 2010; Maltz and Treseder, 2015). The generalist species used in commercial inocula do not account for local adaptations, which can support a home-field advantage for native plant-soil-microbe relationships (Rúa et al., 2016). Use of native inoculants also avoids the relatively unstudied risk that microbes introduced in commercial inoculums could become invasive or pathogenic (Thomsen and Hart, 2018). Additionally, whole soil amendments contain the full soil biological community, not just one or a few species (Hoeksema et al., 2010), including many species that are unculturable and/or disperse by root or hyphal fragments instead of spores. The presence of diverse soil microbial communities increases the probability of beneficial microbial species suitable for the environmental conditions being present (Koziol et al., 2018), and can improve plant performance when plants are exposed to environmental stressors (Bradáčová et al., 2019; Crossay et al., 2019). Diverse soil microbial communities also have the potential for additive benefits. For example, Shishido et al. (1996) found that plant growth-promoting bacteria and mycorrhizal fungi enhanced conifer growth through unrelated mechanisms.

Yet, topsoil is often of limited availability at mines due to a lack of historic soil salvaging practices, necessitating the use of mine waste materials, such as waste rock, overburden and mine tailings, as supplementary growing mediums. Even at mines where topsoil is salvaged, it can undergo degradation during long-term storage in stockpiles, including changes in nutrient availability and loss of biological propagules (Gorzelak et al., 2017; Paterson et al., 2019). Thus, reclamation methods that efficiently use limited quantities of fresh topsoil, which has the greatest inoculum potential, are necessary to maximize the benefits of topsoil for revegetation. Potential methods include spreading a thin layer of fresh topsoil over lower-quality reclamation materials or mixing small volumes of fresh topsoil into the rooting zones of seedlings during planting (termed "soil transfers"; Amaranthus and Perry, 1988; Borchers and Perry, 1990).

Soil transfers have had mixed effects on revegetation of silvicultural and ex-agricultural sites (Amaranthus and Perry, 1987; Pareliussen et al., 2006; St-Denis et al., 2017), but may be more effective at mine sites because: (1) negligible soil microbial community establishment has occurred, thus mutualistic microbes may not yet be present and minimal competition from established microbes is expected, and (2) reclamation materials are low in nutrients, and microbial symbionts can be critical for nutrient acquisition in low-nutrient environments (Carbajo et al., 2011; Getachew et al., 2019). Soil transfers may additionally benefit planted seedlings by providing localized improvements in soil physical and chemical conditions for initial establishment of roots and soil organisms (Lance et al., 2019). Limited research on small-volume topsoil additions has been conducted at mine reclamation sites, but Helm and Carling (1993a, 1993b) showed 250 mL soil transfers from a balsam poplar (*Populus balsamifera*) stand to the rooting zone of balsam poplar seedlings growing in overburden increased seedling growth, nutrient status and ectomycorrhizal (EM) fungal colonization. Two greenhouse experiments found that amending reclamation materials with unsterilized topsoil had greater positive effects on plant growth and mycorrhizal fungal colonization than sterilized topsoil amendments, showing the effectiveness of the biological inoculation (Emam, 2016; Saxerud and Funke, 1991). However, further research is necessary to refine recommendations for topsoil application rates and to investigate the effects of small-volume topsoil additions on different substrates, such as mine tailings, and on different plant functional groups, including conifers.

The objective of this study was to assess the physical, chemical and biological effects of small-volume forest topsoil additions on seedling performance in mine reclamation materials from the Mount Polley Mine, Canada. In a greenhouse experiment, we grew seedlings representing different functional groups in tailings and glacial-till overburden with different proportions of fresh forest topsoil. The experiment was replicated with sterilized soil to isolate the biological effects of the forest soil from the physical and chemical effects. We hypothesized that: (1) growth, foliar N and root symbiont colonization of seedlings grown in reclamation materials would increase with the proportion of forest soil, (2) seedlings grown in reclamation materials with forest soil additions would achieve comparable performance to seedlings grown in reference forest soil, and (3) the biological component of the added forest soil would be partially responsible for positive effects of forest soil additions on seedling performance.

2. Methods

2.1. Substrate collection

This greenhouse experiment used soils from the Mount Polley Mine, an open pit copper and gold mine in British Columbia (BC), Canada (52°32′42.35″ N, 121°37′58.67″ W; Fig. S1). In 2014, a tailings dam embankment failure at the mine, releasing 25 M m^3 of water, mine tailings and dam construction materials to the downstream environment (Golder (Golder Associates Ltd.), 2015). The dominant materials requiring reclamation were native glacial-till material (overburden) exposed by erosion and deposited mine tailings. The Mount Polley Mine tailings are non-acid generating and have not shown negative toxicological effects on soil fauna or plants (Van Geest et al., 2017). Glacial-till overburden and tailings were collected from the disturbed corridor (Fig. S1). Fresh forest topsoil (herein referred to as "forest soil") was collected from the adjacent and unimpacted Interior Cedar Hemlock forest (Moist Cool subzone, Horsefly variant; ICHmk3; Steen and Coupé, 1997) in mid- and late-seral stands dominated by western redcedar (*Thuja plicata*), subalpine fir (*Abies lasiocarpa*) and hybrid white spruce (*Picea engelmannii* x *glauca;* Fig. S1, Table S1). At each reference site, litter was removed and the top 15–20 cm of soil collected, including the fermentation and humic layers, and the upper mineral horizons. Substrates were homogenized and mixed with 20 % v/v perlite to compensate for structural losses due to handling.

Samples of each substrate type were air dried and sieved to <2 mm. Electrical conductivity and pH were measured with a Seven Compact S230 Conductivity meter and PH/Ion meter S220, respectively (2:1 w/v deionized water:soil solution). The following parameters were analyzed by the BC Analytical Laboratory, Victoria, BC: exchangeable cations (Al, Ca, Fe, K, Mg, Mn, Na) and effective cation exchange capacity through barium chloride extraction (0.1 N) and ICP-OES analysis; total N and carbon through combustion and analysis with an elemental analyzer; and available phosphorus (PO_4-P) by Bray P-1 extraction (1-min shake) and UV–Vis analysis. Physical and chemical properties of each substrate type are presented in Table 1.

2.2. Experimental design

A 3 × 3 × 2 factorial set of treatments replicated five times was applied to greenhouse-grown seedlings in a completely randomized design. Individual seedlings were grown in 750 mL Ray Leach tubes containing one of three substrates: tailings, glacial-till overburden, or a 1:1 mixture by volume of tailings and overburden (herein referred to as "tailings + overburden"). Substrates were mixed with one of three forest soil application rates: 0 % (0 mL), 5 % (38 mL), or 25 % (188 mL). These treatments targeted lower ratios of forest soil where the greatest relative improvements in plant performance were expected. The third factor tested was sterilization, where soils autoclaved for 1 h at 121 °C (Trevors, 1996) were used to differentiate between the physical and

Table 1
Chemical and physical properties of forest soil, overburden and tailings collected at the Mount Polley Mine, British Columbia. Forest soil includes the fermentation layer, humic layer and upper mineral horizons. CEC = effective cation exchange capacity; EC = electrical conductivity.

Parameter	Forest soil	Overburden	Tailings
Sand (%)	44.46	48.12	62.07
Silt (%)	34.71	36.69	29.08
Clay (%)	20.83	15.18	8.85
Texture	Loam	Loam	Sandy loam
pH	5.2	8.09	8.23
EC	417	230	543
Total N (%)	0.605	0.025	0.013
Total C (%)	14.28	0.82	0.48
PO_4-P (mg/kg)	41.98	1.42	1.21
CEC	35.139	8.929	6.742

chemical versus biological effects of the forest soil additions. One additional treatment of 100 % forest soil ($n = 5$) was added for comparison to reference conditions.

The above treatments were tested on three plant species native to the Mount Polley Mine area: hybrid white spruce (*Picea engelmannii* Parry ex Engelm. x *glauca* (Moench) Voss), Scouler's willow (*Salix scouleriana* Barratt ex Hook.), and Sitka alder (*Alnus viridis* (Chaix.) D.C.). These plant species represent a cross section of functional groups, plant-microbe associations, and successional stages. Spruce is a mid- to late-seral conifer forming EM, while willow and alder are early successional deciduous shrubs that form EM and possibly arbuscular mycorrhizae (AM; Molina et al., 1992). Alder roots also associate with the N-fixing bacterium *Frankia alni*.

Five seeds collected from the Mount Polley Mine area were sterilized with hydrogen peroxide and planted in each container, then thinned to one seedling per pot following germination. Re-planting in select treatments was done early in the growing period to achieve the desired replication. Seedlings were grown for six months in the University of British Columbia (UBC) Horticulture Greenhouse, Vancouver, BC under 600 W high pressure sodium lights (17-h photoperiod) and hand watered as needed. To mimic mine site conditions, seedlings were not fertilized during the experiment.

2.3. Data collection

Following harvest, seedling shoots were dried for 72 h at 70 °C and weighed. Samples of the youngest foliage were analyzed for total N using an Elemetar vario EL Cube elemental analyzer at the UBC Stable Isotope Facility, Vancouver, BC. Roots washed with deionized water were scanned for morphological analysis using WinRhizo software.

As an indicator of soil microbial activity and the biological effects of the forest soil additions, symbiotic relationships with soil microbes were evaluated. The number of N-fixing nodules on each alder root system was counted and the wet weight of nodules was measured. For analysis of mycorrhizal fungi, 50 random spruce root tips and 50 random 1-cm willow and alder root segments (or 50 % of available tips/segments for small root systems) were collected from each root system. The remaining roots were dried for 72 h at 70 °C and weighed. Willow and alder root segments were cleared in 10 % KOH and stained in an ink and vinegar solution (Vierheilig et al., 2005). The proportion of tips colonized by EM fungi was evaluated for the stained root segments using the gridline intersect method (Giovannetti and Mosse, 1980). AM and non-AM fungal endophyte percent colonization were evaluated at 100 intersections under a compound microscope as per McGonigle et al. (1990). AM fungal colonization data were not used in statistical analyses, as colonization was not detected on alder roots and was negligible on willow roots (only present on seven seedlings at ≤5 %).

Spruce root tips were morphotyped under a dissecting microscope as per Goodman et al. (1996) to assess EM fungal percent colonization and diversity. Voucher specimens (a single root tip or system) of each morphotype were collected and stored at −20 °C for genetic identification. Individual voucher specimens were ground with a sterile micropestle and sterile microsand followed by DNA extraction using the Qiagen PowerPlant Pro Kit as per the manufacturer's instructions. Extracts underwent Illumina MiSeq sequencing at the Integrated Microbiome Resource at Dalhousie University, Halifax, Nova Scotia as per Comeau et al. (2017) using fungal-specific primers for the ribosomal RNA second internal transcribed spacer (ITS2) region, ITS86 and ITS4 (Turenne et al., 1999; Vancov and Keen, 2009; White et al., 1990). The resulting sequences were trimmed for quality using the sliding window function in Trimmomatic (version 0.39; Bolger et al., 2014) where the average quality per base within the four base pair window fell below fifteen. Sequences were then imported into QIIME2 (version 2019.7; Caporaso et al., 2010) and trimmed using Cutadapt to remove primers and read through (Martin, 2011). Following, the ITS2 region was extracted, and chimeras and non-ITS2 sequences were removed using the ITSxpress QIIME2 plugin (version 1.8.0; Rivers et al., 2018). Bidirectional reads were assembled, denoised and assigned to amplicon sequence variants (ASVs), dereplicated, and filtered for chimeras using the DADA2 pipeline (Callahan et al., 2016). Taxonomic identities of the ASVs were determined using a Naïve Bayes classifier trained on the UNITE database (Abarenkov et al., 2010). ASVs were assigned to fungal guilds using the FUNGuild database (Nguyen et al., 2016). Each morphotype voucher was assigned to the EM fungal taxon with the highest number of reads. Sequences are available through GenBank (accession number PRJNA749874).

2.4. Statistical analysis

Analyses were conducted in R (R Core Team, 2021; version 4.0.3). Biomass data were relativized per growing day to account for minor differences in growing periods due to replanting. Linear models were used except for root fungal percent colonization, where binomial or quasibinomial generalized linear models (link = logit) were used. Data for linear models were transformed, as required, to meet model assumptions of normality and equal variance. For all analyses, significance was evaluated as $P \leq 0.05$ and marginal significance as $0.05 < P < 0.1$.

Separate models for each plant species (spruce, willow and alder) were run for each plant performance parameter (response variable) with reclamation material type x forest soil ratio as the explanatory variables. Factor significance was evaluated with Type III ANOVA and post-hoc contrasts using the *emmeans* package (Lenth, 2020) with the Tukey adjustment for multiple comparisons. These models were run for sterilized and unsterilized soil treatments. More detailed comparisons with the reference forest soil treatment were conducted using post hoc contrasts of linear models (*emmeans*; Lenth, 2020) with each unique unsterilized soil treatment (reclamation material type and forest soil ratio combined) as the response variable.

To provide insight into the effects of root symbiont colonization, linear models were run for unsterilized soil treatments with symbiont colonization as the explanatory variable and shoot biomass, root:shoot ratio or specific root length (root length divided by biomass) as the response variable. Soil treatment (reclamation material type and forest soil ratio combined) was used as a covariate to account for differential effects of soil treatment on these relationships. Correlation analysis using the *corrplot* package (Wei and Simko, 2021) was carried out for 100 % tailings, overburden and forest soil treatments (i.e., treatments with associated soil sample data) to show relationships between soil physical, chemical and biological properties and seedling responses.

3. Results

Seedling responses were consistent among the reclamation materials tested (tailings, overburden and tailings + overburden; Table S2). Given the absence of significant differences among reclamation material types

and a lack of interactions between reclamation material type and forest soil application rate (Table S2), combined results across all reclamation material types are presented.

3.1. Forest soil addition effects on seedling performance

Spruce seedlings had greater shoot biomass and foliar N in reclamation materials with 25 % forest soil than in reclamation materials with 5 % forest soil or controls (0 % forest soil), with no difference between the 5 % and 0 % forest soil treatments (shoot biomass: $F_3 = 5.74$, $P = 0.002$; foliar N: $F_3 = 8.93$, $P < 0.001$; Fig. 1). While there was no effect of soil treatment on initial seedling survival ($ResDev_{48} = 48.8$, $P = 0.382$), survival tended to increase with forest soil volume (Table 2). EM fungal colonization was greater in the 5 % and 25 % forest soil treatments than in control reclamation materials ($ResDev_{41} = 883.3$, $P < 0.001$; Fig. 1). Forest soil additions had no effect on root biomass ($F_3 = 1.90$, $P < 0.144$) or EM fungal morphotype richness ($F_2 = 0.41$, $P = 0.669$), which was low (≤ 3 taxa per seedling) and dominated by *Wilcoxina* spp., *Pseudotomentella* sp., *Melinomyces bicolor*, *Tuber* sp., and *Amphinema byssoides* (Table S2, Table S3). Only spruce seedlings in the 25 % forest soil treatments had comparable shoot biomass to seedlings

Table 2
Initial survival (prior to thinning and re-planting) of spruce, willow and alder seedlings by forest soil addition treatment.

Forest soil (%)	Survival (%)		
	Spruce	Willow	Alder
0	66.1	18.1	60.2
5	79.8	24.5	53.6
25	77.0	31.3	56.9
100	85.0	60.1	100

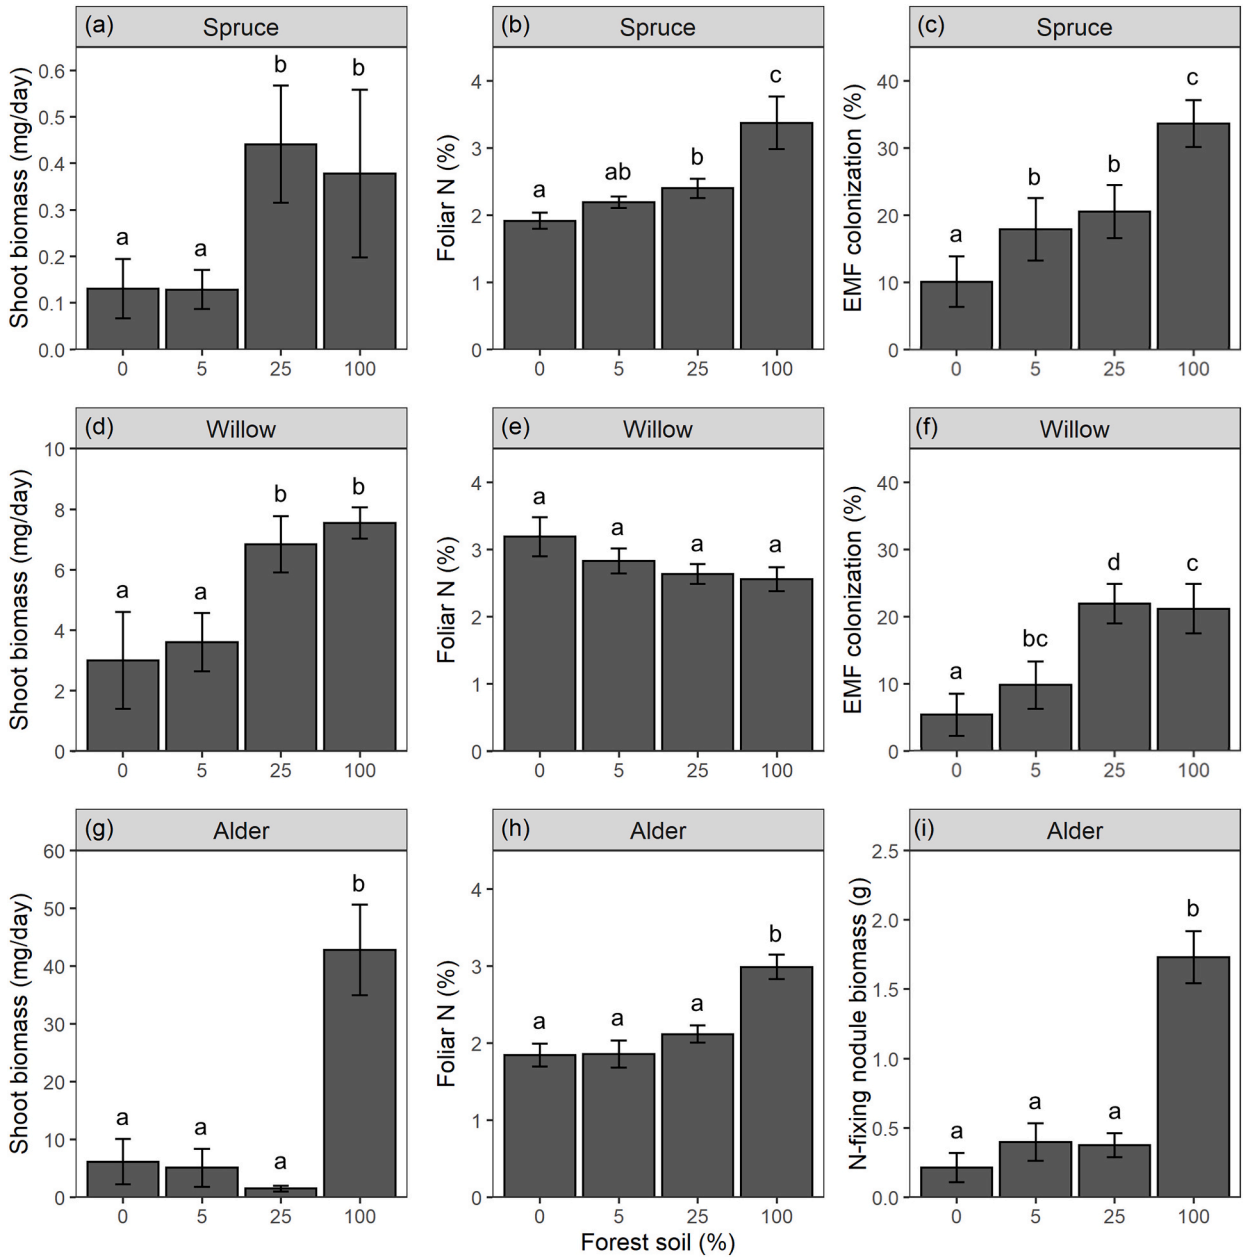

Fig. 1. Effects of different forest soil application rates on spruce (a–c), willow (d–f) and alder (g–i) seedling growth, foliar nitrogen (N) and root symbiont colonization in unsterilized reclamation materials (tailings, overburden and tailings +overburden). Significant differences are indicated by different letters. Error bars = 1 SE. EMF = ectomycorrhizal fungi. Shoot biomass was relativized per growing day to account for minor growth period differences due to replanting.

grown in 100 % forest soil. In treatments containing overburden, the higher quality reclamation material, 25 % forest soil additions also resulted in spruce seedlings having foliar N comparable to that of seedlings grown in 100 % forest soil (overburden: $T_{36} = 2.14$, $P = 0.511$; tailings + overburden: $T_{36} = 2.61$, $P = 0.248$). EM fungal colonization and EM morphotype richness were lower in all reclamation-material treatments (with 0 %, 5 % or 25 % forest soil) compared to seedlings grown in 100 % forest soil (Fig. 1).

Willow seedlings had greater shoot and root biomass in reclamation materials with 25 % forest soil than in reclamation materials with 5 % forest soil or controls (0 % forest soil), with no difference between the 5 % and 0 % forest soil treatments (shoot biomass: $F_3 = 4.36$, $P = 0.011$; root biomass: $F_3 = 4.36$, $P = 0.008$; Fig. 1). Survival also increased with forest soil proportion ($ResDev_6 = 82.3$, $P = 0.007$; Table 2). Willow seedling biomass did not differ between the 25 % and 100 % forest soil treatments (Fig. 1). Willow seedling root colonization by EM fungi and non-AM fungal endophytes was greatest in treatments with 25 % forest soil, followed by 5 % forest soil treatments, then the reclamation-material controls containing no forest soil (Fig. 1, Table S2). 5 % and 25 % forest soil additions to reclamation materials achieved symbiont colonization equivalent to, or greater than, the 100 % forest soil treatment (Fig. 1, Table S2). Forest soil additions had no effect on willow foliar N concentrations ($F_3 = 1.56$, $P = 0.218$; Fig. 1).

Forest soil additions had negligible effects on the performance of alder seedlings. Alder seedlings grown in reclamation materials with 0 %, 5 % or 25 % forest soil showed no difference in shoot biomass ($F_2 < 0.01$, $P = 0.996$), root biomass ($F_2 = 0.05$, $P = 0.955$), foliar N ($F_2 = 1.17$, $P = 0.327$) or N-fixing nodule biomass ($F_2 = 0.22$, $P = 0.807$; Fig. 1, Table S2). However, despite a lack of interaction between reclamation material type and forest soil transplant volume ($F_4 = 0.98$, $P = 0.43$), 25 % forest soil additions tended to increase root nodule biomass in tailings, the lowest quality reclamation material, compared to controls ($T_{10} = 2.39$, $P = 0.089$). Compared to the 100 % forest soil treatment, seedling survival, biomass, foliar N and root symbiont colonization were lower in all reclamation-material treatments (with 0 %, 5 % or 25 % forest soil; $P < 0.001$; Fig. 1, Table 2, Table S2).

3.2. The role of soil biota

Soil sterilization reduced root symbiont colonization to zero or low levels for all plant species, and colonization was significantly lower than in unsterilized treatments (except where colonization was minimal in unsterilized treatments, for example in 100 % tailings; Fig. S2).

For spruce, the positive effects of forest soil additions on seedling shoot biomass and foliar N in unsterilized soils did not occur in sterilized soils where EM fungal colonization was negligible (Table 3). This aligned with models across all unsterilized treatments, which showed that spruce EM fungal colonization was positively related to shoot biomass ($P < 0.001$) and tended to negatively relate to root:shoot ratio, i.e., higher EM colonization corresponded to greater aboveground biomass allocation ($P = 0.074$; Table S4). Similar relationships were observed for alder: N-fixing nodule biomass was positively related to shoot biomass ($P < 0.001$) and alder seedling specific root length decreased (i.e., roots became thicker and less acquisitive) with increased nodulation ($P = 0.009$; Table S4). The minimal benefit of forest soil additions to alder, which tended to increase root nodulation in tailings, did not occur in sterilized treatments (Fig. S2). In contrast to spruce and alder, forest soil additions still benefited the performance of willow seedlings in sterilized treatments (Table 3) and EM fungal colonization did not relate to willow shoot biomass ($P = 0.225$; Table S4). Willow root:shoot ratio was positively related to EM ($P = 0.025$) and non-AM endophyte fungal colonization ($P = 0.032$), i.e., higher colonization corresponded with lower aboveground biomass allocation (Table S4).

Correlation analysis results for the 100 % tailings, overburden and forest soil treatments (i.e., treatments with associated soil sample data) showed that colonization of symbionts (EM fungi, non-AM endophytes and N-fixing nodules), shoot biomass and foliar N had positive relationships with soil nutrient content (total N, total C, PO_4-P, and CEC), but negative relationships with pH and sand content (Fig. 2), indicating greater colonization, growth and nutrient content where pH was lower (characteristic of pH 5 forest soil vs. pH 8 tailings and overburden) and the soil texture was finer. The one exception was foliar N in willow, which did not relate to any other measures.

Table 3
Spruce, willow and alder seedling biomass and foliar nitrogen (N) in sterilized soil treatments (mean ± 1 SE). For each plant species, significant differences among forest soil application rates to reclamation materials (tailings, overburden and tailings + overburden) are indicated by different letters. Growth parameters were relativized per growing day to account for minor growth period differences due to replanting.

Plant species	Forest soil (%)	Shoot biomass (mg/day) ± SE	Root biomass (mg/day) ± SE	Foliar N (%) ± SE
Spruce	0	0.070 ^{a} ± 0.005	0.034 ^{a} ± 0.006	1.91 ^{a} ± 0.14
	5	0.054 ^{a} ± 0.006	0.041 ^{a} ± 0.009	1.92 ^{a} ± 0.14
	25	0.069 ^{a} ± 0.005	0.048 ^{a} ± 0.007	1.82 ^{a} ± 0.15
Willow	0	2.0 ^{a} ± 0.7	0.6 ^{a} ± 0.2	3.02 ^{a} ± 0.22
	5	6.1 ^{b} ± 0.6	3.1 ^{b} ± 0.4	2.74 ^{a} ± 0.12
	25	9.7 ^{c} ± 0.7	5.8 ^{c} ± 0.4	2.21 ^{b} ± 0.11
Alder	0	9.9 ^{a} ± 3.9	5.5 ^{a} ± 2.2	1.59 ^{a} ± 0.13
	5	7.3 ^{a} ± 2.9	2.9 ^{a} ± 1.1	1.60 ^{a} ± 0.11
	25	10.2 ^{a} ± 2.9	5.3 ^{a} ± 1.7	1.42 ^{a} ± 0.06

4. Discussion

The substrates requiring reclamation at mine sites, including tailings and overburden, have poor physical structure, low nutrient content, and negligible biological activity (Bois et al., 2005; Tordoff et al., 2000). We found that amending reclamation materials with low rates of forest topsoil can inoculate beneficial microbial root symbionts and improve initial seedling survival and growth under greenhouse conditions. These findings are applicable to mine sites where limited topsoil is available for reclamation.

In support of our first hypothesis, biomass and EM fungal colonization of spruce and willow seedlings increased with the proportion of forest soil added. Initial seedling survival also increased with forest soil proportion, suggesting an immediate benefit of the soil transfer method in ecological restoration. Spruce roots were colonized by the EM fungal taxa that dominate the roots of spruce seedlings growing near the forest soil collection site, including *Wilcoxina* spp., *Amphinema byssoides* (McMahen, 2020), indicating successful inoculation of native EM fungi.

Forest soil additions were beneficial in all the mine reclamation substrates tested: tailings, overburden and tailings + overburden. Despite the unique setting of the Tailings Storage Facility failure at the Mount Polley Mine, tailings and overburden are common reclamation substrates in the mining industry and both the overburden and tailings used had low nutrient levels and low inoculum potential, consistent with other mine reclamation studies (Bois et al., 2005; Moynahan et al., 2002; Zong et al., 2015). Thus, our findings are likely applicable to other sites. Our results are consistent with Helm and Carling (1993a, 1993b) who found that topsoil transfers to the rooting zone of balsam poplar (*Populus balsamifera*) seedlings at a mine reclamation site increased seedling height, foliar N and EM fungal colonization after two years. Their findings suggest that the results from our greenhouse study may translate to field conditions.

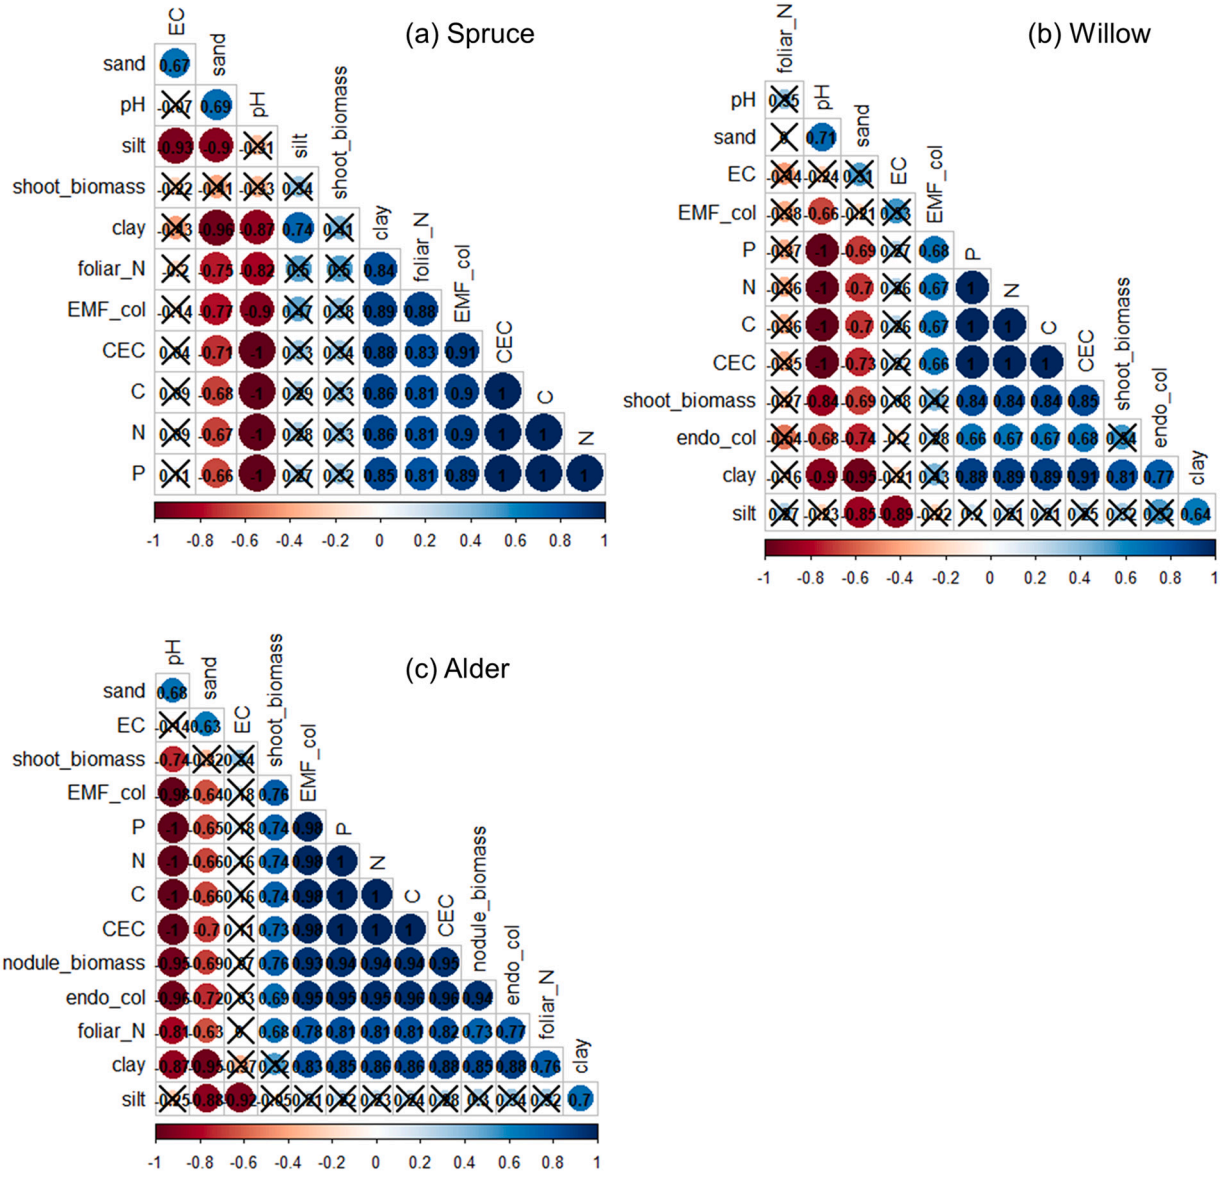

Fig. 2. Correlation matrices of seedling response variables and soil physical and chemical properties for spruce (a), willow (b) and alder (c) seedlings in 100 % forest soil, overburden and tailings treatments (i.e., treatments with associated soil sample data). Non-significant correlations are denoted by an "X". CEC = effective cation exchange capacity; EC = electrical conductivity; EMF = ectomycorrhizal fungi; endo = non-AMF fungal endophyte. While the positive relationship between EM fungal colonization and shoot biomass for spruce was not significant in this limited analysis (100 % tailings, overburden and forest soil treatments only), it was when evaluated over the full dataset ($P < 0.001$).

Unlike spruce and willow, forest soil additions had no effect on alder seedling growth, and only tended to increase N-fixing nodule formation in tailings. The variation in species-specific responses may be due to mismatches between alder and the plant community of the soil donor site (van der Putten et al., 2013). Amaranthus and Perry (1988) found that soil transfers from an arbutus (*Arbutus menziesii*) stand to the rooting zones of Douglas-fir (*Pseudotsuga menziesii*) seedlings had limited benefits, whereas Amaranthus and Perry (1987) found regeneration of Douglas-fir was promoted by soil transfers from older Douglas-fir plantations. Similarly, Guichon (2015) found that soil transfers from stands of AM western redcedar (*Thuja plicata*) to the rooting zones of EM western hemlock (*Tsuga heterophylla*) seedlings had an inhibitory effect on their growth and mycorrhizal colonization. In this study, soil was collected from mid- to late-seral forests where spruce but not alder or willow were present, and it is possible that limited compatible microbial inoculum was available. The N-fixing bacterium *Frankia alni*, which associates with alder, is an actinomycete. PLFA tests on the same forest soil used in this experiment found actinomycetes to account for only 4.7 % of microbial biomass (453 ng/g) and N-fixing *Rhizobia* bacteria were entirely absent (McMahen, 2020), indicating that N-fixing bacteria are not ubiquitous and that *Frankia alni* inoculum levels in the forest soil were likely low. The positive relationship between alder nodulation and shoot biomass suggests that the topsoil additions would have benefited seedlings if the topsoil contained compatible inoculum. Similarly, the negligible colonization of alder roots by EM fungi may have been because alder associates with a high proportion of genus-specific EM fungi, which were likely not present in the forest soil added (Molina, 1979; Tedersoo et al., 2009). Lack of compatible EM fungi may have been compounded by the fact that alder generally does not form symbioses with EM fungi until its roots have been colonized by N-fixing bacteria (Chen et al., 2020; Koo et al., 1995). Our alder results highlight the importance of careful selection of donor soil and using topsoil from areas containing the target plant species or plant species that associate with compatible soil microbes.

In support of our second hypothesis, the larger forest soil addition volume (188 mL, 25 % of the greenhouse pot) was sufficient for improving spruce and willow seedling growth to levels comparable with seedlings grown in 100 % forest soil. Compared to the 38 mL or 5 % treatment, the larger volume may not only provide a higher inoculum load, but also increase nutrient availability and alter rhizosphere conditions (e.g., decrease pH and increase the proportion of finer soil particles) to be more amenable to root development and/or symbiont colonization (Dumbrell et al., 2010; Lance et al., 2019). The 188 mL volume of forest soil applied in our 25 % treatment is comparable to topsoil volumes applied in field experiments by Helm and Carling (1993a, 1993b, 250 mL), Amaranthus and Perry (1989, 150 mL), Querejeta et al. (1998; 150 mL) and Berman and Bledsoe (1998; 250 mL) who found topsoil transfers to seedling rooting zones had positive effects on plant growth and/or mycorrhizal fungal colonization across different disturbance types.

In partial support of our third hypothesis, we found that the biological component of the added forest soil contributed to improved seedling performance, but only for plant species that exhibited dependence on microbial mutualists (i.e., spruce and alder, but not willow). Improvements in spruce growth and foliar nutrition, and increases in alder nodulation (tailings only) with forest soil additions were not present in sterilized soil. Accordingly, spruce EM fungal colonization and alder nodulation were positively related to shoot biomass and also related to seedling morphology changes consistent with increased reliance on microbial symbionts for nutrient uptake (decreased root allocation in spruce and decreased specific root length in alder). These results indicate that soil biota, such as EM fungi and N-fixing bacteria, contribute to growth and nutrient acquisition for these plant species, and play a key role in their establishment. Negative effects of soil sterilization on seedling performance are consistent with Saxerud and Funke (1991) and Emam (2016) who found increased biomass, foliar nutrition and AM fungal colonization of grasses in mine reclamation materials with unsterilized versus sterilized soil additions. Our results also align with research from grassland ecosystems where native soil and mycorrhizal fungal inoculations were more beneficial for late-successional plants, which have greater mycorrhizal dependence than early successional species (Cheeke et al., 2019; Koziol and Bever, 2015).

In contrast to spruce and alder, the benefits of forest soil additions to willow were maintained in sterilized soil, indicating that willow primarily benefited from the physical and chemical components of the forest soil. These results may be explained by the lower mycorrhizal dependence of early successional species, such as willow, which are adapted to soils with low biological activity (Cheeke et al., 2019; Koziol and Bever, 2015). Willow shoot growth was not related to EM fungal colonization and forest soil additions had no effect on foliar N, indicating that seedlings were not N-limited. This suggests that the fibrous fine roots of willow support nutrient acquisition without relying on mycorrhizal fungi. It is possible, however, that willow would show a biological benefit with the addition of topsoil collected from areas where willow plants are present, as willow were not present at our forest soil collection sites and the soil may have lacked compatible mutualists. Of the four dominant EM taxa on roots of willow seedlings growing in these substrates in a separate study, only *Melinomyces bicolor* overlapped with the morphotypes identified on spruce seedlings, suggesting limited overlap in spruce and willow fungal communities (McMahen, 2020). The negligible colonization of willow roots by AM fungi may similarly suggest a lack of compatible inoculum in the forest soil, but it may also reflect EM being a more suitable symbiont in low-nutrient reclamation materials (e.g., ability of EM fungi to access inorganic phosphorus; Teste et al., 2020). Finally, whole soil amendments introduce the full diversity of the soil biological community, ideally inoculating a consortium of microbes that interact to benefit plants, but there is also the potential to transmit antagonistic organisms. A separate study using the same soils found non-AMF fungal endophytes—which can range from mutualistic to parasitic, with the potential to counteract benefits from mycorrhizal fungi (Mayerhofer et al., 2013)—had a negative effect on willow seedling growth (McMahen, 2020). We found a positive relationship between non-AMF fungal endophyte colonization and root:shoot ratio in willow, suggesting that the endophytes present may be detrimental. Early successional species are more susceptible to pathogens, with selection pressures promoting rapid growth and reproduction over defense traits (Kardol et al., 2013; van der Putten et al., 1993). Thus, competitive release may have occurred for willow in sterilized soil.

Further research is required to assess if soil transfers will have lasting effects on seedling growth and nutrition as roots extend beyond the treated rooting zone, as the findings from this experiment only apply to initial seeding establishment. Middleton and Bever (2012) found benefits of inoculated AM fungi to spread to neighbouring plants 2 m away within a couple of growing seasons, suggesting that although growth may lag compared to seedlings growing in reference areas, over time established plants will maintain and further develop communities of microbial mutualists through applied nucleation (Michaels et al., 2020). Although soil biota can ingress over time through their natural dispersal mechanisms, reclamation methods that promote recolonization of soil organisms in substrates with low biological activity can potentially bootstrap ecosystem recovery (Perry et al., 1989). While we are not promoting disturbing new areas to source soil—especially sensitive or at-risk ecosystems—if topsoil is not available or has deteriorated in quality from long-term storage in stockpiles, collecting soil from dispersed areas of adjacent undisturbed ecosystems may be a minimally invasive option at some sites. For example, collecting the top 15 cm of soil from a 1 m^2 area would provide sufficient soil for 750 $\times$ 200 mL soil transfers (equivalent to a rate of 0.5 m^3/ha for 200 mL transfers at 2500 stems/ha). In addition to using minimal topsoil, the soil transfer approach of mixing fresh topsoil into the rooting zones of seedlings during planting does not require heavy machinery (i.e., tree planters carry one bag of soil and one bag of seedlings). Soil transfers could also be applied to seedlings grown in an on-site nursery, supplementing commercial topsoil with native soil biota.

5. Conclusion

We found that amending mine reclamation materials with low rates of forest topsoil can inoculate beneficial microbial root symbionts and improve initial establishment of willow, spruce and alder under greenhouse conditions. Plants dependent on microbial mutualists benefited from the biological component of the forest soil, although this was contingent on the added topsoil containing compatible microbes. Conversely, willow, an early successional plant with low microbial dependence benefited from the physical and chemical components of the topsoil. These findings show that targeted additions of small volumes of fresh topsoil from native ecosystems can improve seedling growth and promote recovery of limiting soil microbial communities, making soil transfers and other methods of applying low rates of topsoil promising approaches for enhancing revegetation of mines and other highly disturbed areas when topsoil availability is limited.

Funding

KM was funded by a Natural Sciences and Engineering Research Council (NSERC) of Canada Postgraduate Doctoral Scholarship (PGSD3-519040-2018) and Killam Trust Pre-Doctoral Fellowship. This work was funded by NSERC Engage (EPG 490666-15) and Mitacs Accelerate grants (IT10615, IT14372) to SWS and KM, respectively, in partnership with and with support from Mount Polley Mining Corporation. This research was also supported by the Puget Sound Mycological Society Ben Woo Scholarship to KM.

Declaration of competing interest

Abstract

Plants alter soil biological communities, generating ecosystem legacies that affect the performance of successive plants, influencing plant community assembly and successional trajectories. Yet, our understanding of how microbe-mediated soil legacies influence plant establishment is limited for primary successional systems and forest ecosystems, particularly for ectomycorrhizal plants. In a two-phase greenhouse experiment using primary successional mine reclamation materials with or without forest soil additions, we conditioned soil with an early successional shrub with low mycorrhizal dependence (willow, *Salix scouleriana*) and a later-successional ectomycorrhizal conifer (spruce, *Picea engelmannii* × *glauca*). The same plant species and later-successional plants (spruce and/or redcedar, *Thuja plicata*, a mid- to late-successional arbuscular mycorrhizal conifer) were grown as legacy-phase seedlings in conditioned soils and unconditioned control soils. Legacy effects were evaluated based on seedling survival and biomass, and the abundance and diversity of root fungal symbionts and pathogens. We found negative intraspecific (same-species) soil legacies for willow associated with pathogen accumulation, but neutral to positive intraspecific legacies in spruce associated with increased mycorrhizal fungal colonization and diversity. Our findings support research showing that soil legacy effects vary with plant nutrient acquisition strategy, with plants with low mycorrhizal dependence experiencing negative feedbacks and ectomycorrhizal plants experiencing positive feedbacks. Soil legacy effects of willow on next-stage successional species (spruce and redcedar) were negative, potentially due to allelopathy, while ectomycorrhizal spruce had neutral to negative legacy effects on arbuscular mycorrhizal redcedar, likely due to the trees not associating with compatible mycorrhizae. Thus, positive biological legacies may be limited to scenarios where mycorrhizal-dependent plants grow in soil containing legacies of compatible mycorrhizae. We found that soil legacies influenced plant performance in mine reclamation materials with and without forest soil additions, indicating that initial restoration actions may potentially exert long-term effects on plant community composition, even in primary successional soils with low microbial activity.

1 | INTRODUCTION

Understanding the factors influencing plant establishment following severe disturbances is necessary for informing ecosystem restoration methods and enabling predictions of successional trajectories. The vegetation communities that develop during succession are a function of abiotic characteristics (e.g., soil properties, climate, topography), but also biological interactions (Connell & Slatyer, 1977). Plants shape soil physiochemical properties and soil biological communities through root development, root exudates, litter inputs, and creation of habitats for specific organisms (van der Putten et al., 2013). Changes in the soil environment based on plant identity leave "ecosystem legacies" that influence the fitness and niche space of successive plants, with effects on plant performance ranging from negative to positive (Bever et al., 1997; Ke & Wan, 2020).

Shifts in the abundances of soil organisms, including mutualists and pathogens, are increasingly recognized as drivers of ecosystem legacies. Legacies resulting from changes in the community composition of soil organisms can influence the structure and dynamics of plant communities through plant–soil feedbacks (Chung et al., 2019; Klironomos, 2002), and create historical contingencies in which the order and timing of past events affect community assembly during succession (Duhamel et al., 2019; Fukami, 2015). In the context of ecological restoration, this means that plant species selected for revegetation can create soil legacies that have the potential to influence the trajectory of the plant community.

Plant–soil feedbacks associated with soil biological legacies vary with plant nutrient acquisition strategy. In general, plant–soil feedbacks tend to be positive for ectomycorrhizal (EM) plants, neutral for arbuscular mycorrhizal (AM) plants, and negative for nitrogen-fixing and non-mycorrhizal plants (Teste et al., 2017). Variation in plant–soil feedbacks according to plants' nutrient acquisition strategies aligns with patterns in vegetation succession: later successional plants with greater mycorrhizal dependence tend to experience more positive feedbacks, while early successional plants, which commonly have more explorative root systems and low mycorrhizal dependence, tend to experience negative feedbacks (Cortois et al., 2016). Early successional plants typically invest more in growth than defense, making them susceptible to pathogens, which is accentuated by their lack of pathogen protection from mycorrhizal fungi (Koziol & Bever, 2015; Lemmermeyer et al., 2015). Accordingly, accumulation of soil-borne pathogens can have negative legacy effects on early successional plants, breaking their dominance and promoting increases in plant diversity as well as species turnover in succession (Kardol et al., 2007; van der Putten et al., 1993).

As pathogen-mediated negative soil legacies reduce the vitality and abundance of early successional plants, niche space opens for other plant species, including the next successional stage plant species. The subsequent plant communities that establish are a function of not only abiotic conditions and stochastic processes, such as dispersal, but also soil biological legacies (Dumbrell et al., 2010). In plant communities dominated by mycorrhizal-dependent plants, particularly EM plants (associated with slower growth but increased pathogen resistance; Cheeke et al., 2019; Koziol & Bever, 2015), the buildup of mycorrhizal fungal propagules in the soil may generate positive legacies and promote establishment of plants that associate with those mycorrhizae. For example, Horton et al. (1999) found EM Douglas-fir (*Pseudotsuga menziesii*) to establish near EM manzanita (*Arctostaphylos* spp.) but not AM chamise (*Adenostoma fasciculatum*). This is consistent with studies reporting overlap in the EM fungal taxa colonizing understorey and overstorey plants (Kennedy et al., 2003) and mid-seral and late-seral tree species (Kennedy et al., 2012). The presence of positive mycorrhizal-mediated legacy effects in later successional plant communities is, however, ecosystem dependent; climax plant communities composed of AM and less mycorrhizal-dependent plants, as opposed to EM plants, can be characterized by neutral to negative legacies, which prevent individual species from becoming dominant, promoting coexistence and diversity (Crawford et al., 2019; Mack et al., 2019).

Limited research has been conducted to understand if the soil legacy effects associated with plant nutrient acquisition type and successional stage described above are consistent under primary successional conditions, including mine reclamation settings (Zhu et al., 2022), and how the initial microbial community influences plant community assembly. Given the severely nutrient-liming conditions in primary succession, simply growing plants in these barren soils can have positive legacies due to abiotic improvements in the soil, particularly when N-fixing plants are present (Castle et al., 2016; Kuťáková et al., 2020; Png et al., 2019). In terms of biological legacies, neutral to negative biological legacies have been found for AM plants in early successional post-glaciation soils (Castle et al., 2016) and foredunes (van der Putten et al., 1993), while Kuťáková et al. (2020) found soil fungi to potentially be positively linked to initial plant establishment in post-mining soils, and Seeds and Bishop (2009) found positive legacies associated with N-fixing bacteria in an area impacted by a volcanic eruption. These results suggest that while biological legacies in primary successional soils may be offset by abiotic legacies or weaker due to low abundances of soil organisms and low nutrient availability, they may be sufficiently present to influence plant community assembly. There is, however, a lack of studies in mine

reclamation settings (Zhu et al., 2022) and on plants that dominate temperate forests, including conifers.

In a greenhouse experiment, we tested three hypotheses regarding how seedlings representing different functional groups and mycorrhizal associations create soil microbial legacies that influence the growth of successive plants in primary-successional mine reclamation materials and mine reclamation materials amended with forest soil.

H1: Intraspecific (same-species) legacy effects would vary with plant nutrient acquisition strategy and successional stage: willow (*Salix scouleriana* Barratt ex Hook.), an early successional shrub with low mycorrhizal dependence, would have negative intraspecific legacy effects corresponding to pathogen accumulation, while hybrid white spruce (*Picea engelmannii* Parry ex Engelm.×*glauca* (Moench)), a later successional stage EM conifer, would have positive intraspecific legacy effects associated with increased colonization by mycorrhizal fungi.

H2: Positive legacy effects would occur on next successional stage plants associating with compatible mycorrhizal fungal guilds, while a lack of compatible mycorrhizal fungal guilds would correspond with neutral legacy effects. Specifically, EM willow would have positive legacy effects on EM spruce, but EM willow and spruce would have neutral legacy effects on AM redcedar (*Thuja plicata* Donn ex D. Don).

H3: In unamended mine reclamation materials, which are low nutrient and have a lower abundance and diversity of soil organisms, legacy effects would be weaker than in mine reclamation materials amended with forest soil.

2 | MATERIALS AND METHODS

2.1 | Study system

Our greenhouse experiment used soils collected near the Mount Polley Mine, an open pit copper and gold mine in British Columbia (BC), Canada (52°32′42.35″ N, 121°37′58.67″ W). Glacial till subsoil (exposed by severe erosion) and deposited mine tailings were collected from the area disturbed by the 2014 tailings dam embankment failure (Figure S1, Table S1). The Mount Polley Mine tailings are non-acid generating and have not shown negative toxicological effects on soil fauna or plants (Van Geest et al., 2017). Forest soil was collected from the adjacent, unimpacted Interior Cedar Hemlock (ICH) forest (Moist Cool subzone, Horsefly variant; Steen & Coupé, 1997) in mid- and late-seral stands dominated by western redcedar, subalpine fir (*Abies lasiocarpa*), and hybrid white spruce (Figure S1, Table S1). At each forest site, litter was removed and the top 15–20 cm of soil collected, including the fermentation and humus layers, and the upper mineral horizons. Soils were homogenized and mixed with 20% v/v perlite to compensate for structural losses due to handling. This corresponds to a mixed soil sampling design as per Gundale et al. (2019), and thus the experiment evaluates the effects of the average or composite soil community of the sample locations.

TABLE 1 Chemical and physical properties of forest soil, subsoil, and tailings collected from the Mount Polley Mine, British Columbia.

Parameter	Forest soil	Subsoil	Tailings
Sand (%)	44.46	48.12	62.07
Silt (%)	34.71	36.69	29.08
Clay (%)	20.83	15.18	8.85
Texture	Loam	Loam	Sandy loam
pH	5.2	8.09	8.23
EC	417	230	543
Total N (%)	0.605	0.025	0.013
Total C (%)	14.28	0.82	0.48
PO_4-P (mg kg^{-1})	41.98	1.42	1.21
CEC (cmol + kg^{-1})	35.14	8.93	6.74

Note: Forest soil includes the fermentation layer, humus layer, and upper mineral horizons.

Abbreviations: CEC, effective cation exchange capacity; EC, electrical conductivity.

This design is suitable for mine reclamation research because in reclamation, soils commonly undergo some level of mixing during stockpiling and application. Physical and chemical properties of each soil type are presented in Table 1 (analytical methods are detailed in Appendix S1).

2.2 | Experimental design

In a two-phase greenhouse experiment, plants species from different functional groups were grown to condition the soil microbiome (conditioning phase) followed by a second growing period (legacy phase) in which conditioning-phase soil was used to grow the same plant species or a later-successional-stage plant species characteristic of ICH ecosystems. As shown in Figure 1, eight conditioning phase-legacy phase combinations were tested (three unconditioned controls and five conditioned treatments). Soil conditioned by willow, an early successional EM shrub, was used to grow willow, hybrid white spruce (a mid-successional EM tree), and western redcedar (a mid- to late-successional AM tree). Spruce-conditioned soil was used to grow spruce and redcedar. For comparison, in the legacy phase, control willow, spruce, and redcedar seedlings were grown in unconditioned soil that was stored at 4°C during the conditioning phase. Phospholipid fatty acidgh-throughput Illumina MiSeq se analysis was conducted to verify that soil inoculum load did not decrease during the storage period (Appendix S2).

We applied two soil factors to all the conditioning-legacy combinations, including the unconditioned controls: (1) three reclamation materials were tested (mine tailings, glacial till subsoil, and a 1:1 mixture by volume of tailings and subsoil, herein referred to as "tailings + subsoil"); and (2) reclamation materials were mixed with 25% v/v forest soil or left unamended. Three reclamation materials × two forest soil treatments × eight conditioning-legacy combinations amounts to 56 treatments (Figure 1).

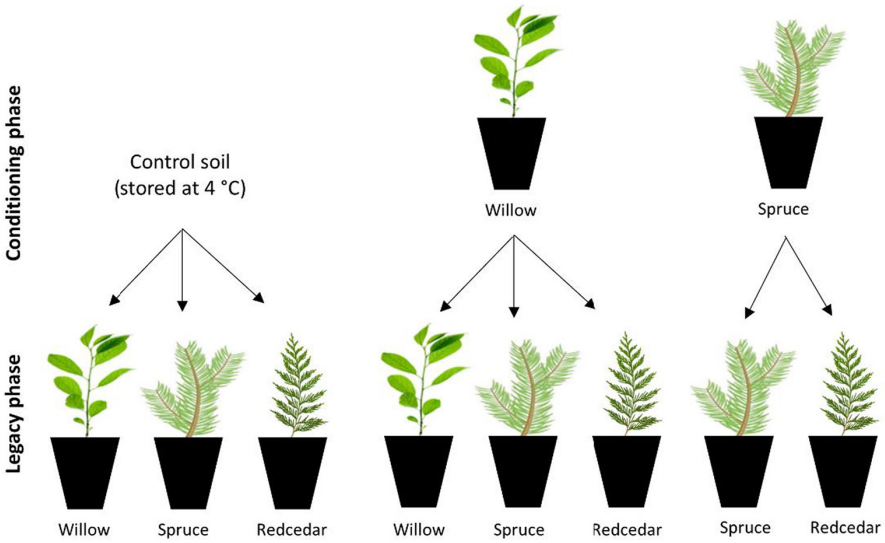

FIGURE 1 Combinations of conditioning- and legacy-phase plant species tested in the two-phase greenhouse experiment evaluating legacy effects on the same species and later-successional species using willow (early successional), spruce (mid-successional), and redcedar (mid- to late-successional). The conditioning-legacy combinations were carried out for three types of reclamation materials (tailings, subsoil, and tailings + subsoil) with or without forest soil additions (8 × 3 × 2 treatments).

For both phases, five seeds collected from the Mount Polley Mine area were sterilized with hydrogen peroxide, sown into pots, and thinned to one seedling per pot. Containers were randomly arranged in the University of British Columbia (UBC) Horticulture Greenhouse, Vancouver, BC under 600 W high pressure sodium lights (17-h photoperiod) and hand watered as needed. To mimic mine site conditions, seedlings were not fertilized during the experiment.

In the conditioning phase, seedlings were grown in 3 L pots in the greenhouse for 6 months, then harvested and the soil and seedlings retained. The roots of the conditioning-phase seedlings were cut into approximately 1 cm pieces and mixed back into their respective soils. In the legacy phase, willow, spruce, and redcedar seedlings were grown in 250-ml Ray Leach cones containing conditioned soil. Soil from each individual conditioning-phase seedling formed an individual legacy-phase treatment. Due to substantially higher mortality of willow seedlings than spruce seedlings in the conditioning phase, fewer replicates of legacy-phase seedlings could be grown in willow-conditioned soil treatments ($n = 6$) than in spruce-conditioned and control soil treatments ($n = 7$).

2.3 | Plant performance assessment

For each legacy-phase seedling, initial germinant survival prior to thinning was recorded. Following harvest, shoots were dried for 72 h at 70°C and weighed. Samples of the youngest foliage were analyzed for total foliar nitrogen (N) and carbon (C) using an Elemetar vario EL Cube elemental analyzer at the UBC Stable Isotope Facility, Vancouver, BC. Washed spruce and redcedar roots were scanned using WinRhizo software to calculate specific root length (SRL; the ratio of root length to root dry biomass). Willow roots were not scanned to avoid inaccuracies associated with their dense, fibrous form. Root tips/segments for mycorrhizal fungal analysis were collected immediately postharvest and the remaining roots were dried for 72 h at 70°C then weighed.

2.4 | Root fungal community assessment

For willow and redcedar, 40 × 1 cm randomly selected root segments per seedling were collected and frozen at −20°C until analysis. Twenty segments per sample were cleared in 10% KOH and stained with ink and vinegar (Vierheilig et al., 2005). Percent colonization of AM fungi and non-AM fungal endophytes was evaluated using 100 intersections under a compound microscope as per McGonigle et al. (1990). For willow, EM fungal percent colonization was measured from the same stained roots using the gridline intersect method (Giovannetti & Mosse, 1980). To assess the identity and diversity of root-associated fungi, DNA was extracted from the remaining 20 willow and redcedar root segments per sample using Qiagen DNeasy Plant Pro kits. High-throughput Illumina MiSeq sequencing was conducted by Integrated Microbiome Resource at Dalhousie University, Halifax, Nova Scotia as per Comeau et al. (2017) using the fungal-specific ribosomal RNA internal transcribed spacer (ITS) region ITS2 primers ITS86 and ITS4 (Turenne et al., 1999; Vancov & Keen, 2009; White et al., 1990). DNA characterization was only conducted for root samples from the 100% tailings and subsoil treatments, as well as 100% forest soil treatments (installed separately to support to support this simplified analysis), because the forest soil addition treatments represented a mixture of the analyzed soils, and therefore likely contained the same fungal species.

The resulting sequences were trimmed for quality using the sliding window function in Trimmomatic (version 0.39; Bolger et al., 2014) where the average quality per base within the four-base-pair window fell below fifteen. Sequences were then imported into QIIME2 (version 2019.7; Caporaso et al., 2010) and trimmed using Cutadapt to remove primers and read through (Martin, 2011). The ITS2 region was extracted and chimeras and non-ITS2 sequences were removed using the ITSxpress QIIME2 plugin (version 1.8.0; Rivers et al., 2018). Bidirectional reads were assembled, denoised, and assigned to amplicon sequence variants (ASVs), dereplicated, and filtered for chimeras using the DADA2 pipeline (Callahan et al., 2016). Taxonomic identities of the ASVs were determined

using a Naïve Bayes classifier trained on the UNITE database (Abarenkov et al., 2010). ASVs were assigned to fungal guilds using the FUNGuild database (Nguyen et al., 2016). Nonfungal sequences and singletons were removed, then data were rarified to the lowest number of reads.

For spruce, 50 random root tips were collected from each root system (or all tips for systems with <50 tips) and morphotyped under a dissecting microscope as per Goodman et al. (1996) to assess EM fungal percent colonization and diversity. For each morphotype, vouchers (one or a few root tips from an individual root system) were collected and stored at −20°C. Individual voucher specimens (minimum three per morphotype except for rare morphotypes observed less than three times) were ground with a sterile micropestle and sterile microsand followed by DNA extraction with PowerPlant Pro kits (Qiagen, 2017) as per the manufacturer's instructions. The ITS1 and ITS2 regions were amplified using polymerase chain reaction (PCR) with the fungal-specific primers ITS4 (White et al., 1990) and ITS1F (Gardes & Bruns, 1993) using GE illustra PuReTaq Ready-To-Go PCR Beads, following the manufacturer's protocol. Thermocycler parameters for PCR involved an initial denaturation of 5 min at 94°C, followed by 35 cycles of denaturation at 94°C for 30 s, annealing at 55°C for 30 s, and elongation at 72°C for 30 s, followed by 7 min at 72°C for a final elongation. Bidirectional Sanger sequencing of PCR products was performed at Macrogen, Korea. Bidirectional reads were trimmed (error probability limit = 0.01) and aligned into consensus contigs using Geneious Prime (version 2019.2.3). The resulting sequences were identified using the Basic Local Alignment Search Tool (BLAST) against the National Center for Biotechnology Information (NCBI) GenBank database and the UNITE database (Abarenkov et al., 2010) with a 97% sequence similarity threshold.

Where morphotype voucher PCR products had more than one band in gel electrophoresis or Sanger sequencing failed, genomic DNA extracts underwent Illumina MiSeq sequencing and downstream bioinformatics as described above (except singletons were not removed and data were not rarified). Each morphotype voucher was assigned to the EM fungal taxon with the highest number of reads.

2.5 | Statistical analysis

Statistical analyses were conducted in R (version 4.0.3; R Core Team, 2020). Linear models for each legacy-phase plant species (willow, spruce, and redcedar) were constructed with soil treatment factors (reclamation material type × forest soil addition treatments × conditioning treatment (i.e., conditioning plant species)) as the explanatory variables with plant growth measures as the response variables. Response variables were natural log ($\log_e$) transformed as required to meet assumptions of normality and equal variance. Foliar N was included as a covariate to account for potential soil nutrient depletion during the conditioning phase. Depth to soil from the top of the pot was also included as a covariate to account for variation in soil settling and potential effects on light availability. Significance of model terms was tested with Type III ANOVA. Seedling survival and percent colonization by root symbionts were assessed using binomial generalized linear models (link = logit) with the same explanatory variables and covariates. Treatment effects were evaluated with pairwise post hoc contrasts using the *emmeans* function with the Tukey adjustment for multiple comparisons (Lenth, 2020). Regressions of shoot biomass against root symbiont colonization and SRL were used to evaluate relationships between response variables for reclamation materials with and without forest soil additions.

For willow and redcedar high-throughput sequencing data, effects of conditioning treatment on root fungal community composition for each soil type were visualized using db-RDAs conditioned on the covariates (foliar N and depth to soil) using the *capscale* function (*vegan* package; Oksanen et al., 2019). PERMANOVA significance testing was done with the *adonis* function in *vegan* (999 permutations). FUNGuild assignments were filtered to remove ASVs with multiple functional guild assignments, that is, fungi that have varying life histories (Nguyen et al., 2016). FUNGuild provides useful insight into potential shifts in microbial community structure; however, it is important to note that only 50% of willow ASVs and 42% of redcedar ASVs remained after filtering unassigned and multi-guild fungi. Linear models of functional guild ASV richness and quasibinomial (link = logit) generalized linear models of functional guild ASV relative abundance were constructed with soil type × conditioning treatment as the explanatory variables along with the covariates described above. Post hoc pairwise testing with *emmeans* was used to test effects of conditioning treatments.

Indicator species analysis of spruce EM fungal morphotyping data as well as willow and redcedar high-throughput sequencing data was done using the *multiplatt* function of the *indicspecies* package (de Caceres & Legendre, 2009; Nguyen et al., 2016). FUNGuild assignments were used to support interpretations (multi-guild taxa were excluded from interpretations due to their unknown functional roles in the system).

3 | RESULTS

Seedling responses were generally consistent among the reclamation materials tested (tailings, subsoil, and tailings + subsoil). Combined results across all reclamation material types are presented except where a significant effect of reclamation material type occurred.

3.1 | Soil legacy effects on willow

Willow had lower germinant survival, shoot biomass, and root biomass in willow-conditioned soils compared to control soils in reclamation materials with and without forest soil additions ($p < .001$; Figure 2, Table 2). High-throughput sequencing of willow roots (forest soil, tailings, and subsoil treatments only) showed that fungal community composition was significantly different in willow-conditioned

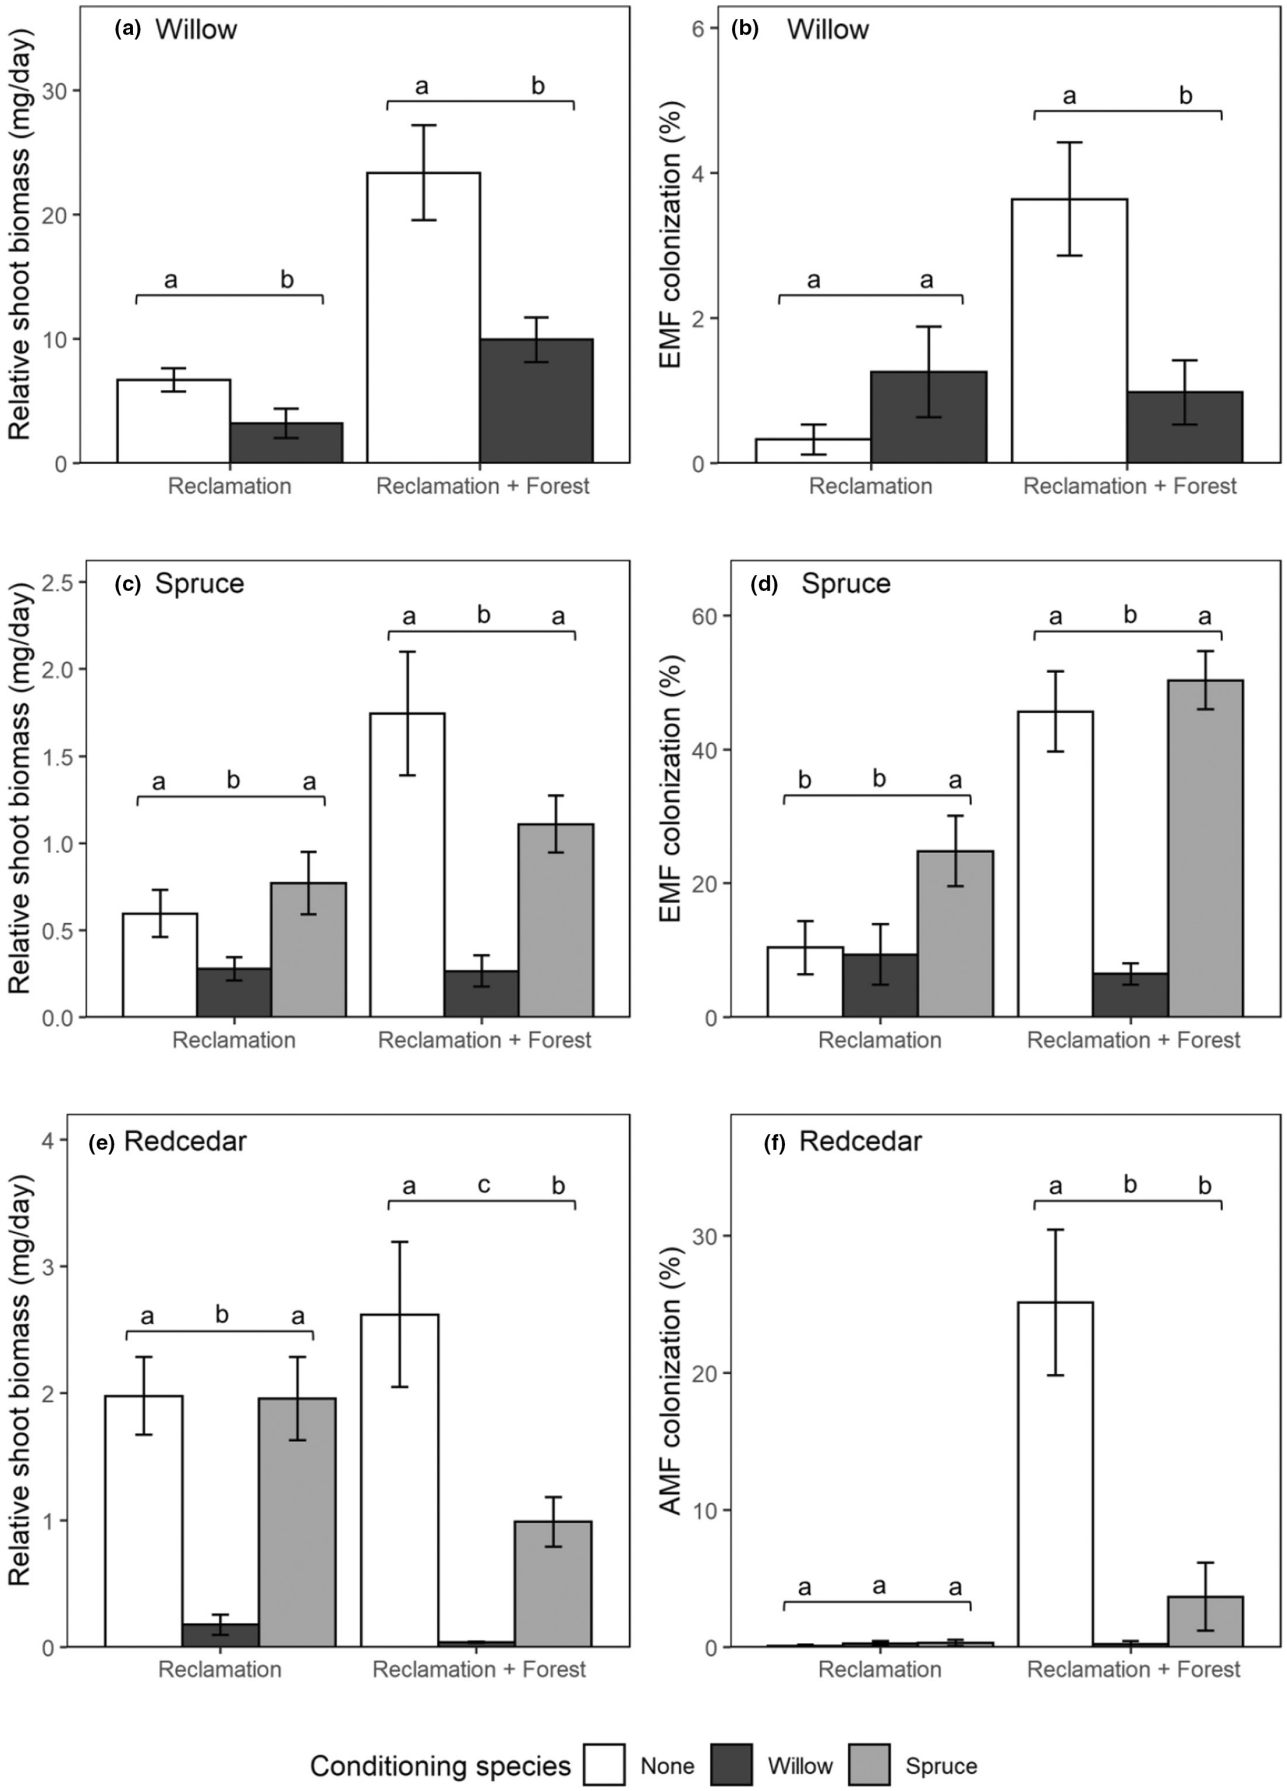

FIGURE 2 Shoot biomass (a, c, e) and percent root colonization by ectomycorrhizal fungi (EMF; b, d) and arbuscular mycorrhizal fungi (AMF; f) of willow (a, b), spruce (c, d), and redcedar (e, f) seedlings grown in control, willow-conditioned, and spruce-conditioned soils. Different letters indicate significant differences ($p < 0.05$) within each soil grouping: reclamation materials (tailings, subsoil, and tailings + subsoil) and reclamation materials mixed with 25% forest soil v/v.

treatments compared to controls for forest soil (PERMANOVA R^2 = .23, p = .001) and subsoil (PERMANOVA R^2 = .13, p = .043), and tended to be different for tailings (PERMANOVA R^2 = .18, p = 0.086; Figure S2). Relative abundance of ASVs of fungal pathogens was greater in willow-conditioned soils compared to controls (p = .018; Figure 3). Fungal pathogen ASV richness tended to increase with willow-conditioning in forest soil and tailings, although effects were not significant (p = .899; Figure S3). Indicator species analysis showed that plant fungal pathogens were maintained or gained in willow-conditioned soil: *Plectosphaerella cucumerina* was dominant in control and willow-conditioned subsoil and tailings (Table S2). Control forest soil was characterized by the pathogen *Neonectria candida*, while the pathogens *Moesziomyces aphidis* and *Plectosphaerella cucumerina* were indicative of willow-conditioned forest soil.

Fungal symbiont ASV richness decreased in the willow-conditioned treatments compared to the controls for forest soil ($p < .001$) but not subsoil or tailings (Figure S3). The fungal symbionts *Cadophora finlandica* and *Cadophora* sp. were indicator species of control and willow-conditioned forest soil, but *Tomentella sublilacina*, *Meliniomyces bicolor*, and *Phialocephala* sp. were indicative of control forest soil only (i.e., were not maintained in willow-conditioned forest soil; Table S2). Willow root EM fungal colonization was low (≤5%) and there was no difference in percent colonization between willow-conditioned and control soils for unamended reclamation materials (Figure 2). However, EM fungal colonization was lower in willow-conditioned soils compared to control soils in reclamation materials with forest soil additions (Figure 2). There was no relationship between willow shoot biomass and EM fungal percent colonization in unamended reclamation materials (R^2_{adj} = .074, p = .599) or reclamation materials with forest soil additions (R^2_{adj} = .047, p = 1.00). Colonization of willow roots by AM fungi was low (≤2%) and did not differ among treatments (Table 2). Conditioning treatment had no significant effect on willow root percent colonization by non-AM fungal endophytes (Table 2).

3.2 | Soil legacy effects on spruce

Spruce seedling shoot and root biomass were lower in willow-conditioned soils than control soils in reclamation materials with and without forest soil additions ($p < .001$; Figure 2, Table 2). A similar trend was observed for spruce germinant survival, which tended to be greater in control soils than willow-conditioned soils (87% vs. 65% in unamended reclamation materials and 89% vs. 82% in reclamation materials with forest soil), although the effects were not significant (Table 2). There was no difference in shoot biomass, root biomass, and germinant survival of spruce seedlings between spruce-conditioned soils and controls in reclamation materials with or without forest soil additions (Figure 2, Table 2).

Ectomycorrhizal fungal colonization of spruce roots was lower in willow-conditioned soils than control soils for reclamation materials with forest soil additions ($p < .001$), but not for unamended reclamation materials (p = .169; Figure 2). EM morphotype richness was low (average richness ≤1.3) and did not differ between willow-conditioned and control soils (Table 2). EM fungal colonization was greater in spruce-conditioned soils than controls in unamended reclamation materials (p = .002; Figure 2), although a significant interaction with reclamation material type (F_4 = 3.50, p = .003) showed this effect only occurred in subsoil and subsoil + tailings, not tailings. In reclamation materials with forest soil additions, EM morphotype richness (but not percent colonization) was greater in spruce-conditioned soils than control soils ($p < .001$; Table 2). Consistent with EM fungal colonization and richness results, indicator species analysis of EM morphotypes showed that EM indicator species were lost in willow-conditioned soil and maintained or gained in spruce-conditioned soils (Tables S3 and S4). *Wilcoxina rehmii* was dominant in control soil and maintained in spruce-conditioned soil, while *Thelephora terrestris* was characteristic of spruce-conditioned soils only. Willow-conditioned soil has no EM indicator species.

Across all conditioning treatments, there was a positive relationship between shoot biomass and EM fungal colonization in both unamended reclamation materials (R^2_{adj} = .091, p = .011) and reclamation materials with forest soil additions (R^2_{adj} = .225, $p < .001$). Additionally, there was a negative relationship between SRL and EM fungal colonization in reclamation materials with forest soil additions (R^2_{adj} = .389, p = .013), indicating that roots became thicker and less acquisitive when EM fungal colonization increased.

3.3 | Soil legacy effects on redcedar

Redcedar shoot biomass, root biomass, and survival were lower in willow-conditioned soils than control soils in reclamation materials with and without forest soil (Figure 2, Table 2). Redcedar shoot biomass, root biomass, and survival were also lower in spruce-conditioned soils than control soils in reclamation materials with forest soil, but not in unamended reclamation materials (Figure 2, Table 2). Effects of conditioning treatment on the root fungal communities of redcedar seedlings were generally limited to soils with sufficient biological activity, that is, treatments containing forest soil amendments: AM fungal colonization of redcedar roots was lower in willow-conditioned and spruce-conditioned soils compared to controls in reclamation materials with forest soil additions, but there was no effect in unamended reclamation materials where AM fungal colonization was low (≤4%; Figure 2). Similarly, the fungal community

TABLE 2 Mean ± standard error for each treatment group, with results combined across all reclamation materials (tailings, subsoil, and tailings + subsoil).

Legacy plant species	Forest soil addition	Conditioning plant species	Survival (%)	Relative shoot biomass (mg/day)	Relative root biomass (mg/day)	EM fungal colonization (%)	EM fungal richness	AM fungal colonization (%)	Fungal endophyte colonization (%)
Willow	No	None	$88.6^{a} \pm 3.1$	$0.9^{a} \pm 6.7$	$2.0^{a} \pm 0.3$	$0.3^{a} \pm 0.2$	–	$0.0^{a} \pm 0.0$	$23.7^{a} \pm 3.3$
		Willow	$37.5^{b} \pm 8.5$	$1.2^{b} \pm 3.2$	$1.2^{b} \pm 0.5$	$1.3^{a} \pm 0.6$	–	$0.3^{a} \pm 0.2$	$22.9^{a} \pm 3.4$

Note: Different superscript letters denote significant differences in the results of the conditioning plant species treatments within each forest soil addition treatment group for each legacy plant species.

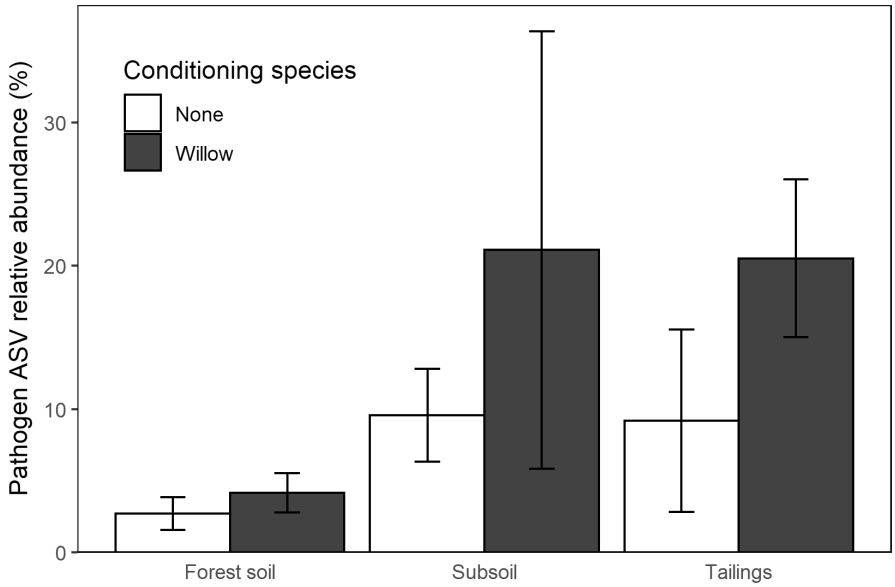

FIGURE 3 Mean willow root fungal pathogen amplicon sequence variant (ASV) relative abundance in forest soil (a), subsoil (b), and tailings (c) ± 1 SE. Pathogen relative abundance was greater in willow-conditioned soils than control soils ($Z = 2.36$, $p = .018$) across all soil types.

of redcedar roots differed with conditioning treatment in forest soil (PERMANOVA $R^2 = .40$, $p = .013$) and subsoil (PERMANOVA $R^2 = .35$, $p = .001$), but not in tailings, which had the lowest biological activity (PERMANOVA $R^2 = .19$, $p = .115$; Figure S4).

Across all conditioning treatments, there was a positive relationship between shoot biomass and AM fungal colonization in reclamation materials with forest soil additions ($R^2_{adj} = .438$, $p < .001$), but not unamended reclamation materials ($R^2_{adj} = -.003$, $p = .412$). Additionally, there tended to be a negative relationship between SRL and AM fungal colonization in reclamation materials with forest soil additions ($R^2_{adj} = .043$, $p = .072$), indicating that roots became thicker and less acquisitive when AM fungal colonization increased.

Conditioning treatment had no significant effects on percent colonization of redcedar roots by non-AMF fungal endophytes (Table 2). There were no significant changes in the relative abundance or species richness of fungal pathogens or non-AMF symbionts in the high-throughput sequencing results for redcedar roots. Indicator species analysis reflected this lack of clear shifts, as symbionts tended to be present in control and conditioned soil (*Cadophora luteo-olivacea* in control and spruce-conditioned tailings; *Cadophora* sp. in control, willow-conditioned, and spruce-conditioned forest soil; *Phalocephala* spp. in control and willow-conditioned forest soil; Table S2). The only pathogenic indicator species was *Olpidium brassicae* in control subsoil and tailings, and it was not indicative of any conditioned soils (Table S2).

4 | DISCUSSION

Understanding the processes underlying the recovery of vegetation communities in forest ecosystems following severe disturbances, such as mining, is critical for informing ecological restoration methods. This study showed that soil legacies mediated by soil microbes have the potential to influence plant community assembly and should be considered in ecosystem restoration and management.

4.1 | Soil legacies promote plant species turnover and persistence

We found that willow, an early successional shrub with low mycorrhizal dependence, had negative intraspecific legacy effects associated with increased fungal pathogen abundance, while spruce, a later successional EM conifer, had neutral to positive intraspecific legacy effects associated with increased mycorrhizal fungal colonization and diversity. These findings support our first hypothesis that soil biological legacies would have contrasting effects depending on plant nutrient acquisition strategy, with non-mycorrhizal plants (or plants with low mycorrhizal dependence) experiencing negative feedbacks and EM plants experiencing positive feedbacks (Teste et al., 2017). Our results align with results from studies in non-forested ecosystems showing that plant–soil feedbacks associated with soil biological legacies shifted from promoting plant species turnover in early succession to promoting stability as succession progresses (Bauer et al., 2015; Kardol et al., 2006).

While we found evidence of root fungal pathogen accumulation corresponding to willow's negative intraspecific legacy effects, other soil biota, such as root-feeding nematodes, may have also played a role as found by van der Putten et al. (1993) and Wilschut et al. (2019). Negative intraspecific legacy effects on willow also corresponded to decreases in EM fungal colonization and loss of EM fungal indicator species in reclamation materials amended with forest soil (but note in unamended reclamation materials where inoculum potential was low). Yet, there was no relationship between EM fungal colonization and willow shoot biomass, and mycorrhizal colonization rates on willow were low very low (≤ 5%), which supports pathogen accumulation as the dominant process. Our experimental design did not evaluate if pathogens were willow-specific or generalists, but our results are consistent with early successional plants that have low mycorrhizal dependence and explorative root systems being sensitive to pathogens and experiencing negative legacy effects (Cheeke et al., 2019; Cortois et al., 2016; Koziol &

Bever, 2015). Conversely, we found a positive relationship between spruce shoot biomass and EM fungal colonization. This is consistent with EM plants having greater mycorrhizal dependence and aligns with evidence that EM fungi can support tree recruitment (Seiwa et al., 2020) and persistence (McGuire, 2007) through positive soil biological legacies.

4.2 | Mycorrhizal fungi generate legacies

In partial support of our second hypothesis, we found neutral to negative legacy effects of EM plants on AM redcedar, which does not associate with compatible mycorrhizal fungi. EM spruce had negative legacy effects on AM redcedar growth, but only in treatments containing forest soil (i.e., only where spruce had negative legacy effects on AM fungal colonization). Since redcedar trees were present in the forest soil collection areas and AM inoculum was in the forest soil, our results suggest that negative legacy effects on redcedar occurred due to the AM inoculum potential of the soil not being maintained by EM spruce and/or the conditioning-phase conditions. In other scenarios where AM propagules are not initially present in the soil, effects on redcedar are expected to be neutral, as in the unamended reclamation materials. That AM fungi are drivers of the observed legacies is supported by the lack of spruce legacy effects on communities of fungal pathogens and non-AM fungal endophytes on redcedar roots. These findings align with research showing established EM trees to have negative effects on AM seedling recruitment (Booth, 2004; Dickie et al., 2002; Guichon, 2015; Weber et al., 2005). Similarly, Seiwa et al. (2020) found hardwood recruitment following thinning may be limited to seedlings forming the same type of mycorrhiza. Thus, mycorrhizal fungal compatibility is likely an important factor in tree recruitment in forest ecosystems dominated by mycorrhizal-dependent tree species.

Willow had negative legacy effects on spruce and redcedar seedling growth, which corresponded to negative legacy effects on mycorrhizal fungal colonization for both plant species, except in reclamation materials where inoculum potential was low. This was anticipated for AM redcedar because willow primarily associates with EM fungi, but no positive legacy effect on EM spruce contradicted our hypothesis. This may be due to the low mycorrhizal colonization observed in willow (i.e., willow and the conditioning-phase conditions did not maintain the EM inoculum that was initially present in the forest soil) and/or low compatibility of willow and spruce EM fungal taxa, which highlights the importance of plant–mycorrhizal species compatibility within mycorrhizal fungal guilds (Ke & Wan, 2020). While most EM fungi are generalists, plant taxa-specific EM fungi do occur (Massicotte et al., 1999) and a high proportion of host-specific EM fungi have been reported to associate with early successional temperate forest plants (Twieg et al., 2007).

Negative willow legacy effects on spruce and redcedar growth also occurred in uninoculated reclamation materials where mycorrhizal fungal inoculum potential was low and no legacy effects on mycorrhizal fungal occurred, suggesting an additional legacy mechanism unrelated to root fungal communities was present. Nutrient depletion in the conditioning phase is an unlikely explanation, given that foliar N was incorporated into the models as a covariate (Cesarano et al., 2017). Accumulation of a generalist pathogen that was not assessed, such as an unclassified fungal taxon or root-feeding nematodes, may have occurred. Additionally, willow produces salicylic acid, a phenolic compound implicated in plant defense responses. Salicylic acid has been shown to have allelopathic properties, reducing shoot growth in a variety of crop and weed species (Raskin, 1992). Allelopathy effects on next-stage successional plant species may be a consequence of willow initiating defense responses to pathogen accumulation and/or an adaptation to delay willow's replacement in succession. We suspect that the negative legacy effects associated with willow may be plant species-specific, especially if allelopathy is occurring, as other studies have found early successional plants to have neutral to positive legacies effects on co-occurring plant species (Kuťáková et al., 2020; van de Voorde et al., 2011). This highlights the complexity of the interacting biotic and abiotic properties that generate soil legacies, and the potential for species-specific inconsistencies with general ecological trends.

4.3 | Legacy effects occur in primary successional soils

Soil legacy effects were generally consistent in mine reclamation materials and mine reclamation materials mixed with forest soil, leading us to reject our third hypothesis that legacy effects would be weaker or neutralized in primary successional conditions where biological colonization of soils is minimal. The only evidence supporting our third hypothesis was spruce seedling legacies had neutral effects on redcedar growth and AM fungal colonization in unamended reclamation materials (when AM presence was negligible), but negative effects in treatments containing forest soil. In contrast, the capacity of mycorrhizal fungi to contribute to soil legacies in primary succession is supported by our result of positive intraspecific legacy effects on spruce EM fungal colonization in reclamation materials. Our results suggest that where mycorrhizal fungi are a dominant mechanism for biotic legacies, negative legacy effects may be reduced or eliminated in barren primary successional soils (i.e., there is no inoculum to be "lost"), but positive legacies can be initiated despite the low abundance of mycorrhizal fungal propagules. This is consistent with studies in gravel quarry soils (Kuťáková et al., 2020) and areas impacted by volcanic eruptions (Nara, 2006; Seeds & Bishop, 2009) that have shown accumulation of microbial mutualists to support initial plant establishment in primary succession.

The negative intraspecific legacy effect we found for willow in unamended reclamation materials aligns with research showing that soil-borne pathogen accumulation can still create negative legacies in primary successional soils, promoting turnover of early successional plants in foredune succession (van der Putten et al., 1993). Negative legacy effects of willow on spruce and redcedar in unamended reclamation materials indicate that the legacy mechanism,

potentially accumulation of generalist pathogens or allelopathy, can occur irrespective of soil developmental phase. Our willow findings contrast with Kuťáková et al. (2020) and Castle et al. (2016), who found early successional plants to create neutral to positive legacies for co-occurring plants in primary successional soils due to improvements in soil abiotic conditions (e.g., increasing nutrient levels). While our study focused on soil microbes and controlled for soil nutrient changes, results of the foliar nutrient covariate indicate that abiotic soil nutrient improvements may have occurred but did not shift net legacy effects. Variability in the results of studies in primary successional systems indicates that future studies should evaluate a broader scope of legacy mechanisms (e.g., allelopathy) to parse out the relative roles of biotic and abiotic mechanisms.

5 | CONCLUSION

We found negative intraspecific soil legacies in willow, an early successional shrub with low mycorrhizal dependence, associated with pathogen accumulation, but neutral to positive intraspecific legacies in spruce, a later successional EM conifer, associated with increased mycorrhizal fungal colonization and diversity. Our findings support research showing that soil legacy effects vary with plant nutrient acquisition strategy, with non-mycorrhizal plants experiencing negative feedbacks and EM plants experiencing positive feedbacks. Negative soil legacy effects of willow on next-stage successional species (spruce and redcedar) were negative due to mechanisms not studied here, potentially allelopathy, while EM spruce had neutral to negative legacy effects on AM redcedar, likely due to the trees not associating with compatible mycorrhizal fungal. This suggests positive legacy effects mediated by soil microbes may be limited to scenarios where mycorrhizal-dependent plants grow in soil containing legacies of compatible mycorrhizal fungal communities.

This study showed that soil legacies can influence plant survival and growth in mine reclamation materials both with and without forest soil additions, which suggests that initial restoration actions can exert effects on plant community composition (Wubs et al., 2019), even in primary successional soils with low microbial activity. This highlights the risks associated with "anything green is good" planting strategies or allowing invasive plants to establish (Dierks et al., 2019; Pickett et al., 2019), and supports restoration approaches that use native species to initiate natural successional trajectories. Consideration should also be given to revegetation with plants that build up communities of microbial mutualists that are relied upon by later successional plants. Our results indicate that revegetation plant selection in forest restoration can influence the successive plant communities that establish and show the importance of accounting for plant–microbe relationships in ecosystem restoration and management.

TECHNICAL MEMORANDUM

DATE 21 December 2022 **Reference No.** 22514095-091-TM-Rev0-31715

TO Mathieu O'Leary
Mount Polley Mining Corporation

FROM Jesse Maddaloni and Darryl Howard **EMAIL Jesse.Maddaloni@wsp.com; Darryl.Howard@wsp.com**

WATER TREATMENT UPDATE TO MINE PLAN AND RECLAMATION PROGRAM UPDATE 2022 – MOUNT POLLEY MINE

1.0 INTRODUCTION

Mount Polley Mining Corporation (MPMC) has developed a Mine Plan and Reclamation Program Update 2022 (herein referred to as the 2022 MRP) that is being submitted to the Ministry of Energy, Mines, and Low Carbon Innovation (EMLI) in compliance with the conditions outlined in the amendment to *Mines Act* Permit M-200. As required in the *Mines Act* Permit M-200 amendment, the 2022 MRP is being provided to EMLI as an update to the 2017 MRP. This technical memorandum provides an update on water treatment activities and progression since the 2017 MRP and discusses water treatment for the remaining operating phase of the mine as well as water treatment during closure/post-closure. The 2022 MRP incorporates the planned disturbance and corresponding reclamation requirements associated with continued mining until September 2024.

This water treatment update memorandum provides:

- A brief overview of the water management and treatment components that currently exist at the mine.
- Predicted and observed water quantity and quality design criteria for water treatment during operations and closure/post-closure.
- A summary the Best Achievable Technology (BAT) assessment previously completed for the mine and the associated technologies that are currently used for operations and considered for closure/post-closure.
- An update on work completed to investigate and advance various treatment technologies.
- An update on anticipated future work to support water treatment during closure/post-closure.

Golder Associates Ltd.

2.0 MINE WATER MANAGEMENT SUMMARY

A network of channels, ponds, and pumping systems is operated by MPMC for managing surface water at the mine. Contact and non-contact water systems are managed with the objective of avoiding the mixing of these waters.

The non-contact water system includes channels to divert runoff from undisturbed catchments away from mine infrastructure. Contact water from within the mine site is actively managed using on-site water management infrastructure and conveyed to the Tailings Storage Facility (TSF) or to the Perimeter Embankment Till Borrow Pond (PETBP) for re-use as part of mine operations or for treatment through the Water Treatment Plant (WTP) and subsequent discharge through a pipeline to Quesnel Lake. The ability to cycle water through the mine mill and back to the TSF or PETBP allows mill components to provide lime pre-treatment for precipitation of metals (copper) when required.

The mine has a positive water balance, with discharge required during mine operations to prevent year-on-year accumulation of water. The only currently permitted discharge of treated contact water from site occurs through the existing WTP and the Quesnel Lake pipe and diffusers. Water management during operations will continue per the current water management infrastructure. The existing WTP (Actiflo patented high-rate ballasted coagulation and flocculation process, with lime pre-treatment as required) is considered the BAT for treatment and discharge through assumed future operations (Golder 2015).

The design capacity of the existing WTP is 0.23 m^3/s. Additional temporary treatment capacity of 0.05 m^3/s has been recently added in 2022 to assist in treating and discharging surplus contact water currently on-site (rental system of the same Actiflo technology). The allowable maximum annual discharge volume from site is currently 10.59 Mm^3/year (average of 0.33 m^3/s), as per Environmental Management Act (EMA) Permit 11678. The design capacity of the WTP effluent pipeline and diffusers is 0.6 m^3/s (equivalent to the permitted maximum daily instantaneous rate).

The mine's water management plan assumes minimal storage of contact water on site, although during freshet (April through June) and extreme storm events, the volume of mine water runoff will exceed the discharge and treatment capacity, and temporary retention will be necessary to store water prior to discharge. Temporary water accumulation will occur in the TSF or in available pit volume(s). Temporary stored water will be discharged to the environment through the WTP following the freshet period or the storm event.

As the mine moves into closure and post-closure, the objectives of water management are to return the impacted land to pre-mining land functions. As the mine is constructed across a watershed divide, it is desired that during the post-closure period, drainages will be distributed back to their natural watersheds (i.e., to Bootjack Lake, Polley Lake, and Hazeltine Creek), provided that this can be achieved in an environmentally appropriate and permittable manner. MPMC has been proceeding with a program of evaluating and developing passive, semi-passive, and active water treatment technologies for their possible use during mine closure to support the goal of distributing discharge back into the pre-mining configuration. Two treatment options are considered the BAT for treatment during closure and post-closure: Option A – distributed passive/semi-passive treatment systems (applied to select sources), and Option B – pit-lake treatment followed by the centralized Actiflo plant (Golder 2016a). Option B is the current assumption for water treatment during closure/post-closure, but MPMC has also been progressing technology evaluations to support Option A.

3.0 WATER TREATMENT DESIGN BASIS

A Site-Wide Water Balance and Water Quality Model (SWWBM) was used to predict flow rates and water quality for mine contact water requiring treatment during operations, closure, and post-closure (Golder 2022a, Golder 2022b). The SWWBM uses a stochastic function to estimate the level of modeled precipitation. Out of 1,000 realizations, 90th percentile results represent the highest 10% of precipitation. The 90th percentile scenario was modeled for the remaining duration of the operational period, and the analysis showed that the existing WTP capacity provides sufficient treatment capacity for this period (Golder 2022a). For closure and post-closure, the model was again used to predict 90th percentile treatment flow rates for the period of 2025 to 2124. For the closure period of 2025 to 2034, results showed that an average treatment capacity of 0.19 m^3/s would be sufficient for the 90th percentile precipitation amount (Golder 2022a). For the post-closure period of 2035 to 2124, results showed than an average treatment capacity of 0.08 m^3/s would be sufficient for the 90th percentile precipitation amount (Golder 2022a).

3.1 Operations Water Quality

The SWWBM was used to predict water quality at the PETBP during operations (the current influent source to the WTP). Table 1 provides a list of constituents of interest determined following review of modeled water quality predictions during operations (Golder 2022b). Table 1 compares the current EMA Permit 11678 WTP discharge limits with the predicted 95th percentile parameter concentrations in the PETBP.

Table 1: WTP Influent Water Quality During Operations

Parameter	Unit	EMA Permit 11678 WTP Discharge Limit	PETBP 95th Percentile Predicted Concentrations
Major Ions			
Total Sulphate	mg/L	1,100	705
Nutrients			
Total Ammonia	mg/L (as N)	1.3	0.24
Total Nitrate	mg/L (as N)	34	21
Total Phosphorus	mg/L	0.09	0.04
Total Metals			
Arsenic	mg/L	0.028	0.002
Chromium	mg/L	0.004	0.001
Copper	mg/L	0.033	**0.273**
Iron	mg/L	1.0	0.62
Manganese	mg/L	3.4	0.70
Molybdenum	mg/L	0.36	0.19
Selenium	mg/L	0.075	**0.105**
Zinc	mg/L	0.059	0.019

Notes:

1) **Bold and underlined** values exceed permitted discharge limits. These EMA Permit 11678 discharge limits apply to the effluent of the WTP, and not to be PETBP (WTP influent). PETBP water quality predictions are shown to demonstrate the requirement for treatment of a water quality parameter.
2) The SWWBM was developed to predict water quality conservatively; where uncertainty exists in the model inputs, the inputs are selected such that under-prediction would be minimized. Thus, over-prediction is generally expected.

Table 1 shows that total copper and total selenium are predicted to require treatment during operations. Total Suspended Solids (TSS), not listed in Table 1, is also required for treatment during operations. The existing WTP has been shown to effectively treat both TSS and total copper for the majority of operating conditions (discussed in more detail in Golder 2022c). WTP influent and effluent quality were assessed over six years between 2016 and 2021, showing effluent TSS consistently below permit limit and effluent total copper only occasionally above permit limit, with high influent copper instances managed through temporary WTP recirculation without discharge and a Trigger Response Plan (Golder 2022c).

Total selenium is modeled to require treatment during operations, as predicted by the 95th percentile PETBP concentration shown in Table 1. Even though predictions show that PETBP total selenium concentration could be above the permit limit, monitoring data has shown actual total selenium in the PETBP consistently below the permit limit (Golder 2022c). The water treatment system during operations has not required selenium treatment and it is not anticipated to require selenium treatment for the remainder of operations.

3.2 Closure/Post-Closure Water Quality

The SWWBM was used to predict water quality at the PETBP during closure/post-closure. The PETBP may not collect all treatment influent water in the final post-closure water treatment configuration (particularly if distributed treatment and discharge can be permitted), but collection to this location has been assumed for the purposes of the 2022 MRP as it represents the currently permitted system configuration. Table 2 provides a list of constituents of interest and the 95th percentile predicted concentrations in the PETBP during closure and post-closure (Golder 2022b). Table 2 also compares predicted PETBP water quality to MPMC's current EMA Permit 11678 WTP discharge limits. These WTP discharge limits have been assumed for closure/post-closure as they represent the currently permitted treatment requirements. Distributed treatment during closure/post-closure may discharge to different receiving environments with different discharge limits than the existing EMA Permit, but the current limits have been assumed for closure/post-closure for the purposes of the 2022 MRP.

Table 2: WTP Influent Water Quality During Closure/Post-Closure

Parameter	Unit	EMA Permit 11678 WTP Discharge Limit	PETBP 95th Percentile Predicted Concentrations – Closure	PETBP 95th Percentile Predicted Concentrations – Post-Closure
Major Ions				
Total Sulphate	mg/L	1,100	654	282
Nutrients				
Total Ammonia	mg/L (as N)	1.3	0.24	0.027
Total Nitrate	mg/L (as N)	34	19	5.2
Total Phosphorus	mg/L	0.09	0.036	0.036
Total Metals				
Arsenic	mg/L	0.028	0.0018	0.0019
Chromium	mg/L	0.004	0.0014	0.0018
Copper	mg/L	0.033	**0.3**	**0.17**
Iron	mg/L	1.0	0.68	0.23
Manganese	mg/L	3.4	0.75	0.23
Molybdenum	mg/L	0.36	0.17	0.074
Selenium	mg/L	0.075	**0.078**	0.033
Zinc	mg/L	0.059	0.014	0.0067

Notes:

1) **Bold and underlined** values exceed permitted discharge limits. These EMA Permit 11678 discharge limits apply to the effluent of the WTP, and not to be PETBP (WTP influent). PETBP water quality predictions are shown to demonstrate the requirement for treatment of a water quality parameter.
2) The SWWBM was developed to predict water quality conservatively; where uncertainty exists in the model inputs, the inputs are selected such that under-prediction would be minimized. Thus, over-prediction is generally expected.

Table 2 shows that total copper and total selenium are predicted to require treatment during closure, with only total copper requiring treatment during post-closure. TSS, not listed in Table 2, is also required for treatment during closure/post-closure.

The assumed treatment system during closure/post-closure is pit-lake treatment followed by the centralized Actiflo plant (existing WTP), with the possibility of distributed passive/semi-passive treatment if systems are environmentally appropriate and permittable. TSS treatment is assumed to be required through closure and post-closure and will be achieved with the Actiflo plant. Total copper treatment is predicted to be required through closure and post-closure and will be achieved with a combination of the Actiflo plant (total copper removal through TSS removal), and future trimercapto-striazine trisodium salt (TMT) pre-treatment, if required (for dissolved copper precipitation).

Total selenium treatment is predicted to be required during closure, but not during post-closure. If required, the assumed method of selenium treatment is semi-passive pit-lake pre-treatment (active dosing of carbon source to pit-lake), followed by treatment by the Actiflo plant. It is not currently known whether selenium treatment will be required during the closure/post-closure phases, as existing monitoring data has consistently shown total selenium in site contact water to be below discharge limits. If selenium treatment is required, MPMC has been progressing the development of multiple treatment technologies that target selenium.

Details on modeled water quality concentrations for all parameters and various site locations (in addition to the PETBP) can be found in Golder 2022b.

4.0 WATER TREATMENT TECHNOLOGY DEVELOPMENT

MPMC has been progressing and evaluating multiple technologies to support the treatment of identified constituents of concern (COCs) and to support potential decentralized treatment and discharge during closure/post-closure. Various studies have been completed since 2017 to support these efforts as an important component of closure refinement. An inventory of treatment technologies and a summary of their development is presented in Table 3.

Good engineering practice typically requires a project to follow a standardized engineering design process for the selection and progressive refinement of the final project concept. A project progresses from a pre-concept phase for the identification of multiple treatment options, through concept, pre-feasibility, and feasibility phases to project execution. Generally, the engineering studies performed for each of these project phases are supported by test work that progresses from proof-of-concept and detailed bench-scale testing to pilot-scale and demonstration-scale test work. Some of the treatment technologies tested may not progress to the next stage of development. For example, a treatment technology may be eliminated if its treatment capacity is insufficient to treat the forecast volumes. This framework takes a staged approach, such that input assumptions, design, and cost for the total system can be refined as each stage is completed and the information that the plan relies on becomes more certain. This allows input assumptions to be less conservative as they become more accurate with accumulated knowledge. The technology development stages presented in Table 3 align with this approach. Additional details regarding this project development framework and how it aligns with the BC Ministry of Environment and Climate Change Strategy's BAT policy is provided in Golder 2020a.

This water treatment update technical memorandum assumes that the reader is familiar with the technologies in Table 3 and only provides updates on work completed by MPMC since 2017 to support the development of these technologies. Detailed descriptions of the technologies and associated process flow schematics can be found in Golder 2020a.

Table 3: Treatment Technology Inventory and Stage of Development

Technology / Stage of Development	Targeted COCs	Proof-of-Concept Bench-Scale Testing	Detailed Bench-Scale Testing	Pilot-Scale Testing	Demo-Scale Testing	Full-Scale Execution	Work Completed
Actiflo	TSS, total copper					→	Bench and full-scale testing.
Lime Treatment	Dissolved copper					→	N/A
TMT Treatment	Dissolved copper	→	→	→	→		Bench and full-scale testing. Toxicity evaluation.
Pit-Lake Treatment	Selenium, nitrate	→	→	→			Preliminary concept design and proof-of-concept bench-scale testing. Pilot-scale testing workplan.
Saturated Rock Fill (SRF)	Selenium, nitrate	→	→				Concept design, proof-of-concept bench-scale testing, detailed bench-scale testing workplan (in progress), and long-term substrate leach testing. Wight Pit SRF assessments.
Packed Bed Reactor (PBR)	Selenium, nitrate	→	→				Concept design, proof-of-concept bench-scale testing, and detailed bench scale testing workplan (in progress).
Biochemical Reactor (BCR)	Selenium, nitrate	—	—				Concept design and proof-of-concept bench-scale testing.
Submerged Sand Reactor (SSR)	Selenium, nitrate	—					Screening analysis.
Constructed Wetland Treatment (CWT)	Selenium, nitrate	→	→	→			Concept design, bench-scale testing, and on-site pilot scale testing (by others).

Implemented → Under Consideration → Eliminated/Paused —

4.1 Actiflo

Actiflo, the tradename of a technology supplied by Veolia, is the technology currently in use as the site's WTP and is considered the BAT for TSS removal during operations and closure/post-closure. The main targeted COC of this technology is TSS, with total copper removal also occurring via TSS removal. Polyaluminum chloride (PAC) is dosed into the influent water in the Actiflo process, which produces aluminum hydroxide precipitates that adsorb to copper complexes, thus removing copper during the solids-liquids separation step of the process. The Actiflo technology is currently implemented at full-scale on-site, as indicated in Table 3.

Concept design, bench-scale, and full-scale testing have been completed for the Actiflo technology, including assessment and optimization of PAC and various chelating agent dosages (including TMT) to assist copper removal (Golder 2016b, Golder 2017a, Golder 2018a, Golder 2019a, Golder 2019b, Golder 2020b).

Actiflo treatment is currently operating as the core component of the treatment system during operations and is currently assumed as the core component of treatment during closure/post-closure.

4.2 Lime Treatment

Active treatment with lime is currently in use at the site, where existing process plant infrastructure is used to raise contact water pH, resulting in the precipitation of metal hydroxides, particularly dissolved copper. The main targeted COC of this technology is dissolved copper. Lime treatment is currently implemented on-site, as indicated in Table 3, and used as a pre-treatment step of the Actiflo water treatment system to target dissolved copper removal. Use of this technology is well known to industry and technology development to support this has not been required.

Lime treatment, when required, is currently a component of the water treatment system during operations.

4.3 TMT Treatment

TMT is a chelating agent that aids with dissolved copper precipitation that allows copper treatment through TSS removal. The main targeted COC of this technology is dissolved copper.

Bench-scale test work completed showed that TMT is able to effectively precipitate dissolved copper (Golder 2016b, Golder 2017a, Golder 2018a) and the full-scale trials completed showed that the existing Actiflo treatment system was able to remove the copper bound with TMT to below the permit limit (Golder 2019a, Golder 2019b, Golder 2020b). Full-scale trials also showed that copper removal to lower concentrations (total copper <0.012 mg/L) was challenging for Actiflo with TMT treatment, not due to limitations in dissolved copper precipitation but due to limitations in TSS removal. TMT was effective in precipitating dissolved copper, but the Actiflo system was not effective in subsequently removing the precipitate to result in low effluent copper concentrations. The toxicity of TMT has also been evaluated and showed that its use would not result in an acutely lethal effluent (Golder 2018b).

TMT treatment is still being considered for full-scale implementation.

4.4 Pit-Lake Treatment

Pit-lake treatment targeting COCs of selenium and nitrate is an in-situ technology that requires nutrient and carbon source dosing to create conditions for biological treatment within the pit-lake.

A conceptual assessment of full-scale pit-lake selenium treatment was completed (Golder 2017b) and the technology was deemed a cost-effective approach to managing selenium and was recommended for further bench and pilot-scale testing. Proof-of-concept bench-scale testing for pit-lake selenium treatment was also completed and showed effective removal of selenium and nitrate, with further pilot-scale testing recommended (Golder 2019c). A pilot-scale study for pit-lake treatment was designed for Cariboo Pit (Golder 2020c), but the pit is being dewatered to support future mining activities and this work has not yet been completed.

Pit-lake treatment targeting selenium and nitrate is still being considered for full-scale implementation and is currently assumed as part of the treatment system during closure/post-closure if required.

4.5 Saturated Rock Fill (SRF)

SRF treatment is a fixed-film anaerobic system targeting the treatment of selenium and nitrate and ideally utilizes a mined-out open pit as a bioreactor operated in a horizontal flow configuration.

A concept study for SRF treatment was completed (Golder 2020d) and SRF was recommended for further bench-scale and pilot-scale testing. Proof-of-concept bench-scale testing for SRF was also completed (Golder 2021), which showed effective removal of selenium and nitrate, but also indicated metal leaching. Detailed bench-scale testing and waste rock SRF substrate metal leach testing was recommended following completion of the proof-of-concept work. Bench-scale leach testing using anticipated SRF substrate waste rock from site was completed (Golder 2022d – draft RevA), which monitored leached metals over a long-term test period of 52 weeks. Results showed that metal leaching varies over time and differs between metals and must be considered during the start-up phase of SRF implementation (and may lead to additional required polishing treatment steps downstream of the SRF). Detailed bench-scale testing for SRF has been proposed for 2023 and a test plan has been submitted in draft to MPMC (Golder 2022e – draft RevA). Geotechnical and geochemical substrate characterization for SRF media waste rock is currently ongoing and anticipated for completion in 2023. It is anticipated that geochemical substrate characterization will be conducted by MPMC's geochemical consultant SRK.

SRF treatment is still being evaluated for full-scale implementation and is currently considered a technology option for semi-passive treatment of selenium and nitrate during closure/post-closure if required.

4.6 Packed Bed Reactor (PBR)

PBR treatment is another fixed-film anaerobic system targeting the treatment of selenium and nitrate. PBR treatment differs from SRF treatment through the use of a vertical flow (top to bottom) reactor.

Proof-of-concept bench-scale testing was completed (Golder 2019d) and PBR treatment was shown to be effective in reducing selenium and nitrate. Further detailed bench-scale and pilot-scale testing was recommended following completion of the initial testing. Detailed bench-scale testing for PBR has been proposed for 2023 and a test plan has been submitted in draft to MPMC (Golder 2022f – draft RevA).

PBR treatment is still being evaluated for full-scale implementation and is currently considered a technology option for semi-passive distributed treatment of selenium and nitrate during closure/post-closure if required.

4.7 Biochemical Reactor (BCR)

BCR treatment is another fixed-film anaerobic treatment technology that consists of a lined pond filled with a submerged organic substrate media mix. The main targeted COCs of this technology are selenium and nitrate. BCR treatment is passive and does not involve continuous dosing of a carbon source to the media bed.

Proof-of-concept bench-scale testing was completed (Golder 2019d) and BCR treatment was shown to be effective in reducing selenium and nitrate, but redox sensitive metals were present in the BCR effluent.

Upon review of the BCR technology in comparison to other passive and semi-passive technologies, MPMC decided to not proceed with further development of this technology (MPMC 2021) for the following reasons:

- Limited lifespan of BCR passive treatment systems based on the availability of a carbon source that is encapsulated in the system during construction – this needs to be replaced periodically at significant cost.
- Emission of elevated levels of biochemical oxygen demand (BOD) from the system during commissioning and start-up of operation that exceed standards for discharge to the environment.
- Persistent emission of phosphorus from the BCR during operation that will likely exceed plausible standards for discharge to the environment.

BCR treatment is no longer being developed as a passive treatment technology option during closure/post-closure.

4.8 Submerged Sand Reactor (SSR)

SSR is similar to other anaerobic reactor technologies, with the use of the existing tailings as media for the bioreactor. The main targeted COCs of this technology are selenium and nitrate.

A concept study was completed for SSR (Golder 2020d), as well as proof-of-concept bench-scale testing (Golder 2019d). Use of MPMC tailings as SSR bioreactor media or use of the site's TSF as an in-situ SSR was not recommended for further investigation. Bench-scale testing resulting in metal release in the reactor effluent when using site tailings as the reactor media. The concept study also concluded that further investigation of SSR was not warranted, based on a review of literature, an evaluation of historical water quality monitoring data, and an evaluation of the feasibility of utilizing the TSF from a hydrogeological and permitting perspective.

SSR treatment is no longer being developed as a treatment technology option during closure/post-closure.

4.9 Constructed Wetland Treatment (CWT)

MPMC retained Ensero Solutions Inc. (Ensero), formerly known as Contango Strategies Ltd., to conduct a detailed assessment and evaluation of the feasibility of a CWT system for passive/semi-passive treatment during closure/post-closure. The main targeted COCs of this technology are selenium and nitrate.

Pilot-scale design, sizing, and testing for CWT was completed by Ensero (Ensero 2020), and the technology demonstrated promising results for treatment of targeted COCs; however other passive/semi-passive technologies have indicated improved treatment capability in comparison. MPMC may choose to proceed with demonstration-scale on-site testing of CWT once the pilot-scale results have been fully understood and if the performance of competing technologies (SRF and others) indicates an advantage for CWT.

CWT is still being evaluated for full-scale implementation and is currently considered a technology option for passive/semi-passive and distributed treatment of selenium and nitrate during closure/post-closure if required.

5.0 ANTICIPATED FUTURE WORK

The existing and assumed water treatment systems for operations, closure, and post-closure have been outlined in this memorandum; however, changes may still be implemented during all phases of the mine as knowledge and needs evolve. The water treatment system for closure/post-closure will continue to develop in more detail as MPMC better understands technology capabilities and refines their final approach to water treatment for the closure period.

Table 3 provides a summary of the development stage of the treatment technologies implemented or being considered for operations, closure, and post-closure. Future work is anticipated for any technology still under consideration that has not achieved full-scale implementation. The following items describe the priority treatment work anticipated over approximately the next three years, but do not exhaustively describe all potential remaining work for technologies still under consideration:

- Actiflo technology is a component of the operations and closure/post-closure BAT and a main component of the existing treatment system during operations and assumed treatment system during closure/post-closure. Further development of the technology is anticipated with respect to PAC and TMT usage, as well improving the solid-liquid separation in the process to address potential high-copper instances. Several recommendations for future system improvements have been outlined in Golder 2020b, including supporting bench-scale and field trials. Recommendations are mainly focused on improving removal of particulate copper from the WTP effluent and improving the effectiveness of PAC and TMT use.
- Pit-lake treatment is currently assumed as a component of the closure/post-closure treatment system. Pilot-scale pit-lake work was anticipated for Cariboo pit, but recent mine operational changes have resulted in the draining of both Springer and Cariboo pits and pit-lake treatment trials are no longer feasible at these locations. Operational changes have also resulted in Wight pit being filled. The previous pilot-scale study designed for Cariboo pit (Golder 2020c) could be redesigned for Wight pit if operational conditions in the near future are deemed appropriate, further advancing the development of this technology.
- Two options exist as the BAT for treatment during closure/post-closure: distributed passive/semi-passive treatment systems, and pit-lake treatment followed by the centralized Actiflo plant. Golder has proposed to undertake a treatment option life cycle cost comparison study between the two options, informed by the knowledge gained during recent technology development, to assess pros/cons and capital and operating costs between the options and inform future treatment program development decisions.
- SRF and PBR detailed bench scale testing have been proposed to MPMC and this work is expected for completion in the near future to continue the development of these technologies.

6.0 CLOSURE

The reader is referred to the Study Limitations section, which precedes the text and forms an integral part of this memorandum. We trust that the information provided herein is sufficient for your needs at this time. If you have any questions or need additional information, please do not hesitate to contact us.

Appendix A - Permits

1 INTRODUCTION

The following describes the Biosolids Storage and Management Plan (the Plan) for the Mount Polley Mine (the Facility), which is located approximately 100 km northeast of Williams Lake, British Columbia (BC), near Likely, British Columbia (BC).

1.1 PLAN OBJECTIVES

This Plan is a guidance document for the storage and application of biosolids at the Facility apprising both the permitting requirements (Section 1.2) and the BC Ministry of Environment (MOE) Land Application Guidelines (BCMOE, 2008).

The objectives of the Plan are to:

- Meet the requirements of the M-200 (Section D-10) Approved Mine Plan and Reclamation Program, issued by the BC Ministry of Energy, Mines and Petroleum Resources pursuant to Section 10 of the *Mines Act* (1996) (MEMPR, 2020);
- Identify the requirements and specifications associated with the discharge of biosolids to tailings and waste rock disposal locations for the purpose of reclamation;
- Describe how the application of biosolids will be monitored;
- Describe inspection and maintenance procedures; and,
- Describe methods of monitoring and management actions based on monitoring and inspection results.

The Plan is a living document that may be periodically updated as new information becomes available or as authorizations and regulations change.

It is important to note that biosolids application has been previously completed at the Facility. Municipal biosolids of Grade A quality were sourced from Metro Vancouver and applied to three reclamation areas at the Facility in 2012 (Figure 1 and 2; SYLVIS, 2012). SYLVIS Environmental was retained by Metro Vancouver, as qualified professionals, to provide a certification of compliance with permitting requirements (Section 1.3) and to provide qualified professional services for the Mount Polley Biosolids Reclamation Program (SYLVIS, 2012). Refer to the Mount Polley Biosolids Reclamation Program prepared for Metro Vancouver for more information (SYLVIS, 2012).

1.2 PERMIT REQUIREMENTS

This Plan was developed by Mount Polley Mining Corporation (MPMC) to meet Biosolids Management requirements of the M-200 Permit (Section D-10) issued by the BC Ministry of Energy, Mines and Petroleum Resources (MEMPR, 2020).

This Plan is also developed by MPMC under the Amended Permit 15968 issued by the BC MOE under the *Environmental Management Act* (*EMA*), which authorizes MPMC to discharge biosolids to land for the purpose of mine site reclamation at the Mount Polley Mine under Section 120(3) (EMA, 2003).

In addition, any biosolids discharged at the Mount Polley Mine will meet or exceed the criteria specified in Division 3 of the Organic Matter Recycling Regulation (OMRR), BC Reg. 18, of the *EMA* and the *Public Health Act* (British Columbia, 2002).

1.3 PROVINCIAL AND FEDERAL REGULATIONS

Provincially, all phases of the mine life (e.g., construction, operation, decommissioning, and reclamation) are regulated under the *EMA*, the BC *Mines Act* (1996), the *Water Stainability Act* (2014), as well as other legislation implemented by the BC Ministry of Forests, Lands, Natural Resource Operations, and Rural Development (MFLNRORD) (MPMC, 2017).

The M-200 Permit and the Amended Permit 15968 issued to MPMC requires that the quality criteria of biosolids discharged at the Facility must be equivalent to Class B (or better, Class A); refer to Section 3.1 for more information regarding characteristics of authorized discharge (British Columbia, 2002).

1.4 FACILITY DESCRIPTION

The Facility represents the permitted areas of the mine where most mine-related activities occur, as shown in Figure 1. The Facility generally includes:

- The tailings storage facility (TSF) and surrounding areas;
- The crusher and mill processing site; and,
- Operations areas (open pits, waste rock dumps, stockpiles, roads, etc.).

The Facility has been in Care and Maintenance since May 31, 2019. Care and Maintenance operations are focused primarily on general site maintenance and to ensure that all water and environmental management systems are functioning as intended. Eleven full-time employees work in 4 shifts, including day shifts and night shifts. Environmental monitoring and sampling activities continue to be followed during the Care and Maintenance phase, as required by all permits.

1.5 TSF AND SURROUNDING AREAS

The TSF at Mount Polley Mine consists of tailings material and a single embankment made up of three dams including the Main Embankment, the Perimeter Embankment, and the South Embankment (Figure 2). During the TSF dam failure that occurred on August 4, 2014, water (both supernatant and interstitial) was released from the TSF, resulting in much of the tailings within the TSF being exposed to the elements (i.e., no longer submerged).

The breach of the Mount Polley TSF resulted in the deposition of tailings between Polley Lake and Hazeltine Creek (known as the Polley Flats); for the purpose of this Plan, the impacted areas between Polley Lake and Hazeltine Creek are also referred to as the Surrounding Areas (see Section 2.4).

1.6 CRUSHER AND MILL PROCESSING SITE

The crusher and mill processing site includes the crusher and mill building and the coarse ore pile, tertiary pile, fine ore (mill feed) pile, and pebble pile (Figure 1). No crushing operations are conducted during the Care and Maintenance period.

1.7 OPERATIONS AREAS

Open pits at the Facility include the Wight, Cariboo and Springer Pits, while the waste rock dumps include the Temporary Northwest Potential Acid Generating (PAG) Stockpile, North East Zone (NEZ) Rock Dump, and the South East Rock Dump (SERD) (Figure 2). Mineral extraction activities are not occurring during the Care and Maintenance period.

The three reclamation areas that have received biosolids applications to date are located at the North Bell Dump, the East Rock Dump (East RDS), and the NEZ Rock Dump (Figure 2) The biosolids stockpile is located within a series of containment berms upslope of the TSF as per requirements under the OMRR (Section 10.6.6 of the BCMOES, 2008; Figure 3). Soil stockpiles are located throughout the Facility and are a suitable source of overburden for mixing with biosolids (Figure 4).

1.8 SURROUNDING AREAS

Surrounding Areas are defined as the areas outside the Facility (i.e., permitted mine area) that were impacted by the TSF embankment breach (Section 2.1), including Polley Flats and the Hazeltine Creek Corridor, which are now subject to ongoing remedial works and monitoring (Golder, 2017; MPMC, 2018). For the purpose of this Plan, the Surrounding Area will also refer to the primary road networks that connect to the Facility, such as the Morehead-Bootjack Forest Service Road (FSR), Gavin Lake Road, and Mitchell Bay Road.

The Surrounding Area is characterized by Interior Cedar Hemlock (ICH) biogeoclimatic (BEC) zone vegetation, which consists of Western red cedar, Douglas-fir, hybrid spruce, and subalpine fir, with a lesser presence of trembling aspen, black cottonwood, and paper birch (MPMC, 2018). Much of the area has been harvested in commercial logging operations and is also used for cattle grazing (MPMC, 2018).

1.8.1 Polley Flats

Polley Flats is located south of Polley Lake and east of the TSF embankment breach (Section 2.1). Prior to the breach, Polley Flats was an established wetland with a riparian vegetation community that encompassed approximately 900 m of the upstream portion of Hazeltine Creek, where it immediately drains from Polley Lake. The wetland, Hazeltine Creek corridor, and associated riparian vegetation were significantly impacted from the release of effluent and tailings during the TSF embankment breach. The release deposited large volumes of mine-related materials into the Polley Flats wetland area and Hazeltine Creek corridor, stripping the riparian vegetation and native soil (Golder, 2017). Since the breach, MPMC has been conducting ongoing remediation of Polley Flats, including removal of tailings, wetland reconstruction, earth mounding, soil placement, planting native seeds, shrubs, and trees, and installing coarse woody debris (CWD) (Golder, 2017; MPMC, 2018).

1.8.2 Hazeltine Creek Corridor

Hazeltine Creek (watershed code (WSC): 160-585700) commences from the southern point of Polley Lake (WSC: 160-585700) and subsequently drains southeast for 8.5 km before terminating at Quesnel Lake (WSC: 160). Edney Creek (WSC: 160-5857-038) is a tributary of Hazeltine Creek and is located approximately 1 km upstream of the confluence of Hazeltine Creek and Quesnel Lake (Pedersen, 1998;

Province of BC, 2021). Prior to the tailings dam failure Bootjack Creek (WSC: 160 5857 487) was a major tributary of Hazeltine Creek, which has since been diverted into Polley Lake.

Hazeltine Creek provided extensive spawning habitat for Sockeye Salmon and Rainbow Trout prior to the TSF embankment failure (Pedersen, 1998). Following the TSF embankment failure, Hazeltine and Edney Creek were re-channelized and armoured, and engineered log structures were installed to improve fish rearing habitat (Golder, 2017). Passive wetland (sediment settling) ponds were constructed near the Quesnel Lake confluence to improve water quality and increase wildlife forage (Golder, 2017). Rehabilitation of the riparian habitat was initiated by planting native trees, shrubs, and seeds, and by using landscape techniques to improve site growing conditions, such as mounding soil, spreading CWD, and adding mulch (Golder, 2017).

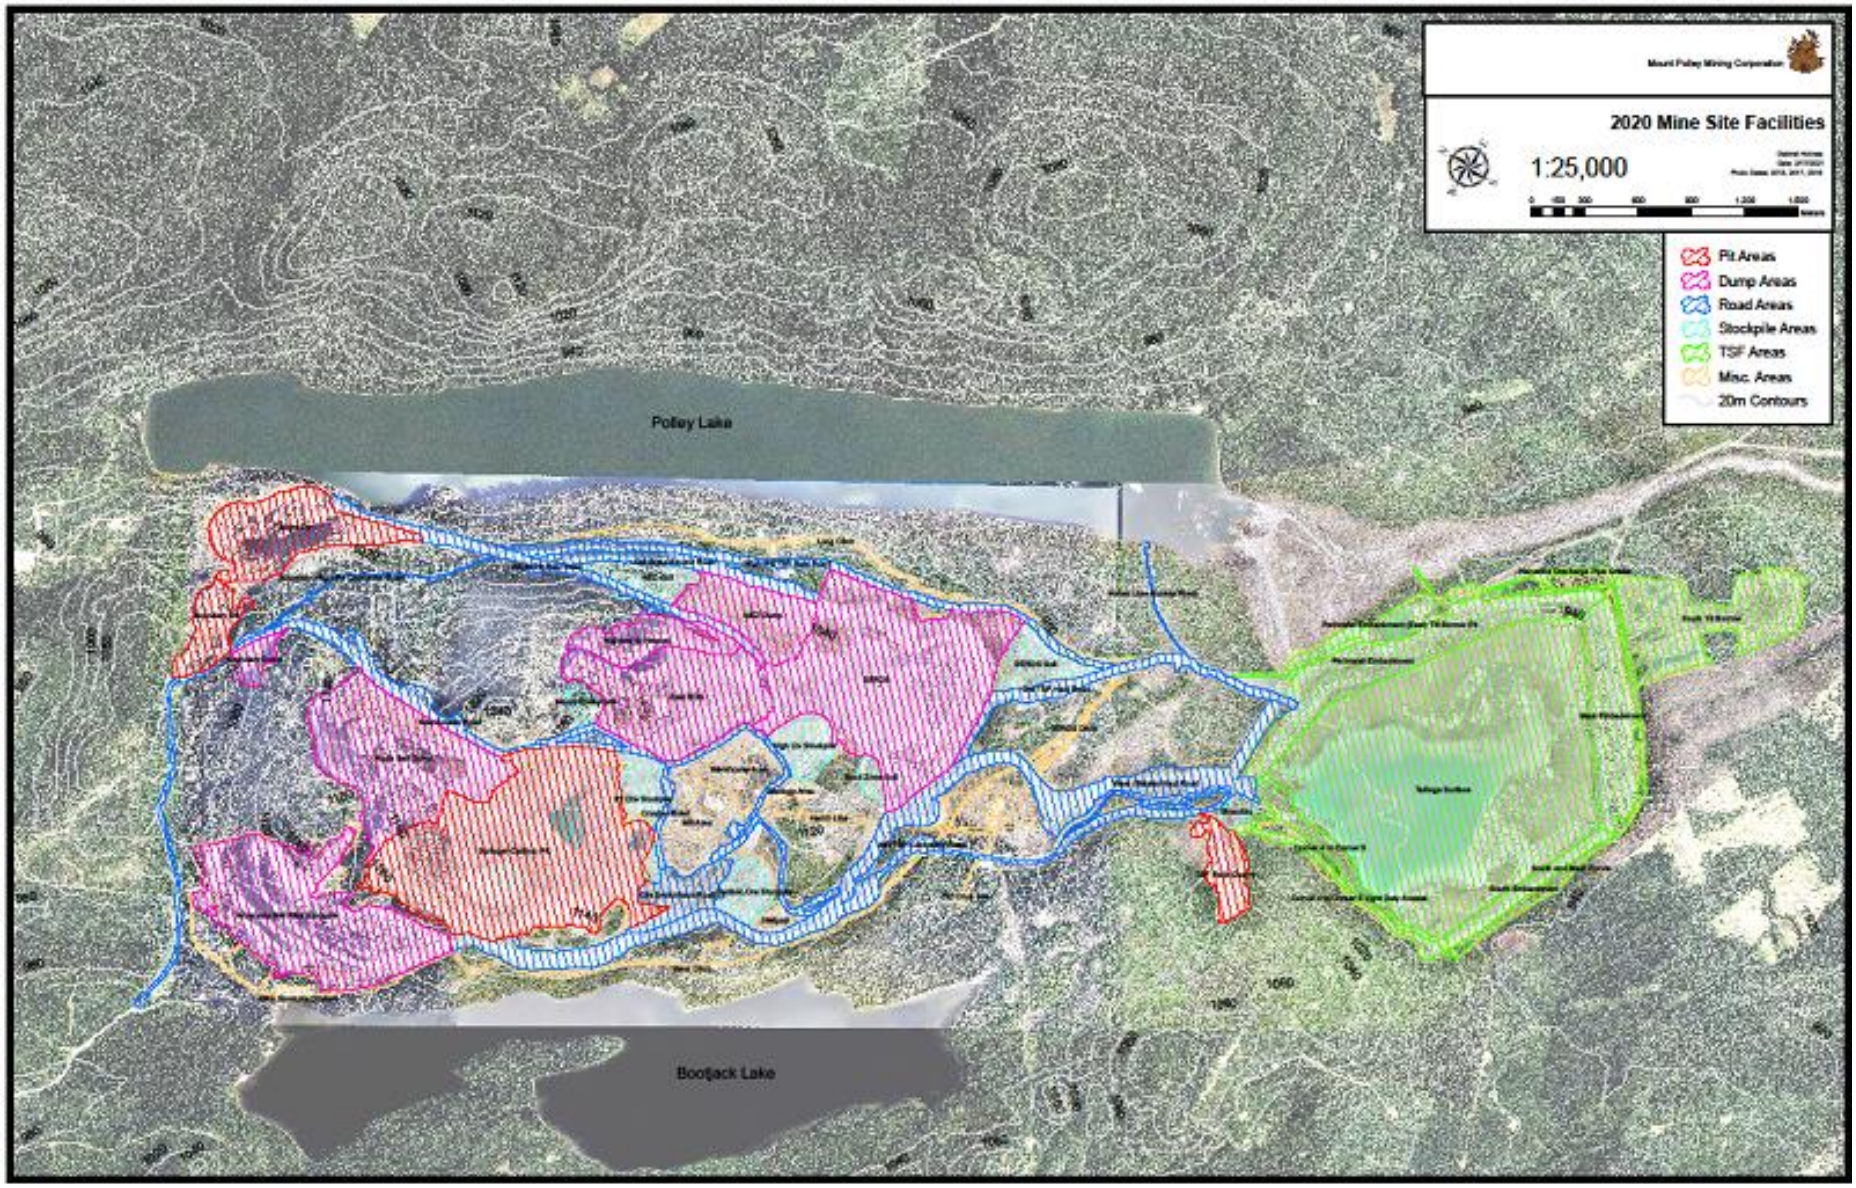

Figure 1. Mine Site Facilities.

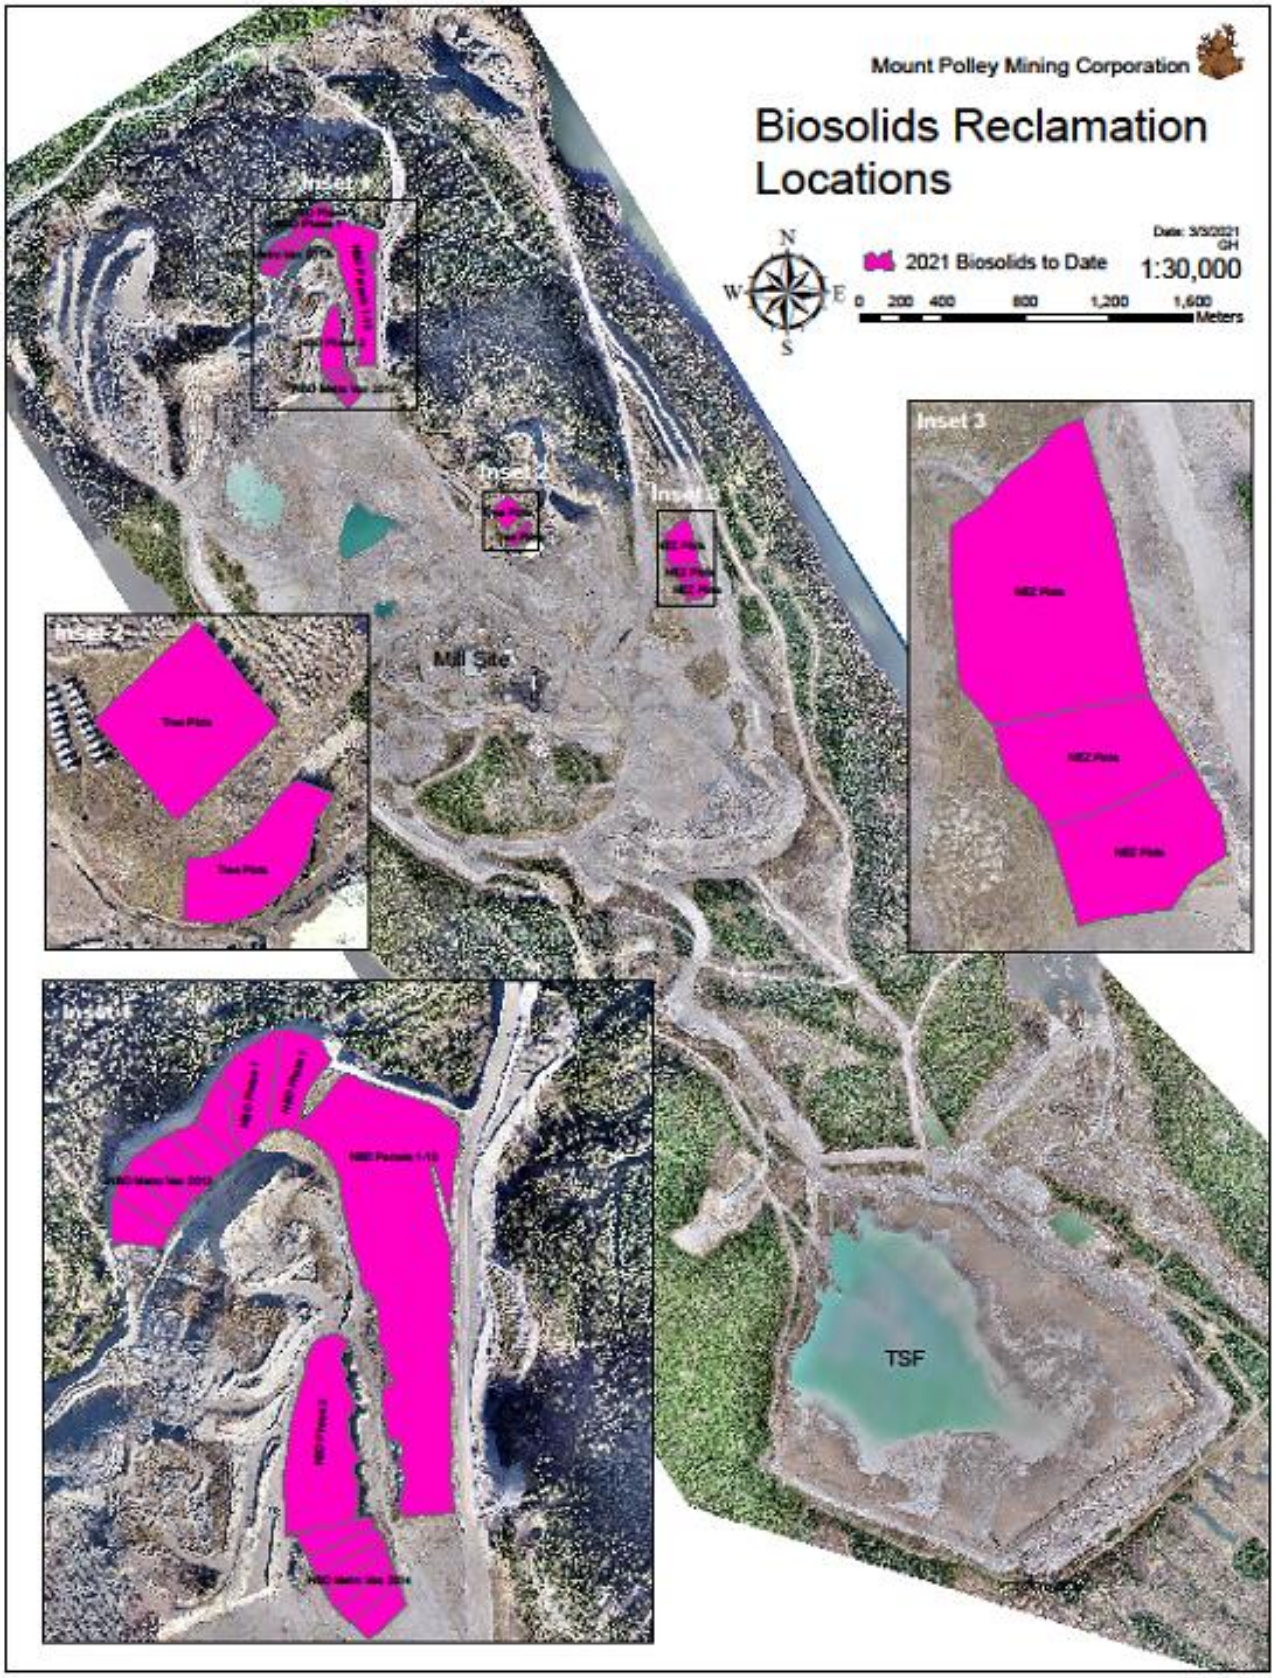

Figure 2. Areas of Biosolid Application Previously Completed.

Figure 3. Biosolids Stockpile at Tailings Storage Facility (TSF). The Stockpile is surrounded by a Berm.

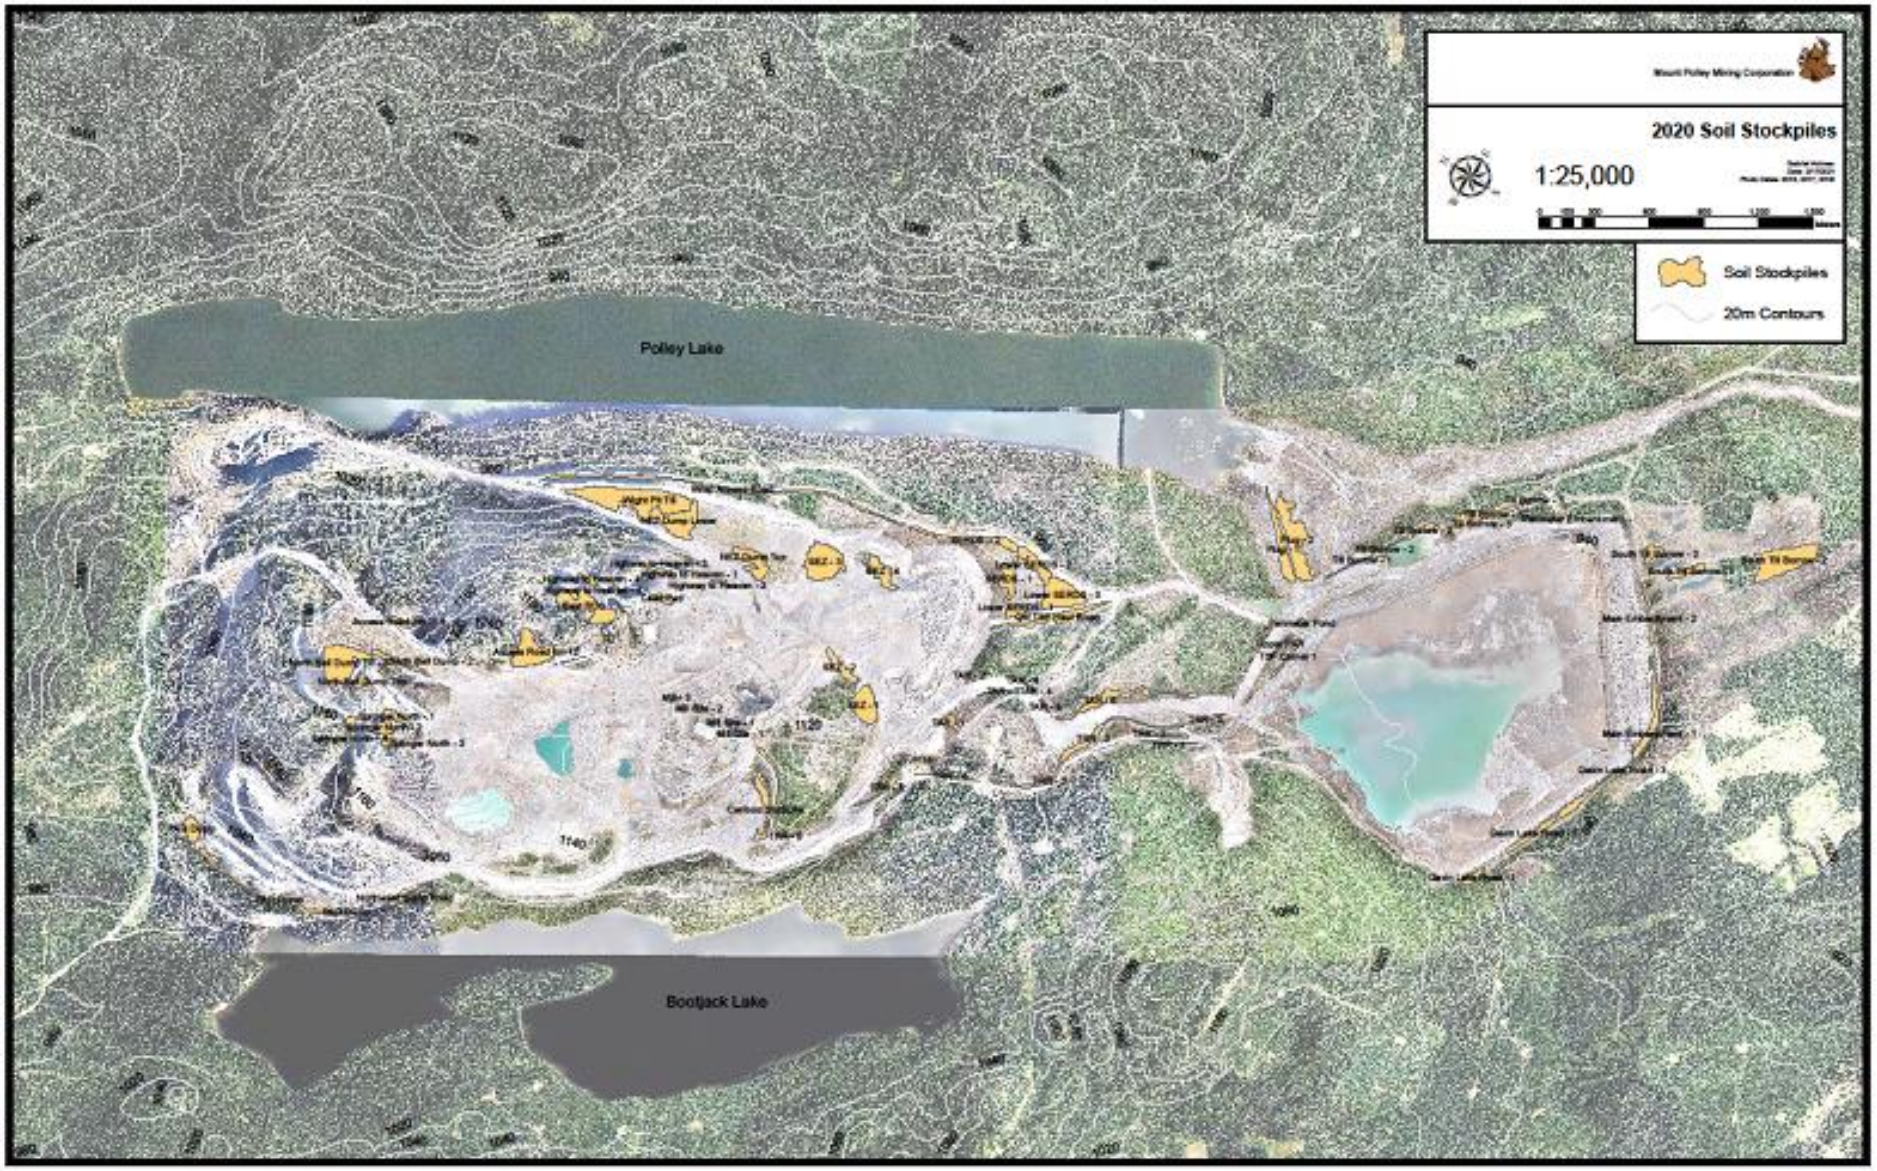

Figure 4. Soil Stockpiles, as of 2020, which are Available Throughout the Facility for Use and Incorporation during Biosolid Application.

2 BIOSOLIDS MANAGEMENT

MPMC has experience with biosolid application as part of an ongoing research program since 1998, which found biosolids to be an effective soil amendment to reclamation sites (MPMC, 2017). While biosolids promote initial tree establishment and root development, they can also increase understory growth that can cause competition with planted seedlings if improperly managed. To determine the most effective vegetation mix and biosolid application ratio to manage for invasive plants and noxious weeds, tree trials on two research parcels were established at the North Bell Dump at Mount Polley mine (MVRD, 2015). The trial design involved the analysis of control plots and treatment plots which included soil quality and nutrient status monitoring, pre-application overburden sampling, formal tree and shrub survival surveys, as well as ground cover and vegetation assessments (MVRD, 2015).

2.1 AUTHORIZED DISCHARGE

MPMC is authorized to discharge biosolids to tailings and waste rock disposal locations for the purpose of reclamation as per Section 1.1 of Permit 15968 (MOE, 2014). Application of biosolids under Section 1.1 is subject to the following terms and conditions:

- The maximum rate of discharge is 165 dry tonnes per hectare. The maximum cumulative discharge is 99,000 dry tonnes. Refer to Table 2 for historical applications of biosolids at the Facility.
- The characteristics of the discharge must be equivalent to Class B (or better, Class A) biosolids as specified in Division 3 of the OMRR (British Columbia, 2002).
    - **Class A** biosolids are the highest quality biosolid, contain low fecal coliform densities, and have lower trace element concentrations than **Class B** biosolids. **Class B** biosolids have less stringent trace element and fecal coliform requirements than Class A biosolids which results in more restrictions to application and distribution. See Table 1 for OMRR criteria for **Class A** and **B** biosolids.
- Biosolids will be stored and discharged within the area of permitted mine disturbance under *Mines Act* Permit M-200. Refer to Section 3.3 for additional biosolids storage requirements. Approximate locations of storage and application can be seen within the site plan in Figure 2 and Figure 3.

Table 1. Criteria for Class A and Class B Biosolids under OMRR Schedule 1,2,3 and 4 (BCMOE, 2008).

OMRR Criteria	Class A Biosolids	Class B Biosolids
Fecal Coliform (MPN/g)	<1,000	<2,000,000
Trace elements (µg/g)		
• Arsenic	75	75
• Cadmium	20	20
• Chromium	-	1,060
• Cobalt	150	150
• Copper	-	2,200
• Lead	500	500
• Mercury	5	15
• Molybdenum	20	20
• Nickel	180	180
• Selenium	14	14
• Zinc	1,850	1,850
Foreign Matter	<1%	<1%

*Class A and Class B biosolids are required to be sampled, analyzed and recorded under Schedule 5 and 6 of the OMRR.

Table 2. Historical Quantities of Biosolids Stockpiled and Applied at the Facility.

	Site ID	Date Stored/Applied	Total Biosolids Delivered/Utilized (dt)
Stockpiled	TSF	2009-2013	13,265
	NEZ	2008-2011	2,579
	North Bell	2012-2014	1178
Total			17,022
Applications	Tree Research Plots	2001/2001	56
	NEZ	2008	1,163
	North Bell Roadside Slopes	2011	1,416
	North Bell	2012	712
	North Bell Tree Trial Plots (Plots 2-6)	2013	269
	North Bell Tree Trial Plots (Plots 8-12)	2014	198
Total			3,813
Maximum allowable cumulative discharge = 99,000 dt Remaining allowable cumulative discharge = 95,187 dt Carry over stockpiled at TSF = 13,209 dt			

2.2 GENERAL REQUIREMENTS

Sections 2.1-2.6 of Permit 15968 outline general requirements that must be met for the application of biosolids at the Facility. These include:

- **Compliance**: MPMC will maintain security with the Minister of Finance as a condition of the Reclamation Permit (M-200; Section E-1) issued by the BC Ministry of Energy, Mines and Petroleum Resources (MEMPR, 2020).
- **Storage**: Biosolids will not be stored over winter unless in a designated storage facility. Storage facilities for biosolids will not be built within 100 meters upstream of any natural watercourse or ditch conveying non-mine influenced water and will be maintained to prevent biosolid escape. Refer to Section 3.3 for additional requirements for biosolids storage.
- **Application**: Biosolids will not be applied to reclamation sites during inclement weather conditions or during periods when the ground is frozen or snow-covered. Refer to Section 3.4 for more information on biosolids application.
- **Public**: Reclamation sites with public access will have warning signs posted at each application site entrance. The signs will describe the nature of the applied biosolids and must remain posted for at least 12 months from the most recent date of biosolids application to the reclamation site.
- **Professional Responsibility**: It is required by Section 2.6 of Permit 15968 (MOE, 2014) that MPMC will retain a suitable qualified professional, registered in BC under an appropriate professional organization, who will be responsible for the design, implementation, and monitoring of the program for the application of biosolids to land.

2.3 BIOSOLIDS STORAGE

MPMC currently has a biosolid stockpile located upslope of the TSF which is managed with the "Mount Polley Biosolids Stockpile Quality Control Protocols" (Figure 3). This biosolid stockpile has been in operation at the Facility since 2000 and is within a series of containment berms, as required under the OMRR (BCMOE, 2008). The biosolid stockpile has also been previously vegetated. Upslope and west of the biosolid stockpile is an unloading pad that is used for temporary storage to allow for sampling and analysis to determine if biosolids meet quality standards for Class A biosolids before incorporation into the pile; if sample analysis determines that biosolids do not meet Class A standards the material will be held until it can be removed from the site. The stockpile is visually inspected on a monthly basis, during snow-free conditions, to ensure no biosolids are escaping and impacting the surrounding environment.

The BC MOE Land Application Guideline provides no restrictions to stockpiles stored up to two weeks as long as movement from the stockpile does not occur (Section 10.6.6 of BCMOE, 2008). Biosolids can be stockpiled for up to nine months providing that the pile is greater than 30 m from surface water or wells and that the stockpiled biosolids are managed to prevent movement of material from the pile. It is recommended that the 30 m buffer from environmentally sensitive areas be applied to all stockpiled biosolid materials.

Storage of materials for longer than nine months must be in a permanent structure that is designed to prevent biosolid escape by leaching or run-off; a bermed area is sufficient for solid or dewatered residuals

(Section 10.6.6 of the BCMOE, 2008). Storage facilities for materials stored longer than nine months must be at least 15 m from watercourses and 30 m from wells. The Land Application Guideline also states that stockpiles will be covered in areas that exceed 600 mm in precipitation from October to March.

2.4 APPLICATION REQUIREMENTS

MPMC is required to retain a qualified professional to develop a monitoring plan for the biosolids application program that, at a minimum, provides information regarding the volume, quality and location of annual biosolids application which will be submitted no later than March 31, 2021 (as per Section 3.1 of the MOE Permit 15968 and Section D-10 of the M-200 Permit). MPMC will adhere to this plan and submit any updates to the Director within 30 days of implementation. MPMC will ensure that the shipment and use of biosolids at the Facility will be incorporated into their Annual Reclamation Report that includes volumes, material characteristics, storage locations, testing, and monitoring.

As part of each application, the biosolids, overburden, and receiving soil must be sampled independently to determine quality (i.e., biosolids, sampled on arrival) or existing condition of receiving soils (i.e., overburden, receiving soil) (BCMOE, 2008). These activities must be guided and performed by a qualified professional retained to oversee the applications. When sampling soils, including overburden, receiving soils or biosolids, samples will be taken in accordance with standard operating procedure MPMC-SOP-016 ABA and Soil Sampling (Quality Assurance/Quality Control Manual, MPMC, 2020) and work method MPMC-Work-016: ABA and Soil Sampling (Quality Assurance/Quality Control Manual, MPMC, 2020).

2.4.1 Pre-application

In accordance with the Mount Polley Biosolids Stockpile Quality Control Protocol (MPMC, 2013), municipal biosolids will be offloaded on a level unloading pad, located upslope and west of the biosolid stockpile, where they will be stored until an approved laboratory has determined that the biosolids meet Class A quality criteria (Table 1); laboratory analysis typically takes two weeks to process samples (MPMC, 2013). Upon verification from the laboratory that the samples meet Class A quality criteria (Table 1), biosolids will be loaded into the existing stockpile (MPMC, 2013). Refer to the Mount Polley Biosolids Stockpile Quality Control Protocol for more information on unloading and scheduling of biosolids deliveries (MPMC, 2013).

To determine baseline conditions of soil quality and nutrient status of reclamation areas, samples of both the receiving soil and the overburden material used to mix with the biosolids will be collected and tested prior to an application of biosolids, as required under the OMRR (Section 12.3 of the BCMOE, 2008).

In accordance with the BC MOE Land Application Guidelines, Grade A biosolids taken from the stockpile will be mixed in a test plot and sampled for trace element concentrations to confirm that the biosolids meet the quality criteria (Table 1) before their application to reclamation sites (BCMOE, 2008).

2.4.2 Application Methodology

2.4.2.1 Biosolids Application

As stated in Section 10.4 of the BC MOE Land Application Guidelines, the rate of discharge for each reclamation area will not only be dependent on the authorized discharge (Section 3.1; Table 2), but also the trace element concentrations, soil quality, and nutrient status present in both the receiving soil and the overburden material (BCMOE, 2008). Regulated residuals, or biosolids, are also required to have a defendable benefit to soil and vegetation (Section 10.4 of the BCMOE, 2008). Prior to application, the existing composition of the receiving soil and the overburden material must be determined in order to calculate the rate of discharge and the appropriate ratio for mixing of the overburden material and biosolids for each proposed reclamation area (BCMOE, 2008). Biosolid Soil Application logs will be recorded for scaling purposes to ensure compliance with the authorized discharge rate and for tracking in the event of an exceedance in trace element concentrations.

In past biosolids applications at the Facility, the reclamation mix was placed on receiving parcels and horizontally windrowed using a bulldozer (SYLVIS, 2012). Windrowing refers to the placement of reclamation mix horizontally across the application area to create rough, mounded surfaces with minimal compaction. Horizontal windrowing will minimize soil compaction and erosion potential as well as promote vegetation establishment with increased site diversity and soil water holding capacity (SYLVIS, 2012). The application of biosolids must be managed to ensure the use of non-competitive grass species and the reduction of seed densities (MPMC, 2017).

2.4.2.2 Revegetation

It is recommended to revegetate application areas following biosolids application. Well-established vegetative cover is one of the most effective methods of reducing erosion and stabilizing soils. Revegetation prescriptions (i.e., grasses, shrubs and deciduous and conifer tree planting) for areas at the Facility are outlined in Section 5.5 of the 2017 Reclamation and Closure Plan Update (MPMC, 2017). Any seed mix that is applied must meet grade of Canada No. 1 Forage Mixture or Canada No. 1 Ground Cover Mixture (as defined within the Seeds Regulation under the *Seeds Act*). Seed mixtures must also have a report of Seed Analysis to document their contents and ensure mixtures do not contain invasive species. Where surface erosion (e.g., compaction, rutting) is observed, additional best management practices will be employed to reduce erosion, as determined by the qualified professional.

2.4.3 Post-application

2.4.3.1 Soil Monitoring

Although not required by the OMRR, monitoring trace element concentrations in treated soil is recommended for due diligence to validate increases in productivity or soil/plant nutrient and to determine if there are negative environmental impacts as a result of biosolids application (Section 10.8 of the BCMOE, 2008). Areas that have received applications of biosolids should be sampled using the same sampling methodology as pre-application samples, to be tested for soil quality, nutrient status, and trace

element accumulations (Section 12.4.4 of the BCMOE, 2008). Post-application soil concentrations of trace elements should be compared with those present in the soil prior to application (BCMOE, 2008).

2.4.3.2 Vegetation Monitoring

Application of soil amendments can sometimes result in the accumulation of high nitrate levels within the foliage (e.g., 2500 to 3500 ppm) of vegetation established on the amended soils. This occurs most often with high nutrient amendments that are applied as a fertilizer (e.g., biosolids or manure). High nitrate levels within foliage can be toxic to livestock, and potentially wildlife, that forage on the vegetation in these areas. In addition, application of biosolids can sometimes result in elevated concentrations of Copper (Cu) in vegetation (i.e., biosolids), which at high concentrations, can be toxic to foraging livestock or wildlife (BCMOE, 2008). Elevated ammonia in biosolids have also been observed to cause root damage in planted seedlings (MVRD, 2015). It is recommended that vegetation monitoring be conducted to determine soil quality and nutrient status in areas that are revegetated as well as determine establishment success of vegetation (MVRD, 2015). The 2017 MPMC Reclamation and Closure Plan Update provides guidelines on vegetation monitoring (MPMC, 2017).

2.5 SAMPLING AND ANALYTICAL PROCEDURES

Sampling will be carried out in accordance with the British Columbia Field Sampling Manual for Continuous Monitoring and the Collection of Air, Air-Emission, Water, Wastewater, Soil, Sediment, and Biological Samples (Province of British Columbia, 2020a), or by suitable alternative procedures as authorized by the Director[1].

Analyses will be carried out in accordance with procedures described in the British Columbia Laboratory Manual (Province of British Columbia, 2020b), or by suitable alternative procedures as authorized by the Director.

As stated in Section 12.0 of the BC MOE Land Application Guidelines, samples will be collected by a qualified professional for every 1,000 dry tonnes (dt) of biosolids that are applied or on an annual basis; whichever is more frequent (BCMOE, 2008).

2.6 RISK MANAGEMENT TO HUMAN HEALTH AND ENVIRONMENT

All facility personnel and contractors working with or around biosolids will be briefed on the pertinent hazards or risks to human health and the environment that are associated with biosolids application by the qualified professional. Relevant staff training regarding the handling, sampling, and storing of biosolids will be conducted. The presence of emerging substances of concern (ESOC) in biosolids will be monitored and reported to manage their potential risk to microbial communities inhabiting the treated soil (LRCS, 2016). Source reduction initiatives will be implemented as a means of managing exposure pathways and mitigating toxicity of human waste to meet pathogen regulations (LRCS, 2016).

Biosolids will have limited human contact and will be immediately incorporated into the soil during application to reduce the exposure of humans to bioaerosols and odours resultant from biosolids

[1] "**Director**" means a person employed by the government and designated in writing by the minister as a director of waste management or as an acting, deputy or assistant director of waste management.

application, as well as to prevent grazing animals from ingesting the biosolids directly (LRCS, 2016). As seasonal precipitation can increase the risk of biosolids impact on aquatic ecosystems, biosolids applications will be avoided when the groundwater table is high and when there are concerns about potential runoff (LRCS, 2016).

2.7 REPORTING

Permittee will submit to the Director the data collected under the monitoring plan by April 30 of each year for the monitoring of the previous year as per Section 3.3 of Permit 15968 (MOE, 2014).

3 RESPONSIBILITIES

The following sections detail the responsibilities held by each of the employment levels at the Facility as they pertain to this Plan.

3.1 SENIOR MANAGEMENT REPRESENTATIVE: MINE MANAGER

The Senior Management Representative, or designate, is responsible for:

- Ensuring the required resources are in place to execute the Plan; and,
- Submitting the results of the Plan to all relevant Provincial agencies and Indigenous groups.

3.2 ACCOUNTABLE FACILITY REPRESENTATIVE: ACTING GENERAL MANAGER

The Accountable Facility Representative, or designate, is responsible for:

- Reviewing the effectiveness of the current biosolids management measures at the Facility;
- Scheduling and coordinating the implementation of the biosolids management measures; and,
- Training of site personnel and contractors on the Plan and best management practices to be implemented.

3.3 OPERATIONS SUPERVISOR: GENERAL FOREMAN

The Operations Supervisor, or designate, are responsible for:

- Reviewing the effectiveness of the current Plan;
- Maintaining documentation of schedules and logs;
- Implementing fugitive biosolids management measures; and,
- Forwarding biosolids observation reports from site personnel to the Accountable Facility Representative.

3.4 FACILITY PERSONNEL AND CONTRACTORS

All Facility Personnel and Contractors are responsible for:

- Following all biosolids management procedures that are currently in place; and,
- Reporting biosolids observations to appropriate supervisor.

3.5 TECHNICAL SERVICES SUPERINTENDENT

The Technical Services Superintendent is responsible for:

- Providing feedback on the effectiveness of the Plan at the Facility;
- Conducting internal audits of the biosolids management measures at the Facility;
- Coordinating external audits of the biosolids management measures at the Facility;
- Coordinating biosolids monitoring programs; and,
- Reporting results to regulatory authorities.

4 ADAPTIVE MANAGEMENT

The Plan will be continually adapted based on the results of ongoing biosolids monitoring programs, reclamation planning, incident and summary reports, and employee education programs. The adaptive management framework recognizes that new information obtained from these sources of information should be used to inform future planning, decision-making, mitigation, and program design to help MPMC maintain compliance. An annual review of the Plan will also be required to ensure adaptive management strategies can be successfully identified and integrated.

Permits

July 3, 2014

Tracking Number: 319721
Authorization Number: 15968

REGISTERED MAIL

MOUNT POLLEY MINING CORPORATION
SUITE 200
580 HORNBY ST
VANCOUVER, BC
V6C 3B6

Dear Permittee:

Enclosed is Amended Permit 15968 issued under the provisions of the *Environmental Management Act*. Your attention is respectfully directed to the terms and conditions outlined in the permit. An annual fee will be determined according to the Permit Fees Regulation.

This permit does not authorize entry upon, crossing over, or use for any purpose of private or Crown lands or works, unless and except as authorized by the owner of such lands or works. The responsibility for obtaining such authority rests with the permittee. This permit is issued pursuant to the provisions of the *Environmental Management Act* to ensure compliance with Section 120(3) of that statute, which makes it an offence to discharge waste, from a prescribed industry or activity, without proper authorization. It is also the responsibility of the permittee to ensure that all activities conducted under this authorization are carried out with regard to the rights of third parties, and comply with other applicable legislation that may be in force.

This decision may be appealed to the Environmental Appeal Board in accordance with Part 8 of the *Environmental Management Act*. An appeal must be delivered within 30 days from the date that notice of this decision is given. For further information, please contact the Environmental Appeal Board at (250) 387-3464.

…/2

Ministry of Environment
Environmental Protection Division
Suite 400 - 640 Borland St.
Williams Lake, BC V2G 4T1
Southern Interior Region - Cariboo
Telephone: (250) 398-4530
Facsimile: (250) 398-4214

Administration of this permit will be carried out by staff from the Southern Interior Region. Plans, data and reports pertinent to the permit are to be submitted to the Regional Manager, Environmental Protection, at Ministry of Environment, Regional Operations, Southern Interior Region, Suite 400 - 640 Borland St., Williams Lake, BC V2G 4T1.

Yours truly,

Shelley Metcalfe, P.Ag.
for Director, *Environmental Management Act*
Southern Interior Region - Cariboo

Enclosure

MINISTRY OF ENVIRONMENT

PERMIT

15968

Under the Provisions of the Environmental Management Act

MOUNT POLLEY MINING CORPORATION

SUITE 200
580 HORNBY ST
VANCOUVER BC V6C 3B6

is authorized to discharge biosolids to land for the purpose of mine site reclamation at the Mount Polley Mine located near Likely, British Columbia, subject to the terms and conditions listed below. Contravention of any of these conditions is a violation of the *Environmental Management Act* and may lead to prosecution.

This permit supersedes and amends all previous versions of permit 15968 issued under Part 2, Section 14 of the *Environmental Management Act*.

1. AUTHORIZED DISCHARGE

1.1 This subsection applies to the discharge of biosolids to tailings and waste rock disposal locations for the purpose of reclamation.

1.1.1 The maximum authorized rate of discharge is 165 dry tonnes per hectare. The maximum authorized cumulative discharge is 99,000 dry tonnes.

1.1.2 The characteristics of the discharge must be equivalent to or better than Class B biosolids as specified in the Organic Matter Recycling Regulation.

1.1.3 The authorized works are storage facilities, a truck washing site, spreading equipment and related appurtenances.

1.1.4 The location of the storage areas and the discharge is within the area of permitted mine disturbance under Mines Permit M-200, located approximately as shown on the attached site plan.

Date issued: December 13, 1999
Date amended: July 3, 2014
(most recent)

Shelley Metcalfe, P.Ag.
for Director, *Environmental Management Act*
Southern Interior Region - Cariboo

2. GENERAL REQUIREMENTS

2.1 The permittee must maintain security with the Minister of Finance as a condition of the Reclamation Permit issued by the Ministry of Energy and Mines.

2.2 Biosolids may not be stored over winter except at a designated storage facility.

2.3 The biosolids storage facilities must be constructed to the following specifications:

2.3.1 Biosolids may not be stored on site within 100 meters upstream of any natural watercourse or ditch conveying non mine influenced water.

2.3.2 The storage facility must be maintained in such a manner as to prevent the escape of biosolids.

2.4 Biosolids must not be applied to reclamation sites during inclement weather conditions or during periods when the ground is frozen or snow covered.

2.5 All reclamation sites which are accessible to the public must have warning signs posted at each gate or entrance to the application location. The signs must describe the nature of the biosolids that have been applied and must remain posted for a period not less than 12 months from the most recent date of biosolids application to the reclamation site.

2.6 The permittee must retain the services of a suitably qualified professional, registered in British Columbia with their appropriate professional organization, who must be responsible for the design, implementation, and monitoring of the program for the application of biosolids to land.

3. MONITORING REQUIREMENTS

3.1 Monitoring Plan

The permittee must retain a suitably qualified professional to develop a monitoring plan for the biosolids application program. This plan must at a minimum, address the volume, quality and location of biosolids applied each year. The permittee must comply with this plan. Updates to the monitoring plan must be submitted to the director within 30 days of implementation.

Date issued: December 13, 1999
Date amended: July 3, 2014
(most recent)

Shelley Metcalfe, P.Ag.
for Director, *Environmental Management Act*
Southern Interior Region - Cariboo

3.2 Sampling and Analytical Procedures

Sampling is to be carried out in accordance with the procedures described in the "British Columbia Field Sampling Manual for Continuous Monitoring and the Collection of Air, Air-Emission, Water, Wastewater, Soil, Sediment, and Biological Samples, 2003 Edition (Permittee)", or most recent edition, or by suitable alternative procedures as authorized by the Director. A copy of the above manual is available on the Ministry web page at www.env.gov.bc.ca/epd/wamr/labsys/lab_meth_manual.html.
Analyses are to be carried out in accordance with procedures described in the "British Columbia Laboratory Manual (2009 Permittee Edition)", or the most recent edition, or by suitable alternative procedures as authorized by the Director. A copy of the above manual is available on the Ministry web page at www.env.gov.bc.ca/epd/wamr/labsys/lab_meth_manual.html.

3.3 Reporting

The permittee must electronically submit to the director the data collected under the monitoring plan by April 30th of each year for the previous year's monitoring.

Date issued: December 13, 1999
Date amended: July 3, 2014
(most recent)

PERMIT

APPROVING MINE PLAN AND RECLAMATION PROGRAM

(Issued pursuant to Section 10 of the *Mines Act* R.S.B.C. 1996, c. 293)

Permit: **M-200** Mine No: **1101163**

Issued to: **Mount Polley Mining Corporation.**
PO Box 12
Likely, British Columbia
V0L 1N0

for work located at the:

Mount Polley Mine

Issue Date

August 3, 1995 Approving Work System and Reclamation Program

This permit supersedes and amends all previous versions of Permit M-200 issued pursuant to Part 10 of the *Mines Act*. (All previously approved works systems are hereby transferred under this permit.)

Amended at Victoria, British Columbia this 10th day of December in the year 2020.

J. Lowell Constable, P.Eng.
Deputy Chief Inspector of Mines
Major Mines Office

(This page is left intentionally blank)

PREAMBLE

The *Mines Act* Permit application, and applications for changes to approved works and conditions to Permit M-200, have been submitted to the Chief Permitting Officer, in accordance with Sections 10(1), 10(6), 10(7), and 11(1) of the *Mines Act*, and Sections 10.1.2 and 10.1.18 of the Health, Safety and Reclamation Code for Mines in British Columbia (Code).

Where more than one version of information exists in the application, the most recent version shall be considered the approved version unless otherwise stated or determined by the Chief Permitting Officer.

1. Approving Work System and Reclamation Program (Issued August 3, 1995)

1.1 Report entitled "The Mount Polley Project Reclamation Plan" by Hallam Knight Piesold Ltd., dated March 1995.
1.2 Report entitled "Mount Polley Access Road Reconnaissance Report" by SNC Fenco Inc., dated April 1995.
1.3 Reports entitled "Tailings Storage Facility Design Report" Volumes I and II and "Tailings Storage Facility Site Inspection Manual", prepared by Knight Piesold Ltd., dated May 26, 1995.

Application Received: April 6, 1995
Gazetted: Williams Lake Tribune April 13, 2015; and BC Gazette April 12, 1995

2. Approving Name Change (Issued June 13, 1996)

2.1 Application dated May 23, 1996.

3. Approval to Construct Tailings Storage Facility to Elevation 934m (Issued September 23, 1996)

3.1 Letter entitled "Mt. Polley Project – Tailings Storage Facility" and accompanying drawings prepared by Knight Piesold Ltd., dated June 14, 1996.
3.2 Letter report entitled "Borehole Logs for PRW 96-1 to" prepared by Knight Piesold Ltd., dated July 30, 1996.
3.3 Letter report entitled "Geotechnical Information Obtained from 1996 Borehole Investigation" prepared by Knight Piesold Ltd., dated July 26, 1996.
3.4 Letter report entitled "CPT Investigations at Main Embankment" prepared by Knight Piesold Ltd., dated July 30, 1996.
3.5 Letter report entitled "CPT Investigation", prepared by Knight Piesold Ltd, dated July 29, 1996.

Application Received: June 17, 1996

4. Approving Amendment of Reclamation Permit and Approval to Construct Open Pits and Waste Dumps, and Traffic Control Plan (Issued July 11, 1997)

4.1 Application entitled "The Mount Polley Mine Project Reclamation Plan", prepared by Hallam Knight Piesold Ltd., dated April 1996.
4.2 Letter dated June 11, 1997 from Mount Polley mining Corporation to Brian McBride.
4.3 The Annual Reclamation Report dated March 31, 1997.
4.4 Application entitled "Approval to Construct Open Pits and Waste Dumps" dated July 23, 1996.
4.5 A Report entitled "Report of Geotechnical Investigation and Design of the Open Pits and Waste Dumps" prepared by Knight and Piesold, dated July 5, 1996.
4.6 The "Traffic Control Plan" enclosed in the application entitled "Approval to Construct Open Pits and Waste Dumps", dated July 23, 1996.

Applications Received: May 1, 1996 and July 23, 1996

5. Approving Amendment to Construct Tailings Facility to Elevation 940 Meters (Issued April 7, 1998)

5.1 Application letter entitled "Construction Approval Request for Tailings Dam Works", dated March 27, 1997.
5.2 Report entitled "Report on On-Going Construction Requirements (Ref. No. 10162/9-3)", prepared by Knight Piesold Ltd., dated December 2, 1997.
5.3 Report entitled "Operation, Maintenance and Surveillance manual for Stage Ib Embankment (E1.934m)", prepared by Knight Piesold Ltd., dated November 24, 1997.
5.4 Report entitled "Report on Stage Ia/Ib Construction (ref. No. 10162/7-5)", prepared by Knight Piesold Ltd., dated August 14, 1997.

Application Received: April 2, 1998

6. Approving Construction of Tailings Storage Facility to Elevation 944 Meters (Issued June 13, 2000)

6.1 Application Letter entitled "Mt. Polley Tailings Storage Facility Application to Construct to Elevation 944 Meters Amendment Permit M-200" including Drawings 11162-13-210, -215, -130, and 11162-12-120, -125, dated May 25, 2000.
6.2 Report entitled "Tailings Cyclone Sands Geochemical Evaluation" prepared by Mt. Polley Mining Corporation, dated December 2, 1998.
6.3 Report entitled "Tailings Storage Facility, Evaluation of Cycloned Tailings for Embankment Construction", prepared by Knight Piesold Ltd., dated June 16, 1999.

6.4 Report entitled "Report on Cycloned Sand Construction of Stage 3 and On-going Stages of the Tailings Storage Facility, Volumes I and II", prepared by Knight Piesold Ltd., dated December 13, 1999.

6.5 Report entitled "Tailings Cyclone Sand Geochemical Evaluation Update", prepared by Mt. Polley Mining Corporation, dated February 2000.

6.6 Report entitled "Addendum to Report on Cycloned Sand Construction of Stage 3 and On-going Stages of the Tailings Storage Facility", prepared by Knight Piesold Ltd., dated May 11, 2000.

Application Received: June 2, 2000

7. Approving Tailings Storage Facility and Amended Metal Leaching and Acid Rock Drainage Conditions (Issued August 2, 2000)

8. Approving Construction of Tailings Storage Facility to Elevation 945 Meters (Issued May 30, 2001)

8.1 Application entitled "Mt. Polley Tailings Storage Facility Application to Construct to Elevation 945 Metres Amendment to Permit M-200", dated April 30, 2001.

8.2 Drawings 11162-13-100 Rev 3, -102 Rev. 3, -104 Rev 1, -120 Rev. 3, -125 Rev. 3, -127 Rev. 1, -130 Rev. 3, -210 Rev. 4, -215 Rev. 4, -250 Rev. 2, -251 Rev. 2, -256 Rev. 3, -258 Rev. 2, and -259 Rev. 3, submitted May 16, 2001.

8.3 Report entitled "Tailings, Cyclone Sands Geochemical Evaluation" prepared by Mount Polley Mining Corporation", dated December 2, 1998.

8.4 Report entitled "Tailings Storage Facility, Evaluation of Cycloned Tailings for Embankment Construction" prepared by Knight Piesold Ltd., dated June 16, 1999.

8.5 Report entitled "Report on Cycloned Sand Construction of Stage 3 and On-going Stages of the Tailings Storage Facility, Volumes I and II", prepared by Knight Piesold Ltd., dated December 13, 1999.

8.6 Report entitled "Tailings Cyclone Sands Geochemical Evaluation Update" prepared by Mount Polley Mining Corporation, dated February 2000.

8.7 Report entitled, "Addendum to Report on Cycloned Sand Construction of Stage 3 and On-going Stages of the Tailings Storage Facility" prepared by Knight Piesold Ltd., dated May 11,2000.

Application Received: May 16, 2000

9. Approving Milling of Ore and Tailings Deposition from the International Wayside Bulk Sample (Issued February 16, 2004)

9.1 Application letter, dated January 16, 2004.

Application Received: January 14, 2004

10. Approving Mining and Reclamation Program for the Northeast Zone and Approving Mine Restart (Issued November 1, 2004)

10.1 Application entitled "Amendment Application Northeast Zone", dated July 30, 2004.

Application Received: August 10, 2004

11. Approving Tailings Storage Facility Stage 4 Construction (Issued May 25, 2005)

11.1 Application entitled "Mount Polley Mining Corporation, Mount Polley Mine, Design of the Tailings Storage Facility to Ultimate Elevation" prepared by Knight Piesold, dated March 14, 2005.
11.2 Letter entitled "Mount Polley Mining Corporation, Mount Polley Mine, Design of the Tailings Storage Facility to Ultimate Elevation" prepared by Knight Piesold Ltd., dated April 14, 2005.

Application Received: March 17, 2005

12. Approving Haulage Road Construction from Northeast Zone to TSF (Issued August 2, 2005)

12.1 Application letter entitled "Mount Polley Haulage Road", dated June 17, 2005
12.2 Report entitled "Mount Polley Mining Corporation, Mines Act Permit M-200 Amendment Application Northeast Zone" dated June 17, 2005

Application Received: June 20, 2005

13. Approving Mining of Southeast Zone (Issued November 24, 2005)

13.1 Application entitled "Mines Act Permit M-200 Amendment Application Southeast Zone", dated July 8, 2005.

Application Received: July 13, 2005

14. Approving Change of Name and Deletion of Requirement to Monitor Blasting (Issued August 2, 2006)

14.1 Application letter entitled "Mount Polley Mining Corporation (MPMC) and Mount Polley Holding Company Limited (MPHCL)", dated January 16, 2006.
14.2 Application letter entitled "Variance Request for Section 1,2,3 (Health and Safety) M-200, Permit Northeast Zone" dated February 6, 2006.

Applications Received: January 23, 2006 and February 10, 2006

15. Approving Tailings Storage Facility Stage 5 Construction (Issued August 2, 2006)

15.1 Application entitled "Mount Polley Mining Corporation, Mount Polley Mine, Stage 5 Design of the Tailings Storage Facility", prepared by Knight Piesold Ltd., dated June 12, 2006.

Application Received: June 23, 2006

16. Approving Northeast Zone Dump Extension (Issued March 29, 2007)

16.1 Application entitled "Mount Polley Mining Corporation, Amendment Application Northeast Zone Dump Expansion", dated December 21, 2006.

Application Received: January 8, 2007

17. Approving Copper Oxide Test Heap Leach Facility (Issued March 29, 2007)

17.1 Application entitled "Test Leach, Operations/Environment Monitoring Manual", dated June 28, 2006.
17.2 Report entitled "Report on Feasibility Design of Test Heap Leach Pad", prepared by Knight Piesold Consulting, dated October 20, 2006

Application Received: July 6, 2006

18. Approving Boundary Road (Issued August 31, 2007)

18.1 Notice of Work Application entitled "Boundary Road Application – Mount Polley", dated March 5, 2007.
18.2 Memorandum entitled "Mount Polley- Waste Dump and Haul Road", by Golder Associates, dated August 29, 2007.
18.3 Report entitled "Geotechnical Assessment of Proposed Boundary Haul Road", by Golder Associates, dated January 3, 2007.

Application Received: March 12, 2007

19. Approving Wight Pit High Wall Rehabilitation (Issued December 5, 2007)

19.1 Application entitled "Wight Pit High Wall Rehabilitation Program", dated October 17, 2007.

Application Received: October 19, 2007

20. Approving Tailings Storage Facility Stage 6 Construction (Issued February 19, 2008)

20.1 Application letter, entitled "Stage 6 Design Report for the Tailings Storage Facility – Mount Polley Mine" prepared by the Mount Polley Mining Corporation, dated July 4, 2007.
20.2 Report entitled "Stage 6 TSF Design of the Tailings Storage Facility" prepared by Knight Piesold, dated June 18, 2007.
20.3 Letter entitled "Mount Polley Stage 6 TSF Design" prepared by Knight Piesold, dated December 19, 2007.

Application Received: July 25, 2007

21. Approving Transfer of Road Use, Maintenance and Reclamation Obligations (Issued March 6, 2008)

21.1 Application entitled "Transfer of Road Use and Maintenance Obligations Under Permit M-200", dated January 31, 2008.

Application Received: February 14, 2008

22. Approving Mining and Reclamation Program for the Pond Zone (Issued July 8, 2009)

22.1 Application entitled "Pond Zone Permit Application to Amend M-200 - Mount Polley", dated January 30, 2009.
22.2 Document entitled "Response to MEMPR Comments Respecting the Pond Zone Pit Application Addendum I", dated May 4, 2009.
22.3 Report entitled "Pond Zone Waste Rock Management Plan, Mount Polley Mine", dated June 2009.

Application Received: February 10, 2009

23. Approving Mining of the C2 and Boundary Zone Pits (Issued August 15, 2011)

23.1 Application entitled "Mine Permit Amendment Application" dated November 1, 2010.
23.2 Report entitled "Revised Mine Permit Amendment Application", prepared by Mount Polley Mining Corporation, dated November 1, 2010.
23.3 Report entitled, "Item 1 – Tailings Storage Facility Calculation", prepared by Mount Polley Mining Corporation, undated, submitted December 22, 2010.
23.4 Report entitled, "A Review of the Stability of the Proposed Southeast Waste Rock Dump", prepared by Golder Associates, dated December 23, 2010.
23.5 Report entitled, "Technical Memorandum on Field and Laboratory Investigations (for West Dumps)", prepared by Golder Associates, dated December 1, 2010.

23.6 Report entitled, "ABA Sampling Procedure", prepared by Mount Polley Mining Corporation, received December 22, 2010.
23.7 Report entitled "Mount Polley Water Balance 2010 Update", prepared by Mount Polley Mining Corporation, undated.
23.8 Report entitled "Permit Conditions Response", prepared by Mount Polley Mining Corporation, received on December 22, 2010.
23.9 Report entitled "Detailed Site Plan" undated.
23.10 Email entitled "RE: Permit amendment application – geochem questions", from Mount Polley Mining Corporation received May 5, 2011.
23.11 Email entitled – "FW: Permit Amendment 5 questions", from Mount Polley Mining Corporation, received May 12, 2011.

Application Received: November 9, 2010

24. Approving Tailings Storage Facility Stage 8 Construction (Issued June 29, 2012)

24.1 Application entitled "Mount Polley Mine – 2012 Tailings Construction," dated April 3, 2012.
24.2 A report entitled "Tailings Storage Facility – Stage 8 2012 Construction Monitoring Manual" prepared by AMEC Environmental & Infrastructure, dated March 30, 2012.

Application Received: April 3, 2012

25. Approving Tailings Storage Facility Stage 8A Construction (Issued October 15, 2012)

25.1 Application to allow 2012 construction to the 965m elevation (Stage 8A Raise), dated September 18, 2012.
25.2 Report entitled "Tailings Storage Facility – Stage 8 2012 Construction Monitoring Manual," prepared by AMEC Environmental & Infrastructure, dated March 30, 2012.
25.3 Letter report entitled "2012 Stage 8A Tailings Storage Facility Construction Drawings and Stability Analyses for Embankment Raise to El. 965 m," prepared by AMEC Environmental & Infrastructure, and dated September 10, 2012.

Application Received: September 18, 2012

26. Approving Boundary Zone Underground Project (Issued March 25, 2013)

26.1 Application entitled "Boundary Zone Underground Project", dated August 23.

Application Received: August 30, 2012

27. Approving Processing 15000 Tonnes of Ore from Dome Mountain (Issued April 22, 2013)

27.1 Letter application entitled "Approval to Process a Total of 15,000 Tonnes of Ore from Dome Mountain", dated February 26, 2013

Application Received: February 26, 2013

28. Approving Northwest PAG Dump Expansion and South Haul Road (Issued July 25, 2013)

28.1 Application entitled "Mine Permit Amendment Application", dated November 1, 2012.

28.2 Report entitled "A Review of the Proposed Northwest Dump and the Tailings Ponds: Mount Polley Mine", prepared by Golder Associates Ltd, dated March 28, 2013.

28.3 Document entitled "Surface Erosion Prevention and Sediment Control Plan", prepared by Mount Polley Mining Corporation, dated 2010.

28.4 Document entitled "Environmental Management Plan for the Installation of a Culvert in Bootjack Creek", prepared by Mount Polley Mining Corporation, undated.

Application Received: November 1, 2012

29. Approving Tailings Storage Facility Stage 9 Construction (Issued August 9, 2013)

29.1 Application to construct the Stage 9 dam raise on the TSF submitted on April 18, 2013.

29.2 Report entitled "Tailings Storage Facility – Stage 9 2013 Construction Monitoring Manual," prepared by AMEC Environmental & Infrastructure, dated April 11, 2013.

29.3 Report entitled, "Mount Polley Mine Tailings Storage Facility Operation, Maintenance and Surveillance Manual", prepared by Mount Polley Mining Corporation, dated July 1, 2013.

29.4 2013 Site Water Balance, submitted by Mount Polley Mining Corporation on May 21, 2013.

Application Received: April 18, 2013

30. Approving Cariboo Phase 4 Expansion (Issued March 17, 2014)

30.1 Report entitled "Review of Cariboo Pit Slope Design", prepared by Golder Associates, dated January 31, 2014.

Application Received: February 17, 2014

31. Approving Change to Reclamation Security Schedule (Issued March 27, 2014)

32. Approving Waste Rock and Tailings Comingling Research Project (Issued June 24, 2014)

32.1 Application entitled "Mount Polley Mine Research Project: Co-Mingling of Waste Rock with Non-Acid Generating Tailings", dated March 18, 2014.

Application Received: March 18, 2014

33. Approving TSF Breach Repair and Perimeter Embankment Buttress Design for 2015 Freshet (Issued December 17, 2014)

33.1 Report entitled "2015 Freshet Embankment Design" (Application), prepared by Golder Associates, dated November 28, 2014.
33.2 Memo entitled "Site Water Management", prepared by Mount Polley Mining Corporation, dated December 10, 2014.
33.3 Memo entitled "Materials (PAG) Management", prepared by Mount Polley Mining Corporation, dated December 10, 2014.

Application Received: November 28, 2014
Application Referred: November 29, 2014
MDRC Meetings: November 5, 2015 and December 5, 2014

34. Approving Return of Restricted Restart of Operations (Issued July 9, 2015)

34.1 Report entitled "Permit Amendment Application, Mount Polley Mine Return to Restricted Operations Revision 1" Prepared by Mount Polley Corporation, dated March 20, 2015.
34.2 Letter entitled "Review of Acid-Base Accounting of Ore Materials", prepared by SRK Consulting Inc., dated June 18, 2015.
34.3 Report entitled "Acid-Base Accounting of Ore Materials", prepared by Mount Polley Mining Corporation, dated June 18, 2015.
34.4 Report entitled "Ore Stockpile Characterization Plan, Mount Polley Mine", prepared by SRK Consulting Inc., dated May 2015.
34.5 Report entitled "Closure Management Manual", prepared by Mount Polley Mining Corporation, dated May 27, 2015.
34.6 Report entitled "Ore Stockpile Geochemical Characterization Program Update", prepared by Mount Polley Mining Corporation, dated May 23, 2015.
34.7 Procedure entitled "Working Safely Around Water", prepared by Mount Polley Mining Corporation, dated May 21, 2015.
34.8 Report entitled "Mine Plan Synopsis", prepared by Mount Polley Mining Corporation, dated May 21, 2015.
34.9 Technical Memorandum entitled "Assessment of Groundwater Seepage Outflows from Springer Pit to Bootjack Lake at the Mount Polley Mine, BC", prepared by Golder Associates, dated May 8, 2015.

34.10 Report entitled "Erosion and Sediment Control Management Plan", prepared by Mount Polley Mining Corporation, dated April 30, 2015

Application Received: March 20, 2015
Application Referred: March 30, 2015
MDRC Meetings: March 31, 2015 and April 28, 2015

35. Approving Main Embankment Buttress (Issued October 22, 2015)

35.1 Report entitled "Mount Polley Tailings Storage Facility Elevation 970 m Embankment Stability Analysis and Buttress Design," prepared by Golder Associates, dated July 10, 2015.
35.2 Letter entitled "Tailings Storage Facility – Elevation 970 m Buttress Construction", prepared by Mount Polley Mining Corporation, dated July 31, 2015.
35.3 Report entitled "Mt. Polley Tailings Storage Facility Surficial Geology and Quaternary Geological Overview of the Mt. Polley Tailings Storage Facility (TSF) Area, British Columbia", prepared by Golder Associates, dated July 6, 2015.
35.4 Report entitled "2015 Geotechnical Investigation Factual Report Mount Polley Tailings Storage Facility, Likely, BC", prepared by Golder Associates, dated July 7, 2015.

Application Received: August 1, 2015
Application Referred: August 10, 2015

36. Approving Upstream TSF Construction and 2016 Freshet Water Management (February 25, 2016)

36.1 Application entitled "Amendment to Permit M-200 (Mount Polley Mine) – 2016 Freshet TSF Contingency Use", prepared by Mount Polley Mining Corporation, dated November 19, 2015.
36.2 Letter application entitled "Site Conditions Update (#5) – Site Water Management and Upstream Tailings Storage Facility (TSF) Construction", prepared by Mount Polley Mining Corporation, dated February 2, 2016.
36.3 Report entitled "Tailings Storage Facility Detailed Design to Elevation 970 m", prepared by Golder Associates Ltd., dated November 3, 2015.

Applications Received: November 19, 2015 and February 2, 2016
Application Referred: December 17, 2015
MDRC Meeting: February 4, 2016

37. Approving Springer Pit Lake Elevation Increase (Issued March 17, 2016)

37.1 Letter application entitled "Temporary Storage in the Springer Pit Above 1030 m asl Elevation" prepared by Mount Polley Mining Corporation, dated February 22, 2016.
37.2 Letter regarding "Site Conditions Update (#5) – Site Water Management and Upstream Tailings Storage Facility (TSF) Construction", dated February 2, 2016, prepared by Mount Polley Mining Corporation.
37.3 Technical Memorandum "Mount Polley Mine – Prediction of Water Level and Seepage from the Springer Pit and Bootjack Lake Water Quality", dated March 7, 2016, prepared by Golder Associates Ltd.

Applications Received: February 22, 2016
Application Referred: February 22, 2016
MDRC Meeting: February 4, 2016

38. Approving Extension to Restricted Restart of Operations and Corner 1 Buttressing (Issued April 29, 2016)

38.1 Letter application entitled "Extension to Restricted Operations", prepared by Mount Polley Mining Corporation, dated February 23, 2016.
38.2 Letter application entitled "Amendment to *Mines Act* Permit M-200 (Mount Polley Mine) – El. 963m Corner 1 Perimeter Embankment Buttress", prepared by Mount Polley Mining Corporation, dated April 19, 2016.
38.3 Memorandum entitled "Mount Polley Mine – Prediction of Water Level and Seepage from the Springer Pit and Bootjack Lake Water Quality", prepared by Golder Associates Ltd., dated March 7, 2016.
38.4 Letter entitled "Site Conditions Update (#6)", prepared by Mount Polley Mining Corporation, dated March 25, 2016.
38.5 Letter entitled "Water Treatment Plant (WTP) Capacity Increase Plan", prepared by Mount Polley Mining Corporation, dated March 31, 2016.
38.6 Technical Memorandum entitled "Update to the Assessment of Seepage Conditions near the Springer Pit – Mount Polley Mine – Rev 0", prepared by Golder Associates Ltd., dated April 26, 2016.
38.7 Report entitled "Tailings Storage Facility Detailed Design to Elevation 970 m", prepared by Golder Associates Ltd., dated November 3, 2015.

Applications Received: February 23, 2016 and April 19, 2016
Application Referred: March 11, 2016
MDRC Meeting: March 17, 2016 and April 15, 2016

39. Approving Return to Full Operation and Use of Tailings Storage Facility (Issued June 23, 2016)

39.1 Application entitled "Mount Polley Mine Return to Full Operations", prepared by Mount Polley Mining Corporation, dated November 6.

39.2 Report entitled "Mine Reclamation and Closure Plan Update November 2015" prepared by Mount Polley Mining Corporation, dated November 6, 2015.

39.3 Report entitled "Mount Polley Mine Return to Restricted Operations: Mine Plan Synopsis" prepared by Mount Polley Mining Corporation, dated May 21, 2015.

39.4 Report entitled "Tailings Storage Facility Detailed Design to Elevation 970m", prepared by Golder Associates, dated November 3, 2015.

39.5 Report entitled "Tailings Storage Facility Life of Mine Feasibility Design", prepared by Golder Associates, dated November 3, 2015.

39.6 Report entitled "Cariboo-Springer Pit Phase 4 Water Management Plan (TSF 970m Design)", prepared by Golder Associates, dated November 2, 2015.

39.7 Report entitled "Response to BCMEM Screening Comments – Quantitative Performance Objectives", prepared by Golder Associates, dated January 27, 2016.

39.8 Report entitled "Review of Cariboo Pit Slope Design" prepared by Golder Associates, dated January 31, 2014.

39.9 Report entitled "MPMC-SOP-016: ABA and Soil Sampling", prepared by Mount Polley Mining Corporation, dated March 23, 2016.

39.10 Report entitled "MPMC-WORK-016: ABA and Soil Sampling", prepared by Mount Polley Mining Corporation, dated March 23, 2016.

39.11 Report entitled "Water Management Plan and System Review", prepared by Mount Polley Mining Corporation, dated March 31, 2016.

39.12 Report entitled "Permit amendment application to discharge treated water to Quesnel Lake via Hazeltine Creek", prepared by Mount Polley Mining Corporation, dated September 25, 2015.

Applications Received: November 6, 2015
Application Referred: February 2, 2016
MDRC Meeting: February 4, 2016; March 17, 2016; April 15, 2016; and May 16, 2016

40. Approving TSF Upstream Drain Design Modification (Issued July 22, 2016)

40.1 Application entitled "Mount Polley Mine Tailings Storage Facility Embankment Construction to Elevation 970 m – Upstream Design Modification", prepared by Golder Associates Ltd., dated June 30, 2016.

Applications Received: July 4, 2016
Application Referred: July 4, 2016

41. Approving Security Schedule (Issued June 29, 2017)

41.1 Letter application entitled "Mount Polley Mine Reclamation Security Installment Schedule", prepared by Mount Polley Mining Corporation, dated June 22.

Applications Received: June 22, 2017

42. Approving Reclamation and Closure Plan (Issued December 10, 2020)

42.1 Application entitled "Mine Reclamation and Closure Plan Update January 2017", prepared by Mount Polley Mining Corporation, dated January 15, 2017.
42.2 Report entitled "ML/ARD Management Procedure Manual", prepared by Mount Polley Mining Corporation, dated January 5, 2016.
42.3 Report entitled "Actiflo – Operation & Maintenance Manual Mount Polley", prepared by Veolia Water Technologies Canada Inc., dated January 2016.
42.4 Report entitled "Mount Polley WWTP, BC – Operation and Maintenance Manual Volume 2" prepared by Veolia Water Technologies Canada Inc., dated January 2016.

Application Received: January 16, 2017
Application Referred: April 5, 2017

Mine Development Certificate 92-13 was issued for this project by the Minister of Energy, Mines and Petroleum Resources, with the concurrence of the Minister of Environment, Lands and Parkes under the authority of the former *Mine Development Act* on October 6, 1992. On June 30, 1995 the *Environmental Assessment Act* (the Act) came into force. Section 93(8) of the Act deemed that Mine Development Certificate 92-13 was issued under the Act and as such, the certificate continued to be in force as Project Approval Certificate M96-07 pursuant to the *Environmental Assessment Act* R.S.B.C 1996, C.119.

This permit contains the requirements of the Ministry of Energy, Mines and Petroleum Resources. It also is compatible, to the extent possible, with the requirements of other provincial ministries. However, nothing in this permit limits the authority of other provincial ministries to set other conditions, or to act independently, under their respective permits and legislation.

Decisions made pursuant to this permit by staff of the Ministry of Energy and Mines will be made following consultation with the Williams Lake First Nation, Xat'sull First Nation (Soda Creek Indian Band), other provincial ministries and federal departments and agencies, as appropriate, within reasonable timeframes.

The mine is located in the asserted traditional territory of the Williams Lake First Nation and Xat'sull First Nation. Representatives of the Williams Lake First Nation and Xat'sull First Nation participated in the CMDRC meetings and extensive discussions of the application.

Table of Contents

PREAMBLE **3**
CONDITIONS **18**
A. General **18**
1. Compliance with *Mines Act* and Code 18
2. Departure from Approval ..... **Error! Bookmark not defined.**
3. Permit Approval 18
4. Permit 18
5. Maintenance of Mine 18
6. Reports to be signed by a Qualified Professional 19
7. Responsibility to Reclaim 19
8. Information Sharing 19
B. Health and Safety **20**
1. Mine Emergency Response Plans (MERP) 20
C. Geotechnical **21**
1. General 21
2. Underground Mine 21
3. Surface Pits 23
4. Waste Rock Dumps 24
5. Tailings Storage Facility 26
6. Surface Water Ponds, Ditches and Diversions 26
7. Soil, Overburden, Rock and Ore Stockpiles 27
8. Borrow Pits and Quarry Excavations 27
9. Mine Site Roads 27
10. Mine Site, Plant, Shop, and Other Infrastructure 28
D. Protection of Land and Watercourses **29**
1. Environmental Management System 29
2. Environmental Site Management 29
3. Metal Leaching (ML) and Acid Rock Drainage (ARD) 29
4. Surface and Ground Water Management and Monitoring 32
5. Model Validation and Updated Water Quality Predictions 33
6. Water Treatment 33
7. Fugitive Dust Management 34
8. Sediment and Erosion Control 34
9. Soil Salvage and Stockpiling 35
10. Biosolids Management 36
11. Vegetation Management 36

CONDITIONS

The Chief Permitting Officer hereby approves the Mine Plan and Reclamation Program as submitted in the Application(s), subject to compliance with the following conditions:

A. General

1. Compliance with *Mines Act* and Code

The Permittee shall ensure all work is in compliance with all sections and parts of the *Mines Act* and the Health, Safety and Reclamation Code for Mines in B.C. (Code), and the Permittee shall obey all orders issued by the Chief Inspector of Mines (Chief Inspector) or their delegate.

2. Permit Approval

(a) The Permittee is authorized under this permit (M-200) for development, including surface disturbance and works, encompassing approximately 1744 Ha (Figure 1 – Permitted Mine Area). The Permittee is not approved to develop borrow sources located outside of the permitted mine area.

(b) The Permittee is authorized under this permit (M-200) to conduct surface mining only in Cariboo-Springer Pit Phase 4.

(c) The Permittee is authorized under this permit (M-200) to conduct underground mining only in the Boundary, Zuke, and Halo Zones.

(d) The Permittee shall ensure that, on an annual average basis, the ore production rate does not exceed 22,450 tonnes per day.

3. Permit

This Permit is not transferable or assignable.

4. Maintenance of Mine

The Permittee shall maintain mine facilities and infrastructure in a manner to meet design objectives, environmental protection requirements and reclamation requirements.

5. Reports to be signed by a Qualified Professional

Unless otherwise approved in writing by the Chief Inspector or the Chief Inspector's delegate, the Permittee shall ensure all reports required to be submitted under this permit are signed by a qualified professional with applicable experience and registered in the province of British Columbia.

6. Responsibility to Reclaim

The Permittee shall assume responsibility for any outstanding reclamation associated with Exploration Permit MX-Gen-78 that exists within the permitted mine area for the Mount Polley Mine, defined in Figure 1, under the terms and conditions of this permit.

7. Information Sharing

Unless otherwise requested by the Chief Inspector or the Chief Inspector's delegate, the Permittee shall provide to the Williams Lake First Nation, Xat'sull First Nation, Cariboo Regional District, and the community of Likely through the Likely and District Chamber of Commerce all material reports and plans required to be submitted under this permit, including annual monitoring reports.

9. Compliance Status Report

The Permittee shall track compliance status of all permit conditions and inspection orders in a form acceptable to the Chief Inspector. The Permittee shall maintain an up-to-date tracking table on site. The Permittee shall ensure that the tracking table is available at the mine site at all times and to a Mines Inspector upon request. The Permittee shall prepare and submit an annual Compliance Status report to the Chief Inspector by March 31st and shall include a summary of outstanding non-compliance issues and an action plan, to the satisfaction of the Chief Inspector, for achieving compliance.

B. Health and Safety

1. Mine Emergency Response Plans (MERP)

(a) The Permittee shall update the Mine Emergency Response Plan (MERP). The Permittee shall submit the updated MERP by March 31, 2021, to the satisfaction of the Chief Inspector. The Permittee shall keep the MERP up to date, with updates filed with the Chief Inspector, and be made available at the mine site at all times.

(b) The Permittee shall ensure that mine site employees and contractors are knowledgeable and accountable for fulfilling the actions of the MERP.

C. Geotechnical

1. General

(a) The Permittee shall ensure that all geotechnical designs, specifications, work plans, monitoring requirements and reports required to be prepared under section (C) are:

(i) Signed by a Professional Engineer and are submitted to the satisfaction of the Chief Inspector; and

(ii) Maintained on site and made available to any Inspector of Mines, upon request.

(b) The Permittee shall ensure construction is completed under the supervision of a Professional Engineer and that sufficient field reviews have been conducted to ensure that facilities are built in general conformance with the design, accepted engineering practices, and the Code.

(c) The Permittee shall ensure recommendations by a Professional Engineer, relating to health and safety, geotechnical stability or environmental protection are followed, unless a suitable alternative course of action is approved in writing by a Professional Engineer.

(d) The Permittee shall submit an Advice of Geotechnical Incident form to the Chief Inspector for any geotechnical incident that is classified as a dangerous occurrence or any other incident as described in the current EMPR Advice of Geotechnical Incident form.

2. Underground Mine

(a) Design

The Permittee shall ensure underground development is conducted in accordance with the permitted design and recommendations prepared by a Professional Engineer.

(b) Operations

(i) Prior to commencing any rehabilitation, new development, or stoping, the Permittee shall ensure geological and geotechnical mapping is undertaken to verify and, if required, update the assumptions used in the preliminary support designs.

(ii) The Permittee shall install ground control in accordance with the recommendations of a Professional Engineer.

(iii) The Permittee shall dimension all excavations and pillars as per the recommendation of a Professional Engineer.

(iv) The Permittee shall not commence construction of any underground dams or bulkheads until Issued for Construction (IFC) drawings and specification are submitted to the Chief Inspector.

(v) The Permittee shall ensure that the following are assessed prior to re-commencing underground mining:

(i) Conditions and stability of all active areas of the mine;

(ii) Stability of all stopes and the potential for caving to impact mine infrastructure; and

(iii) Stability of the stope bulkheads and verify design assumptions related to water inflow/outflow and hydraulic head remain valid.

(c) Monitoring

(i) The Permittee shall develop, maintain, and implement a Ground Control Management Plan consistent with industry standards.

(ii) The Permittee shall ensure the Ground Control Management Plan is updated at minimum annually, or more frequently as conditions warrant, by a Professional Engineer.

(iii) The Permittee shall ensure that ground control monitoring is recorded in the Daily Examination and Record Book and ensure that the Daily Examination and Record Book are made available to any Inspector of Mines upon request.

(iv) The Permittee shall ensure that the Daily Examination and Record Book is read and signed each day by the shiftboss and the Mine Manager or mine engineer designated by the Mine Manager.

(d) Reporting

The Permittee shall ensure an annual review and inspection of the underground workings is undertaken, and observations and recommendations made during the review and inspection are summarized in a report. The Permittee shall submit this report to the Chief Inspector by March 31 of the year following the review and inspection.

3. Surface Pits

(a) Design

The Permittee shall ensure surface pit development is conducted in accordance with the permitted design and recommendations prepared by a Professional Engineer.

(b) Operations

(i) The Permittee shall ensure that the pit slope design is reviewed annually by a registered Professional Engineer with experience in the design of pit slopes.

(ii) The Permittee shall develop and implement a design for controlled production blasting to minimize blast damage at and near the final pit wall and all interim pit walls employing multi-benching, and all interim pit walls that will be left in place for more than 12 months.

(iii) The Permittee shall ensure that surface water is diverted away from the pit slopes.

(iv) The Permittee shall map geological units as they are exposed, and the Permittee shall ensure that the mapping is reviewed by a Professional Engineer to confirm and refine the recommended pit designs

(v) The Permittee shall carry out groundwater monitoring and depressurization of the pit walls during mining as required by the pit design engineer.

(c) Monitoring

(i) The Permittee shall ensure that the open pit monitoring plan is reviewed and updated annually in conjunction with the annual open pit inspection, or more frequently as conditions warrant.

(ii) The Permittee shall ensure that an open pit monitoring and instrumentation program is developed and implemented as soon as mining commences in the pits. The Permittee shall ensure that the monitoring and instrumentation program shall:

(a) Be designed to verify acceptable performance, detect early signs of instability, and confirm design assumptions;
(b) Include details of instrumentation, monitoring frequency, trigger thresholds, and trigger response criteria; and,

(c) Be developed in consultation with the pit design engineer and approved by the pit design engineer.

(iii) The Permittee shall maintain on-site inspection, monitoring, and instrumentation records and make such records available to an Inspector of Mines upon request.

(d) Reporting

The Permittee shall ensure an annual review and inspection of all surface pits is undertaken and observations and recommendations made during the review and inspection are summarized in an annual pit slope performance report. The Permittee shall submit this report to the Chief Inspector by March 31 of the year following the review and inspection.

4. Waste Rock Dumps

(a) Design

(i) The Permittee shall ensure waste rock dumps are developed in accordance with the permitted design and recommendations prepared by a Professional Engineer.

(ii) The Permittee is authorized to construct the Northwest (NW) Temporary PAG stockpile to a maximum elevation of 1150 m.

(iii) The Permittee is authorized to store a maximum of 3 million tonnes of ore in the High-grade Ore Stockpile (Caribou Stockpile) to a maximum elevation of 1110 m.

(iv) The Permittee is authorized to construct the Northeast Dump to a maximum elevation of 1066 m.

(v) The Permittee is authorized to construct the Southeast Rock Disposal Site (SERDS) to a maximum height of 140 m.

(b) Operations

(i) The Permittee shall ensure foundation preparation work for all waste rock dumps is completed as recommended by a Professional Engineer to provide a stable foundation for waste rock dump construction.

(ii) The Permittee shall ensure that a foundation inspection is completed by a

Professional Engineer prior to waste rock dump construction to confirm that unsuitable materials have been removed from the footprint area and the foundation is suitable and as required by the design.

(iii) The Permittee shall ensure that no weak, cohesive materials or snow is dumped on the outside edge of the waste rock dump platforms, unless approved by a Professional Engineer.

(iv) The Permittee shall ensure waste rock dump platforms are constructed with a slope that promotes surface water drainage away from the waste rock dump face.

(v) The Permittee shall ensure that a catch-bench of suitable width, or a designed impact berm, is established for boulder rollout protection in areas where waste rock dumps are to be constructed above active work areas or active roads.

(c) Monitoring

(i) The Permittee shall develop and implement a waste rock dump monitoring program for all waste rock dumps.

(ii) The Permittee shall ensure that the waste rock dump monitoring program includes:

(a) Quantitative performance objectives (QPOs);
(b) Tracking of advance rates in critical areas;
(c) Rock quality monitoring where required (i.e. bog crossing);
(d) Monitoring frequencies;
(e) Frequency of engineering review of data;
(f) Trigger-Action-Response plans (TARPs);
(g) Monitoring data storage procedures;
(h) Frequency of operational review and trigger threshold review;
(i) Frequency of 3rd party data auditing; and
(j) All other parameters recommended by the Professional Engineer.

(iii) The Permittee shall ensure that waste rock dump development and monitoring is completed in accordance with the waste rock dump monitoring program.

(iv) The Permittee shall ensure that the waste rock dump monitoring program is reviewed annually and updated as conditions warrant, or as directed by the Chief Inspector. The Permittee shall submit the waste rock dump monitoring program to the Chief Inspector when updates are made.

(d) Reporting

The Permittee shall ensure that waste dump design and stability performance for all dumps are reviewed annually and that this review includes an inspection of all dumps. The Permittee shall submit an annual report documenting the review of waste dump design and stability performance to the Chief Inspector by March 31st of the year following review and inspection.

5. Tailings Storage Facility

(a) Design

(i) The Permittee is authorized to construct the tailings storage facility (TSF) to an elevation of 970 m per the permitted design.

(i) The Permittee shall ensure that the Operations, Monitoring and Surveillance Manual includes quantitative performance objectives (QPOs) and Trigger Action Response Plans (TARPs).

(ii) The Permittee shall ensure that the required minimum freeboard is defined by the Engineer of Record and included in the QPOs. The Permittee shall ensure that the TSF Emergency Preparedness and Response Plan (EPRP) includes plans to restore normal operating pond level should it be exceeded.

(b) Operations

The Permittee shall ensure that the Tailings Storage Facility (TSF) is constructed, operated, maintained and monitored in conformance with the design, the specifications, the OMS manual, the Code, this Permit, and accepted industry practice.

6. Surface Water Ponds, Ditches and Diversions

(a) The Permittee shall not commence construction of surface water ponds and ditches that carry mine-influenced water until IFC drawings, signed by a Professional Engineer, are submitted to the Chief Inspector. This condition does not apply to temporary diversion channels required to facilitate construction.

(b) The Permittee shall ensure that surface water ponds, ditches and diversion channels are designed to convey the design flood without overtopping, without side slope failure, and with adequate armour or lining to prevent significant erosion.

(c) The Permittee shall design all surface water ponds and ditches that impound or carry mine-influenced water with a minimum 0.3 m freeboard under the design flood. The

Permittee shall choose the design flood with consideration of the consequence of failure and duty life of the structure but shall ensure no less than the 1:200 year peak flow event.

(d) The Permittee shall submit an "As-Built" report to the Chief Inspector for all surface water ponds, ditches and diversion channels by March 31 of the year following completion of construction. The Permittee shall ensure that the report certifies that each facility has been constructed in accordance with the design and the applicable guidelines.

(e) The Permittee shall ensure that all surface water ponds, ditches and diversion channels are inspected, at minimum, annually.

7. Soil, Overburden, Rock and Ore Stockpiles

The Permittee shall ensure that all soil, overburden, rock and ore stockpiles are constructed in accordance with designs prepared by a Professional Engineer and are constructed and inspected to ensure stability and erosion control is maintained, unless exempted in writing by the Chief Inspector.

8. Borrow Pits and Quarry Excavations

The Permittee shall ensure that borrow and quarry excavations are constructed in accordance with designs prepared by a Professional Engineer and are constructed and inspected to ensure stability and erosion control is maintained.

9. Mine Site Roads

(a) The Permittee shall ensure that mine roads are constructed in accordance with designs prepared by a Professional Engineer and are constructed and inspected to ensure stability and erosion control is maintained.

(b) The Permittee shall ensure that road cuts and fills in excess of 6 m height (if any) are designed by a Professional Engineer.

(c) Where necessary to ensure geotechnical stability, the Permittee shall ensure that the footprint of fill slopes are stripped of organics and topsoil and/or have the fill toe "keyed-in" to original ground. For slopes exceeding a gradient of 15 degrees, the Permittee shall ensure that the prepared foundation of fill slopes in excess of 10 m height are inspected by a Professional Engineer prior to fill placement.

(d) The Permittee shall ensure that "As-Built" drawings are prepared within three months of completion. The Permittee shall ensure that the "As-Built" drawings and records are filed on-site.

10. Mine Site, Plant, Shop, and Other Infrastructure

(a) The Permittee shall ensure that all building foundation designs address bearing capacity, potential settlement, and any necessary foundation preparation or treatment. The Permittee shall ensure that foundation designs and "As Built" records are filed on-site.

(b) The Permittee shall ensure an inspection of the prepared excavation prior to the placement of permanent foundations is completed with a record of the inspection filed on-site and made available to any Inspector of Mines upon request.

D. Protection of Land and Watercourses

1. Environmental Management System

(a) The Permittee shall implement an Environmental Management System (EMS) consisting of Environmental Management Plans (EMPs) and SOPs. The Permittee shall ensure the EMS reference relevant policies and establish proactive procedures to provide direction for effective operational management and monitoring on-site.

(b) The Permittee shall ensure the EMS is reviewed annually and revised as required. The Permittee shall make the EMS available at the mine site at all times and to an Inspector of Mines upon request. The Permittee shall include the findings of the annual EMS review in the Annual Reclamation Report.

(c) The Permittee shall ensure that mine site employees and contractors are knowledgeable and accountable to act consistently with the requirements of the EMPs and SOPs that form the EMS.

2. Environmental Site Management

(a) The Permittee shall ensure that a qualified Environmental Site Manager is assigned.

(b) The Permittee shall ensure that the Environmental Site Manager has authority to implement any remedial actions to ensure maintenance of environmental standards and permit requirements. If suspension of construction or operations occurs due to environmental concerns, the Permittee shall immediately notify the Chief Inspector.

3. Metal Leaching (ML) and Acid Rock Drainage (ARD)

(a) General

(i) The Permittee shall ensure the all materials with the potential to generate metal leaching and acid rock drainage (ML/ARD) are placed in a manner that minimizes the production and release of metals and contaminants.

(ii) The Permittee shall ensure that, unless otherwise approved, all plans for the prediction, and if necessary, the prevention, mitigation, and management of ML/ARD are prepared in accordance with the *Guidelines for Metal Leaching and Acid Rock Drainage at Minesites in British Columbia* (1998).

(iii) The Permittee shall not make changes to the criteria for ML/ARD definition, waste handling procedures, mitigation strategies, or materials monitoring programs without the written approval of the Chief Inspector.

(b) Definition of Potentially ARD Generating (PAG) and Metal Leaching (ML) Materials

(i) The Permittee shall calculate Neutralization Potential (NP) using total inorganic carbon (TIC).

(ii) The Permittee shall calculate acid potential (AP) using Total Sulphur (TS).

(iii) The Permittee shall classify all waste rock, quarry rock, borrow materials and tailings as potentially acid generating (PAG) if they have a NP/AP ratio of less than 2.0.

(iv) The Permittee shall consider all waste rock or borrow materials containing soluble metal levels (as determined by shake flask test) higher than the receiving water objectives as having a potential for metal leaching.

(c) Mine Materials Handling and ML/ARD Mitigation

(i) Waste Rock

(a) The Permittee shall only permanently dispose of PAG waste rock in the Cariboo, combined Cariboo/Springer, Wight, and Southeast Zone pits. The Permittee shall ensure that the PAG waste rock is permanently submerged beneath a water cover.

(b) The Permittee may store a maximum of 62 million tonnes of PAG waste rock in the Temporary NW PAG Stockpile.

(c) The Permittee shall permanently dispose of all PAG waste rock stored in the Temporary NW PAG dump by back filling the material into the Cariboo/Springer Pit, by December 31, 2027.

(d) The Permittee shall ensure that isolated pockets of PAG materials (less than 1,000 tonnes) are blended with non-PAG materials within the waste rock dumps, at a minimum non-PAG:PAG ratio of 20:1.

(ii) Quarry Rock

The Permittee shall only use quarry rock with a NP/AP greater than 2.0 and total Cu solid concentration less than 180 mg/kg for construction of the TSF.

(iii) Tailings

(a) The Permittee shall not cyclone PAG tailings to make sand for dam construction.

(b) The Permittee may cyclone tailings with an NP/AP ratio greater than 2.0

(c) The Permittee may only use cyclone tailings for construction of the following TSF components:

(i) The upstream and downstream faces of the Perimeter Embankment;
(ii) The upstream side of the Main Embankment; and
(iii) The maintenance of a till core in the Perimeter and Main Embankments.

(iv) Low-grade Ore

The Permittee shall develop and assess contingency reclamation plans for the ore stockpiles in the event they remain in place at closure. These plans shall be presented in detail in the Mine Plan and Reclamation Program update in accordance with permit condition E.13.

(v) Test Heap Leach Facility

The Permittee shall provide a report that includes a detailed plan and timeline for the removal of the test heap leach facility and all stockpiled sulphur by June 30, 2021, to the satisfaction of the Chief Inspector. The Permittee shall ensure the plan includes, but is not limited to, the removal and disposal of the leached ore, sulphur stockpile, waste rock, contaminated soil, reagents or chemicals, and all associated infrastructure.

(d) ML/ARD Operational Monitoring

(i) The Permittee shall implement the ML/ARD Management Procedure Manual (Document 42.2), including SOPs, as required.

(ii) The Permittee shall implement the quality assurance / quality control (QA/QC) program included in the ML/ARD Management Procedure Manual.

(iii) The Permittee shall ensure that all personnel involved in waste rock mining and handling, and tailings segregation and handling are trained and kept up to date on the content and implementation of the ML/ARD Management Procedure Manual.

(e) On-Site Laboratory and Confirmation Testing

The Permittee shall include QA/QC results from the on-site laboratory in the Annual Reclamation Report.

(f) ML/ARD Reporting

The Permittee shall report the results of all the ML/ARD analytical test work, detailed in the ML/ARD Management Procedure Manual in the Annual Reclamation Report. The Permittee shall assess any significant changes or trends in the results, compared to the overall dataset, discuss implications for materials handling, and propose changes to the ML/ARD Management Procedure Manual, if required.

4. Surface and Ground Water Management and Monitoring

(a) The Permittee shall develop and implement a Water Management Plan. The Permittee shall track changes to surface water, seepage, and groundwater quality and quantity on the mine site. The Permittee shall ensure that the program is capable of providing early warning about the onset of ML/ARD or an increase in contaminant loading. The Permittee shall ensure that the plan is submitted by March 31, 2021, to the satisfaction of the Chief Inspector.

(b) The Permittee shall not make any significant changes to the Water Management Plan without the written approval of the Chief Inspector. Significant changes include removal of monitoring sites, or changes to monitored parameters.

(c) The Permittee shall ensure that detection limits are sufficient to compare to water quality standards and permit requirements established by the British Columbia Ministry of Environment and Climate Change Strategy (ENV).

(d) The Permittee shall ensure that an effective QA/QC program for the surface water, groundwater, and seepage monitoring programs is included and implemented as part of the Water Management Plan. The Permittee shall ensure that this includes detection limits, performance criteria that define acceptable levels of precision and accuracy and reporting of any missed sampling events.

(e) The Permittee shall ensure that monitoring results of surface water, groundwater, and seepage quality and quantity are kept up to date in a dedicated database available for review by an Inspector of Mines upon request. The Permittee shall ensure that water quality monitoring results, including interpretation of results, are reported and assessed in the Annual Reclamation Report. The Permittee shall ensure that any significant changes or trends in water quality or quantity are discussed, and those that require additional evaluation and management are identified in the report.

(f) The Permittee shall include a table comparing relevant monitoring and test work data to source term concentrations used in water quality predictions in the Annual Reclamation Report. The Permittee shall ensure that the implications of the results to source term refinement, water quality mitigation, and adaptive management are discussed in the report.

5. Model Validation and Updated Water Quality Predictions

(a) During operations, the Permittee shall refine the inputs and assumptions for water quality predictions based on site-specific performance information.

(b) The Permittee shall update the water balance model, water quality model and groundwater model every five years, beginning in 2022, as part of the Mine Plan and Reclamation Program update required under condition E.13, or more frequently as necessary to inform mine planning and mitigation design and engineering.

6. Water Treatment

(a) Operation

(i) The Permittee shall ensure that no changes are made to the water treatment process without the approval of the Chief Inspector.

(ii) The Permittee shall update the WTP OMS Manual (Document 42.3 and Document 42.4) as procedures are modified. The Permittee shall submit updated versions to the Chief Inspector.

(b) Monitoring and Reporting

(i) The Permittee shall monitor, track and report, in the Annual Reclamation Report, information on the performance of the water collection and treatment system. The Permittee shall ensure that the information includes system performance, volume and water quality of drainage inputs and outputs of the water treatment system, volumes of reagents used, volumes and characteristics of waste generated, and information on any process changes.

(ii) The Permittee shall ensure that the Annual Reclamation Report includes a breakdown of all annual costs associated with operation of the Water Treatment Facility. The Permittee shall include all major cost items including labour, electricity, waste handling and storage, and all delivered costs for diesel, lime, reagents, etc. in the Annual Reclamation Report.

(c) Research

(i) The Permittee shall provide a workplan and implementation schedule for the research, development, piloting, and implementation of proposed closure water treatment system(s) for contact water at the Northwest Sump, 9K Sump, and South Toe Drain, by March 31, 2021, to the satisfaction of the Chief Inspector.

(ii) The Permittee shall ensure a detailed summary of all water treatment technology research, conducted each year, is provided on an annual basis in the Annual Reclamation Report. The Permittee shall ensure that this summary includes, but is not limited to, a description of each technology, results, and a discussion of the outcomes, recommendations, and next steps of the research.

7. Fugitive Dust Management

(a) The Permittee shall implement the Fugitive Dust Management Plan (Document 42.1) to the satisfaction of the Chief Inspector, to effectively control dust emissions from the Mine Facilities and access roads.

(b) The Permittee shall ensure that the Fugitive Dust Management Plan is reviewed annually and updated as procedures are modified to reflect site-specific considerations. The Permittee shall report annual updates and monitoring results in the Annual Reclamation Report and ensure that substantive changes provided to the Chief Inspector prior to implementation.

(c) In the event that airborne dust from the site is reported to be a nuisance, the Permittee shall implement immediate remedial action to mitigate the airborne dust.

8. Sediment and Erosion Control

(a) The Permittee shall implement the Erosion and Sediment Control Plan (Document 42.1).

(b) The Permittee shall ensure that the Erosion and Sediment Control Plan is reviewed annually, and updates reported in the Annual Reclamation Report. Substantive changes shall be provided to the Chief Inspector prior to implementation.

(c) The Permittee shall ensure inspections are conducted at stream crossings, contact and non-contact water management structures, snow dumps, and the tailings rock storage facility daily during rain events and the snowmelt period on the mine site. Where excessive sediment laden runoff is observed, the Permittee shall implement immediate remedial action.

(d) The Permittee shall appropriately characterize any significant releases of sediment-laden water, defined as an unauthorized discharge to the receiving environment, with respect to extent and loading, and report it to the Chief Inspector.

(e) The Permittee shall ensure the characterization of unauthorized discharges of sediment-laden run-off include, at a minimum, flow, total suspended solids, turbidity, pH, conductivity, temperature, dissolved oxygen, and total and dissolved metals, of both the effluent and the receiving water.

9. Soil Salvage and Stockpiling

(a) The Permittee shall by implement the Soil Management Plan (Document 42.1).

(b) The Permittee shall salvage and stockpile topsoil, overburden, and organic material, including large woody debris, for use in reclamation.

(c) The Permittee shall ensure that a Qualified Professional monitors and directs sampling, soil salvage, segregation, and stockpiling activities on-site.

(d) The Permittee shall ensure that materials salvaged for use in reclamation are segregated based on salvage origin and measured suitability for reclamation purposes. Prior to mixing with other sources and/or applying on-site, the Permittee shall characterize and evaluate the suitability for reclamation any materials with the potential to be contaminated.

(e) The Permittee shall maintain an inventory of stockpiles of salvaged soil, overburden, and organic matter, including large woody debris, specifying the locations, origins, and quantities of material. The Permittee shall report this information in the Annual Reclamation Report.

(f) The Permittee shall protect stockpiles from erosion, degradation, and contamination through revegetation and/or other practices.

(g) The Permittee shall ensure that stockpiles are clearly marked to ensure that they are protected during construction and mine operations.

(h) The Permittee shall not use soil suitable for use in reclamation as fill.

10. Biosolids Management

(a) The Permittee shall develop a Biosolids Storage and Management Plan. The Permittee shall submit the plan by March 31, 2021, to the satisfaction of the Chief Inspector.

(b) The Permittee shall ensure that the importation to site and use of biosolids are reported in the Annual Reclamation Report, including, but not limited to, volumes, material characteristics, storage locations, testing and monitoring.

11. Vegetation Management

(a) The Permittee shall implement the Invasive Plant Management Plan. (Document 42.1).

(b) The Permittee shall limit disturbance to vegetation to those areas approved by this permit (Figure 1).

(c) The Permittee shall manage and control weeds that establish on the site and shall ensure that weeds do not migrate from the site to adjacent areas. The Permittee shall consider using non-toxic means for weed control. The Permittee shall ensure that all seed used on-site is certified weed free.

(d) The Permittee shall not burn or dispose of woody debris suitable for use in reclamation.

12. Wildlife Protection

(a) The Permittee shall develop a Wildlife Management Plan. The Permittee shall submit the plan by March 31, 2021, to the satisfaction of the Chief Inspector.

(b) Pursuant to Part 1.6.9 of the Code, the Permittee shall incorporate in the mine safety program a no hunting and shooting policy for the mine permit area (Figure 1).

(c) The Permittee shall implement a policy of no fishing and hunting for all employees and contractors while on company business or while commuting to and from the mine.

(d) The Permittee shall ensure that, where wildlife exclusion fencing (e.g., electric fencing) is installed, it is maintained in effective working order at all times that people are present on site.

13. Archaeological Resources

(a) Prior to beginning any mechanized surface disturbance on undisturbed lands, the Permittee shall conduct field surveys consistent with archaeological and cultural heritage resources management procedures consistent with the provisions of the BC Heritage Conservation Act.

(b) For those sites which cannot be avoided, the Permittee shall contact the Archaeological Permitting Section of the Ministry of Forests, Lands and Natural Resource Operations and Rural Development and make arrangements to scientifically excavate and record findings.

14. Ongoing Reclamation Research

(a) The Permittee shall submit to the Chief Inspector by March 31, 2021, a Reclamation Research Program that includes details for achieving the research requirements outlined in this permit with a schedule for implementation and description for how results will be utilized and reported.

(b) The Permittee shall ensure a detailed summary of all research being conducted under this section is provided in the Annual Reclamation Report and the Mine Plan and Reclamation Program Updates, including description of activities, results, and outcomes.

(c) The Permittee shall conduct research to inform closure water management strategies and identify post-closure maintenance and contingency requirements.

(d) The Permittee shall conduct research to determine the viability of revegetation with native plant species, including culturally important species.

(e) The Permittee shall conduct research intended to develop an end land use plan for the post-closure landscape represented in the mine disturbance footprint that is based on pre-mining ecosystems and habitats. Where a discrepancy in the comparative areas represented by ecosystem types is identified, the Permittee shall develop mitigation options.

(f) The Permittee shall, at a minimum 60 days prior to the start of construction, complete mitigation planning procedures for pre-mining habitats (terrestrial and aquatic) identified in the permit boundary (Figure 1) that are predicted to be lost or substantially changed (physically or functionally) due to direct mining activities or subsidence. Contingency plans shall be developed as part of this mitigation planning process that can be implemented in the event that on-site mitigation options are deemed to not be feasible based on ongoing monitoring and research results.

(g) The Permittee shall conduct research intended to inform design of and to test potential mitigation options for restoring ecosystems and habitats that are predicted to be affected by mining activities.

(h) The Permittee shall establish test plots that will be used to evaluate the reclamation approaches and prescriptions applied to confirm that ecological trajectories consistent with the land use and capability targets are being achieved.

(i) The Permittee shall conduct research to inform the development of a soil replacement plan that is designed to achieve land capability and end land use objectives. If a shortfall of soil volumes is anticipated, the Permittee shall develop contingency plans, including the identification of potential sources of borrow material for use in reclamation. The Permittee must collect information on potential borrows including location, size, and soil characterization.

(j) The Permittee shall conduct research to inform reclamation prescriptions for the TSF, such that it will meet end land use and land capability objectives.

(k) The Permittee shall conduct research to assess decompaction methodologies to ensure that the severity of compaction that exists prior to commencing reclamation activities is effectively addressed in a manner intended to achieve end land use objectives and erosion control.

(l) The Permittee shall conduct geomorphic landform and run-off modeling assessments in order to identify opportunities to shape landforms in a manner that optimizes surface water pathways and soil moisture regimes, reduces infiltration through spoil materials, and enhances erosion control and habitat function and connectivity.

(m) The Permittee shall develop and implement a monitoring program designed to evaluate the success of revegetation, habitat restoration, soil development and erosion control. The Permittee shall include in this program ecosystem-specific sampling parameters and performance criteria, which the Permittee shall base on pre-mining ecosystem benchmarks.

(n) The Permittee shall develop and implement a monitoring program for evaluating metal uptake in exposed terrestrial and aquatic ecosystems, which specifies sampling requirements and performance criteria. Where harmful levels are found, the Permittee shall take any corrective action necessary to mitigate to ensure levels are safe for plant and animal life.

(o) The Permittee shall undertake study programs to evaluate the cumulative effects of fertilization on total nutrient loading and impacts to receiving waters.

15. Ecological Risk Assessment

The Permittee shall develop and implement a plan to conduct an ecological risk assessment to evaluate the pathways for uptake of metals for receptors relevant to the end land use objectives for the site and identify any closure remediation activities and long-term monitoring requirements needed to address potential risks identified. The Permittee shall ensure that this plan is developed in consultation with the Ministry of Environment and Climate Change Strategy, Williams Lake First Nation, and Xat'sull First Nation. The Permittee shall ensure that he ecological risk assessment results and interpretations are used to inform closure requirements and are included in the Mine Plan and Reclamation Program Update required under condition E.13.

E. Reclamation and Closure Program

1. Reclamation Security

(a) The Permittee shall maintain a total security for this permit of Thirty One Million Three Hundred and Fifty Thousand, Six Hundred and Eleven dollars ($31,350,611.00). The security will be held by the Minister of Finance for the proper performance of the approved program and all the conditions of this permit in a manner satisfactory to the Chief Inspector.

(b) Notwithstanding the security posted as a condition of this Permit, the Permittee remains responsible for covering all closure and reclamation costs associated with reclamation and environmental protection.

2. Land Use

(a) The Permittee shall ensure the land surface is reclaimed with the intent of re-establishing average pre-mining capability to the following end land use objectives: forest cover, wildlife habitat, hunting, trapping, guide outfitting, grazing recreation, and opportunities for traditional use of the land by the Williams Lake First Nation and Xat'sull First Nation.

(b) The Permittee shall ensure that compensation for loss of wetland habitat is provided by replacement with equivalent habitat capability.

(c) The Permittee shall reclaim all borrow pits and quarries belonging to the mine development and operations to the approved end land use, once no longer required.

3. Erosion Control

The Permittee shall achieve reduction of erosion through landform configuration, development of maintenance-free vegetation covers, and the development of stable, self-sustaining drainage control features and watercourses.

4. Re-vegetation

The Permittee shall ensure the land is revegetated to a self-sustaining state using appropriate and or native plant species including culturally important native species.

5. Growth Medium

(a) The Permittee shall monitor soil replacement operations to ensure the minimum depths are achieved and a confirmation sampling plan shall be developed to ensure quality of soil used for reclamation purposes will achieve end land use objectives. The Permittee shall report all results in the Annual Reclamation Report.

(b) With the exception of areas where closure plans require compaction prior to placement of growth medium in order to reduce infiltration and contact water, the Permittee shall ensure all areas to be reclaimed shall be decompacted to the minimum depth required to adequately address the severity of compaction prior to placement of soil and or vegetation, in a manner intended to achieve end land use objectives and erosion control.

(c) The Permittee shall conduct an assessment to identify contingency options (i.e., alternatives to soil previously stockpiled or salvaged from disturbance footprints approved in this amendment) that can be implemented in the event that available soil volumes on site are insufficient. The Permittee shall ensure that this includes a survey and assessment of additional resources of soil materials that could be used.

(d) The Permittee shall removal all PAG material from temporary waste rock and ore stockpile base pads, prior to placement of growth medium and revegetation.

(e) The Permittee shall include a plan to appropriately address soil quality deficiencies by application of organic or inorganic amendments in the Mine Plan and Reclamation Program update required under Condition E.13.

6. Contaminated Sites Assessment

(a) Prior to reclamation of the fuel and hydrocarbon dispensing and storage areas, Explosives Storage areas, and the temporary Ore and PAG Stockpiles, or other areas where contamination may have occurred during mining operations, the Permittee shall develop monitoring programs designed to assess soil contamination and inform remediation plans to ensure success of subsequent reclamation activities.

(b) At least 3 months prior to decommissioning contaminated areas, the Permittee shall develop, and submit to the Chief Inspector for approval, a closure plan that addresses the remediation requirements.

7. Surface Water Management Ponds and Channels

(a) The Permittee shall reclaim all surface water management ponds and water diversions to satisfy stability and erosion control requirements and the approved end land use, once no longer required.

(b) At least 3 months prior to decommissioning the water treatment facility, the Permittee shall develop and submit to the Chief Inspector for approval, a closure plan that addresses all non-contact and contact water management features that will no longer be required.

8. Tailings Storage Facility (TSF)

The Permittee shall conduct an assessment of reclamation and closure designs of the TSF. The Permittee shall ensure that the assessment evaluates options for maximizing long-term stability, minimizing long-term monitoring and maintenance requirements, and integrating site-wide land capability and land use objectives. The Permittee shall include the assessment and assessment results in the Mine Plan and Reclamation Program update required under condition E.13. The Permittee shall use the results to inform proposed reclamation prescriptions, post-closure monitoring programs, and the liability cost estimate.

9. Waste Rock Facility

(a) The Permittee shall slope waste rock dumps to a maximum of 2:1 (individual slopes) for final reclamation with appropriate slope breaks (benches) and other features for water management and creation of habitat and aesthetic features.

(b) The Permittee shall prioritize visual impacts and aesthetic values in the final reclamation designs of all waste rock dumps, due to the heavy recreational use of Bootjack Lake and Polley Lake. The Permittee shall include the methods used to reduce visual impacts and restore aesthetic values in the Mine Plan and Reclamation Program Update required by condition E.13.

10. Mine Facility

The Permittee shall conduct an assessment of the closure designs for the underground openings. The Permittee shall ensure that the assessment evaluates options for maximizing long-term stability, minimizing long-term monitoring and maintenance requirements, and consider end land use objectives. The Permittee shall include the assessment and assessment results in the Reclamation and Closure Plan required under condition E.13. The Permittee shall use the results to inform proposed closure prescriptions, post-closure monitoring programs, and the liability cost estimate.

11. Mine Roads

(a) The Permittee shall ensure all mine roads are reclaimed, in accordance with recommendations of a qualified professional, to satisfy the approved end land use objectives, including all reasonable effort to fully re-configure to conform to adjacent landscape where long-term stability is not compromised, unless permanent access is required.

(b) The Permittee may be exempted from the requirement for total reclamation of individual mine roads, required by permit condition E.11(a), if either:

(i) The Permittee can demonstrate that an agency of the Crown has explicitly accepted responsibility for the operation, maintenance and ultimate deactivation and abandonment of the road; or

(ii) The Permittee can demonstrate that another private party has explicitly agreed to accept responsibility for the operation, maintenance and ultimate deactivation and abandonment of the road and has, in this regard, agreed to comply with all the terms and conditions, including bonding provisions, of this reclamation permit, and to comply with all other relevant provincial government (and federal government) regulatory requirements.

12. Temporary Shutdown

If the mine ceases operation, including for seasonal closure, within one month of closure, the Permittee shall submit a Care and Maintenance Plan which describes, documents, and tracks key aspects of the ongoing mitigation, monitoring, and maintenance requirements for the care and maintenance of the site. The Permittee shall ensure the Care and Maintenance Plan documents the outstanding reclamation activities and closure requirements for the site and includes a trigger action response plan, which will be implemented to activate closure activities based on monitoring results and site conditions. The Permittee shall update the Care and Maintenance Plan as required and submit updates to the Chief Inspector.

13. Mine Plan and Reclamation Program Update

On or before December 31, 2022, and every five years thereafter, the Permittee shall develop and submit an updated Mine Plan and Reclamation Program, providing (but not limited to):

(a) The current status of the mine plan and reclamation obligations;
(b) Detailed mine plan for the next five years, and conceptually thereafter until the end of mine life;
(c) Life of mine closure plan and end land use plan;

(d) A compilation and interpretation of all monitoring including ML/ARD prediction, water quality and quantity, modelling predictions, soil, vegetation and progressive reclamation programs;
(e) A compilation of ongoing maintenance activities;
(f) A compilation and interpretation of research programs;
(g) A compilation of ongoing contingency/remediation plans; and
(h) A breakdown of outstanding liabilities and associated costs for the approved mine plan.

14. Closure Plan

Twelve months prior to final closure, the Permittee shall develop and submit a Closure Plan describing (but not limited to):

(a) The current status of the mine plan and reclamation obligations based on the approved end land use;
(b) A compilation and interpretation of all monitoring for life of mine, including ML/ARD prediction, water quality and quantity, modelling predictions, soil, vegetation and progressive reclamation programs;
(c) Detailed closure objectives and criteria for each mine component;
(d) Detailed closure and maintenance activities;
(e) A compilation and interpretation of any research program used to inform closure planning strategies;
(f) Detailed contingency/remediation plans;
(g) Detailed schedule for completion of reclamation/closure works;
(h) A Closure Management Manual that details plans for monitoring and maintenance activities for post closure; and
(i) A breakdown of outstanding liabilities and associated costs including activities detailed for remediation and post closure.

Metal Leaching and Acid Rock Drainage Management Procedure Update

(Electronic format only)

MOUNT POLLEY MINING CORPORATION
IMPERIAL METALS CORPORATION

ML/ARD MANAGEMENT PROCEDURE MANUAL

OBJECTIVE

The objective of this Metal Leaching/Acid Rock Drainage (ML/ARD) Management Procedure Manual is to provide detail on how ML/ARD potential is considered in material management at the Mount Polley Mine (MPM). This document summarizes all the various procedures and considerations related to ML/ARD potential through mine life processes.

DOCUMENT REVISION HISTORY

This document replaces earlier versions of similar documents that directed ML/ARD Management at MPM in response to *Mines Act* Permit M-200 issued on August 3, 1995. This update reflects requirements outlined in the current M-200 Permit, amended May 3, 2023.

Document Update Summary

Revision Date	Author	Comment
June 30, 2016	Chad Cameron Ben Harding Katie McMahen Luke Moger Ryan Brown Stephen Day (SRK)	Original Document
August 04, 2022	Mathieu O'Leary Gabriel Holmes Aaron Zwiebel (DWB) Shauna Litke (SRK)	Added contacts, water treatment plant waste ML/ARD characterization, QA/QC sampling, and PAG misplacement action plan.
October 23, 2023	Mathieu O'Leary Gabriel Holmes	Updated NPR criterion for Springer Deep and WX Zones, and annual blast fractionation confirmatory sampling.

	Alicia Lalonde (DWB) Shauna Litke (SRK)	

KEY CONTACTS AND QUALIFIED PROFESSIONALS

Numerous personnel at Mount Polley are responsible for carrying out the procedures written in this plan. Key mine personnel and their contact information are as follows.

Name	Role	Phone	Email
Kelly Parker	General Manager	236-800-4771	kelly.parker@mountpolley.com
Don Parsons	Chief Compliance Officer	604-488-2652	don.parsons@imperialmetals.com
Mathieu O'Leary	Technical Services Superintendent	236-317-4938	mathieu.oleary@mountpolley.com
Gary Roste	Senior Mine Geologist	250-991-0438	gary.roste@mountpolley.com
Natalie Henderson	Senior Mine Geologist	236-700-6603	natalie.henderson@mountpolley.com
Gabriel Holmes	Environmental Coordinator	236-317-4939	gabriel.holmes@mountpolley.com
Bill Grieves	Foreman	236-602-3203	bill.grieves@mountpolley.com
Al Trottier	Mill Ops Foreman	236-602-3203	al.trottier@mountpolley.com
Scott Borneman	Assay Supervisor	236-800-3630	scott.borneman@mountpolley.com

Any update to this document is reviewed by a Qualified Professional (QP) in the area of practice of ML/ARD management, as required by *Mines Act* Permit M-200 Condition A.5. Qualified professionals reviewing this document are as follows:

BACKGROUND

Metal leaching and acid generation are naturally occurring chemical processes which may have negative impacts on the receiving environment. The potential environmental impact of ML/ARD will depend on their magnitude, the sensitivity of the receiving environment, dilution and/or attenuation, as well as any mitigation measures that are in place.

Metal leaching occurs as a result of weathering of metal-containing minerals (i.e., exposure to water and oxygen), drainage conditions that increase solubility, and flow of water through source materials. Acid generation occurs when minerals containing reduced sulfur (e.g., sulfide and elemental sulfur) are exposed

to the weathering effects of oxygen and water. In iron sulphide minerals (e.g., pyrite) acidity is also generated when ferric iron precipitates. Other minerals in the source rock, primarily calcium and magnesium carbonates can neutralize the acid. ARD occurs when the amount of acid-generation exceeds the ability of the source rock to neutralize this acid. Any surplus acid is entrained in water and can create acidic and metal-containing run-off.

Pre-mining and operational geochemical characterization has shown that ARD potential at MPM is restricted due to the abundance of acid-consuming carbonate minerals compared to acid generating sulphide minerals. In addition, the presence of natural carbonate and oxide copper minerals in the pre-mining weathering zone reinforce the expectation that weathering conditions are dominantly basic. However, due to the potential consequences of acid generation for long term management of the site, Mount Polley Mining Corporation (MPMC) actively manages waste rock based on its ARD potential as described in the following sections.

MPMC has focused on managing potential for ARD due to the link between acid generation and enhanced solubility of copper which is expected to be the primary concern for ML. Selenium leaching has also been identified as occurring at MPM. Selenium is released by oxidation of sulphide minerals, but leaching is not necessarily associated with pH depression. Selenium leaching occurs regardless of whether waste rock is classified as potentially ARD generating (PAG) or non-PAG (referred to as NAG at MPM).

UNDERSTANDING OF THE DISTRIBUTION OF ARD POTENTIAL

Like other alkalic porphyry deposits (e.g., Copper Mountain, Brenda), MPM lacks the strong hydrothermal alteration zoning that is commonly observed in calc-alkalic porphyry deposits (e.g., Highland Valley Copper, Island Copper, Gibraltar). In particular, phyllic alteration is absent at MPM. A common feature of calc-alkalic porphyry deposits is often a pronounced pyritic halo that surrounds the copper mineralization and is associated with phyllic and propylitic alteration. At MPM, discontinuous pyritic zones are present but do not appear to be mineralization halos. MPMC geological staff identified a pyritic zone in the south wall of the Springer Pit which extends into the adjacent Cariboo Pit.

This ML/ARD Management Procedure Manual applies to waste rock and ore stockpiles. Tailings are consistently NAG due to removal of copper sulphides by ore processing.

MANAGEMENT OF PAG ROCK

Best practice for management of PAG rock is subaqueous disposal in a configuration that provides permanent and low maintenance containment. At MPM, this has been implemented by disposing of waste rock in completed open pits that will subsequently fill with water. Mine planning is carried out at MPM such that the open pits have sufficient capacity that PAG material can be re-handled into the open pits and stored subaqueously at closure. The following pits are available for subaqueous disposal (in sequence):

- Cariboo Pit
- Bell Pit
- Pond Zone Pit

- Southeast Zone Pit
- Wight Pit
- Cariboo-Springer Pit.

For the Springer Pit, backfill locations are not currently available. The PAG rock is therefore stockpiled adjacent to the open pit in the Temporary Northwest PAG Stockpile for backhauling to the Cariboo-Springer Pit upon completion of mining.

For the small Pond Zone Pit, low sulfur PAG waste rock is layered with NAG waste rock.

Onset of acidic conditions in waste rock at MPM takes at least decades as shown by humidity cells, and the lack of acidification in the natural exposure of the deposit indicates that flooding of PAG waste rock does not need to be immediate. The current approaches of backfilling into dry pits and stockpiling following by backfilling allows PAG rock to be submerged before it acidifies.

DETERMINATION OF ML/ARD POTENTIAL

Waste rock on site is separated into two categories, NAG and PAG, using Neutralizing Potential Ratio (NPR) defined as:

$$NPR = NP/AP.$$

Acid Potential (AP) (in kg $CaCO_3$/t) is measured from:

- Total sulfur (%) x 31.25

Neutralizing Potential (NP) (in kg $CaCO_3$/t) is measured from total carbonate NP determined from:

- Total carbon (%C) x 83.33.

Due to the dominantly intrusive rock host at MPM, total carbon is an appropriate proxy for carbonate (SRK 2023a).

NPR CRITERION

A site-specific criterion (NPR) of 1.6 was developed by SRK for Springer Deep and WX Zones (SRK 2023b). To derive the NPR*, the stable rate of sulphate release was compared to the relative rate of acid neutralization by calcium and magnesium carbonate minerals, as well as potassium and sodium to account for cation exchange. The data showed a tendency toward consumption of approximately 1.6 moles of calcium, magnesium, sodium, and potassium per mole of sulphate released.

Rock sourced from other zones is defined as PAG when NPR $\leq$ 2.

BLAST FRACTIONATION

SRK was retained by MPMC to refine ABA procedures and understand the specific factors controlling ARD potential at MPM to support mining of the Springer Deep and WX zones. This work has led to the

development of site-specific ABA procedures for these particular geological zones. An excerpt from the summary report provided by SRK (2023b) is included below.

"Mineral partitioning during blasting can have an effect on the classification of waste rock ARD potential since fines tend to be more reactive. If carbonate minerals preferentially partition into the blast fines, the use of a bulk TIC-NP/AP classification factor can lead to misclassification of rock that will probably not generate acid as PAG. The reverse can also occur if sulphide minerals preferentially partition to the fines."

Review of SRK's results of blast fractionation for the Springer Deep and WX Zones showed:

- No difference in levels of total sulfur in the fine and bulk fraction.
- NP (calculated from TIC) was enriched in the fine fraction compared to the bulk fraction.

SRK (2023b) derived a regression for the NP/AP relationship between the fines and the bulk fraction.

An NPR* of 0.7 in the blast hole cuttings is used to determine dig limits for PAG rock because this is equivalent to an NPR* of 1.6 in the blast fines, which is the reactive component in the rock. For all other rock types, an NPR of 2 in the blast hole cuttings will be used to determine dig limits until a relationship is confirmed.

MATERIAL CHARACTERIZATION OVERVIEW

This section provides an overview of characterization procedures.

The MPM program characterizes all material types that will be handled during the mine life. Analysis is completed on site by Mount Polley's LECO™ instrument , allowing MPMC to best manage mine waste by directing it to suitable storage sites, or to construction usage when required (and if deemed suitable).

On each bench, a sample of cuttings is collected from each blast hole and analyzed for total copper, non-sulphide copper, iron, and gold. Areas of ore and waste are identified by interpolation of these assay results and the economic analysis of the resulting metal grades. Ore/waste boundaries are then established based on the calculated mill head values.

In areas which have proven to be consistently NAG on previous adjacent benches in blasthole samples, the waste tonnage in each blast is divided by 40,000 in order to determine the number of ABA samples to be submitted (i.e., one per 40,000 tonnes (t) of waste). However, in areas where PAG has been modelled through either exploration sampling, or results of previous blasthole sampling on other benches, (or where NAG and PAG may coincide), the sample density is doubled to one per 20,000 t. This approach results in greater sampling density in areas of suspected NAG/PAG boundaries, and increases the certainty of defining PAG. Typically structures at MPM are vertically oriented, and relatively continuous. This provides some assurance that blasthole samples from previously mined benches have relevance for determining where additional samples should be taken on new benches.

Any ore that will be stockpiled rather than processed immediately is sampled at a frequency of one (1) per 20,000 t to determine if it is classified as PAG or NAG. Millfeed ore areas are excluded from ABA analysis, as this material is processed through the Mill.

Composite tailings samples are collected and analyzed every month when processing of ore occurs to represent the tonnage of tailings deposited.

Water treatment wastes are quantified monthly and sampled quarterly, with material characterization performed to assess ML/ARD potential and contribute to a material inventory.

As a confirmatory sampling measure, the Environmental Department takes random weekly grab samples from the NAG waste dump when NAG is being dumped and/or used for construction, to verify that material is being appropriately characterized and handled.

In the event that a confirmatory sample or other activities result in the discovery of PAG material in a NAG-designated area, a QP is to be informed without delay, who will dictate the response actions in coordination with site contacts. Mount Polley is permitted to blend pockets of less than 1,000 t of PAG materials with non-PAG materials at a ratio of 20:1, as described in *Mines Act* Permit M-200 Section D.3.(c)(i)(d). If these conditions cannot be met, it may be necessary to remove PAG material from NAG areas.

Water chemistry monitoring of seepage from rock dumps, water treatment plant wastes, and contact water from the site water collection systems is also conducted by the Environmental Department to inform development of geochemical source terms and long-term water quality predictions. Similarly, tailings composites and monthly random drill pulp samples are sent to a third-party laboratory for metals analysis as an additional source of data for site geochemical models.

IN-PIT SEGREGATION

Blasthole Samples:

1. After the production drill has completed and moved away from the hole, the sample may be taken.
2. Using a tube sampler, the Driller will take a representative sample of the cuttings pile.
3. Samples are to be collected in a clean plastic sample bag.
4. The Driller is to complete a Blasthole Sample Tag, tearing off the tag once completed and inserting it into sample bag.
5. The sample bag is to be tied off using ribbon.
6. In the case where multiple composite samples are to be taken from a single hole, the remaining cuttings after the sample are to be removed by the Driller so a clean new pile of cuttings can be formed.
7. Completed samples are to be left on the drill by the Driller. At the end of shift, the Mine Operations Pit Supervisor (or designate) will collect all samples and deliver them to the Bucking Room.

Bucking Room:

1. Each sample is to be transferred from the sample bag to a clean metal tray. The Blasthole Sample Tag is to be kept with the sample.
2. The sample is to be dried at 105°C.
3. The sample is then to be crushed in the Primary Crusher.
4. The sample is then to be crushed in the Fine Crusher.
5. The sample is to be split until the sample size is approximately 200 g.

a. Reject from the sample is to be wasted.

6. The sample is then to be pulverized for 75 seconds.
7. The sample is to be placed in a pouch with the Blasthole Sample Tag stapled to the pouch.
8. If the pouch is a pit sample, it is to be sent to Assay Lab 1. If the sample is an ABA sample, it is to be sent to Assay Lab 2.

Assay Lab 1:

1. The Assay Lab is to run the sample through the atomic absorption analyzer which automatically transfers the copper (CU), non-sulphide copper (CUNS) and iron (FE) values into the LIMS database.
2. The samples for gold analysis are to be fire assayed and analyzed by atomic absorption which automatically transfers the gold (AU) value into the LIMS database.
3. The sample is then to be placed into storage. Pit samples are to be stored for 21 days.

Ore Control Technician 1:

1. Once assays have been entered into the LIMS database, the Ore Control Technician will review the data and roughly determine where in the blast any Mill Feed Ore will be located.
2. Once the Ore Control Technician drafts the Mill Feed Ore locations, the Ore Control Technician will evenly select holes in the non-Mill Feed Ore areas (including materials designated for ore stockpiles) at a ratio of one (1) sample per 20,000 t of rock. This equates to about one for every nine blast holes. Additional samples can be requested whenever additional data is desired for improving understanding of the geological conditions. An example of a sample layout is included as Figure 1.

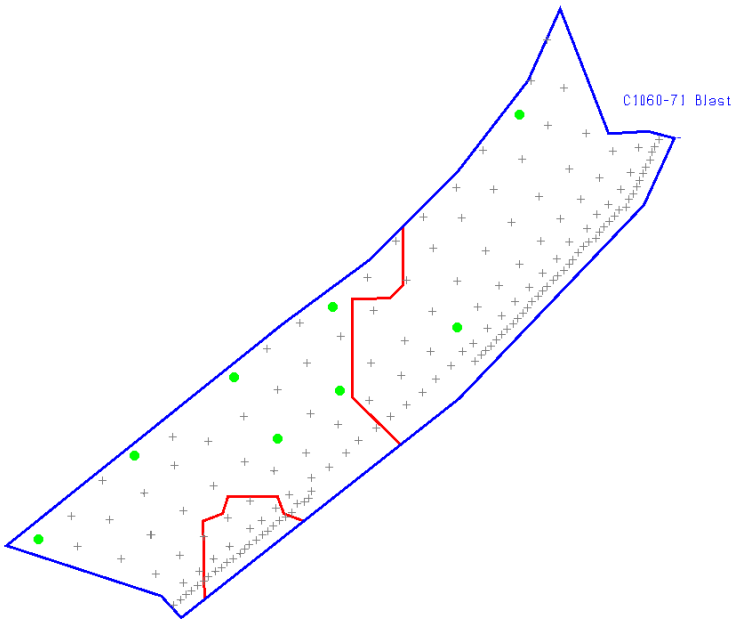

Figure 1: Location of ABA samples (green dots) within a blast. Red polygons denote mill feed ore, remainder is waste. The Ore Control Technician focuses sampling on areas which are designated waste and/or stockpile ore by the blasthole model. Reference blast = 149,173 t.

3. The Ore Control Technician is to then make an Analysis Request with the holes selected to the Assay Lab.

Assay Lab 2:

1. If the Assay Lab receives an Analysis Request, they will retrieve the sample pouch from storage, otherwise the sample will be delivered to the Bucking Room.
2. The Assay Lab will run the sample through the LECO CS230 Carbon Sulfur Analyzer.
3. Once analyzed, the machine transfers the carbon percentage (C%) and the sulfur percentage (S%) to a spreadsheet where NPR, NP and AP are calculated.
4. The NPR, NP, AP, C% and S% are transferred automatically to the LIMS database.
5. The sample is then to be placed into storage. ABA samples are to be stored for 14 days.

Ore Control Technician 2:

1. Once all the assays and ABAs have been entered into the LIMS database, the Ore Control Technician is to review the data and model the blast.
2. Modeling the blast
    a. The software used is MineSight.
    b. The model is based on a 5 metre (m) x 5 m x 12 m block system.
    c. The block closest to the ABA sample will closely match the sample.
    d. The blocks between the samples receive a weighted average of the sample carbon and sulfur grades.
    e. Once each block gets the weighted C% and S%, then the AP, NP and NPR is calculated for each block.
    f. Using the calculated NPR value, the model is to be coded as Ore/NAG/PAG by the Ore Control Technician and the resulting markup design is to be provided to the Surveyor.
3. The Ore Control Technician is responsible for the release of the final ore markup to the Surveyor. An example of a sample layout is included as Figure 2.

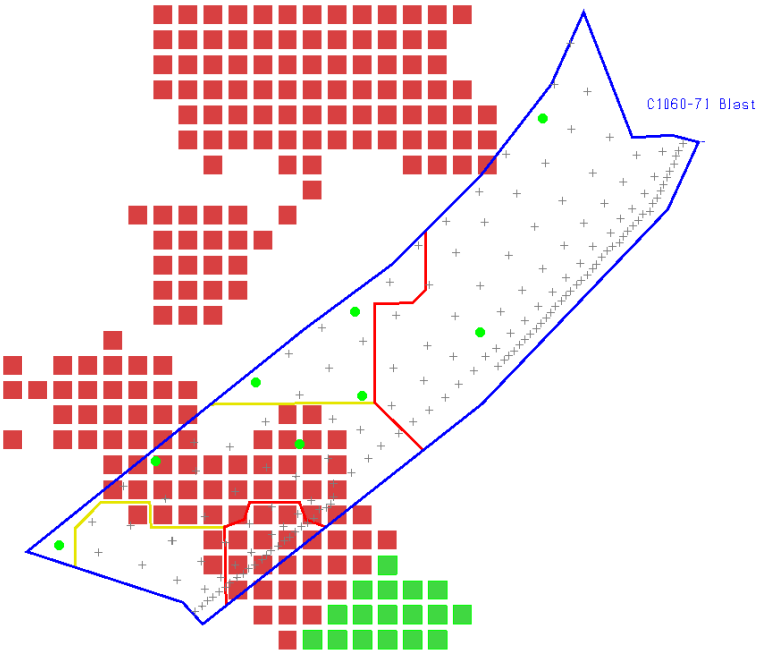

Figure 2. ABA results from samples shown in Figure 1 are used to update the blasthole PAG model item which identifies blocks which meet PAG criteria (red). The Ore Control Technician then marks up the PAG waste (yellow polygon) and the complete ore/waste markup is released to the Surveyor.

Surveyor:

1. The Surveyor will be responsible for the layout all Ore/NAG/PAG, as determined by the Ore Control Technician, in the field.

2. Using four (4) foot stakes spaced approximately 5 m apart, the Surveyor will mark out the contacts using marked placards.

    a. Red Placard = High Grade Ore
    b. White Placard = Super High Grade Ore
    c. Green Placard = Low Grade Ore
    d. Yellow Placard = PAG
    e. Blue Placard = NAG
    f. Pink Ribbon = High Grade Mill Feed Ore

3. Once complete, the Surveyor will print out maps of the area delineating material types for the shovel operator(s), and, if required, provide field verification of material types.

MATERIAL HANDLING

Shovel/Haul Truck Operators:

1. The Shovel Operator will mine the rock, following the contacts laid out by the Surveyor.

2. The Shovel Operator will ensure that all material contained within the contact stakes is routed as described by the markup and that any uncertainty in material classification is resolved by seeking the assistance of either the Pit Supervisor or the Engineering Department.
3. Upon loading a haul truck, the Shovel Operator shall direct the Haul Truck Driver as to the material type being hauled, and destination, using a horn sequence. The Haul Truck Driver will then take the material to the designated area.

IN-PIT MONITORING

Shovel Operator:

The Shovel Operator follows the staking of the Surveyor. Any material marked out as PAG is only to be hauled to approved locations. If a discrepancy is found, the Surveyor is to be called out to verify the material markup.

Pit Supervisor:

Throughout the shift, the Pit Supervisor will check in with the Shovel Operator and confirm the material type being loaded and that the destination is correct.

Haul Truck Driver:

If the Haul Truck Driver is uncertain of the material loaded, the Haul Truck Driver will confirm with the Shovel Operator or the Pit Supervisor.

Ore Control Technician:

The Ore Control Technician is to check Shovel Operator dig faces and confirm that the markup is appropriate and material is being routed appropriately.

Surveyor:

The Surveyor is to verify that material staking is visible and correct.

Environmental Department:

Once a month, the Environmental Department is to send a randomly selected drill hole pulp sample that MPMC analyzed for total sulfur and total carbon at the Assay Lab to a third-party laboratory (typically ALS Environmental in Burnaby, BC) for element analysis by ICP-MS following aqua regia digestion as an additional source of data to support site geochemical models.

Additionally, the Environmental Department takes water samples from all pit sumps to inform long-term geochemical predictions. Samples are collected as per MPMC-SOP-002: Surface Water Quality Monitoring. Monitoring locations and frequencies are regularly updated to reflect site developments and are summarized in the Comprehensive Environmental Management Plan.

TAILINGS MONITORING

Mill Metallurgy

1. The Mill Metallurgy Department is to take a monthly composite sample of the tailings generated through the month.
    - Slurry is to be sampled every two (2) hours and made into a composite for the shift.
    - The shift composite is then to be added to a monthly composite.
    - At the end of the month, the monthly composite is to be given to the Bucking Room and prepared for ABA total sulfur and carbon analysis.
2. The Environmental Department is to send the monthly tailings composite sample to a third-party laboratory (typically ALS Environmental in Burnaby, BC) for element analysis by ICP-MS following aqua regia digestion to provide data for site geochemical modelling.

WATER TREATMENT PLANT WASTE

Environmental Department:

1. Record the value on the waste line totalizer monthly when Water Treatment Plant (WTP) data are downloaded.
2. Collect samples of waste which has exited the WTP quarterly to characterize WTP wastes. Samples shall be taken of material that has exited the sludge line, to the West of the WTP and down-flow from where microsand is cycloned for re-use.
3. Sampling Method for liquid wastes (adapted from MPMC-WORK-002):
    - Record in-situ measures: pH, temperature, conductivity, and turbidity.
    - Take a water sample from the pipe outflow and send for lab analysis corresponding with other contact water samples as described in the Comprehensive Environmental Monitoring Plan, including but not limited to: physical parameters, pH, total and dissolved metals.
4. Sampling method for solid wastes (adapted from MPMC-WORK-016):
    - Take a composite sample of solids from the sludge pile adjacent to the WTP, with samples from at least 5 locations on the pile.
    - Send to an external laboratory for total sulfur, total inorganic carbon, elemental analysis by ICP-MS following aqua regia digestion and shake flask extraction testing to assess the ML/ARD potential of solids.
5. Review and archive lab data in a timely manner for use by personnel responsible for the Annual Reclamation Report.
6. The TSS concentration in wastewater will be used along with the waste line totalizer values to quantify the solids delivered to the TSF. The relationship between total and dissolved metals in the WTP waste line sample will be used to quantify the suspended (filterable) metals in this sample.
7. This information will be included in the MLARD materials inventory, and reported to EMLI in the Annual Reclamation Report as per Code Section 10.5.7 on water treatment wastes and by-products.

NAG Material Monitoring

Environment Department

1. As a confirmatory sampling measure, the Environmental Department is to take ABA grab samples from the NAG Dump and any area where NAG rock is used for construction on a weekly basis, while NAG dumping and/or NAG rock construction is occurring. Sampling will conform with MPMC-SOP-016: ABA and Soil Sampling. Two size fractions (+2 mm and -2 mm) will be analyzed for each sample collected. Sieving to be completed by lab once samples have been collected.
2. To assure data quality, as recommended in the BC Field Sampling Manual, a minimum of one in ten samples will be a duplicate sample, as written in MPMC-SOP-016.
3. Seeps and contact water collected on site are sampled to provide data for site geochemical modelling. Samples are collected as per MPMC-SOP-002: Surface Water Quality Monitoring. The frequency and locations of these monitoring sites are updated regularly to reflect changes to the mine site are summarized in the Comprehensive Environmental Management Plan.

Ore Control

1. As a blast fractionation confirmatory sampling measure, ten samples of blast muck will be collected each year. Blasts to sample will be selected based on mining activities and by targeting a range of sulfur contents.

Response to Finding PAG in NAG Areas

Environmental Department

1. Upon reviewing data indicating PAG material has been found in a NAG area, without delay contact one or more Qualified Professionals listed in this document, and the Pit Supervisor or designate to pass along the relevant data and sampling location.
2. Return to the location where PAG material was discovered and stake the sampling location. Note that material may have been dozed, buried or pushed down the dump face, in which case personnel are to mark as close as possible.
3. At the discretion of Qualified Professionals, undertake additional ABA sampling to assess the prevalence of PAG material.

Pit Supervisor:

1. Discuss NAG/PAG separation with shovel and haul truck operators and investigate the possibility of a loading or dumping mix-up. This is not a punitive activity but meant to identify potential causes and estimate material volume.
2. At the discretion of Qualified Professionals, organize the removal of PAG material from the non-PAG area.

ML/ARD Qualified Professional

1. Work with site contacts to develop an appropriate plan of action to address the situation.
2. If it is not possible to demonstrate that PAG material meets conditions outlined in M-200 Section D.3.(c)(i)(d), it may be necessary to remove recoverable PAG material.

REVIEW OF RESULTS AND PROGRAM EFFICACY

Data collected and corresponding interpretation regarding the ML/ARD program are included in the Annual Environmental and Reclamation Reports (AER and ARR, respectively), due annually to the British Columbia Ministry of Environment and Ministry of Energy and Mines on March 31 of each year, reflective of the previous calendar year. Personnel responsible for the AER/ARR may recommend updates to the ML/ARD program based on operational changes or findings of annual reporting. The AER/ARR include sections on: waste rock characterization and disposal; drainage water quality monitoring; and, updates to long-term predictions (kinetic testing).

1. INTRODUCTION

Mount Polley Mining Corporation (MPMC) is submitting this progress report as required by Section (s) 2.12 of *Environmental Management Act (EMA)* Permit 11678, issued on December 1, 2022. This progress report provides an update on progress on all aspects of s 2.11 under a general heading titled *Water Treatment and Discharge Program*. Progress Report #12 covers the period between January 1, 2023 and June 30, 2023, and includes relevant past work that falls under the requirements of s 2.11.

The Mount Polley mine was in care and maintenance from May 2019 through October 2021. Mining operations resumed November 2021 with the mining of Springer Phase 4, beginning with the removal of the saddle between Springer Pit and Cariboo Pit. The crusher and concentrator were refurbished, milling operations began June 2022, as did operation of the Tailings Storage Facility.

MPMC is currently progressing towards lowering the phreatic surface within the tailings that were deposited in the Springer Pit in 2015/2016. Ore reserves are located beneath the tailings, which are expected to provide an additional 2 years of production. MPMC is pursuing further operational permits to extend the mine life to 2030.

2. BACKGROUND

This Progress Report #12 references the newest version of *EMA* Permit 11678 (Dec 2022), which extends the effluent discharge into Quesnel Lake to June 30, 2025. A permit amendment application is in the pre-application stage of permitting through the Major Mine Office to extend the discharge to Quesnel Lake for the operating period of Mount Polley Mine.

EMA Permit 11678 (Dec 2022) includes s 2.11.2, a Numeric Performance Metric (NPM) of 0.012 mg/L total copper. The NPM value is a treatment optimization target for effluent discharge, which differs from the permit limit of 0.033 mg/L total copper.

MPMC recently filed a 5-year update to the Mine Plan and Reclamation Update 2022 (MRP) (Golder 2022g) submitted to the Ministry of Energy, Mines and Low Carbon Initiative (EMLI) in compliance with sections in *Mines Act* Permit M-200 dated December 10, 2020. Excerpts from the MRP Appendix G – Water Treatment Update are extracted to provide the update on water treatment technology development.

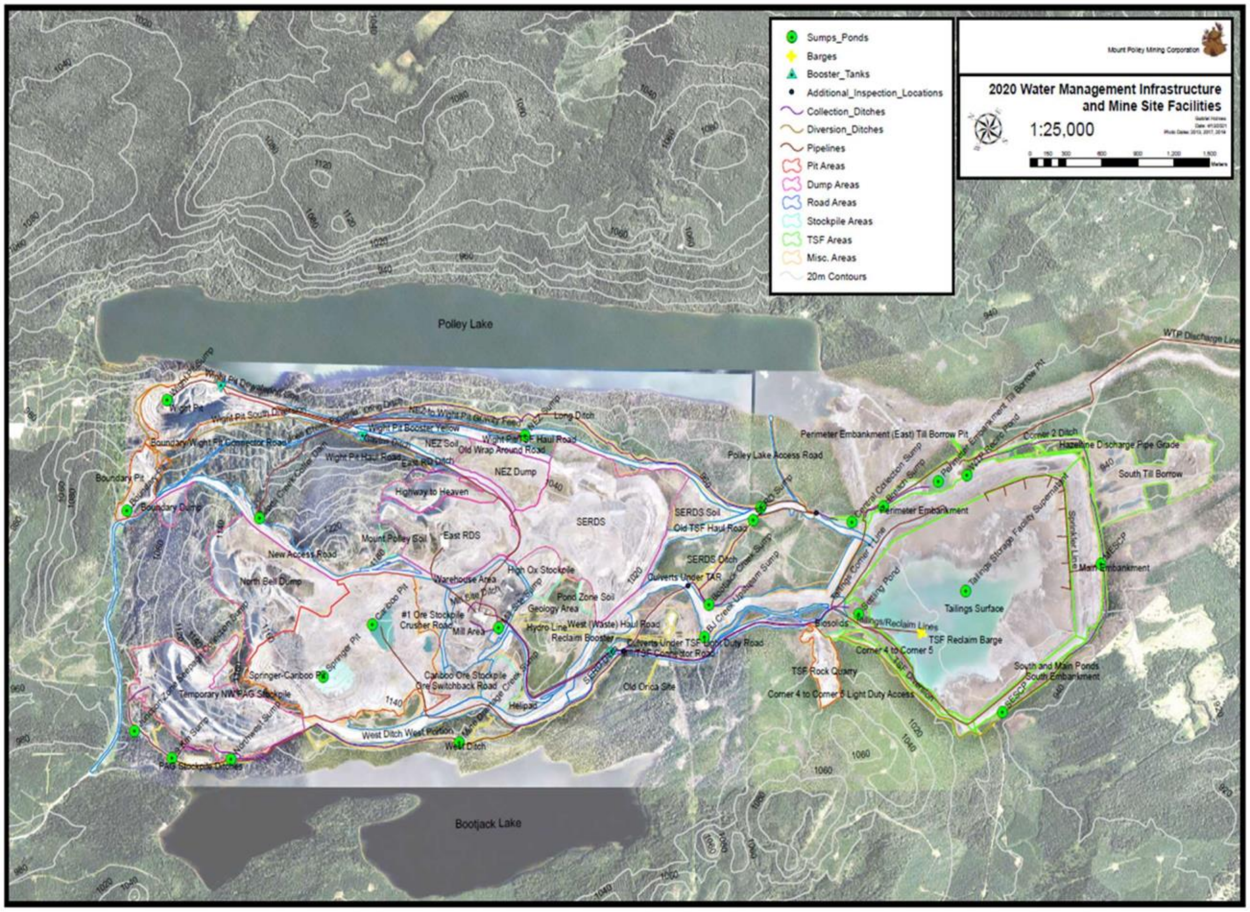

Figure 1. Water Management Infrastructure and Mine Site Facilities

3. WATER TREATMENT TECHNOLOGY DEVELOPMENT

Water treatment technology development is a cumulation of Best Available Technology (BAT) assessments through bench and pilot testing of treatment systems. This section of the report addresses Permit 11678 s 2.12(a) and s 2.12(b). What follows is an excerpt from the Mine Plan and Reclamation Update 2022 (MRP Appendix G) with updates of the results of BAT assessments, bench and pilot testing of treatment systems.

MPMC has been progressing and evaluating multiple technologies to support the treatment of identified constituents of concern (COCs) and to support potential decentralized treatment and discharge during closure/post-closure. Various studies have been completed since 2017 to support these efforts as an important component of closure refinement. An inventory of treatment technologies and a summary of their development is presented in Table 1.

Good engineering practice typically requires a project to follow a standardized engineering design process for the selection and progressive refinement of the final project concept. A project

progresses from a pre-concept phase for the identification of multiple treatment options, through concept, pre-feasibility, and feasibility phases to project execution. Generally, the engineering studies performed for each of these project phases are supported by test work that progresses from proof-of-concept and detailed bench-scale testing to pilot-scale and demonstration-scale test work. Some of the treatment technologies tested may not progress to the next stage of development. For example, a treatment technology may be eliminated if its treatment capacity is insufficient to treat the forecast volumes. This framework takes a staged approach, such that input assumptions, design, and cost for the total system can be refined as each stage is completed and the information that the plan relies on becomes more certain. This allows input assumptions to be less conservative as they become more accurate with accumulated knowledge. The technology development stages presented in Table 1 align with this approach. Additional details regarding this project development framework and how it aligns with the BC Ministry of Environment and Climate Change Strategy's BAT policy is provided in Golder 2020a.

This water treatment update technical memorandum assumes that the reader is familiar with the technologies in Table 1 and only provides updates on work completed by MPMC since 2017 to support the development of these technologies. Detailed descriptions of the technologies and associated process flow schematics can be found in Golder 2020a.

Table 1. Treatment Technology Inventory and Stage of Development

Technology / Stage of Development	Targeted COCs	Proof-of-Concept Bench-Scale Testing	Detailed Bench-Scale Testing	Pilot-Scale Testing	Demo-Scale Testing	Full-Scale Execution	Work Completed
Actiflo	TSS, total copper					→	Bench and full-scale testing.
Lime Treatment	Dissolved copper					→	N/A
TMT Treatment	Dissolved copper	→	→	→	→		Bench and full-scale testing. Toxicity evaluation.
Pit-Lake Treatment	Selenium, nitrate	→	→	→			Preliminary concept design and proof-of-concept bench-scale testing. Pilot-scale testing workplan.
Saturated Rock Fill (SRF)	Selenium, nitrate	→	→				Concept design, proof-of-concept bench-scale testing, detailed bench-scale testing workplan (in progress), and long-term substrate leach testing. Wight Pit SRF assessments.

Technology / Stage of Development	Targeted COCs	Proof-of-Concept Bench-Scale Testing	Detailed Bench-Scale Testing	Pilot-Scale Testing	Demo-Scale Testing	Full-Scale Execution	Work Completed
Packed Bed Reactor (PBR)	Selenium, nitrate						Concept design, proof-of-concept bench-scale testing, and detailed bench scale testing workplan (in progress).
Biochemical Reactor (BCR)	Selenium, nitrate						Concept design and proof-of-concept bench-scale testing.
Submerged Sand Reactor (SSR)	Selenium, nitrate						Screening analysis.
Constructed Wetland Treatment (CWT)	Selenium, nitrate						Concept design, bench-scale testing, and on-site pilot scale testing (by others).

3.1 Actiflo

Actiflo, the tradename of a technology supplied by Veolia, is the technology currently in use as the site's WTP and is considered the BAT for TSS removal during operations and closure/post-closure. The main targeted COC of this technology is TSS, with total copper removal also occurring via TSS removal. Polyaluminum chloride (PAC) is dosed into the influent water in the Actiflo process, which produces aluminum hydroxide precipitates that adsorb to copper complexes, thus removing copper during the solids-liquids separation step of the process. The Actiflo technology is currently implemented at full-scale on-site, as indicated in Table 1.

Concept design, bench-scale, and full-scale testing have been completed for the Actiflo technology, including assessment and optimization of PAC and various chelating agent dosages (including TMT) to assist copper removal (Golder 2016b, Golder 2017a, Golder 2018a, Golder 2019a, Golder 2019b, Golder 2020b).

Actiflo treatment is currently operating as the core component of the treatment system during operations and is currently assumed as the core component of treatment during closure/post-closure.

3.1.1 Flocculant Management Plan

Per Permit s 2.10, a Flocculant Management Plan (FMP) was prepared and outlines the methods for the settling of solids at the WTP using coagulant, flocculant and ballast, while preventing potential detrimental effects in the receiving environment. The FMP also outlines the procedures and equipment used for storage and dosing of the settling aids, including monitoring of the influent and effluent water quality (Golder 2023a). This document, provided by Golder, was appended to the 2022 Annual Environmental Report and submitted to ENV in March 2023.

3.2 Lime Treatment

Active treatment with lime is currently in use at the site, where existing process plant infrastructure is used to raise contact water pH, resulting in the precipitation of metal hydroxides, particularly dissolved copper. The main targeted COC of this technology is dissolved copper. Lime treatment is currently implemented on-site, as indicated in Table 1, and used as a pre-treatment step of the Actiflo water treatment system to target dissolved copper removal. Use of this technology is well known to industry and technology development to support this has not been required.

Lime treatment, when required, is currently a component of the water treatment system during operations.

3.3 TMT Treatment

TMT is a chelating agent that aids with dissolved copper precipitation that allows copper treatment through TSS removal. The main targeted COC of this technology is dissolved copper.

Bench-scale test work completed showed that TMT is able to effectively precipitate dissolved copper (Golder 2016b, Golder 2017a, Golder 2018a) and the full-scale trials completed showed that the existing Actiflo treatment system was able to remove the copper bound with TMT to below the permit limit (Golder 2019a, Golder 2019b, Golder 2020b). Full-scale trials also showed that copper removal to lower concentrations (total copper < 0.012 mg/L) was challenging for Actiflo with TMT treatment, not due to limitations in dissolved copper precipitation but due to limitations in TSS removal. TMT was effective in precipitating dissolved copper, but the Actiflo system was not effective in subsequently removing the precipitate to result in low effluent copper concentrations. The toxicity of TMT has also been evaluated and showed that its use would not result in an acutely lethal effluent (Golder 2018b).

TMT treatment is still being considered for full-scale implementation.

3.4 Pit-Lake Treatment

Pit-lake treatment targeting COCs of selenium and nitrate is an in-situ technology that requires nutrient and carbon source dosing to create conditions for biological treatment within the pit-lake.

A conceptual assessment of full-scale pit-lake selenium treatment was completed (Golder 2017b) and the technology was deemed a cost-effective approach to managing selenium and was recommended for further bench and pilot-scale testing. Proof-of-concept bench-scale testing for pit-lake selenium treatment was also completed and showed effective removal of selenium and nitrate, with further pilot-scale testing recommended (Golder 2019c). A pilot-scale study for pit-lake treatment was designed for Cariboo Pit (Golder 2020c), but the pit is being dewatered to support future mining activities and this work has not yet been completed.

Pit-lake treatment targeting selenium and nitrate is still being considered for full-scale implementation and is currently assumed as part of the treatment system during closure/post-closure if required.

3.5 Saturated Rock Fill (SRF)

SRF treatment is a fixed-film anaerobic system targeting the treatment of selenium and nitrate and

ideally utilizes a mined-out open pit as a bioreactor operated in a horizontal flow configuration.

A concept study for SRF treatment was completed (Golder 2020d) and SRF was recommended for further bench-scale and pilot-scale testing. Proof-of-concept bench-scale testing for SRF was also completed (Golder 2021), which showed effective removal of selenium and nitrate, but also indicated metal leaching. Detailed bench-scale testing and waste rock SRF substrate metal leach testing was recommended following completion of the proof-of-concept work.

Bench-scale leach testing using anticipated SRF substrate waste rock from site was completed (Golder 2022d – draft RevA, Golder 2023d), which monitored leached metals over a long-term test period of 52 weeks. A high-level summary of findings is below and the full report is included in Appendix A:

- The bench-scale SRF reactor used was very effective in removing total and dissolved selenium and nitrate.
- The use of mine waste rock as reactor media for SRF introduces the risk of leaching or release of metals into the SRF effluent. For this treatment technology to be implemented at full-scale as a viable option, the effects of metal leaching should be understood at specific reducing conditions that are required for SRF to achieve effective removal of selenium and nitrate.
- Metal leaching varies over time and differs between metals and must be considered during the start-up phase of SRF implementation (and may lead to additional required polishing treatment steps downstream of the SRF).
- SRF technology can provide copper removal during closure.

Detailed bench-scale testing for SRF has been proposed for 2023 and a test plan has been submitted in draft to MPMC (Golder 2022e – draft RevA). Geotechnical and geochemical substrate characterization for SRF media waste rock is currently ongoing and anticipated for completion in 2023. Golder has completed geotechnical laboratory testing of the SRF substrate and the analytical results will be used in the geotechnical settlement assessment of SRF bed geometrics. It is anticipated that geochemical substrate characterization will be conducted by MPMC's geochemical consultant SRK.

SRF treatment is still being evaluated for full-scale implementation and is currently considered a technology option for semi-passive treatment of selenium and nitrate during closure/post-closure if required.

3.5.1 DNA Analysis

Additionally, to investigate if the observed reduction in contaminants of concern in Wight Pit is facilitated by microbial activity, Golder sampled the effluent water of Wight Pit from the bench scale SRF to determine if the presence of genetic material could be used to indicate the presence of these bacteria and any favorable activity (Golder, 2023b). Microbial community composition and interactions were also studied using DNA analysis of the microbial communities from various locations on site. The analysis of samples collected from the site provided proof-of-concept for the

biological activity in terms of selenate and nitrate reduction in Wight Pit as several species that are potentially involved in selenium and/or nitrate removal were present in the microbial community in the pit (Golder, 2023b). Copper removal through precipitation as copper sulfide was also investigated and it was determined that although some sulfur/sulfide reducing bacteria were present, the sulfate reducing bacteria were not sufficient. The full report is included in Appendix B.

3.6 Packed Bed Reactor (PBR)

PBR treatment is another fixed-film anaerobic system targeting the treatment of selenium and nitrate. PBR treatment differs from SRF treatment through the use of a vertical flow (top to bottom) reactor.

Proof-of-concept bench-scale testing was completed (Golder 2019d) and PBR treatment was shown to be effective in reducing selenium and nitrate. Further detailed bench-scale and pilot-scale testing was recommended following completion of the initial testing. Detailed bench-scale testing for PBR has been proposed and a test plan has been submitted in draft to MPMC (Golder 2022f – draft RevA). PBR detailed bench scale testing has been postponed while focus is placed on immediate permit application priorities regarding the extension of the life-of-mine plan. Water balance, water quality and hydrogeological modelling as well as surface water infrastructure design are currently being completed to support permitting.

PBR treatment is still being evaluated for full-scale implementation and is currently considered a technology option for semi-passive distributed treatment of selenium and nitrate during closure/post-closure if required.

3.7 Biochemical Reactor (BCR)

BCR treatment is another fixed-film anaerobic treatment technology that consists of a lined pond filled with a submerged organic substrate media mix. The main targeted COCs of this technology are selenium and nitrate. BCR treatment is passive and does not involve continuous dosing of a carbon source to the media bed.

Proof-of-concept bench-scale testing was completed (Golder 2019d) and BCR treatment was shown to be effective in reducing selenium and nitrate, but redox sensitive metals were present in the BCR effluent.

Upon review of the BCR technology in comparison to other passive and semi-passive technologies, MPMC decided to not proceed with further development of this technology (MPMC 2021) for the following reasons:

- Limited lifespan of BCR passive treatment systems based on the availability of a carbon source that is encapsulated in the system during construction – this needs to be replaced periodically at significant cost.
- Emission of elevated levels of biochemical oxygen demand (BOD) from the system during commissioning and start-up of operation that exceed standards for discharge to the environment.
- Persistent emission of phosphorus from the BCR during operation that will likely exceed

plausible standards for discharge to the environment.

BCR treatment is no longer being developed as a passive treatment technology option during closure/post-closure.

3.8 Submerged Sand Reactor (SSR)

SSR is similar to other anaerobic reactor technologies, with the use of the existing tailings as media for the bioreactor. The main targeted COCs of this technology are selenium and nitrate.

A concept study was completed for SSR (Golder 2020d), as well as proof-of-concept bench-scale testing (Golder 2019d). Use of MPMC tailings as SSR bioreactor media or use of the site's TSF as an in-situ SSR was not recommended for further investigation. Bench-scale testing resulting in metal release in the reactor effluent when using site tailings as the reactor media. The concept study also concluded that further investigation of SSR was not warranted, based on a review of literature, an evaluation of historical water quality monitoring data, and an evaluation of the feasibility of utilizing the TSF from a hydrogeological and permitting perspective.

SSR treatment is no longer being developed as a treatment technology option during closure/post-closure.

3.9 Constructed Wetland Treatment (CWT)

MPMC retained Ensero Solutions Inc. (Ensero), formerly known as Contango Strategies Ltd., to conduct a detailed assessment and evaluation of the feasibility of a CWT system for passive/semi-passive treatment during closure/post-closure. The main targeted COCs of this technology are selenium and nitrate.

Pilot-scale design, sizing, and testing for CWT was completed by Ensero (Ensero 2020), and the technology demonstrated promising results for treatment of targeted COCs; however other passive/semi-passive technologies have indicated improved treatment capability in comparison. MPMC may choose to proceed with demonstration-scale on-site testing of CWT once the pilot-scale results have been fully understood and if the performance of competing technologies (SRF and others) indicates an advantage for CWT.

CWT is still being evaluated for full-scale implementation and is currently considered a technology option for passive/semi-passive and distributed treatment of selenium and nitrate during closure/post-closure if required.

4. ANTICIPATED FUTURE WORK

The existing and assumed water treatment systems for operations, closure, and post-closure have been outlined in this memorandum; however, changes may still be implemented during all phases of the mine as knowledge and needs evolve. The water treatment system for closure/post-closure will continue to develop in more detail as MPMC better understands technology capabilities and refines their final approach to water treatment for the closure period.

Table 1 provides a summary of the development stage of the treatment technologies implemented

or being considered for operations, closure, and post-closure. Future work is anticipated for any technology still under consideration that has not achieved full-scale implementation. The following items describe the priority treatment work anticipated over approximately the next three years, but do not exhaustively describe all potential remaining work for technologies still under consideration:

- Actiflo technology is a component of the operations and closure/post-closure BAT and a main component of the existing treatment system during operations and assumed treatment system during closure/post-closure. Further development of the technology is anticipated with respect to PAC and TMT usage, as well improving the solid-liquid separation in the process to address potential high-copper instances. Several recommendations for future system improvements have been outlined in Golder 2020b, including supporting bench-scale and field trials. Recommendations are mainly focused on improving removal of particulate copper from the WTP effluent and improving the effectiveness of PAC and TMT use.
- Pit-lake treatment is currently assumed as a component of the closure/post-closure treatment system. Pilot-scale pit-lake work was anticipated for Cariboo pit, but recent mine operational changes have resulted in the draining of both Springer and Cariboo pits and pit-lake treatment trials are no longer feasible at these locations. Operational changes have also resulted in Wight pit being filled. The previous pilot-scale study designed for Cariboo pit (Golder 2020c) could be redesigned for Wight pit if operational conditions in the near future are deemed appropriate, further advancing the development of this technology.
- Two options exist as the BAT for treatment during closure/post-closure: distributed passive/semi-passive treatment systems, and pit-lake treatment followed by the centralized Actiflo plant. Golder has proposed to undertake a treatment option life cycle cost comparison study between the two options, informed by the knowledge gained during recent technology development, to assess pros/cons and capital and operating costs between the options and inform future treatment program development decisions.
    - Golder initiated the treatment option life cycle cost comparison study between the two options in Q2 2023, with the associated draft report anticipated to be completed in Q4 2023.
- SRF and PBR detailed bench scale testing have been proposed to MPMC and this work is expected for completion in the near future to continue the development of these technologies.
    - SRF and PBR detailed bench scale testing have been postponed while focus is placed on immediate permit application priorities regarding the extension of the life-of-mine plan. Water balance, water quality and hydrogeological modelling as well as surface water infrastructure design are currently being completed to support permitting.

5. NUMERIC PERFORMANCE METRIC

5.1 Measurement of the Numeric Performance Metric

A Numeric Performance Metric for total copper has been specified in *EMA* Permit 11678 (Dec 2022), [s 2.11.2], expressed as follows:

a. *"Numeric Performance Metric" (NPM) means a measurable value that quantifies the outcome or result of water treatment and the ability of the treatment to remove specified chemical constituent(s). It forms the basis for a numeric comparison of untreated water, to water that has been treated by the treatment system.*

b. *The permittee must operate and optimize the design and performance of the WTP to target achievement of any prescribed NPM. The stated NPM target value represents WTP operation that achieves annual average effluent quality that is at or below any specified NPM. Assessment of the attainment of NPM values must be reported in an annual optimization update progress report appended to the annual report required in section 4.2. If the effluent qualify does not achieve an NPM value specified by the director, the permittee must identify and propose response actions to bring the effluent quality toward meeting the target value in the annual optimization update progress report. Response action may include treatment plant optimization and/or source control and/or water management improvements, and a schedule for implementing the response action must be included in the annual optimization update progress report.*

The following NPM is established:

Total copper 12 µg/L

c. *"Annual average effluent quality" means the effluent concentration of total copper based on a 52-week rolling average, using the average of the 52 grab samples at HAD-3 when the WTP is discharging.*

Progress reporting on the implementation of response action(s) for attainment of the NPM target value is a condition of Permit 11678 (Dec 2022) [s 2.12(c)]. Water quality samples of the Water Treatment Plant effluent identified as HAD-3 are taken weekly when the WTP is operating for analysis by a certified laboratory.

A graphical presentation of the weekly total copper concentrations (mg/L) of the Water Treatment Plant (WTP) effluent (HAD-3) discharge to Quesnel Lake is shown:

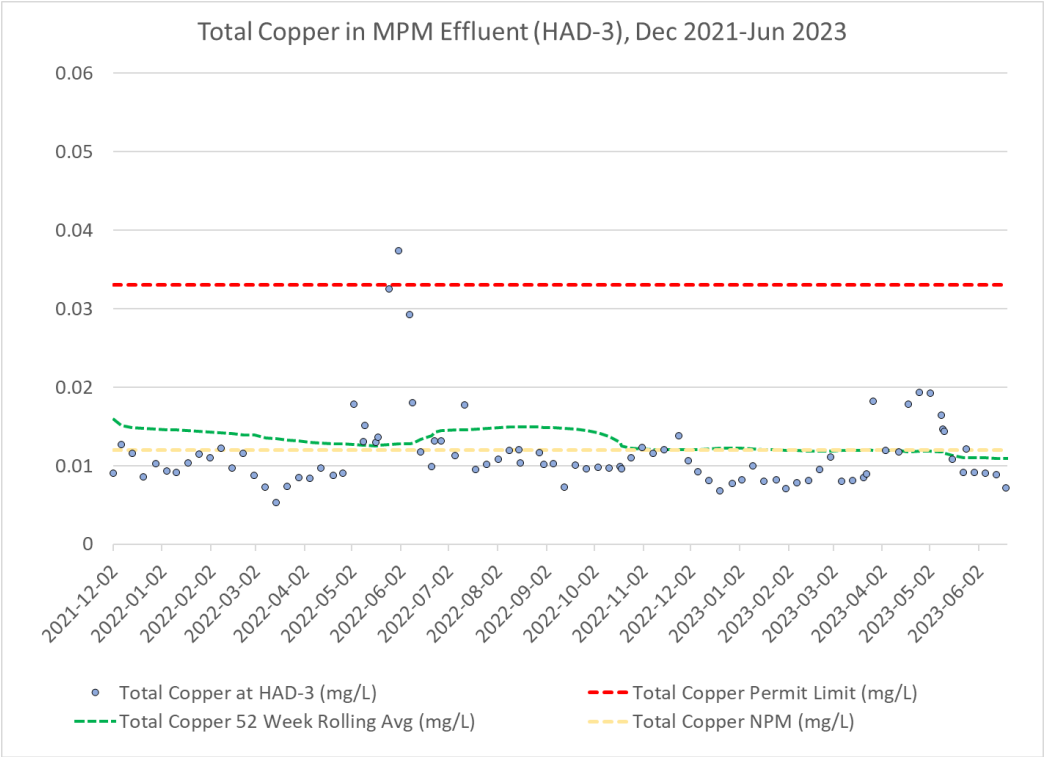

Figure 2. WTP effluent (HAD-3) total copper concentrations relative to the NPM (dashed yellow line), NPM annual average (dashed green line) and Permit 11678 end-of-pipe limit (dashed red line)

The NPM annual average of total copper is based on a 52-week rolling average, calculated using the average of 52 grab samples collected at HAD-3 when the WTP is discharging [s 2.11.2(c)].

To date in 2023, the NPM target has been achieved in 21/29 WTP samples or 72% of the time. In 2022, WTP samples achieved the NPM target approximately 69% of the time, in 38/55 samples. This represents an improvement over 2021 when the NPM was achieved 43% of the time, which is an improvement over 2020, when the NPM was achieved 23% of the time. The NPM annual average of total copper was 0.01217 mg/L as of December 13, 2022 and has continuously decreased to 0.01068 mg/L as of June 19, 2023.

The year-over-year improvement in reaching the NPM target is a result of improved WTP optimization with the addition of a second Actiflo WTP, and the establishment of pre-treatment processes developed as part of a water treatment train preceding the WTP; in-situ pit lake treatment, pre-treatment with sodium hydrosulphide and improved source control.

The operational response actions in achieving the NPM in 2023 are detailed in later sections of this Progress Report #12.

6. WATER TREATMENT PROGRESS (JANUARY – JUNE 2023)

The site has experienced a year-over-year reduction of water stored on site, from 7.01 Mm^3 on December 28, 2021 to 5.83 Mm^3 on December 27, 2022, a net reduction of 1.28 Mm^3. The return to milling operations in June 2022 and resulting tailings deposition into the tailings storage facility consumes free water into the void spaces of the tailings.

The volume of water treated shows a year-over-year increase in treatment capacity from 6.7 million cubic meters in 2021 to 7.0 million cubic meters in 2022. From January to June 27, 2023, 3.6 million cubic meters of water have been treated, the water stored on site is 4.14 Mm^3.

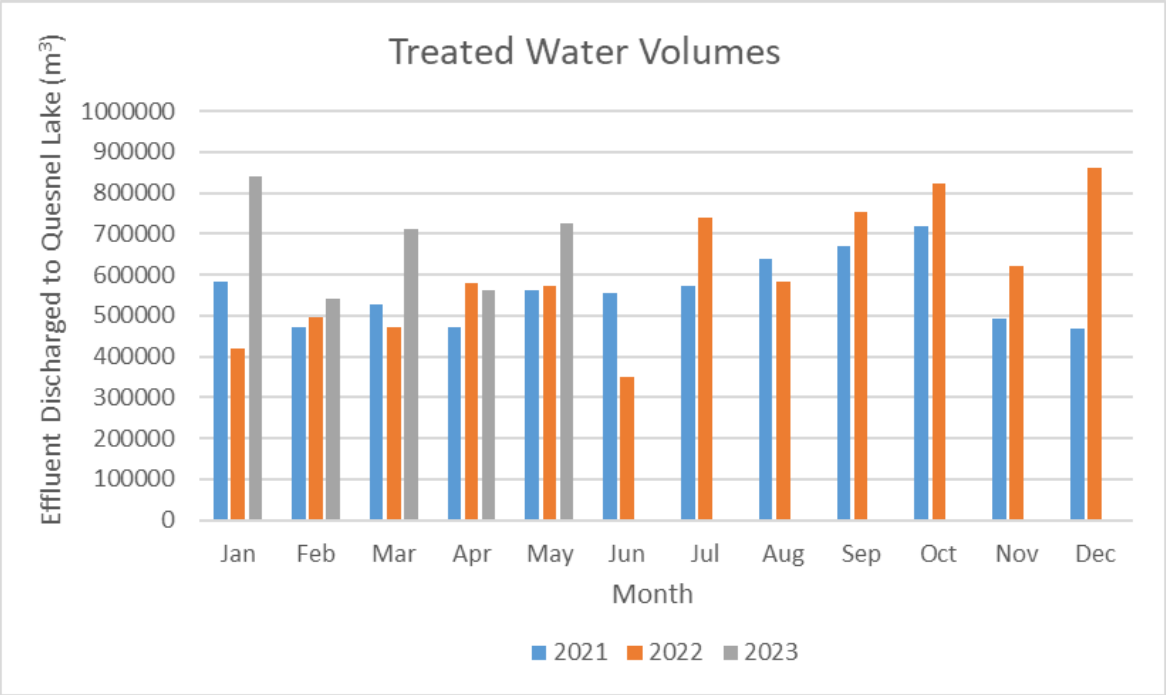

Figure 3. Treated Water Discharged over 2021, 2022 and 2023

6.1 Mobile Water Treatment Plant Installation

MPMC commissioned an interim rental Veolia Actiflo mobile water treatment plant (MWTP) to increase discharge throughput and assist with management of onsite water inventory, Commissioning of the MWTP began on March 16, 2022, by Veolia automation and process technicians and was completed on April 1, 2022. The MWTP began discharging to Quesnel Lake on April 9, 2022, after approval was granted by BC-ENV and was decommissioned on May 10, 2023 once the Mount Polley mine water balance reached a more manageable level. The HAD-3 sample results from April 12, 2022 to May 9, 2023 represent the combined effluent from both plants. To properly represent end-of-pipe conditions, the sample port was located downstream from the wye where effluent from both plants was mixed. Sample results from May 10, 2023 onward represent effluent from the permanent WTP only.

The MWTP assisted with the optimization of water treatment plant operations by allowing for higher throughput than the permanent WTP alone, with an increased retention time to allow for more complete particle settling, resulting in lower total suspended solids (TSS). Because the NPM

limit is in terms of total copper, a reduction in TSS is likely to be associated with lower copper and therefore a higher probability of NPM attainment.

6.2 Pit Lake Treatment

The Cariboo, Springer and Wight Pits have a combined 2.66 Mm^3 of stored water. The site has excess water stored in the pits currently. It is MPMC's objective to continue dewatering the site in 2023 so that mining can occur in the Springer and Cariboo Pits. A temporary mobile water treatment plant was commissioned in Q2 2022 to increase treatment capacity and was decommissioned in Q2 2023.

6.2.1 Cariboo Pit

The Cariboo Pit contains approximately 0.22 Mm^3 of stored water. The concentration of total copper and selenium have over time fallen below the *EMA* Permit 11678 limits of s 1.2.4, Column 2 of Table 1 for the Treatment Plant Outlet. In 2021, MPMC implemented a 'pit profiling' water column monitoring program to record changes in water chemistry at various water depths over time through seasonal temperature changes, lake turnover and ice cover. This data set is provided in Figure 4, supplemented by samples from E8, the regulatory site for Cariboo Pit which is analogous with surface water.

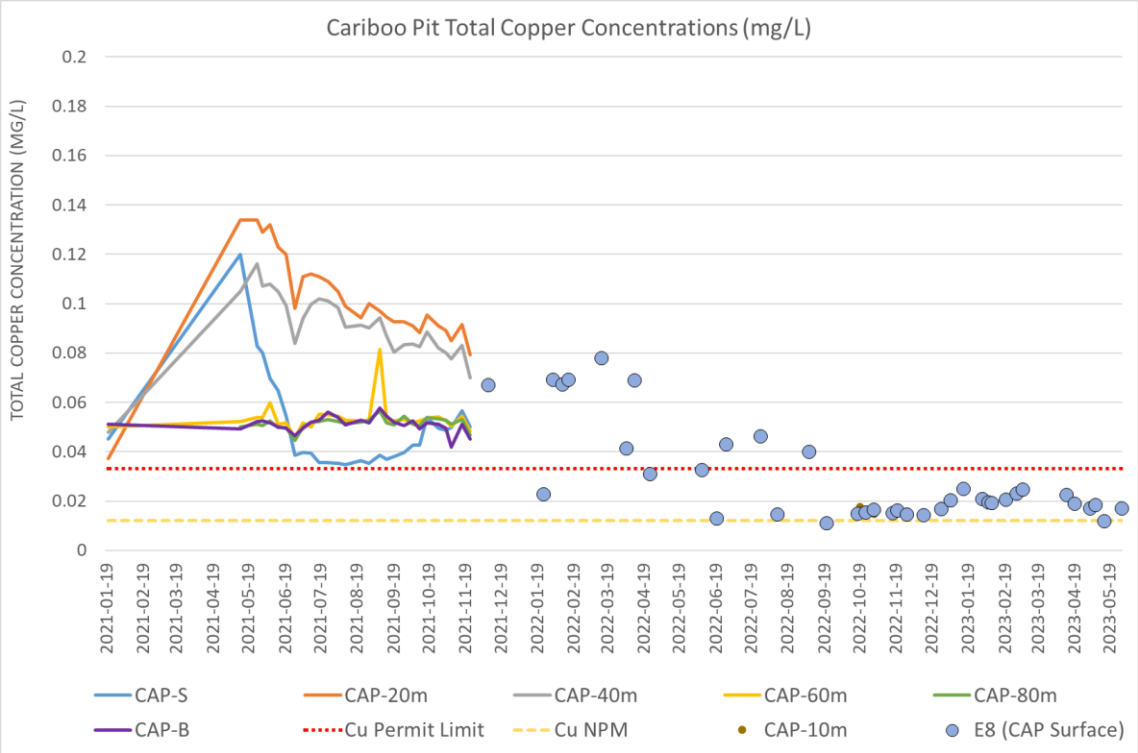

Figure 4. Cariboo Pit total copper concentration at 20 m depth increments 2021-Present.

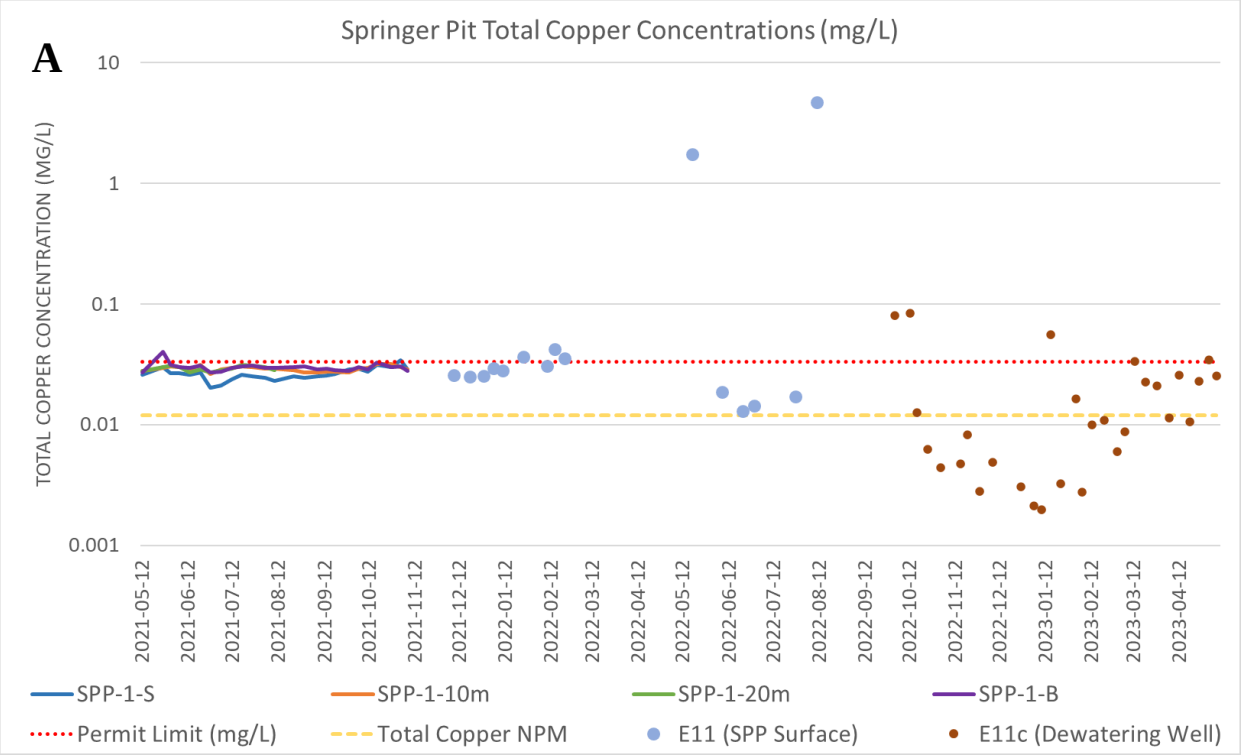
Copper concentrations in the Cariboo Pit trended downward in 2022, with a dramatic reduction of copper observed between January and May 2022. Historically, the highest copper concentrations have been found at the 20 and 40 m depths, while surface water and water from below 60 m depth contained less copper. In the profile taken May 11, 2022, the Pit Lake was mixed at all depths,

with a uniform total copper concentration of approximately 0.017 mg/L. Thus far in 2023, copper concentrations have been relatively constant with copper concentrations ranging from 0.012 mg/L to 0.0246 mg/L.

In-situ treatment processes contribute to this trend. In-situ treatments utilized in 2022 and 2023 include the settling of solids and in 2022 only, dosage with sodium hydrosulfide (NaHS) to sequester copper. More on sodium hydrosulfide treatment can be found in Section 6.3.

6.2.2 Springer Pit

Springer Pit is effectively dewatered to allow mining activities to proceed. During the ice-free season of 2021, passive treatment through settling has contributed to a reduction of total copper to less than the *EMA* Permit 11678 limits. The supernatant water meeting this threshold was removed and treated as a permit requirement through the water treatment plant.



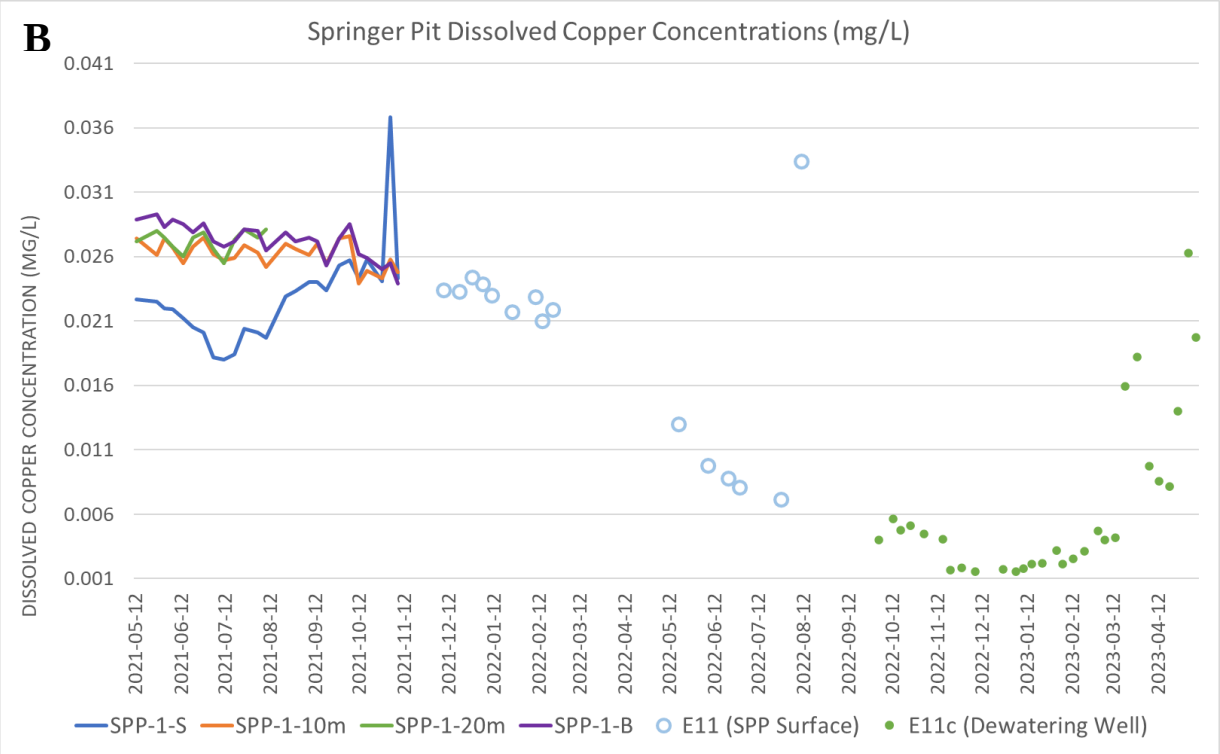


Figure 5. Springer Pit total (A) and dissolved (B) copper concentrations 2021-2023. The divergent trends in total and dissolved values may be a result of copper sequestration in sediment.

The last total copper and selenium concentrations in the Cariboo and Springer Pits are shown in Table 2. Note that due to dewatering and 2023 mining activities, it is no longer practicable to profile the Springer or Cariboo pits at depth. The Springer Pit water is represented by the regulatory site E11c, corresponding with interstitial water within and below the tailings pumped from three dewatering wells within the pit. Profiling the Cariboo Pit at depth intervals ceased in November 2022 due to ice formation on the pit lake resulting in accessibility and safety issues; therefore, the last profile of the Cariboo Pit was collected on November 1, 2022.

Table 2. Water parameters of interest as of November 1, 2022 in the Cariboo Pit and November 29,2022 in the Springer Pit

Sample ID	TSS (mg/L)	pH	Cu Total (mg/L)	Cu Diss (mg/L)	Se Total (mg/L)
Cariboo Pit					
Surface	<1.0	7.91	0.0138	0.0103	0.0507
10 m	1.6	7.94	0.0146	0.0104	0.0509
Bottom	1.2	7.94	0.0147	0.0103	0.0514
Springer Pit					
Interstitial Water	2.0	7.64	0.00279	0.00185	0.0076

6.2.3 Wight Pit

Wight Pit contains approximately 2.44 Mm^3 of stored water, sourced primarily from the dewatering of Cariboo Pit earlier in 2022. Investigations are underway to understand passive water treatment which is believed to have occurred in the Wight Pit. Golder was retained to study evidence of a naturally occurring biological reaction reducing nitrate, selenium and copper. A recent technical memorandum, entitled "Mount Polley Mine: Investigation of Potential Saturated Rock Fill at Wight Pit" was included with Progress Report #9 in December 2021 (Golder 2021b). In summary, Golder used multivariate analysis of water chemistry to investigate whether water quality improvement was due to dilution by infiltrating groundwater and found this was not the case (Figure 6). Treatment of the target analytes is occurring due to another process than dilution or displacement.

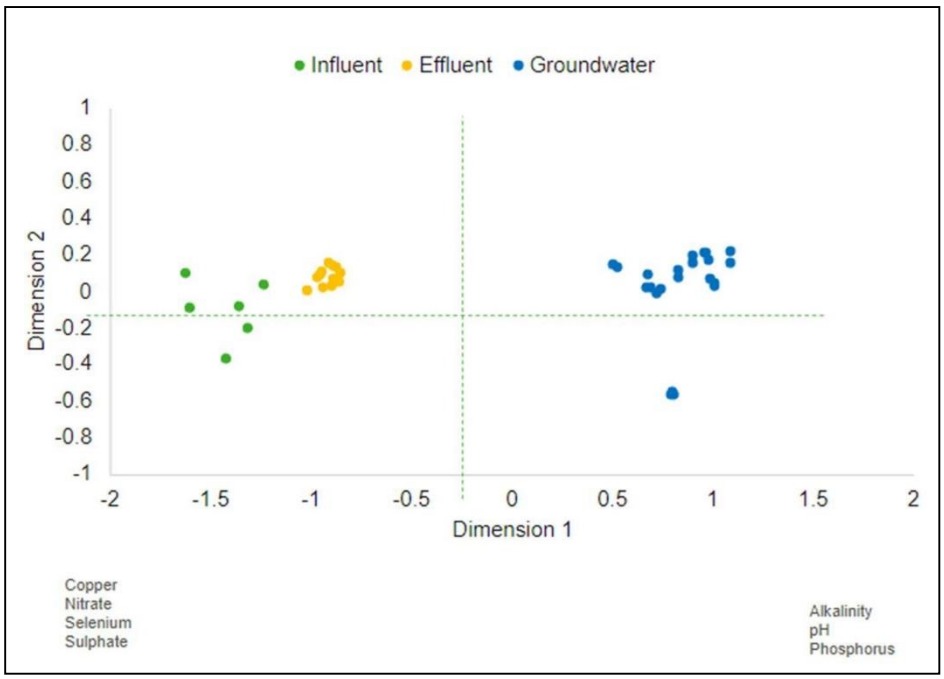

Figure 6. Visualization of Golder's Wight Pit multivariate analysis. Influent, effluent, and groundwater are dissimilar, which indicates a process other than source mixing

Work in the Wight Pit is most recently being expanded to include DNA analysis. Samples were collected from Wight Pit, the TSF, other water storage areas on-site in the winter of 2021-2022, and Golder's bench-scale reactor in the laboratory. Third party laboratory DNA analysis of the sampling was completed and results indicated the presence of several species that are potentially involved in selenium and/or nitrate removal in the pit. Copper removal through precipitation as copper sulfide was also investigated and it was determined that although some sulfur/sulfide reducing bacteria were present, the sulfate reducing bacteria were not sufficient. This, combined with the bench-scale investigation of SRF processes, discussed earlier in this report, will expand on the possibility of passive treatment in the Wight Pit.

6.3 Sodium Hydrosulphide Treatment for Copper

MPMC investigated the use of sodium hydrosulfide (NaHS) as an agent to reduce copper concentrations in water by precipitation of metal sulphides. NaHS is a water-soluble chemical used in the MPMC concentrator as a flotation activator for copper-oxide mineral processing. In the context of water treatment, it can be added to water with high concentrations of dissolved copper. Ionic minerals, including copper, will interact to form insoluble metal sulfides which can be removed from the water by settling, and therefore sequestered.

This process has been demonstrated to be effective at removing copper in bench and pilot-scale trials by MPMC personnel. A series of demonstration-scale trials were conducted in 2021 with favorable results indicating that NaHS could be a worthwhile component of the MPMC water treatment train. NaHS was used to treat water in the Cariboo Pit, Heap Leach Pad (HLP) leachate, and Tailings Storage Facility supernatant. A technical memorandum (Sterling 2021) summarizing these results was submitted with Progress Report #9 in December 2021. The positive results are attributable to NaHS dosage in conjunction with settling and clarification.

A further trial was held between January 24 and March 2, 2022, in which TSF water and HLP leachate were pumped to the Tailings Box in the mill and dosed with 10-100 ml/min of NaHS, then monitored while being pumped back to the TSF. This was designed to inform further NaHS treatment options for water sourced from other areas of the mine. These dosages appear to have been successful (Figure 7), with results from February 16 to March 2, 2022 showing a marked decrease in dissolved copper in mill discharge relative to TSF water.

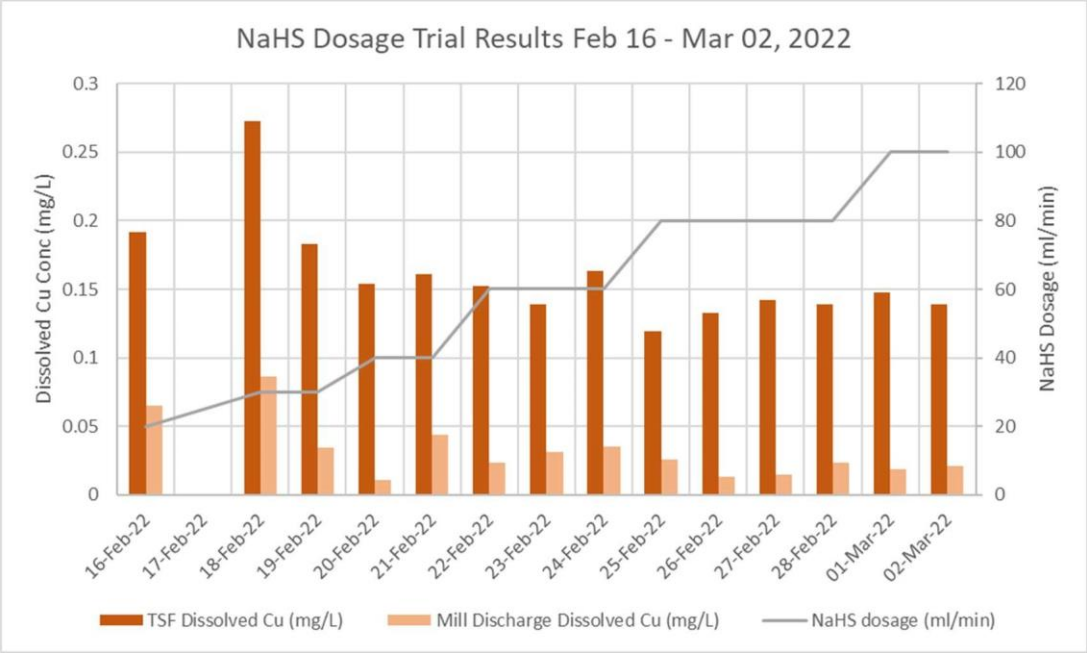

Figure 7. NaHS Dosage Trial Results Feb 16 – Mar 02, 2022. Dissolved Cu in Mill discharge water is lower than TSF source water. Dosages up to 80 ml/min appear to increase treatment efficacy.

The NaHS addition system was installed in the plant concentrator in 1997 during initial construction to assist with flotation of oxide copper minerals. The NaHS system remains in service for this purpose and can be used for future water treatment as required.

6.4 Grafta™ Treatment for Total Copper, Selenium and Other Metals

The newest treatment program being pursued by MPMC is the use of GRAFTA™ technology to remove elevated metal constituents from Northeast Zone (NEZ) seepage water. Water from the NEZ seeps have elevated concentrations of total copper and selenium, and as such NEZ seepage water has to be managed effectively on the mine site. Currently, NEZ seepage water is being pumped to the mill building for use in mineral processing or, in the event of a power outage onsite, transported to the Wight Pit where passive in pit treatment occurs.

GRAFTA™ is a nanotechnology-based adsorbent with several variations that are engineered to remove metals and organic compounds from water. GRAFTA Nanotech Inc. carried out GRAFTA™ lab-scale column adsorption test work at their laboratory in Toronto, ONT, using samples of NEZ seepage water that were shipped from the mine. The samples were used to test GRAFTA™ (fine and coarse) using a single column GRAFTA™ filter or chain of multiple GRAFTA™ filters, with which the influent (NEZ seepage water) was permeated through at a retention time of approximately 45 minutes (on average). The pH of the influent water was acidified in select tests to increase selenium removal. Functionalized GRAFTA™, that is GRAFTA™ with various reducing agents (GRAFTA™-F100 and GRAFTA™-F200), were also applied to select column tests to aid in metal reduction.

A high-level summary of findings is provided below:

- Upon testing different variations of GRAFTA™, it was concluded that the functionalized GRAFTA™-F200 was the most effective in removing both selenium and copper consistently to non-detectable levels. This was achieved through average hydraulic retentions times of approximately 45 minutes.
- Estimating the design parameters is recommended to be ensured through a larger-scale pilot to be implemented at the site and monitored for a longer period of time.
- It is estimated that the longevity of GRAFTA™-F200 should be significantly longer than what was experienced in the lab-scale tests. For an approximate 500 m^3/d flow rate of the contaminated water (i.e., NEZ seepage water), approximately 17 to 18 tons of GRAFTA™-F200 is estimated to be required which would be expected to remain active (until saturation of the adsorption sites) for several weeks to potentially months.
- Improvement in longevity at a lower retention time corresponding to lower GRAFTA™-F200 may also be possible which can be verified through onsite performance evaluation.

The findings in the technical memorandum (GRAFTA 2022) are subject to a confidentially agreement and are under review by MPMC. No further work is planned.

7. SOURCE CONTROL OPTIMIZATION STUDIES

Source control optimization is required to be performed at Mount Polley under *EMA* Permit 11678 (Dec 2022) [s 2.11.3]:

> *The permittee must undertake ongoing maintenance and surveillance of on-site water management systems and activities undertaken to increase source control of any potential contaminants of concern.*
>
> *(a) The permittee must undertake source control optimization yearly.*

MPMC undertakes ongoing maintenance, monitoring and improvements of water management systems and source control measures across the Mount Polley Mine site. This is a well-established part of operations at the Mine. MPMC's progress is described in the following sections.

7.1 Monitoring & Management Plans

Source control optimization is driven through ongoing collection and analysis of water quality and flow data per the Comprehensive Environmental Monitoring Plan (CEMP). Data is interpretated weekly to assess changing conditions and inform pre-treatment requirement, source control and discharge options. Pumping and conveyance systems are arranged to be flexible and stored volumes are managed to ensure water treatment capacity is utilized.

The environmental effects of the discharge to Quesnel Lake are monitored under the CEMP and governed by the Metal and Diamond Mining Effluent Regulations of Environment and Climate Change Canada.

Monitoring and management plans contribute to this effort, recent updates are listed;

- Comprehensive Environmental Monitoring Plan (2019) (CEMP) (MPMC 2019)
- Annual Discharge Plan
- Sediment and Erosion Control Management Plan
- ML/ARD Management Procedure Manual (Aug 2022) (MPMC 2022b)
- Water Management Plan (Nov 2020) (Golder 2020a)
- Water Balance Model (Golder 2022a)
- Water Quality Model (Golder 2022b)
- Flocculant Management Plan (Golder, 2023a)
- Erosion and Sediment Control Plan Review Report (Golder, 2023c)

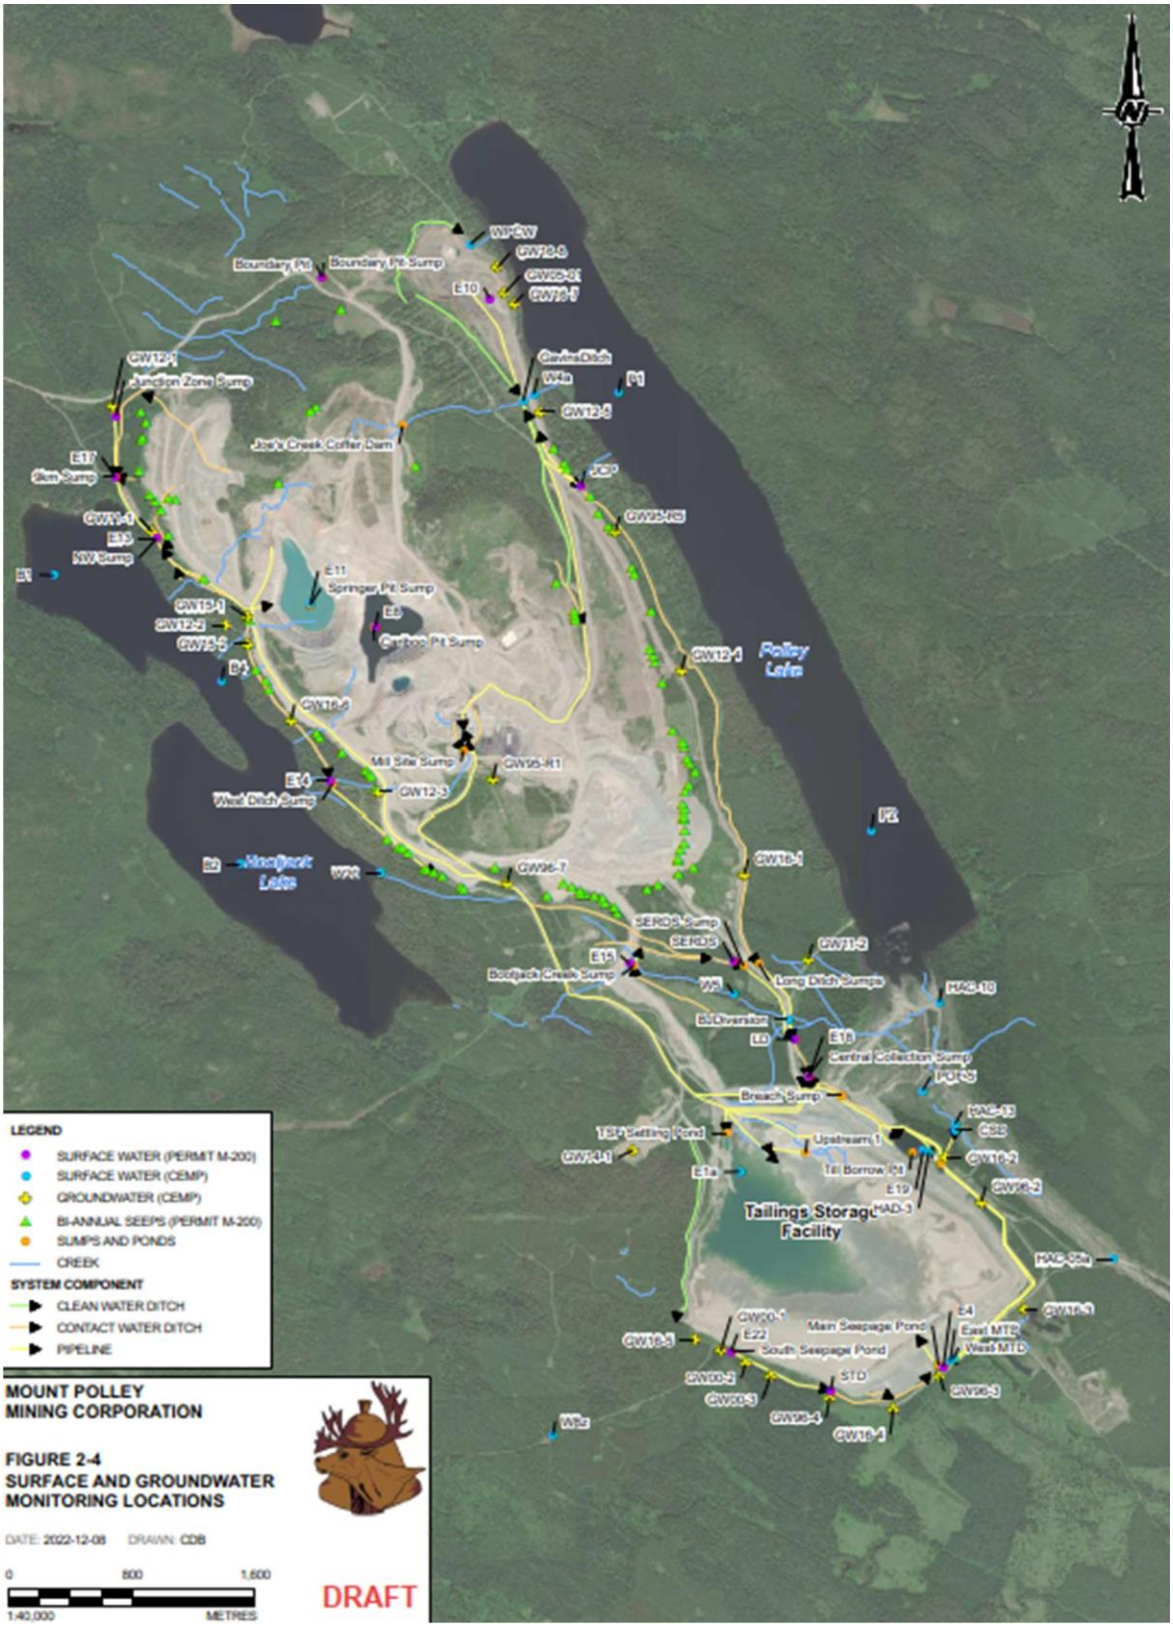

Figure 6. CEMP Monitoring Locations

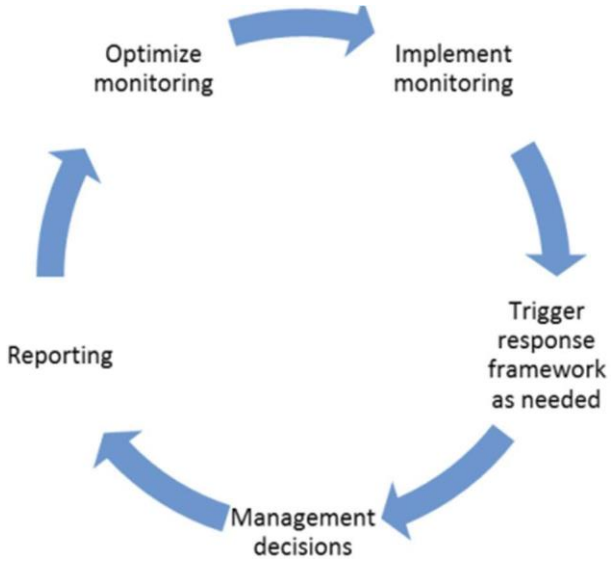
EMA Permit 11678 (Dec 2022) [s 2.12(d)] requires reporting on source control optimization. Recent interpretative reports influencing treatment options and source control decisions;

- Phase 2 Environmental Effects Monitoring Program Interpretative Report (Minnow 2019)
- 2022 Annual Environmental Report for the Mount Polley Mine. BC Ministry of Environment and Climate Change Strategy. Mount Polley Mining Corporation.

Monitoring for a specific year will be verified in monitoring work plans following the adaptive management framework.



7.2 Booster Station Overflow Alarm System

The TSF Booster Station overflow valve is used to manage supernatant water in the TSF and achieve Engineer of Record specifications for water storage and beach width by sending water from the TSF to the WTP influent pond. Although this system is essential for safe management of the TSF, its use has the potential to overwhelm the water treatment capacity of the plant, and it has been associated with copper exceedances in the past, most recently on May 31, 2022.

A full investigation report was prepared which shed light on the May 2022 permit exceedance and the possible role of the TSF booster station during that event. One planned remedial action was to install an alarm which will alert mine managers and operators when the booster station valve is open, to limit the extent of release. The booster sump water levels and high-level alarm system is monitored by the Control Room operator in the concentrator building. The plant supervisor travels the reclaim and tailings pipeline system once per shift during operations.

7.3 Heap Leach Pad Decommissioning

The experimental lined Heap Leach Pad (HLP) and excessed stockpiled elemental sulfur was identified as a source of acid rock drainage in a report; An Investigation into Determining the

Source of Elevated Metal Concentrations in Seepage at the Mount Polley Mine (Litke 2019). The acidity has been neutralized by reaction with carbonate and silicate minerals in the waste rock, but it resulted in depressed pHs and occasional breakthrough of acidic waters to waste rock seeps. The removal of the elemental sulfur pile seems to have arrested the downward trend in pH and upward trend in copper. (SRK 2022a)

A plan was developed to decommission the infrastructure, drain down and treat the leachate by NaHS addition and dispose the excess sulfur and HLP construction materials in the Tailings Storage Facility.

The decommissioning plan (Sterling 2022) was submitted to the Ministry of Energy, Mines and Low Carbon Innovation (EMLI) in April 2022. The disposal option for each material type was chosen based on geochemical characterization by qualified professionals at SRK Consulting. EMLI commented on the plan in a letter on October 13, 2022. MPMC responded to comments on May 12, 2023 after a meeting with EMLI on May 4, 2023. The decommissioning plan will be finalized once the comment period is completed.

Currently the elemental sulfur has been relocated to the HLP and contained above the HDPE liner. Precipitation on the HLP contributes to leachate production which in managed by intermittent pumping to the concentrator for NaHS treatment and discharge to the TSF. The Northeast Zone seeps at the toe of the Rock Disposal Site is collected and pumped to the concentrator for use as process water.

7.4 Review of Geochemical Source Terms

To support water quality prediction and waste management planning, Mount Polley operates kinetic tests on waste rock and tailings. This work is undertaken by SRK Consulting, with the most recent result from this test reported in a March 22, 2022 memo (SRK 2022a).

While not directly relating to water treatment, this work provides information on site water chemistry and is helpful to understand and predict water quality arising from contact water and rock dump seepage.

In 2022, the Mine Site's geochemical source terms were reviewed by SRK, as a basis for extending MPMC's *EMA* Permit 11678 permitted discharge period. SRK found that no update to the source terms was required (SRK 2022a). The SRK memo indicated that seepage from RDSs has been mostly stable for key parameters over the monitoring period, except for localized influences from sulphuric acid water likely originating from the Test Heap Leach. (Golder 2022g)

7.5 Erosion and Sediment Control Plan Review and Update

In accordance with Permit 11678 s 2.6.2, MPMC's Erosion and Sediment Control Plan (ESCP) was reviewed and an ESCP Review Report provided. Modifications recommended in the review report are currently being applied to MPMC's ESCP. The ESCP Review Report provided by Golder was appended to the 2022 Annual Environmental Report submitted in March 2023. The updated ESCP is anticipated to be completed and submitted in Q3 2023.

8. REVIEW OF DISCHARGE ALTERNATIVES

EMA Permit 11678 (Dec 2022) s 2.11.4 requests the permittee to review discharge alternatives to Quesnel Lake:

> *The permittee must review discharge alternatives for direct discharge of treated mine water on and around the mine site including considering the following mine phases: operations, care and maintenance, closure, and post-closure.*
>
> *The review of discharge alternatives must include consideration of:*
>
> *(a) Passive and semi-passive water treatment options for distributed discharges across the mine site informed by the Water Management Plan dated November 27, 2020, and most recent Reclamation and Closure Plan for the site,*
>
> *(b) Physical (geomorphological and hydrological), chemical and biological characteristics of potential receiving environments, and*
>
> *(c) The capacity of the proposed discharge locations to receive the additional discharges of treated water and meet applicable environmental benchmarks.*
>
> *(d)* This section of Progress Report #12 addresses *EMA* Permit 11678 (Dec 2022) s 2.12 I*(e) summary and discussion of proposed alternative discharge locations that have the capacity to receive the treated water and changes from the previous progress reports,*

The Mine Plan and Reclamation Program Update 2022 (MRP) (Golder 2022g) s 5.2.4 addresses subjects related to water treatment, water balance and water quality for the periods of operations, closure, and post-closure. Further context is provided in MRP Appendices G, H & I.

The MRP s 5.2.4 discusses the approach to alternative discharge locations;

Currently, one objective for the active and post-closure phases of the Mine Site's life cycle is the development and implementation of a decentralized passive/semi-passive water treatment system. Given that the Mine Site was developed on a watershed divide, it is desired that such a system returns water to its respective pre-development watersheds – an objective consistent with the Environmental Assessment and input from local communities and First Nations. Ultimately, this decentralized system will be achieved using passive/semi-passive technologies developed through bench scale and pilot testing. The status of current research towards this end is discussed in Section 4.4. (*this report Section 3*)

While a distributed system is desired for active and post-closure, there are several challenges that will need to be overcome. For instance, the ability of the receiving environment to accommodate the post-closure flows needs to be carefully assessed. Given that runoff from disturbed areas is higher than runoff from forested areas (the pre-mine case), the flow volumes during early post-

closure may be too great to be accommodated without damaging the existing receiving environment and their associated habitats. Further, water quality receiving environment targets are likely to become more stringent, given the lower assimilative capacity of these receiving environment. Although distributed passive/semi-passive treatment and discharge is a desired closure outcome, these technologies have not yet been fully developed to full scale and face permitting uncertainty. The assumed treatment configuration for active and post-closure is pit lake pre-treatment followed by centralized Actiflo treatment (one the closure BAT options identified (Golder 2016c). Figure 5 1 and Figure 5 2 provide the current models for active closure and post-closure water management. Appendix H and Appendix I provide discussion on predicted water balance, water management, and water quality at closure. Figure 5 3 shows the anticipated catchments for the post-closure environment.

End of Excerpt from the MRP (Golder 2022g)

9. CONCLUSION

Environmentally responsible water management, treatment, and discharge are priorities at Mount Polley Mine. Effluent treatment, and interrelated monitoring and optimization activities, conform with the requirements of Permit 11678, including Sections 2.11 and 2.12. MPMC is actively pursuing the following water treatment or discharge optimization technologies: Actiflo optimization, lime treatment, pit lake treatment, saturated rock fill (SRF), packed bed reactor (PBR), constructed wetland treatment (CWT), and source control improvements.

Attainment of the NPM is becoming more prevalent over time, with 70% of WTP samples collected from January 1 to June 6, 2023 below this threshold. Discharge total copper measured 0.01075 mg/L over a 52-week rolling average to June 6, 2023. This represents superior discharge performance relative to previous 6- month update periods.

As MPMC restarts and builds capacity, treatment actions are being continuously improved. The decommissioning of the Heap Leach Pad with BC-EMLI approval following a staged approach is being planned. Mount Polley strives for continual improvement and adaptive management, in collaboration with technical experts, local communities, First Nations, and regulators.

Executive Summary

Mount Polley Mining Corporation (MPMC) retained WSP Canada Inc. (WSP) to carry out a long-term bench-scale leaching test in a saturated rock fill (SRF). The objective of the leaching test was to evaluate the extent to which leaching of metals occurs from the waste rock material in an SRF reactor under reducing conditions. The leaching study also provided information on the duration of time before the onset of leaching is observed after a period of continuous operation as well as the period that is needed for leaching to stabilize in the system. Metal leaching is a common issue in all in situ anaerobic remediation technologies where a media is used as support for the attached growth of bacteria in the system including packed bed reactors (PBR), biochemical reactors (BCR), and SRF. The findings of this long-term leaching test emphasized the importance of studying metal leaching behaviour in attached growth systems which rely on creating an anaerobic zone in an aquifer for contaminant removal. The industries considering the implementation of these systems for full-scale water treatment purposes must consider and plan for the potential release of leachable metals such as arsenic, manganese, and iron.

To achieve these objectives, a custom-fabricated SRF cell, that was previously used in the proof-of-concept work (Golder 2021), was used to conduct the bench-scale tests. The SRF was filled with a representative source of rock that was retained from the Site. The bench-scale test work was conducted for a duration of 52 weeks and included 3 main phases: Initial Batch Phase (Inoculation), Start-up, and Continuous Testing.

Acetic acid and phosphoric acid were used as carbon and phosphorous sources for growth of microorganisms in the SRF. The stoichiometric molar ratio of acetate was calculated for the reduction of all nitrate and selenate in the feed. To avoid limiting carbon situation, 2 to 5-times stoichiometric carbon source was added to the SRF throughout the test. The amount of dosed carbon source was adjusted based on the oxidation reduction potential (ORP) in the effluent of SRF to be within the targeted optimum range of ORP for selenium (Se) and nitrate (NO_3) removal. To monitor the concentrations of selenium, nitrate, and leachable metals especially copper, arsenic, manganese, and iron, samples were taken from the influent feed water and the effluent of the system. Two types of sampling were conducted, bench parameter monitoring (in-house) and laboratory analytical monitoring (ALS).

The results of the bench-scale test work provided insights on the extent and timeline for leaching of metals from the rock media. To understand the effect of reducing conditions on metals leaching from the media in the SRF under study, the total and dissolved concentrations of metals were monitored during the bench-scale trial. The leaching behaviour varied for different metals; some were removed, some did not change, and some were leached in the effluent of the bench-scale SRF reactor system. Overall, none of the metals being leached into the SRF effluent were above site-specific treatment targets except for iron.

For the metals that leaching occurred in the system, leaching was observed during inoculation and start-up of the test and generally the rate of leaching decreased over the course of testing. Some of the metals including copper, and molybdenum that were leached, were later removed in the system during continuous testing. Leaching of arsenic stopped during continuous testing but after approximately 120 days, the concentration of arsenic in the bench-scale SRF reactor system increased slightly. For other leachable metals such as iron and manganese, leaching continued until the end of the test.

Selenium and nitrate reductions were also monitored during the long-term bench-scale test work. The bench-scale SRF reactor demonstrated excellent performance in selenium and nitrate removal with average percentage removal of 98% and 96%, respectively. The SRF technology was evaluated as a cost-effective alternative to an active treatment system and was shown to perform reliably in terms of Se and NO_3 removal. Due to the diversity of the microbial community in the system, this technology was also resilient in response to changes in the influent water chemistry and operational condition such as ORP. However, the leaching data confirmed that proper monitoring and management of metal leaching is critical in operating SRF treatment systems.

Study Limitations

WSP Canada Inc. (WSP) has prepared this document in a manner consistent with that level of care and skill ordinarily exercised by members of the engineering and science professions currently practising under similar conditions in the jurisdiction in which the services are provided, subject to the time limits and physical constraints applicable to this document. No warranty, express or implied, is made.

This document, including all text, data, tables, plans, figures, drawings and other documents contained herein, has been prepared by WSP for the sole benefit of Mount Polley Mining Corporation (MPMC). It represents WSP's professional judgement based on the knowledge and information available at the time of completion. WSP is not responsible for any unauthorized use or modification of this document. All third parties relying on this document do so at their own risk.

The factual data, interpretations, suggestions, recommendations and opinions expressed in this document pertain to the specific project, site conditions, design objective, development and purpose described to WSP by MPMC, and are not applicable to any other project or site location. In order to properly understand the factual data, interpretations, suggestions, recommendations and opinions expressed in this document, reference must be made to the entire document.

This document, including all text, data, tables, plans, figures, drawings and other documents contained herein, as well as all electronic media prepared by WSP are considered its professional work product and shall remain the copyright property of WSP. MPMC may make copies of the document in such quantities as are reasonably necessary for those parties conducting business specifically related to the subject of this document or in support of or in response to regulatory inquiries and proceedings. 1.0 INTRODUCTION

Mount Polley Mining Corporation (MPMC) retained WSP Canada Inc. (WSP) to conduct a long-term bench-scale leaching test to provide insights to the client on the extent to which leaching occurs from a waste rock material collected from the site as a potential media for saturated rock fill (SRF) treatment.

This bench-scale leaching test work followed the “proof-of-concept” test works in which it was demonstrated that packed bed reactor (PBR) (Golder 2019) and saturated rock fill (SRF) (Golder 2021) technologies are capable of selenium (Se) and nitrate (NO_3) removal from mining influenced water (MIW). However, WSP identified elevated concentrations of metals including copper (Cu), iron (Fe), arsenic (As), and manganese (Mn) in the effluent of the proof-of-concept SRF system (Golder 2021). This raised a concern that the metals may have been released from the waste rock under reducing conditions which is required for the reduction of Se and NO_3 in bioreactors. Consequently, a long-term leaching test was conducted to evaluate the extent to which leaching occurs from the waste rock material in an SRF reactor under reducing conditions. The leaching study also provided information on the duration of time before the onset of leaching is observed after a period of continuous operation as well as the period that is needed for leaching to stabilize in the system. The leaching of metals from SRF media needs to be appropriately managed through selection and characterization such as the testing presented herein and consideration of polishing treatment technologies, if necessary, downstream of SRF to ensure compliance with discharge criteria.

2.0 OBJECTIVES AND SCOPE OF WORK

The objectives of the bench-scale leaching test were as follows:

- Understand the extent of metals leaching from the rock media in the SRF reactor under reducing conditions.
- Understand the timeline for onset and stabilization of leaching effects.
- Monitor the concentrations of Se, NO_3, Cu, and some leachable metals such as As, Fe, Mn over the duration of the test.

The scope of work included the following tasks:

- Procurement of necessary test materials and supplies, some of which were supplied by MPMC.
- Design of experiment and execution of bench-scale test work.
- Preparation of a report (current document) that summarizes the results of the bench-scale test work and includes recommendations for implementation of detailed bench-scale treatment systems.

3.0 SYSTEM DESIGN AND CONSTRUCTION

A block flow diagram of the bench-scale testing is provided in Figure 1. The leaching test took place in a bench-scale reactor designed to simulate the anaerobic conditions in a full-scale SRF. The process for the bench-scale leaching test is based on the “proof-of-concept” bench-scale process for SRF (Golder 2021) without the aeration cell and the settling cell.

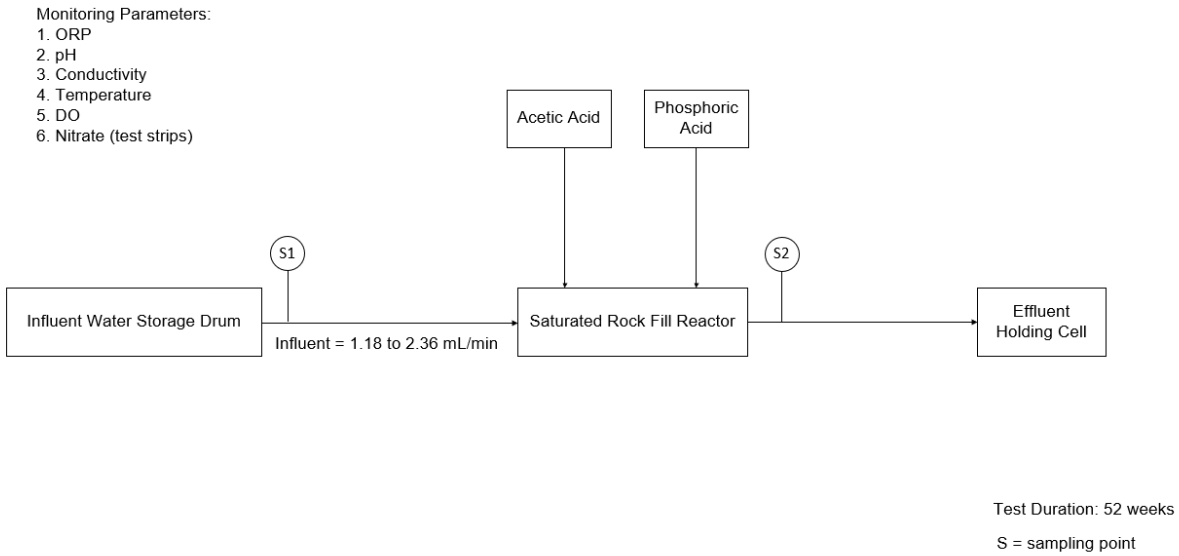

Figure 1: Block Flow Diagram for Bench-Scale Testing of SRF Leaching Test

3.1 Saturated Rock Fill Reactor

The SRF is a fixed-film anaerobic reactor which is commonly designed and implemented for removal of selenium and nitrate from MIW. The SRF consists of a submerged waste rock bed media which provides a biofilm growth surface for attachment and growth of bacteria. Within the rock media void spaces exist, where oxygen is consumed by microorganisms and anaerobic conditions prevail.

Under anaerobic conditions, the Se removal mechanism includes reduction of soluble oxidized forms of Se to particulate elemental Se by selenium reducing bacteria (SeRB). Nitrate is removed by the process of denitrification where nitrate reducing bacteria (NRB) facilitate the reduction of nitrate to nitrogen gas. The nitrate reduction process is more energetically favourable to the microbial community than the Se reduction pathway, and nitrate is generally reduced prior to Se reduction. Some nitrate reducing bacteria can reduce Se as well. Carbon and phosphorus dosing is required as nutrient sources for energy production and cell synthesis of anaerobic bacteria.

3.1.1 Bench SRF Reactor Design

As discussed in the previous Section, nitrate reduction affects the rate of Se reduction in the SRF. Since concentration of nitrate is orders of magnitude higher than Se in MIW, nitrate reduction hydraulic retention time (HRT) is the limiting factor and is selected as the main design criterion for the SRF.

In addition, the dimensions of the bench-scale SRF units were determined to replicate those of the Wight Pit (Golder 2021). To test the SRF unit process, a custom-built 79-L open top polyethylene basin was used (**Photograph 1A**). The basins were fitted with sampling ports for effluent sample collection, a level sight tube, and an off-gassing valve on the lid to vent gas build-up. The substrate mixture provided by MPMC consisted of waste rock that was washed and screened to ¼" to 3" particle size in the WSP Laboratory. The assembled cells with media are shown in **Photograph 1B**. The assembled SRF reactor system is shown in **Photograph 1C.** Nutrients (carbon and phosphorous) were manually added to the SRF cells through an injection valve on the influent feed line. The key SRF design parameters are provided in Table 1.

mL/min millilitre per minute.

3.2 Source of Rock Media

Representative waste rock from the site was used as the attached growth media for the SRF leaching test work. The waste rock sample that was used in this bench-scale test work was supplied by MPMC and is assumed to be representative of the waste rock in Wight Pit. Based on the rock type and information provided by MPMC, WSP determined that the waste rock in the SRF portion of Wight Pit (below 860 m) was predominantly PAG (95 wt%) and that it consists of waste rock originating from South East Pit (59 wt%) and Springer Pit (35 wt%).

Representative waste rock samples for bench-scale testing were supplied by MPMC from two locations for the SEZ/PZ material (UTM 10 592699 5825548 and 592895 5825231) and one location for the Springer Pit material (UTM 10 592886 5825268). These samples were sourced from a depth of approximately 2 m below surface. The rock was screened to 3/8” to 3” particle size and was washed in the WSP Laboratory prior to use in this test.

3.3 Source of Inoculum and Influent Water

Biomass collected from a bench-scale bioreactor previously operated by WSP was used as inoculum for the bench-scale leaching test. The inoculum had a density similar to water with a slight grey color and some suspended solids. Prior to the batch inoculation of bench-scale SRF reactor, the inoculum was stored in the fridge to preserve the bacteria. The inoculum was mixed with influent water at 15% volume/volume ratio which was based on the previous proof-of-concept test work (Golder 2021). Approximately 3.6 L of the inoculum was added into the 20.2 L of influent water to create the inoculation solution.

The influent water for the bench-scale leaching test was collected from Joe’s Creek Pipe (JCP) at the Site, as it was identified as the site that best represents the anticipated closure water quality (DWB 2021). WSP noted that although nitrite and most total metal concentrations at JCP from February 2020 to January 2021 are significantly lower than the corresponding concentrations during post-closure, the concentrations for target analyte (parameter of interest from water treatment presentive), primarily Se and NO_3, at JCP are comparable to the post-closure water quality. WSP is aware that phosphorous in JCP exceed the proposed treatment targets. The purpose of the leaching test work was not to target the removal of these constituents per se, but to establish the extent to which leaching occurs under the reducing conditions in an SRF reactor. The full SRF treatment system is likely to include carbon and nutrient polishing steps downstream of the SRF reactor in order to meet the treatment target.

MPMC collected bulk water samples from JCP in two 1,000 L totes, which was sufficient to facilitate up to 52 weeks of bench-scale work. The average water quality of target analyte in the bulk water samples received is summarized in Table 2 along with the average water quality from JCP from February 2020 to January 2021, modelled post-closure influent water quality and the proposed discharge target.

The water quality of the two totes was comparable with the average water quality at JCP from February 2020 to January 2021 except for phosphorous. The phosphorus concentrations in the totes were lower than the corresponding concentration in JCP. However, as indicated above, the purpose of the test work was to establish the extent to which leaching occurs. This lower phosphorus concentration did not affect the test work; more phosphoric acid was dosed into the SRF reactor as nutrient to account for this.

3.4 Effluent Water Quality

Although the purpose of the leaching test work was not to remove target analyte, the proposed discharge targets are presented in Table 2 as a reference. These targets are based on SRF effluent being discharged to Polley Lake as the receiving body and are based on the latest data available to WSP at the time of writing this report which was the 2017 Reclamation and Closure Plan (RCP) Water Quality Modelling Report (Golder 2017). WSP is aware that the RCP is currently being updated and these values may change in the future based on the new RCP. The Polley Lake closure water quality targets are used as the discharge targets for water treatment design purposes. Should the option to discharge to Polley Lake be retained, it is anticipated that a future permit amendment would use a smaller list of target analyte, and that the concentration values and volumes in the discharge would be evaluated for suitability for discharge, supported by plume modelling if required (i.e., as is commonly done for a Technical Assessment Report).

These proposed discharge targets should not be viewed as proposed permit limits because the necessary work to develop permit limits has not yet been undertaken and requires the identification of treatment effectiveness and a Best Achievable Technology (BAT) assessment when the operational characteristics of the technology are known. The specific scope of work to support permitting would be based on application instructions from BC ENV.

Table 2: Average Water Quality of Target Analyte and Proposed Treatment Targets for Discharge to Polley Lake

Parameter	Unit	Joe's Creek Pipe Average Water Quality [(a)] (±Standard Deviation)	Joe's Creek Pipe Tote 1 Average Water Quality (±Standard Deviation)	Joe's Creek Pipe Tote 2 Average Water Quality (±Standard Deviation)	Post Closure Influent Water Quality [(b)]	Proposed Discharge Target [(c)]	Proposed Discharge Target Notes [(d)]

Notes:

(a) Water quality at Joe's Creek Pipe is the average of 5 samples collected between February 2020 to January 2021.

(b) Influent for Centralized Water Treatment based on predicted site water quality in the Perimeter Embankment Till Borrow Pond (PETBP) at closure - reproduced from the Closure Water Treatment Conceptual Design Report (Golder 2016a).

(c) Polley Lake Closure Target- reproduced from the Reclamation and Closure Plan Water Quality Modelling Report (Golder 2017).

(d) Proposed treatment targets for discharge to Polley Lake post-closure were derived from the lowest of Effluent Discharge Objectives (EDOs), Metal Mining Effluent Regulations (MMER) limits, maximum BC water quality guidelines (WQGs) or alternate acute screening values (ASV). EDOs are back calculated to meet WQGs in the receiving waterbody. The max WQG when there is no 30-d WQG was used in the calculation of EDOs, unless noted otherwise. WQGs specified for the protection of aquatic life were considered in the evaluation of the treatment targets unless noted otherwise. WQGs were calculated based on a baseline hardness in the receiving environment. ASVs are maximum WQGs based on source water chemistry or alternative screening value identified in the LTWMP-TAR. Further details on the evaluation of the treatment targets can be found in the Golder 2016 report (2016b). For total copper the maximum water quality in the current water treatment plant effluent is used according to the Environmental Management Act (EMA) Permit 11678, as amended on 1 February 2020 (BC ENV 2020).

s.u. standard units.

X Indicates concentration exceeding the closure treatment targets for post closure.

EDO Effluent Discharge Objectives.

WQG Water Quality Guideline.

3.5 Test Location and Conditions

The bench-scale tests were conducted at WSP's laboratory and warehouse, located in Calgary, AB. The entire test period of 52 weeks was divided into three phases, the inoculation, the start-up, and the testing phase. Table 3 provides a summary of the flow rates for each phase. The conditions for the testing phase were adjusted depending on the performance of the system during the start-up and the data in the previous testing phases, if needed.

During inoculation, the SRF reactor was filled with rock media; then a mixture of inoculum (15% v/v) and site water (85% v/v) was added into the SRF to initiate the growth of SeRB. The experiment was initially started in batch mode to allow time for bacteria to grow in the system. This initial batch phase was also needed for anoxic conditions and nitrate reduction to develop in the SRF.

After nitrate reduction activity was observed in the system, the reactor was switched to continuous mode. The forward flow was started at a slow flow rate of 1.18 mL/min to avoid the risk of washout of the SeRB from the system. The flow rate was then increased in a stepwise manner to reach the targeted flow rate and consequently the targeted hydraulic retention time (HRT) for the testing phase. During testing phase, the flow rate was maintained to have a constant HRT of 7 days in the reactor for which high removal of selenium was observed during the previous SRF bench-scale tests (Golder 2021). Carbon and phosphorus were dosed twice per week as nutrients to support the growth of microorganisms in the system. Since the influent contained appreciable nitrate concentration, additional nitrogen dosing was not required.

Table 3: Summary of Test Conditions

Experimental Phase	Inoculation	Start-up Phase[(a)]	Testing Phase
Flow Rate	0 mL/min	1.18 to 2.36 mL/min	2.36 mL/min

Note:

(a) This phase is initiated once 50% nitrate reduction is achieved during inoculation.

3.5.1 Flow Rate Calculations

Since the size of SRF cell was determined by the size of readily available container used for proof-of-concept test work, the flow rates were adjusted to achieve the desired HRTs. The design HRTs for the SRF for different phases were set as discussed in Section 4.0. The pore volume was determined by measuring the volume required to submerge the substrates, approximately 2 to 3 cm above the rock surface. The pore volume for the SRF was 23.78 L, and the liquid level was maintained constant throughout the entire bench trial unless an unforeseen event happened in the system. Based on pore volume of 23.78 L, the calculated influent flow rate was 2.36 mL/min for the continuous operation to achieve the HRT of 7 days.

3.5.2 Nutrient Dosing Calculation

Acetic acid was provided as carbon source. The required amount (moles) of acetate was calculated using two different approaches.

The first approach calculates the acetic acid required based on the electron demand from the influent water. A stoichiometric molar ratio was applied to the acetic acid required to avoid carbon limiting situation and accommodate the higher bacterial specific growth rate. The ratio was adjusted to maintain a residual total organic carbon (TOC) in the effluent similar to the residual TOC in the previous proof-of-concept SRF test (Golder 2021).

Throughout the leaching test, it was observed that this dosing approach resulted in overdose of carbon source, which resulted in undesired sulphate reduction in the SRF reactor (see Section 6.2.1 for discussion on the relationship between carbon source dosing and selenium and sulphate reduction). A second carbon source dosing approach was adopted.

The second approach assumes that only 60% of acetate is used by the bacteria for energy production and the rest of 40% acetate was used for cell synthesis. The stoichiometric molar ratio of acetate was calculated for the reduction of all nitrate and selenate in the feed. To avoid carbon limiting situation and accommodate the higher bacterial specific growth rate, 2 to 5-times stoichiometric excess carbon source was added to the SRF. The amount of dosed carbon source was adjusted based on the ORP in the effluent of SRF to be within the targeted optimum range of ORP for Se and nitrate removal.

Phosphoric acid was dosed to the SRF as phosphorous source at a 10:1 nitrogen to phosphorus (N:P) molar ratio. To maintain the 10:1 N:P molar ratio with the influent nitrogen concentration, 1.52 mg/L of phosphorous was required, equivalent to 0.011 mL/day of 85% pure solution of phosphoric acid.

A 100 – 1000 µL variable volume micropipette was used to dose both acetic acid and phosphoric acid. Acetic acid was dosed from a fresh bottle of 99.5% glacial acetic acid from VWR International. For accurate dosing of phosphoric acid, the 85% phosphoric acid from Aldon Corporation was diluted to a ratio of 1:10 in DI water and then dosed into the reactor.

In full-scale system, nutrient is typically dosed continuously. However, due to low flow rates in the bench-scale leaching test and the minimum achievable flow of available pumps, it was not feasible to dose nutrients continuously. Nutrients were dosed into the reactor twice a week instead. Refer to Appendix A which summarizes nutrient dosage and dosing frequency.

4.0 OPERATIONS

The bench-scale system was intended to operate for 52 weeks. The testing period was divided into three phases, initial batch inoculation, start-up, and continuous testing.

- Initial Batch Inoculation (Phase 1): During Phase 1, the reactor was running in a closed system without any influent pumping in or effluent out from the reactor. This objective of this phase was to give time for SeRB to grow biofilms on the rock media and adapt to the new environment.
- Start-up (Phase 2): During Phase 2, the influent and effluent pumps were switched on to continuous mode. The pumping rates were adjusted gradually to obtain the desired HRT. The stepwise increase in pumping rate was to prevent washout of bacteria and to give time for the microbial communities to adapt to increasing flowrate.
- Continuous Testing (Phase 3): During Phase 3, the influent and effluent pumping rates were maintained at the desired HRT. Regular analytical samples were collected to monitor the extent of metal leaching during steady state operation.

At the beginning of the experiment, two sets of influent samples were collected from each raw water tote to establish a baseline for influent water quality. The date on which the influent sample was collected, was considered as Day 0. Phase 1 started on Day 14 following setting up of the SRF reactor system. The operations phases are presented in Table 4.

Table 4: Summary of Operation Phases

Phase	Phase Description	Phase Duration
1	Initial Batch Inoculation	Day 14 to Day 34 (Week 2 to Week 5)
2	Start-up	Day 34 to Day 93 (Week 5 to Week 13)
3	Continuous Testing	Day 93 to Day 377 (Week 13 to Week 54)

During the 52 weeks of batch inoculation and continuous testing, WSP was responsible for coordination of analytical sample delivery to a third-party laboratory designated by MPMC (i.e., ALS). ALS conducted quality assurance (QA) and quality control (QC) of the analytical parameters. WSP reviewed the data on a regular basis and compiled all measured bench parameters and analytical test results in an incorporated meta data table.

Additional activities during operation phase included:

- Weekly checks on pumps and quarterly replacement of system tubing to ensure the system is flowing and no obstructions have occurred that block the flow.
- Weekly calibration on multi-meter probe for bench parameter measurements.
- Weekly bench parameter measurements.
- Quarterly blind duplicates and one set of blank sample collection for QA/QC.

4.1 Initial Batch Inoculation (Phase 1)

After the bench-scale SRF reactor system was constructed, on Day 14, the SRF reactor was filled with a 15% V/V of inoculum in influent water from JCP. Nutrients were dosed at half of the required amount to achieve a C:N:P ratio of 100:10:1 to initiate the growth of the bacterial consortium. The SRF lid was sealed tight and any connection tubing from the reactor were sealed to prevent oxygen intrusion. The reactor was then left to incubate.

While waiting for the bacterial consortium to grow, the SRF effluent was sampled for bench and analytical parameters on a regular basis. Refer to Section 5.3 and 5.4 for the monitoring frequencies for bench and analytical parameters, respectively. Once the system showed consistent nitrate reduction of more than 50% and confirmed selenium removal from the analytical laboratory result, Phase 2 was initiated. Influent flow was introduced at a set flowrate of 1.18 mL/min on Day 34.

4.2 Start-up (Phase 2)

The continuous flow of the influent water into the SRF reactor and effluent out of the SRF reactor was provided by two Grundfos DDA Pumps (Product number DDA 17-7). At the beginning of Phase 2, the set flowrate into the reactor was 1.18 mL/min, which was equivalent to HRT of 14 days. Bench parameters were measured twice per week to closely monitor the reactor to ensure anoxic conditions and nitrate reductions in the reactor were maintained. SRF effluent samples were collected on a weekly basis to verify reactor performance in nitrate and selenium reductions (Sections 5.3 and 5.4). Nutrient dosages were increased based on flowrate and adjusted until the residual TOC in the SRF effluent was approximately 10 mg/L.

After confirming selenium removal activity and presence of residual TOC in the SRF, the forward flow was increased to a flow rate of 1.5 mL/min, corresponding to HRT of 11 days. The same monitoring procedures in selenium removal, and residual TOC were repeated until the reactor was ready for the next flowrate increase. The monitoring period after each stepwise increase was approximately two weeks. In the first week the flow was increased and in the second week the nutrient dose was increased. Flowrate and nutrient dosage increases were never done during the same week to allow bacteria consortium to adapt to changing condition. During this two-week period, reactor's response to increase in flow and nutrient dose was monitored. Set flowrate was increased stepwise to reach the target HRTs of 10, 9, 8, and finally 7 days, which was the HRT of Phase 3.

Pump tests were performed after each flowrate increase and before each bench parameter measurement on the days which flowrate was not adjusted. Pump calibration was performed when the relative percent difference (RPD) between the measured pumping rate and set flowrate was greater than 10%.

4.3 Continuous Testing (Phase 3)

Continuous testing started after HRT of 7 days was achieved. The flowrate was then maintained at 7 days for the entire duration of Phase 3. Pump tests were performed once per week after sample collection to ensure the flowrate remained constant. Flowrate during Phase 3 was maintained at 2.33 ±0.08 mL/hr while the set flowrate was 2.36 mL/hr (refer to Appendix B Figure B1 for a graph of flowrates plotted over time).

The second carbon source dosing method was adopted during Phase 3 to determine the stoichiometric ratio of carbon source dosing for obtaining the optimal ORP for selenium removal. Once the stoichiometric ratio was determined, the dosage was maintained constant to establish a steady-state condition inside the SRF reactor to monitor the extent of metals leaching from the rock media in the SRF reactor under reducing conditions.

The influent tote was switched from tote 1 to tote 2 on Day 272. A summary table comparing the water quality of the two influent totes can be found in Appendix C. WSP noted a change in concentration in the total cadmium, total zinc, dissolved aluminum, dissolved boron, dissolved manganese, and dissolved zinc concentrations between the two totes. However, these changes did not impact the reactor performance nor had a noticeable impact on metals leaching. From the bench parameter measurement of influent from the two totes, it was noted that tote 1 had a lower ORP measurement than tote 2. This was addressed by adjusting the stoichiometric ratio of carbon source dosage for the two totes during the continuous testing phase.

From Day 93 to Day 377, the SRF reactor system encountered four upsets. Refer to Appendix D on details resulting in upsets and actions implemented to recover the SRF reactor. The reactor performance typically recovered within one week following the upset.

5.0 SAMPLING AND ANALYSES FOR PERFORMANCE MONITORING

Two types of sampling were conducted: 1) bench parameter monitoring and 2) laboratory analytical monitoring. Bench parameter monitor was conducted in-house, whereas the analytical samples were submitted to a third-party laboratory (ALS).

5.1 Sampling Equipment

The following equipment were required during sampling and SRF performance monitoring:

- calibrated bench multi-meter capable of measuring pH, temperature, oxidation-reduction potential (ORP), dissolved oxygen (DO), and conductivity (YSI 556 or YSI Pro)
- nitrate test strips (WaterWorks 480009)
- sulphate test strips (MQuant™ 110019)
- hydrogen sulphide test strips (WaterWorks 481197-1)
- laboratory sample containers and 0.45 µm filters for dissolved samples
- 500 mL and 250 mL graduated cylinders for flow rate measurement

5.2 Sampling Locations

Table 5 provides sample locations, names, and descriptions.

Table 5: Description of Sample Locations

Sample Location	Name	Description
Influent Water Drum (S1)	INF	Sampled collected from the influent drum using a disposable syringe.
SRF Effluent (S2)	SRF	Sampled from the SRF effluent line.
Blind Duplicates	DUP	Varied locations throughout the test.
Blanks	FB	One full set of sampling bottles filled with laboratory supplied blank/distilled water. Filled on site using the same sampling equipment/containers used for normal samples and same standard cleaning procedures.

5.3 Bench Parameter Monitoring

The list of bench parameters monitored at the WSP laboratory and the monitoring frequency at different sampling location is presented in Table 6.

Table 6: List of Bench Parameters Monitored and Monitoring Frequency

Sampling Location	Bench Parameters	Monitoring Frequency
SRF	Conductivity	▪ Twice per week for Phase 1 and 2 ▪ Once per week for Phase 3
	Dissolved Oxygen (DO)	
	Nitrate	
	Sulphide [(a)]	
	Sulphate [(a)]	
	ORP	
	pH	
	Temperature	

Table 6: List of Bench Parameters Monitored and Monitoring Frequency

Sampling Location	Bench Parameters	Monitoring Frequency
INF	Conductivity	Bench parameter monitoring of SRF influent was initially conducted at the same frequency as the SRF effluent. It was noted these parameters remained fairly consistent between measurements and monitoring of influent was stopped until the switching of influent totes.
	Dissolved Oxygen (DO)	
	Nitrate	
	ORP	
	pH	
	Temperature	

Note:

(a) Sulphide and sulphate were added to the list during Phase 3 to monitor sulphate reduction in the SRF reactor.

5.4 Laboratory Analytical Monitoring

The analytical monitoring suite consisted of the following parameters:

Table 7: List of Bench Parameters Monitored and Monitoring Frequency

Sampling Location	Analytical Parameters	Monitoring Frequency
SRF	Total Organic Carbon (TOC)	Once per week for all phases.
	Total Selenium	
	Dissolved Selenium [(a)]	
	Nitrate (NO_3)	Once per week for all phase if bench NO_3 measurement is greater than 0. Otherwise, it was analyzed once per month.
	Sulphate (SO_4)	Once per week for all phases if bench ORP measurement is below -300 mV. Otherwise, it was analyzed once per month.
	Total Metals	Bi-weekly for Phase 3 only.
	Dissolved Metals, filtered at WSP laboratory	
	Alkalinity (as $CaCO_3$)	Once per monthly for Phase 3 only.
	Anions (Cl, Br, F, NO_2)	
	Sulphide	
	Ammonia, as N	
	Total Phosphorus	
	Turbidity	
	Total Suspended Solids (TSS)	
	5-day Biochemical Oxygen Demand (BOD_5)	

Table 7: List of Bench Parameters Monitored and Monitoring Frequency

Sampling Location	Analytical Parameters	Monitoring Frequency
INF	Alkalinity (as $CaCO_3$)	Once per month.
	Anions (Cl, Br, F, NO_2, NO_3, SO_4)	
	Sulphide	
	Ammonia, as N	
	Total Phosphorus	
	Total Metals	
	Dissolved Metals, filtered at WSP laboratory	
	TDS	
	Turbidity	
	TSS	
	BOD_5	
	TOC	

Note:

(a) Out of the first 24 samples collected for selenium analyses, dissolved selenium concentration of 17 samples exceeded the total selenium concentration by greater than 20% RPD. This exceedance is likely due to the standard laboratory method used for the analysis. It has been reported by ALS that volatile reduced organoselenium species produced by anaerobic bioreactors can cause dissolved selenium test results exceed total selenium results (ALS 2020). Since then, dissolved selenium was analyzed by another analytical method as per ALS's recommendation.

One-off analytical samples for metals analyses were also collected during Phase 1 and 2 to capture any metal leaching during inoculation and start-up.

6.0 TESTING RESULTS AND DISCUSSION

This section presents the results from the long-term bench-scale leaching test of the SRF reactor system. Additional figures showing both bench and analytical data are presented in Appendix B. Summary tables of bench and analytical data over the testing period are provided in Appendix E. Certificates of Analyses from the analytical laboratory are provided in Appendix F.

6.1 Influent and SRF Effluent Water Quality

A comparison of average influent and SRF effluent water quality for the target analyte identified in the previous SRF proof-of-concept (Golder 2021) during each phase of the leaching test is presented in Table 8.

Key observations from the table are as follows:

- Nitrate and total selenium concentration in Phase 2 and 3 were well below the proposed discharge target. The SRF reactor system was successful at nitrate and selenium reduction (see Section 6.3.1 and 6.3.2 for details).
- Total copper and dissolved cadmium were leached and exceeded the proposed discharge target during Phase 1. Leaching of total copper and dissolved cadmium eventually stopped in Phase 3. Total and dissolved iron were leached and exceeded the proposed discharge target during Phase 2. Leaching of total and dissolved iron slowed during Phase 3. The total iron concentration was below the proposed discharge target while the dissolved iron concentration was near the proposed discharge target considering the standard deviation (see Section 6.3.3 for details).
- Total phosphorus concentration exceeded the proposed discharge target in Phase 3 (see Section 6.3.4 for details) suggesting the need for nutrient polishing step downstream of the SRF reactor in order to meet the treatment target.

Biochemical oxygen demand was monitored throughout the leaching test as a measure for constituents that exert an oxygen demand (Figure B7). The influent BOD was below the laboratory detection of 2 mg/L while the BOD in SRF effluent fluctuates between <2 mg/L to 319 mg/L. To prevent anoxia in the receiving environment, aeration would be necessary.

Table 8: Comparison of Average Concentrations of Identified Target Analyte in the Influent and SRF Effluent

Parameter	Units	Influent Average Water Quality Tote 1 (±Standard Deviation)	Influent Average Water Quality Tote 2 (±Standard Deviation)	SRF Effluent Average Water Quality (±Standard Deviation)[a]			Proposed Discharge Target[b]	Notes[c]

Notes:

(a) Standard deviation is presented only if two or more sample results were available.

(b) Polley Lake Closure Target- reproduced from the Reclamation and Closure Plan Water Quality Modelling Report (Golder 2017).

(c) Proposed treatment targets for discharge to Polley Lake post-closure were derived from the lowest of Effluent Discharge Objectives (EDOs), Metal Mining Effluent Regulations (MMER) limits, maximum BC water quality guidelines (WQGs) or alternate acute screening values (ASV). EDOs are back calculated to meet WQGs in the receiving waterbody. The max WQG when there is no 30-d WQG was used in the calculation of EDOs, unless noted otherwise. WQGs specified for the protection of aquatic life were considered in the evaluation of the treatment targets unless noted otherwise. WQGs were calculated based on a baseline hardness in the receiving environment. ASVs are maximum WQGs based on source water chemistry or alternative screening value identified in the LTWMP-TAR. Further details on the evaluation of the treatment targets can be found in the Golder 2016 report (2016b). For total copper the maximum water quality in the current water treatment plant effluent is used according to the Environmental Management Act (EMA) Permit 11678, as amended on 1 February 2020 (BC ENV 2020).

s.u. standard units.

X Indicates concentration exceeding the closure treatment targets for post closure.

NA Not applicable.

EDO Effluent Discharge Objectives.

WQG Water Quality Guideline.

6.2 Bench Parameters

Bench parameters such as ORP, dissolved oxygen, pH, and conductivity were monitored on a regular basis to provide information on the performance of SRF reactor. Among these, ORP was used as the key indicator of the performance and to adjust the carbon source dosing.

Please refer to Appendix B and E for figures and summary tables of the bench parameter readings during the leaching test, respectively.

Key observations on the bench parameters are summarized as follows:

- Dissolved oxygen was maintained below 1 mg/L for most of leaching test duration to maintain an anoxic condition inside the SRF reactor (Figure B2). This is critical for biological selenium removal because only in the absence of DO, do the anaerobic microorganisms use nitrate or Se as electron acceptor.
- The average pH of influent from the first tote is 7.39 ± 0.26 and from the second tote is 8.32 ± 0.10. The average pH of effluent from all phases is 7.10 ± 0.26. Effluent pH is slightly below the influent pH. This decrease in pH could be attributed to addition of acetic acid and phosphoric acid as nutrients. Since the amount of nutrients dosed was relatively small compared to the overall reactor volume, the pH of the SRF reactor was maintained in the neutral range (Figure B3).
- The average influent conductivity from the first tote is 1449 ± 50 µS/cm and from the second tote is 1442 ± 30 µS/cm. The average conductivity of effluent from all phases is 1440 ± 209 µS/cm. The conductivity was mostly maintained constant throughout the leaching test (Figure B4). The high standard deviation calculated was due to a couple lower conductivity measured, which is believed to be due to measurement error.

6.2.1 Oxidation Reduction Potential (ORP)

ORP was identified as the key indicator for the performance of the SRF reactor because it was used to determine the carbon source dosing ratio during Phase 3. Figure 2 shows the changes in ORP measured through the leaching test and the corresponding stoichiometric ratio of carbon source dosed on the day of measurement.

Based on literature, the optimal range of ORP for selenium reduction is in the range of -50 mV to -200 mV (Simm R.,2021). The optimal range of ORP for sulphate reduction is in the range of -50 mV to -250 mV, which overlaps with that of selenium reduction. For MPMC, the goal for the full-scale SRF treatment system is to remove selenium and not sulphate. Therefore, it was critical to determine the leaching of metals under optimal ORP range for selenium reduction. The stoichiometric ratio of carbon source dosing to be within the optimal ORP range was also determined.

During Phase 1 and 2 of the leaching test, the carbon source was dosed in excess to avoid carbon limitation by maintaining a residual TOC of approximately 10 mg/L in SRF effluent. As a result of excess carbon source dosing, during the transition period from Phase 2 to Phase 3, ORP dropped to below -250 mV. Significant sulphate reduction was observed in the SRF reactor (Figure B5), which indicated an undesirable shift of SeRB to sulphate reducing bacteria in the long-term SRF reactor. Since this observation, the stoichiometric ratio used for carbon source dosing was decreased and the second carbon source dosing approach based on ORP measurement was implemented.

For the remaining period of the leaching test, high selenium removal was maintained at an ORP range of -100 mV to -200 mV, which was determined to be the optimal ORP range for the microbial community present in the long-term leaching test SRF reactor (as indicated by the two red lines in Figure 2). The corresponding carbon source dosing was 1 to 2-times stoichiometric to maintain the optimal ORP. Although the optimal ORP range in literature provides a basis for running the SRF reactor for selenium reduction, it is still critical to run bench-scale test work to determine the ORP range for specific microbial community populating the SRF reactor system.

During Phase 3, there were three instances where the ORP increased to 0 mV. These sudden increases were a result of three reactor upsets. Refer to Appendix D on details on reactor troubleshooting.

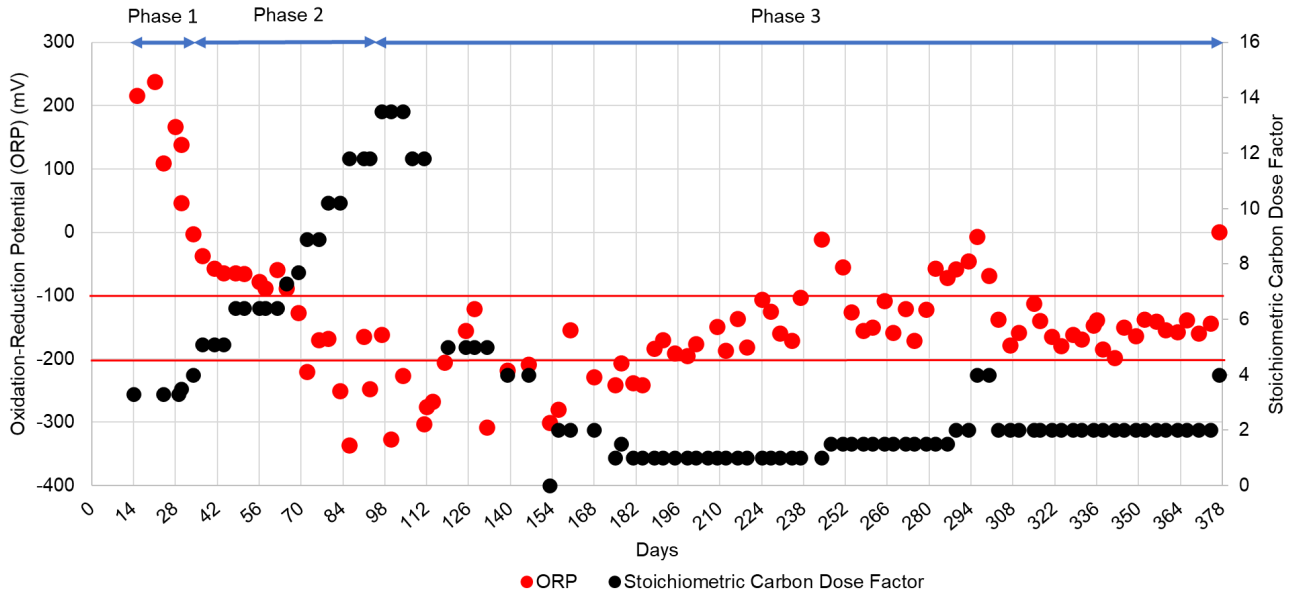

Figure 2 Effect of Carbon Source Dosing on ORP Measurements in SRF:

6.3 Analytical Parameters

Samples were collected from the SRF reactor on a weekly basis and submitted to a third party analytical laboratory. Analytical parameters such as selenium and TOC were analyzed on a weekly basis to monitor the SRF reactor performance and allow WSP to make any adjustment to SRF operation. Total and dissolved metals were analyzed on a biweekly basis to monitor the extent of leaching for leachable metals. All other analytical parameters were analyzed monthly to provide supplementary information on how the system was behaving overall.

6.3.1 Total Selenium Removal

The concentration of influent total selenium (T-Se), effluent T-Se and the percentage removal of T-Se over the duration of the leaching test are presented in Figure 3. Total selenium was effectively removed for the entire duration of Phase 3 with an average percentage removal of 98.33 ± 1.36% regardless of fluctuation in ORP measured, which suggested the microbial community in the SRF was versatile and diverse. The effluent T-Se had been consistently below the proposed T-Se treatment target of 0.0064 mg/L.

Changes in dissolved selenium (D-Se) concentration and the percentage removal of D-Se is presented in Figure B6 in Appendix B. Dissolved selenium was also effectively removed for the entire duration of Phase 3 with an average percentage removal of 97.23± 3.03%. The removal rate for dissolved selenium is lower than total selenium because of the dissolved concentration exceeding the total concentration. Out of the first 24 samples collected for selenium analyses, the dissolved selenium concentration of 17 samples exceeded the total selenium concentration by greater than 20% RPD. This exceedance is likely due to the standard laboratory method used for the analysis. It has been reported by ALS that volatile reduced organoselenium species produced by anaerobic bioreactors can cause dissolved selenium test results to exceed total selenium results (ALS 2020). Since identifying this, dissolved selenium was analyzed by another analytical method as per ALS's recommendation.

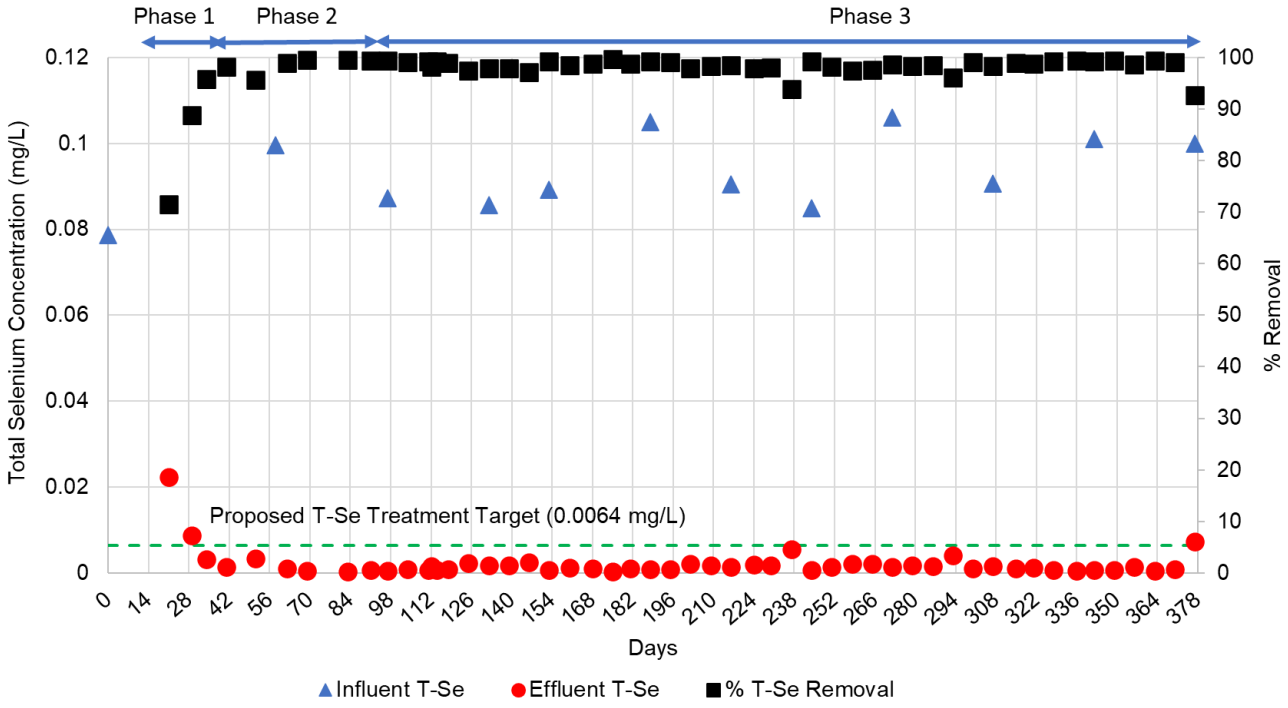

Figure 3: Total Selenium Concentration in Influent and SRF Effluent, and the Percentage Removal Over 52 weeks of Testing

6.3.2 Nitrate Removal

Concentration of influent nitrate, effluent nitrate and the percentage removal of nitrate over the duration of the leaching test is presented in Figure 4. Except for the spike in nitrate during Phase 1, nitrate removal was maintained at an average of 96.57% indicating nitrate was effectively removed for the entire duration of continuous flow.

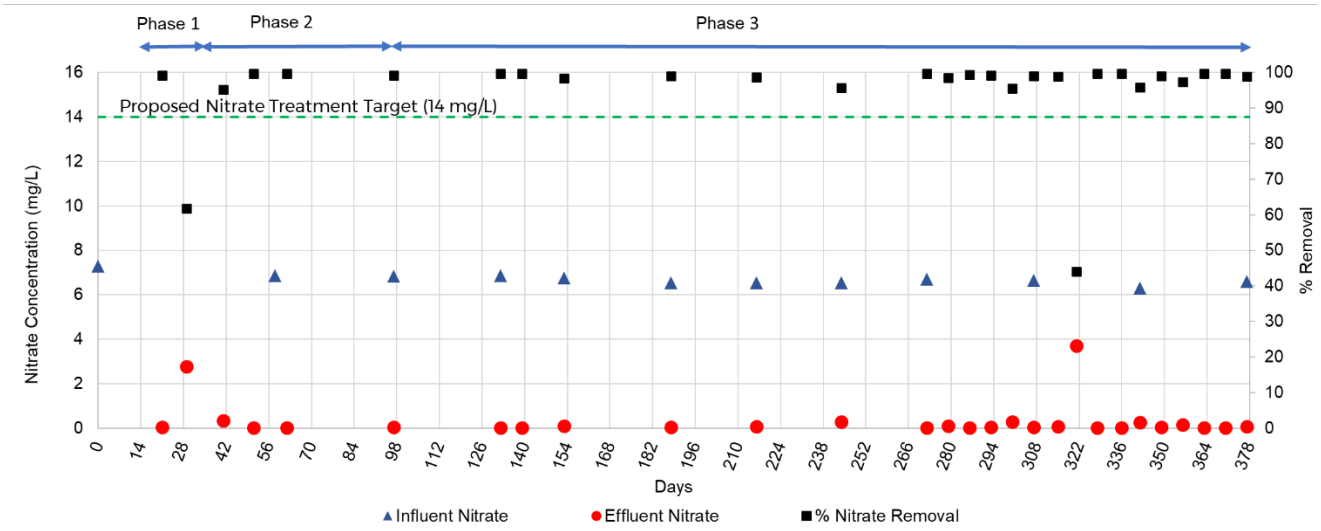

Figure 4: Nitrate Concentration in Influent and SRF Effluent, and the Percentage Removal Over 52 weeks of Testing

6.3.3 Total and Dissolved Metals

As noted in the SRF proof-of-concept bench-scale test (Golder 2021), under reducing conditions which are required for removal of Se and NO_3 in bioreactors, leachable metals were released or dissolved from waste rock media into the effluent resulting in elevated metals concentrations observed in the effluent of bioreactor treatment systems. To study the extent of metal leaching from the waste rocks, metals concentrations were monitored throughout the course of the leaching test.

The concentrations of leachable metals including arsenic, copper, iron, and manganese are plotted in Figure 5 to Figure 8, respectively. Figures for other metals monitoring during the leaching test can be found in Appendix B (Figure B8 to Figure B31).

Key observations on the trends in metal leaching are summarized as follows:

- Arsenic leaching was observed during all phases of the leaching test. The effluent arsenic concentration peaked on Day 97 during the transition from Phase 2 into Phase 3 at 0.0094 mg/L for total arsenic when the influent total arsenic concentration was 0.00096 mg/L around the same period. On Day 190, arsenic leaching seemed to have stopped, i.e. the effluent arsenic concentration is similar to the influent arsenic concentration. After Day 244, the effluent arsenic concentration increased slightly again.
- Copper leaching was observed during Phases 1 and 2 of the leaching test. The effluent copper concentration peaked on Day 21 during Phase 1 at 0.045 mg/L for total copper when the influent total copper concentration at the beginning of the test was 0.020 mg/L. On Day 51, copper removal was observed and continued until the end of the test. Copper removal in the SRF was important since Cu is a key parameter of interest for MPMC. It was also noted that influent copper concentration decreased overtime during the leaching test.
- Iron leaching was observed during all phases of the leaching test. The effluent iron concentration peaked on Day 51 during Phase 2 at 6.71 mg/L for total iron when the influent total iron concentration was less than laboratory detection limit of 0.01 mg/L around the same period. Leaching continued until the end of the test with effluent total and dissolved iron concentrations fluctuating around the dissolved iron treatment target of 0.35 mg/L. Note that the influent total iron was typically below detection limit of 0.01 mg/L and that is why the influent data does not appear in Figure 7.

- Manganese leaching was observed during all phases of the leaching test. The effluent manganese concentration peaked on Day 51 during Phase 2 at 2.9 mg/L for total manganese when the influent total manganese was 0.0015 mg/L around the same period. Leaching of manganese continued until the end of the test.
- There were other metals that leached from the waste rock media during the test but either stopped leaching or slowly transitioned into reduction in Phase 3. Refer to Table 9 for the list of metals that were leached, were removed, or were constant during the leaching test. Total metal concentration of leached metals in the SRF effluent during the leaching test are plotted in two separate figures (Figure 9 and Figure 11) to prevent overlapping of data for clarity. Refer to Appendix E for total metal concentration of leached metals in the influent.
- After Phase 1 (Inoculation), none of the leachable metals being leached into the SRF effluent were above the proposed site-specific treatment targets except for iron. Proper monitoring of leaching and adequate polishing steps after SRF are critical in running SRF treatment systems.

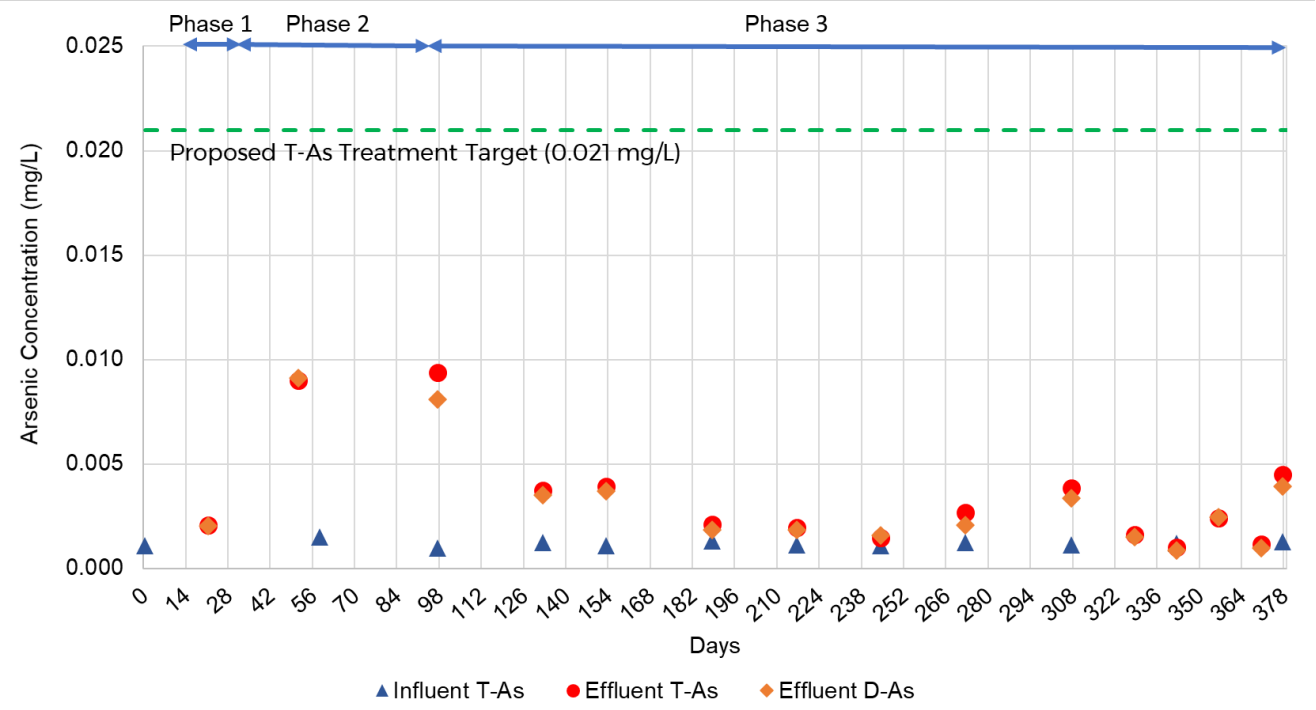

Figure 5: Total and Dissolved Arsenic Concentrations in the SRF over 52 weeks of Testing in Comparison with Influent Total Arsenic Concentration and Treatment Target

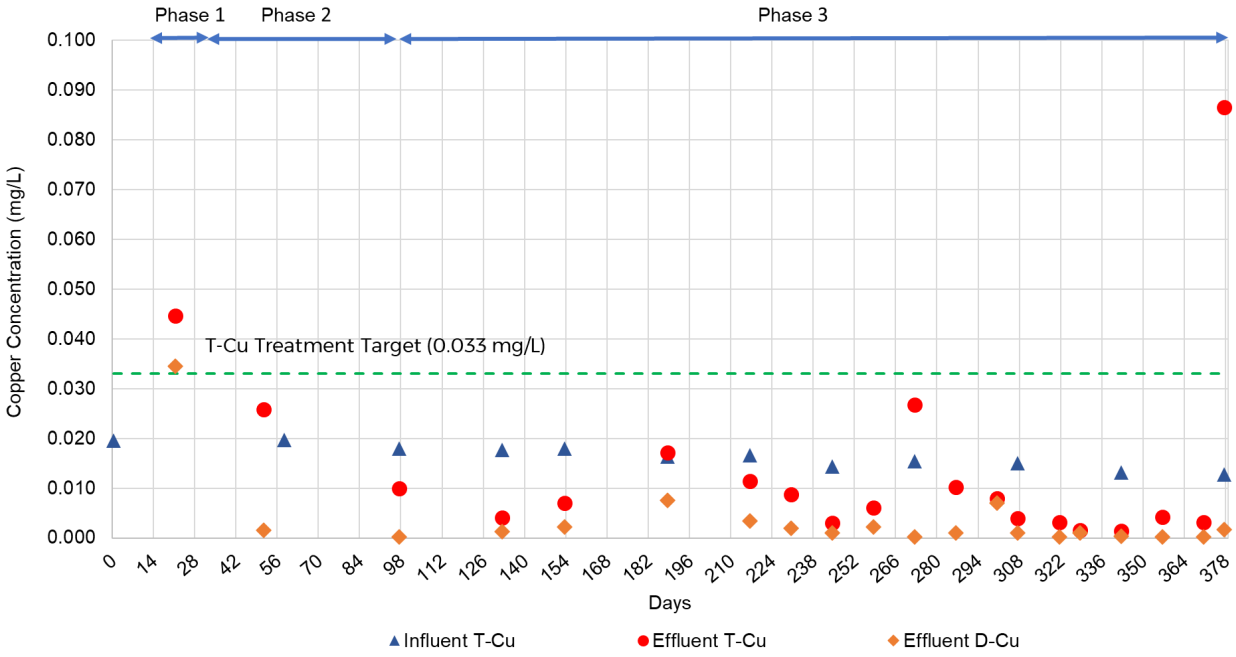

Figure 6: Total and Dissolved Copper Concentrations in the SRF Over 52 weeks of Testing in Comparison with Influent Total Copper Concentration and Treatment Target

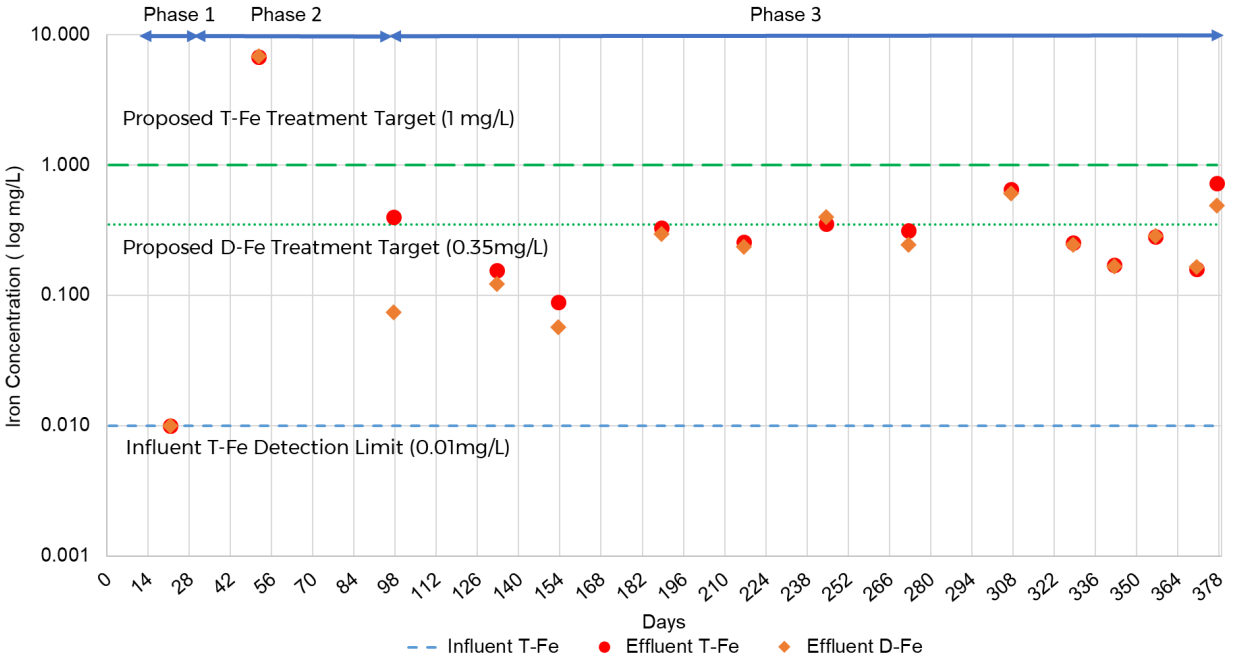

Figure 7: Total and Dissolved Iron Concentrations in the SRF Over 52 weeks of Testing in Comparison with Treatment Targets (Note: Influent T-Fe concentration is shown as detection limit concentration because it was typically below detection limit of 0.01 mg/L.)

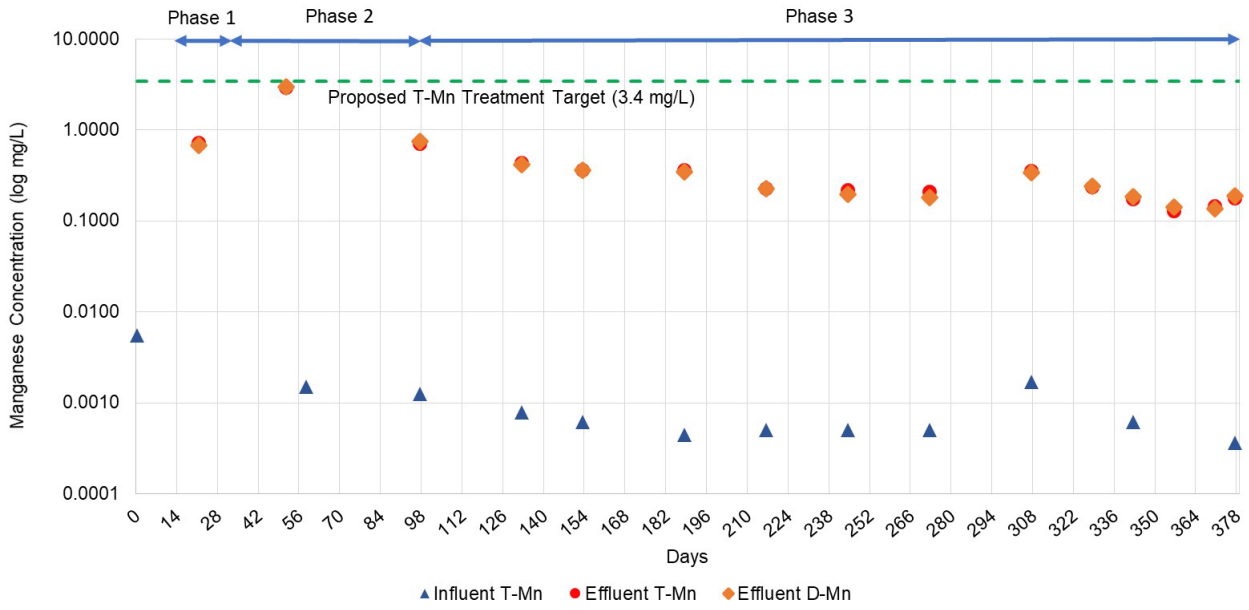

Figure 8: Total and Dissolved Manganese Concentrations in the SRF Over 52 weeks of Testing in Comparison with Influent Total Manganese Concentration and Treatment Target

Table 9: Summary of Total Metals Leached, Removed, and was Constant During Leaching Test

Total Metals Concentration Trend	Total Metals	
Metals leached	▪ Arsenic ▪ Antimony ▪ Barium ▪ Cadmium ▪ Cobalt ▪ Copper (a) ▪ Iron	▪ Lead ▪ Lithium ▪ Manganese ▪ Molybdenum (a) ▪ Mercury ▪ Silicon ▪ Strontium
Metals Removed	▪ Copper (a)	▪ Molybdenum (a)
Constant	▪ Beryllium ▪ Bismuth ▪ Boron ▪ Chromium ▪ Nickel ▪ Silver	▪ Thallium ▪ Tin ▪ Titanium ▪ Uranium ▪ Vanadium ▪ Zinc ▪ Zirconium

Notes:

(a) Copper and molybdenum were initially leached during Phase 1 and Phase 2 of the leaching test but slowly transitioned into reduction during Phase 3.

(b) Aluminum is not included in this table due to an inconclusive trend.

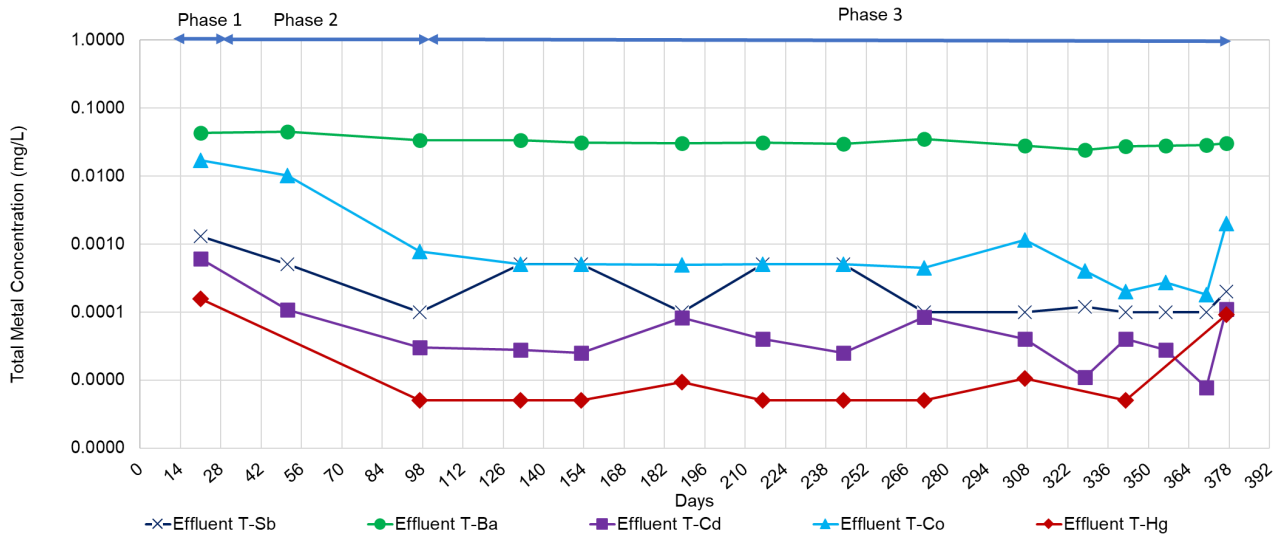

Figure 9: Total Concentration of Leached Metals in SRF Effluent Over 52 weeks of Testing

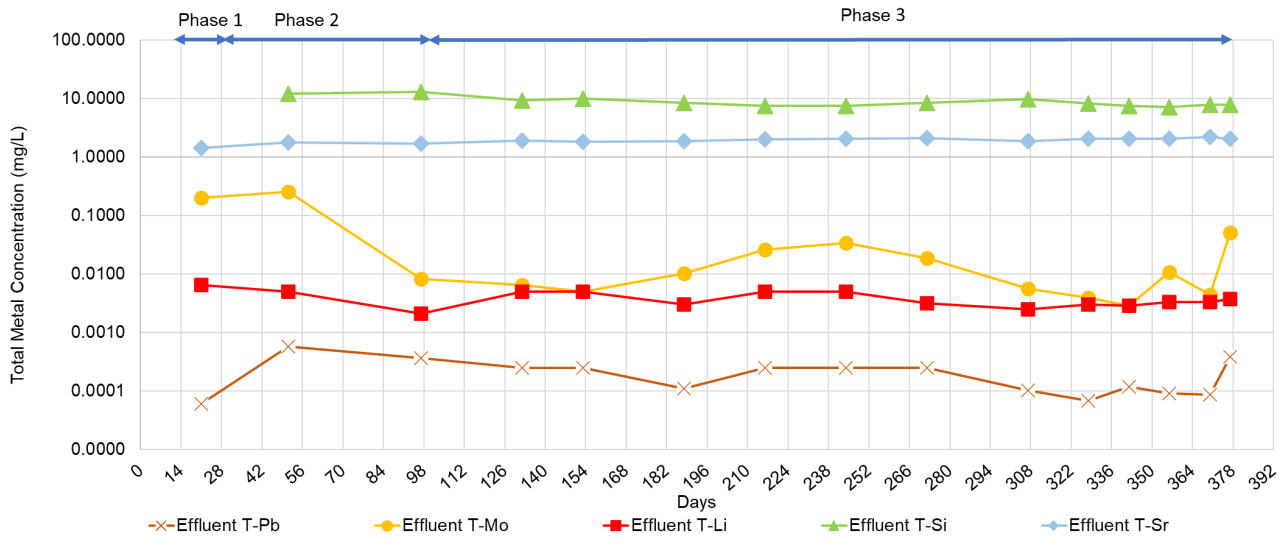

Figure 10: Total Concentration of Leached Metals in SRF Effluent Over 52 weeks of Testing

6.3.4 Residual Nutrients and the Effect on Bioreactor Performance

Acetic acid and phosphoric acid were dosed as carbon and phosphorus sources, respectively, to support the bacterial growth in the SRF reactor. To avoid overdosing or nutrient limiting conditions, TOC and total phosphorus (TP) were monitored in the SRF effluent throughout the test. TOC and TP concentrations in the SRF effluent during the leaching test are plotted in Figure 11 and Figure 12, respectively.

During Phase 3 when optimal ORP was maintained at a stoichiometric ratio of 1 to 2, it was observed that the TOC in the SRF effluent was almost the same amount as TOC that was coming in with the influent. A potential explanation for this was that the TOC in the influent was not utilized by the bacteria and potentially the externally added carbon source was used. It was unclear if the SRF reactor was in a nutrient limiting condition while observing high selenium removal.

TP was observed to increase in SRF effluent throughout the leaching test, which was possibly due to overdosing of the phosphorus source. For the future detailed bench-scale test, it is recommended to adjust the dose of phosphoric acid accordingly to avoid overdosing of phosphorus.

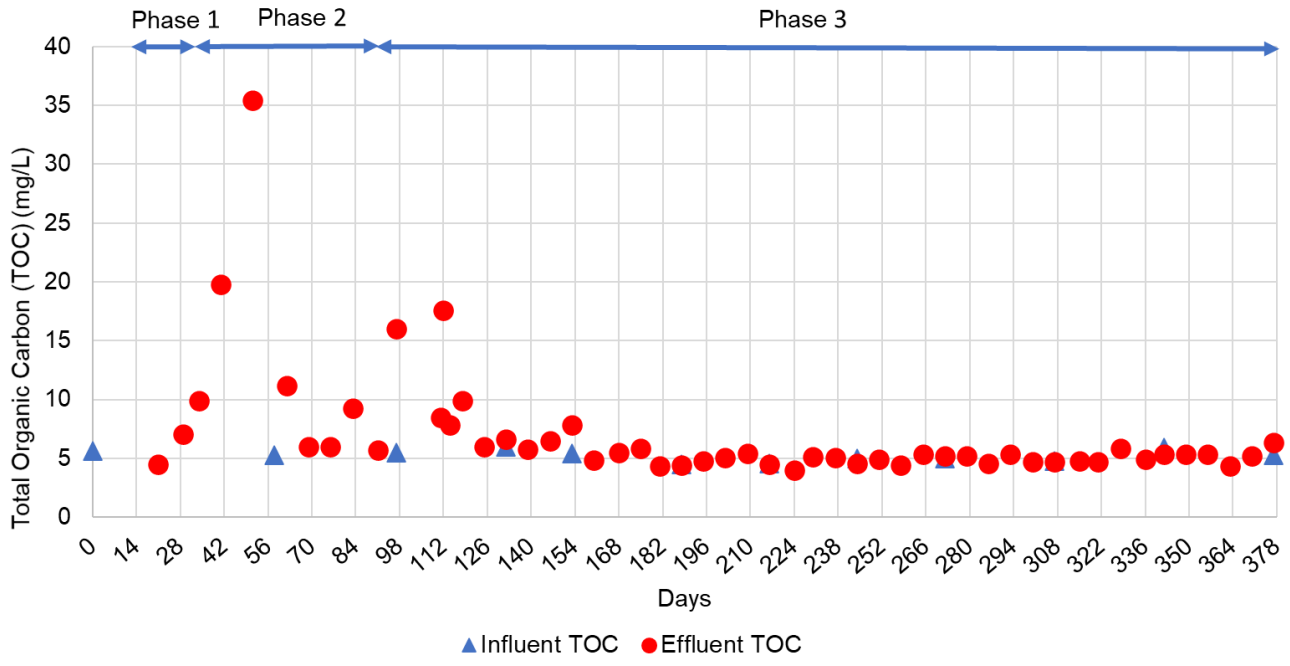

Figure 11: TOC Concentration over 52 weeks of Testing

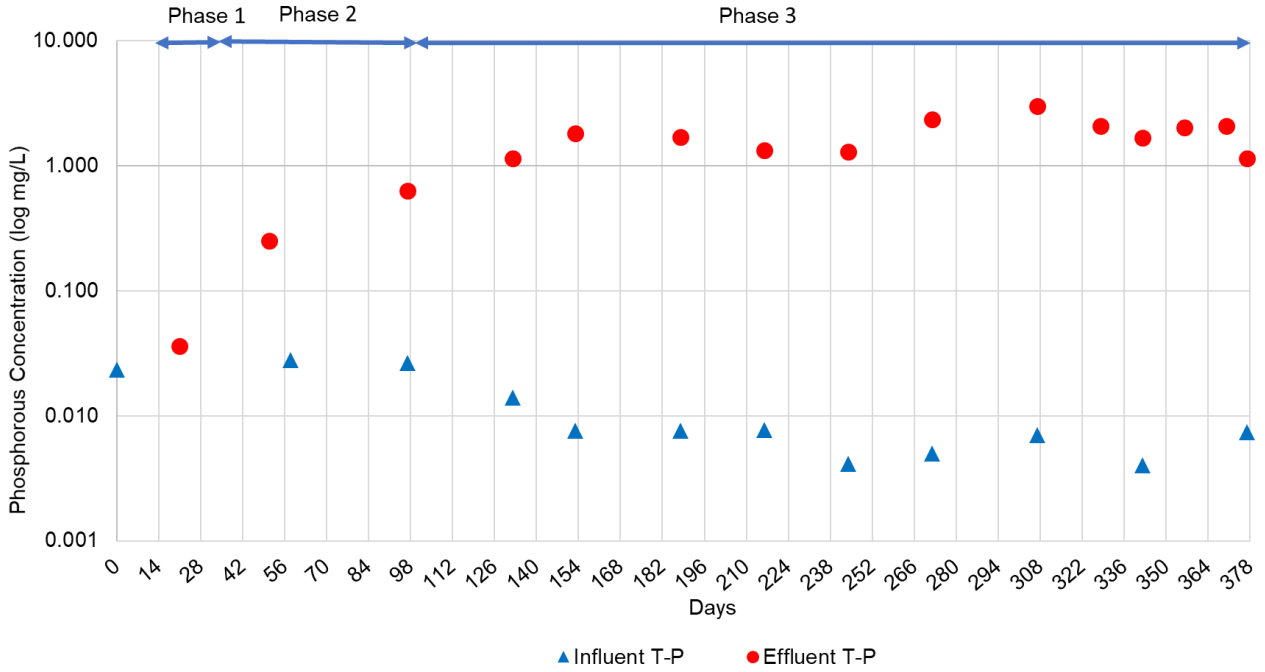

Figure 12: Total Phosphorus Concentration over 52 weeks of Testing

6.4 Quality Assurance and Quality Control (QAQC) in Sampling and Data Analysis

To avoid contamination of samples, extra care was taken during collection, handling, and preservation of samples. A summary of key considerations during the bench parameter monitoring were as follows:

- The bench parameters were analyzed immediately after sample collection to prevent inaccurate results due to samples being in contact with oxygen in the air.
- The samples for analytical monitoring were properly preserved immediately after sampling based on the intended analytical method using ALS laboratory-supplied bottles and preservatives.
- Nitrate analysis was submitted for analytical measurement when the bench nitrate strip testing exceeded zero to obtain more accurate results.
- Sulphate analysis was submitted for analytical measurement when the bench ORP testing went below -300 mV to monitor whether the SRF was in the sulphate reducing condition.
- A field blank was submitted during the beginning of the leaching test to confirm contamination was not occurring during sampling. The field blank result is presented in Appendix G with all parameters below detection limit.
- Quarterly blind duplicates were submitted for analytical measurement to ensure the laboratory's QA/QC method was reliable. The RPD, as a measure to determine the acceptability of laboratory duplicates according to BC Field Sampling Manual (BCFSM, 2013), between the sample and duplicate was calculated and presented in Appendix G. There was only one parameter (T-Mn) of a duplicate collected on 20 June 2022, that exceeded the RPD of 20%.
- Re-analysis was requested from the analytical laboratory when an unexpected result was received.
- Values from the ALS excel report were used to avoid any issues with ALS PDF documents reporting raised detection limits incorrectly.

7.0 CONCLUSIONS AND RECOMMENDATIONS

Key conclusions from the long-term leaching test are as follows:

- The saturated rock fill (SRF) is a reliable technology for selenium and nitrate removal from the treatability perspective. The bench-scale SRF reactor used in this study was very effective in removing total and dissolved selenium, and nitrate with an average percentage removal of 98.33 ± 1.36%, 97.23 ± 3.03%, and 96.57 ± 10.57%, respectively.
- Utilizing mine waste rock as reactor media for SRF introduces the risk of leaching or release of metals into the SRF effluent. Consequently, for this treatment techonology to be implemented at full-scale as a viable option, the effect of metals leaching should be understood at the specific reducing conditions (-100 to -200 mV) that are required for SRF to achieve effective removal of selenium and nitrate.
- The data from this leaching test confirmed that the leaching behaviour of metals can change over time and is different for each type of metal. Leaching of metals in the bench-scale SRF reactor system effluent was observed during inoculation (Phase 1) and start-up (Phase 2) of the long-term leaching test. For most metals, leaching stopped or slowly transitioned into removal in the continuous testing phase (Phase 3).
- By the end of 52 weeks of testing, none of the metals being leached into the SRF effluent were above the proposed site-specific treatment targets except for iron.
- Total copper, which is one of the key constituents for this site, was leached and exceeded the proposed site-specific discharge target for a period during Phase 1 and 2. Copper then decreased to be below the influent and the target; indicating the SRF technology could provide copper removal during closure.
- Some other leachable metals such as arsenic, manganese, and iron continued leaching during Phase 3; however, the concentrations did not exceed the proposed site-specific discharge target except for dissolved iron.
- Based on the trends observed for most of the metals, the concentration of leachable metals can be managed through a start-up or commissioning period prior to discharge from the system. Another possible solution to manage metals that leached for the entire test period could be the use of additional polishing treatment steps downstream of the SRF reactor.

WSP recommends the followings to be considered during the detailed bench-scale test work to be completed in 2023 and during further evaluation and development of SRF treatment technology:

- Optimize the design parameters and operational conditions, including HRT and nutrient dosing, to establish the process design criteria for the pilot-scale SRF treatment system to be implemented on-site.
- Evaluate the effectiveness and stability of the SRF treatment system in achieving the treatment goals over a range of design parameter setpoints.
- Improve the performance of the SRF treatment system in removal of contaminants from the site water by including aeration and settling cells as downstream polishing cells.

- Evaluate the effect of elevated copper concentration (highest concentration of copper that has been observed onsite) on the performance of the SRF treatment system as copper is a current and predicted key constituent for the site. Copper inhibits nitrification at concentration of 0.1 mg/L, while denitrification is less sensitive to copper concentration. High copper concentration could be toxic to bacteria and result in adverse effects on microbial community in SRF. It is recommended to establish the benchmark for when copper inhibits denitrification to understand how copper can interfere with the performance of SRF.

8.0 CLOSURE

The reader is referred to the Study Limitations section, which precedes the text and forms an integral part of this report.

We trust the above meets your present requirements. If you have any questions or comments, please contact the undersigned.

APPENDIX D

SRF Reactor Troubleshooting

1.0 INTRODUCTION

During the 52 weeks of running the SRF reactor, the SRF reactor experienced three upsets which resulted in sudden changes in ORP and deviation from steady-state operation. The following sections describe the situations that resulted in the upsets and the corresponding recovery measures.

2.0 FIRST UPSET

On Day 111, the SRF reactor was partially drained (roughly 50% of reactor liquid volume and some suspended biomass) during the switch out of effluent drum that caused a siphoning situation. This error was caught before the reactor was completely drained.

The day prior to the siphoning issues, high sulphate reduction was observed in the SRF reactor. This high sulphate reduction could suggest that the bacterial community had been slowly shifting to sulphate reduction and away from selenium reduction. The shift in bacterial community was undesired as the goal for the MPMC on-site SRF is selenium reduction.

The immediate actions taken to recover the SRF reactor were as follows:

1) Refilled the SRF reactor with influent water.
2) Stopped both influent and effluent pumps and returned the SRF to batch operation (similar to the incubation phase) to promote regrowth of bacterial cells that were lost.
3) During this time, acetic acid and phosphoric acid were dosed into the SRF as usual to provide nutrient for faster recovery of the microbial community.

Follow-up actions were as follows:

1) Bench parameters measurements were conducted every other day to monitor the recovery process of the reactor.
2) SRF effluent samples were also collected after the bench parameter measurements and were submitted to ALS for total organic carbon (TOC), total selenium, dissolved selenium, and sulphate measurement.
3) A new carbon dosing approach was adopted, where dosage was adjusted based on the oxidation reduction potential (ORP) measured. The stoichiometric ratio of dosed carbon was increased when ORP was above -100 mV and was decreased when ORP was below -200 mV.

The ORP value reached -205.3 mV within 8 days after the upset. The SRF reactor was then put back to continuous mode with target HRT of 7 days. With the new approach for carbon source dosing, sulphate reduction slowed, then stopped.

3.0 SECOND UPSET

On Day 244, the ORP measured in the SRF effluent was significantly higher than the ORP measured 7 days prior. The exact reason for this upset is unknown but it may have been caused by oxygen intrusion identified during a reactor inspection when a loose connection was found.

The immediate actions taken to recover the SRF reactor were as follows:

1) Carbon source was dosed at the normal stoichiometric ratio for 4 days to see if ORP recovered in the system.
2) ORP was measured again before the next dosing event to observe any changes in ORP. Based on the ORP reading, the stoichiometric ratio for carbon dosing was increased to target an ORP of -200 mV.
3) All connections of the SRF reactor system were checked and sealed with parafilm to prevent future oxygen intrusion.

After approximately one week, the SRF effluent ORP reading was back to the optimal -100 to -200 mV ORP range.

4.0 THIRD UPSET

On Day 296, the ORP measured in the SRF effluent was significantly higher than the optimal ORP range. After reviewing the ORP measurements for the previous weeks, it was noted that the ORP was increasing overtime. The cause for the increase in ORP may have been due to switching of the influent tote on Day 272. After reviewing the influent water quality and conducting bench parameters measurement of the two influent totes, it was found that tote 2 had higher ORP reading than tote 1.

The immediate actions taken to recover the SRF reactor were as follows:

1) The stoichiometric ratio for carbon dosing was increased to target an ORP of -200 mV.
2) ORP was measured again before the next dosing event to observe any changes in ORP.

After approximately one week, the SRF effluent ORP reading was back to the optimal -100 to -200 mV ORP range.

5.0 FOURTH UPSET

On Day 370, after the pump check, it was observed the effluent pump was pumping at a faster rate than the influent pump which resulted in approximately 4 L of SRF reactor volume loss. To recover the lost volume in the SRF, the effluent pump was stopped on Day 375 for 1 day while the influent pump was running at the set flow rate. This action resulted in the sudden increase in ORP.

The immediate action taken to recover the SRF reactor was as follows:

1) The stoichiometric ratio for carbon dosing was increased to 4 to target an ORP of -200 mV.

The leaching test had already completed the 52-week testing period before the outcomes of this action could be evaluated.

APPENDIX E

Raw Data Table

Week	Days	Date	Mode	Lab Analysis Submitted? (Y/N)	Probes Calibrated? (Y/N)	Influent
