Value did not meet the data quality objective of ≤ 30% Relative Percent Difference (RPD).

Notes: Relative Percent Difference (RPD) was calculated using the LRL if one result in a duplicate pair was below the LRL. RPD was not calculated if both results were < LRL. "-" indicates that the RPD was not calculated; "wwt" indicates wet weight.

Value did not meet the data quality objective of ≤ 30% Relative Percent Difference (RPD).

Notes: Relative Percent Difference (RPD) was calculated using the LRL if one result in a duplicate pair was below the LRL. RPD was not calculated if both results were < LRL. "-" indicates that the RPD was not calculated; "wwt" indicates wet weight.

Value did not meet the data quality objective of ≤ 30% Relative Percent Difference (RPD).

Notes: Relative Percent Difference (RPD) was calculated using the LRL if one result in a duplicate pair was below the LRL. RPD was not calculated if both results were < LRL. "-" indicates that the RPD was not calculated; "wwt" indicates wet weight.

Kidney tissue had the highest rate of DQO exceedances (21.9% of duplicate sets) and liver and ovary tissue had the lowest average rate of DQO exceedances (3.13% of duplicate sets, each). These relatively high rates of DQO exceedances were likely due to sample heterogeneity expected in biological tissues and this source of variability will be considered during data interpretation, especially with regards to kidney and muscle tissue. Generally, field duplicate samples of fish tissue were considered to have acceptable field precision and reproducibility.

B10.4 Data Accuracy

Data accuracy was evaluated based on results of 28 RM samples and 57 LCS samples (see laboratory reports VA22B2820, VA22B2821, VA22B4917, and VA22B5055; Appendix G). Out of 756 individual analyte results for RM samples, three did not meet the laboratory DQO (0.40% of analyte results), including one result for nickel and two results for lead. Both of these DQO exceedances occurred in multi-element scans where >10% of analytes met the laboratory DQO, which is a level deemed acceptable by the CCME (VA22B2820, VA22B2821; Appendix G). Out of the 1,029 individual LCS results, eight did not meet the laboratory DQO (0.78% of analyte results), including one result for iron, two results each for lithium and silver, and three results for boron. All of the above DQO exceedances were due to multi-element scans where >10% of analytes met the laboratory DQO, which is a level deemed acceptable by the CCME (VA22B2820, VA22B2821, VA22B4917, and VA22B5055; Appendix G). As these DQO exceedances only represent 0.40 and 0.78% of all individual analyte results for RM and LSC samples respectively, laboratory accuracy can be considered excellent.

B10.5 Hold Times

Recommended hold times for fish tissue samples were met for all parameters in all samples (VA22B2820, VA22B2821, and VA22B4917, and VA22B5055; Appendix G).

B10.6 Data Quality Statement

Fish tissue chemistry data collected as part of the 2022 CEMP were of good quality as characterized by appropriate LRLs, excellent laboratory precision, no evidence of laboratory contamination, and excellent laboratory accuracy. Field sampling precision, as quantified using field duplicate samples, was relatively low, especially in kidney and muscle tissue; however, this is likely compensated for by the number of replicate fish tissue samples employed in this study. Therefore, fish tissue chemistry data can be used with a high level of confidence in the derivation of conclusions for the 2022 CEMP, though these sources of variability will be considered during data interpretation.

B11 FISH AGING

Data Accuracy

Analytical reports of fish age estimates from AAE Tech Services Inc. (see laboratory reports in Appendix G) were examined to evaluate data accuracy. To determine the accuracy of rainbow trout, longnose sucker, peamouth chub, lake trout, and northern pikeminnow age estimates, all aging structures that were analyzed by AAE Technical Service were re-processed by a second analyst. The original and second analyst assigned a confidence index to each age estimate and check. Original and re-assessed age estimates were in agreement for all samples. Accuracy achieved by the laboratory in this study can therefore be considered excellent.

B12 DATA QUALITY REVIEW SUMMARY

Data collected for the 2022 CEMP were of acceptable quality as characterized by appropriate LRLs, good detectability, negligible analyte concentration in MB samples, good laboratory precision, and good laboratory accuracy. Field sampling precision, as measured by RPD in field duplicate pairs, was low in benthic invertebrate and periphyton tissue samples, reflecting natural variability. The hold times for chlorophyll-a were exceeded in four samples from August as these samples were not field-filtered, which highlights the importance of filtering these samples in the field to ensure the highest data quality possible. Additionally, the concentrations of several dissolved analytes were greater than the concentration of the corresponding total analyte. These unexpected results could be due to contamination during field filtration or could represent inaccuracies that are inevitable when conducting multi-element scans.

Overall, data collected as part of the 2022 Mount Polley Mine CEMP can be used with a high level of confidence in the derivation of conclusions.

Table C.1.1: British Columbia Water Quality Guidelines for the Protection of Aquatic Life (BCMOECCS 2019b, 2019c, 2021a, 2021b), 2022

Parameter	Units	Long-term Average	Short-term Maximum
Anions, Organics, Nutrients, and Physical Properties			
pH	pH units	6.5 - 9.0	
Temperature (*in situ*)[a]	°C	± 1	
Alkalinity ($CaCO_3$)	mg/L	> 20[b]	-
Conductivity	µS/cm	-	-
Dissolved Oxygen (*in situ*)[c]	mg/L	> 8	> 5
Dissolved Oxygen (*in situ*)[d]	mg/L	> 11	> 9
Total Suspended Solids[e]	mg/L	+ 5	+ 25
Turbidity[e]	NTU	+ 2	+ 8
Chloride	mg/L	150	600
Fluoride[f]	mg/L	-	For hardness ≤ 10 mg/L, WQG = 0.4 For hardness > 10 mg/L, WQG = [-51.73 + 92.57 × log10]×0.01 Maximum applicable hardness = 385 mg/L
Sulphate[g]	mg/L	hardness dependent	-
Ammonia (as N)[h]	mg/L	temperature and pH dependent	temperature and pH dependent
Nitrate (as N)	mg/L	3.0	32.8
Nitrite (as N)[i]	mg/L	chloride dependent	chloride dependent
Phosphorus - Total[j]	mg/L	0.005 - 0.015	
Dissolved Organic Carbon[k]	mg/L	-	± 20%[k]
Total Metals			
Antimony	µg/L	9	-
Arsenic	µg/L	-	5
Beryllium	µg/L	0.13	-
Boron	mg/L	1.2	-
Chromium[l]	µg/L	For Cr, WQG = 0.001 For Cr, WQG = 0.0089	-
Cobalt	µg/L	4	110
Iron	mg/L	-	1
Lead[f]	µg/L	For hardness ≤ 8 mg/L, none proposed For hardness 8 to 360 mg/L, WQG = 0.001×{3.31+ exp[1.273 × ln - 4.704]} Maximum applicable hardness = 360 mg/L	For hardness ≤ 8 mg/L, WQG ≤ 0.003 For hardness 8 to 360 mg/L, WQG = 0.001×{exp[1.273 × ln - 1.460]} Maximum applicable hardness = 360 mg/L
Manganese[f]	mg/L	For hardness 37 to 450 mg/L, WQG ≤ 0.004 × hardness + 0.605 Maximum applicable hardness = 450 mg/L	For hardness 25 to 259 mg/L, WQG ≤ 0.01102 × hardness + 0.54 Maximum applicable hardness = 259 mg/L
Mercury[m]	mg/L	WQG = [0.0001/] OR When MeHg = 0.5% of THg, WQG= 0.00002	-
Molybdenum	mg/L	7.6	46
Nickel[f]	µg/L	For hardness ≤60, WQG = 0.025 For hardness 60 to 180, WQG = exp{0.76[ln]+1.06} For hardness ≥180, WQG = 0.15	-
Selenium	µg/L	2	-
Silver	mg/L	For hardness ≤ 100 mg/L, WQG = 0.00005 For hardness > 100 mg/L, WQG = 0.0015	For hardness ≤ 100 mg/L, WQG = 0.0001 For hardness > 100 mg/L, WQG = 0.003
Thallium	µg/L	0.8	-
Uranium	µg/L	8.5	-
Zinc[f]	µg/L	For hardness ≤ 90 mg/L, WQG = 0.0075 For hardness 90 to 330 mg/L, WQG = [7.5 + 0.75]; Maximum applicable hardness = 330 mg/L	For hardness ≤ 90 mg/L, WQG = 0.033 For hardness 90 to 500 mg/L, WQG = [33 + 0.75]; Maximum applicable hardness = 500 mg/L
Dissolved Metals			
Aluminum	mg/L	0.05	0.1
Cadmium[f]	µg/L	For hardness = 3.4 to 285 mg/L, WQG = {exp[0.736×ln - 4.943]} Maximum applicable hardness = 285 mg/L	For hardness = 7 to 455 mg/L, WQG = {exp[1.03×ln-5.274]} Maximum applicable hardness = 455 mg/L
Copper[n]	mg/L	Biotic Ligand Model	Biotic Ligand Model
Iron	mg/L	-	0.35

Notes: "-" indicates no applicable guideline. BCMOECCS = British Columbia Ministry of Environment and Climate Change Strategy.

[a] Change from optimal . No guideline applied.

[b] For waterbodies with low sensitivity to acid inputs.

[c] Minimum for all life stages other than buried embryo / alevin.

[d] Minimum for buried embryo / alevin life stages.

[e] Increase relative to background; no guideline applied.

[f] For hardness-based guidelines, concurrent hardness values were used for calculating guidelines. If hardness values exceeding the maximum applicable hardness, then guidelines were determined using the maximum applicable hardness. If hardness values are lower than the minimum hardness, then guidelines were determined using the minimum hardness.

[g] 128 mg/L at hardness 0-30 mg/L; 218 mg/L at hardness 31-75 mg/L; 309 mg/L at hardness 76-180 mg/L; 429 mg/L at hardness > 250 mg/L.

[h] Use tables in BCMOECCS 2021b.

[i] When chloride < 2 mg/L, long-term = 0.02 mg/L and short-term = 0.06 mg/L; increase with increasing chloride.

[j] Aquatic Life - Lakes; minimum guideline was applied.

[k] ±20% of the background median; no guideline applied.

[l] Chromium is the dominant oxidation state in oxygenated environments, and so its guideline was applied.

[m] Values were screened against 0.00002 mg/L which assumes MeHg = 0.5% of THg.

[n] Site specific guidelines developed using the BLM model and calculated concurrently for each sample .

Indicates value greater than the long-term average British Columbia Water Quality Guideline (BCMOECCS 2019c, 2021a,b)
Indicates value greater than the short-term maximum British Columbia Water Quality Guideline (BCMOECCS 2019c, 2021a,b)

Notes: "-" indicates data not available. Standard deviation was not calculated where all results were below the laboratory reporting limit.

[a] Guidelines were derived from the British Columbia Water Quality Guidelines for the protection of aquatic life (BCMOECCS 2019c, 2021a,b) outlined in Table C.1.1.
[b] Guidelines for these parameters (Total Suspended Solids, Turbidity, Dissolved Organic Carbon) are narrative and were not evaluated.

Table C.1.2: Supporting Overlying Water Quality Data Collected Concurrently with Sediment Quality Sampling in Polley Lake (POL-S; Exposed) and Bootjack Lake (BOL-S; Reference) Shallow Areas, 2022

Indicates value greater than the long-term average British Columbia Water Quality Guideline (BCMOECCS 2019c, 2021a,b)

Indicates value greater than the short-term maximum British Columbia Water Quality Guideline (BCMOECCS 2019c, 2021a,b)

Notes: "-" indicates data not available. Standard deviation was not calculated where all results were below the laboratory reporting limit.

[a] Guidelines were derived from the British Columbia Water Quality Guidelines for the protection of aquatic life (BCMOECCS 2019c, 2021a,b) outlined in Table C.1.1. [b] Guidelines for these parameters (Total Suspended Solids, Turbidity, Dissolved Organic Carbon) are narrative and were not evaluated.

Table C.1.3: Supporting Spot Water Quality Data Collected During Plankton Sampling in Polley Lake (POL-P2; Exposed) and Bootjack Lake (BOL-B2; Reference), 2022

Indicates value greater than the long-term average British Columbia Water Quality Guideline (BCMOECCS 2019c, 2021a,b)
Indicates value greater than the short-term maximum British Columbia Water Quality Guideline (BCMOECCS 2019c, 2021a,b)

Note: "-" indicates data not available.

[a] Guidelines were derived from the British Columbia Water Quality Guidelines for the protection of aquatic life (BCMOECCS 2019c, 2021a,b) outlined in Table C.1.1. [b] Guidelines for these parameters (Total Suspended Solids, Turbidity, Dissolved Organic Carbon) are narrative and were not evaluated.

Table C.1.4: Supporting Overlying Water Quality Data Collected During Sediment Quality Sampling in Quesnel Lake at QUL-LNF1 (Exposed) and QUL-LREF1 (Reference) Shallow Areas, 2022

Indicates value greater than the long-term average British Columbia Water Quality Guideline (BCMOECCS 2019c, 2021a,b)
Indicates value greater than the short-term maximum British Columbia Water Quality Guideline (BCMOECCS 2019c, 2021a,b)

Notes: "-" indicates data not available. Standard deviation was not calculated where all results were below the laboratory reporting limit.

[a] Guidelines were derived from the British Columbia Water Quality Guidelines for the protection of aquatic life (BCMOECCS 2019c, 2021a,b) outlined in Table C.1.1.
[b] Guidelines for these parameters (Total Suspended Solids, Turbidity, Dissolved Organic Carbon) are narrative and were not evaluated.

Indicates value greater than the long-term average British Columbia Water Quality Guideline (BCMOECCS 2019c, 2021a,b)
Indicates value greater than the short-term maximum British Columbia Water Quality Guideline (BCMOECCS 2019c, 2021a,b)

Notes: "-" indicates data not available. Standard deviation was not calculated where all results were below the laboratory reporting limit.

[a] Guidelines were derived from the British Columbia Water Quality Guidelines for the protection of aquatic life (BCMOECCS 2019c, 2021a,b) outlined in Table C.1.1.
[b] Guidelines for these parameters (Total Suspended Solids, Turbidity, Dissolved Organic Carbon) are narrative and were not evaluated.

Table C.1.5: Supporting Spot Water Quality Data Collected During Plankton Sampling in Quesnel Lake at QUL-ZOO-1 (Exposed) and QUL-ZOO-7 (Reference) Areas, 2022

Indicates value greater than the long-term average British Columbia Water Quality Guideline (BCMOECCS 2019e, 2021a,b)

Indicates value greater than the short-term maximum British Columbia Water Quality Guideline (BCMOECCS 2019e, 2021a,b)

Note: "-" indicates data not available.

[a] Guidelines were derived from the British Columbia Water Quality Guidelines for the protection of aquatic life (BCMOECCS 2019e, 2021a,b) outlined in Table C.1.1.

[b] Guidelines for these parameters (Total Suspended Solids, Turbidity, Dissolved Organic Carbon) are narrative and were not evaluated.

APPENDIX C.2
SEDIMENT QUALITY

Table C.2.1: Sediment Quality Data for Bootjack Lake (BOL-S; Reference) Shallow Area, 2019 to 2022

Value is > BC Lower Working Sediment Quality Guideline.

Value is > BC Upper Working Sediment Quality Guideline.

Notes: "-" indicates no guideline available or no data, mg/kg = milligrams per kilogram, ***Bold/Italics:*** Value is > reference 95th percentile value (<5th percentile value for pH). QUL-PREF1 was not sampled in 2022, therefore displayed data include to 2021 only and the reference 95th percentile value was calculated using data from 2014 to 2021.

[a] British Columbia Working Sediment Guidelines (BCMOECCS 2021a) and approved BC Sediment Quality Guideline for Selenium (BCMOECCS 2021b).

[b] 5th percentile value for pH.

[c] Total sulphur measured in bulk sediment, not the <63 µm fraction.

Value is > BC Lower Working Sediment Quality Guideline.

Value is > BC Upper Working Sediment Quality Guideline.

Notes: "-" indicates no guideline available or no data, mg/kg = milligrams per kilogram, ***Bold/Italics*** : Value is > reference 95th percentile value (<5th percentile value for pH).

[a] British Columbia Working Sediment Guidelines (BCMOECCS 2021a) and approved BC Sediment Quality Guideline for Selenium (BCMOECCS 2021b)

[b] 5th percentile value for pH.

[c] Total sulphur measured in bulk sediment, not the <63 µm fraction

Value is > BC Lower Working Sediment Quality Guideline.

Value is > BC Upper Working Sediment Quality Guideline.

Notes: "-" = no current BC Working Sediment Quality Guidelines/ no data. ***Bold/ Italics*** indicates value is > pre-breach and is > reference 95th percentile value (<5th percentile value for pH).

[a] British Columbia Working Sediment Guidelines (BCMOECCS 2021a) and approved BC Sediment Quality Guideline for Selenium (BCMOECCS 2021b).

[b] Pre-breach values that were reported as < the laboratory reporting limit were not used for screening. The 5th percentile is reported and screened for the pH reference data. For calculation of reference and pre-breach 95th percentile values, see Appendix Tables C.2.6 and C.2.8, respectively.

[c] Total Organic Carbon (TOC) and metals data are presented for the <63 µm sediment fraction for post-breach (2014 to 2022) data only. TOC and metals data presented for pre-breach results represent bulk sediment samples (see Appendix Table C.2.8).

[d] Total sulphur measured in bulk sediment, not the <63 µm fraction.

APPENDIX C.3
PLANKTON COMMUNITY & PRODUCTIVITY

Notes: "-" = only one sample (replicate) collected. Cells/L = cells per litre. µg/L = micrograms per litre. Displayed data were collected using depth-integrated (DI) sampling methods. Sampling methods employed in 2019 included both surface (S) and DI methods. See Minnow (2019a, 2020a) for results of surface phytoplankton sampling completed in 2018 and 2019. See Minnow 2020a for a comparison of results from the S and DI sampling methodologies, and for rationale regarding the selection of DI methods for ongoing phytoplankton monitoring.

[a] Phytoplankton data for area POL-P1 collected in June 2019 are not displayed. These data were presented in Minnow (2020a).

Notes: "-" = only one sample (replicate) collected. Displayed data were collected using depth-integrated (DI) sampling methods. Sampling methods employed in 2019 included both surface (S) and DI methods. See Minnow (2019a, 2020a) for results of surface phytoplankton sampling completed in 2018 and 2019. See Minnow 2020a for a comparison of results from the S and DI sampling methodologies, and for rationale regarding the selection of DI methods for ongoing phytoplankton monitoring.

[a] Phytoplankton data for area POL-P1 collected in June 2019 are not displayed. These data were presented in Minnow (2020a).

Table C.3.2: Summary Statistics for Phytoplankton Community Metrics for Polley Lake (POL-P2; Exposed) and Bootjack Lake (BOL-B2; Reference) in July, 2019 to 2022[a]

Notes: Cell/L = cells per litre. µg/L = micrograms per litre. Displayed data were collected using depth-integrated (DI) sampling methods. Sampling methods employed in 2019 included both surface (S) and DI methods. See Minnow (2019a, 2020a) for results of surface phytoplankton sampling completed in 2018 and 2019. See Minnow 2020a for a comparison of results from the S and DI sampling methodologies, and for rationale regarding the selection of DI methods for ongoing phytoplankton monitoring

[a] Summary statistics are displayed for replicated data collected in July 2019 to 2022. For results without replicates collected in June and August 2019 to 2022, see Appendix Table C.3.1.

Table C.3.3: Zooplankton Community Metrics from Polley Lake (POL-P2) and Reference (Bootjack Lake; BOL-B2), 2019 to 2022 [a]

Year	Area	Type	Date	Replicate	Density (cells/L)	Richness (# of Taxa)	Simpson's Diversity	Simpson's Evenness	Wet Weight Biomass (mg/L)	Dry Weight Biomass (mg/L)	Calanoida (#/L)	Cladocera (#/L)

Note: "-" = only one sample (replicate) collected. #/L = organisms per litre. mg/L = miligrams per litre. Results displayed for POL-P2 (August 2019) in the current figure differ from those presented in previous reports (Minnow 2020a, 2021a, 2022a) for the same sampling area and date. This discrepany is due to an incorrect calculation for these results in the prior reporting years.

[a] Zooplankton data for area POL-P1 collected in June 2019 are not displayed. These data were presented in Minnow (2020a).

Table C.3.3: Zooplankton Community Metrics from Polley Lake (POL-P2) and Reference (Bootjack Lake; BOL-B2), 2019 to 2022 [a]

Note: "-" = only one sample (replicate) collected. #/L = organisms per litre. mg/L = miligrams per litre. Results displayed for POL-P2 (August 2019) in the current figure differ from those presented in previous reports (Minnow 2020a, 2021a, 2022a) for the same sampling area and date. This discrepany is due to an incorrect calculation for these results in the prior reporting years.

[a] Zooplankton data for area POL-P1 collected in June 2019 are not displayed. These data were presented in Minnow (2020a).

Table C.3.4: Summary Statistics for Zooplankton Community Metrics for Polley Lake (POL-P2; Exposed) and Bootjack Lake (BOL-B2; Reference) in July, 2019 to 2022[a]

Endpoint	Year	Area	Type	n	Mean	Standard Deviation	Minimum	Median	Maximum

Notes: "-" = only one sample (replicate) collected. Displayed data were collected using depth-integrated (DI) sampling methods. Sampling methods employed in 2019 included both surface (S) and DI methods. See Minnow (2019a, 2020a) for results of surface phytoplankton sampling completed in 2018 and 2019. See Minnow 2020a for a comparison of results from the S and DI sampling methodologies, and for rationale regarding the selection of DI methods for ongoing phytoplankton monitoring.

[a] Phytoplankton data for areas QUL-18, QUL-58S, QUL-2A, QUL-120A, and QUL-ZOO-8 collected in June 2019 are not displayed. These data were presented in Minnow (2020a

Notes: Cell/L = cells per litre. µg/L = micrograms per litre. Displayed data were collected using depth-integrated (DI) sampling methods. Sampling methods employed in 2019 included both surface (S) and DI methods. See Minnow (2019a, 2020a) for results of surface phytoplankton sampling completed in 2018 and 2019. See Minnow 2020a for a comparison of results from the S and DI sampling methodologies, and for rationale regarding the selection of DI methods for ongoing phytoplankton monitoring.

[a] Summary statistics are displayed for replicated data collected in July 2019 to 2022. For results without replicates collected in June and August 2019 to 2022, see Appendix Table C.3.5.

Table C.3.6: Summary Statistics for Phytoplankton Community Metrics for Quesnel Lake at QUL-ZOO-1 (Exposed) and QUL-ZOO-7 (Reference) Areas in July, 2019 to 2022[a]

Endpoint	Year	Area	Type	n	Mean	Standard Deviation	Minimum	Median	Maximum

Notes: #/L = organisms per litre. mg/L = milligrams per litre.

[a] Summary statistics are displayed for replicated data collected in July 2019 to 2022. For results without replicates collected in June and August 2019 to 2022, see Appendix Table C.3.7.

APPENDIX C.4
ZOOPLANKTON TISSUE QUALITY

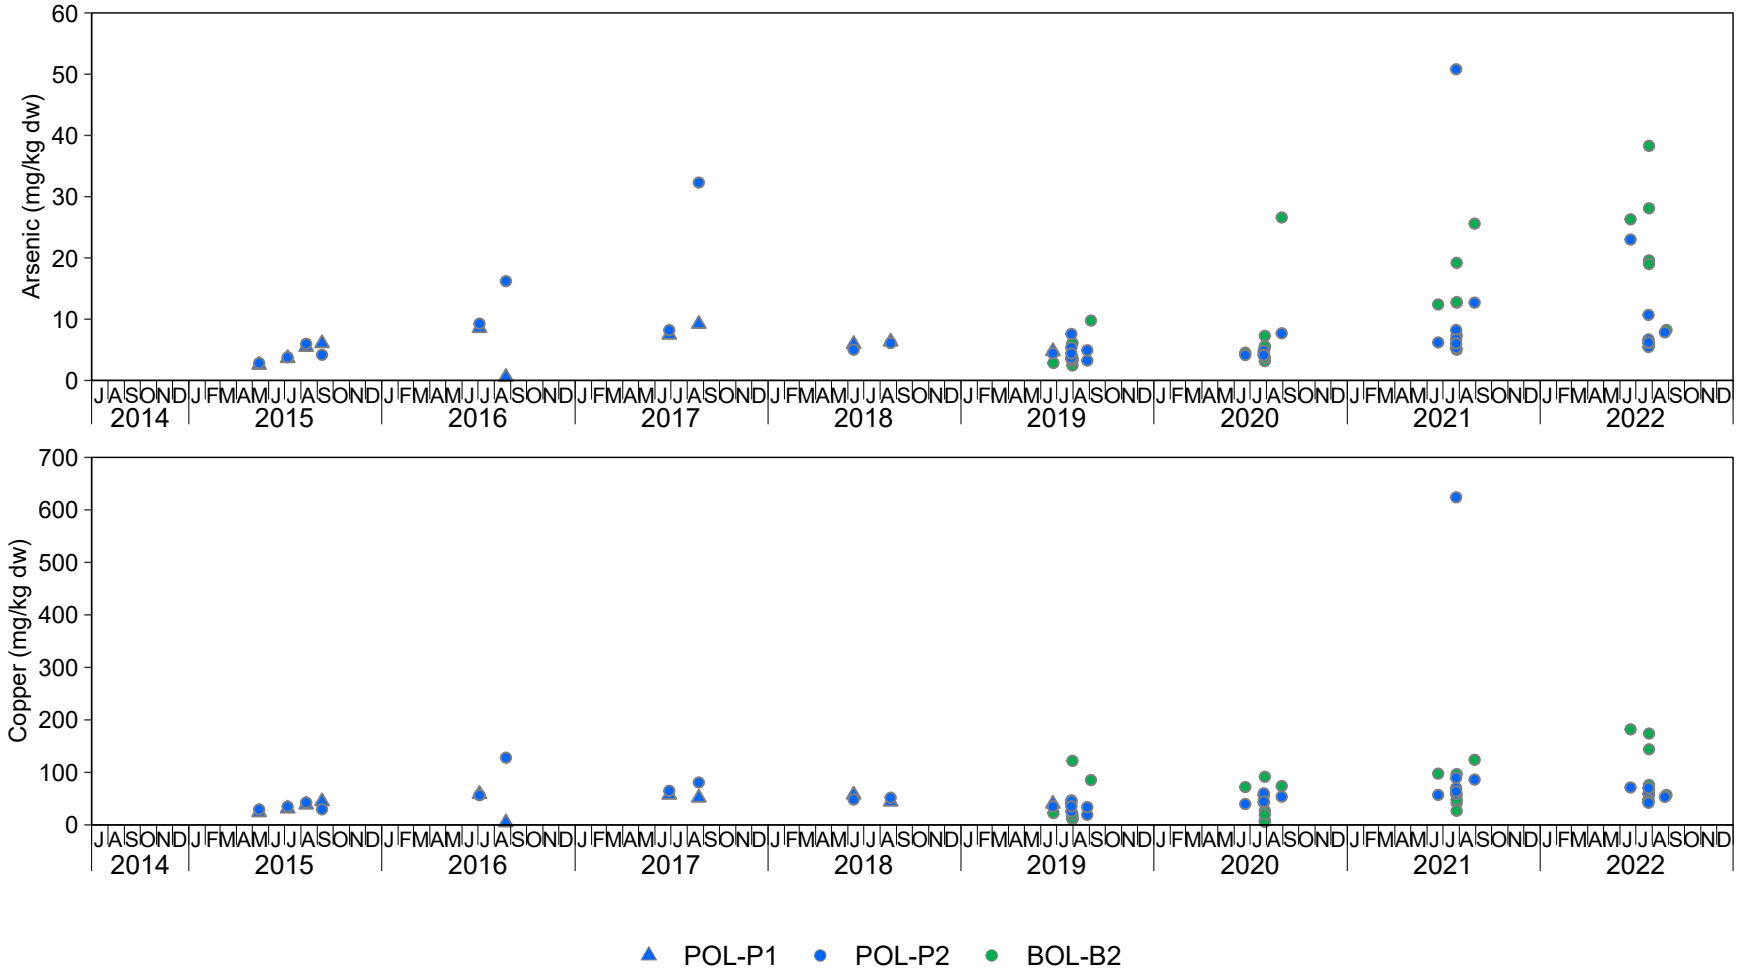

Figure C.4.1: Zooplankton Tissue Primary and Secondary Analyte Concentrations for Polley Lake (POL-P1, POL-P2; Exposed) and Bootjack Lake (BOL-B2; Reference) Areas, 2014 to 2022

Notes: mg/kg dw = milligrams per kilogram dry weight. Concentrations below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL and the open symbol represents one or more values reported below the LRL. Red horizontal line represents British Columbia interim long-term guideline for selenium in invertebrate tissue (4 mg/kg dw; BCMOE 2014). Green symbols indicate reference while blue symbols indicate exposed. Sampling at POL-P1 was discontinued after 2019.

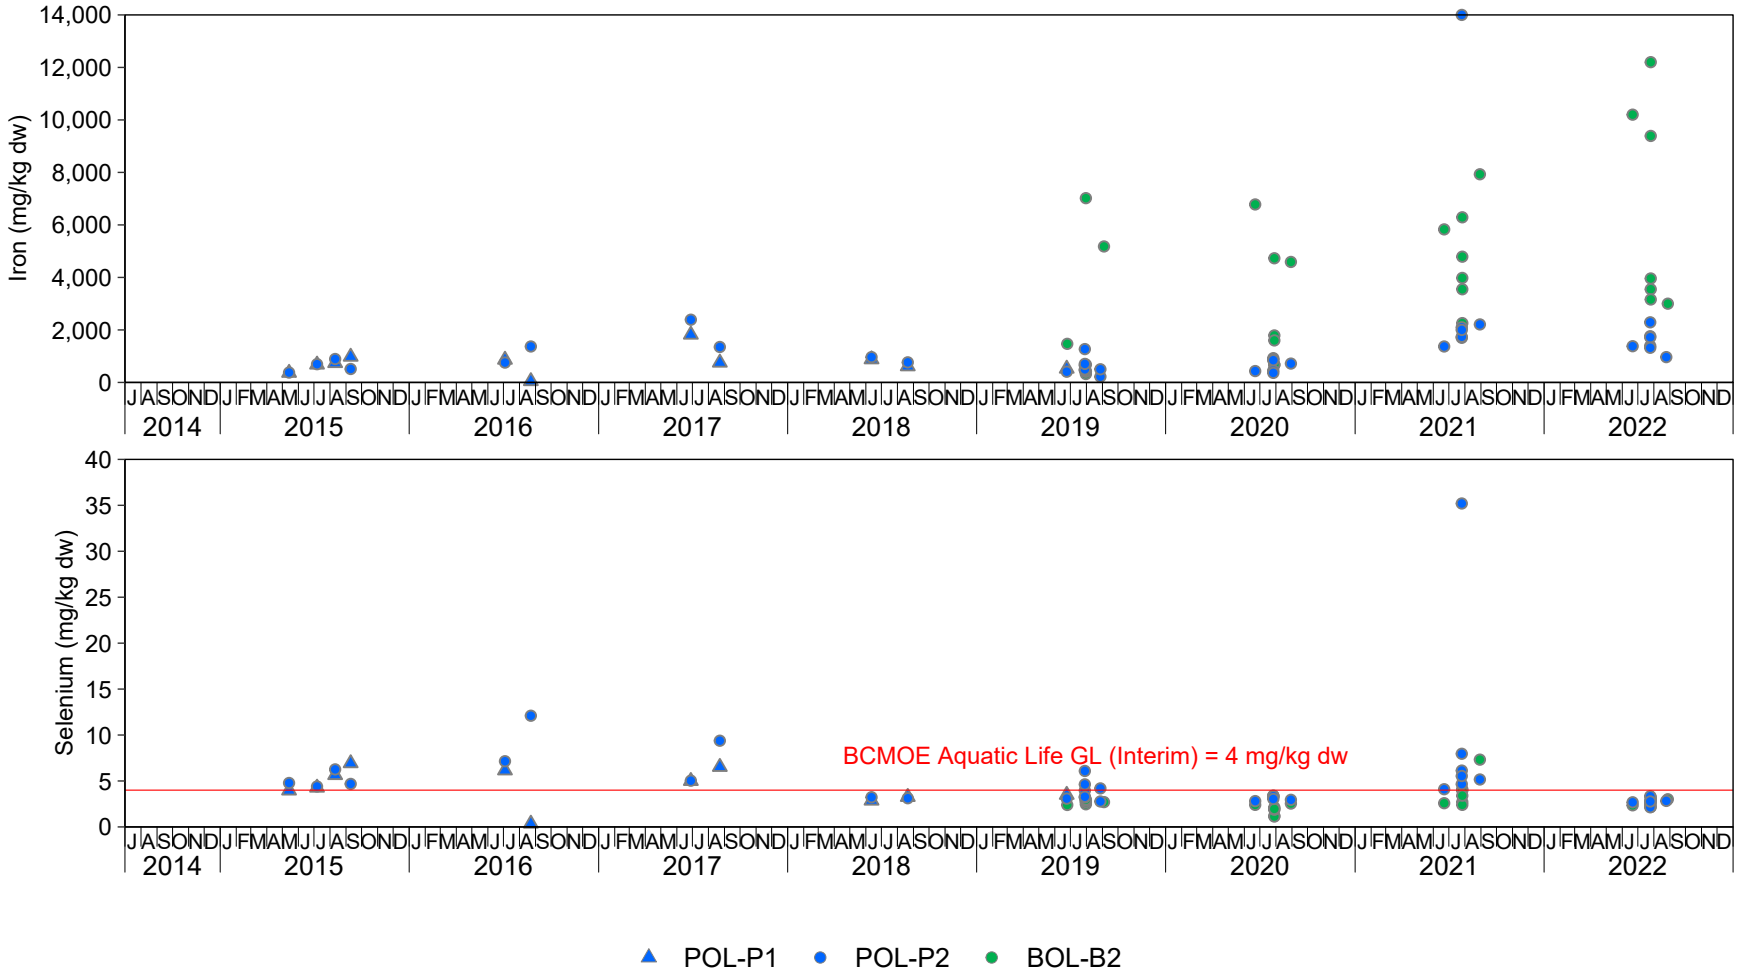

Figure C.4.1: Zooplankton Tissue Primary and Secondary Analyte Concentrations for Polley Lake (POL-P1, POL-P2; Exposed) and Bootjack Lake (BOL-B2; Reference) Areas, 2014 to 2022

Value exceeds interim long-term benthic invertebrate tissue guideline for selenium (4 mg/kg dw; BCMOE 2014).

Notes:"-" = standard deviation not calculated as all results were below laboratory reporting limit. mg/kg = milligrams per kilogram. dw = dry weight. ww = wet weight. All summary statistics are reported to three significant digits for display purposes. All summary statistics were calculated using the Kaplan-Meier method.

APPENDIX C.5
BENTHIC COMMUNITY

Table C.5.1: **Benthic Invertebrate Community Metrics for Quesnel Lake at QUL-PNF (Exposed) and QUL-PREF1 (Reference) Deep Areas, 2014 to 2022**

Year	Area	Type	Replicate	Density (#/m²)	Richness (# of Taxa)	Simpson's Evenness	Simpson's Diversity	EPT (#/m²)	Arachnida (#/m²)	Chironomidae (#/m²)	Oligochaeta (#/m²)	EPT (%)	Arachnida (%)	Chironomidae (%)	Oligochaeta (%)	CA1 (24.4%)	CA2 (16.7%)	CA3 (9.1%)

Notes: ID = identifier. UTM = Universal Transverse Mercator. NAD = North American Datum. CPUE = catch-per-unit-effort. HN = hoop net.

[a] CPUE is calculated as the number of fish per days of fishing effort. Total CPUE is calculated as the total catch of a single species over the total effort for all the hoop net sets in one area.

Table C.6.2: Hoop Net Catch Data from Polley Lake (POL; Exposed), September 2022

Net ID	Net Size (hoop diameter, ft)	UTM (NAD83, Zone 10U)		Set Date	Lift Date	Set Time	Lift Time	Depth Range (m)		Effort (days)	Rainbow Trout			Longnose Sucker			Redside Shiner		
		Easting	Northing								Catch	Mortalities	CPUE [a]	Catch	Mortalities	CPUE [a]	Catch	Mortalities	CPUE [a]

Value exceeds Se Guideline for Aquatic Life, fish muscle or whole body tissue (4 mg/kg dw; BCMOE 2014).

Value exceeds Se Guideline for Human Health, general population, high consumption (7.3 mg/kg dw; BCMOE 2014).

Value exceeds Se Guideline for Human Health, general population, moderate consumption (14.5 mg/kg dw; BCMOE 2014).

Value exceeds Hg Guideline for Human Health (0.5 mg/kg ww; CFIA 2015).

Notes: "-" = no data available or standard deviation not calculated. mg/kg = milligrams per kilogram. dw = dry weight. ww = wet weight. LRL = laboratory reporting limit.

[a] All summary statistics are reported to three significant digits for display purposes. All summary statistics were calculated using the Kaplan-Meier method.

Value exceeds Se Guideline for Aquatic Life, fish ovary tissue (11 mg/kg dw; BCMOE 2014).

Value exceeds Se Threshold for Effects, fish ovary tissue (20 mg/kg dw; DeForest et al 2012).

Notes: "-" = no data available or standard deviation not calculated. mg/kg = milligrams per kilogram. dw = dry weight. ww = wet weight. LRL = laboratory reporting limit.

Value exceeds Se Guideline for Aquatic Life, fish ovary tissue (11 mg/kg dw; BCMOE 2014).

Value exceeds Se Threshold for Effects, fish ovary tissue (20 mg/kg dw; DeForest et al 2012).

Notes: "-" = no data available or standard deviation not calculated. mg/kg = milligrams per kilogram. dw = dry weight. ww = wet weight. LRL = laboratory reporting limit.

[a] All summary statistics are reported to three significant digits for display purposes. All summary statistics were calculated using the Kaplan-Meier method.

Value exceeds Se Guideline for Aquatic Life, fish muscle or whole body tissue (4 mg/kg dw; BCMOE 2014).

Value exceeds Se Guideline for Human Health, general population, high consumption (7.3 mg/kg dw; BCMOE 2014).

Value exceeds Se Guideline for Human Health, general population, moderate consumption (14.5 mg/kg dw; BCMOE 2014).

Value exceeds Hg Guideline for Human Health (0.5 mg/kg ww; CFIA 2015).

Notes: "-" = no data available or standard deviation not calculated. mg/kg = milligrams per kilogram. dw = dry weight. ww = wet weight. LRL = laboratory reporting limit.

Value exceeds Se Guideline for Aquatic Life, fish muscle or whole body tissue (4 mg/kg dw; BCMOE 2014).

Value exceeds Se Guideline for Human Health, general population, high consumption (7.3 mg/kg dw; BCMOE 2014).

Value exceeds Se Guideline for Human Health, general population, moderate consumption (14.5 mg/kg dw; BCMOE 2014).

Value exceeds Hg Guideline for Human Health (0.5 mg/kg ww; CFIA 2015).

Notes: "-" = no data available or standard deviation not calculated. mg/kg = milligrams per kilogram. dw = dry weight. ww = wet weight. LRL = laboratory reporting limit.

Value exceeds Se Guideline for Aquatic Life, fish muscle or whole body tissue (4 mg/kg dw; BCMOE 2014).
Value exceeds Se Guideline for Human Health, general population, high consumption (7.3 mg/kg dw; BCMOE 2014).
Value exceeds Se Guideline for Human Health, general population, moderate consumption (14.5 mg/kg dw; BCMOE 2014).
Value exceeds Hg Guideline for Human Health (0.5 mg/kg ww; CFIA 2015).

Notes: "-" = no data available or standard deviation not calculated. mg/kg = milligrams per kilogram. dw = dry weight. ww = wet weight. LRL = laboratory reporting limit.

[a] All summary statistics are reported to three significant digits for display purposes. All summary statistics were calculated using the Kaplan-Meier method.

Value exceeds Se Guideline for Aquatic Life, fish ovary tissue (11 mg/kg dw; BCMOE 2014).
Value exceeds Se Threshold for Effects, fish ovary tissue (20 mg/kg dw; DeForest et al 2012).

Notes: "-" = no data available or standard deviation not calculated. mg/kg = milligrams per kilogram. dw = dry weight. ww = wet weight. LRL = laboratory reporting limit.

[a] All summary statistics are reported to three significant digits for display purposes. All summary statistics were calculated using the Kaplan-Meier method.

Value exceeds Se Guideline for Aquatic Life, fish muscle or whole body tissue (4 mg/kg dw; BCMOE 2014).
Value exceeds Se Guideline for Human Health, general population, high consumption (7.3 mg/kg dw; BCMOE 2014).
Value exceeds Se Guideline for Human Health, general population, moderate consumption (14.5 mg/kg dw; BCMOE 2014).
Value exceeds Hg Guideline for Human Health (0.5 mg/kg ww; CFIA 2015).

Notes: "-" = no data available or standard deviation not calculated. mg/kg = milligrams per kilogram. dw = dry weight. ww = wet weight. LRL = laboratory reporting limit.

Value exceeds Se Guideline for Aquatic Life, fish muscle or whole body tissue (4 mg/kg dw; BCMOE 2014).
Value exceeds Se Guideline for Human Health, general population, high consumption (7.3 mg/kg dw; BCMOE 2014).
Value exceeds Se Guideline for Human Health, general population, moderate consumption (14.5 mg/kg dw; BCMOE 2014).
Value exceeds Hg Guideline for Human Health (0.5 mg/kg ww; CFIA 2015).

Notes: "-" = no data available or standard deviation not calculated. mg/kg = milligrams per kilogram. dw = dry weight. ww = wet weight. LRL = laboratory reporting limit.

[a] All summary statistics are reported to three significant digits for display purposes. All summary statistics were calculated using the Kaplan-Meier method.

Zirconium	mg/kg dw	<0.20	<0.20	<0.20	<0.20	<0.20	<0.20	<0.20	7	100%	<0.20	-	<0.20	<0.20	<0.20

Value exceeds Se Guideline for Aquatic Life, fish ovary tissue (11 mg/kg dw; BCMOE 2014).
Value exceeds Se Threshold for Effects, fish ovary tissue (20 mg/kg dw; DeForest et al 2012).

Notes: "-" = no data available or standard deviation not calculated. mg/kg = milligrams per kilogram. dw = dry weight. ww = wet weight. LRL = laboratory reporting limit.

[a] All summary statistics are reported to three significant digits for display purposes. All summary statistics were calculated using the Kaplan-Meier method.

Value exceeds Se Guideline for Aquatic Life, fish muscle or whole body tissue (4 mg/kg dw; BCMOE 2014).
Value exceeds Se Guideline for Human Health, general population, high consumption (7.3 mg/kg dw; BCMOE 2014).
Value exceeds Se Guideline for Human Health, general population, moderate consumption (14.5 mg/kg dw; BCMOE 2014).
Value exceeds Hg Guideline for Human Health (0.5 mg/kg ww; CFIA 2015).

Notes: "-" = no data available or standard deviation not calculated. mg/kg = milligrams per kilogram. dw = dry weight. ww = wet weight. LRL = laboratory reporting limit.

Value exceeds Se Guideline for Aquatic Life, fish muscle or whole body tissue (4 mg/kg dw; BCMOE 2014).
Value exceeds Se Guideline for Human Health, general population, high consumption (7.3 mg/kg dw; BCMOE 2014).
Value exceeds Se Guideline for Human Health, general population, moderate consumption (14.5 mg/kg dw; BCMOE 2014).
Value exceeds Hg Guideline for Human Health (0.5 mg/kg ww; CFIA 2015).

Notes: "-" = no data available or standard deviation not calculated. mg/kg = milligrams per kilogram. dw = dry weight. ww = wet weight. LRL = laboratory reporting limit.

[a] All summary statistics are reported to three significant digits for display purposes. All summary statistics were calculated using the Kaplan-Meier method.

APPENDIX D
DATA - CREEKS

APPENDIX D.1
WATER QUALITY

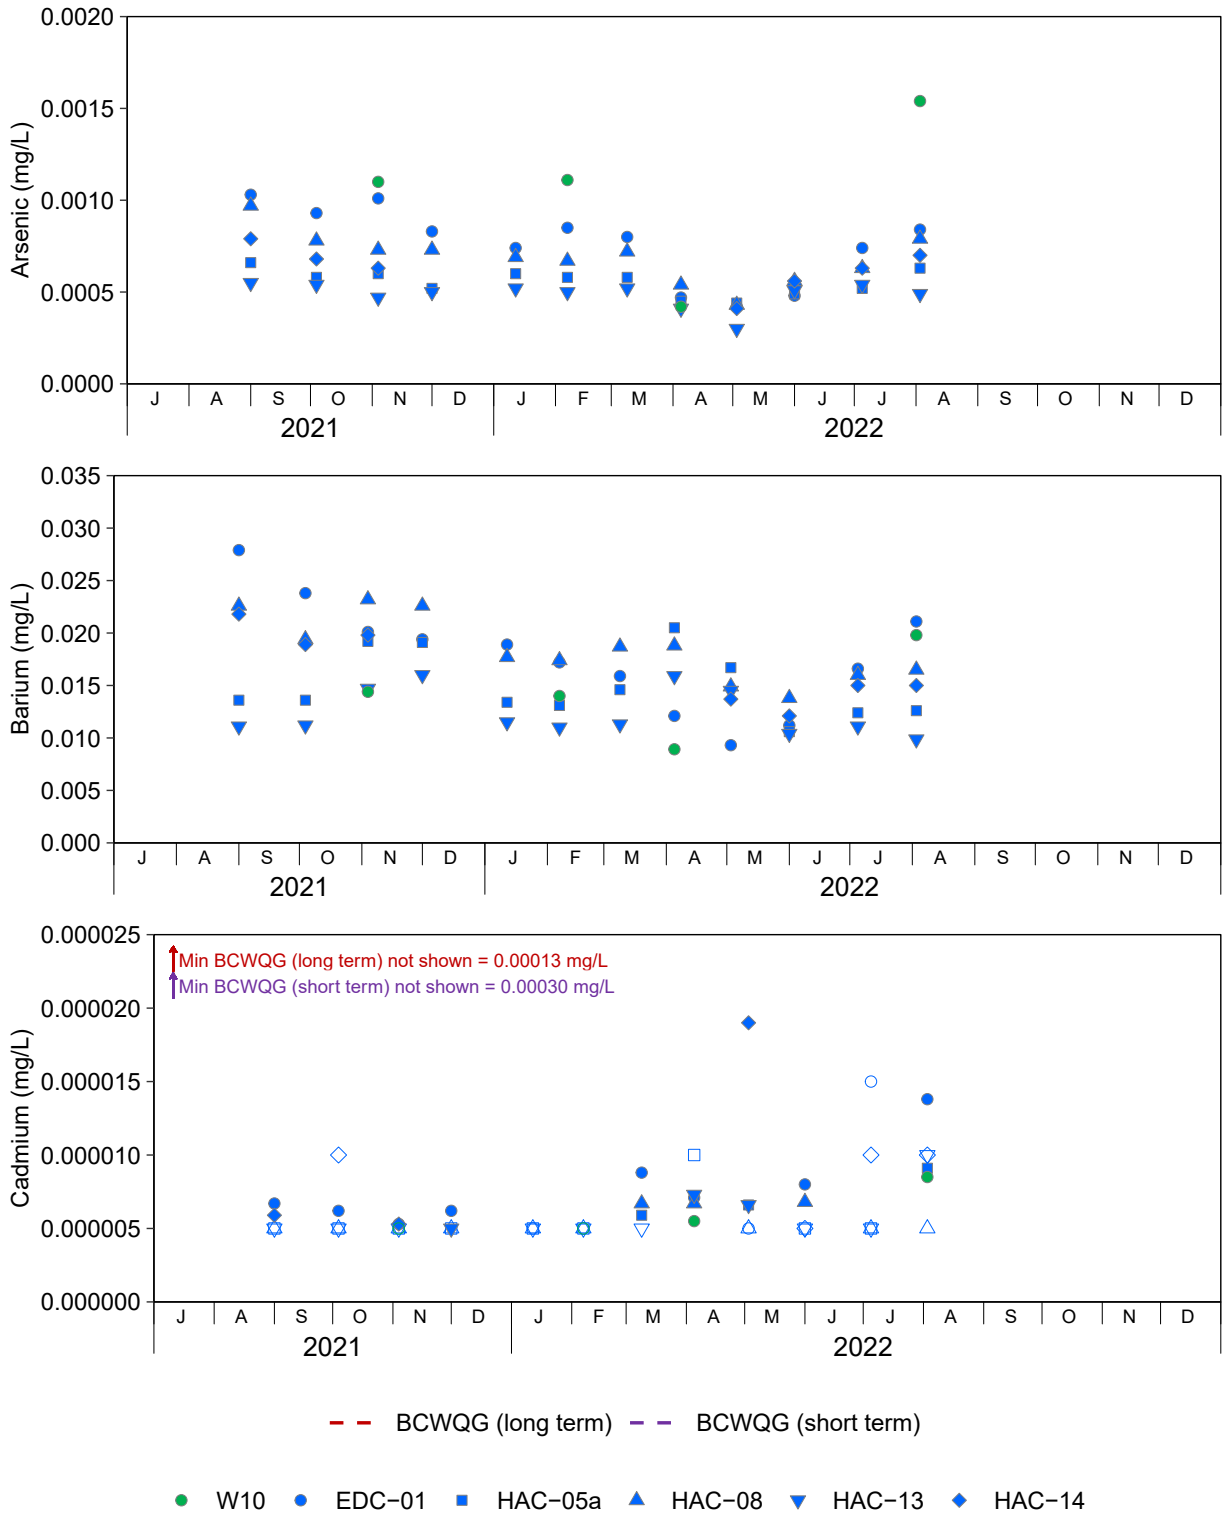

Figure D.1.1: Dissolved Aqueous Concentrations of Primary and Secondary Analytes in Surface Water Samples from Hazeltine Creek (HAC-13, HAC-05a, HAC-14, HAC-08) and Edney Creek (EDC-01a, W10), September 2021 to August 2022

Notes: BCWQG = British Columbia Water Quality Guideline (BCMOECCS 2021a,b). Green represents reference stations and blue represents exposed stations. Concentrations reported below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL.Values displayed for BCWQG that are condition specific (i.e., hardness dependent or based on the Biotic Ligand Model) are the most conservative (i.e., lowest) of those calculated for the multiple monitoring stations displayed. See Appendix Tables D.1.3 to D.1.8 for comparison of analyte concentrations to BCWQG that were calculated concurrently for each sample. Dissolved mercury and dissolved phosphorus were not measured.

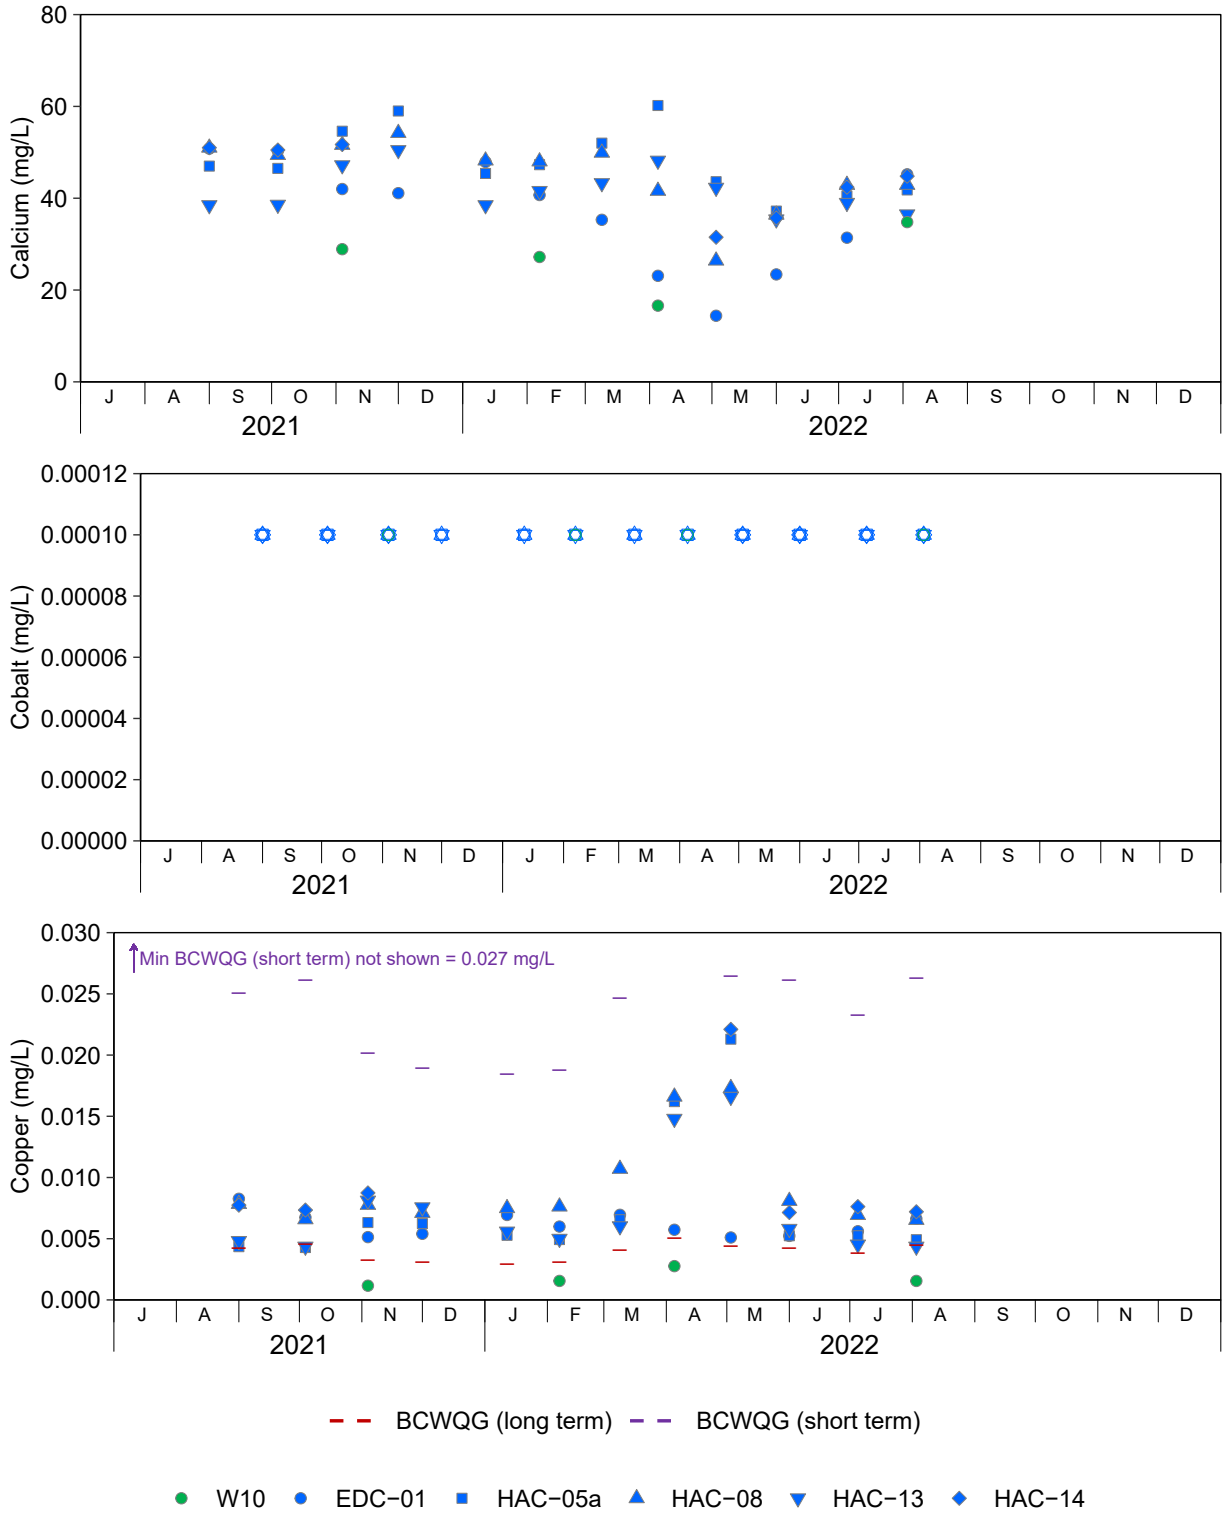

Figure D.1.1: Dissolved Aqueous Concentrations of Primary and Secondary Analytes in Surface Water Samples from Hazeltine Creek (HAC-13, HAC-05a, HAC-14, HAC-08) and Edney Creek (EDC-01a, W10), September 2021 to August 2022

Table D.1.1: British Columbia Water Quality Guidelines for the Protection of Aquatic Life (BCMOECCS 2019b, 2019c, 2021a, 2021b), 2022

Parameter	Units	Long-term Average	Short-term Maximum
Anions, Organics, Nutrients, and Physical Properties			
pH	pH units	6.5 - 9.0	
Temperature (*in situ*)[a]	°C	± 1	
Alkalinity ($CaCO_3$)	mg/L	> 20[b]	-
Conductivity	µS/cm	-	-
Dissolved Oxygen (*in situ*)[c]	mg/L	> 8	> 5
Dissolved Oxygen (*in situ*)[d]	mg/L	> 11	> 9
Total Suspended Solids[e]	mg/L	+ 5	+ 25
Turbidity[e]	NTU	+ 2	+ 8
Chloride	mg/L	150	600
Fluoride[f]	mg/L	-	For hardness ≤ 10 mg/L, WQG = 0.4 For hardness > 10 mg/L, WQG = [-51.73 + 92.57 × log10]×0.01 Maximum applicable hardness = 385 mg/L
Sulphate[g]	mg/L	hardness dependent	-
Ammonia (as N)[h]	mg/L	temperature and pH dependent	temperature and pH dependent
Nitrate (as N)	mg/L	3.0	32.8
Nitrite (as N)[i]	mg/L	chloride dependent	chloride dependent
Phosphorus - Total[j]	mg/L	0.005 - 0.015	
Dissolved Organic Carbon[k]	mg/L	-	± 20%[k]
Total Metals			
Antimony	µg/L	9	-
Arsenic	µg/L	-	5
Beryllium	µg/L	0.13	-
Boron	mg/L	1.2	-
Chromium[l]	µg/L	For Cr, WQG = 0.001 For Cr, WQG = 0.0089	-
Cobalt	µg/L	4	110
Iron	mg/L	-	1
Lead[f]	µg/L	For hardness ≤ 8 mg/L, none proposed For hardness 8 to 360 mg/L, WQG = 0.001×{3.31+ exp[1.273 × ln - 4.704]} Maximum applicable hardness = 360 mg/L	For hardness ≤ 8 mg/L, WQG ≤ 0.003 For hardness 8 to 360 mg/L, WQG = 0.001×{exp[1.273 × ln - 1.460]} Maximum applicable hardness = 360 mg/L
Manganese[f]	mg/L	For hardness 37 to 450 mg/L, WQG ≤ 0.004 × hardness + 0.605 Maximum applicable hardness = 450 mg/L	For hardness 25 to 259 mg/L, WQG ≤ 0.01102 × hardness + 0.54 Maximum applicable hardness = 259 mg/L
Mercury[m]	mg/L	WQG = [0.0001/] OR When MeHg = 0.5% of THg, WQG= 0.00002	-
Molybdenum	mg/L	7.6	46
Nickel[f]	µg/L	For hardness ≤60, WQG = 0.025 For hardness 60 to 180, WQG = exp{0.76[ln]+1.06} For hardness ≥180, WQG = 0.15	-
Selenium	µg/L	2	-
Silver	mg/L	For hardness ≤ 100 mg/L, WQG = 0.00005 For hardness > 100 mg/L, WQG = 0.0015	For hardness ≤ 100 mg/L, WQG = 0.0001 For hardness > 100 mg/L, WQG = 0.003
Thallium	µg/L	0.8	-
Uranium	µg/L	8.5	-
Zinc[f]	µg/L	For hardness ≤ 90 mg/L, WQG = 0.0075 For hardness 90 to 330 mg/L, WQG = [7.5 + 0.75]; Maximum applicable hardness = 330 mg/L	For hardness ≤ 90 mg/L, WQG = 0.033 For hardness 90 to 500 mg/L, WQG = [33 + 0.75]; Maximum applicable hardness = 500 mg/L
Dissolved Metals			
Aluminum	mg/L	0.05	0.1
Cadmium[f]	µg/L	For hardness = 3.4 to 285 mg/L, WQG = {exp[0.736×ln - 4.943]} Maximum applicable hardness = 285 mg/L	For hardness = 7 to 455 mg/L, WQG = {exp[1.03×ln-5.274]} Maximum applicable hardness = 455 mg/L
Copper[n]	mg/L	Biotic Ligand Model	Biotic Ligand Model
Iron	mg/L	-	0.35

Notes: "-" indicates no applicable guideline, BCMOECCS = British Columbia Ministry of Environment and Climate Change Strategy, WQG = water quality guideline.

[a] Change from optimal . No guideline applied.

[b] For waterbodies with low sensitivity to acid inputs.

[c] Minimum for all life stages other than buried embryo / alevin.

[d] Minimum for buried embryo / alevin life stages.

[e] Increase relative to background; no guideline applied.

[f] For hardness-based guidelines, concurrent hardness values were used for calculating guidelines. If hardness values exceeding the maximum applicable hardness, then guidelines were determined using the maximum applicable hardness. If hardness values are lower than the minimum hardness, then guidelines were determined using the minimum hardness.

[g] 128 mg/L at hardness 0-30 mg/L; 218 mg/L at hardness 31-75 mg/L; 309 mg/L at hardness 76-180 mg/L; 429 mg/L at hardness > 250 mg/L.

[h] Use tables in BCMOECCS 2021b.

[i] When chloride < 2 mg/L, long-term = 0.02 mg/L and short-term = 0.06 mg/L; increase with increasing chloride.

[j] Aquatic Life - Lakes; minimum guideline was applied.

[k] ±20% of the background median; no guideline applied.

[l] Chromium is the dominant oxidation state in oxygenated environments, and so its guideline was applied.

[m] Values were screened against 0.00002 mg/L which assumes MeHg = 0.5% of THg.

[n] Site specific guidelines developed using the BLM model and calculated concurrently for each sample .

Table D.1.2: Supporting Spot Water Quality Data Collected During Periphyton and Benthic Invertebrate Sampling in Hazeltine Creek, Edney Creek, and Frypan Creek, 2022

Indicates value greater than the long-term average British Columbia Water Quality Guideline (BCMOECCS 2019c, 2021a,b).
Indicates value greater than the short-term maximum British Columbia Water Quality Guideline (BCMOECCS 2019c, 2021a,b).
Note: "-" indicates data not available or no applicable guideline exists.

[a] Guidelines were derived from the British Columbia Water Quality Guidelines for the protection of aquatic life (BCMOECCS 2019c, 2021a,b) outlined in Table D.1.1.
[b] Guidelines for these parameters (Total Suspended Solids, Turbidity, Dissolved Organic Carbon) are narrative and were not evaluated.

Table D.1.3: Surface Water Sample Data Collected Routinely at HAC-13 in Upper Hazeltine Creek, September 2021 to August 2022

Indicates value greater than the long-term average British Columbia Water Quality Guideline (BCMOECCS 2019b,c, 2021a,b).
Indicates value greater than the short-term maximum British Columbia Water Quality Guideline (BCMOECCS 2019b,c, 2021a,b).
Percent exceedance > 0%.

Notes: "-" = data not available or no applicable guideline exists. < LRL = below laboratory reporting limit. GL = guideline. Guidelines for these parameters (Total Suspended Solids, Turbidity, Dissolved Organic Carbon) are narrative and were not evaluated.

[a] Guidelines were derived from the British Columbia Water Quality Guidelines for the protection of aquatic life (BCMOECCS 2019b,c, 2021a,b) outlined in Table D.1.1.
[b] % displayed for pH indicates results falling outside the guideline range. % displayed for dissolved oxygen indicates results below the guideline.

Table D.1.3: Surface Water Sample Data Collected Routinely at HAC-13 in Upper Hazeltine Creek, September 2021 to August 2022

Indicates value greater than the long-term average British Columbia Water Quality Guideline (BCMOECCS 2019b,c, 2021a,b).
Indicates value greater than the short-term maximum British Columbia Water Quality Guideline (BCMOECCS 2019b,c, 2021a,b).
Percent exceedance > 0%.

Notes: "-" = data not available or no applicable guideline exists. < LRL = below laboratory reporting limit. GL = guideline. Guidelines for these parameters (Total Suspended Solids, Turbidity, Dissolved Organic Carbon) are narrative and were not evaluated.

[a] Guidelines were derived from the British Columbia Water Quality Guidelines for the protection of aquatic life (BCMOECCS 2019b,c, 2021a,b) outlined in Table D.1.1.

[b] % displayed for pH indicates results falling outside the guideline range. % displayed for dissolved oxygen indicates results below the guideline.

Table D.1.4: Surface Water Sample Data Collected Routinely at HAC-05a in Upper Hazeltine Creek, September 2021 to August 2022

Indicates value greater than the long-term average British Columbia Water Quality Guideline (BCMOECCS 2019b,c, 2021a,b).
Indicates value greater than the short-term maximum British Columbia Water Quality Guideline (BCMOECCS 2019b,c, 2021a,b).
Percent exceedance > 0%.

Notes: "-" = data not available or no applicable guideline exists. < LRL = below laboratory reporting limit. GL = guideline. Guidelines for these parameters (Total Suspended Solids, Turbidity, Dissolved Organic Carbon) are narrative and were not evaluated.

[a] Guidelines were derived from the British Columbia Water Quality Guidelines for the protection of aquatic life (BCMOECCS 2019b,c, 2021a,b) outlined in Table D.1.1.
[b] % displayed for pH indicates results falling outside the guideline range. % displayed for dissolved oxygen indicates results below the guideline.

Table D.1.4: Surface Water Sample Data Collected Routinely at HAC-05a in Upper Hazeltine Creek, September 2021 to August 2022

Indicates value greater than the long-term average British Columbia Water Quality Guideline (BCMOECCS 2019b,c, 2021a,b).
Indicates value greater than the short-term maximum British Columbia Water Quality Guideline (BCMOECCS 2019b,c, 2021a,b).
Percent exceedance > 0%.

Notes: "-" = data not available or no applicable guideline exists. < LRL = below laboratory reporting limit. GL = guideline. Guidelines for these parameters (Total Suspended Solids, Turbidity, Dissolved Organic Carbon) are narrative and were not evaluated.

[a] Guidelines were derived from the British Columbia Water Quality Guidelines for the protection of aquatic life (BCMOECCS 2019b,c, 2021a,b) outlined in Table D.1.1.
[b] % displayed for pH indicates results falling outside the guideline range. % displayed for dissolved oxygen indicates results below the guideline.

Indicates value greater than the long-term average British Columbia Water Quality Guideline (BCMOECCS 2019b,c, 2021a,b).
Indicates value greater than the short-term maximum British Columbia Water Quality Guideline (BCMOECCS 2019b,c, 2021a,b).
Percent exceedance > 0%.

Notes: "-" = data not available or no applicable guideline exists. < LRL = below laboratory reporting limit. GL = guideline. Guidelines for these parameters (Total Suspended Solids, Turbidity, Dissolved Organic Carbon) are narrative and were not evaluated.

[a] Guidelines were derived from the British Columbia Water Quality Guidelines for the protection of aquatic life (BCMOECCS 2019b,c, 2021a,b) outlined in Table D.1.1.

[b] % displayed for pH indicates results falling outside the guideline range. % displayed for dissolved oxygen indicates results below the guideline.

Table D.1.6: Surface Water Sample Data Collected Routinely at HAC-08 in Lower Hazeltine Creek, September 2021 to August 2022

Indicates value greater than the long-term average British Columbia Water Quality Guideline (BCMOECCS 2019b,c, 2021a,b).
Indicates value greater than the short-term maximum British Columbia Water Quality Guideline (BCMOECCS 2019b,c, 2021a,b).
Percent exceedance > 0%.

Notes: "-" = data not available or no applicable guideline exists. < LRL = below laboratory reporting limit. GL = guideline. Guidelines for these parameters (Total Suspended Solids, Turbidity, Dissolved Organic Carbon) are narrative and were not evaluated.

[a] Guidelines were derived from the British Columbia Water Quality Guidelines for the protection of aquatic life (BCMOECCS 2019b,c, 2021a,b) outlined in Table D.1.1.
[b] % displayed for pH indicates results falling outside the guideline range. % displayed for dissolved oxygen indicates results below the guideline.

Table D.1.6: Surface Water Sample Data Collected Routinely at HAC-08 in Lower Hazeltine Creek, September 2021 to August 2022

Indicates value greater than the long-term average British Columbia Water Quality Guideline (BCMOECCS 2019b,c, 2021a,b).
Indicates value greater than the short-term maximum British Columbia Water Quality Guideline (BCMOECCS 2019b,c, 2021a,b).
Percent exceedance > 0%.

Notes: "-" = data not available or no applicable guideline exists. < LRL = below laboratory reporting limit. GL = guideline. Guidelines for these parameters (Total Suspended Solids, Turbidity, Dissolved Organic Carbon) are narrative and were not evaluated.

[a] Guidelines were derived from the British Columbia Water Quality Guidelines for the protection of aquatic life (BCMOECCS 2019b,c, 2021a,b) outlined in Table D.1.1.

[b] % displayed for pH indicates results falling outside the guideline range. % displayed for dissolved oxygen indicates results below the guideline.

Indicates value greater than the short-term maximum British Columbia Water Quality Guideline (BCMOECCS 2019b,c, 2021a,b).
Percent exceedance > 0%.

Notes: "-" = data not available or no applicable guideline exists. < LRL = below laboratory reporting limit. GL = guideline. Guidelines for these parameters (Total Suspended Solids, Turbidity, Dissolved Organic Carbon) are narrative and were not evaluated.

[a] Guidelines were derived from the British Columbia Water Quality Guidelines for the protection of aquatic life (BCMOECCS 2019b,c, 2021a,b) outlined in Table D.1.1.

[b] % displayed for pH indicates results falling outside the guideline range. % displayed for dissolved oxygen indicates results below the guideline.

Table D.1.8: Surface Water Sample Data Collected Routinely at EDC-01a in Lower Edney Creek, September 2021 to August 2022

Indicates value greater than the long-term average British Columbia Water Quality Guideline (BCMOECCS 2019b,c,2021a,b).
Indicates value greater than the short-term maximum British Columbia Water Quality Guideline (BCMOECCS 2019b,c, 2021a,b).
Percent exceedance > 0%.

Notes: "-" = data not available or no applicable guideline exists. < LRL = below laboratory reporting limit. GL = guideline. Guidelines for these parameters (Total Suspended Solids, Turbidity, Dissolved Organic Carbon) are narrative and were not evaluated.

[a] Guidelines were derived from the British Columbia Water Quality Guidelines for the protection of aquatic life (BCMOECCS 2019b,c, 2021a,b) outlined in Table D.1.1.
[b] % displayed for pH indicates results falling outside the guideline range. % displayed for dissolved oxygen indicates results below the guideline.

Table D.1.8: Surface Water Sample Data Collected Routinely at EDC-01a in Lower Edney Creek, September 2021 to August 2022

Indicates value greater than the long-term average British Columbia Water Quality Guideline (BCMOECCS 2019b,c, 2021a,b).
Indicates value greater than the short-term maximum British Columbia Water Quality Guideline (BCMOECCS 2019b,c, 2021a,b).
Percent exceedance > 0%.

Notes: "-" = data not available or no applicable guideline exists. < LRL = below laboratory reporting limit. GL = guideline. Guidelines for these parameters (Total Suspended Solids, Turbidity, Dissolved Organic Carbon) are narrative and were not evaluated.

[a] Guidelines were derived from the British Columbia Water Quality Guidelines for the protection of aquatic life (BCMOECCS 2019b,c, 2021a,b) outlined in Table D.1.1.

[b] % displayed for pH indicates results falling outside the guideline range. % displayed for dissolved oxygen indicates results below the guideline.

Notes: Sediment metal concentrations are based predominantly on bulk sediment samples. Concentrations reported in 1995 and 1996 were for the silt and clay (< 63 µm) fraction only. Iron concentrations in sediment in 1999 were measured using both ICP-AA (Inductively Coupled Plasma Atomic Absorption) as well as ICP-MS (Inductively Coupled Plasma Mass Spectrometry for each sample collected (Beak 2000). Iron results measured using ICP-MS are displayed herein because this method is consistent with analysis methods used for post-breach monitoring (see Section 4.1.2). "-" indicates no data available.

[a] Monitoring areas WQ8, WQ8B, WQ9, and WQ10 sampled in 1995 (HKP 1996) were considered equivalent to sampling areas W8, W8A, W9, and W10 sampled in 1996 (HKP 1997a), respectively.

[b] Some unusually high sediment metal concentrations were reported for 1996 (HKP 1997a) and are suspected errors.

Notes: Sediment metal concentrations are based predominantly on bulk sediment samples. Concentrations reported in 1995 and 1996 were for the silt and clay (< 63 µm) fraction only. Iron concentrations in sediment in 1999 were measured using both ICP-AA (Inductively Coupled Plasma Atomic Absorption) as well as ICP-MS (Inductively Coupled Plasma Mass Spectrometry for each sample collected (Beak 2000). Iron results measured using ICP-MS are displayed herein because this method is consistent with analysis methods used for post-breach monitoring (see Section 4.1.2). "-" indicates no data available.

[a] Monitoring areas WQ8, WQ8B, WQ9, and WQ10 sampled in 1995 (HKP 1996) were considered equivalent to sampling areas W8, W8A, W9, and W10 sampled in 1996 (HKP 1997a), respectively.

[b] Some unusually high sediment metal concentrations were reported for 1996 (HKP 1997a) and are suspected errors.

Notes: **Bold/Italics** indicates value is > reference 95th percentile value (<5th percentile value for pH). Pre-breach values that were reported as < the laboratory reporting limit were not used for screening. "-" no data. Sediment metal concentrations are based predominantly on bulk sediment samples, concentrations reported in 1995 and 1996 were for the silt and clay (< 63 µm) fraction only. S = spring. F = fall.

[a] Some unusually high sediment metal concentrations were reported for 1996 (HKP 1997) and are suspected errors.

[b] Particle fractions for these samples are as follow: gravel (>2 mm), sand (2.0 mm - 0.050 mm), silt (0.050 mm - 0.002 mm), clay (<0.002 mm).

[c] 95th percentile includes all data except those from 1996 (HKP 1997) due to suspected errors.

Note: "-" indicates no current BC Working Sediment Quality Guideline.

[a] British Columbia Working Sediment Guidelines (BCMOECCS 2021) and approved BC Sediment Quality Guideline for Selenium (BCMOECCS 2019c)

[b] 5th percentile value for pH.

[c] Total sulphur measured in bulk sediment, not the <63 µm fraction.

Notes: "-" no data, S = spring, F = fall. ***Bold/ Italics*** indicates value is > reference 95th percentile value (<5th percentile value for pH). Sediment metal concentrations are based predominantly on bulk sediment samples. Concentrations reported in 1995 and 1996 were for the silt and clay (< 63 µm) fraction only.

[a] Some unusually high sediment metal concentrations were reported for 1996 (HKP 1997a) and are suspected errors.

[b] Particle fractions for these samples are as follow: gravel (>2 mm), sand (2.0 mm - 0.050 mm), silt (0.050 mm - 0.002 mm), clay (<0.002 mm).

[c] 95th percentile includes all data except those from 1996 (HKP 1997a) due to suspected errors.

Notes: "-" no data, S = spring, F = fall. ***Bold/ Italics*** indicates value is > reference 95th percentile value (<5th percentile value for pH). Sediment metal concentrations are based predominantly on bulk sediment samples. Concentrations reported in 1995 and 1996 were for the silt and clay (< 63 µm) fraction only.

[a] Some unusually high sediment metal concentrations were reported for 1996 (HKP 1997a) and are suspected errors.

[b] Particle fractions for these samples are as follow: gravel (>2 mm), sand (2.0 mm - 0.050 mm), silt (0.050 mm - 0.002 mm), clay (<0.002 mm).

[c] 95th percentile includes all data except those from 1996 (HKP 1997a) due to suspected errors.

Value is > BC Lower Working Sediment Quality Guideline

Value is > BC Upper Working Sediment Quality Guideline

Notes: "-" indicates no current BC Working Sediment Guideline/ no data. ***Bold/ Italics*** indicates value is > than both reference and pre-breach 95th percentile value (< 5th percentile value for pH).

[a] British Columbia Working Sediment Guidelines (BCMOECCS 2021a) and approved BC Sediment Quality Guideline for Selenium (BCMOECCS 2021b).

[b] Pre-breach values that were reported as < the laboratory reporting limit were not used for screening. For calculation of pre-breach 95th percentile values see Appendix Table D.2.2. For calculation of reference 95th percentile values see Appendix Table D.2.3. Pre-breach sediment metal concentrations are based predominantly on bulk sediment rather than the fines fraction (<63 µm). The 5th percentile is reported for pH.

[c] Total Organic Carbon (TOC) and metals data are presented for the <63 µm sediment fraction for post-breach (2014 to 2022) data only. TOC and metals data presented for pre-breach results represent bulk sediment samples (see Appendix Tables D.2.2)

[d] Total sulphur measured in bulk sediment, not the <63 µm fraction.

Table D.2.8: Sediment Quality Data for Lower Edney Creek (EDC-D; Reference), 2022

Parameter	Units	BC Working Sediment Quality Guidelines[a]		Reference 95th Percentile (EDC-D 2018 to 2022)[b]	Reference (Edney Creek; EDC-D)

Notes: ***Bold/Italics*** - Value is > than both reference and pre-breach 95th percentile value (< 5th percentile value for pH). "-" indicates no current BC Working Sediment Guideline/parameter was not calculated.

[a] British Columbia Working Sediment Guidelines (BCMOECCS 2021) and approved BC Sediment Quality Guideline for Selenium (BCMOECCS 2021b).

[b] For calculation of pre-breach 95th percentile values see Appendix Table D.2.4. For calculation of reference 95th percentile values see Appendix Table D.2.5. Pre-breach sediment metal concentrations are based predominantly on bulk sediment rather than the fines fraction (<63 µm). The 5th percentile is reported for pH. [c] Total sulphur measured in bulk sediment, not the <63 µm fraction.

APPENDIX D.3
PERIPHYTON COMMUNITY & PRODUCTIVITY

Table D.3.1: Periphyton Community Metrics for Upper Hazeltine Creek (HAC-R1, HAC-U; Exposed) and Upper Edney Creek (EDC-U; Reference), 1995 to 2022

Notes: "-" indicates no data available. cells/cm^2 = cells per square centimetre. Periphyton community metrics that could be calculated for historical (baseline and pre-breach) data were limited due to the qualitative nature of these data. Periphyton data were classified as "Other" taxa in laboratory results issued in 2018 but the taxonomic groups contained in this category were unknown (i.e., unknown taxonomic idenification of these organisms), but suspected to include Phaeophytes, Chrysophytes, and Rhodophytes. See Minnow 2019a for detailed laboratory results for 2018. Data reported in 2018 for this "Other" category has therefore excluded from data presentation and analyses in the present report. Periphyton taxonomy results have not been reported in an "Other" category by the laboratory since 2018. See report Section 4.2.3.1 for details.

[a] W7 is the pre-breach sampling area associated with HAC-R1 and HAC-U. W9 is the pre-breach sampling area associated with EDC-U.

Notes: "-" indicates no data available. cells/cm^2 = cells per square centimetre. Periphyton community metrics that could be calculated for historical (baseline and pre-breach) data were limited due to the qualitative nature of these data. Periphyton data were classified as "Other" taxa in laboratory results issued in 2018 but the taxonomic groups contained in this category were unknown (i.e., unknown taxonomic idenification of these organisms), but suspected to include Phaeophytes, Chrysophytes, and Rhodophytes. See Minnow 2019a for detailed laboratory results for 2018. Data reported in 2018 for this "Other" category has therefore excluded from data presentation and analyses in the present report. Periphyton taxonomy results have not been reported in an "Other" category by the laboratory since 2018. See report Section 4.2.3.1 for details.

[a] W7 is the pre-breach sampling area associated with HAC-R1 and HAC-U. W9 is the pre-breach sampling area associated with EDC-U.

Table D.3.1: Periphyton Community Metrics for Upper Hazeltine Creek (HAC-R1, HAC-U; Exposed) and Upper Edney Creek (EDC-U; Reference), 1995 to 2022

Notes: "-" indicates no value. Periphyton community metrics that could be calculated for historical (baseline and pre-breach) data were limited due to the qualitative nature of these data. Periphyton data were classified as "Other" taxa in laboratory results issued in 2018 but the taxonomic groups contained in this category were unknown (i.e., unknown taxonomic idenification of these organisms), but suspected to include Phaeophytes, Chrysophytes, and Rhodophytes. See Minnow 2019a for detailed laboratory results for 2018. Data reported in 2018 for this "Other" category has therefore excluded from data presentation and analyses in the present report. Periphyton taxonomy results have not been reported in an "Other" category by the laboratory since 2018. See report Section 4.2.3.1 for details.

[a] W7 is the pre-breach sampling area associated with HAC-R1 and HAC-U. W9 is the pre-breach sampling area associated with EDC-U.

Notes: "-" indicates no value. Periphyton community metrics that could be calculated for historical (baseline and pre-breach) data were limited due to the qualitative nature of these data. Periphyton data were classified as "Other" taxa in laboratory results issued in 2018 but the taxonomic groups contained in this category were unknown (i.e., unknown taxonomic idenification of these organisms), but suspected to include Phaeophytes, Chrysophytes, and Rhodophytes. See Minnow 2019a for detailed laboratory results for 2018. Data reported in 2018 for this "Other" category has therefore excluded from data presentation and analyses in the present report. Periphyton taxonomy results have not been reported in an "Other" category by the laboratory since 2018. See report Section 4.2.3.1 for details.

[a] W7 is the pre-breach sampling area associated with HAC-R1 and HAC-U. W9 is the pre-breach sampling area associated with EDC-U.

Notes: "-" = no data available. EPT = Ephemeroptera, Trichoptera, Plecoptera. DW = dry weight. WW = wet weight. Reference area EDC-U not sampled in 2020 due to habitat differences (in water depth and flow) relative to the remediated areas HAC-R1 and HAC-U. See Section 4.3 for details.

[a] UHC is the pre-breach sampling area associated with HAC-R1 and HAC-U. UER is the pre-breach sampling area associated with EDC-U.

Notes: For 2010 data at HAC-D and HAC-U, historical station codes were W11 and W7, respectively. All results are in dry weight. Summary statistics reported to 3 significant figures for display purposes. "-" indicates no data available.

Table D.5.2: Periphyton Tissue Primary and Secondary Analytes Concentrations for Upper Hazeltine Creek (HAC-R1, HAC-U; Exposed), Upper Edney Creek (EDC-U; Reference), Lower Hazeltine Creek (HAC-D; Exposed), and Lower Edney Creek Exposed (E1) and Reference (EDC-D), 2010 to 2021

Value exceeds the British Columbia interim guideline for selenium in invertebrate tissue (4 mg/kg dw; BCMOE 2014).

Notes: "-" = no data or summary statistic could not be calculated. mg/kg dw = milligrams per kilogram dry weight. All summary statistics are reported to three significant digits for display purposes and were calculated using the Kaplan-Meier method.

Value exceeds the British Columbia interim guideline for selenium in invertebrate tissue (4 mg/kg dw; BCMOE 2014).

Notes: "-" = no data or summary statistic could not be calculated. mg/kg dw = milligrams per kilogram dry weight. All summary statistics are reported to three significant digits for display purposes and were calculated using the Kaplan-Meier method.

Value exceeds the British Columbia interim guideline for selenium in invertebrate tissue (4 mg/kg dw; BCMOE 2014).

Notes: "-" = no data or summary statistic could not be calculated. mg/kg dw = milligrams per kilogram dry weight. All summary statistics are reported to three significant digits for display purposes and were calculated using the Kaplan-Meier method.

Notes: For 2010 data at HAC-D and HAC-U, historical station codes were W11 and W7, respectively. All values reported in dry weight. Summary statistics reported to 3 significant figures for display purposes. "-" indicates no data available.

Table D.5.6: Composite-Taxa Benthic Invertebrate Tissue Primary and Secondary Analytes Concentrations for Upper Hazeltine Creek (HAC-R1, HAC-U; Exposed), Upper Edney Creek (EDC-U; Reference), Lower Hazeltine Creek (HAC-D; Exposed), and Lower Edney Creek Exposed (E1) and Reference (EDC-D), 2010 to 2021

Notes: For 2010 data at HAC-D and HAC-U, historical station codes were W11 and W7, respectively. All values reported in dry weight. Summary statistics reported to 3 significant figures for display purposes. "-" indicates no data available.

Table D.5.6: Composite-Taxa Benthic Invertebrate Tissue Primary and Secondary Analytes Concentrations for Upper Hazeltine Creek (HAC-R1, HAC-U; Exposed), Upper Edney Creek (EDC-U; Reference), Lower Hazeltine Creek (HAC-D; Exposed), and Lower Edney Creek Exposed (E1) and Reference (EDC-D), 2010 to 2021

Notes: For 2010 data at HAC-D and HAC-U, historical station codes were W11 and W7, respectively. All values reported in dry weight. Summary statistics reported to 3 significant figures for display purposes. "-" indicates no data available.

Table D.5.7: Trophic Transfer Factors for Caddisfly Tissue Primary and Secondary Analytes Concentrations for Upper Hazeltine Creek (HAC-R1, HAC-U; Exposed), Upper Edney Creek (EDC-U; Reference), Lower Hazeltine Creek (HAC-D; Exposed), and Lower Edney Creek Exposed (E1) and Reference (EDC) Areas, 2018 to 2022

Notes: For 2010 data at HAC-D and HAC-U, historical station codes were W11 and W7, respectively. All values reported in dry weight. Summary statistics reported to 3 significant figures for display purposes. TTF calculated as Benthic Invertebrate Analyte Concentration/Periphyton Analyte Concentration. "-" = data were not available to calculate a TTF or TTF was not calculated because the concentration of an analyte was below the Laboratory Reporting Limit (LRL) for either the periphyton or benthic invertebrate tissue results.

Table D.5.7: Trophic Transfer Factors for Caddisfly Tissue Primary and Secondary Analytes Concentrations for Upper Hazeltine Creek (HAC-R1, HAC-U; Exposed), Upper Edney Creek (EDC-U; Reference), Lower Hazeltine Creek (HAC-D; Exposed), and Lower Edney Creek Exposed (E1) and Reference (EDC) Areas, 2018 to 2022

Waterbody	Area	Parameter	Units	Year	Replicate								Mean	Standard Deviation	Minimum	Median	Maximum

Notes: For 2010 data at HAC-D and HAC-U, historical station codes were W11 and W7, respectively. All values reported in dry weight. Summary statistics reported to 3 significant figures for display purposes. TTF calculated as Benthic Invertebrate Analyte Concentration/Periphyton Analyte Concentration. "-" = data were not available to calculate a TTF or TTF was not calculated because the concentration of an analyte was below the Laboratory Reporting Limit (LRL) for either the periphyton or benthic invertebrate tissue results.

Table D.5.7: Trophic Transfer Factors for Caddisfly Tissue Primary and Secondary Analytes Concentrations for Upper Hazeltine Creek (HAC-R1, HAC-U; Exposed), Upper Edney Creek (EDC-U; Reference), Lower Hazeltine Creek (HAC-D; Exposed), and Lower Edney Creek Exposed (E1) and Reference (EDC) Areas, 2018 to 2022

Notes: For 2010 data at HAC-D and HAC-U, historical station codes were W11 and W7, respectively. All values reported in dry weight. Summary statistics reported to 3 significant figures for display purposes. TTF calculated as Benthic Invertebrate Analyte Concentration/Periphyton Analyte Concentration. "-" = data were not available to calculate a TTF or TTF was not calculated because the concentration of an analyte was below the Laboratory Reporting Limit (LRL) for either the periphyton or benthic invertebrate tissue results.

Table D.5.7: Trophic Transfer Factors for Caddisfly Tissue Primary and Secondary Analytes Concentrations for Upper Hazeltine Creek (HAC-R1, HAC-U; Exposed), Upper Edney Creek (EDC-U; Reference), Lower Hazeltine Creek (HAC-D; Exposed), and Lower Edney Creek Exposed (E1) and Reference (EDC) Areas, 2018 to 2022

Notes: For 2010 data at HAC-D and HAC-U, historical station codes were W11 and W7, respectively. All values reported in dry weight. Summary statistics reported to 3 significant figures for display purposes. TTF calculated as Benthic Invertebrate Analyte Concentration/Periphyton Analyte Concentration. "-" = data were not available to calculate a TTF or TTF was not calculated because the concentration of an analyte was below the Laboratory Reporting Limit (LRL) for either the periphyton or benthic invertebrate tissue results.

Table D.5.7: Trophic Transfer Factors for Caddisfly Tissue Primary and Secondary Analytes Concentrations for Upper Hazeltine Creek (HAC-R1, HAC-U; Exposed), Upper Edney Creek (EDC-U; Reference), Lower Hazeltine Creek (HAC-D; Exposed), and Lower Edney Creek Exposed (E1) and Reference (EDC) Areas, 2018 to 2022

Notes: For 2010 data at HAC-D and HAC-U, historical station codes were W11 and W7, respectively. All values reported in dry weight. Summary statistics reported to 3 significant figures for display purposes. TTF calculated as Benthic Invertebrate Analyte Concentration/Periphyton Analyte Concentration. "-" = data were not available to calculate a TTF or TTF was not calculated because the concentration of an analyte was below the Laboratory Reporting Limit (LRL) for either the periphyton or benthic invertebrate tissue results.

Table D.5.7: Trophic Transfer Factors for Caddisfly Tissue Primary and Secondary Analytes Concentrations for Upper Hazeltine Creek (HAC-R1, HAC-U; Exposed), Upper Edney Creek (EDC-U; Reference), Lower Hazeltine Creek (HAC-D; Exposed), and Lower Edney Creek Exposed (E1) and Reference (EDC) Areas, 2018 to 2022

Notes: For 2010 data at HAC-D and HAC-U, historical station codes were W11 and W7, respectively. All values reported in dry weight. Summary statistics reported to 3 significant figures for display purposes. TTF calculated as Benthic Invertebrate Analyte Concentration/Periphyton Analyte Concentration. "-" = data were not available to calculate a TTF or TTF was not calculated because the concentration of an analyte was below the Laboratory Reporting Limit (LRL) for either the periphyton or benthic invertebrate tissue results.

Table D.5.7: Trophic Transfer Factors for Caddisfly Tissue Primary and Secondary Analytes Concentrations for Upper Hazeltine Creek (HAC-R1, HAC-U; Exposed), Upper Edney Creek (EDC-U; Reference), Lower Hazeltine Creek (HAC-D; Exposed), and Lower Edney Creek Exposed (E1) and Reference (EDC) Areas, 2018 to 2022

Notes: For 2010 data at HAC-D and HAC-U, historical station codes were W11 and W7, respectively. All values reported in dry weight. Summary statistics reported to 3 significant figures for display purposes. TTF calculated as Benthic Invertebrate Analyte Concentration/Periphyton Analyte Concentration. “-“ = data were not available to calculate a TTF or TTF was not calculated because the concentration of an analyte was below the Laboratory Reporting Limit (LRL) for either the periphyton or benthic invertebrate tissue results.

Table D.5.8: Trophic Transfer Factors for Composite-Taxa Benthic Invertebrate Tissue Primary and Secondary Analytes Concentrations for Upper Hazeltine Creek (HAC-R1, HAC-U; Exposed), Upper Edney Creek (EDC-U; Reference), Lower Hazeltine Creek (HAC-D; Exposed), and Lower Edney Creek Exposed (E1) and Reference (EDC-D) Areas, 2010 to 2022

Notes: For 2010 data at HAC-D and HAC-U, historical station codes were W11 and W7, respectively. All values reported in dry weight. Summary statistics reported to 3 significant figures for display purposes. TTF calculated as Benthic Invertebrate Analyte Concentration/Periphyton Analyte Concentration. "-" = data were not available to calculate a TTF or TTF was not calculated because the concentration of an analyte was below the Laboratory Reporting Limit (LRL) for either the periphyton or benthic invertebrate tissue results.

Table D.5.8: Trophic Transfer Factors for Composite-Taxa Benthic Invertebrate Tissue Primary and Secondary Analytes Concentrations for Upper Hazeltine Creek (HAC-R1, HAC-U; Exposed), Upper Edney Creek (EDC-U; Reference), Lower Hazeltine Creek (HAC-D; Exposed), and Lower Edney Creek Exposed (E1) and Reference (EDC-D) Areas, 2010 to 2022

Waterbody	Area	Parameter	Units	Year	Replicate								Mean	Standard Deviation	Minimum	Median	Maximum

Notes: For 2010 data at HAC-D and HAC-U, historical station codes were W11 and W7, respectively. All values reported in dry weight. Summary statistics reported to 3 significant figures for display purposes. TTF calculated as Benthic Invertebrate Analyte Concentration/Periphyton Analyte Concentration. "-" = data were not available to calculate a TTF or TTF was not calculated because the concentration of an analyte was below the Laboratory Reporting Limit (LRL) for either the periphyton or benthic invertebrate tissue results.

Table D.5.8: Trophic Transfer Factors for Composite-Taxa Benthic Invertebrate Tissue Primary and Secondary Analytes Concentrations for Upper Hazeltine Creek (HAC-R1, HAC-U; Exposed), Upper Edney Creek (EDC-U; Reference), Lower Hazeltine Creek (HAC-D; Exposed), and Lower Edney Creek Exposed (E1) and Reference (EDC-D) Areas, 2010 to 2022

Notes: For 2010 data at HAC-D and HAC-U, historical station codes were W11 and W7, respectively. All values reported in dry weight. Summary statistics reported to 3 significant figures for display purposes. TTF calculated as Benthic Invertebrate Analyte Concentration/Periphyton Analyte Concentration. "-" = data were not available to calculate a TTF or TTF was not calculated because the concentration of an analyte was below the Laboratory Reporting Limit (LRL) for either the periphyton or benthic invertebrate tissue results.

Table D.5.8: Trophic Transfer Factors for Composite-Taxa Benthic Invertebrate Tissue Primary and Secondary Analytes Concentrations for Upper Hazeltine Creek (HAC-R1, HAC-U; Exposed), Upper Edney Creek (EDC-U; Reference), Lower Hazeltine Creek (HAC-D; Exposed), and Lower Edney Creek Exposed (E1) and Reference (EDC-D) Areas, 2010 to 2022

Notes: For 2010 data at HAC-D and HAC-U, historical station codes were W11 and W7, respectively. All values reported in dry weight. Summary statistics reported to 3 significant figures for display purposes. TTF calculated as Benthic Invertebrate Analyte Concentration/Periphyton Analyte Concentration. "-" = data were not available to calculate a TTF or TTF was not calculated because the concentration of an analyte was below the Laboratory Reporting Limit (LRL) for either the periphyton or benthic invertebrate tissue results.

Table D.5.8: Trophic Transfer Factors for Composite-Taxa Benthic Invertebrate Tissue Primary and Secondary Analytes Concentrations for Upper Hazeltine Creek (HAC-R1, HAC-U; Exposed), Upper Edney Creek (EDC-U; Reference), Lower Hazeltine Creek (HAC-D; Exposed), and Lower Edney Creek Exposed (E1) and Reference (EDC-D) Areas, 2010 to 2022

Notes: For 2010 data at HAC-D and HAC-U, historical station codes were W11 and W7, respectively. All values reported in dry weight. Summary statistics reported to 3 significant figures for display purposes. TTF calculated as Benthic Invertebrate Analyte Concentration/Periphyton Analyte Concentration. "-" = data were not available to calculate a TTF or TTF was not calculated because the concentration of an analyte was below the Laboratory Reporting Limit (LRL) for either the periphyton or benthic invertebrate tissue results.

Table D.5.8: Trophic Transfer Factors for Composite-Taxa Benthic Invertebrate Tissue Primary and Secondary Analytes Concentrations for Upper Hazeltine Creek (HAC-R1, HAC-U; Exposed), Upper Edney Creek (EDC-U; Reference), Lower Hazeltine Creek (HAC-D; Exposed), and Lower Edney Creek Exposed (E1) and Reference (EDC-D) Areas, 2010 to 2022

Notes: For 2010 data at HAC-D and HAC-U, historical station codes were W11 and W7, respectively. All values reported in dry weight. Summary statistics reported to 3 significant figures for display purposes. TTF calculated as Benthic Invertebrate Analyte Concentration/Periphyton Analyte Concentration. "-" = data were not available to calculate a TTF or TTF was not calculated because the concentration of an analyte was below the Laboratory Reporting Limit (LRL) for either the periphyton or benthic invertebrate tissue results.

Table D.5.8: Trophic Transfer Factors for Composite-Taxa Benthic Invertebrate Tissue Primary and Secondary Analytes Concentrations for Upper Hazeltine Creek (HAC-R1, HAC-U; Exposed), Upper Edney Creek (EDC-U; Reference), Lower Hazeltine Creek (HAC-D; Exposed), and Lower Edney Creek Exposed (E1) and Reference (EDC-D) Areas, 2010 to 2022

Value exceeds the British Columbia interim guideline for selenium in invertebrate tissue (4 mg/kg dw; BCMOE 2014).

Notes: "-" = no data or summary statistic could not be calculated. mg/kg dw = milligrams per kilogram dry weight. All summary statistics are reported to three significant digits for display purposes and were calculated using the Kaplan-Meier method.

Value exceeds the British Columbia interim guideline for selenium in invertebrate tissue (4 mg/kg dw; BCMOE 2014).

Notes: "-" = no data or summary statistic could not be calculated. mg/kg dw = milligrams per kilogram dry weight. All summary statistics are reported to three significant digits for display purposes and were calculated using the Kaplan-Meier method.

APPENDIX E
STATISTICAL ANALYSES – LAKES

APPENDIX E.1
SEDIMENT QUALITY

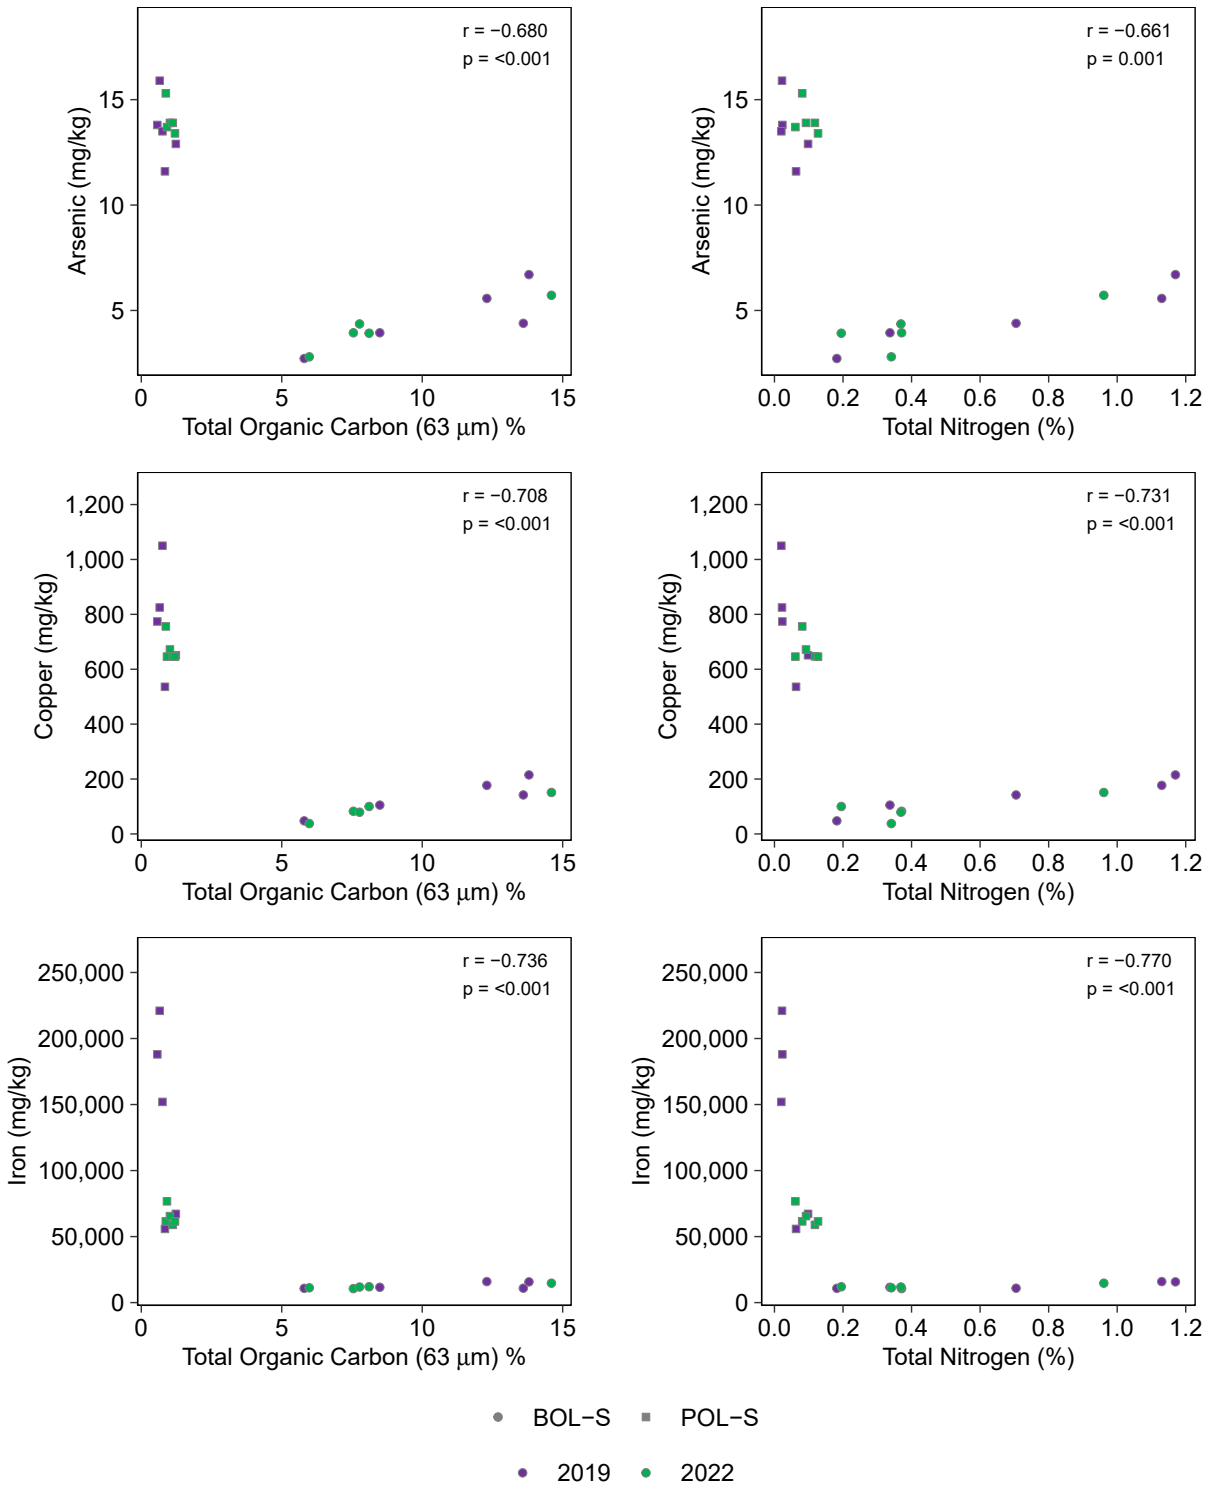

Figure E.1.1: Scatterplots of Significant Spearman's Correlation Relationships (p < 0.0125, Bonferroni Corrected) Between Analyte of Interest Concentrations (<63 µm Fraction) and Sediment Physical and Chemical Parameters for Polley Lake (POL-S; Exposed) and Bootjack Lake (BOL-B2; Reference) Shallow Areas, 2019 to 2022

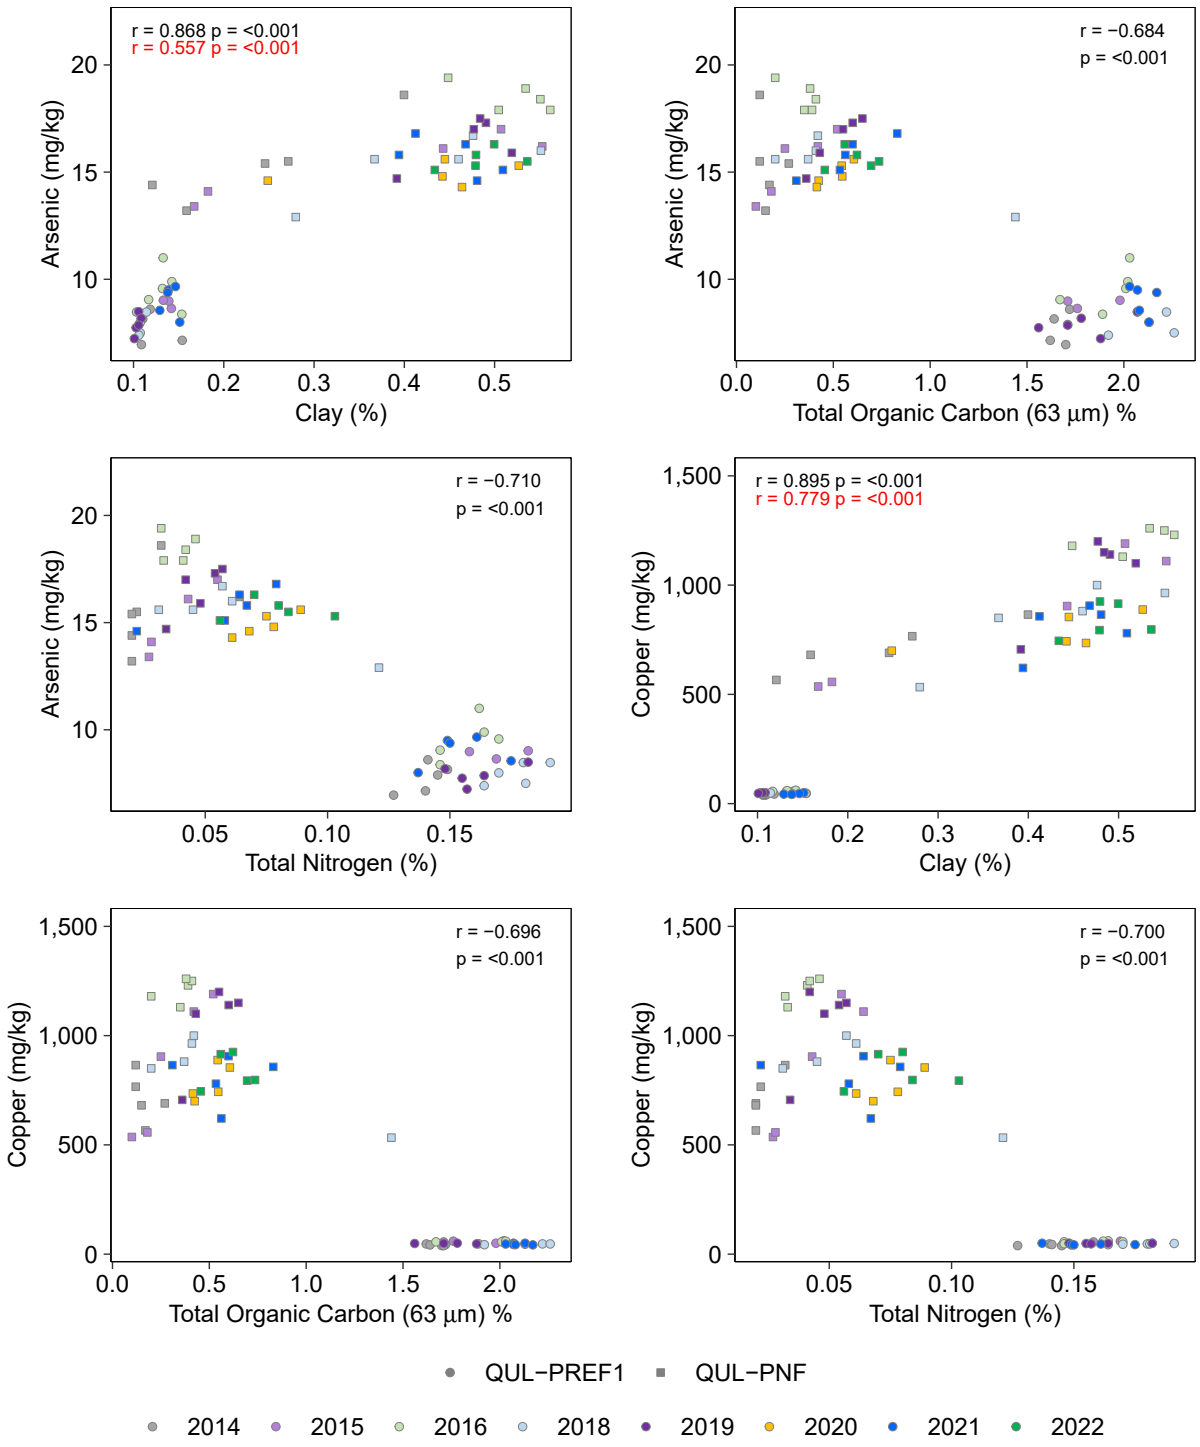

Figure E.1.2: Scatterplots of Significant Spearman's Correlation Relationships (p < 0.0125, Bonferroni Corrected) Between Analyte of Interest Concentrations (<63 µm Fraction) and Sediment Physical and Chemical Parameters for Quesnel Lake at QUL-PNF (Exposed) and QUL-PREF1 (Reference) Deep Areas, 2014 to 2022

Notes: Results of correlations that evaluated data from deep exposed and reference sampling areas of Quesnel Lake (QUL−PNF, QUL-PREF1) are shown in black font on each plot. Results of correlations that only evaluated data from the deep exposed area of Quesnel Lake (QUL−PNF) are shown in red font. An absence of results in red font on a plot indicates the displayed variables were not significantly correlated when only exposed sediment results were considered.

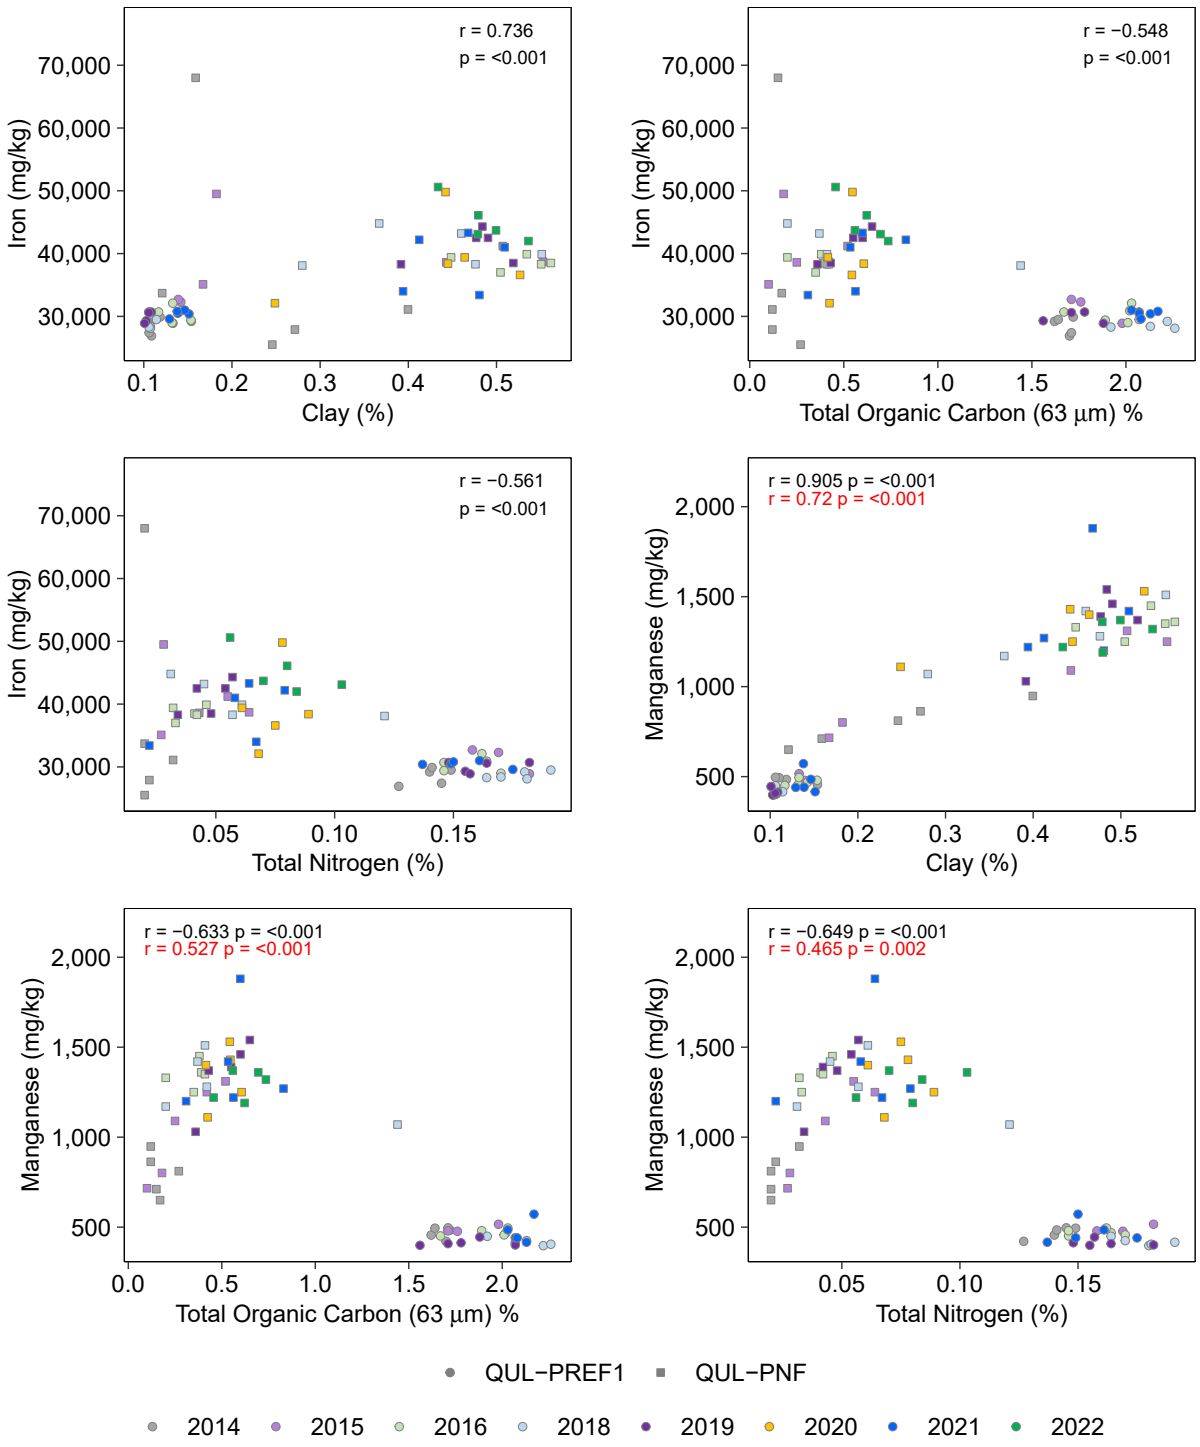

Figure E.1.2: Scatterplots of Significant Spearman's Correlation Relationships (p < 0.0125, Bonferroni Corrected) Between Analyte of Interest Concentrations (<63 µm Fraction) and Sediment Physical and Chemical Parameters for Quesnel Lake at QUL-PNF (Exposed) and QUL-PREF1 (Reference) Deep Areas, 2014 to 2022

Notes: Results of correlations that evaluated data from deep exposed and reference sampling areas of Quesnel Lake (QUL−PNF, QUL-PREF1) are shown in black font on each plot. Results of correlations that only evaluated data from the deep exposed area of Quesnel Lake (QUL−PNF) are shown in red font. An absence of results in red font on a plot indicates the displayed variables were not significantly correlated when only exposed sediment results were considered.

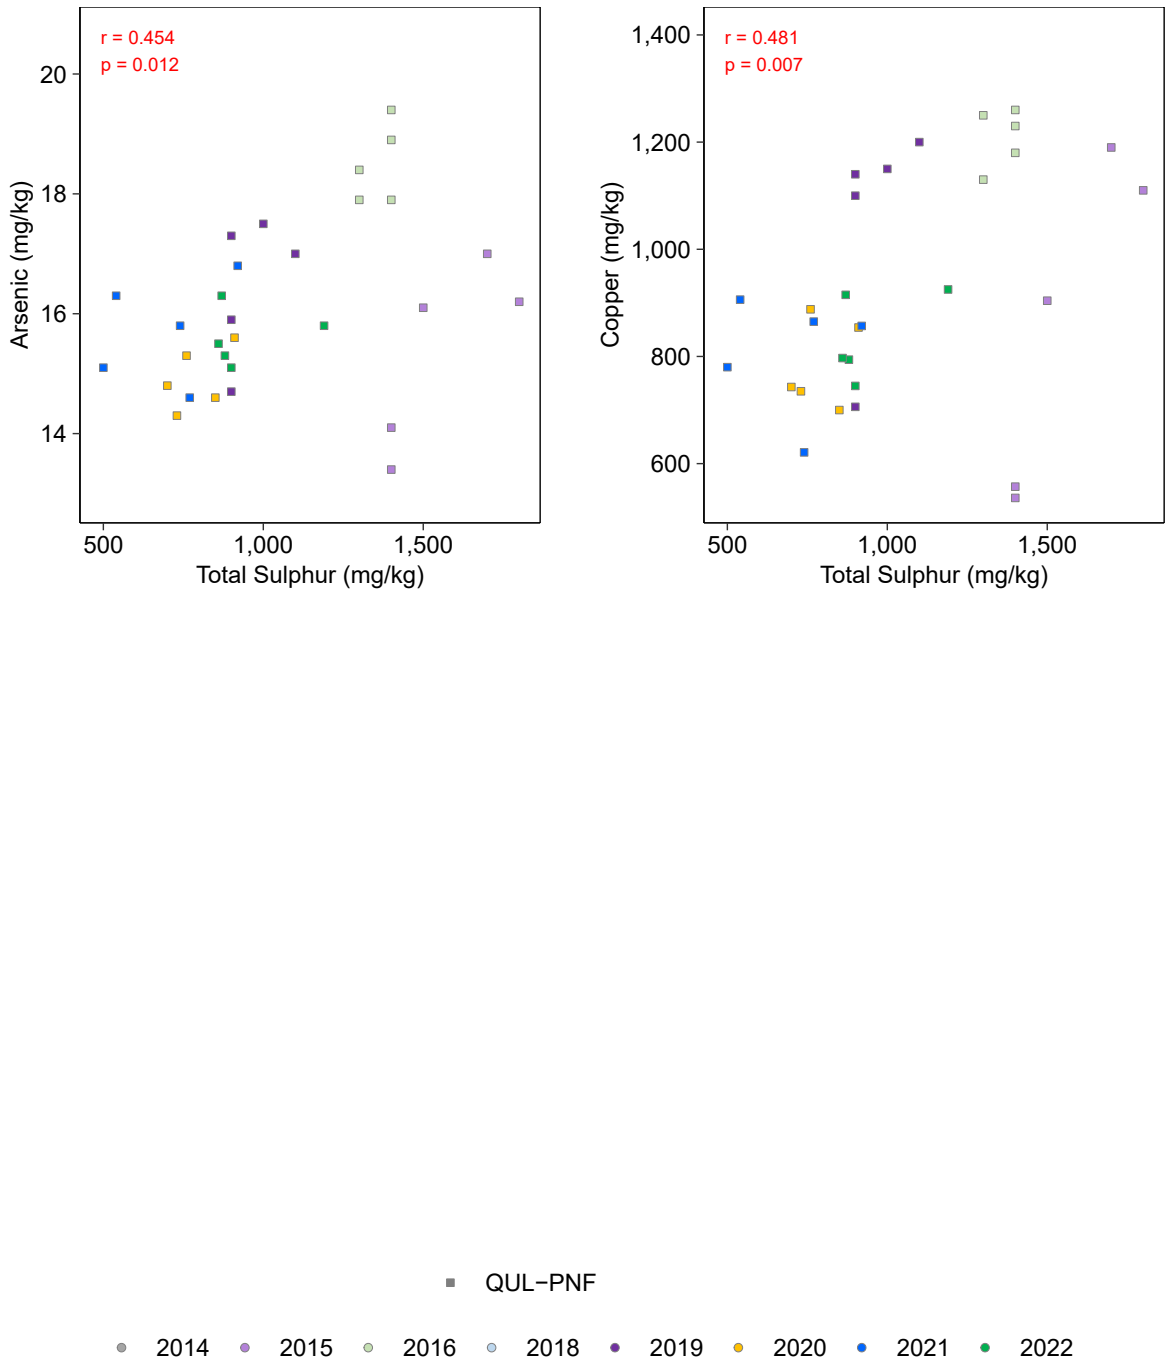

Figure E.1.2: Scatterplots of Significant Spearman's Correlation Relationships (p < 0.0125, Bonferroni Corrected) Between Analyte of Interest Concentrations (<63 µm Fraction) and Sediment Physical and Chemical Parameters for Quesnel Lake at QUL-PNF (Exposed) and QUL-PREF1 (Reference) Deep Areas, 2014 to 2022

Notes: Results of correlations that evaluated data from deep exposed and reference sampling areas of Quesnel Lake (QUL−PNF, QUL-PREF1) are shown in black font on each plot. Results of correlations that only evaluated data from the deep exposed area of Quesnel Lake (QUL−PNF) are shown in red font. An absence of results in red font on a plot indicates the displayed variables were not significantly correlated when only exposed sediment results were considered.

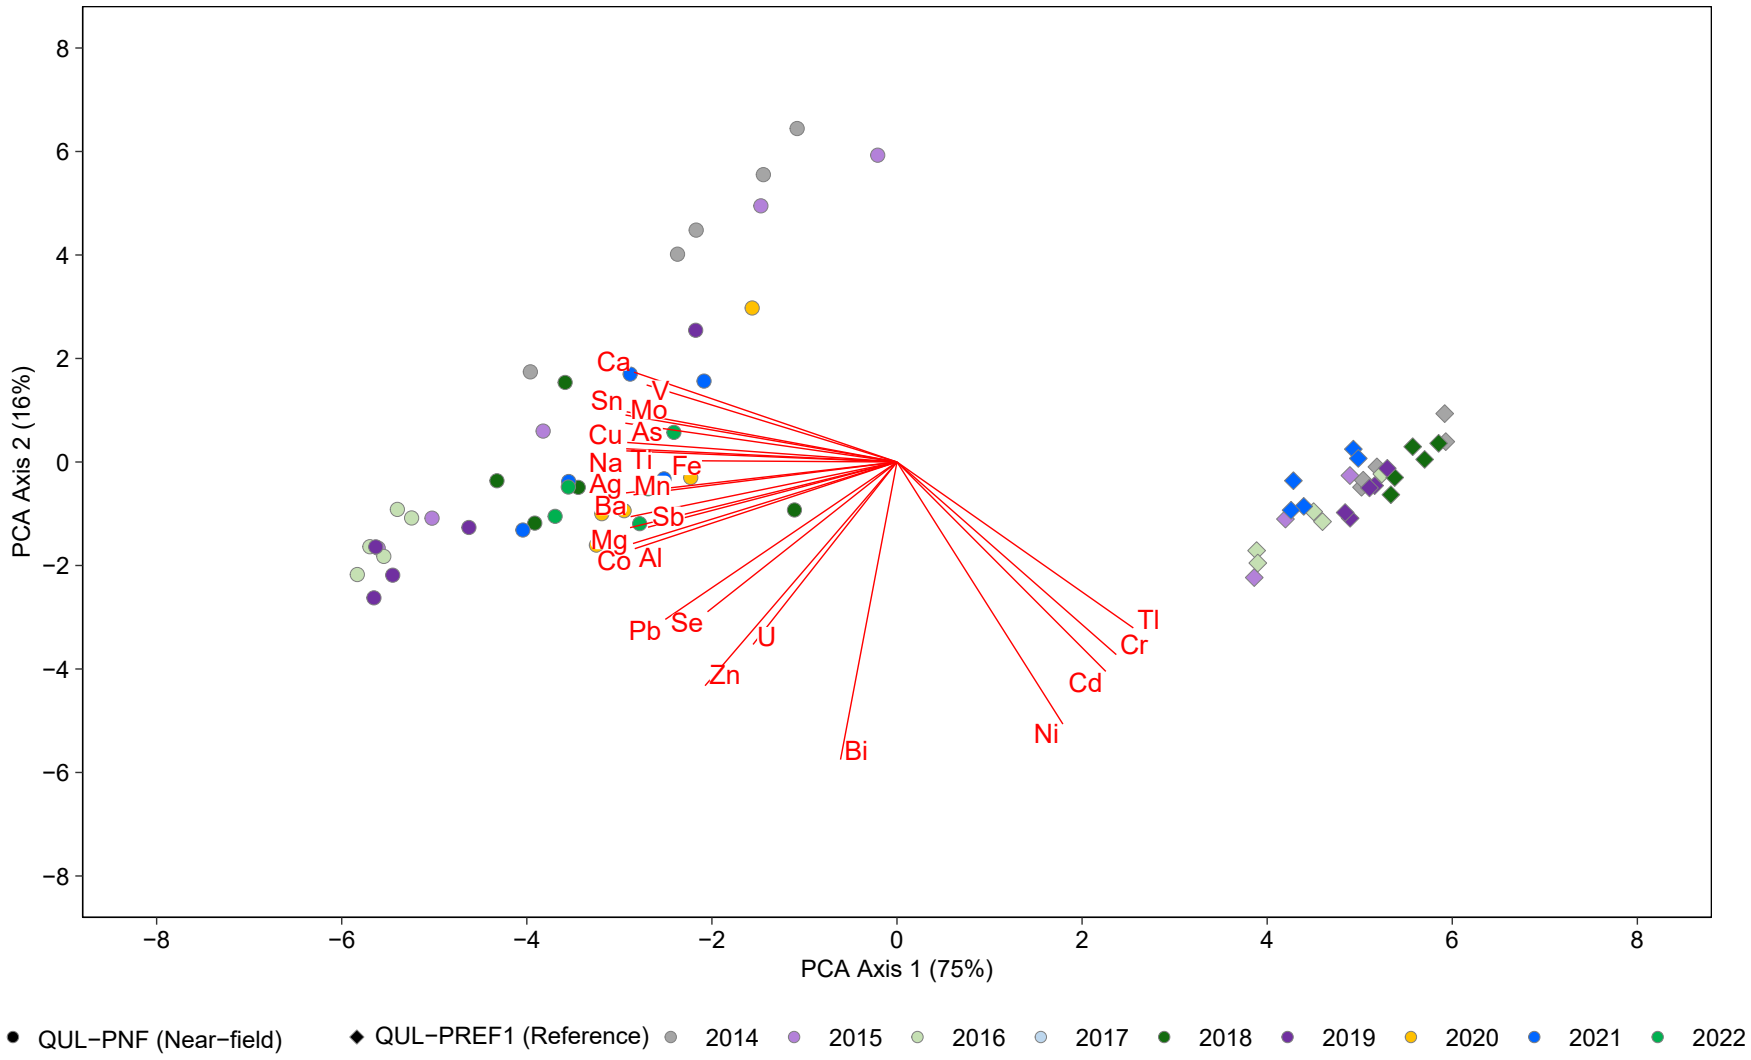

Figure E.1.3: Biplot of Principal Components Analysis (PCA) Axis Scores (PC-1, PC-2) for Metal Concentrations in Sediment (<63 µm Fraction) for Quesnel Lake at QUL-PNF (Exposed) and QUL-PREF1 (Reference) Deep Areas, 2014 to 2022

Notes: PCA conducted on correlation matrix with $\log_{10}$−transformed concentrations. Vectors represent the PC loadings for each parameter (scaled). Parameters that had more than 25% censored data were excluded from the analyses.

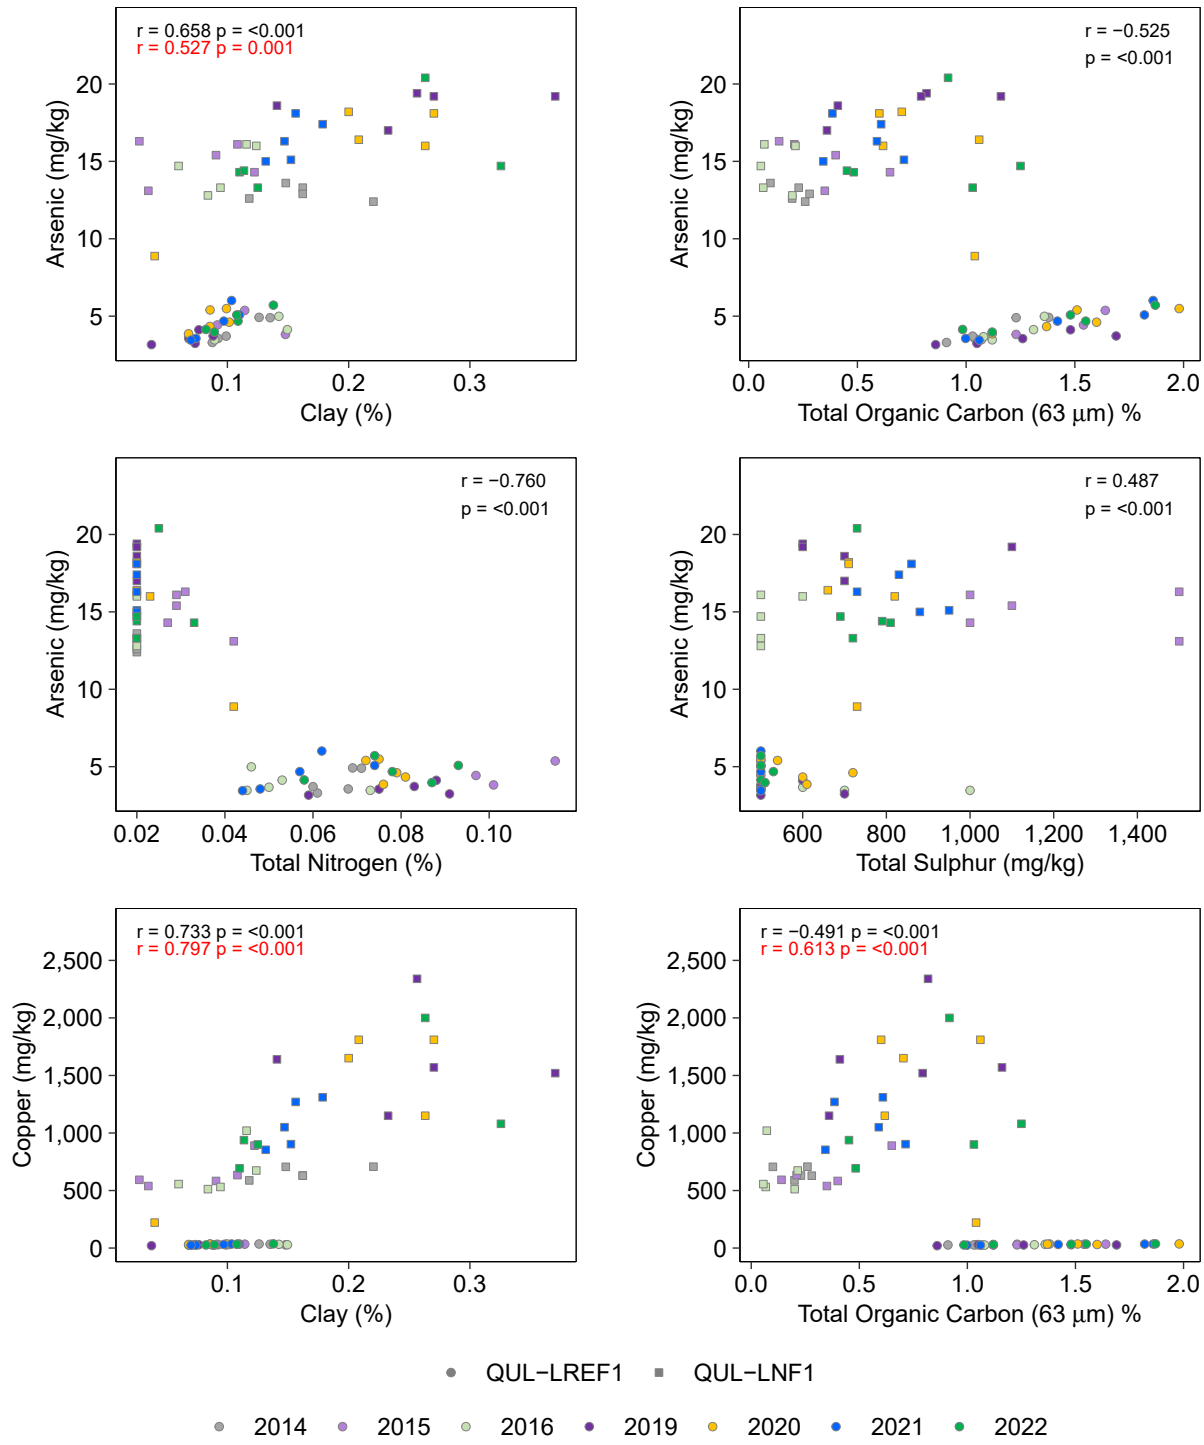

Figure E.1.4: Scatterplots of Significant Spearman's Correlation Relationships (p < 0.0125, Bonferroni Corrected) Between Analyte of Interest Concentrations (<63 µm Fraction) and Sediment Physical and Chemical Parameters for Quesnel Lake at QUL-LNF1 (Exposed) and QUL-LREF1 (Reference) Shallow Areas, 2014 to 2022

Notes: Results of correlations that evaluated data from shallow exposed and reference sampling areas of Quesnel Lake (QUL −LREF1, QUL−LNF1) are shown in black font on each plot. Results of correlations that only evaluated data from the shallow exposed area of Quesnel Lake (QUL−LNF1) are shown in red font. An absence of results in red font on a plot indicates the displayed variables were not significantly correlated when only exposed sediment results were considered.

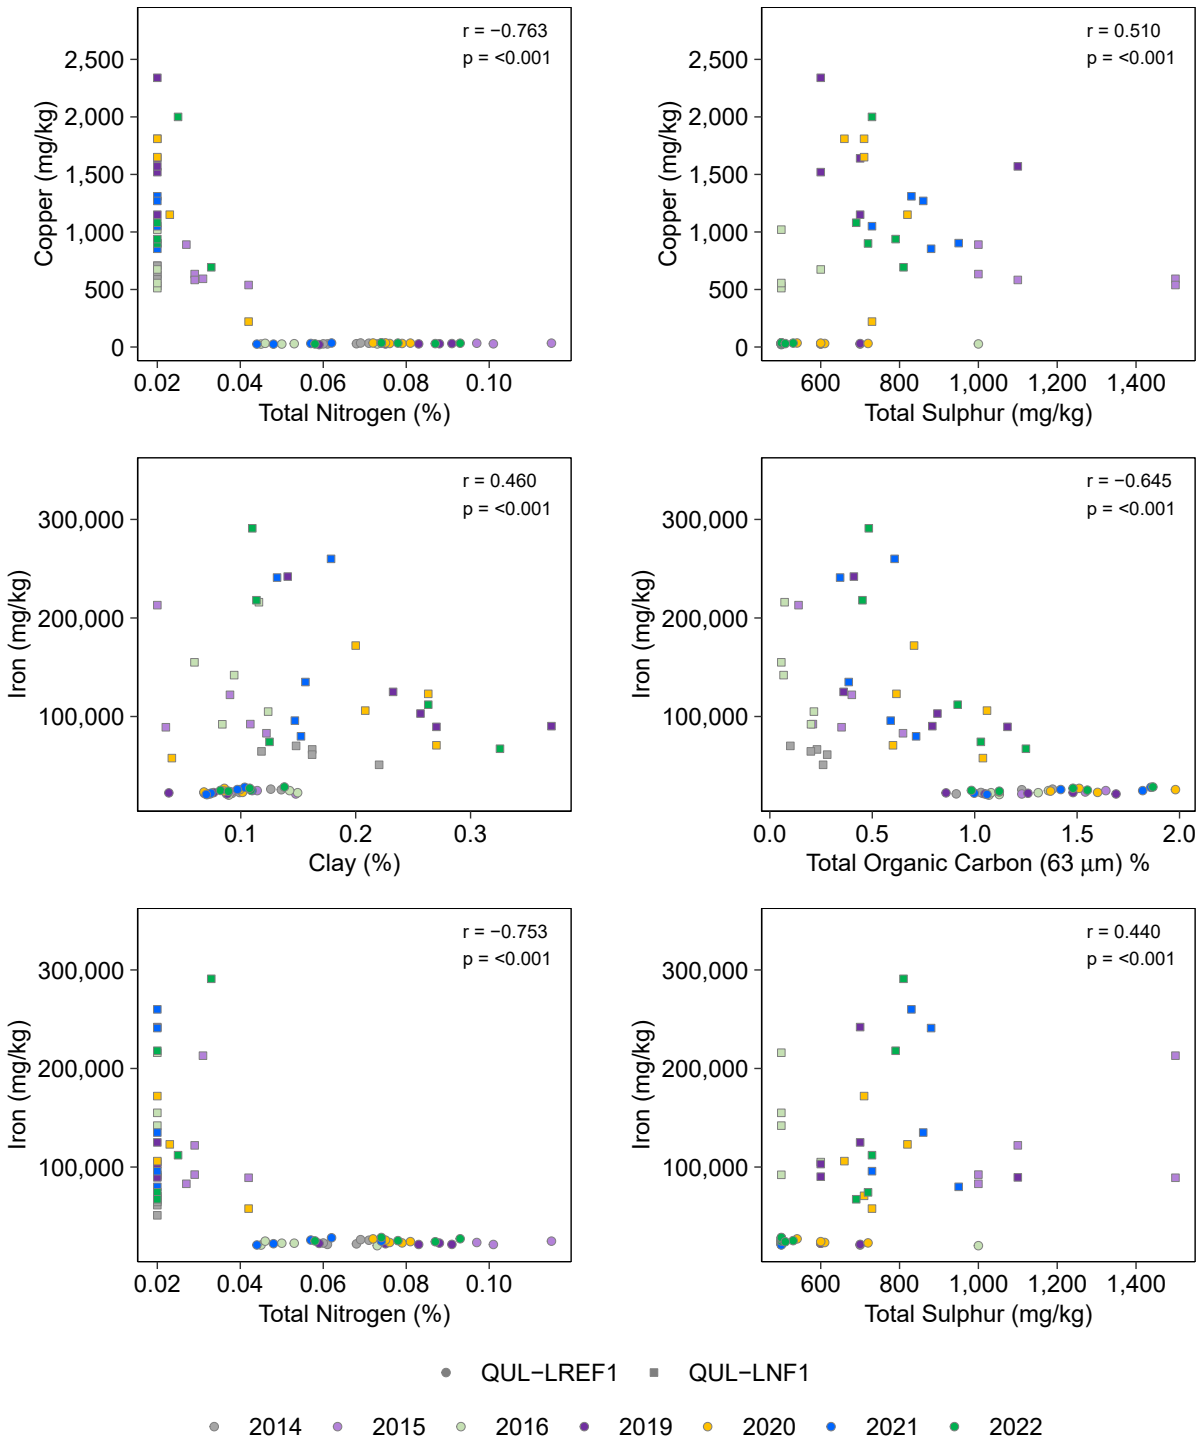

Figure E.1.4: Scatterplots of Significant Spearman's Correlation Relationships (p < 0.0125, Bonferroni Corrected) Between Analyte of Interest Concentrations (<63 µm Fraction) and Sediment Physical and Chemical Parameters for Quesnel Lake at QUL-LNF1 (Exposed) and QUL-LREF1 (Reference) Shallow Areas, 2014 to 2022

Notes: Results of correlations that evaluated data from shallow exposed and reference sampling areas of Quesnel Lake (QUL−LREF1, QUL−LNF1) are shown in black font on each plot. Results of correlations that only evaluated data from the shallow exposed area of Quesnel Lake (QUL−LNF1) are shown in red font. An absence of results in red font on a plot indicates the displayed variables were not significantly correlated when only exposed sediment results were considered.

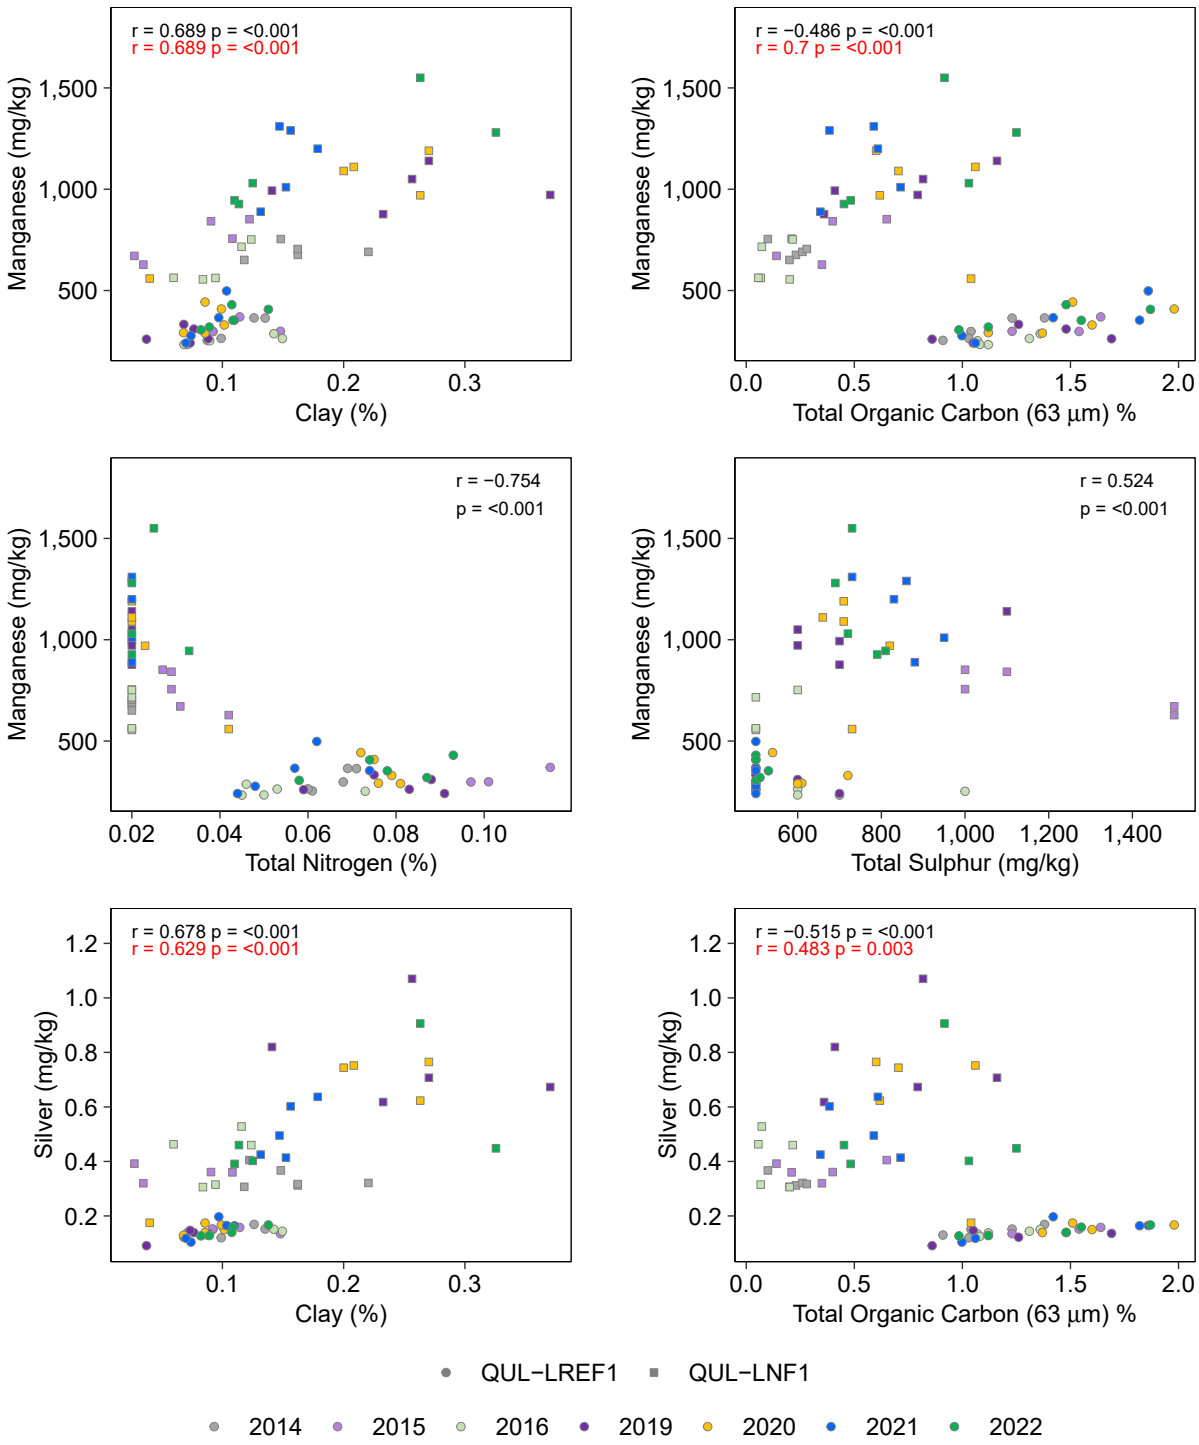

Figure E.1.4: Scatterplots of Significant Spearman's Correlation Relationships (p < 0.0125, Bonferroni Corrected) Between Analyte of Interest Concentrations (<63 µm Fraction) and Sediment Physical and Chemical Parameters for Quesnel Lake at QUL-LNF1 (Exposed) and QUL-LREF1 (Reference) Shallow Areas, 2014 to 2022

Notes: Results of correlations that evaluated data from shallow exposed and reference sampling areas of Quesnel Lake (QUL−LREF1, QUL−LNF1) are shown in black font on each plot. Results of correlations that only evaluated data from the shallow exposed area of Quesnel Lake (QUL−LNF1) are shown in red font. An absence of results in red font on a plot indicates the displayed variables were not significantly correlated when only exposed sediment results were considered.

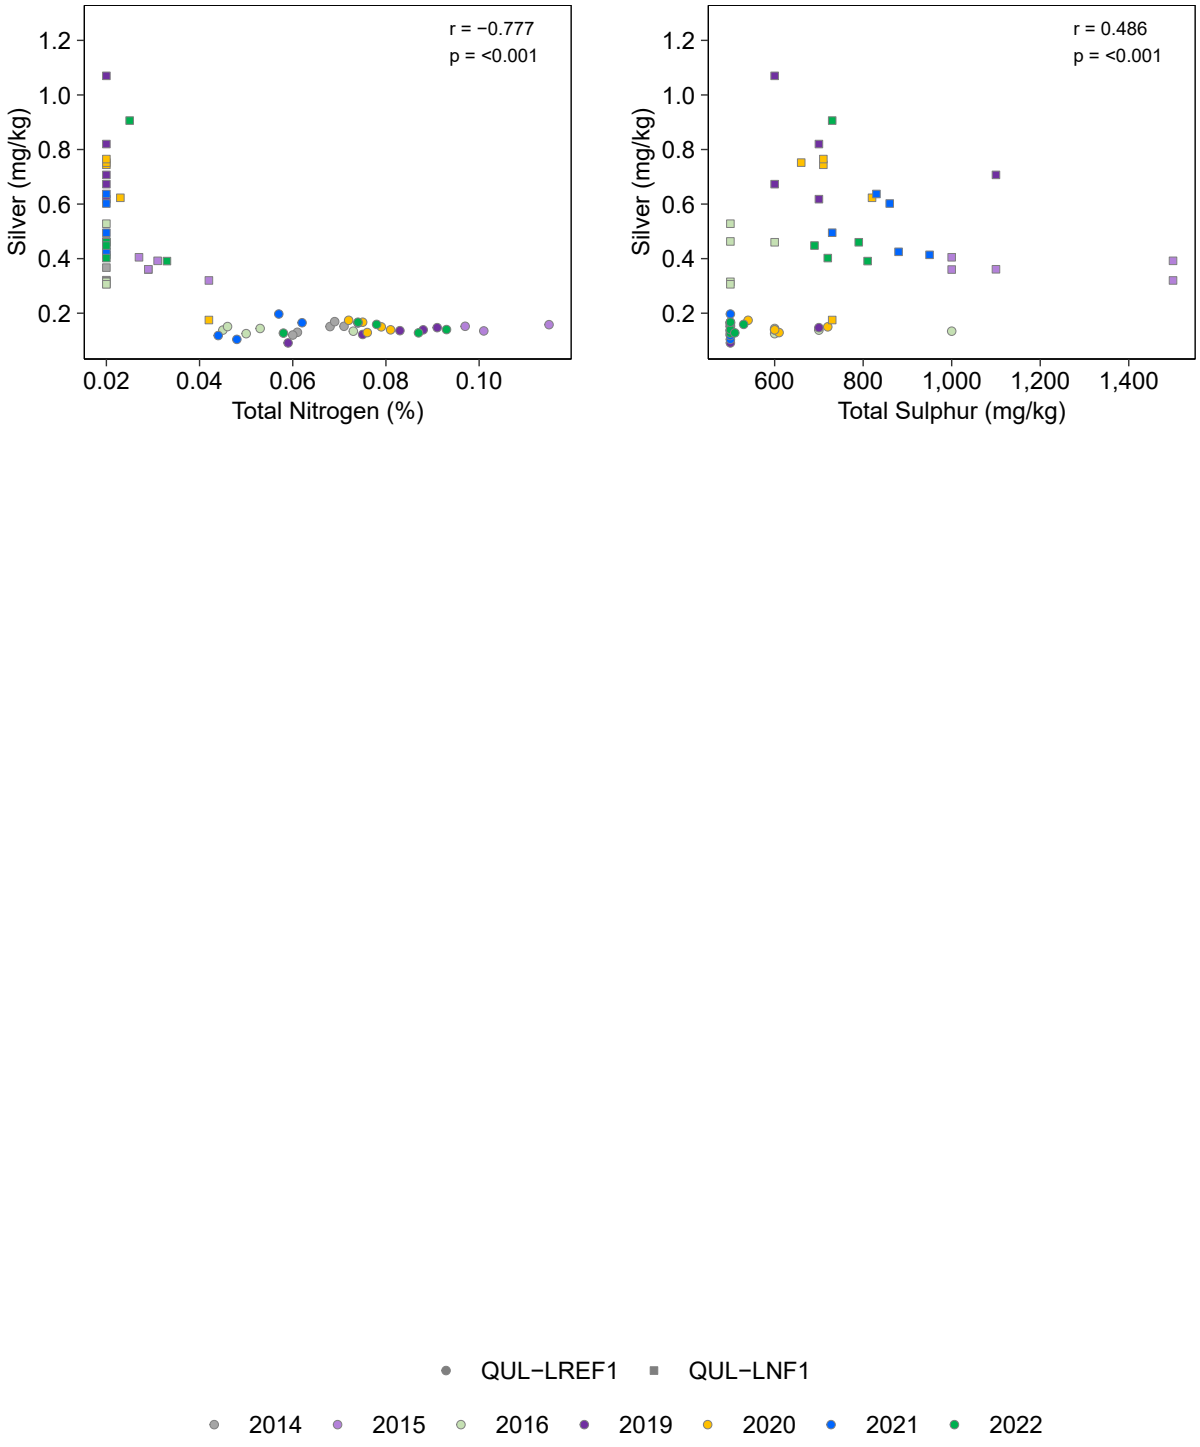

Figure E.1.4: Scatterplots of Significant Spearman's Correlation Relationships (p < 0.0125, Bonferroni Corrected) Between Analyte of Interest Concentrations (<63 µm Fraction) and Sediment Physical and Chemical Parameters for Quesnel Lake at QUL-LNF1 (Exposed) and QUL-LREF1 (Reference) Shallow Areas, 2014 to 2022

Notes: Results of correlations that evaluated data from shallow exposed and reference sampling areas of Quesnel Lake (QUL−LREF1, QUL−LNF1) are shown in black font on each plot. Results of correlations that only evaluated data from the shallow exposed area of Quesnel Lake (QUL−LNF1) are shown in red font. An absence of results in red font on a plot indicates the displayed variables were not significantly correlated when only exposed sediment results were considered.

Table E.1.1: Statistical Comparisons of Exposed - Reference Relative Differences of Sediment Analyte of Interest Concentrations (<63 µm Fraction) for Polley Lake (POL-S; Exposed) and Bootjack Lake (BOL-B2; Reference) Shallow Areas, 2019 to 2022

ANOVA Model						(Exposed - Reference) Relative Differences Among Years[a]		Relative MOD for Exposed - Reference Over Time (%)[b]
Parameter	Units	Transformation	Area	Year	Area x Year	2019	2022	2022
Total Organic Carbon	%	none	<0.001	0.424	0.324	A	A	ns
Arsenic	mg/kg	log10	<0.001	0.779	0.500	A	A	ns
Copper	mg/kg	log10	<0.001	0.188	0.441	A	A	ns
Iron	mg/kg	log10	<0.001	0.039	0.088	A	A	ns

P-value < 0.05

Indicates negative MOD

Indicates positive MOD

Notes: "-" indicates no data; "ns" indicates not significant; MOD = Magnitude of Difference; mg/kg = milligrams per kilogram.

[a] Years that share a letter are not significantly different among years.

[b] MOD calculated as $(Exp_{observed} - Exp_{predicted}) / (Exp_{predicted})x100\%$, where $Exp_{predicted} = Ref_{observed} + (Exp_{observed\ 2019} - Ref_{observed\ 2019})$. Exp = Exposed (POL-S); Ref = Reference (BOL-S).

Table E.1.2: Statistical Comparisons of Exposed - Reference Relative Differences of Sediment Analyte of Interest Concentrations (<63 µm Fraction) for Polley Lake (POL-S; Exposed) and Bootjack Lake (BOL-B2; Reference) Shallow Areas, 2019 to 2022

ANOVA Model						Area	Pairwise Differences Among Years for Each Area[a]		Do Concentrations Differ from 2019?	Do Concentrations Differ Between the Areas?
Parameter	Units	Transformation	Area	Year	Area x Year		2019	2022	Magnitude of Difference (MOD)[b]	Magnitude of Difference (MOD)[c]
Total Organic Carbon	%	none	<0.001	0.424	0.324	BOL-S	A	A	ns	-91
						POL-S				
Arsenic	mg/kg	log10	<0.001	0.779	0.500	BOL-S	A	A	ns	224
						POL-S				
Copper	mg/kg	log10	<0.001	0.188	0.441	BOL-S	A	A	ns	609
						POL-S				
Iron	mg/kg	log10	<0.001	0.039	0.088	BOL-S	A	A	ns	608
						POL-S				

P-value < 0.05
Indicates negative MOD
Indicates positive MOD

Notes: "-" indicates no data; "ns" indicates not significant; MOD = Magnitude of Difference; mg/kg = milligrams per kilogram.

[a] Years that do not share a letter are significantly different for that area.

[b] MOD is calculated as ([$year_{2022}$ - $year_{2019}$] / $year_{2019}$)*100.

[c] MOD calculated as ((POL-S - BOL-S) / BOL-S)*100.

Table E.1.3: Spearman's Correlation Relationships Between Analyte of Interest Concentrations (<63 µm Fraction) and Sediment Physical and Chemical Parameters for Polley Lake (POL-S; Exposed) and Bootjack Lake (BOL-B2; Reference) Shallow Areas, 2019 to 2022[a]

Analyte of Interest	Correlation Parameter	Data used in Correlation: POL-S and BOL-S				Data used in Correlation: POL-S			
		Clay (%)[b]	Total Organic Carbon (%)	Total Nitrogen (%)	Total Sulphur (mg/kg)	Clay (%)[b]	Total Organic Carbon (%)	Total Nitrogen (%)	Total Sulphur (mg/kg)
Arsenic (mg/kg)	Correlation Coefficient	0.158	-0.68	-0.661	-0.315	-0.097	-0.316	-0.188	0.141
	Sig. (2-tailed)	0.506	<0.001	0.001	0.176	0.789	0.374	0.602	0.698
Copper (mg/kg)	Correlation Coefficient	0.066	-0.708	-0.731	-0.425	-0.389	-0.559	-0.614	-0.495
	Sig. (2-tailed)	0.782	<0.001	<0.001	0.062	0.266	0.093	0.059	0.145
Iron (mg/kg)	Correlation Coefficient	-0.011	-0.736	-0.770	-0.481	-0.894	-0.529	-0.699	-0.563
	Sig. (2-tailed)	0.962	<0.001	<0.001	0.032	<0.001	0.116	0.024	0.09

Significant correlation; p-value < 0. 0125 (p<0.05, Bonferroni corrected for 4 independent variables).

Notes: n=20 for all correlations. Analyte of Interest was defined as an analyte at the exposed areas with a mean concentration that exceeded guidelines as well as reference/pre-breach 95th values. mg/kg = milligrams per kilogram. % = percent.

[a] Results below the Laboratory Reporting Limit (LRL) were used at the LRL for calculations.

[b] % clay represents the clay proportion of the < 63 µm (silt and clay) sediment fraction that was used for metals analysis. % clay was calculated as: [% clay] / [% silt and clay].

Table E.1.4: Statistical Comparisons of Exposed - Reference Relative Differences of Sediment Analyte of Interest Concentrations (<63 µm Fraction) for Quesnel Lake at QUL-PNF (Exposed) and QUL-PREF1 (Reference) Deep Areas, 2014 to 2022

ANOVA Model						(Exposed - Reference) Relative Differences Among Years[a]						Relative MOD for Exposed - Reference Over Time (%)[b]

Significant correlation; p-value < 0.0125 (p<0.05, Bonferroni corrected for 4 independent variables).

Notes: n=68 for all correlations. Analyte of Interest was defined as an analyte at the exposed areas with a mean concentration that exceeded guidelines as well as reference 95th percentile values. mg/kg = milligrams per kilogram. % = percent.

[a] Results below the Laboratory Reporting Limit (LRL) were used at the LRL for calculations.

[b] % clay represents the clay proportion of the < 63 µm (silt and clay) sediment fraction that was used for metals analysis. % clay was calculated as: [% clay] / [% silt and clay].

APPENDIX E.2
PLANKTON COMMUNITY
& PRODUCTIVITY

APPENDIX E2 PLANKTON DATA COLLAPSING METHODS

E2 PLANKTON DATA COLLAPSING METHODS 1
E2.1 Zooplankton 1
E2.2 Phytoplankton 1

E2 PLANKTON DATA COLLAPSING METHODS

E2.1 Zooplankton

Zooplankton community densities were calculated by the laboratory, Biologica Environmental Services (Biologica; Appendix G). Biologica used sampling information (haul depth, net diameter; provided by Minnow) and zooplankton abundances in each sample to calculate densities for taxa within each sample using the following formula:

$$Density(\frac{\#}{L}) = \frac{Abundance}{Haul\ Depth\ (m) \times \left(0.25\pi \times \left(Net\ mouth\ diameter\ (m)\right)^2\right) * 1000}$$

Zooplankton taxa identified in samples from the vicinity of the Mount Polley Mine typically are part of four major taxonomic groups: Cladocera, Rotifera, Calanoida, and Cyclopoida. Cladocera and Rotifera are easier to identify than Calanoida and Cyclopoida and have better developed taxonomic classifications. Therefore, decisions regarding taxonomic resolution of Cladocera and Rotifera taxa were made using a decision key, as described in Appendix E.4 (i.e., Resolving mixed-levels of taxonomic resolution for benthic invertebrates). Calanoida and Cyclopoida are less consistently identified to lower (i.e., higher resolution) taxonomic levels than Cladocera and Rotifera, making them unsuitable for the decision key described above for resolving inconsistent taxonomic resolution. Thus, inconsistent taxonomic resolution with within the Calanoida and Cyclopoida orders was resolved by pooling results within their respective major taxonomic group level (i.e., higher taxonomic resolution) for analysis, with the Copepod Nauplii stage remaining as a separate taxon group.

E2.2 Phytoplankton

Phytoplankton taxa are commonly identified to genus level but are occasionally identified to species level / species complex level (i.e., higher resolution) or phylum level (i.e., lower resolution). Due to the high proportion of ambiguously resolved taxa within phytoplankton data, phytoplankton taxonomy is not suited for the decision key described in Appendix E.4.

As such phytoplankton data were processed prior to analysis as follows. Phytoplankton taxa identified to species were rolled up to genus, and taxa identified to genus remained at genus. Two morphological groups, centric and pennate Diatoms, were considered as genera for the purpose of resolving taxonomic resolution. For each sample, taxa at a higher taxonomic level (e.g., phylum) were proportionally assigned to a lower taxonomic level (i.e., genera) if taxa at a lower taxonomic level were present in that sample. In cases where taxa at a lower taxonomic level were not observed in a sample, the taxon was assigned to the most common lower taxonomic level present in samples from that monitoring station (e.g., QUL-ZOO-1) in the present sampling year. If a lower taxonomic level was not observed at that station, the original taxonomic level was retained.

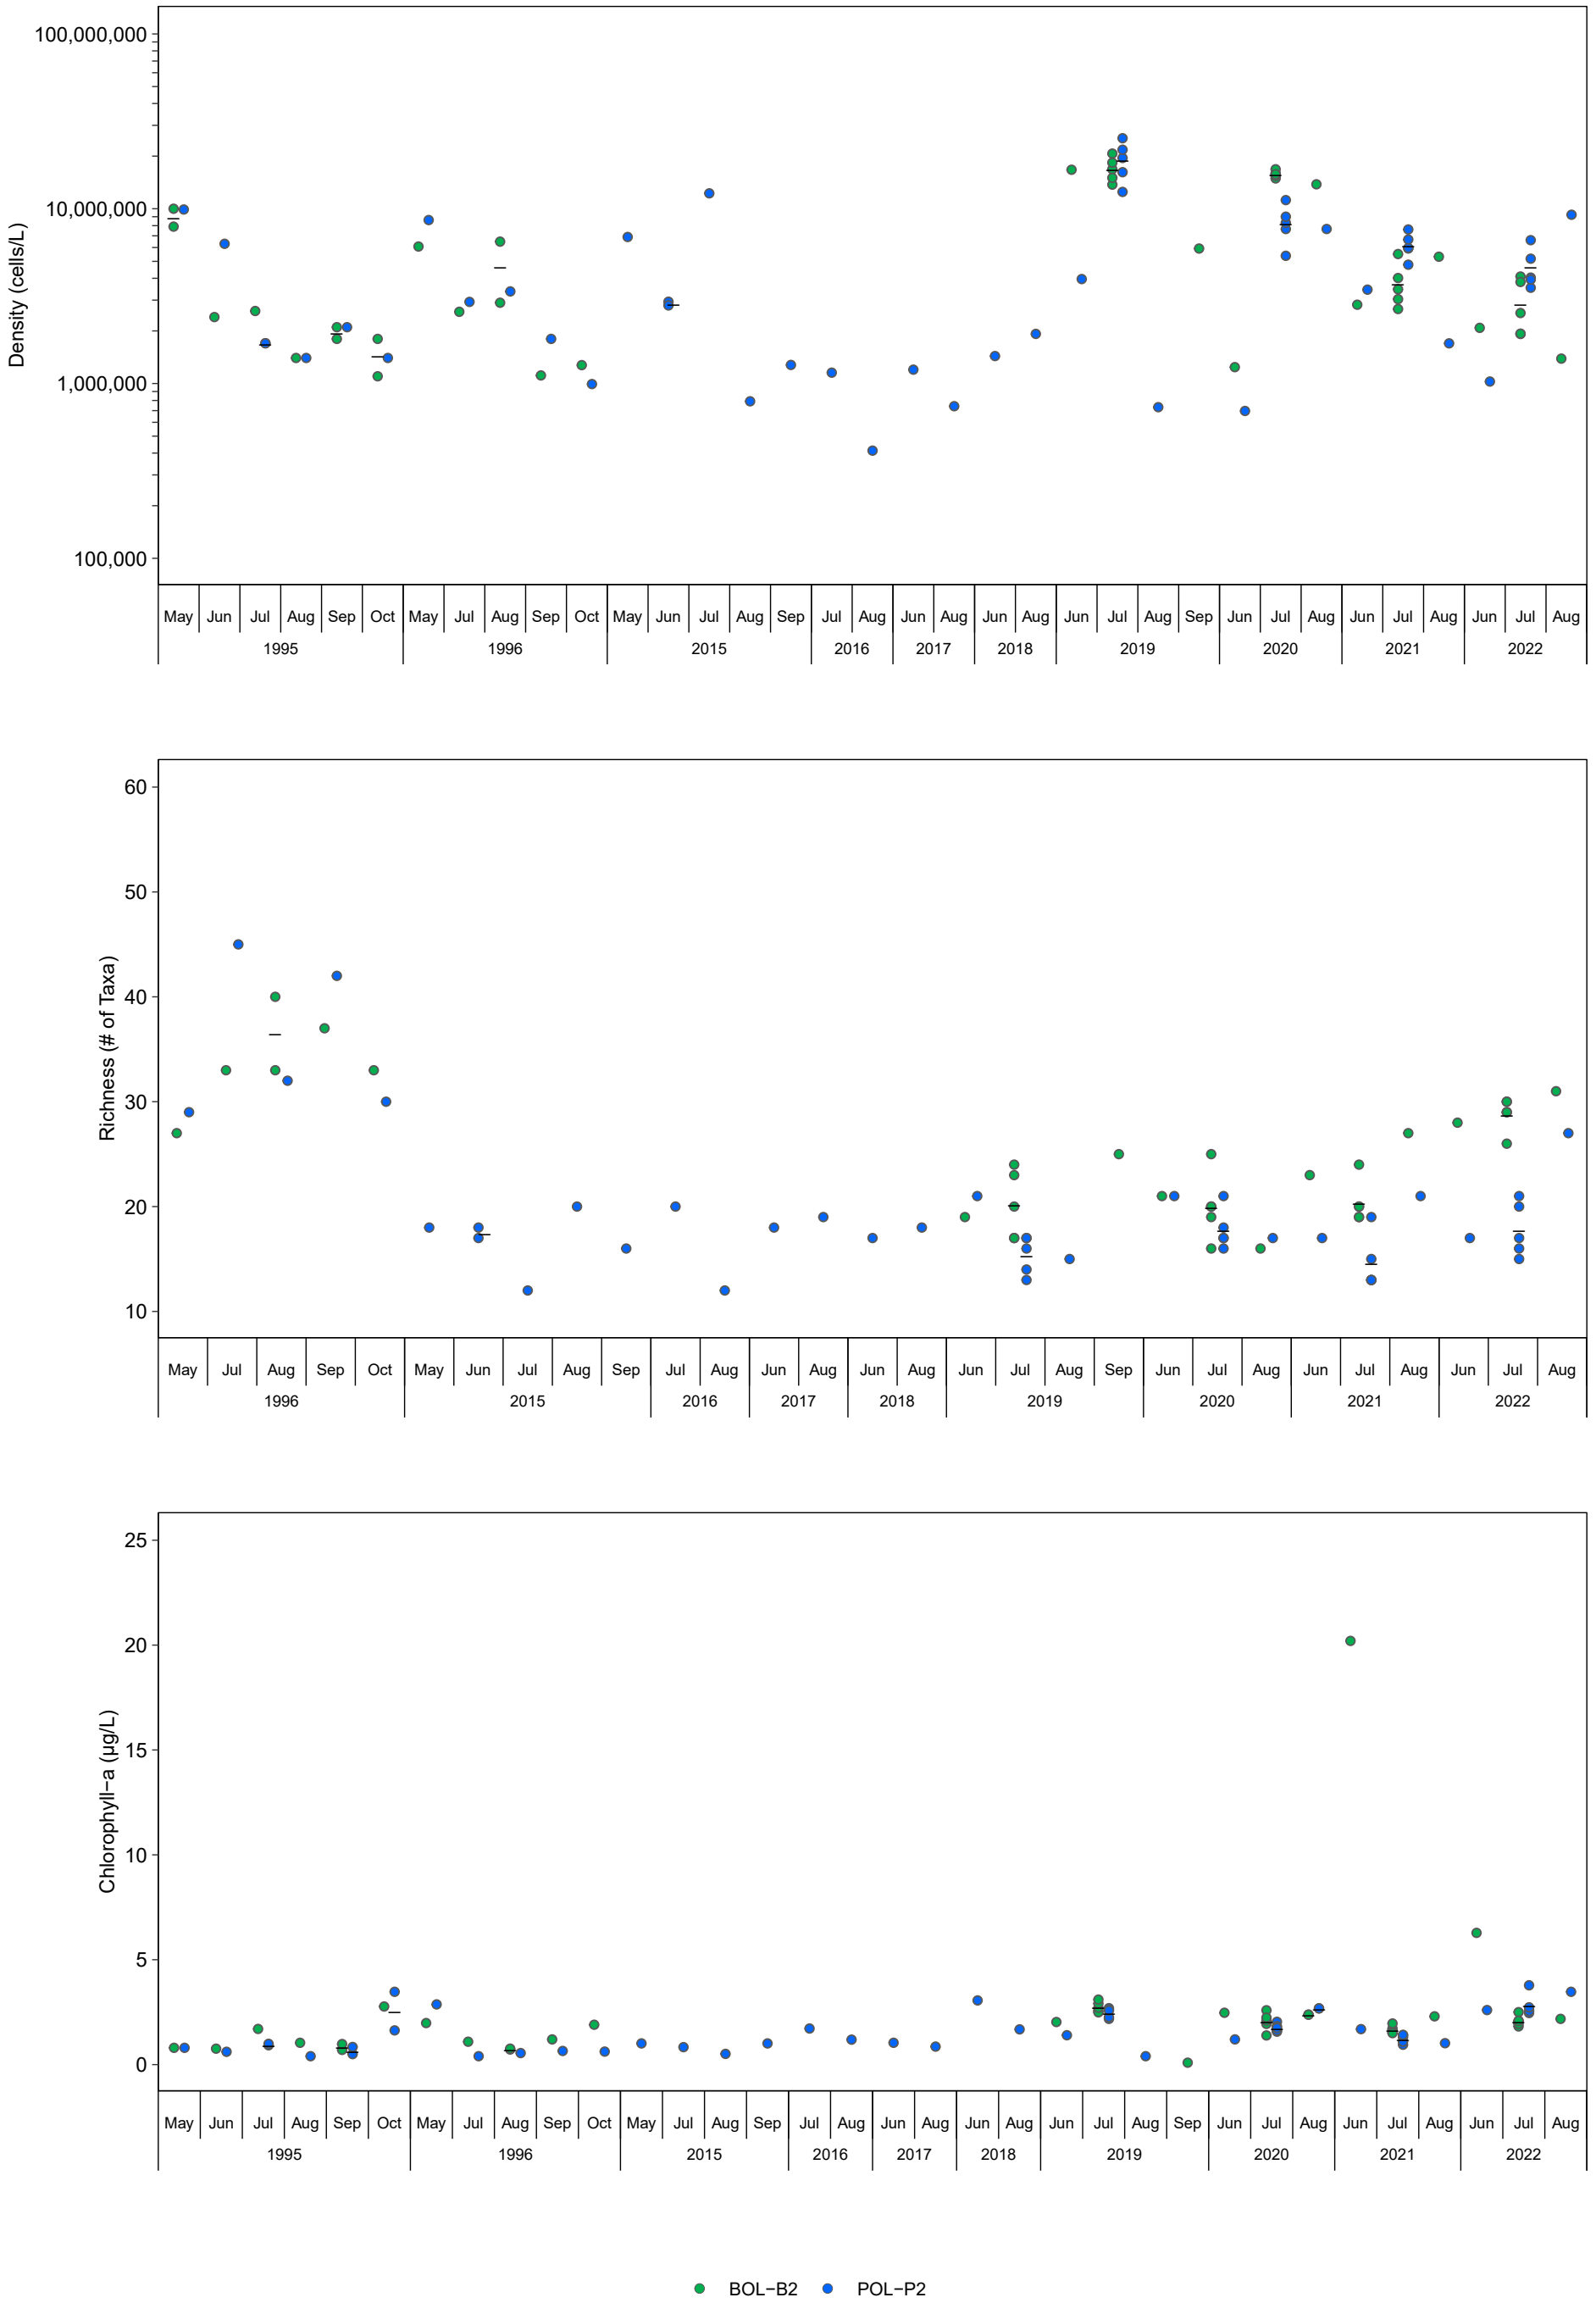

Figure E.2.1: Phytoplankton Community Endpoints for Polley Lake (POL–P2; Exposed) and Bootjack Lake (BOL–B2; Reference) Areas, 1995 to 2022

Notes: Black bars represent mean values.

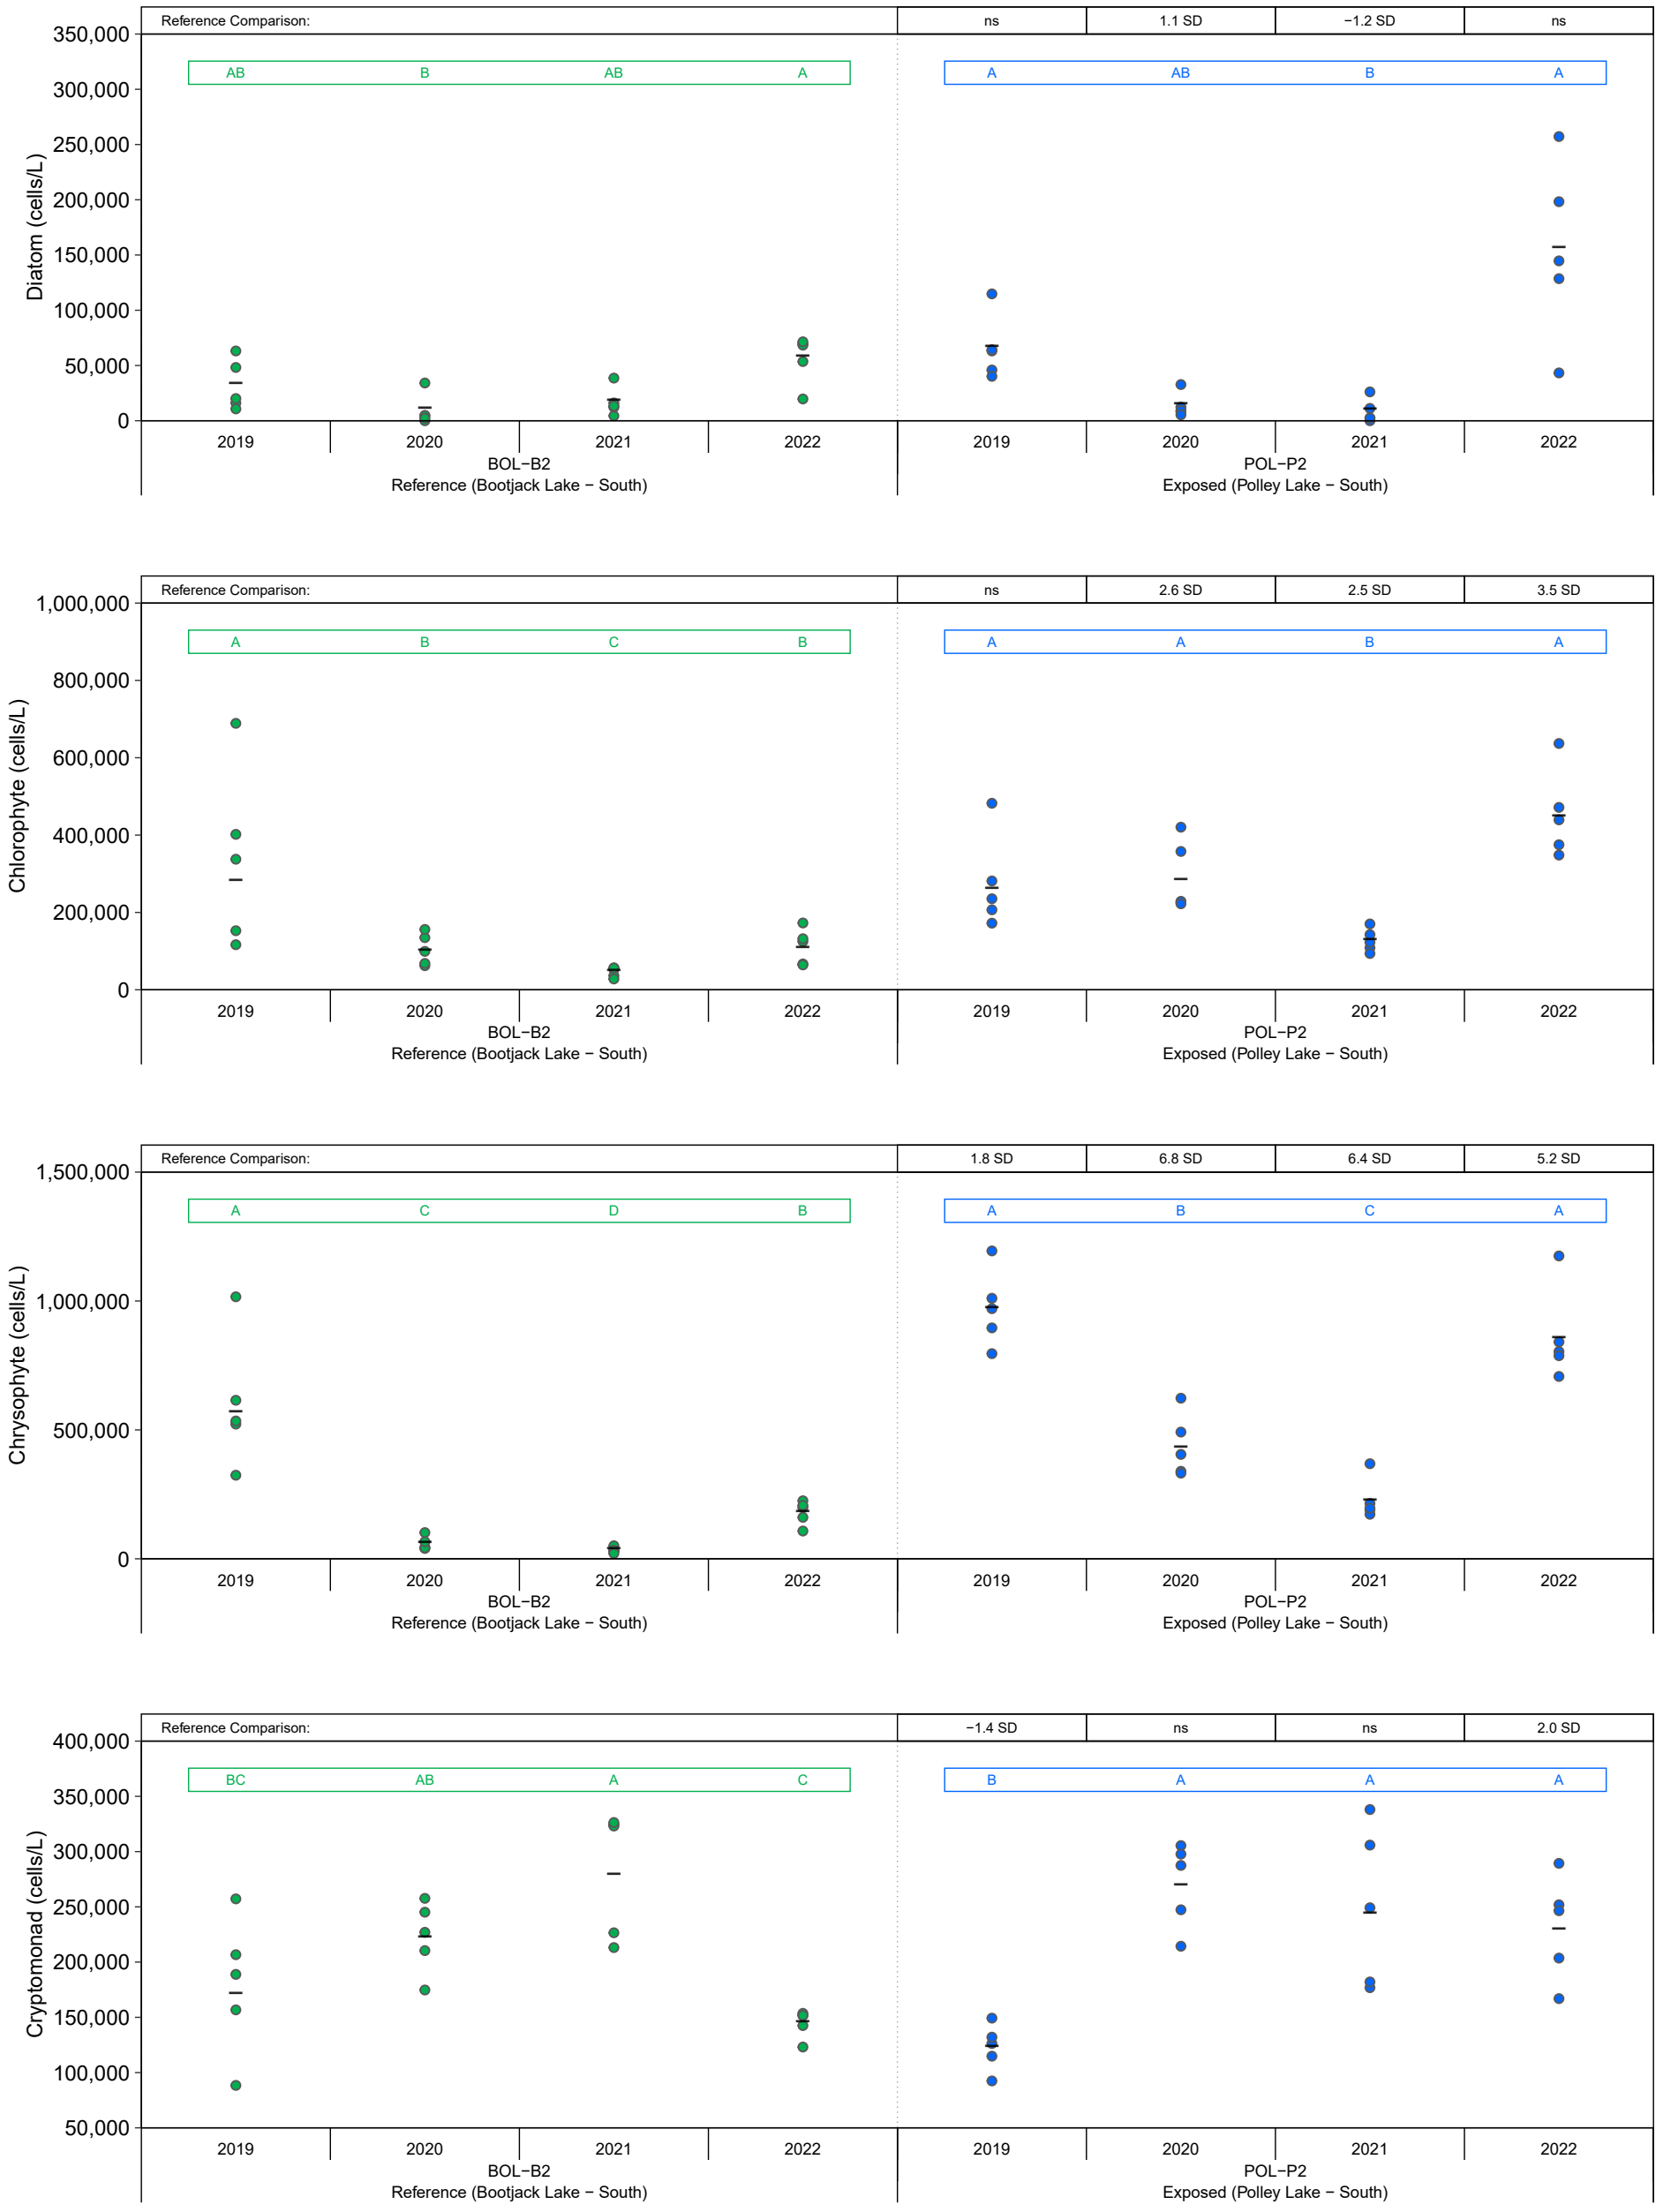

Figure E.2.2: Phytoplankton Community Endpoints for Polley Lake (POL−P2; Exposed) and Bootjack Lake (BOL−B2; Reference) Areas in July, 2019 to 2022

Notes: Black bars represent measures of central tendency (mean, geometric mean, or median depending on if analysis was conducted on untransformed, log10−transformed or rank−transformed data). Coloured letters represent significant (p−value <0.1) post−hoc comparisons within areas over time; years that share a letter of the same colour (e.g., A, B) within a box of the same colour do not differ significantly within an area. A number above the plot indicates significant exposed vs. reference post−hoc comparisons within a given year. The magnitude of difference (MOD) for these significant post−hoc comparisons are expressed in units of standard deviation (SD) or median absolute deviations (MAD; if the data were rank−transformed prior to analysis) relative to reference. 'nc' indicates no comparisons were possible; 'ns' indicates a non−significant contrast; 'nm' indicates that the MOD could not be calculated because MAD = 0. For plots of phytoplankton results prior to 2019, see Minnow 2019a, 2020a, 2021a. For unreplicated phytoplankton results collected in June and August 2022, see Appendix Table C.3.1.

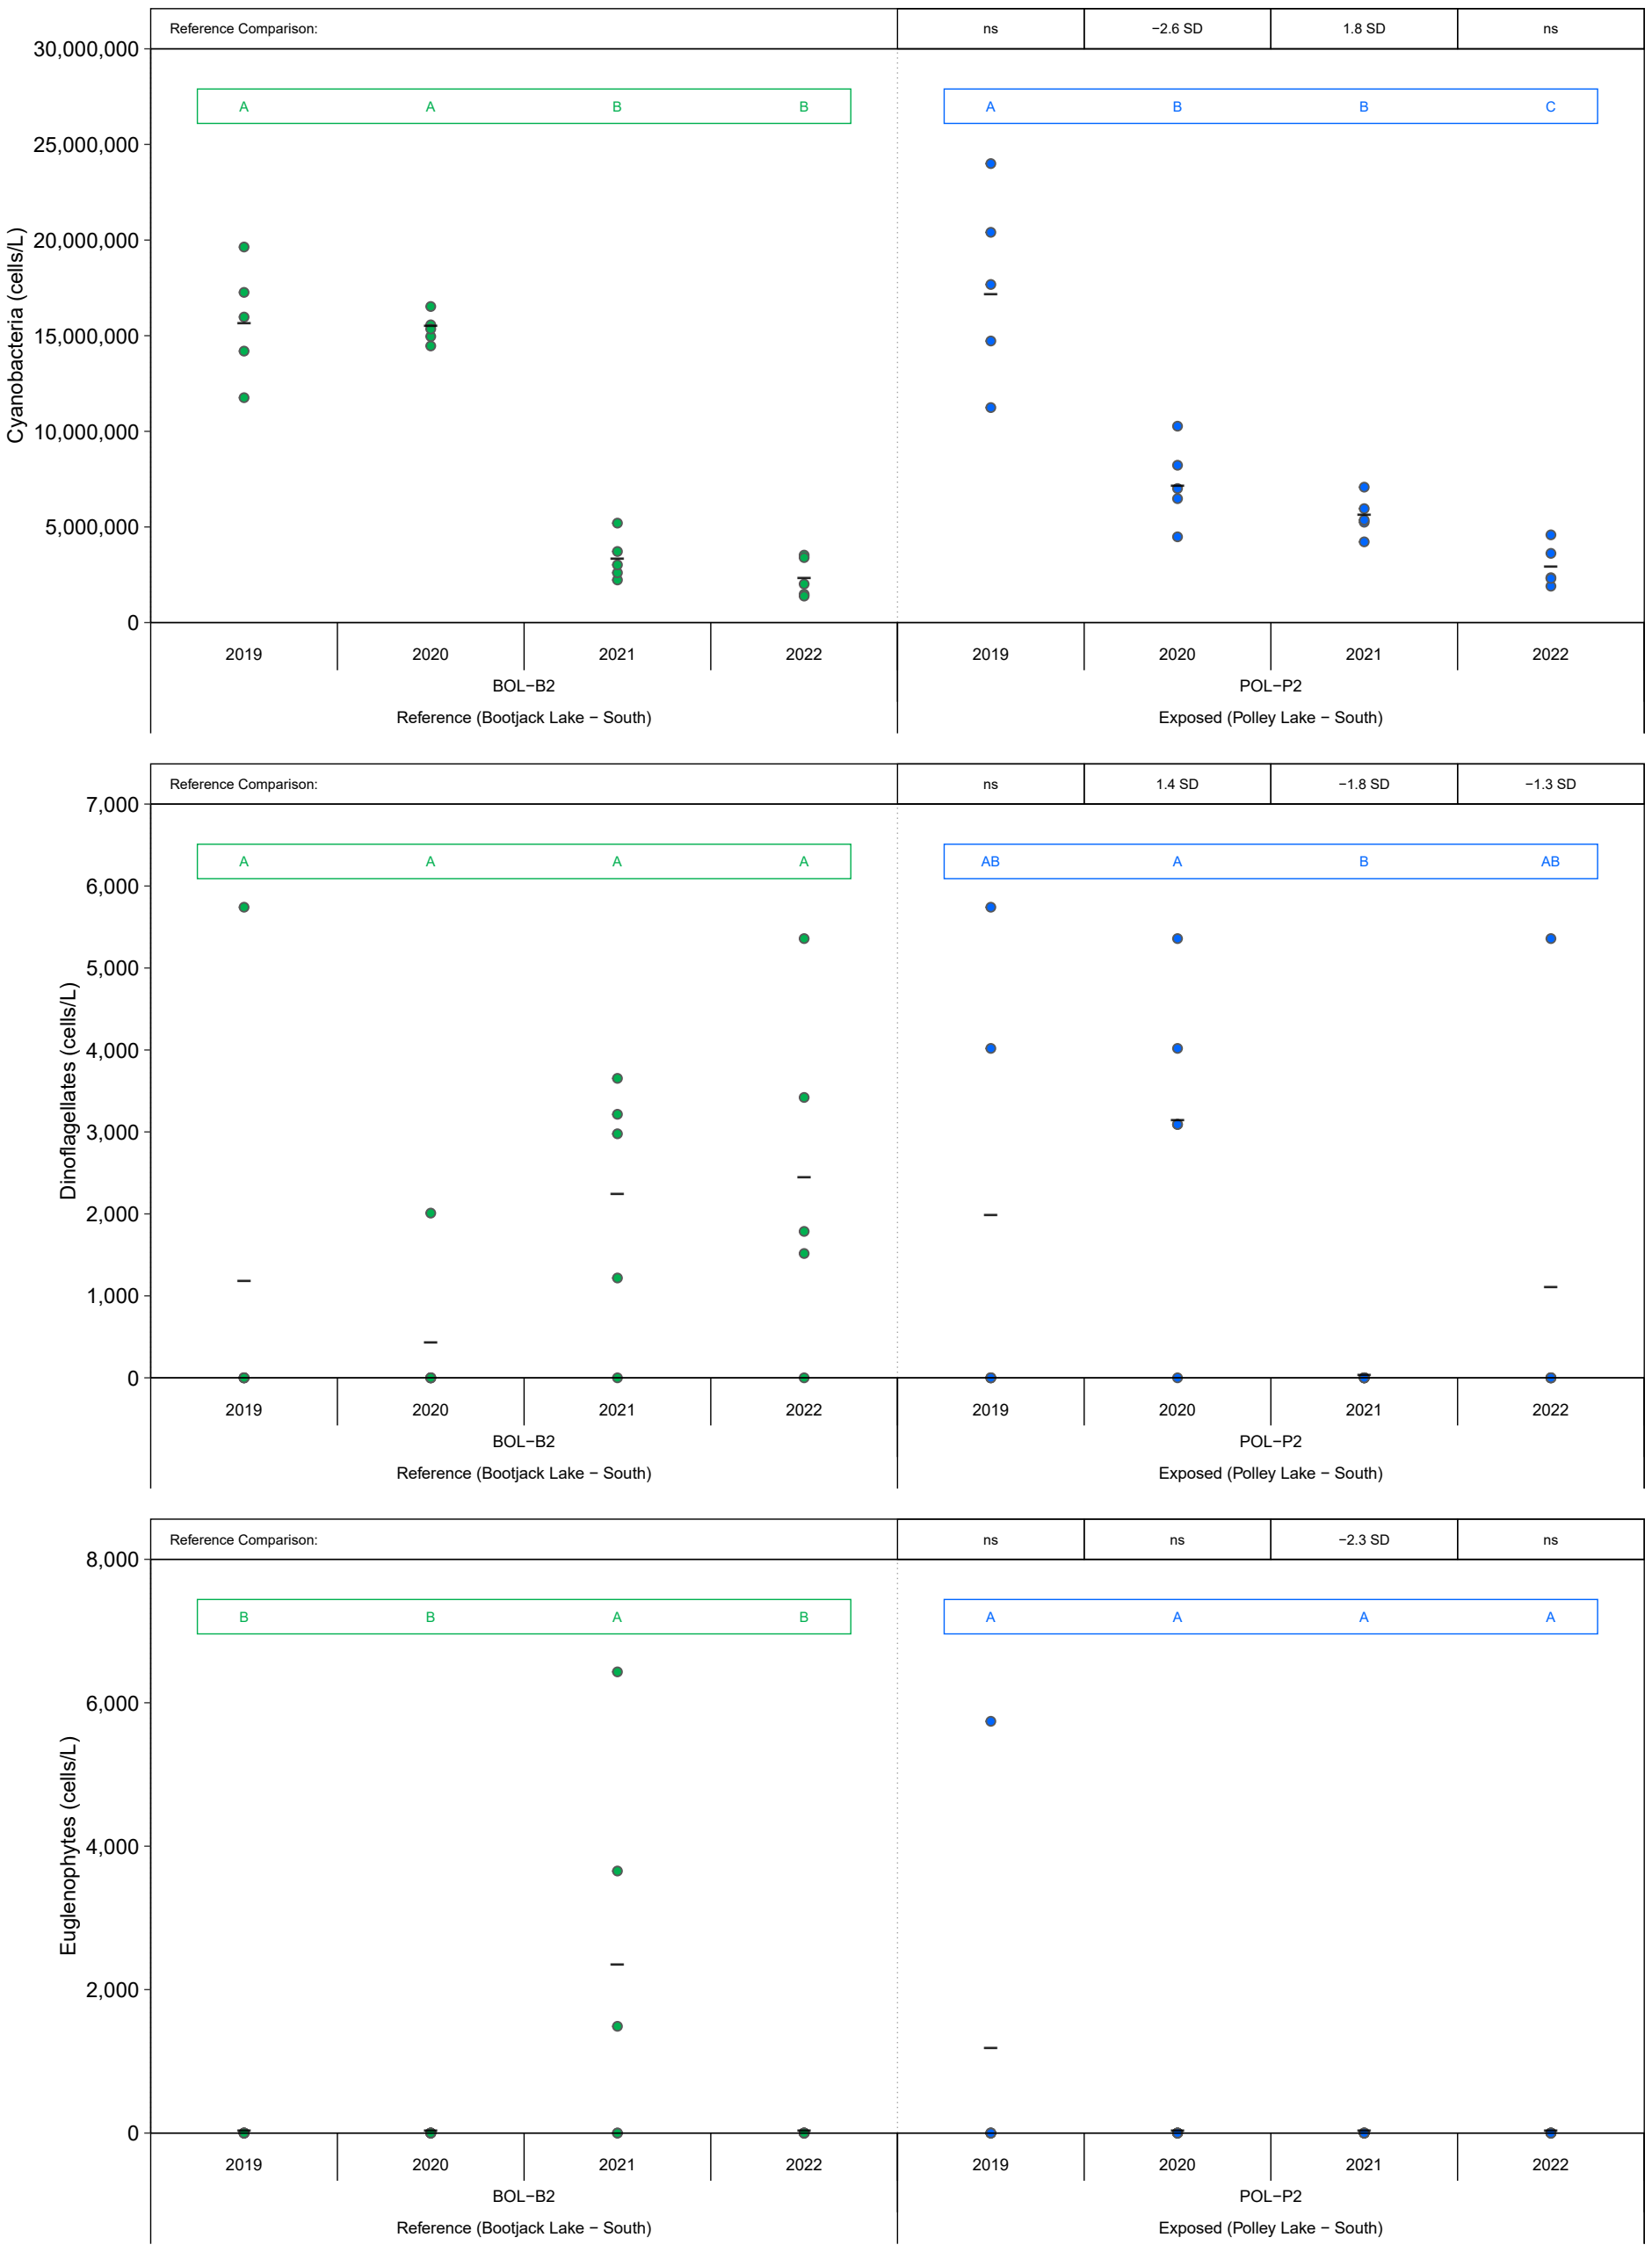

Figure E.2.2: Phytoplankton Community Endpoints for Polley Lake (POL−P2; Exposed) and Bootjack Lake (BOL−B2; Reference) Areas in July, 2019 to 2022

Notes: Black bars represent measures of central tendency (mean, geometric mean, or median depending on if analysis was conducted on untransformed, log10−transformed or rank−transformed data). Coloured letters represent significant (p−value <0.1) post−hoc comparisons within areas over time; years that share a letter of the same colour (e.g., A, B) within a box of the same colour do not differ significantly within an area. A number above the plot indicates significant exposed vs. reference post−hoc comparisons within a given year. The magnitude of difference (MOD) for these significant post−hoc comparisons are expressed in units of standard deviation (SD) or median absolute deviations (MAD; if the data were rank−transformed prior to analysis) relative to reference. 'nc' indicates no comparisons were possible; 'ns' indicates a non−significant contrast; 'nm' indicates that the MOD could not be calculated because MAD = 0. 'nc' indicates no comparisons were possible; 'ns' indicates a non−significant contrast; 'nm' indicates that the MOD could not be calculated because MAD = 0. For plots of phytoplankton results prior to 2019, see Minnow 2019a, 2020a, 2021a. For unreplicated phytoplankton results collected in June and August 2022, see Appendix Table C.3.1.

Figure E.2.3: Mean Densities of Major Phytoplankton Community Taxonomic Groups for Polley Lake (POL−P2; Exposed) and Bootjack Lake (BOL−B2; Reference) Areas, 2019 to 2022

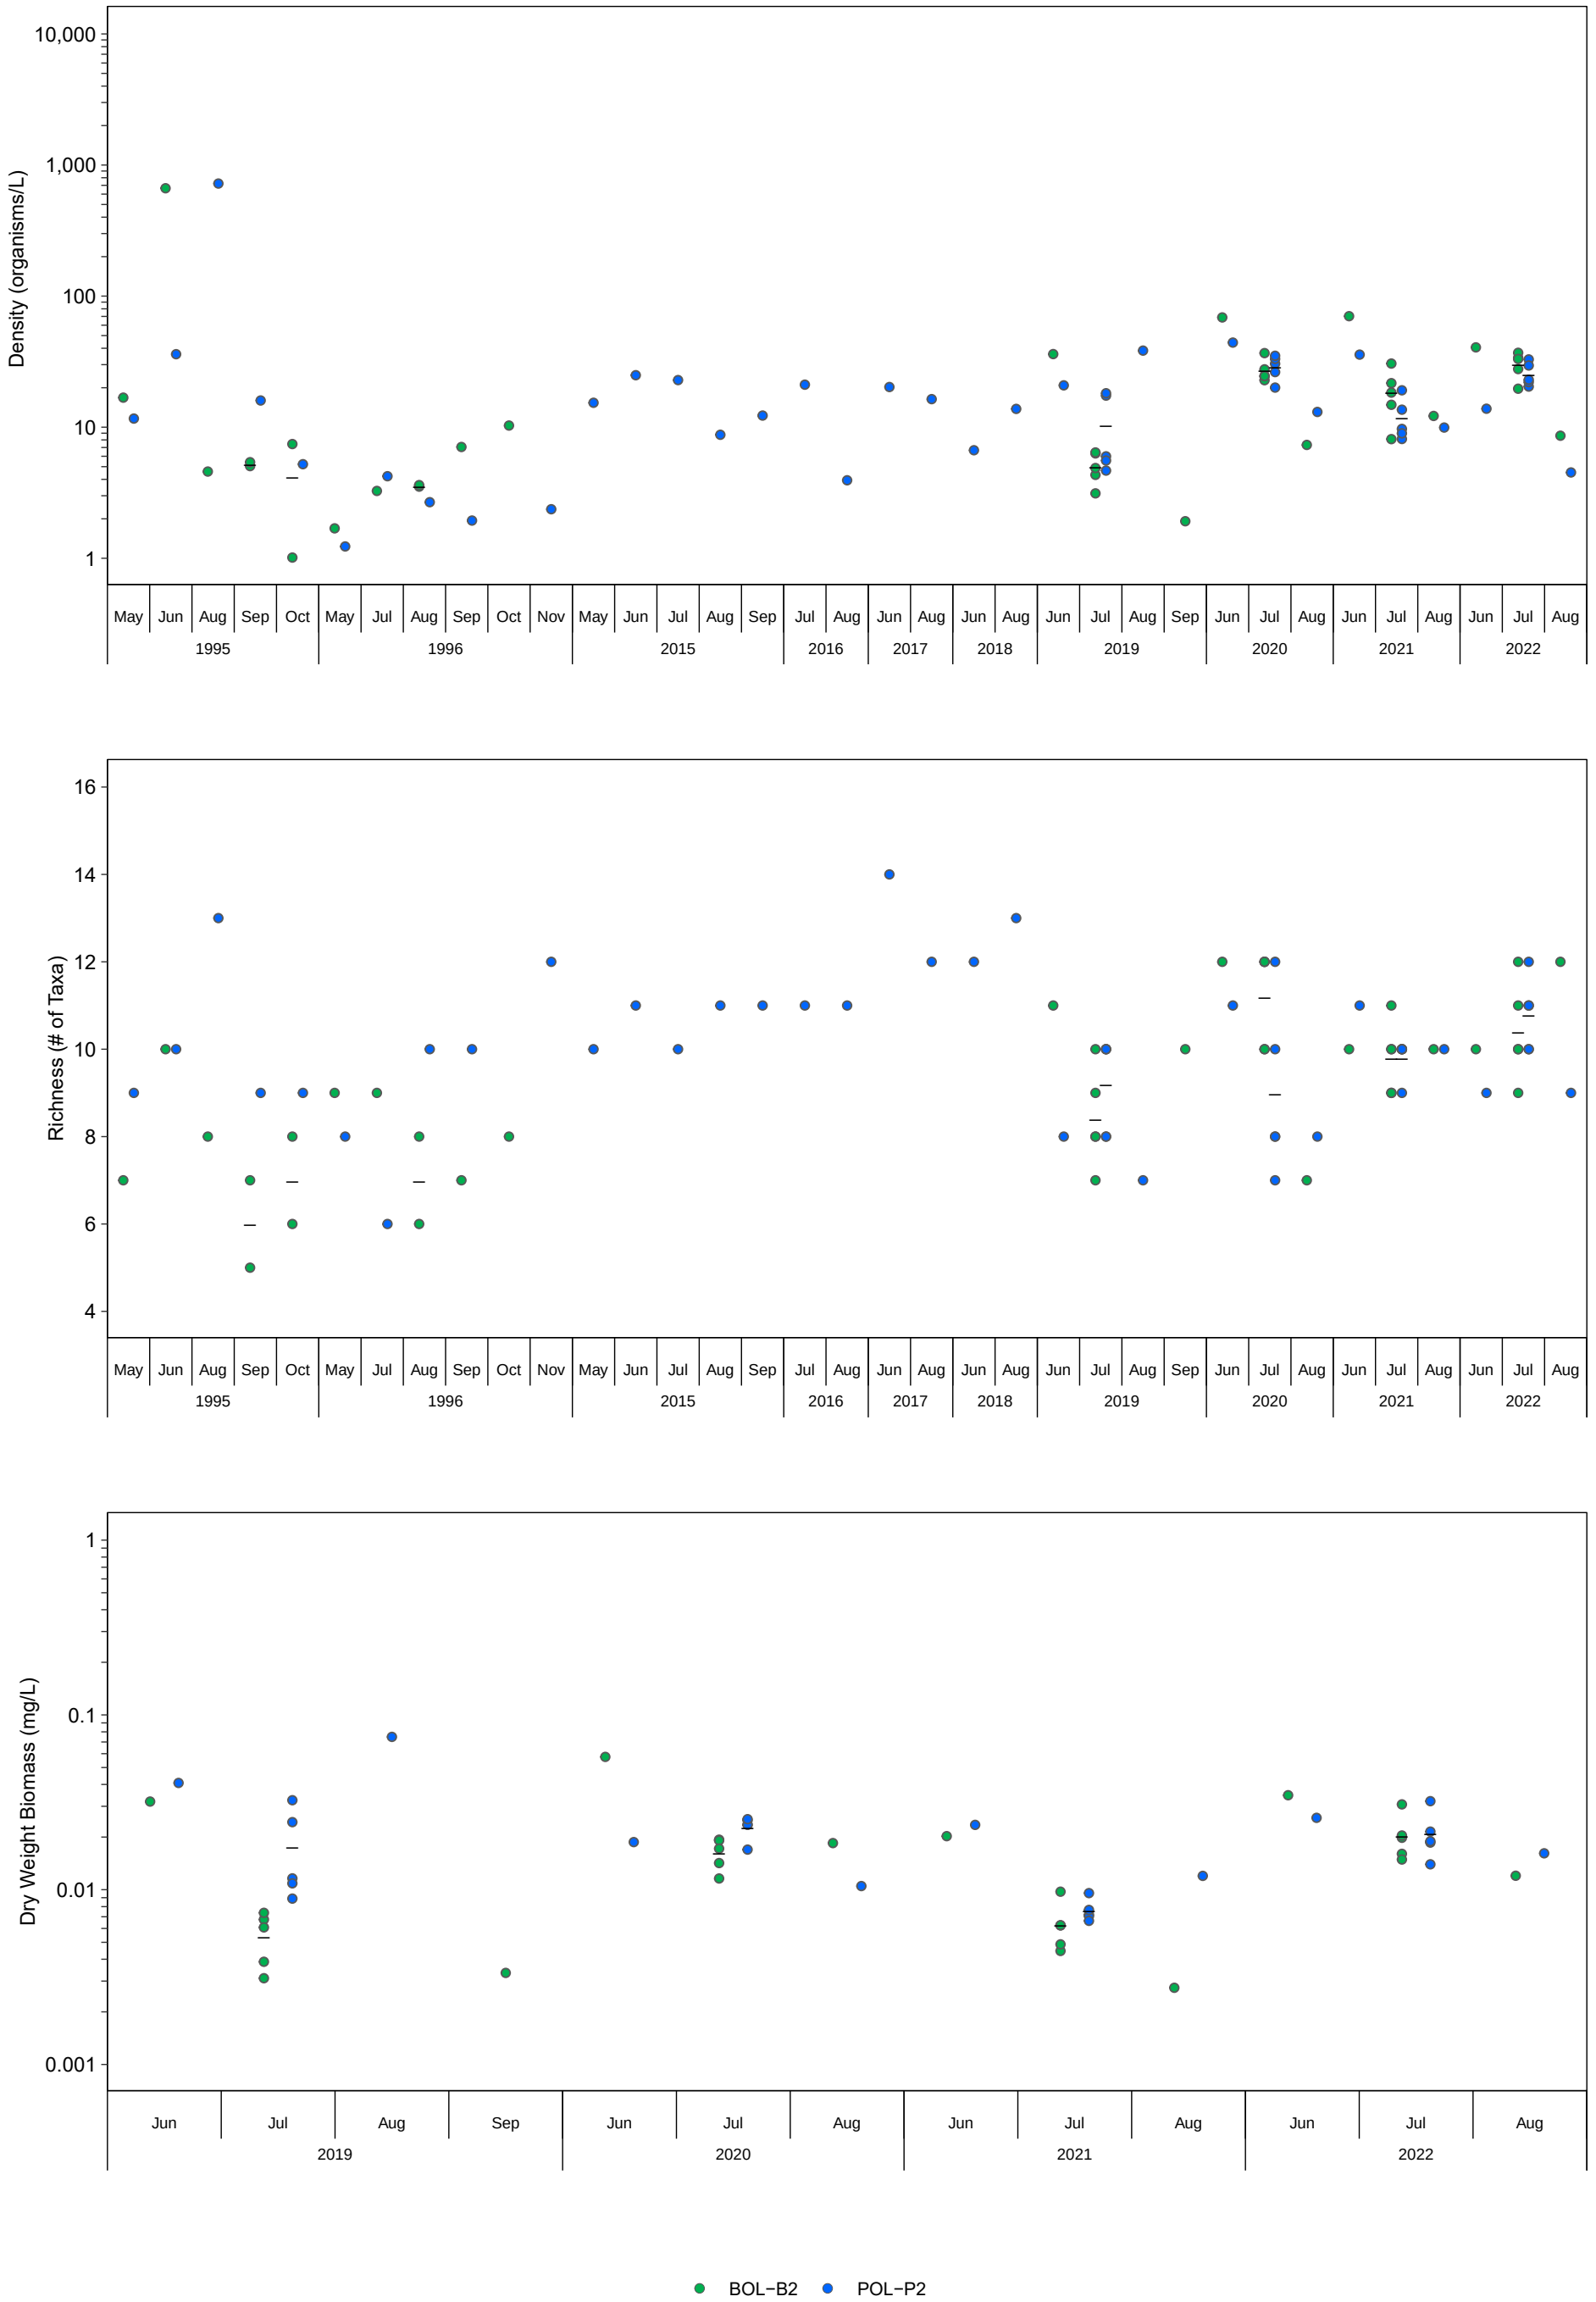

Figure E.2.4: Zooplankton Community Endpoints for Polley Lake (POL−P2; Exposed) and Bootjack Lake (BOL−B2; Reference) Areas, 1995 to 2022

Notes: Black bars represent mean values. Results displayed for POL-P2 (August 2019) in the current figure differ from those presented in previous reports (Minnow 2020a, 2021a, 2022a) for the same sampling area and date. This discrepancy is due to an incorrect calculation for these results in the prior reporting years.

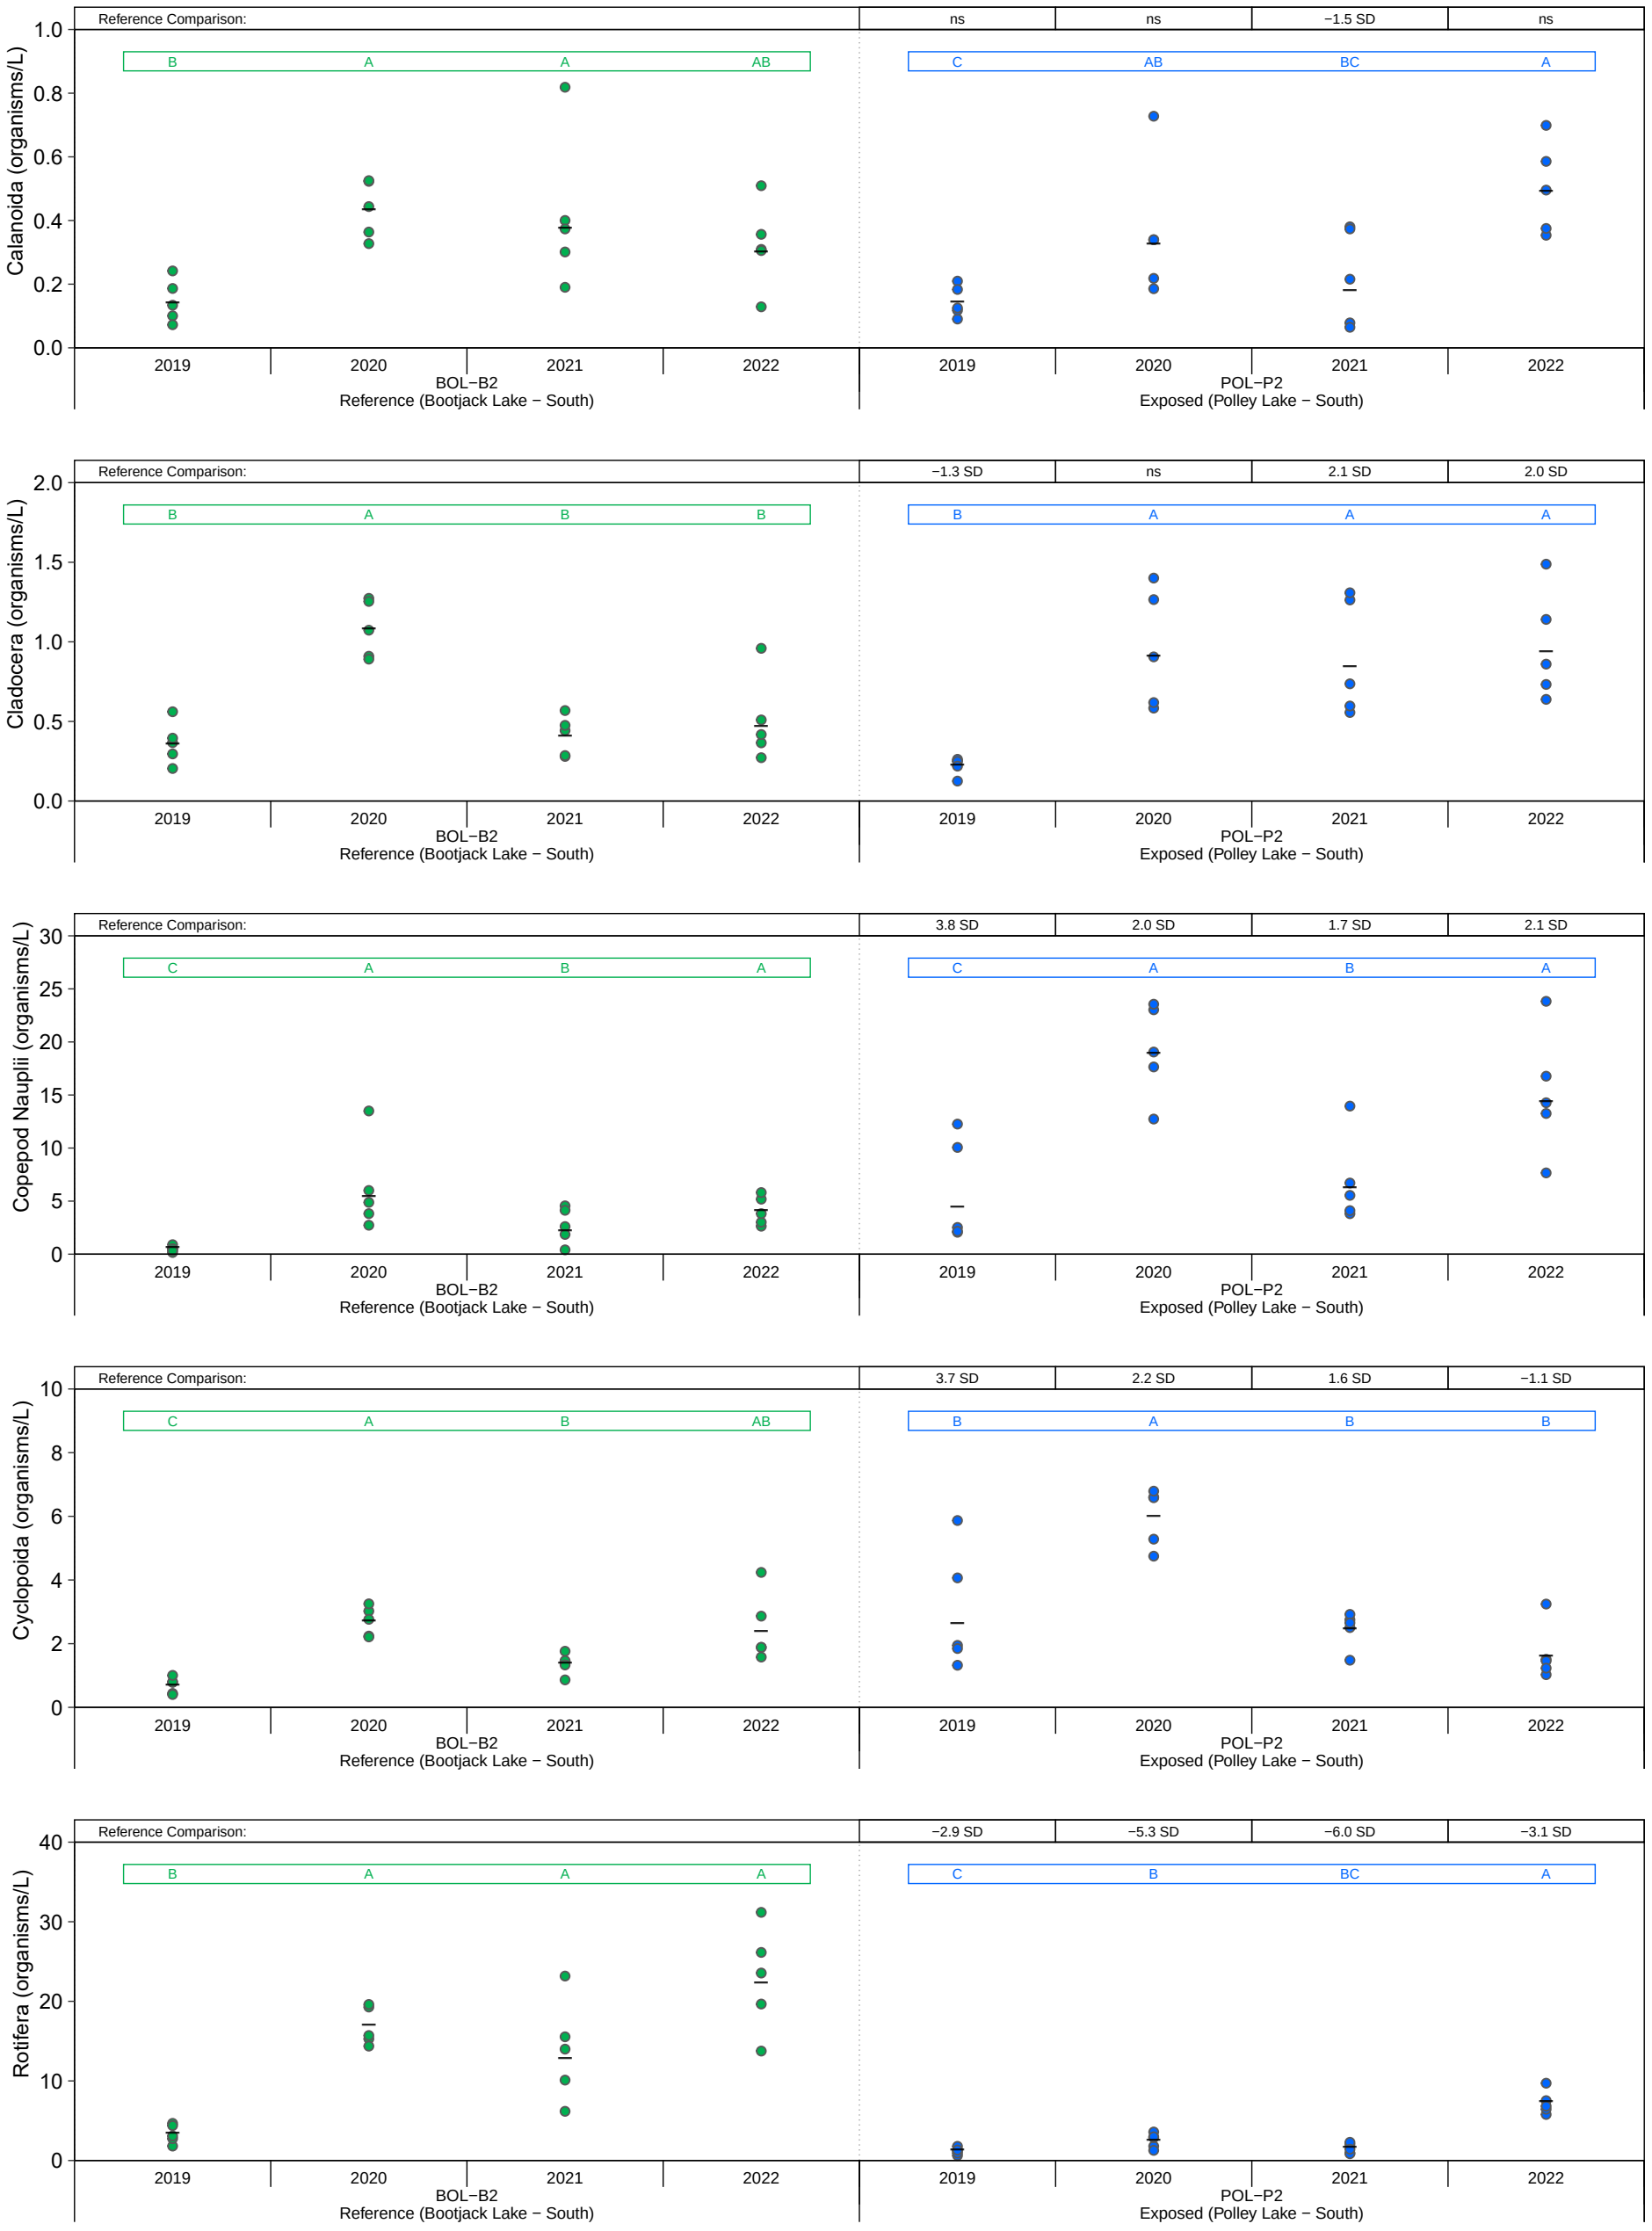

Figure E.2.5: Zooplankton Community Endpoints for Polley Lake (POL−P2; Exposed) and Bootjack Lake (BOL−B2; Reference Areas in July, 2019 to 2022

Notes: Black bars represent measures of central tendency (mean, geometric mean, or median depending on if analysis was conducted on untransformed, log10−transformed or rank−transformed data). Coloured letters represent significant (p−value <0.1) post−hoc comparisons within areas over time; years that share a letter of the same colour (e.g., A, B) within a box of the same colour do not differ significantly within an area. A number above the plot indicates significant exposed vs. reference post−hoc comparisons within a given year. The magnitude of difference (MOD) for these significant post−hoc comparisons are expressed in units of standard deviation (SD) or median absolute deviations (MAD; if the data were rank−transformed prior to analysis) relative to reference. 'nc' indicates no comparisons were possible; 'ns' indicates a non−significant contrast; 'nm' indicates that the MOD could not be calculated because MAD = 0. For plots of zooplankton results prior to 2019, see Minnow 2019a, 2020a, 2021a. For unreplicated zooplankton results collected in June and August 2022, see Appendix Table C.3.3.

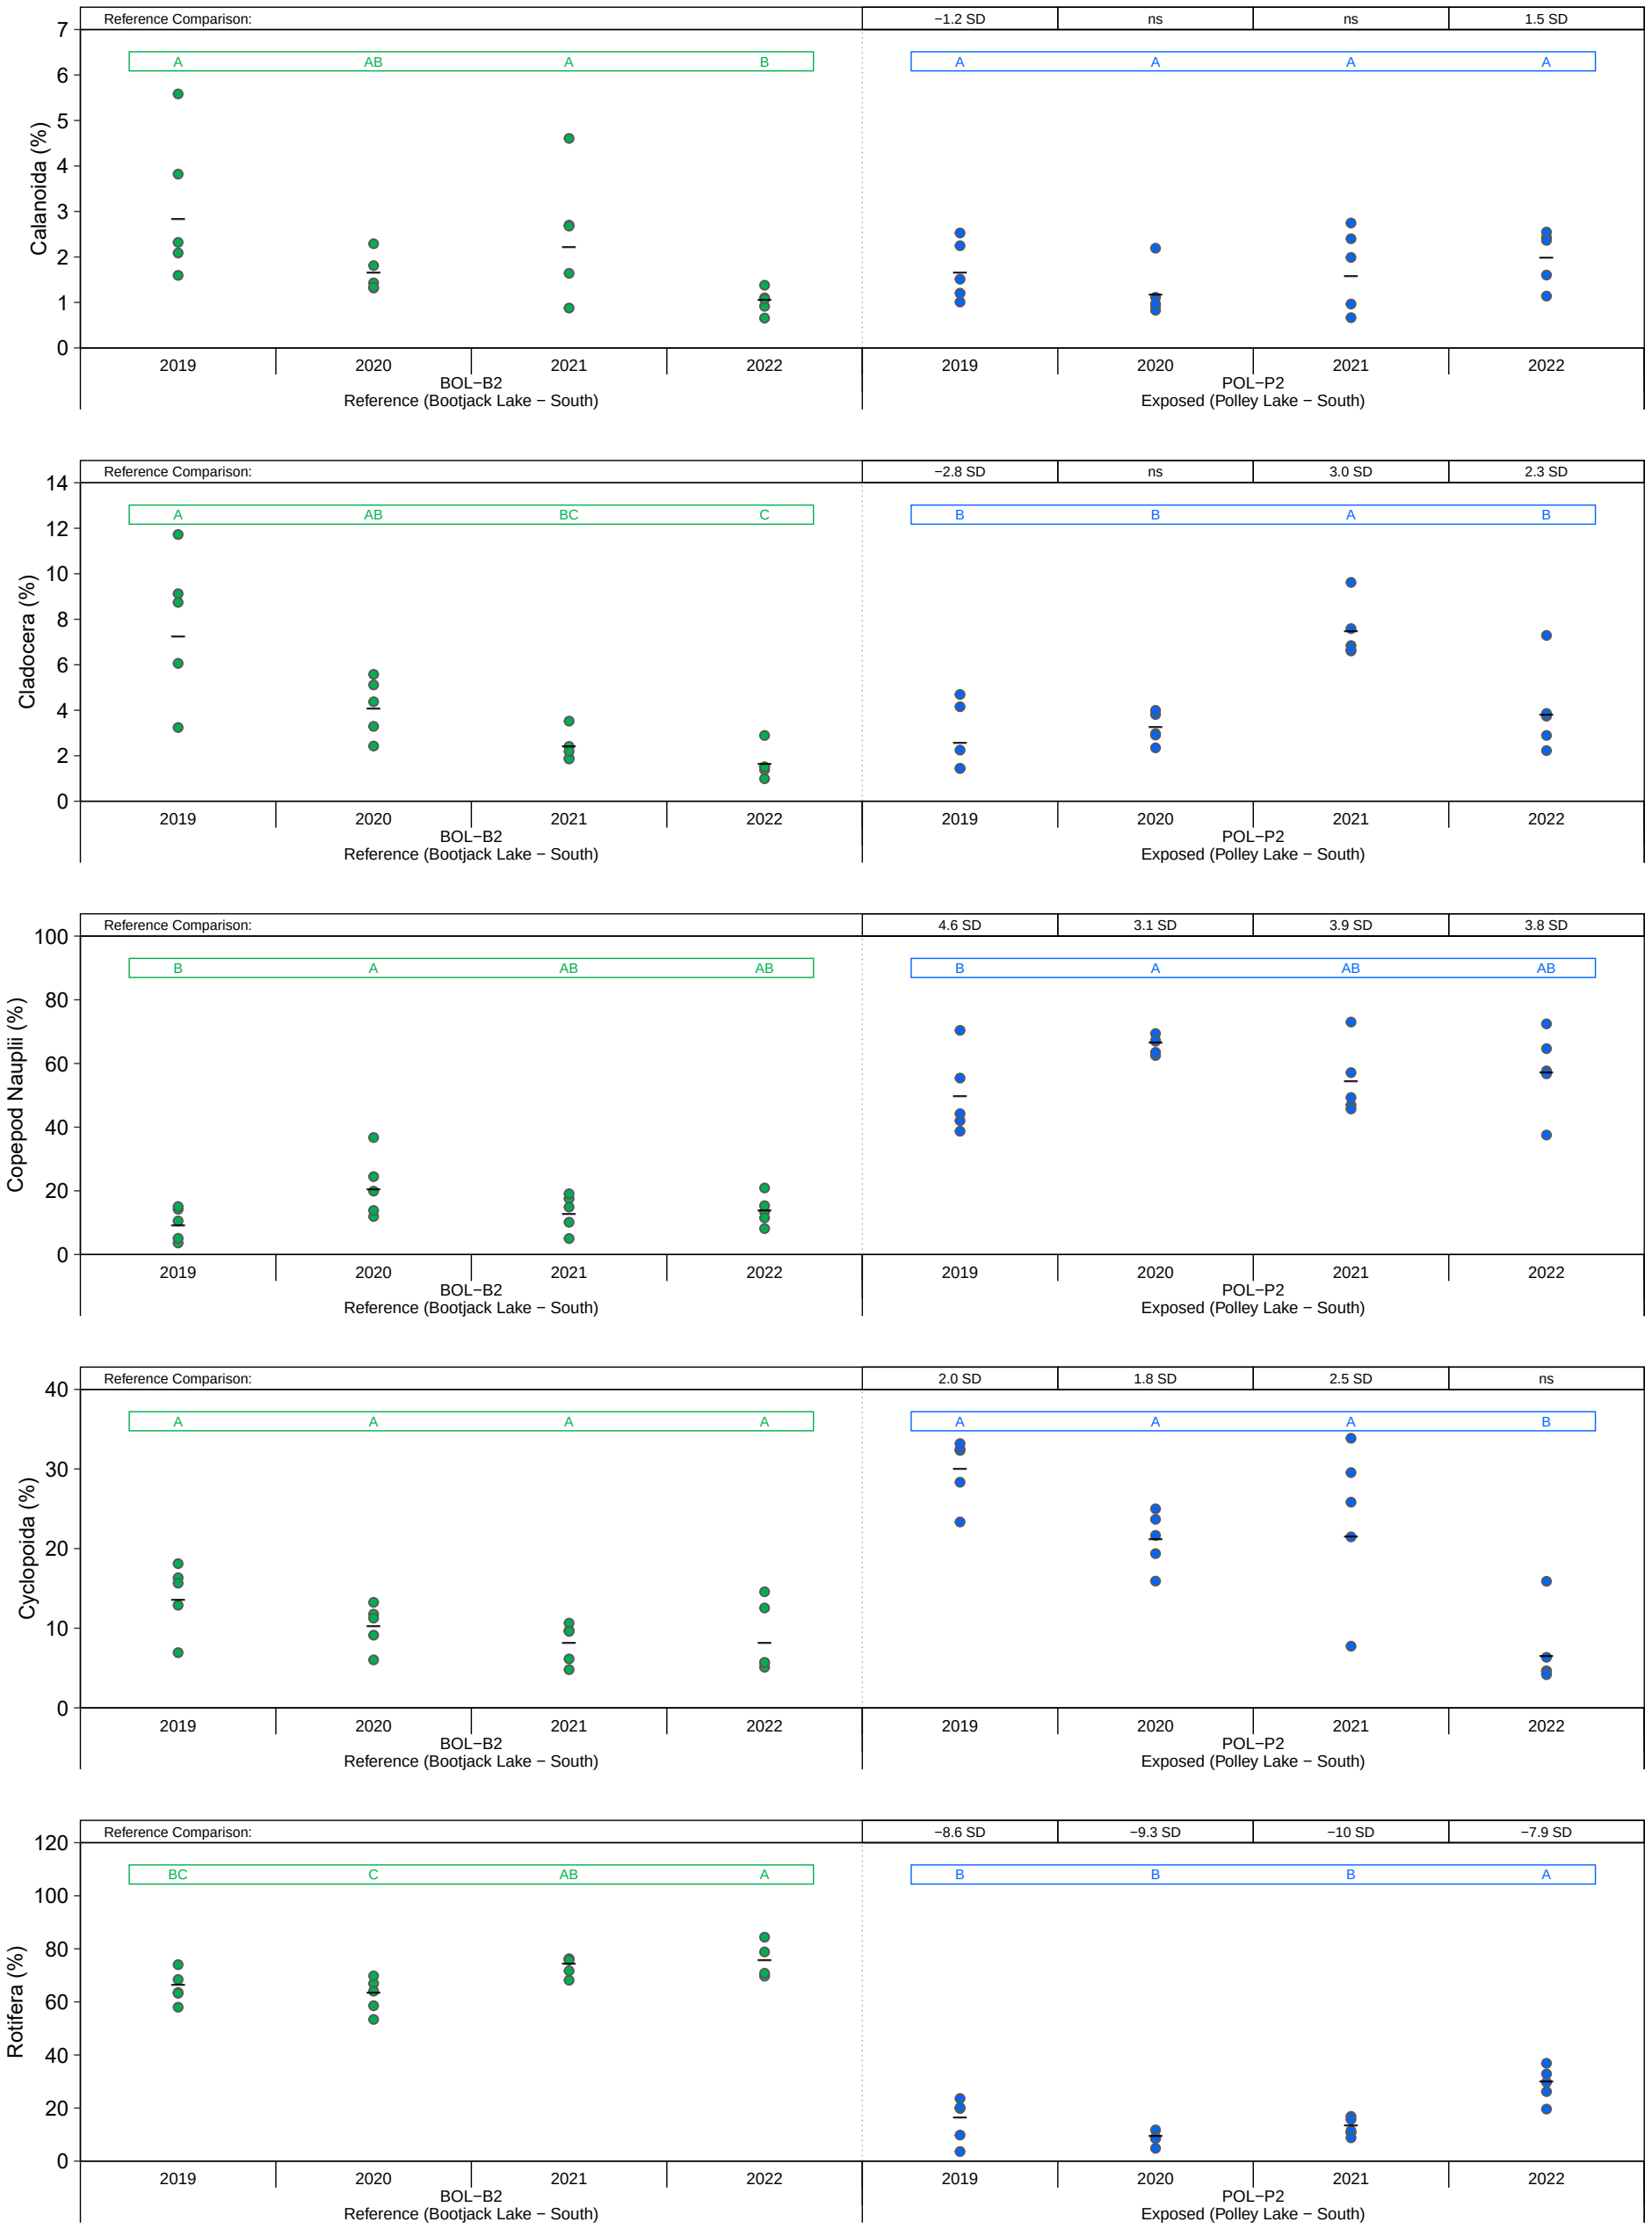

Figure E.2.5: Zooplankton Community Endpoints for Polley Lake (POL−P2; Exposed) and Bootjack Lake (BOL−B2; Reference) Areas in July, 2019 to 2022

Notes: Black bars represent measures of central tendency (mean, geometric mean, or median depending on if analysis was conducted on untransformed, log10−transformed or rank−transformed data). Coloured letters represent significant (p−value <0.1) post−hoc comparisons within areas over time; years that share a letter of the same colour (e.g., A, B) within a box of the same colour do not differ significantly within an area. A number above the plot indicates significant exposed vs. reference post−hoc comparisons within a given year. The magnitude of difference (MOD) for these significant post−hoc comparisons are expressed in units of standard deviation (SD) or median absolute deviations (MAD; if the data were rank−transformed prior to analysis) relative to reference. 'nc' indicates no comparisons were possible; 'ns' indicates a non−significant contrast; 'nm' indicates that the MOD could not be calculated because MAD = 0. For plots of zooplankton results prior to 2019, see Minnow 2019a, 2020a, 2021a. For unreplicated zooplankton results collected in June and August 2022, see Appendix Table C.3.3.

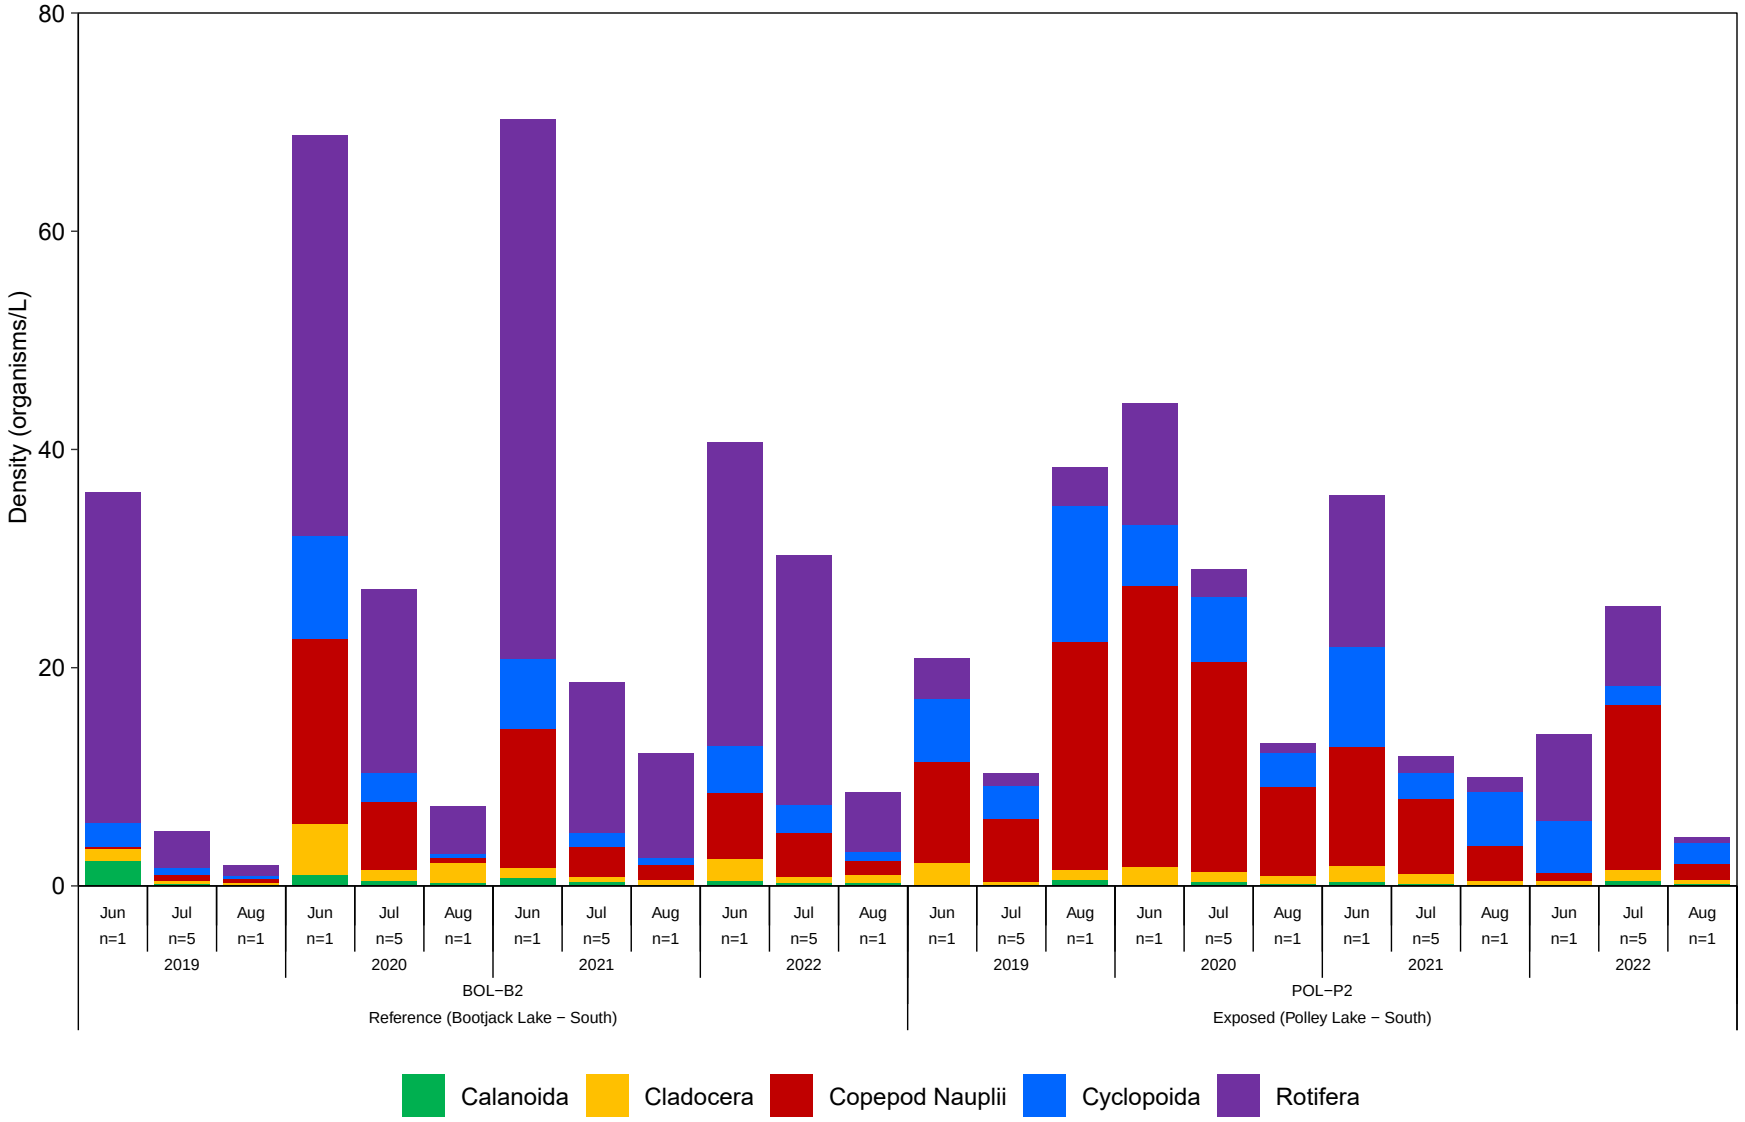

Figure E.2.6: Mean Densities of Major Zooplankton Community Taxonomic Groups for Polley Lake (POL−P2; Exposed) and Bootjack Lake (BOL−B2; Reference) Areas, 2019 to 2022

Notes: Results displayed for POL-P2 (August 2019) in the current figure differ from those presented in previous reports (Minnow 2020a, 2021a, 2022a) for the same sampling area and date. This discrepany is due to an incorrect calculation for these results in the prior reporting years.

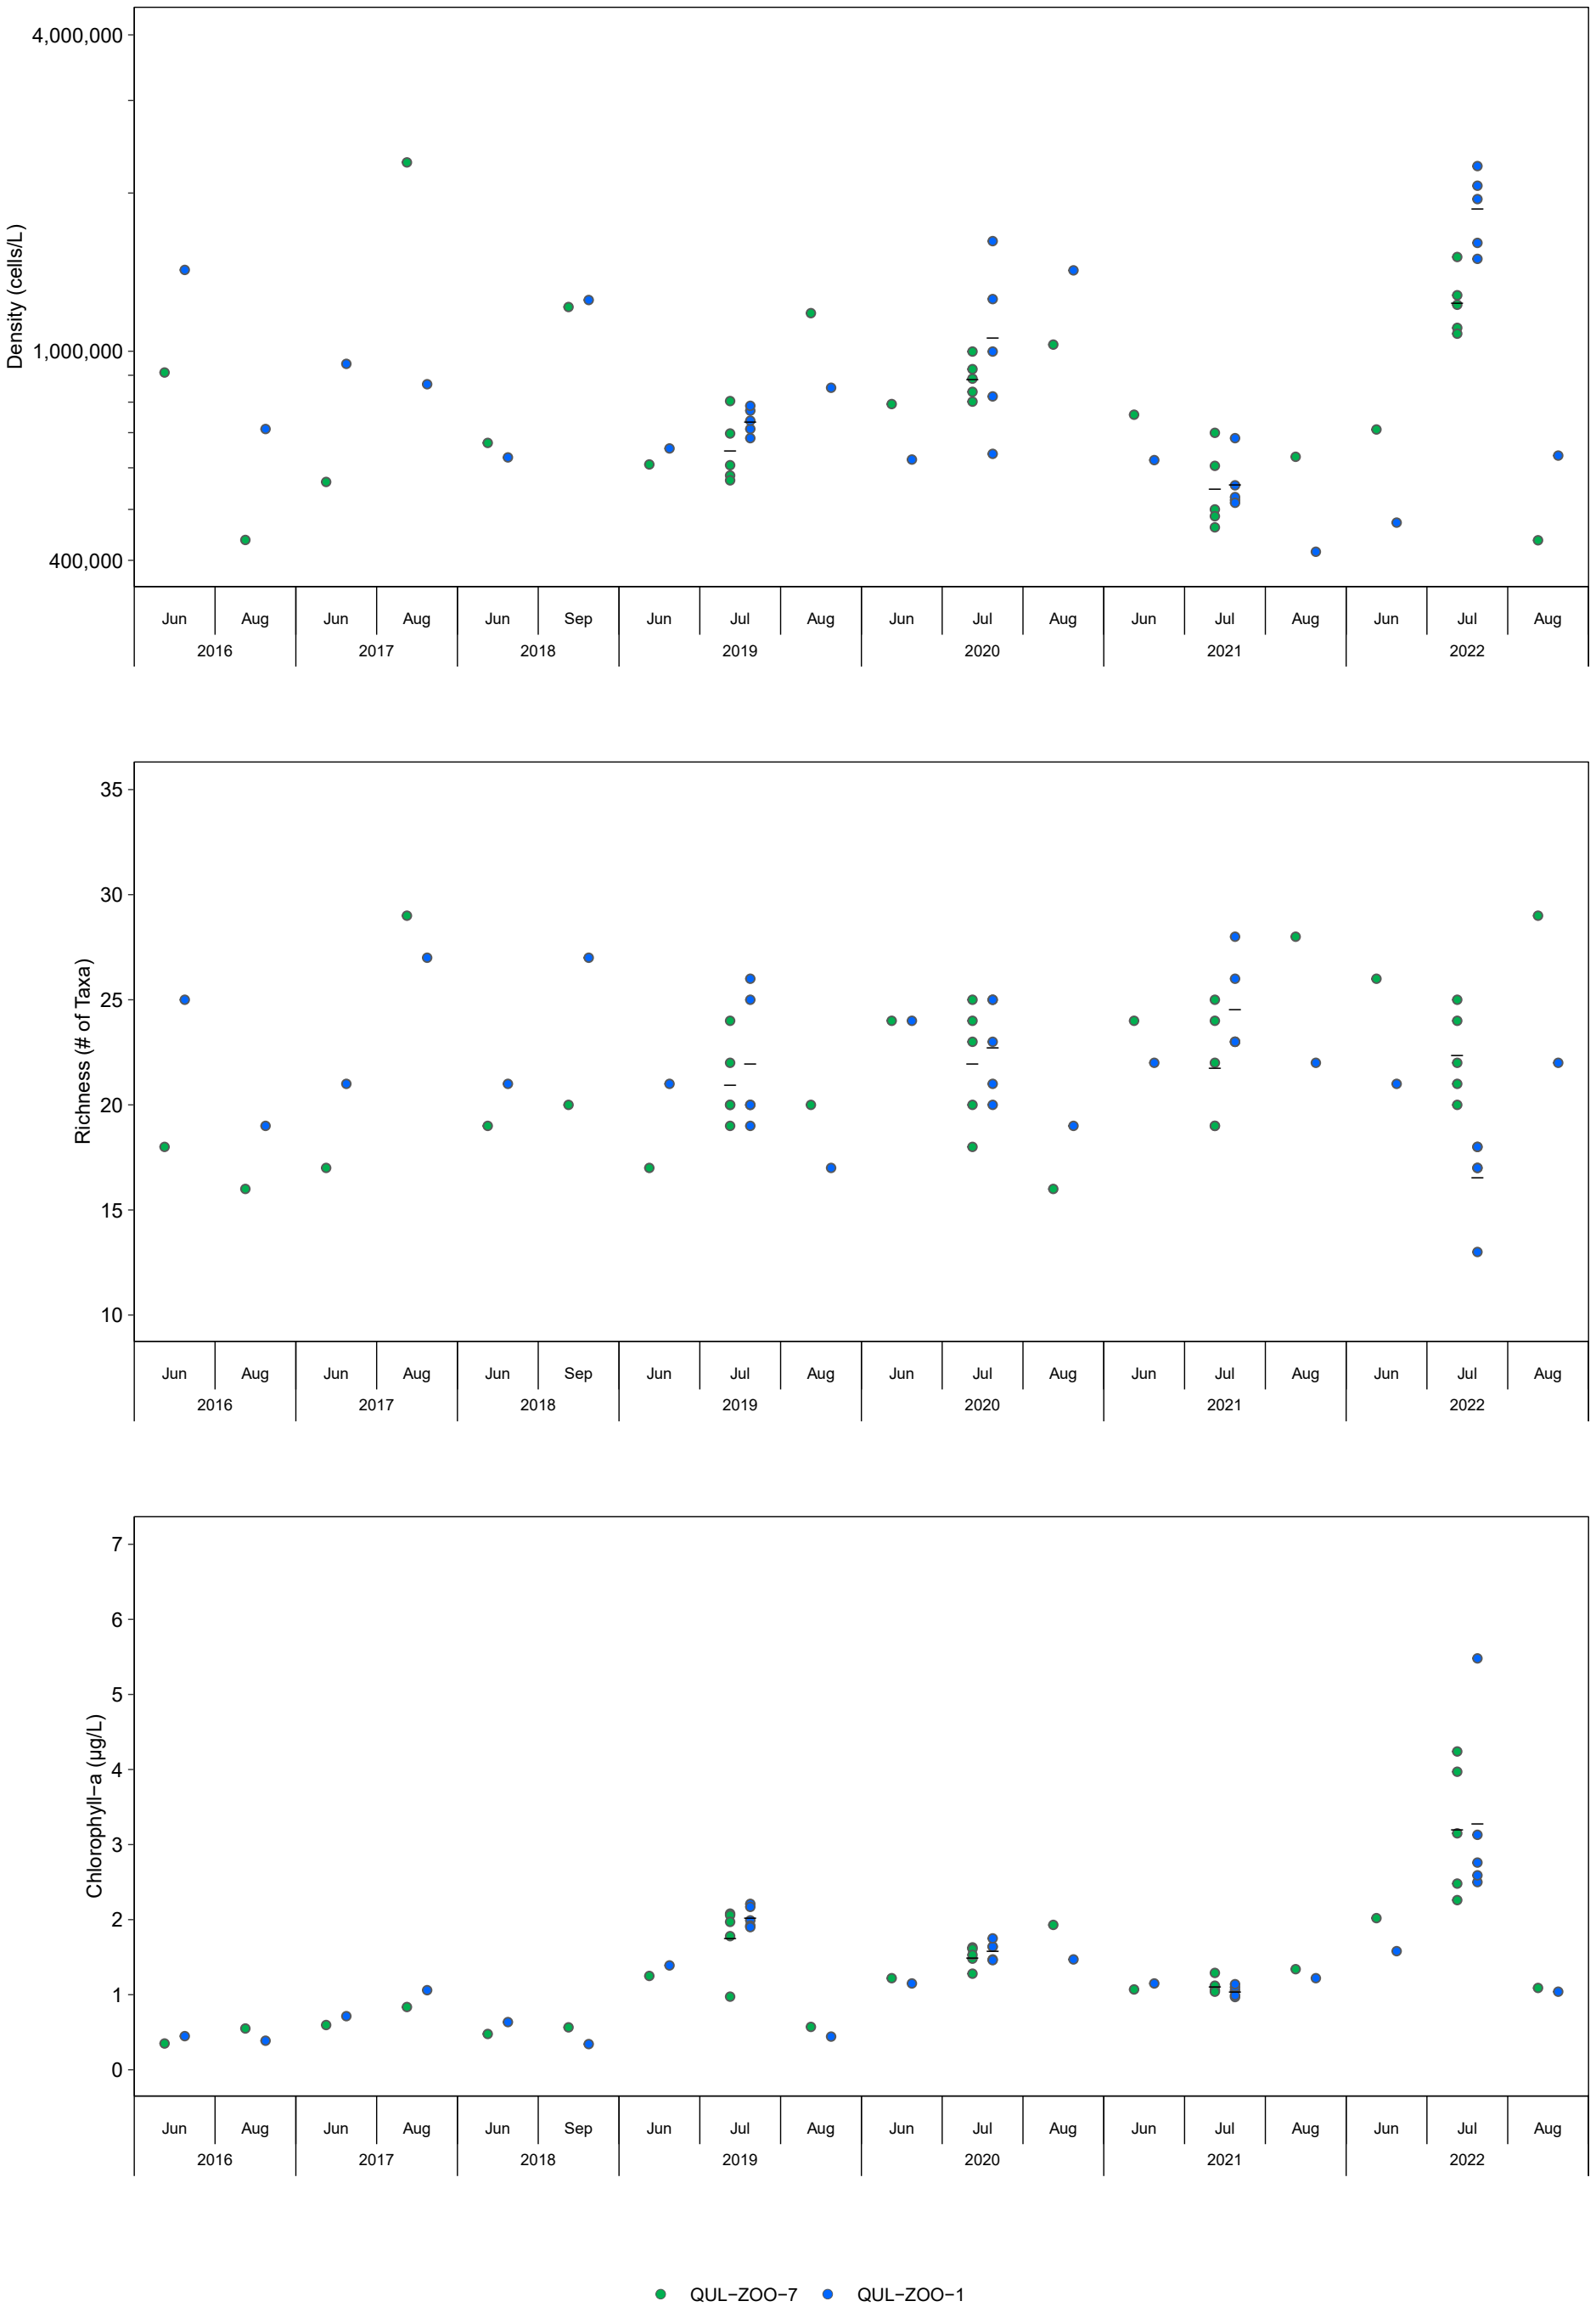

Figure E.2.7: Phytoplankton Community Endpoints for Quesnel Lake at QUL−ZOO−1 (Exposed) and QUL−ZOO−7 (Reference) Areas, 2016 to 2022

Notes: Black bars represent mean values.

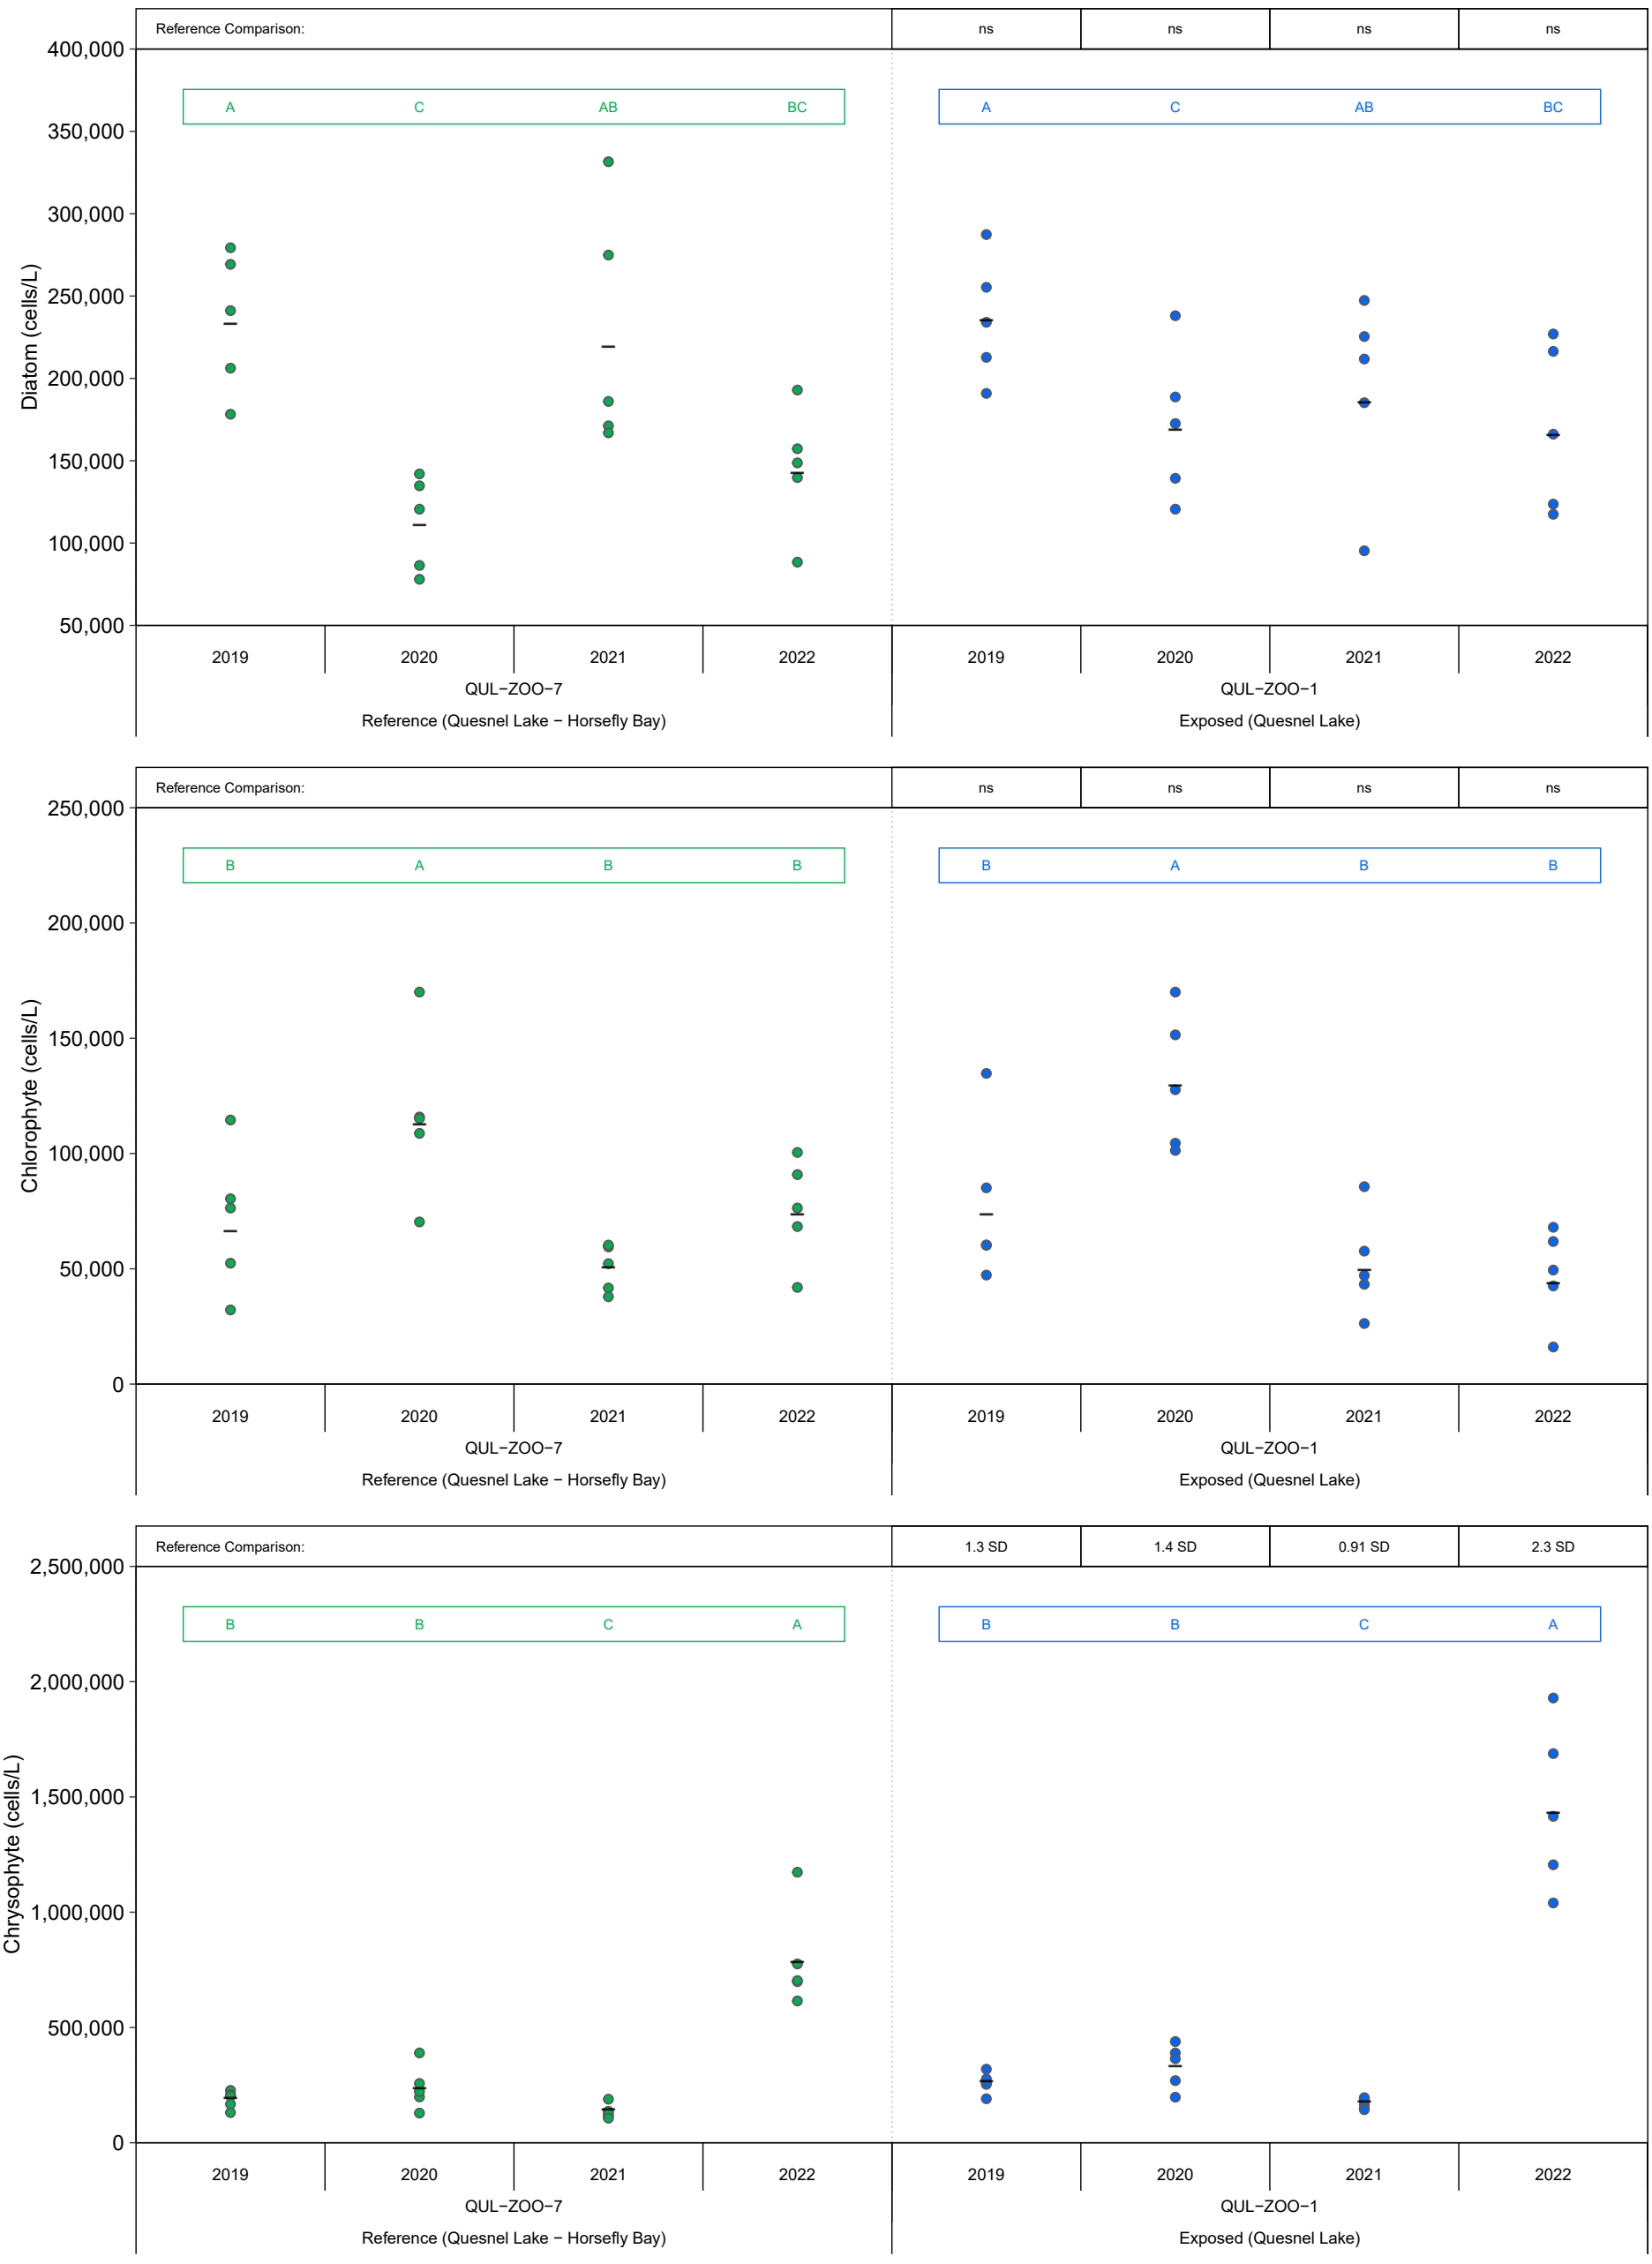

Figure E.2.8: Phytoplankton Community Endpoints for Quesnel Lake at QUL−ZOO−1 (Exposed) and QUL−ZOO−7 (Reference) Areas in July, 2019 to 2022

Notes: Black bars represent measures of central tendency (mean, geometric mean, or median depending on if analysis was conducted on untransformed, log10−transformed or rank−transformed data). Coloured letters represent significant (p−value <0.1) post−hoc comparisons within areas over time; years that share a letter of the same colour (e.g., A, B) within a box of the same colour do not differ significantly within an area. MOD calculated for Kruskal-Wallis (i.e., rank-transformed data) as (Exposed Median - Reference Median)/MAD, where MAD was the pooled median absolute deviation.

APPENDIX E.3
ZOOPLANKTON TISSUE QUALITY

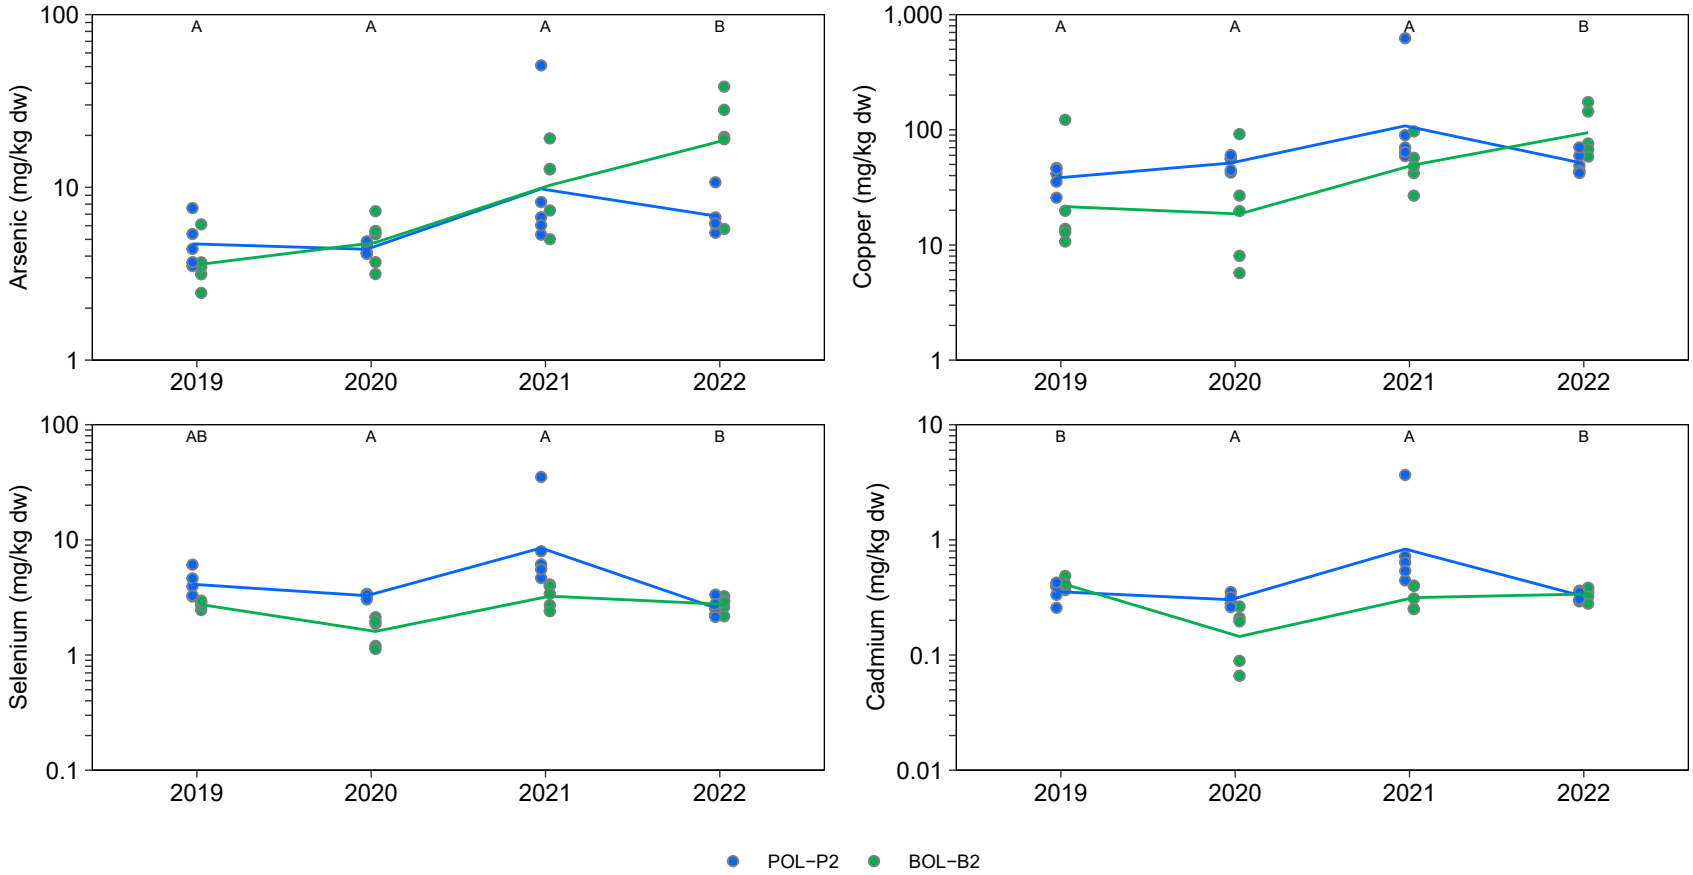

Figure E.3.1: Zooplankton Tissue Primary and Secondary Analyte Concentrations for Polley Lake (POL-P2; Exposed) and Bootjack Lake (BOL-B2; Reference) Areas for which a Significant Area x Year Effect was Detected in July, 2019 to 2022

Notes: dw = dry weight. Concentrations below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL and the open symbol represents one or more values reported below the LRL. Individual samples are plotted and lines join the least−squares estimated mean values for years included in the statistical analysis (i.e., not <LRL). Statistical analyses were conducted using a two−way ANOVA with factors Area and Year. The models were fit using Maximum Likelihood Estimation with an assumed log−normal distribution. Years that share a letter (e.g., A,B,C) have ratios of concentrations (Exposed : Reference) that do not differ significantly (p−value < 0.05) among years. Letter A was assigned to the year with the highest ratio of concentrations (Exposed : Reference). Only years with samples from both reference and exposed areas are plotted.

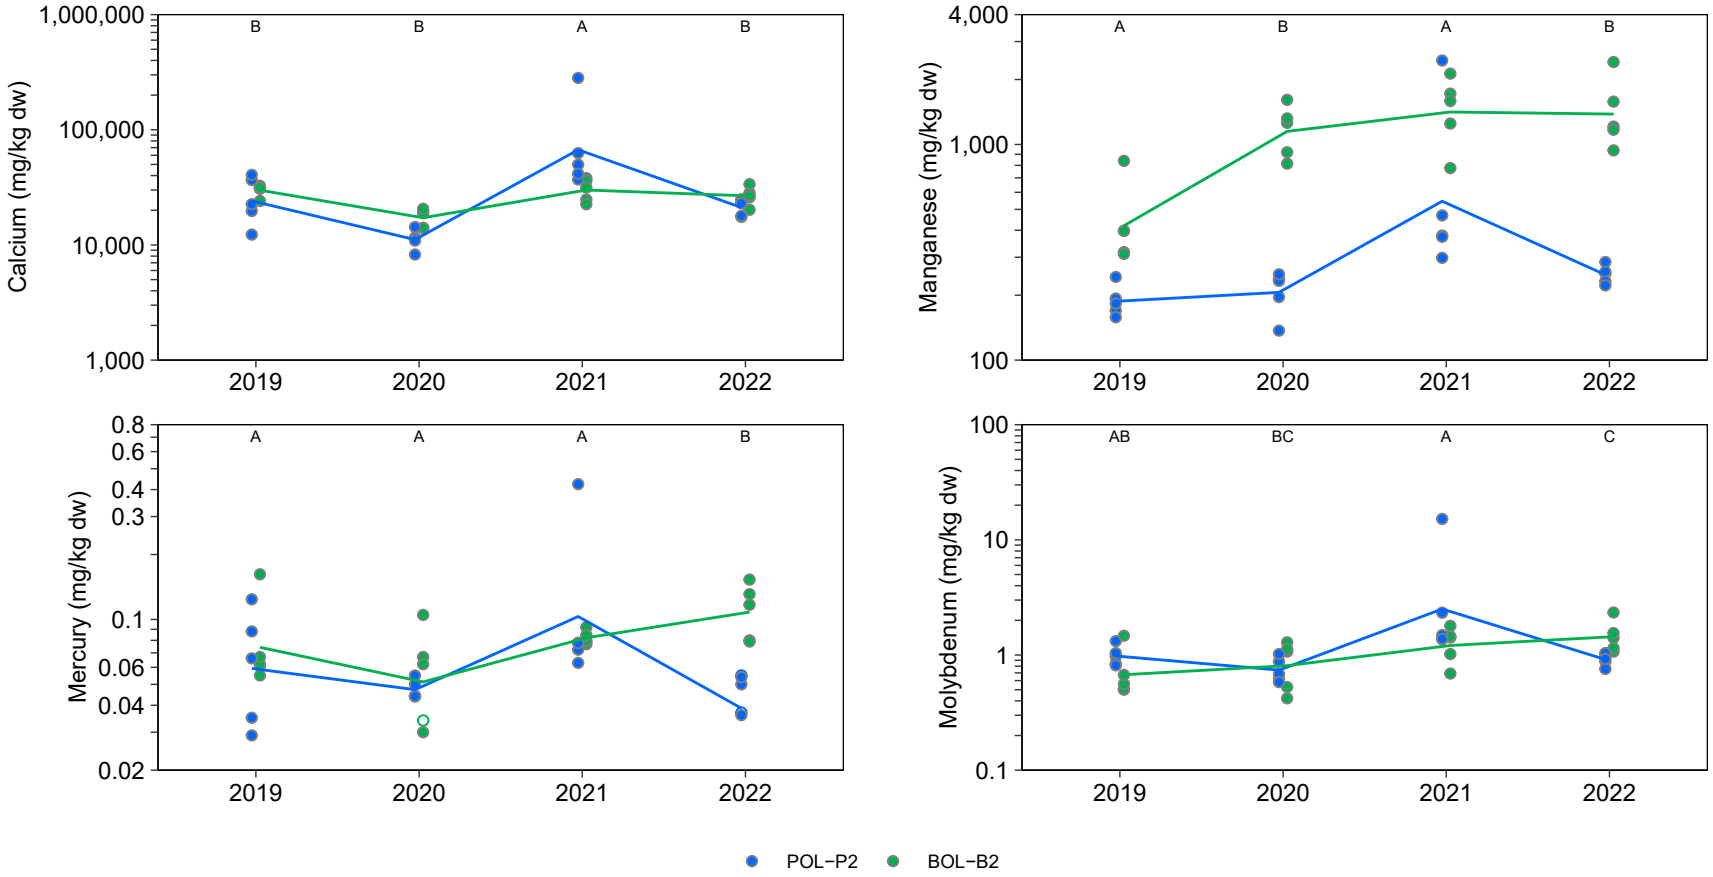

Figure E.3.1: Zooplankton Tissue Primary and Secondary Analyte Concentrations for Polley Lake (POL-P2; Exposed) and Bootjack Lake (BOL-B2; Reference) Areas for which a Significant Area x Year Effect was Detected in July, 2019 to 2022

Notes: dw = dry weight. Concentrations below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL and the open symbol represents one or more values reported below the LRL. Area x Year or Area P-value < 0.05.

Contrast is significant (α = 0.05) and magnitude of difference is positive.

Contrast is significant (α = 0.05) and magnitude of difference is negative.

Notes: "-" = no data available, nt = not tested because all data were reported below the method detection limit (LRL) or because there were only data for a single time period, ns = not significant, baseline= first year of data included in analysis, <LRL = greater than 50% LRL data for both stations so the time period was omitted from the analysis, ANOVA = two way analysis of variance, MLE = censored regression using maximum likelihood estimation. Data were analysed in units of mg/kg dry weight. Merged cells across years indicate that the Area × Time term was not significant, therefore MOD is for all years combined. Only years with samples from both reference and exposed were included in the analysis.

[a] Years that share a letter (e.g., A,B,C) had ratios of concentrations (POL-P2:BOL-B2) that do not differ significantly among years. Letters are assigned such that A is assigned to the year with the highest ratio of concentrations (POL-P2:BOL-B2).

[b] Magnitude of difference (MOD) calculated on backtransformed least-squares means for the observed time period as $(Exp_{observed} - Exp_{predicted})/(Exp_{predicted}) \times 100\%$ where $Exp_{predicted} = Ref_{observed} + (Exp_{baseline} - Ref_{baseline})$.

[c] Magnitude of difference (MOD) calculated on backtransformed least-squares means as (Exp-Ref)/Ref x 100%.

Table E.3.2: Seasonal Kendall Trend Analysis of Primary and Secondary Analyte Concentrations in Post-Breach Surface Water for Polley Lake (POL-P1, POL-P2; Exposed) Monitoring Stations, 2015 to 2022

Contrast is significant (α = 0.05) and magnitude of difference is negative.

Notes: "-" = no data available, nt = not tested because all data were reported below the method detection limit (LRL) or because there were only data for a single time period, ns = not significant, baseline= first year of data included in analysis, <LRL = greater than 50% LRL data for both stations so the time period was omitted from the analysis, ANOVA = two way analysis of variance, MLE = censored regression using maximum likelihood estimation. Data were analysed in units of mg/kg dry weight. Merged cells across years indicate that the Area × Time term was not significant, therefore MOD is for all years combined. Only years with samples from both reference and exposed were included in the analysis.

[a] Years that share a letter (e.g., A,B,C) had ratios of concentrations (QUL-ZOO-1 [Exposed] : QUL-ZOO-7 [Reference]) that do not differ significantly among years. Letters are assigned such that A is assigned to the year with the highest ratio of concentrations (QUL-ZOO-1 [Exposed]:QUL-ZOO-7 [Reference]).

[b] Magnitude of difference (MOD) calculated on backtransformed least-squares means for the observed time period as $(Exp_{observed} - Exp_{predicted})/(Exp_{predicted}) \times 100\%$ where $Exp_{predicted} = Ref_{observed} + (Exp_{baseline} - Ref_{baseline})$.

[c] Magnitude of difference (MOD) calculated on backtransformed least-squares means as (Exp-Ref)/Ref x 100%.

Table E.3.4: Seasonal Kendall Trend Analysis of Primary and Secondary Analyte Concentrations in Post-Breach Surface Water for Quesnel Lake at Exposed (QUL-18, QUL-2a) and Reference (QUL-120) Monitoring Stations, 2015 to 2022

P-Value < 0.05

Significant decreasing temporal trend (Seasonal Kendall test for monotonic trend at α = 0.05). Value reported is the Sen's slope reported as a percentage of the median concentration or value.

Significant increasing temporal trend (Seasonal Kendall test for monotonic trend at α = 0.05). Value reported is the Sen's slope reported as a percentage of the median concentration or value.

Notes: GEF = Guideline Exceedance Factor. NS = no significant temporal trend (Seasonal Kendall test for monotonic trend at α = 0.05). "-" not enough detected data to test for trend (> 75 % of values below laboratory reporting limit).

APPENDIX E.4
BENTHIC COMMUNITY

APPENDIX E4 RESOLVING MIXED-LEVELS OF TAXONOMIC RESOLUTION FOR BENTHIC INVERTEBRATES

E.4.1 INTRODUCTION 1
E.4.2 DECISION KEY 3
E.4.3 REFERENCES 4

E.4.1 INTRODUCTION

Processing of benthic invertebrate data for ecological assessment generally involves determining taxonomic richness (number of taxa present) as well as community composition, which is typically assessed using abundances (and/or density) of all taxa present and their relative proportion of the total community. Taxonomic richness and community composition can be informative metrics on their own, however they are also utilized in the calculation of diversity indices (e.g. Simpson's Evenness and Simpson's Diversity). Determination of taxonomic richness and community composition from taxonomic data can be complicated by inconsistencies in taxonomic data, relating to the taxonomic level to which organisms can practicably be identified by the laboratory ("resolution"). Taxonomists endeavour to classify organisms within the most specific taxon (a defined taxonomic identity of any rank) possible, generally Genus or Species, however specimens that are damaged or are in an early developmental stage may lack the morphological features necessary to confirm an identification to the same level that can be achieved for some adult specimens. Furthermore, the information needed to confirm the identification of specimens may not be available in taxonomic keys or other resources. When individuals of a single taxon are identified to different levels of resolution within a single sample they are considered redundant or "ambiguous" taxa. The presence of these ambiguous taxa may result in inflated estimates of richness or distorted patterns of diversity across sites. For example, some specimens may be identified to the genus level (e.g., *Baetis*) while others are identified to the species level (e.g., *Baetis tricaudatus*). If ambiguous taxa are not resolved, then the coarser-resolution taxon (i.e., the Genus-level, *Baetis*) is counted as a unique taxon when it may actually be the same species as the finer-level taxon (i.e., species-level, *B. tricaudatus*). Therefore, one consequence of the common practice of identifying organisms to the lowest practicable taxonomic level (LPL) is that the "species list" (complete list of taxa identified) from any site contains a mixture of taxa (or "mixed-level") wherein an individual taxon may have multiple specimens identified to several different levels of taxonomic resolution. As a result, benthic invertebrate data typically comprise a mixture of identification levels due to difficulties in achieving a uniform Species, Genus, or even Family-level identification for aquatic macroinvertebrates (Cranston 1990) and must undergo additional consolidation steps prior to data analysis.

At least four options are available for dealing with taxa identified to mixed-levels of taxonomic resolution:

1. remove data for any organisms identified to a level less-specific than the target resolution (i.e., anything not at the Genus or Species level);

2. group all data for any organisms identified to a level less-specific than the target resolution into an "Other" group, a standalone but undefined taxon;

3. proportionally distribute data for any organisms identified to a level less-specific than the target resolution into values for organisms positively identified to target resolution according to the ratios of those positively identified taxa (i.e. “rolling down” unidentified taxa to more specific taxonomic levels); or

4. combine all related taxa least-specific taxon to which consistent identification is possible (i.e. “rolling up” unidentified taxa to less-specific taxonomic levels – often family-level).

Option 1 (though sometimes used) is unsatisfactory because a bias is introduced into the sample (because difficult to identify taxa are not randomly distributed, but rather occur more frequently in particular Classes, Orders, and Families). The second option (also sometimes used) is unsatisfactory because organisms grouped as “Other” contribute no useful information (beyond increasing the total density estimate), and complicate further analyses. The third option assumes that the ratio of taxa among ambiguous taxa is the same as in specimens of identified decisively, which may or may not be accurate. The fourth option is most conservative but may lead to a significant loss of data. For example, specimens of the Genera *Baetis* and *Pseudocloeon* might be lumped together and analyzed as Baetidae. The preferred option for analysis depends on the distribution of the organisms among taxa. If identified specimens in the two genera above constitute only 10% of the total abundance, it may be most appropriate to lump them together with the other 90% in the less-specific taxon (Family: Baetidae). Conversely, if 90% of the identified organisms fall into the two Genera, it is more defensible to apportion the ambiguous taxa identified only to Baetidae (Family) into the values for specimens identified to Genus, and any resulting error may not seriously bias the analysis. In order to standardize the decision-making process, reduce subjectivity, and improve the efficiency of benthic community data processing, Minnow has developed and applied a decision key which is used in the processing of all benthic invertebrate community data.

E.4.2 DECISION KEY

Resolution of redundant or ambiguous taxa was achieved through implementation of a decision key that dictated criteria for data processing (Figure E.4.1). The first two options for dealing with taxa identified to mixed-levels of taxonomic resolution outlined in Section E.4.1 were considered unsatisfactory, therefore the decision key makes use of abundance and richness criteria to apply options 3 (roll-down) and 4 (roll-up) for each level of the taxonomic hierarchy. This method preserves as much detailed taxonomic information as possible, while addressing issues of taxonomic ambiguities. The decision key was modified from the Puget Sound Long-Term Marine Sediment Benthic Invertebrate Summary and is outlined below (Weakland et al. 2018).

The decision key rules are summarised as follows (see Figure E.4.1 for details).

- If identifications have not been taken to the same level consistently over multiple years of monitoring, data are rolled up to a less-specific taxonomic level. If identifications have been taken to the same level consistently over multiple years or only one year of data is available, they are kept at their respective taxonomic levels.
- If for a taxa identified to mixed-levels of resolution it is known that differentiating among specimens at more-specific levels of identification is notably challenging (e.g. due to inconsistencies in taxonomic keys or fragility of defining features) then all taxa are rolled up to a less-specific taxonomic level. If the difficulty of identifications are of mixed levels of difficulty, then easy-to-identify taxa are left at their respective level of identification, whereas difficult-to-identify taxa are rolled up to a less-specific level. If the identifications are easy, then they are kept at their respective taxonomic levels.
- For examples that have satisfied the above criteria, if there are no more-specific levels of identification or there are no organisms identified to a more-specific taxon, they are left at that level of identification.

Cranston, P.S. 1990. Biomonitoring and invertebrate taxonomy. Environmental Monitoring and Assessment 14: 265-273

Weakland, S., V. Partridge, and M. Dutch. 2018. Sediment Quality in Puget Sound: Changes in chemistry, toxicity, and benthic invertebrates at multiple geographic scales, 1989–2015. Publication Number: 18-03-004.https://fortress.wa.gov/ecy/publications/SummaryPages/1803004.html

Identifications have NOT been taken to the same level consistently over multiple years

Identifications have been taken to the same level consistently over multiple years (or only 1 year of data available)

More specific identifications are not easily achievable

Mixed levels of difficulty to achieve identification at more specific levels

More specific identifications are easily achievable

Leave easy-to-identify levels separate and roll up levels that are difficult to identify into the less specific taxonomic level

Taxon is redundant (representatives of ≥1 more-specific taxon identified in samples)

Taxon is at most-specific identified level and there are no redundant more-specifically identified taxa

Roll Up to less-specific level

Taxon level contains only one more specific identification

Taxon level contains >1 more specific identification

Keep assigned identifications at their levels

Abundance at less-specifically identified level is ≤50% of the combined total abundance of that taxon and more specifically identified taxa (family/genus/species, etc.).

Abundance at less-specific level is >50% of the combined total abundance of that taxon and more-specifically identified taxa (family/genus/species, etc.)

Proportionally assign less-specifically identified abundance to more specifically identified taxa

Less-specifically identified taxon contains only 2 more specific identifications and ≥50% of the combined abundance of that taxon and more specifically identified taxa

Less-specifically identified taxon contains >2 more specific identifications and ≥50% of the combined abundance of that taxon and more specifically identified taxa

Roll to higher level

Leave the less AND more-specific levels of identification

Figure E.4.2: Benthic Invertebrate Community Endpoints for Quesnel Lake at QUL−PNF (Exposed) and QUL−PREF1 (Reference) Deep Areas, 2014 to 2022

Notes: Black bars represent measures of central tendency (mean, geometric mean, or median depending on if analysis was conducted on untransformed, log10−transformed or rank−transformed data). Coloured letters represent significant (p−value <0.1) post−hoc comparisons within areas over time; years that share a letter of the same colour (e.g., A, B) within a box of the same colour do not differ significantly within an area. A number above the plot indicates significant exposed vs. reference post−hoc comparisons within a given year. The magnitude of difference (MOD) for these significant post−hoc comparisons is expressed in units of standard deviation (SD) or median absolute deviations (MAD; if the data were rank−transformed prior to analysis) relative to reference. 'nc' indicates no comparisons were possible; 'ns' indicates a non−significant contrast; 'nm' indicates that the MOD could not be calculated because MAD = 0.

Area x Year or Area P-value < 0.05.
Magnitude of Difference (MOD) < -2
Magnitude of Difference (MOD) > 2

Note: "-" = no data available. "nc" = no comparison. "ns" = no significance. "nm" = Contrast MODs could not be calculated because the MAD=0 (MAD = Median Absolute Deviation).

[a] mean, geometric mean, or median depending on if analysis was conducted on untransformed, log_{10}-transformed, or rank-transformed data.

[b] Magnitude of difference (MOD) calculated for two-way ANOVA as (Exposed Mean - Reference Mean)/SD (or [Mean - Baseline Mean]/SD for temporal comparisons) on the transformed scale, where SD was the pooled standard deviation of the model residuals. MOD calculated for Kruskal-Wallis (i.e., rank-transformed data) as (Exposed Median - Reference Median)/MAD, where MAD was the pooled Median Absolute Deviation.

Notes: Correspondence Analysis was conducted using ln(x+1)-transformed density benthic invertebrate results at the Lowest Practicable Level (LPL).
A "-" indicates that no organisms were present in all replicate samples from QUL-PFF1-1 and QUL-PFF1-2 in 2014, therefore CA site scores could not be calculated.

Significant correlation; p-value <0.00357 (p <0.05, Bonferroni corrected for 14 independent variables).

Correlation p-value <0.01.

Note: EPT = Ephemeroptera, Plecoptera, Trichoptera.

APPENDIX E.5
FISH POPULATION HEALTH

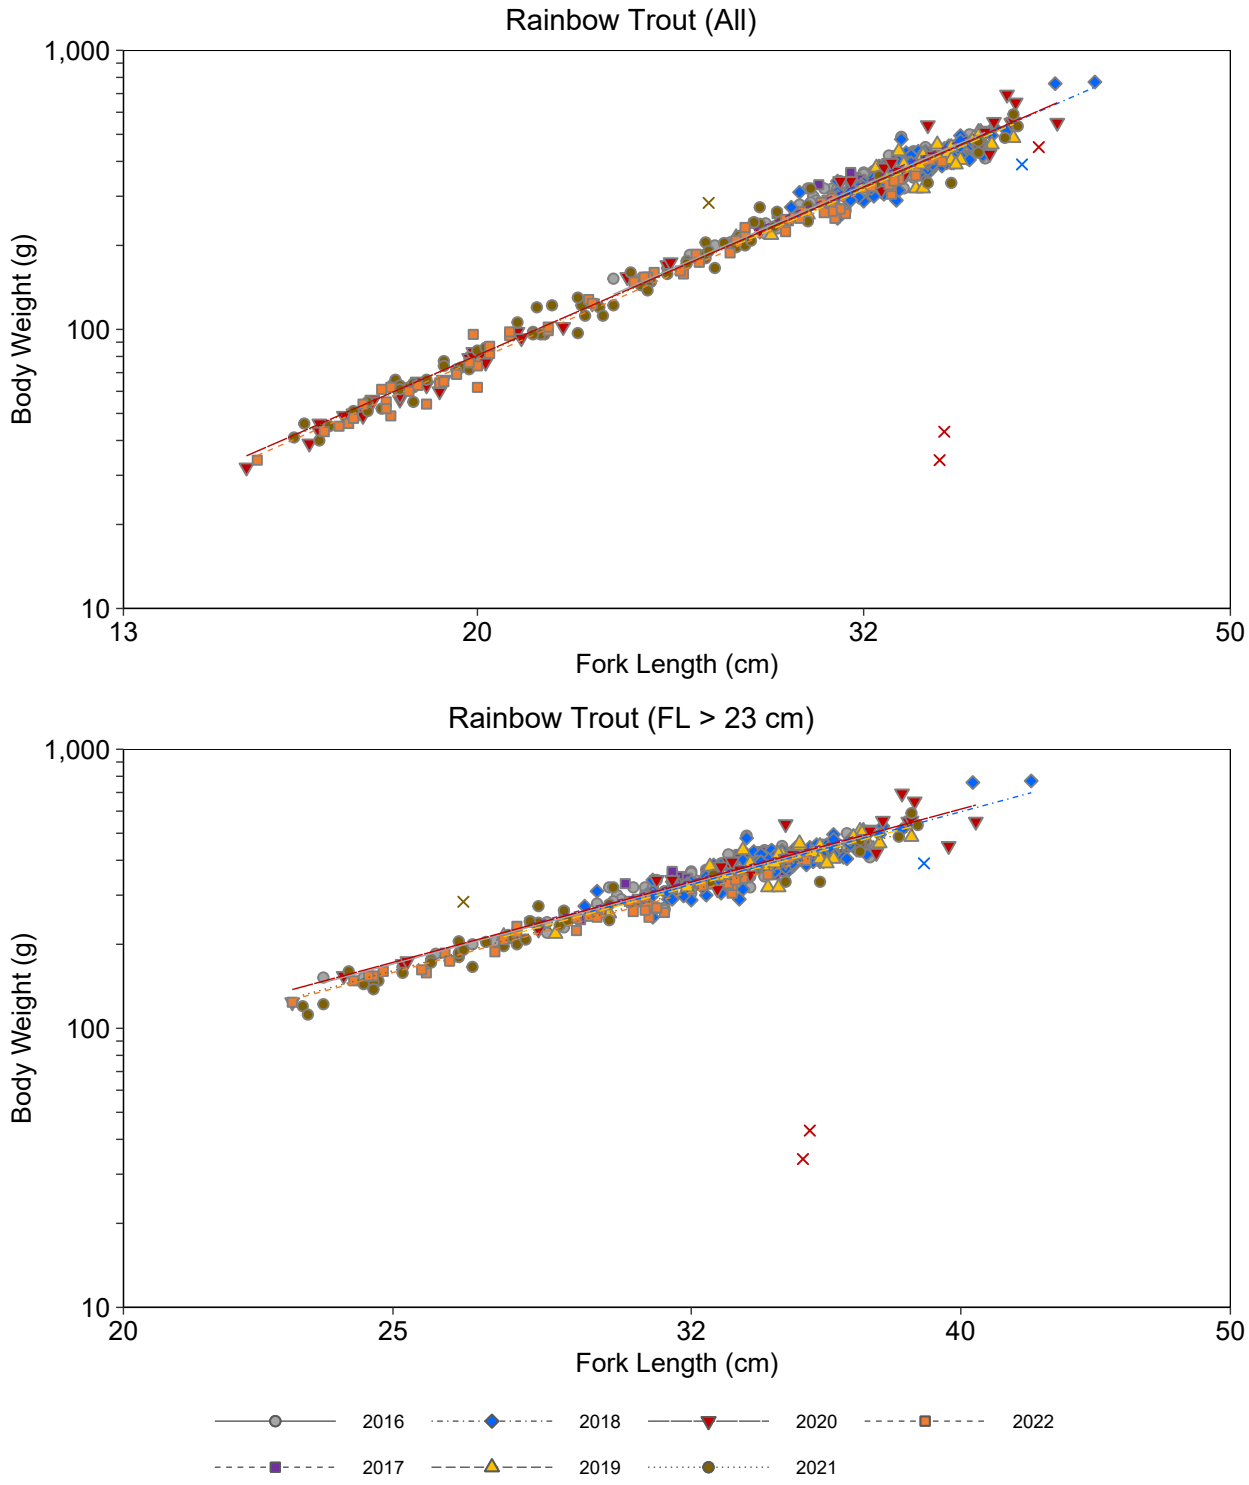

Figure E.5.1: Condition (Weight−at−Length) of a) All Rainbow Trout and b) Rainbow Trout With Fork Length Greater than 23 cm for Polley Lake in Spring, 2016 to 2022

Notes: FL = Fork Length. Outliers removed from the statistical analyses are plotted with an x through them.

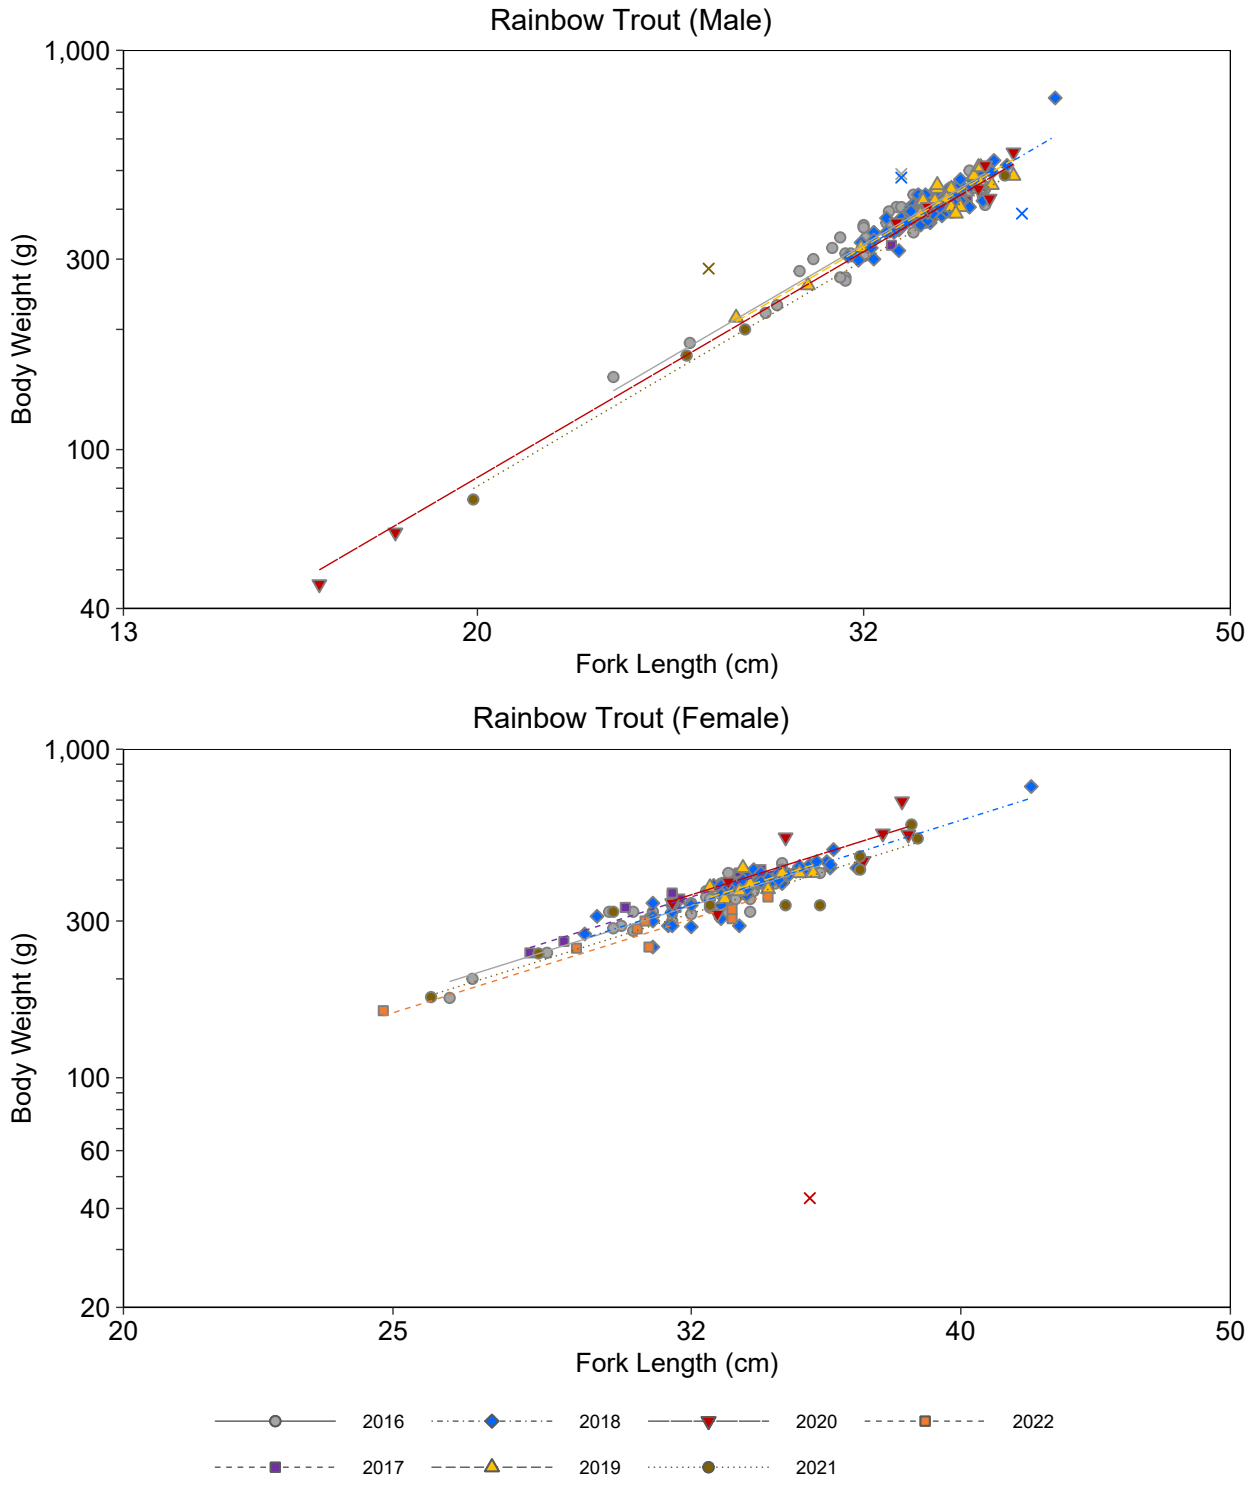

Figure E.5.1: Condition (Weight−at−Length) of a) Male Rainbow Trout and b) Female Rainbow Trout for Polley Lake in Spring, 2016 to 2022

Notes: FL = Fork Length. Outliers removed from the statistical analyses are plotted with an x through them.

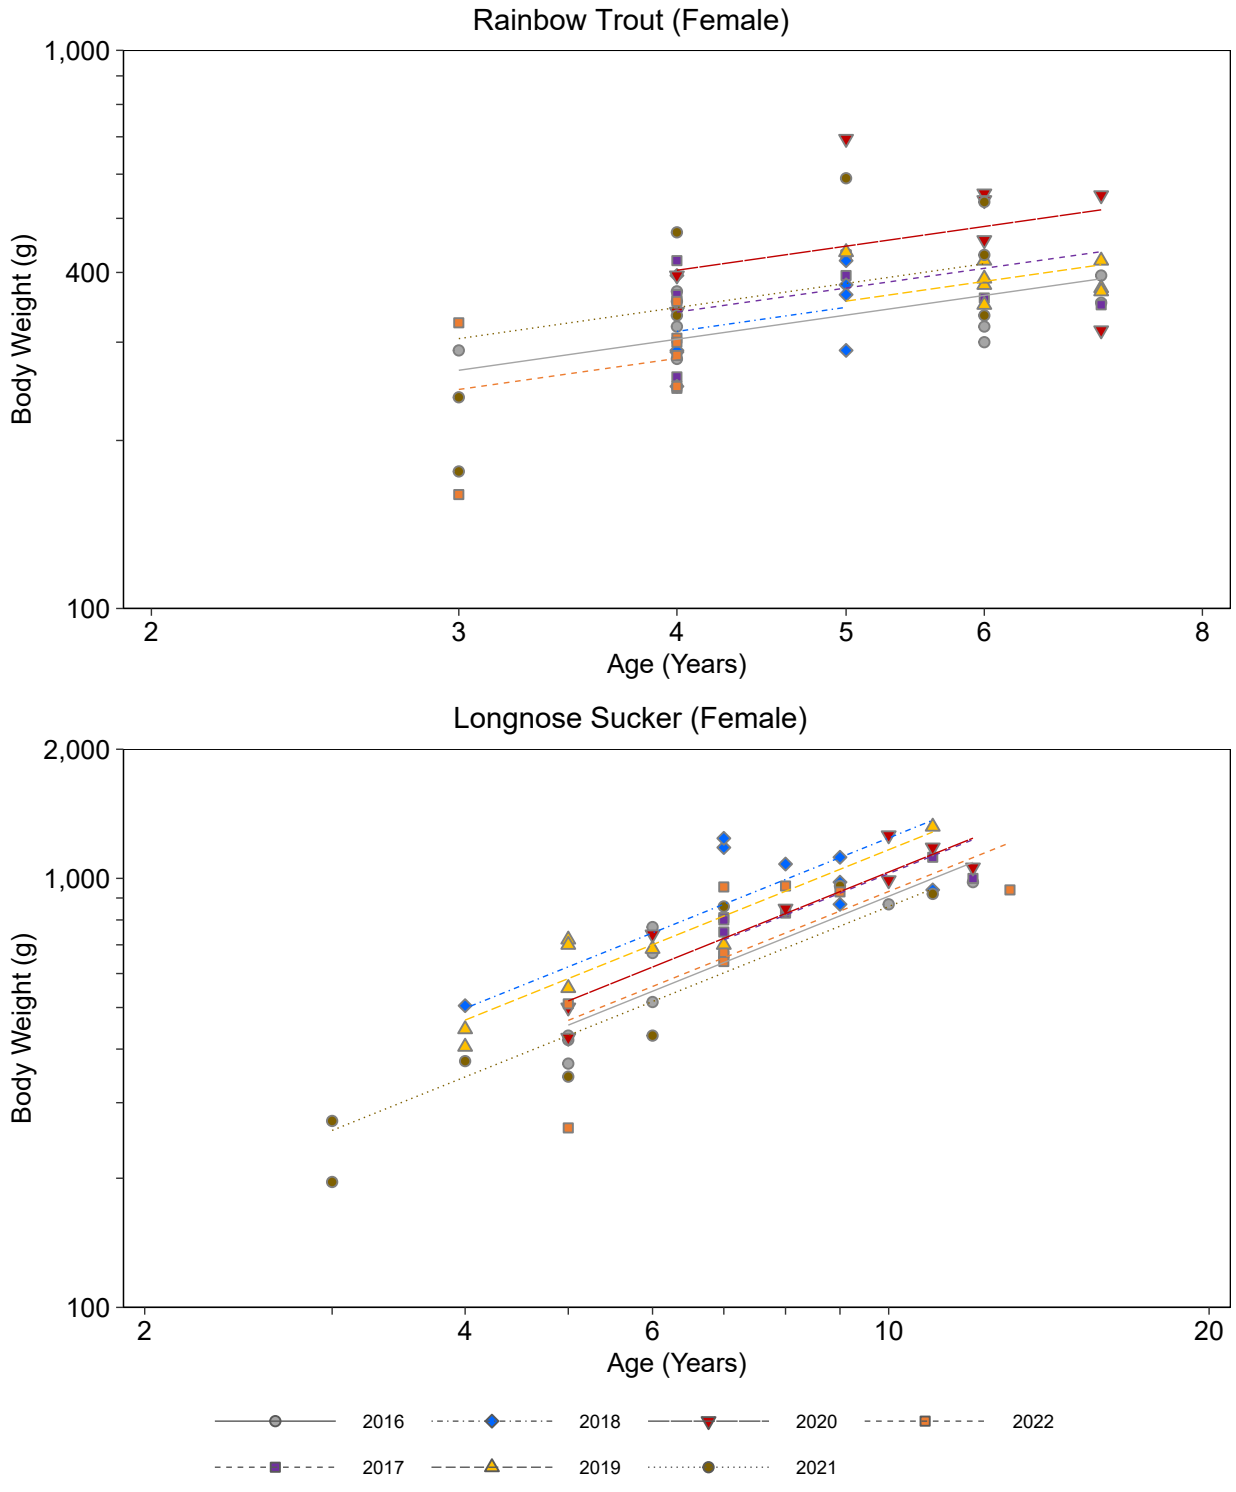

Figure E.5.2: Weight−at−Age of a) Female Rainbow Trout and b) Female Longnose Sucker for Polley Lake in Spring, 2016 to 2022

Note: Outliers removed from the statistical analyses are plotted with an x through them.

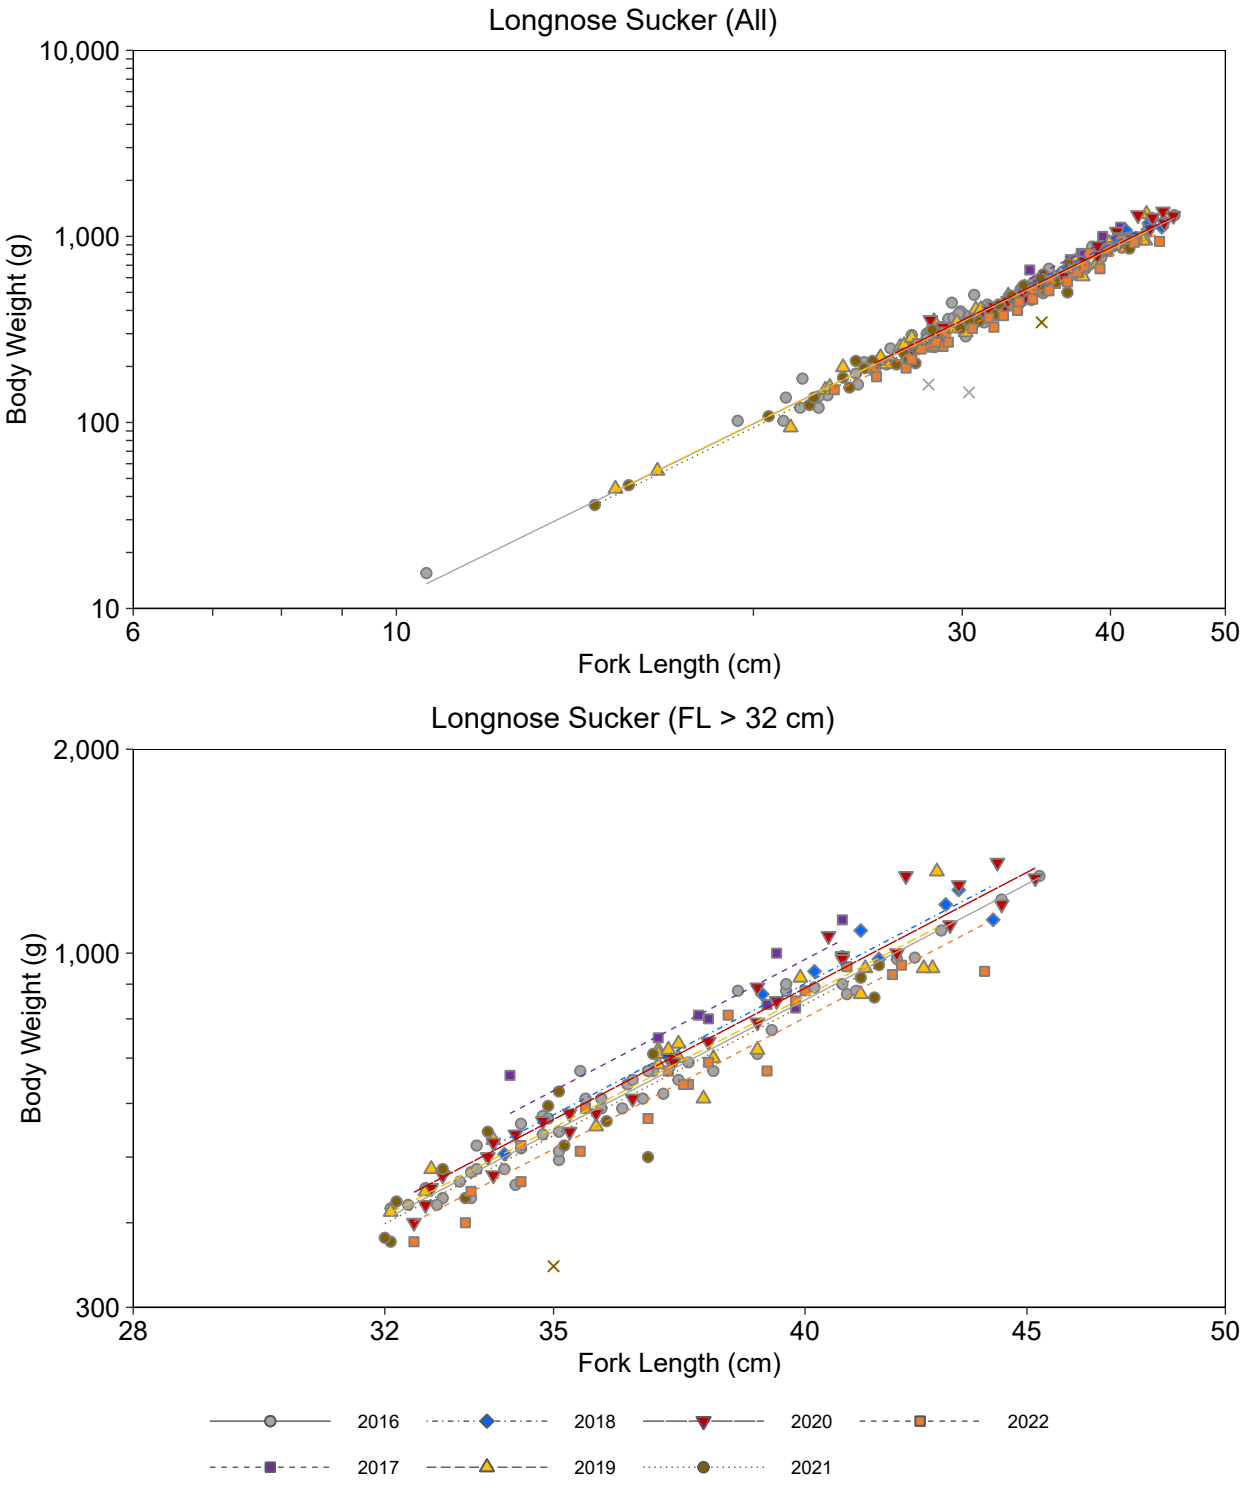

Figure E.5.3: Condition (Weight−at−Length) of a) All Longnose Sucker and b) Longnose Sucker With Fork Length Greater than 32 cm for Polley Lake in Spring, 2016 to 2022

Notes: FL = Fork Length. Outliers removed from the statistical analyses are plotted with an x through them.

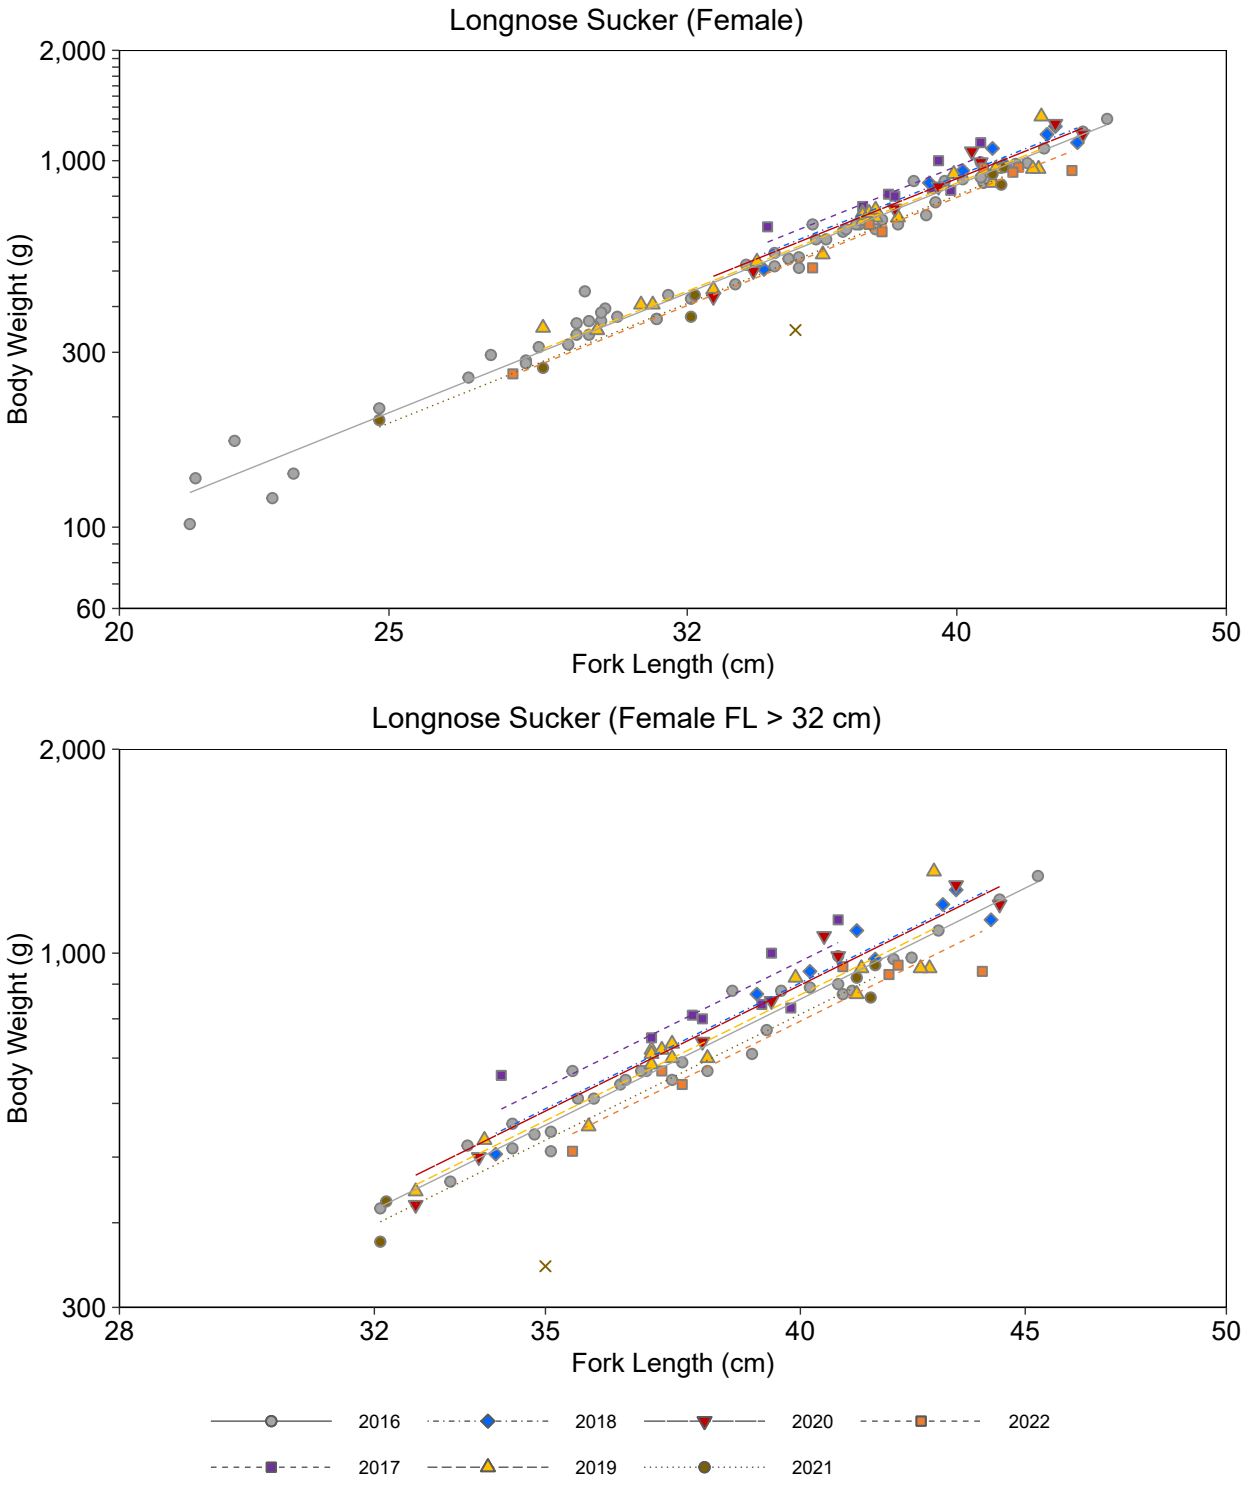

Figure E.5.3: Condition (Weight−at−Length) of a) Female Longnose Sucker and b) Female Longnose Sucker With Fork Length Greater than 32 cm for Polley Lake in Spring, 2016 to 2022

Notes: FL = Fork Length. Outliers removed from the statistical analyses are plotted with an x through them.

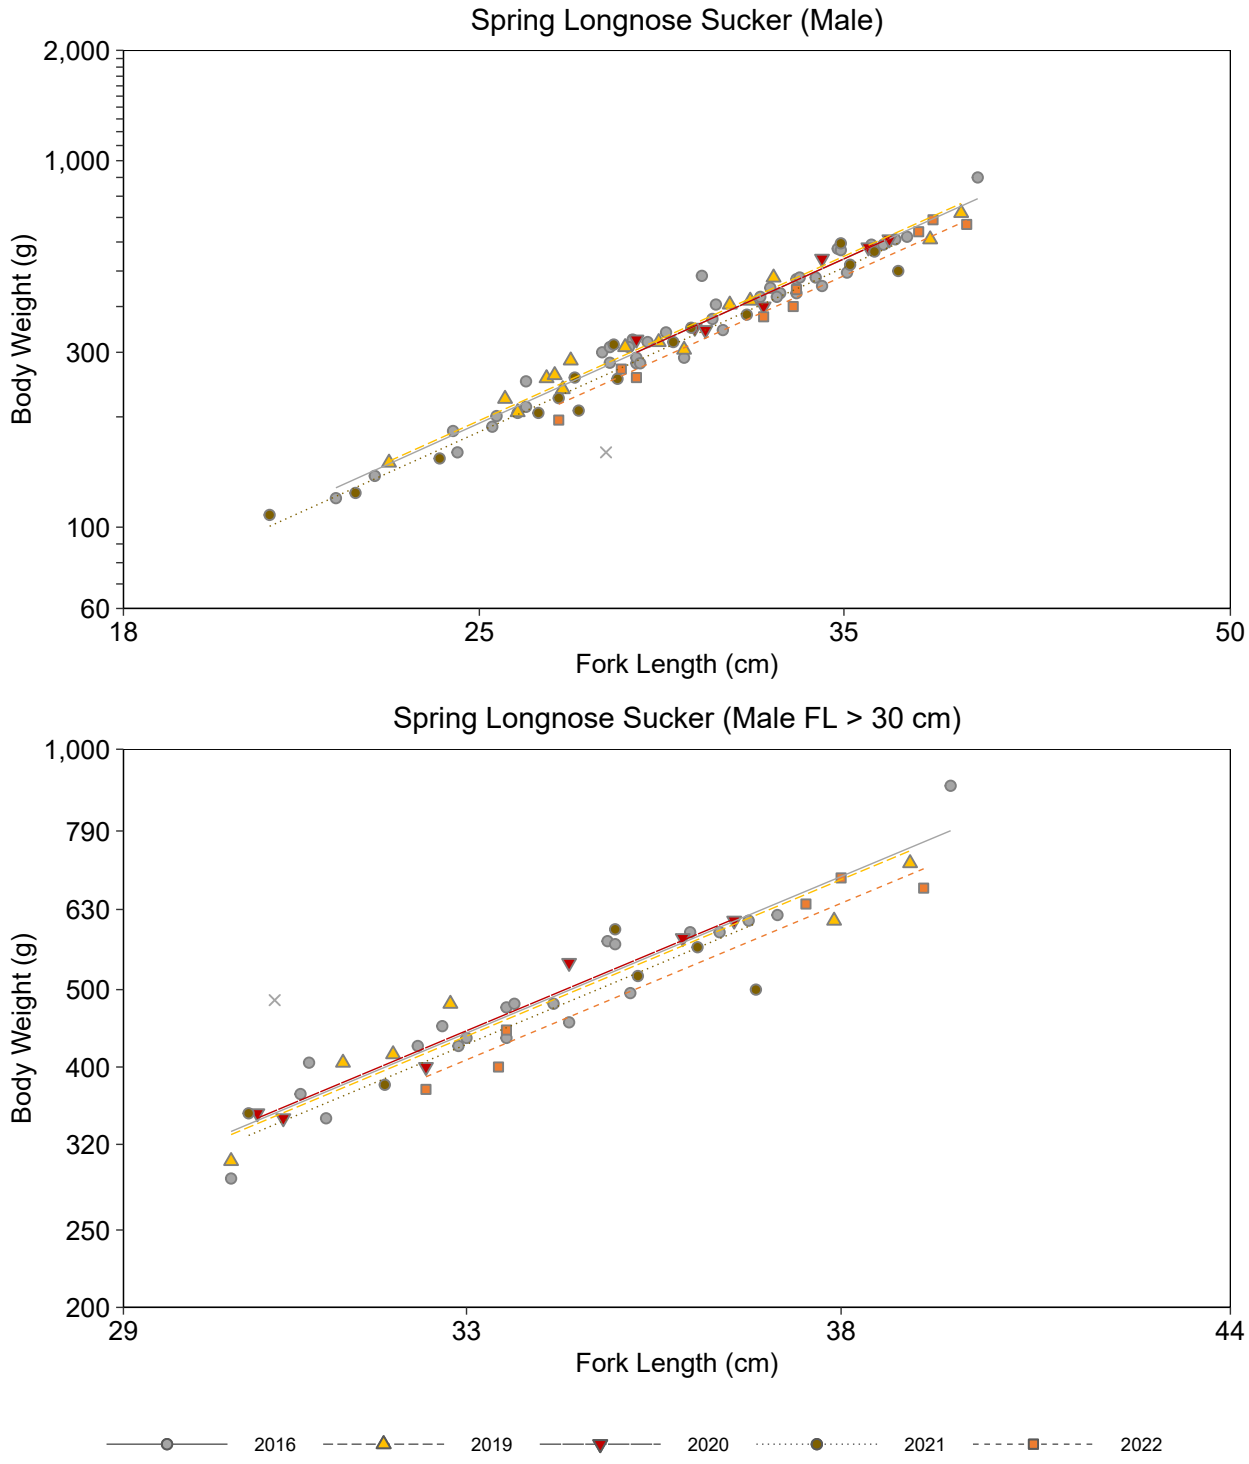

Figure E.5.3: Condition (Weight−at−Length) of a) Male Longnose Sucker and b) Male Longnose Sucker With Fork Length Greater than 30 cm for Polley Lake in Spring, 2016 to 2022

Notes: FL = Fork Length. Outliers removed from the statistical analyses are plotted with an x through them.

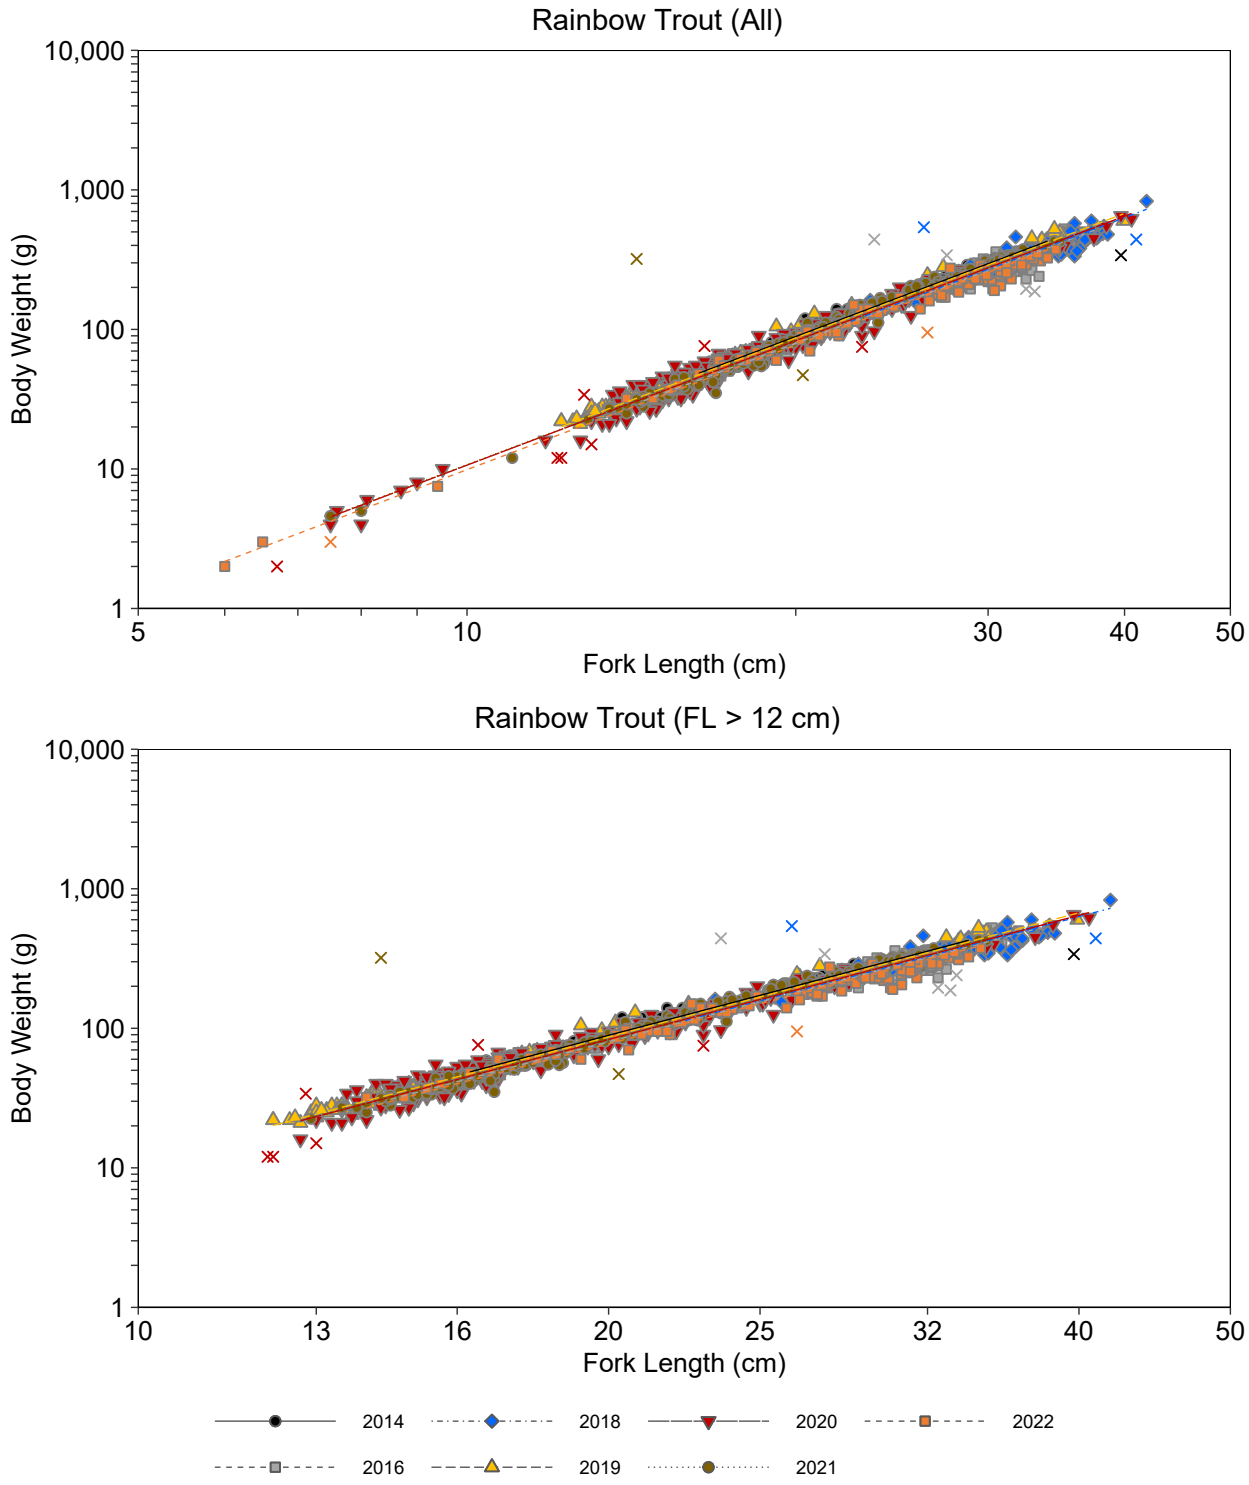

Figure E.5.4: Condition (Weight−at−Length) of a) All Rainbow Trout and b) Rainbow Trout With Fork Length Greater than 12 cm for Polley Lake in Fall, 2014 to 2022

Note: Note: FL = Fork Length. Outliers removed from the statistical analyses are plotted with an x through them.

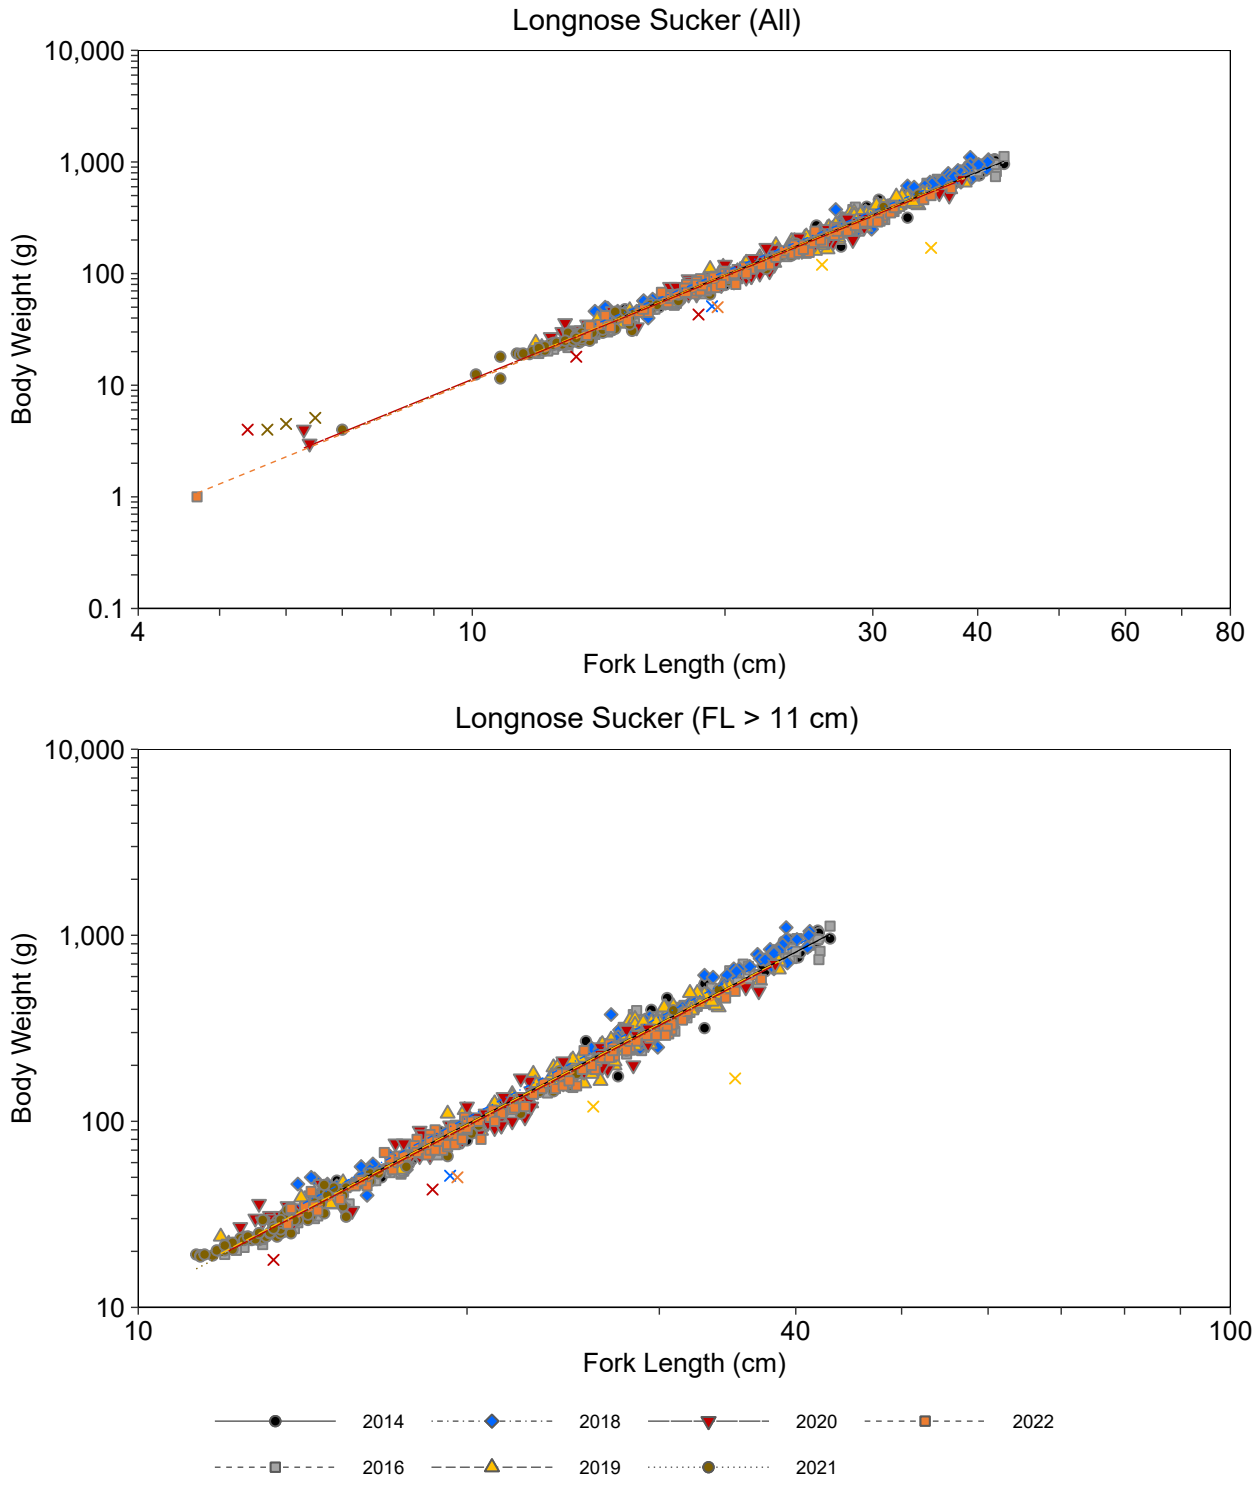

Figure E.5.4: Condition (Weight−at−Length) of a) All Longnose Sucker and b) Longnose Sucker With Fork Length Greater than 11 cm for Polley Lake in Fall, 2014 to 2022

Note: Note: FL = Fork Length. Outliers removed from the statistical analyses are plotted with an x through them.

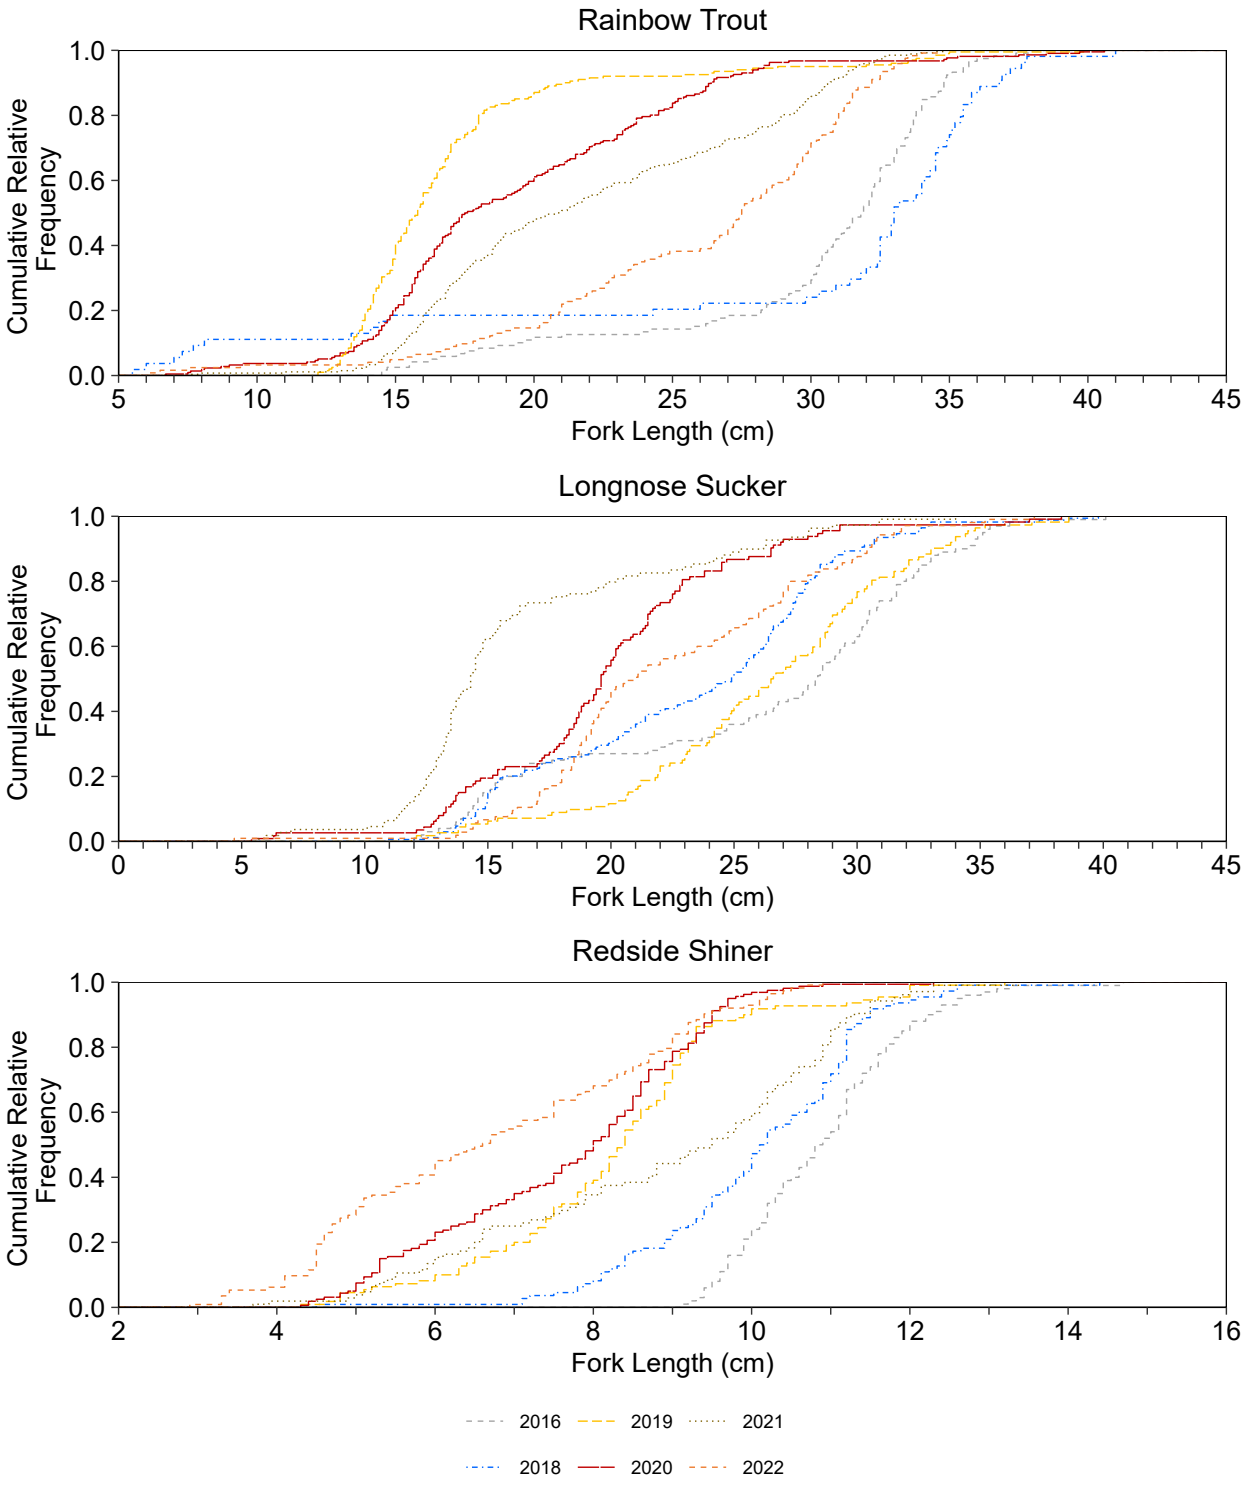

Figure E.5.5: Cumulative Relative Frequency Distributions of Rainbow Trout, Longnose Sucker, and Redside Shiner from Randomized Fall Hoop Netting in Polley Lake, 2016 to 2022

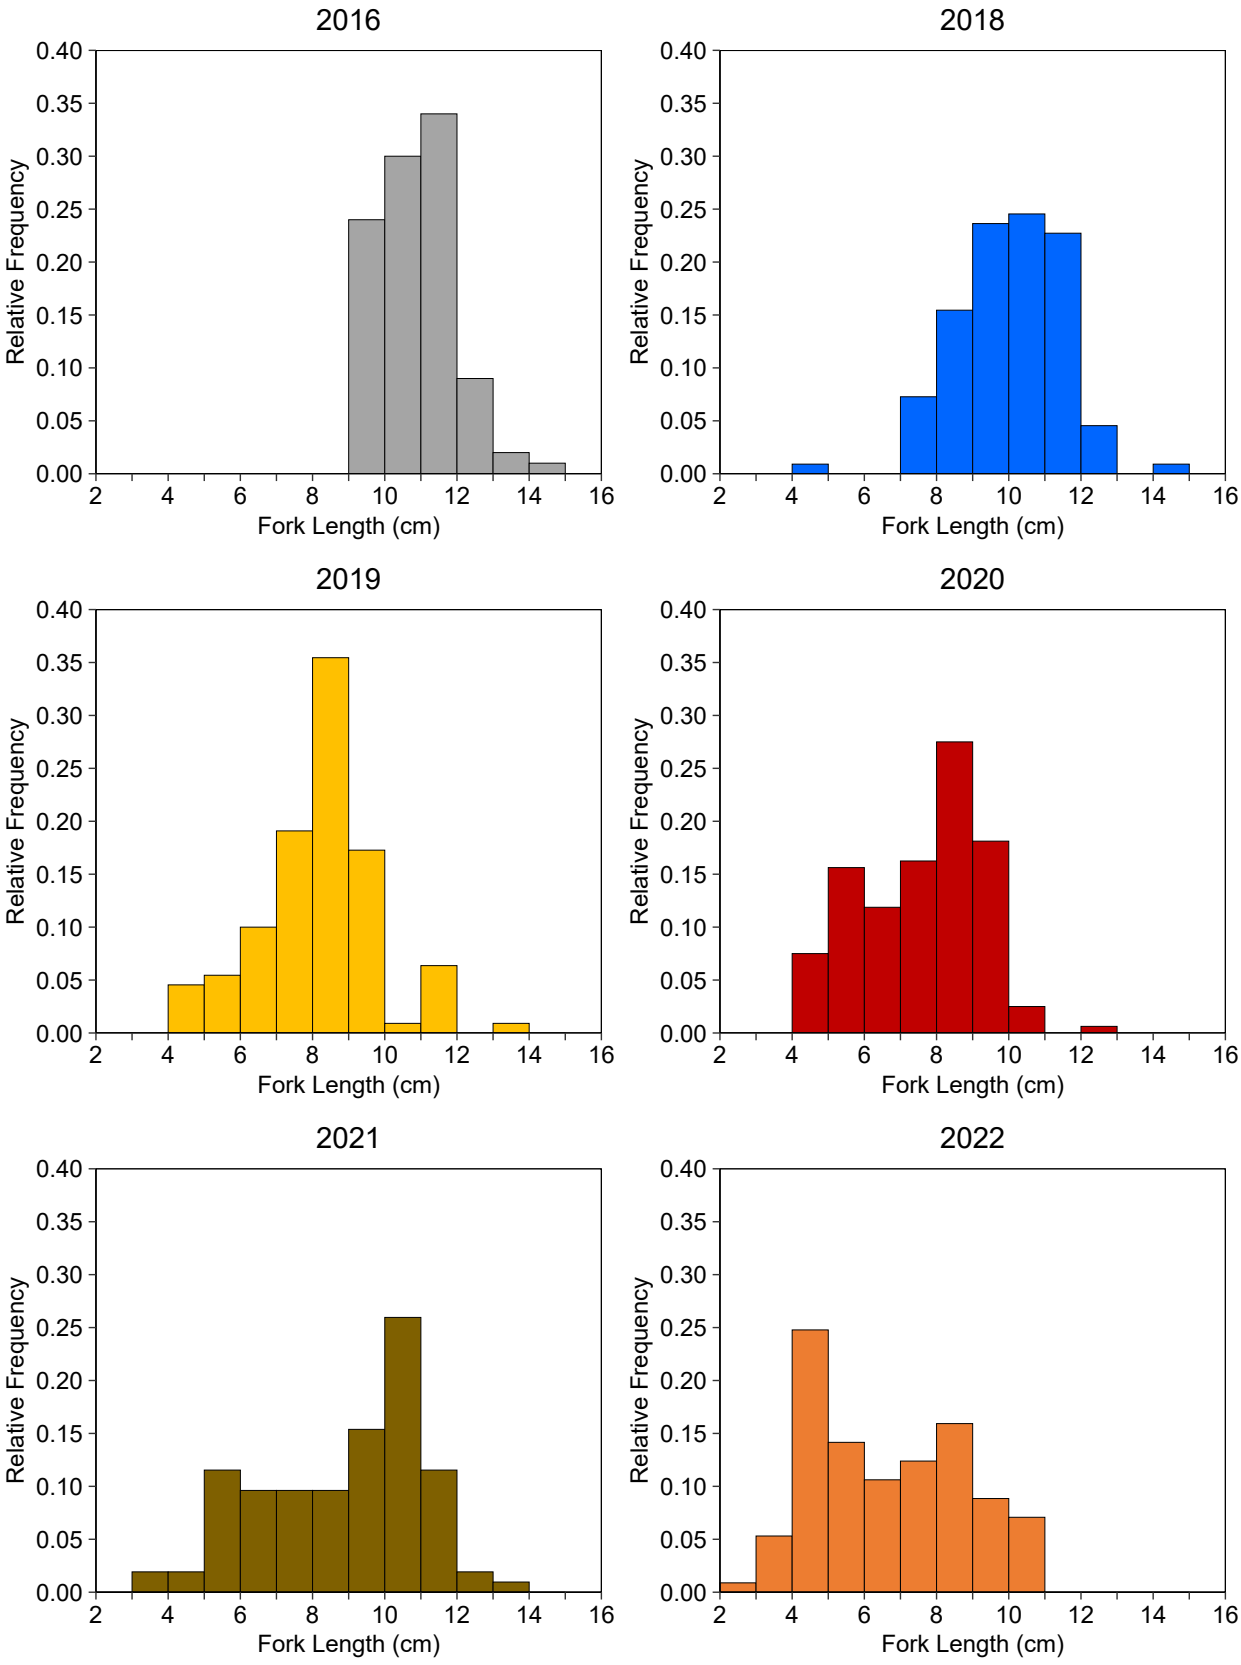

Figure E.5.6: Redside Shiner Length Frequency Distributions for Randomized Fall Hoop Netting in Polley Lake, 2016 to 2022

Table E.5.1: Statistical Comparisons of Condition and Weight-at-Age of Rainbow Trout and Longnose Sucker for Polley Lake in Spring and Fall, 2014 to 2022

P-value < 0.1

Mean is significantly greater than baseline year

Mean is significantly lower than baseline year

Covariate was not significant therefore an ANOVA was conducted

Note: "-" = no data; RBT = rainbow trout; LSU = longnose sucker; ANCOVA = analysis of covariance; ANOVA = analysis of variance; nt = no test (not enough data to conduct comparisons); ns = not significant.

[a] Model: $Y = \beta_0 + \beta_1(Cov) + \beta_2(Year) + \beta_3(Cov \times Year) + \varepsilon$.

[b] The mean value of the covariate (that corresponds to the adjusted means for the response variable) for the parallel slope ANCOVA model or the minimum and maximum values of the overlap in covariate values for the interaction ANCOVA model.

[c] The median, mean (geometric mean for log10-transformed variables), and adjusted mean are reported for ANCOVA, and the predicted means of the regression line equations for minimum and maximum values of the covariate (where the data sets overlap) for ANCOVAs where a significant interaction (i.e., different slopes) occurs.

[d] Calculated as the difference in measure of central tendency (MCT) between years (i.e., 2022 minus baseline year), expressed as a percentage of the baseline year MCT.

[e] Outliers removed. See Table E.5.2 for details.

[f] ANCOVA proceeded under the assumption that the slopes are practically parallel (R^2 of interaction model = 0.9877 and R^2 of parallel slope model = 0.9868; a difference < 0.02) following Environment Canada (2012b).

[g] ANCOVA proceeded under the assumption that the slopes are practically parallel (R^2 of interaction model = 0.9893 and R^2 of parallel slope model = 0.9885; a difference < 0.02) following Environment Canada (2012b).

[h] ANCOVA proceeded under the assumption that the slopes are practically parallel (R^2 of interaction model = 0.9889 and R^2 of parallel slope model = 0.9882; a difference < 0.02) following Environment Canada (2012b).

[i] ANCOVA proceeded under the assumption that the slopes are practically parallel (R^2 of interaction model = 0.9845 and R^2 of parallel slope model = 0.9837; a difference < 0.02) following Environment Canada (2012b).

[j] ANCOVA proceeded under the assumption that the slopes are practically parallel (R^2 of interaction model = 0.9909 and R^2 of parallel slope model = 0.99; a difference < 0.02) following Environment Canada (2012b).

[k] ANCOVA proceeded under the assumption that the slopes are practically parallel (R^2 of interaction model = 0.9903 and R^2 of parallel slope model = 0.9894; a difference < 0.02) following Environment Canada (2012b).

Table E.5.3: Two-Sample Kolmogorov-Smirnov Test Results of Rainbow Trout, Longnose Sucker, and Redside Shiner Length Frequency Distributions for Polley Lake in Spring and Fall, 2016 to 2022

Species	Sample Size						P-Value					
	2016	2018	2019	2020	2021	2022	Baseline Year	2018	2019	2020	2021	2022
RBT	119	54	201	216	268	123	2016	0.008	<0.001	<0.001	<0.001	<0.001
LSU	100	169	112	113	109	105	2016	<0.001	0.088	<0.001	<0.001	<0.001
RSC	100	110	110	160	104	113	2016	0.001	<0.001	<0.001	<0.001	<0.001

P-Value < 0.1

Notes: RBT = rainbow trout; LSU = longnose sucker; RSC = redside shiner.

APPENDIX E.6
FISH TISSUE QUALITY

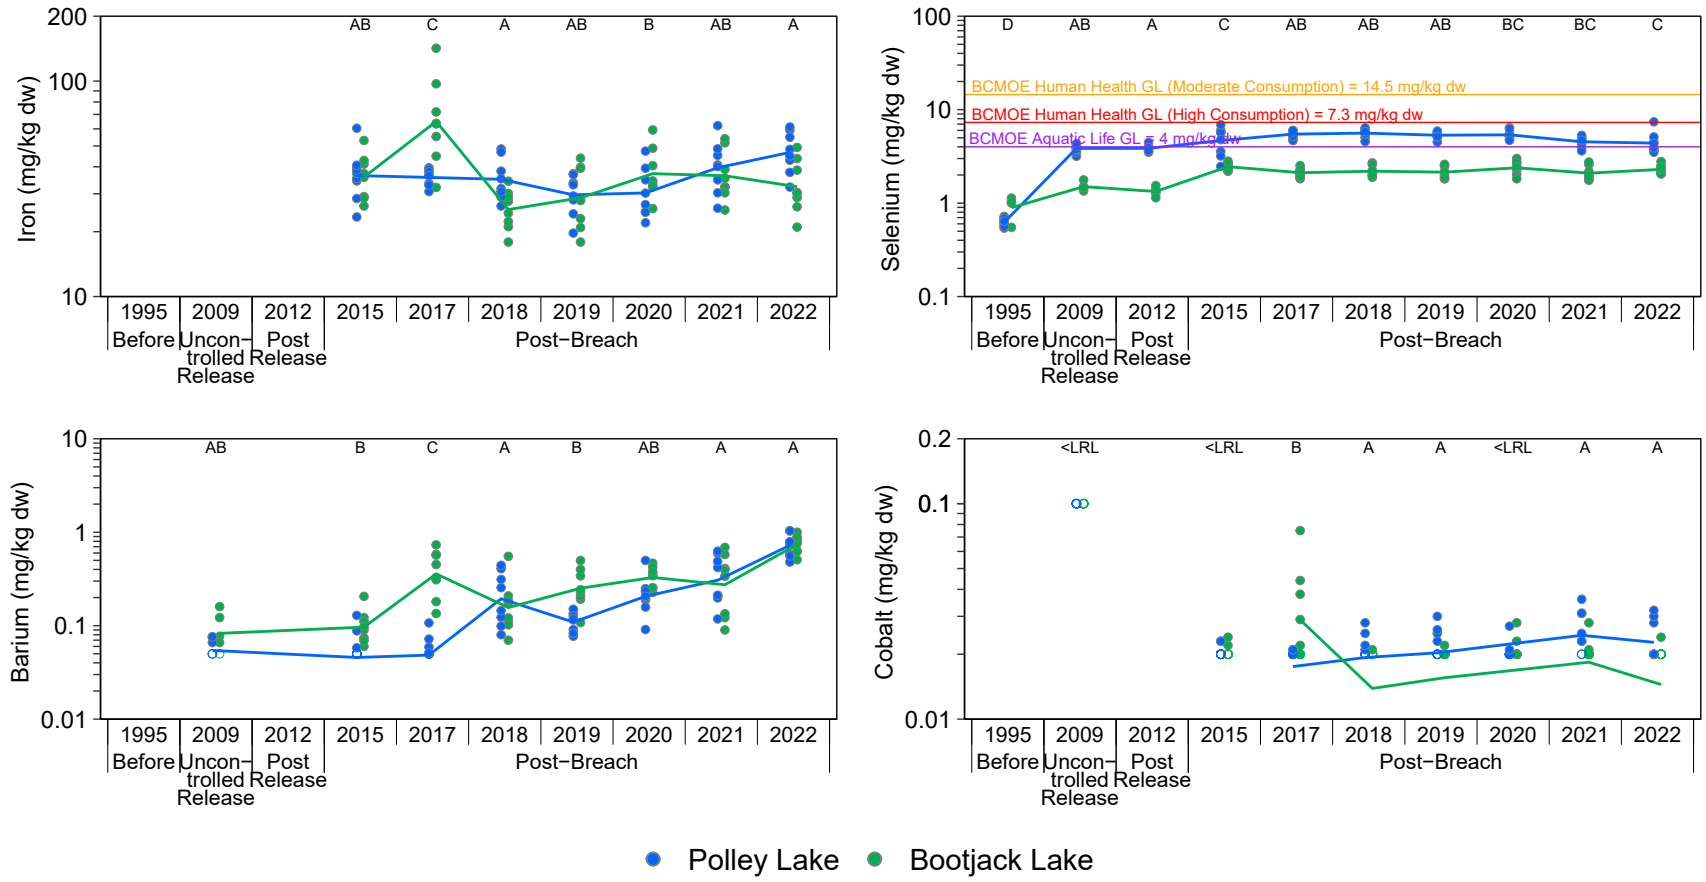

Figure E.6.1: Rainbow Trout Muscle Tissue Primary and Secondary Analyte Concentrations with a Significant Area x Year Effect for Polley Lake (Exposed) and Bootjack Lake (Reference), 1995 to 2022

Notes: BCMOE = British Columbia Ministry of the Environment; GL = Guideline; dw = dry weight; ww = wet weight; <LRL = lower than the laboratory reporting limit. Concentrations <LRL are plotted as open symbols at the LRL and the open symbol represents one or more values reported below the LRL. Individual samples are plotted and lines join the least−squares estimated mean values for years included in the statistical analysis (i.e., not <LRL). Statistical analyses were conducted using a two−way ANOVA with factors Area and Year. The models were fit using Maximum Likelihood Estimation with an assumed log−normal distribution. Years that share a letter (e.g., A,B,C) have ratios of concentrations (Polley Lake:Bootjack Lake) that do not differ significantly (p−value < 0.05) among years. Letter A was assigned to the year with the highest ratio of concentrations (Polley Lake:Bootjack Lake). Only years with samples from both reference and exposed areas are plotted.

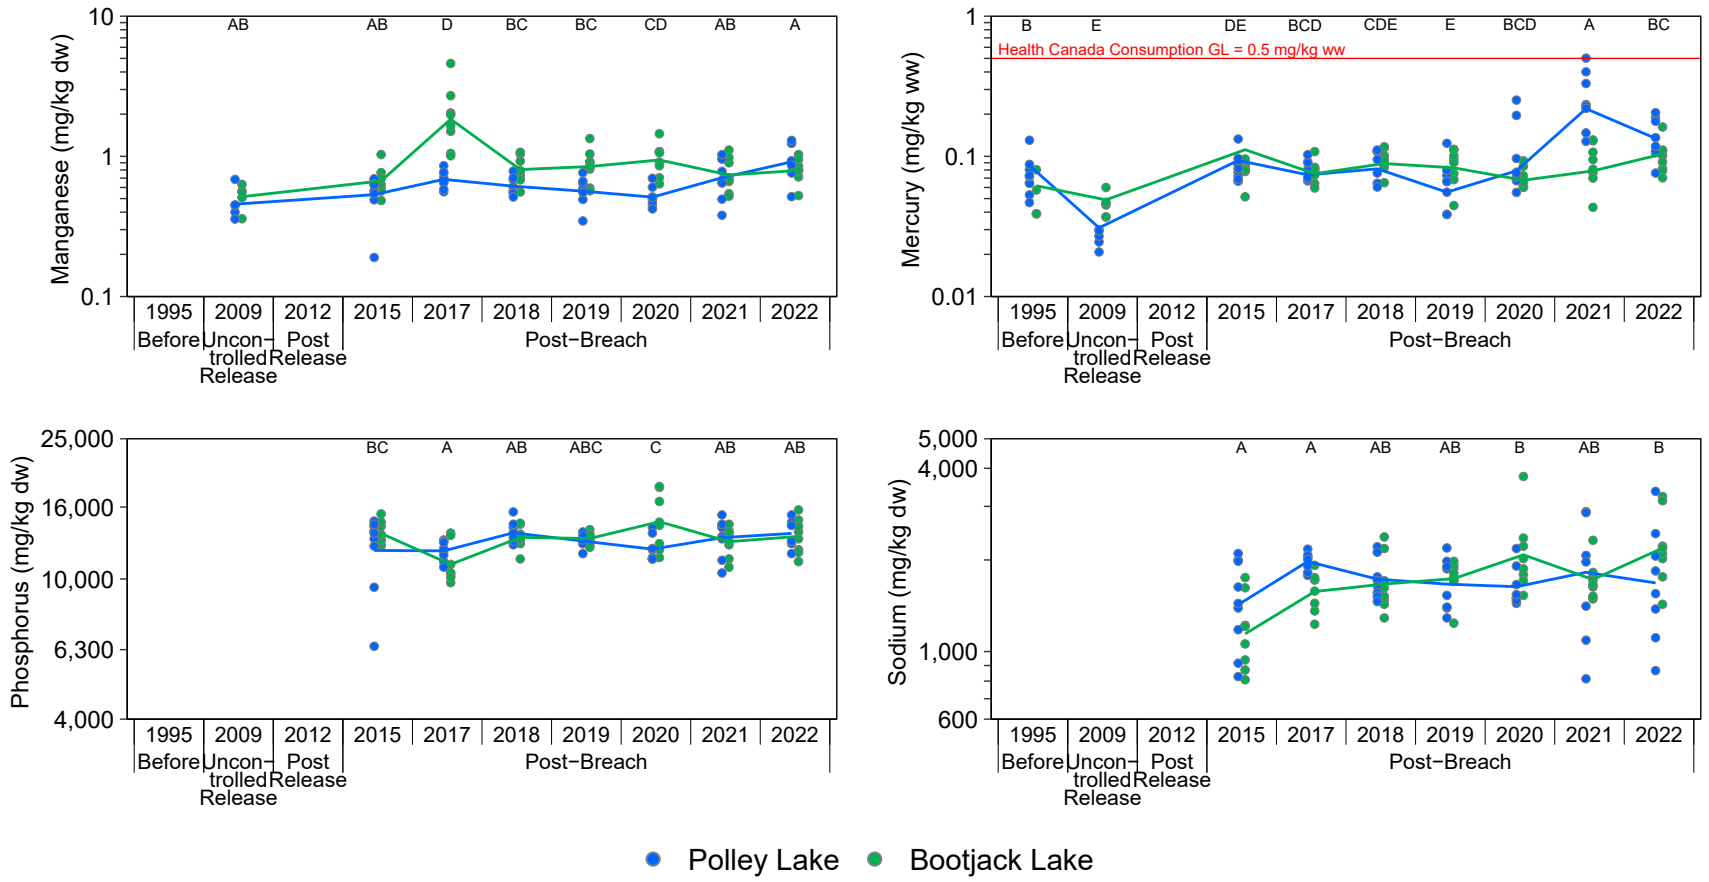

Figure E.6.1: Rainbow Trout Muscle Tissue Primary and Secondary Analyte Concentrations with a Significant Area x Year Effect for Polley Lake (Exposed) and Bootjack Lake (Reference), 1995 to 2022

Notes: BCMOE = British Columbia Ministry of the Environment; GL = Guideline; dw = dry weight; ww = wet weight; <LRL = lower than the laboratory reporting limit. Concentrations <LRL are plotted as open symbols at the LRL and the open symbol represents one or more values reported below the LRL. Notes: GL = Guideline; dw = dry weight; ww = wet weight; <LRL = lower than the laboratory reporting limit. Concentrations below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL and the open symbol represents one or more values reported below the LRL. Individual samples are plotted and lines join the least−squares estimated mean values for years included in the statistical analysis (i.e., not <LRL). Statistical analyses were conducted using a two−way ANOVA with factors Area and Year. The models were fit using Maximum Likelihood Estimation with an assumed log−normal distribution. Years that share a letter (e.g., A,B,C) have ratios of concentrations (Exposed:Reference) that do not differ significantly (p−value < 0.05) among years. Letter A was assigned to the year with the highest ratio of concentrations (Exposed:Reference). Only years with samples from both reference and exposed areas are plotted.

Figure E.6.13: Peamouth Chub Kidney Tissue Primary and Secondary Analyte Concentrations with a Significant Area x Year Effect for Quesnel Lake near Hazeltine Creek (NHC; Exposed) and near Grain Creek (NGC; Reference), 2018 to 2022

Notes: GL = Guideline; dw = dry weight; ww = wet weight; <LRL = lower than the laboratory reporting limit. Concentrations below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL and the open symbol represents one or more values reported below the LRL. Individual samples are plotted and lines join the least−squares estimated mean values for years included in the statistical analysis (i.e., not <LRL). Statistical analyses were conducted using a two−way ANOVA with factors Area and Year. The models were fit using Maximum Likelihood Estimation with an assumed log−normal distribution. Area x Year or Area P-value < 0.05

Contrast is significant (α = 0.05) and magnitude of difference is positive

Contrast is significant (α = 0.05) and magnitude of difference is negative

Notes: "-" = no data available; "nt" = not tested because all data were reported below the method detection limit (LRL) or because there were only data for a single time period; "ns" = not significant; "baseline" = first year of data included in analysis; "<LRL" = greater than 50% LRL data for both stations so the time period was omitted from the analysis; "ww" = wet weight; "ANOVA" = two way analysis of variance; "MLE" = censored regression using maximum likelihood estimation; "ANCOVA" = two-way analysis of covariance, MOD = magnitude of difference. Data were analysed in units of mg/kg dry weight except mercury which was analysed in units of mg/kg wet weight. Merged cells across years indicate that the Area × Time term was not significant, therefore MOD is for all years combined. Only years with samples from both reference and exposed were included in the analysis.

[a] Years that share a letter (e.g., A,B,C) had ratios of concentrations (Polley Lake:Bootjack Lake) that do not differ significantly among years. Letters are assigned such that A is assigned to the year with the highest ratio of concentrations (Polley Lake:Bootjack Lake).

[b] Magnitude of difference (MOD) calculated on backtransformed least-squares means for the observed time period as $(Exp_{observed} - Exp_{predicted})/(Exp_{predicted}) \times 100\%$ where $Exp_{predicted} = Ref_{observed} + (Exp_{baseline} - Ref_{baseline})$.

[c] Magnitude of difference (MOD) calculated on backtransformed least-squares means as (Exp-Ref)/Ref x 100%.

[d] Conducted as a two-way ANCOVA with $\log_{10}$(fork length) as a covariate. Because the covariate was significant, all contrasts were conducted at a $\log_{10}$(fork length) of 1.60.

[e] MOD may be inflated because data for one of the groups for two consecutive years in the comparison (2020, Polley Lake; 2021, Bootjack Lake) were entirely < LRL, leading to an underestimate of the mean for the <LRL result and a consequent increase in MOD between the two groups.

[f] Results of statistical contrasts for age, fork length, and body weight may differ among tissue types for a given species due to different sample sizes or sampling years among tissue types. Only the results associated with muscle and ovary tissue types were used in data interpretation.

Area x Year or Area P-value < 0.05

Contrast is significant (α = 0.05) and magnitude of difference is positive

Contrast is significant (α = 0.05) and magnitude of difference is negative

Notes: "-" = no data available; "nt" = not tested because all data were reported below the method detection limit (LRL) or because there were only data for a single time period; "ns" = not significant; "baseline" = first year of data included in analysis; "<LRL" = greater than 50% LRL data for both stations so the time period was omitted from the analysis; "ww" = wet weight; "ANOVA" = two way analysis of variance; "MLE" = censored regression using maximum likelihood estimation; "ANCOVA" = two-way analysis of covariance, MOD = magnitude of difference. Data were analysed in units of mg/kg dry weight except mercury which was analysed in units of mg/kg wet weight. Merged cells across years indicate that the Area × Time term was not significant, therefore MOD is for all years combined. Only years with samples from both reference and exposed were included in the analysis.

[a] Years that share a letter (e.g., A,B,C) had ratios of concentrations (Polley Lake:Bootjack Lake) that do not differ significantly among years. Letters are assigned such that A is assigned to the year with the highest ratio of concentrations (Polley Lake:Bootjack Lake).

[b] Magnitude of difference (MOD) calculated on backtransformed least-squares means for the observed time period as $(Exp_{observed} - Exp_{predicted})/(Exp_{predicted}) \times 100\%$ where $Exp_{predicted} = Ref_{observed} + (Exp_{baseline} - Ref_{baseline})$.

[c] Magnitude of difference (MOD) calculated on backtransformed least-squares means as (Exp-Ref)/Ref x 100%.

[d] Conducted first as a two-way ANCOVA with $\log_{10}$(fork length) as a covariate, but the covariate was not a significant predictor of mercury concentration. Analysis proceeded as a two-way ANOVA on Mercury in units of wet weight (ww).

[e] Results of statistical contrasts for age, fork length, and body weight may differ among tissue types for a given species due to different sample sizes or sampling years among tissue types. Only the results associated with muscle and ovary tissue types were used in data interpretation.

[f] MOD is inflated because data for one of the groups in the comparison were entirely < LRL, leading to an underestimate of the mean for the <LRL result and a consequent increase in MOD between the two groups.

Area x Year or Area P-value < 0.05

Contrast is significant (α = 0.05) and magnitude of difference is positive

Contrast is significant (α = 0.05) and magnitude of difference is negative

Notes: "-" = no data available; "nt" = not tested because all data were reported below the method detection limit (LRL) or because there were only data for a single time period; "ns" = not significant; "baseline" = first year of data included in analysis; "ww" = wet weight; "ANOVA" = two way analysis of variance; "MLE" = censored regression using maximum likelihood estimation; "ANCOVA" = two-way analysis of covariance, MOD = magnitude of difference. Merged cells across years indicate that the Area × Time term was not significant, therefore MOD is for all years combined. Only years with samples from both reference and exposed were included in the analysis.

[a] Years that share a letter (e.g., A,B,C) had ratios of concentrations (Polley Lake:Bootjack Lake) that do not differ significantly among years. Letters are assigned such that A is assigned to the year with the highest ratio of concentrations (Polley Lake:Bootjack Lake). <LRL = all of the concentrations were reported as <LRL for at least one area so the time period was omitted from the analysis.

[b] Magnitude of difference (MOD) calculated on backtransformed least-squares means for the observed time period as $(Exp_{observed} - Exp_{predicted})/(Exp_{predicted}) \times 100\%$ where $Exp_{predicted} = Ref_{observed} + (Exp_{baseline} - Ref_{baseline})$.

[c] Magnitude of difference (MOD) calculated on backtransformed least-squares means as (Exp-Ref)/Ref x 100%.

[d] MOD is inflated because data for one of the groups in the comparison were entirely < LRL, leading to an underestimate of the mean for the <LRL result and a consequent increase in MOD between the two groups.

[e] Conducted as a two-way ANCOVA with $\log_{10}$(fork length) as a covariate. Because the covariate was significant, all contrasts were conducted at a $\log_{10}$(fork length) of 1.60.

[f] Results of statistical contrasts for age, fork length, and body weight may differ among tissue types for a given species due to different sample sizes or sampling years among tissue types. Only the results associated with muscle and ovary tissue types were used in data interpretation.

Area x Year or Area P-value < 0.05.

Contrast is significant (α = 0.05) and magnitude of difference is positive.

Contrast is significant (α = 0.05) and magnitude of difference is negative.

Notes: "-" = no data available; "nt" = not tested because all data were reported below the method detection limit (LRL) or because there were only data for a single time period; "ns" = not significant; "baseline" = first year of data included in analysis; "<LRL" = greater than 50% LRL data for both stations so the time period was omitted from the analysis; "ww" = wet weight; "ANOVA" = two way analysis of variance; "MLE" = censored regression using maximum likelihood estimation; "ANCOVA" = two-way analysis of covariance, MOD = magnitude of difference. Data were analysed in units of mg/kg dry weight except mercury which was analysed in units of mg/kg wet weight. Merged cells across years indicate that the Area × Time term was not significant, therefore MOD is for all years combined. Only years with samples from both reference and exposed were included in the analysis.

[a] Years that share a letter (e.g.. A.B.C) had ratios of concentrations (Polley Lake:Bootjack Lake) that do not differ significantly among years. Letters are assigned such that A is assigned to the year with the highest ratio of concentrations (Polley Lake:Bootjack Lake).

[b] Magnitude of difference (MOD) calculated on backtransformed least-squares means for the observed time period as $(Exp_{observed} - Exp_{predicted})/(Exp_{predicted})\times 100\%$ where $Exp_{predicted} = Ref_{observed} + (Exp_{baseline} - Ref_{baseline})$.

[c] Magnitude of difference (MOD) calculated on backtransformed least-squares means as (Exp-Ref)/Ref x 100%

[d] Conducted as a two-way ANCOVA with $\log_{10}$(fork length) as a covariate. Because the covariate was significant. all contrasts were conducted at a $\log_{10}$(fork length) of 1.60.

[e] Results of statistical contrasts for age, fork length, and body weight may differ among tissue types for a given species due to different sample sizes or sampling years among tissue types. Only the results associated with muscle and ovary tissue types were used in data interpretatio

[f] MOD is inflated because data for one of the groups in the comparison were entirely < LRL, leading to an underestimate of the mean for the <LRL result and a consequent increase in MOD between the two groups

Area x Year or Area P-value < 0.05

Contrast is significant (α = 0.05) and magnitude of difference is positive

Contrast is significant (α = 0.05) and magnitude of difference is negative

Notes: "-" = no data available; "nt" = not tested because all data were reported below the method detection limit (LRL) or because there were only data for a single time period; "ns" = not significant; "baseline" = first year of data included in analysis; "ww" = wet weight; "ANOVA" = two way analysis of variance; "MLE" = censored regression using maximum likelihood estimation; "ANCOVA" = two-way analysis of covariance, MOD = magnitude of difference. Data were analysed in units of mg/kg dry weight except mercury which was analysed in units of mg/kg wet weight. Merged cells across years indicate that the Area × Time term was not significant, therefore MOD is for all years combined. Only years with samples from both reference and exposed were included in the analysis. No female lake trout were collected from the Quesnel Lake reference area in 2021, so 2021 was excluded fron analyses.

[a] Years that share a letter (e.g., A,B,C) had ratios of concentrations (Exposed:Reference) that do not differ significantly among years. Letters are assigned such that A is assigned to the year with the highest ratio of concentrations (Exposed:Reference).

[b] Magnitude of difference (MOD) calculated on backtransformed least-squares means for the observed time period as $(Exp_{observed} - Exp_{predicted})/(Exp_{predicted})\times 100\%$ where $Exp_{predicted} = Ref_{observed} + (Exp_{baseline} - Ref_{baseline})$.

[c] Magnitude of difference (MOD) calculated on backtransformed least-squares means as (Exp-Ref)/Ref x 100%.

[d] Conducted as a two-way ANCOVA with $\log_{10}$(fork length) as a covariate. Because the covariate was significant, all contrasts were conducted at a $\log_{10}$(fork length) of 1.76.

[e] MOD is inflated because data for one of the groups in the comparison were entirely < LRL, leading to an underestimate of the mean for the <LRL result and a consequent increase in MOD between the two groups.

[f] Results of statistical contrasts for age, fork length, and body weight may differ among tissue types for a given species due to different sample sizes or sampling years among tissue types. Only the results associated with muscle and ovary tissue types were used in data interpretation.

Area x Year or Area P-value < 0.05

Contrast is significant (α = 0.05) and magnitude of difference is positive

Contrast is significant (α = 0.05) and magnitude of difference is negative

Notes: "-" = no data available; "nt" = not tested because all data were reported below the method detection limit (LRL) or because there were only data for a single time period; "ns" = not significant; "baseline" = first year of data included in analysis; "ww" = wet weight; "ANOVA" = two way analysis of variance; "MLE" = censored regression using maximum likelihood estimation; "ANCOVA" = two-way analysis of covariance, MOD = magnitude of difference. Data were analysed in units of mg/kg dry weight except mercury which was analysed in units of mg/kg wet weight. Merged cells across years indicate that the Area × Time term was not significant, therefore MOD is for all years combined. Only years with samples from both reference and exposed were included in the analysis.

[a] Years that share a letter (e.g., A,B,C) had ratios of concentrations (Exposed:Reference) that do not differ significantly among years. Letters are assigned such that A is assigned to the year with the highest ratio of concentrations (Exposed:Reference).

[b] Magnitude of difference (MOD) calculated on backtransformed least-squares means for the observed time period as $(Exp_{observed} - Exp_{predicted})/(Exp_{predicted})\times 100\%$ where $Exp_{predicted} = Ref_{observed} + (Exp_{baseline} - Ref_{baseline})$.

[c] Magnitude of difference (MOD) calculated on backtransformed least-squares means as (Exp-Ref)/Ref x 100%.

[d] Conducted as a two-way ANCOVA with $\log_{10}$(fork length) as a covariate. Because the covariate was significant, all contrasts were conducted at a $\log_{10}$(fork length) of 1.30.

[e] MOD is inflated because data for one of the groups in the comparison were entirely < LRL, leading to an underestimate of the mean for the <LRL result and a consequent increase in MOD between the two groups.

[f] Results of statistical contrasts for age, fork length, and body weight may differ among tissue types for a given species due to different sample sizes or sampling years among tissue types. Only the results associated with muscle and ovary tissue types were used in data interpretation.

Area x Year or Area P-value < 0.05

Contrast is significant (α = 0.05) and magnitude of difference is positive

Contrast is significant (α = 0.05) and magnitude of difference is negative

Notes: "-" = no data available; "nt" = not tested because all data were reported below the method detection limit (LRL) or because there were only data for a single time period; "ns" = not significant; "baseline" = first year of data included in analysis; "ww" = wet weight; "ANOVA" = two way analysis of variance; "MLE" = censored regression using maximum likelihood estimation; "ANCOVA" = two-way analysis of covariance, MOD = magnitude of difference. Data were analysed in units of mg/kg dry weight except mercury which was analysed in units of mg/kg wet weight. Merged cells across years indicate that the Area × Time term was not significant, therefore MOD is for all years combined. Only years with samples from both reference and exposed were included in the analysis.

[a] Years that share a letter (e.g., A,B,C) had ratios of concentrations (Exposed:Reference) that do not differ significantly among years. Letters are assigned such that A is assigned to the year with the highest ratio of concentrations (Exposed:Reference). <LRL = all of the concentrations were reported as <LRL for at least one area so the time period was omitted from the analysis.

[b] Magnitude of difference (MOD) calculated on backtransformed least-squares means for the observed time period as $(Exp_{observed} - Exp_{predicted})/(Exp_{predicted}) \times 100\%$ where $Exp_{predicted} = Ref_{observed} + (Exp_{baseline} - Ref_{baseline})$.

[c] Magnitude of difference (MOD) calculated on backtransformed least-squares means as (Exp-Ref)/Ref x 100%.

[d] Conducted as a two-way ANCOVA with $\log_{10}$(fork length) as a covariate. Because the covariate was significant, all contrasts were conducted at a $\log_{10}$(fork length) of 1.20.

[e] Results of statistical contrasts for age, fork length, and body weight may differ among tissue types for a given species due to different sample sizes or sampling years among tissue types. Only the results associated with muscle and ovary tissue types were used in data interpretation.

Area x Year or Area P-value < 0.05

Contrast is significant (α = 0.05) and magnitude of difference is positive

Contrast is significant (α = 0.05) and magnitude of difference is negative

Notes: "-" = no data available; "nt" = not tested because all data were reported below the method detection limit (LRL) or because there were only data for a single time period; "ns" = not significant; "baseline" = first year of data included in analysis; "ww" = wet weight; "ANOVA" = two way analysis of variance; "MLE" = censored regression using maximum likelihood estimation; "ANCOVA" = two-way analysis of covariance, MOD = magnitude of difference. Data were analysed in units of mg/kg dry weight except mercury which was analysed in units of mg/kg wet weight. Merged cells across years indicate that the Area × Time term was not significant, therefore MOD is for all years combined. Only years with samples from both reference and exposed were included in the analysis.

[a] Years that share a letter (e.g., A,B,C) had ratios of concentrations (Exposed:Reference) that do not differ significantly among years. Letters are assigned such that A is assigned to the year with the highest ratio of concentrations (Exposed:Reference).

[b] Magnitude of difference (MOD) calculated on backtransformed least-squares means for the observed time period as $(Exp_{observed} - Exp_{predicted})/(Exp_{predicted})\times 100\%$ where $Exp_{predicted} = Ref_{observed} + (Exp_{baseline} - Ref_{baseline})$.

[c] Magnitude of difference (MOD) calculated on backtransformed least-squares means as (Exp-Ref)/Ref x 100%.

[d] Conducted as a two-way ANCOVA with $\log_{10}$(fork length) as a covariate. Because the covariate was significant, all contrasts were conducted at a $\log_{10}$(fork length) of 1.30.

[e] MOD is inflated because data for one of the groups in the comparison were entirely < LRL, leading to an underestimate of the mean for the <LRL result and a consequent increase in MOD between the two groups.

[f] Results of statistical contrasts for age, fork length, and body weight may differ among tissue types for a given species due to different sample sizes or sampling years among tissue types. Only the results associated with muscle and ovary tissue types were used in data interpretation.

Area x Year or Area P-value < 0.05

Contrast is significant (α = 0.05) and magnitude of difference is positive

Contrast is significant (α = 0.05) and magnitude of difference is negative

Notes: "-" = no data available; "nt" = not tested because all data were reported below the method detection limit (LRL) or because there were only data for a single time period; "ns" = not significant; "baseline" = first year of data included in analysis; "ww" = wet weight; "ANOVA" = two way analysis of variance; "MLE" = censored regression using maximum likelihood estimation; "ANCOVA" = two-way analysis of covariance, MOD = magnitude of difference. Data were analysed in units of mg/kg dry weight except mercury which was analysed in units of mg/kg wet weight. Merged cells across years indicate that the Area × Time term was not significant, therefore MOD is for all years combined. Only years with samples from both reference and exposed were included in the analysis.

[a] Years that share a letter (e.g., A,B,C) had ratios of concentrations (Exposed:Reference) that do not differ significantly among years. Letters are assigned such that A is assigned to the year with the highest ratio of concentrations (Exposed:Reference).

[b] Magnitude of difference (MOD) calculated on backtransformed least-squares means for the observed time period as $(Exp_{observed} - Exp_{predicted})/(Exp_{predicted}) \times 100\%$ where $Exp_{predicted} = Ref_{observed} + (Exp_{baseline} - Ref_{baseline})$.

[c] Magnitude of difference (MOD) calculated on backtransformed least-squares means as (Exp-Ref)/Ref x 100%.

[d] Conducted as a two-way ANCOVA with $\log_{10}$(fork length) as a covariate. Because the covariate was significant, all contrasts were conducted at a $\log_{10}$(fork length) of 1.75.

[e] MOD is inflated because data for one of the groups in the comparison were entirely < LRL, leading to an underestimate of the mean for the <LRL result and a consequent increase in MOD between the two groups.

[f] Results of statistical contrasts for age, fork length, and body weight may differ among tissue types for a given species due to different sample sizes or sampling years among tissue types. Only the results associated with muscle and ovary tissue types were used in data interpretation.

Area x Year or Area P-value < 0.05

Contrast is significant (α = 0.05) and magnitude of difference is positive

Contrast is significant (α = 0.05) and magnitude of difference is negative

Notes: "-" = no data available; "nt" = not tested because all data were reported below the method detection limit (LRL) or because there were only data for a single time period; "ns" = not significant; "baseline" = first year of data included in analysis; "ww" = wet weight; "ANOVA" = two way analysis of variance; "MLE" = censored regression using maximum likelihood estimation; "ANCOVA" = two-way analysis of covariance, MOD = magnitude of difference. Data were analysed in units of mg/kg dry weight except mercury which was analysed in units of mg/kg wet weight. Merged cells across years indicate that the Area × Time term was not significant, therefore MOD is for all years combined. Only years with samples from both reference and exposed were included in the analysis.

[a] Years that share a letter (e.g., A,B,C) had ratios of concentrations (Exposed:Reference) that do not differ significantly among years. Letters are assigned such that A is assigned to the year with the highest ratio of concentrations (Exposed:Reference).

[b] Magnitude of difference (MOD) calculated on backtransformed least-squares means for the observed time period as $(Exp_{observed} - Exp_{predicted})/(Exp_{predicted})\times 100\%$ where $Exp_{predicted} = Ref_{observed} + (Exp_{baseline} - Ref_{baseline})$.

[c] Magnitude of difference (MOD) calculated on backtransformed least-squares means as (Exp-Ref)/Ref x 100%.

[d] Conducted as a two-way ANCOVA with $\log_{10}$(fork length) as a covariate. Because the covariate was significant, all contrasts were conducted at a $\log_{10}$(fork length) of 1.75.

[e] MOD is inflated because data for one of the groups in the comparison were entirely < LRL, leading to an underestimate of the mean for the <LRL result and a consequent increase in MOD between the two groups.

[f] Results of statistical contrasts for age, fork length, and body weight may differ among tissue types for a given species due to different sample sizes or sampling years among tissue types. Only the results associated with muscle and ovary tissue types were used in data interpretation.

Year P-value < 0.05.

Contrast is significant (α = 0.05) and magnitude of difference is positive.

Contrast is significant (α = 0.05) and magnitude of difference is negative.

Notes: "-" = no data available, nt = not tested because all data were reported below the method detection limit (LRL) or because there were only data for a single time period, ns = not significant, baseline= first year of data included in analysis, <LRL = all of the concentrations were reported as < LRL so the time period was omitted from the analysis, ww = wet weight, ANOVA = one way analysis of variance, MOD = Magnitude of Difference, MLE = censored regression using maximum likelihood estimation. Data were analysed in units of mg/kg dry weight except mercury which was analysed in units of mg/kg wet weight.

[a] Years that share a letter (e.g., A,B,C) had concentrations that do not differ significantly among years. Letters are assigned such that A is assigned to the year with the highest concentrations. <LRL = all of the concentrations were reported as <LRL for at least one area so the time period was omitted from the analysis.

[b] Magnitude of difference (MOD) calculated on backtransformed least-squares means as $(year_t - year_{baseline})/year_{baseline} \times 100\%$.

[c] Assessed as a one-way ANCOVA with log10(fork length) as a covariate. Post-hoc comparisons made at a log10 fork length of 1.48

APPENDIX F
STATISTICAL ANALYSES – CREEK HABITAT

APPENDIX F.1
SEDIMENT QUALITY

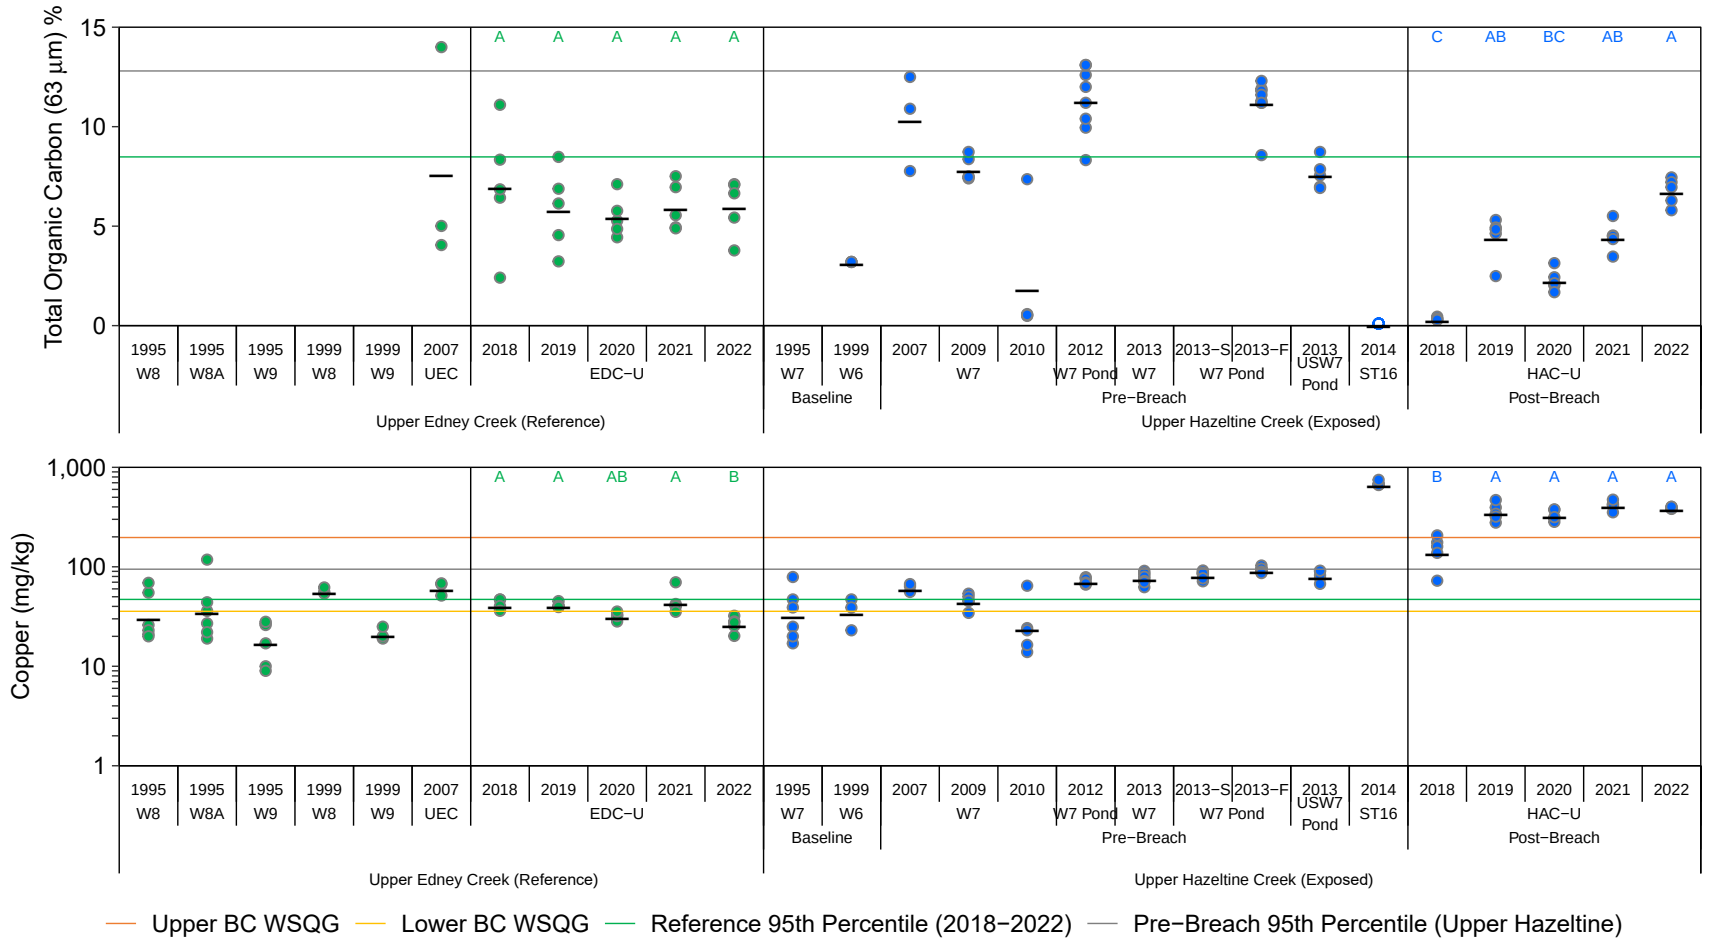

Figure F.1.1: Sediment Analyte of Interest Concentrations (<63 µm Fraction) for Upper Hazeltine Creek (HAC-U; Exposed) and Upper Edney Creek (EDC-U; Reference), 1995 to 2022

Notes: Data not available for all analytes in all years (particularly baseline). Concentrations below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. Means are plotted as horizontal bars. Years that share a letter within an area (i.e., EDC−U [green] and HAC−U [blue]) do not differ significantly. Statistical differences among years were evaluated from 2018 to 2022. Reference 95th Percentile was calculated with EDC−U data from 2018 to 2022. S and F following the sampling years = Spring and Fall, respectively. British Columbia Working Sediment Guidelines (BCMOECCS 2021a) and approved BC Sediment Quality Guideline for Selenium (BCMOECCS 2021b). Some sediment metal concentrations reported for 1996 (HKP 1997a) were unusually high and are suspected errors (see Appendix Table D.2.1 and D.2.2), data from 1996 were therefore not plotted, selenium was the only parameter measured in 2012 (Minnow 2013a), therefore concentrations of analytes of interest are not plotted for this year.

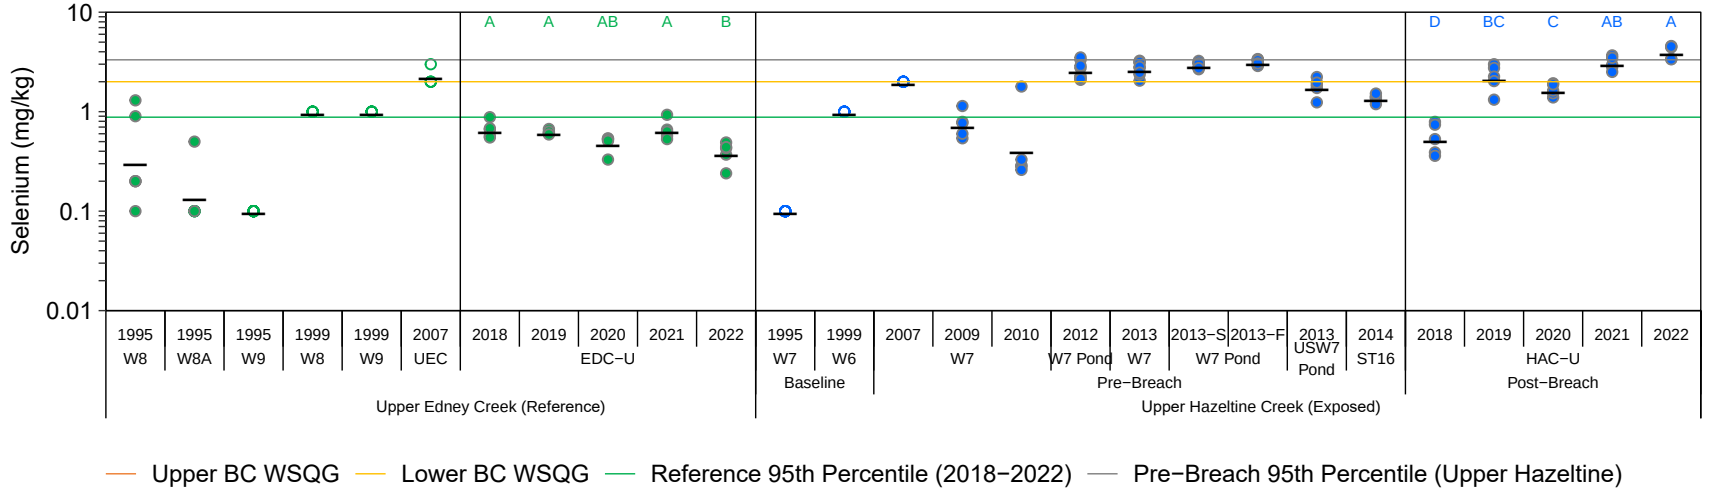

Figure F.1.1: Sediment Analyte of Interest Concentrations (<63 µm Fraction) for Upper Hazeltine Creek (HAC-U; Exposed) and Upper Edney Creek (EDC-U; Reference), 1995 to 2022

Notes: Data not available for all analytes in all years (particularly baseline). Concentrations below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. Means are plotted as horizontal bars. Years that share a letter within an area (i.e., EDC−U [green] and HAC−U [blue]) do not differ significantly. Statistical differences among years were evaluated from 2018 to 2022. Reference 95th Percentile was calculated with EDC−U data from 2018 to 2022. S and F following the sampling years = Spring and Fall, respectively. British Columbia Working Sediment Guidelines (BCMOECCS 2021a) and approved BC Sediment Quality Guideline for Selenium (BCMOECCS 2021b). Some sediment metal concentrations reported for 1996 (HKP 1997a) were unusually high and are suspected errors (see Appendix Table D.2.1 and D.2.2), data from 1996 were therefore not plotted, selenium was the only parameter measured in 2012 (Minnow 2013a), therefore concentrations of analytes of interest are not plotted for this year.

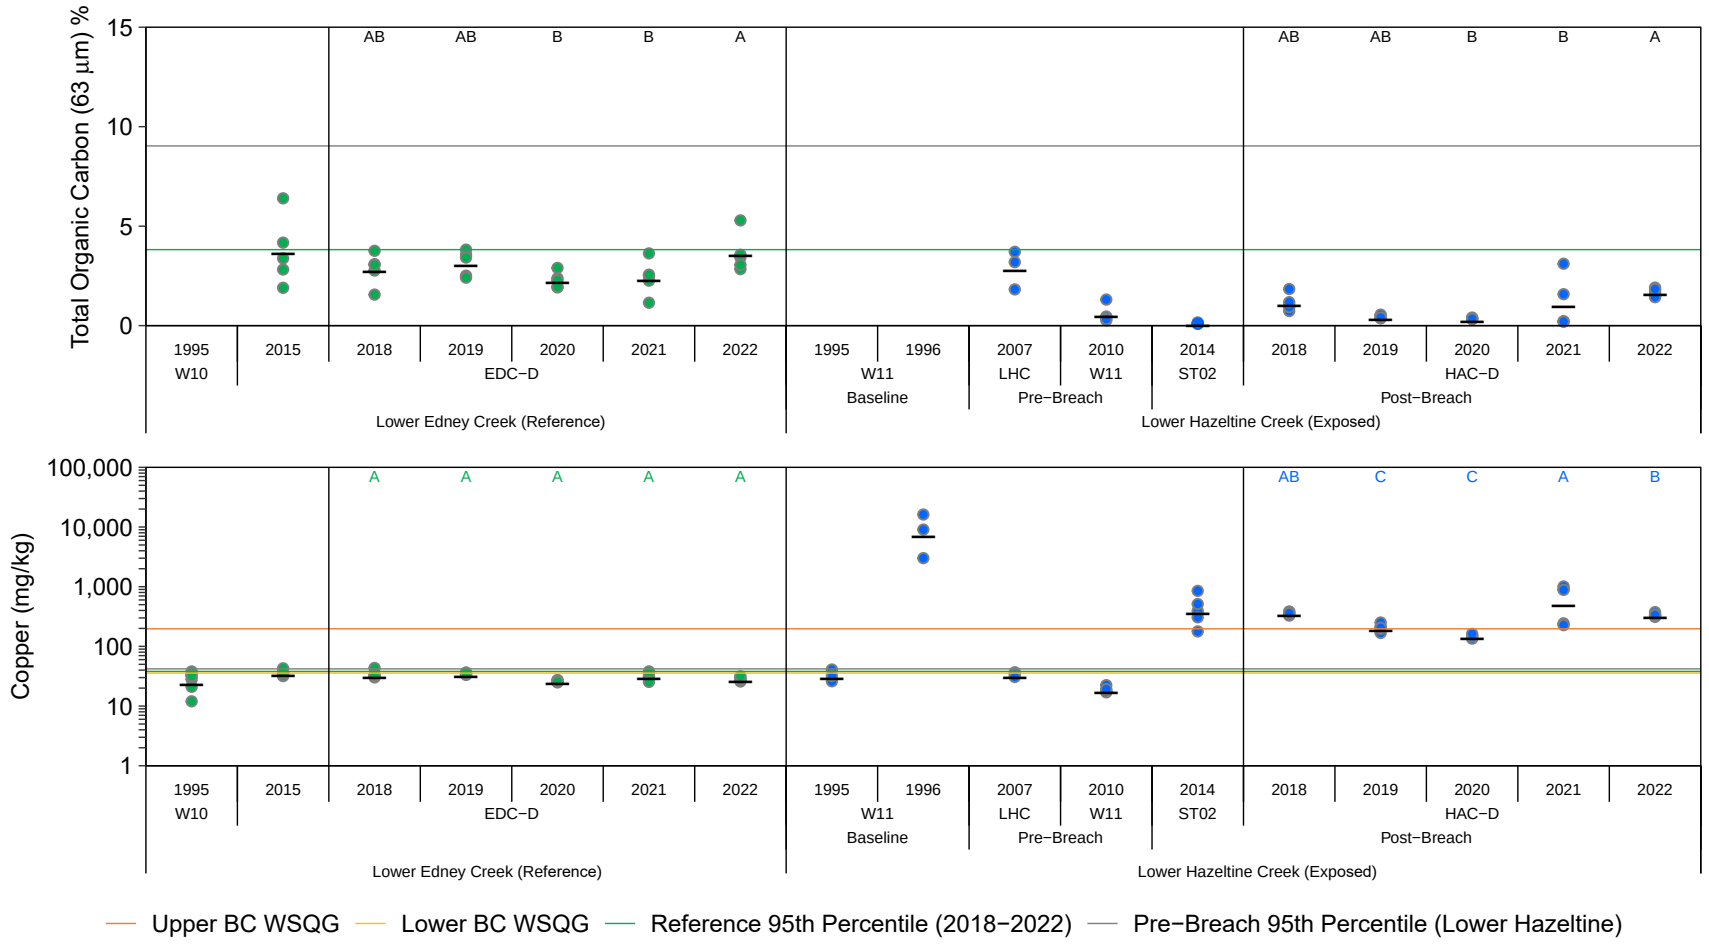

Figure F.1.2: Sediment Analyte of Interest Concentrations (<63 µm Fraction) for Lower Hazeltine Creek (HAC-D; Exposed) and Lower Edney Creek (EDC-D; Reference), 1995 to 2022

Notes: Data not available for all analytes in all years (particularly baseline). Concentrations below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. Means are plotted as horizontal bars. Years that share a letter within an area (i.e., EDC−D [green] and HAC−D [blue]) do not differ significantly. Statistical differences among years were evaluated from 2018 to 2022. Reference 95th Percentile was calculated with EDC−D data from 2018 to 2022. British Columbia Working Sediment Guidelines (BCMOECCS 2021a) and approved BC Sediment Quality Guideline for Selenium (BCMOECCS 2021b). Some sediment metal concentrations reported for 1996 (HKP 1997a) were unusually high and are suspected errors (see Appendix Table D.2.1 and D.2.4), data from 1996 were therefore not plotted, selenium was the only parameter measured in 2012 (Minnow 2013a), therefore concentrations of analytes of interest are not plotted for this year.

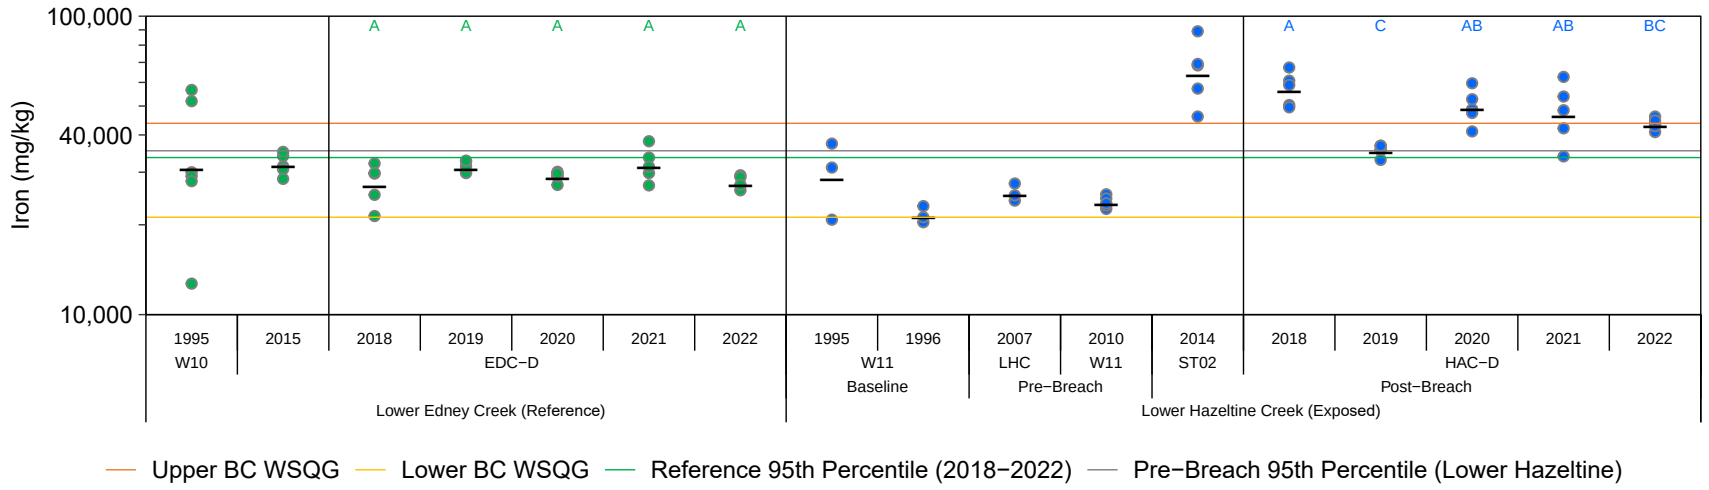

Figure F.1.2: Sediment Analyte of Interest Concentrations (<63 µm Fraction) for Lower Hazeltine Creek (HAC-D; Exposed) and Lower Edney Creek (EDC-D; Reference), 1995 to 2022

Notes: Data not available for all analytes in all years (particularly baseline). Concentrations below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. Means are plotted as horizontal bars. Years that share a letter within an area (i.e., EDC−D [green] and HAC−D [blue]) do not differ significantly. Statistical differences among years were evaluated from 2018 to 2022. Reference 95th Percentile was calculated with EDC−D data from 2018 to 2022. British Columbia Working Sediment Guidelines (BCMOECCS 2021a) and approved BC Sediment Quality Guideline for Selenium (BCMOECCS 2021b). Some sediment metal concentrations reported for 1996 (HKP 1997a) were unusually high and are suspected errors (see Appendix Table D.2.1 and D.2.4), data from 1996 were therefore not plotted, selenium was the only parameter measured in 2012 (Minnow 2013a), therefore concentrations of analytes of interest are not plotted for this year.

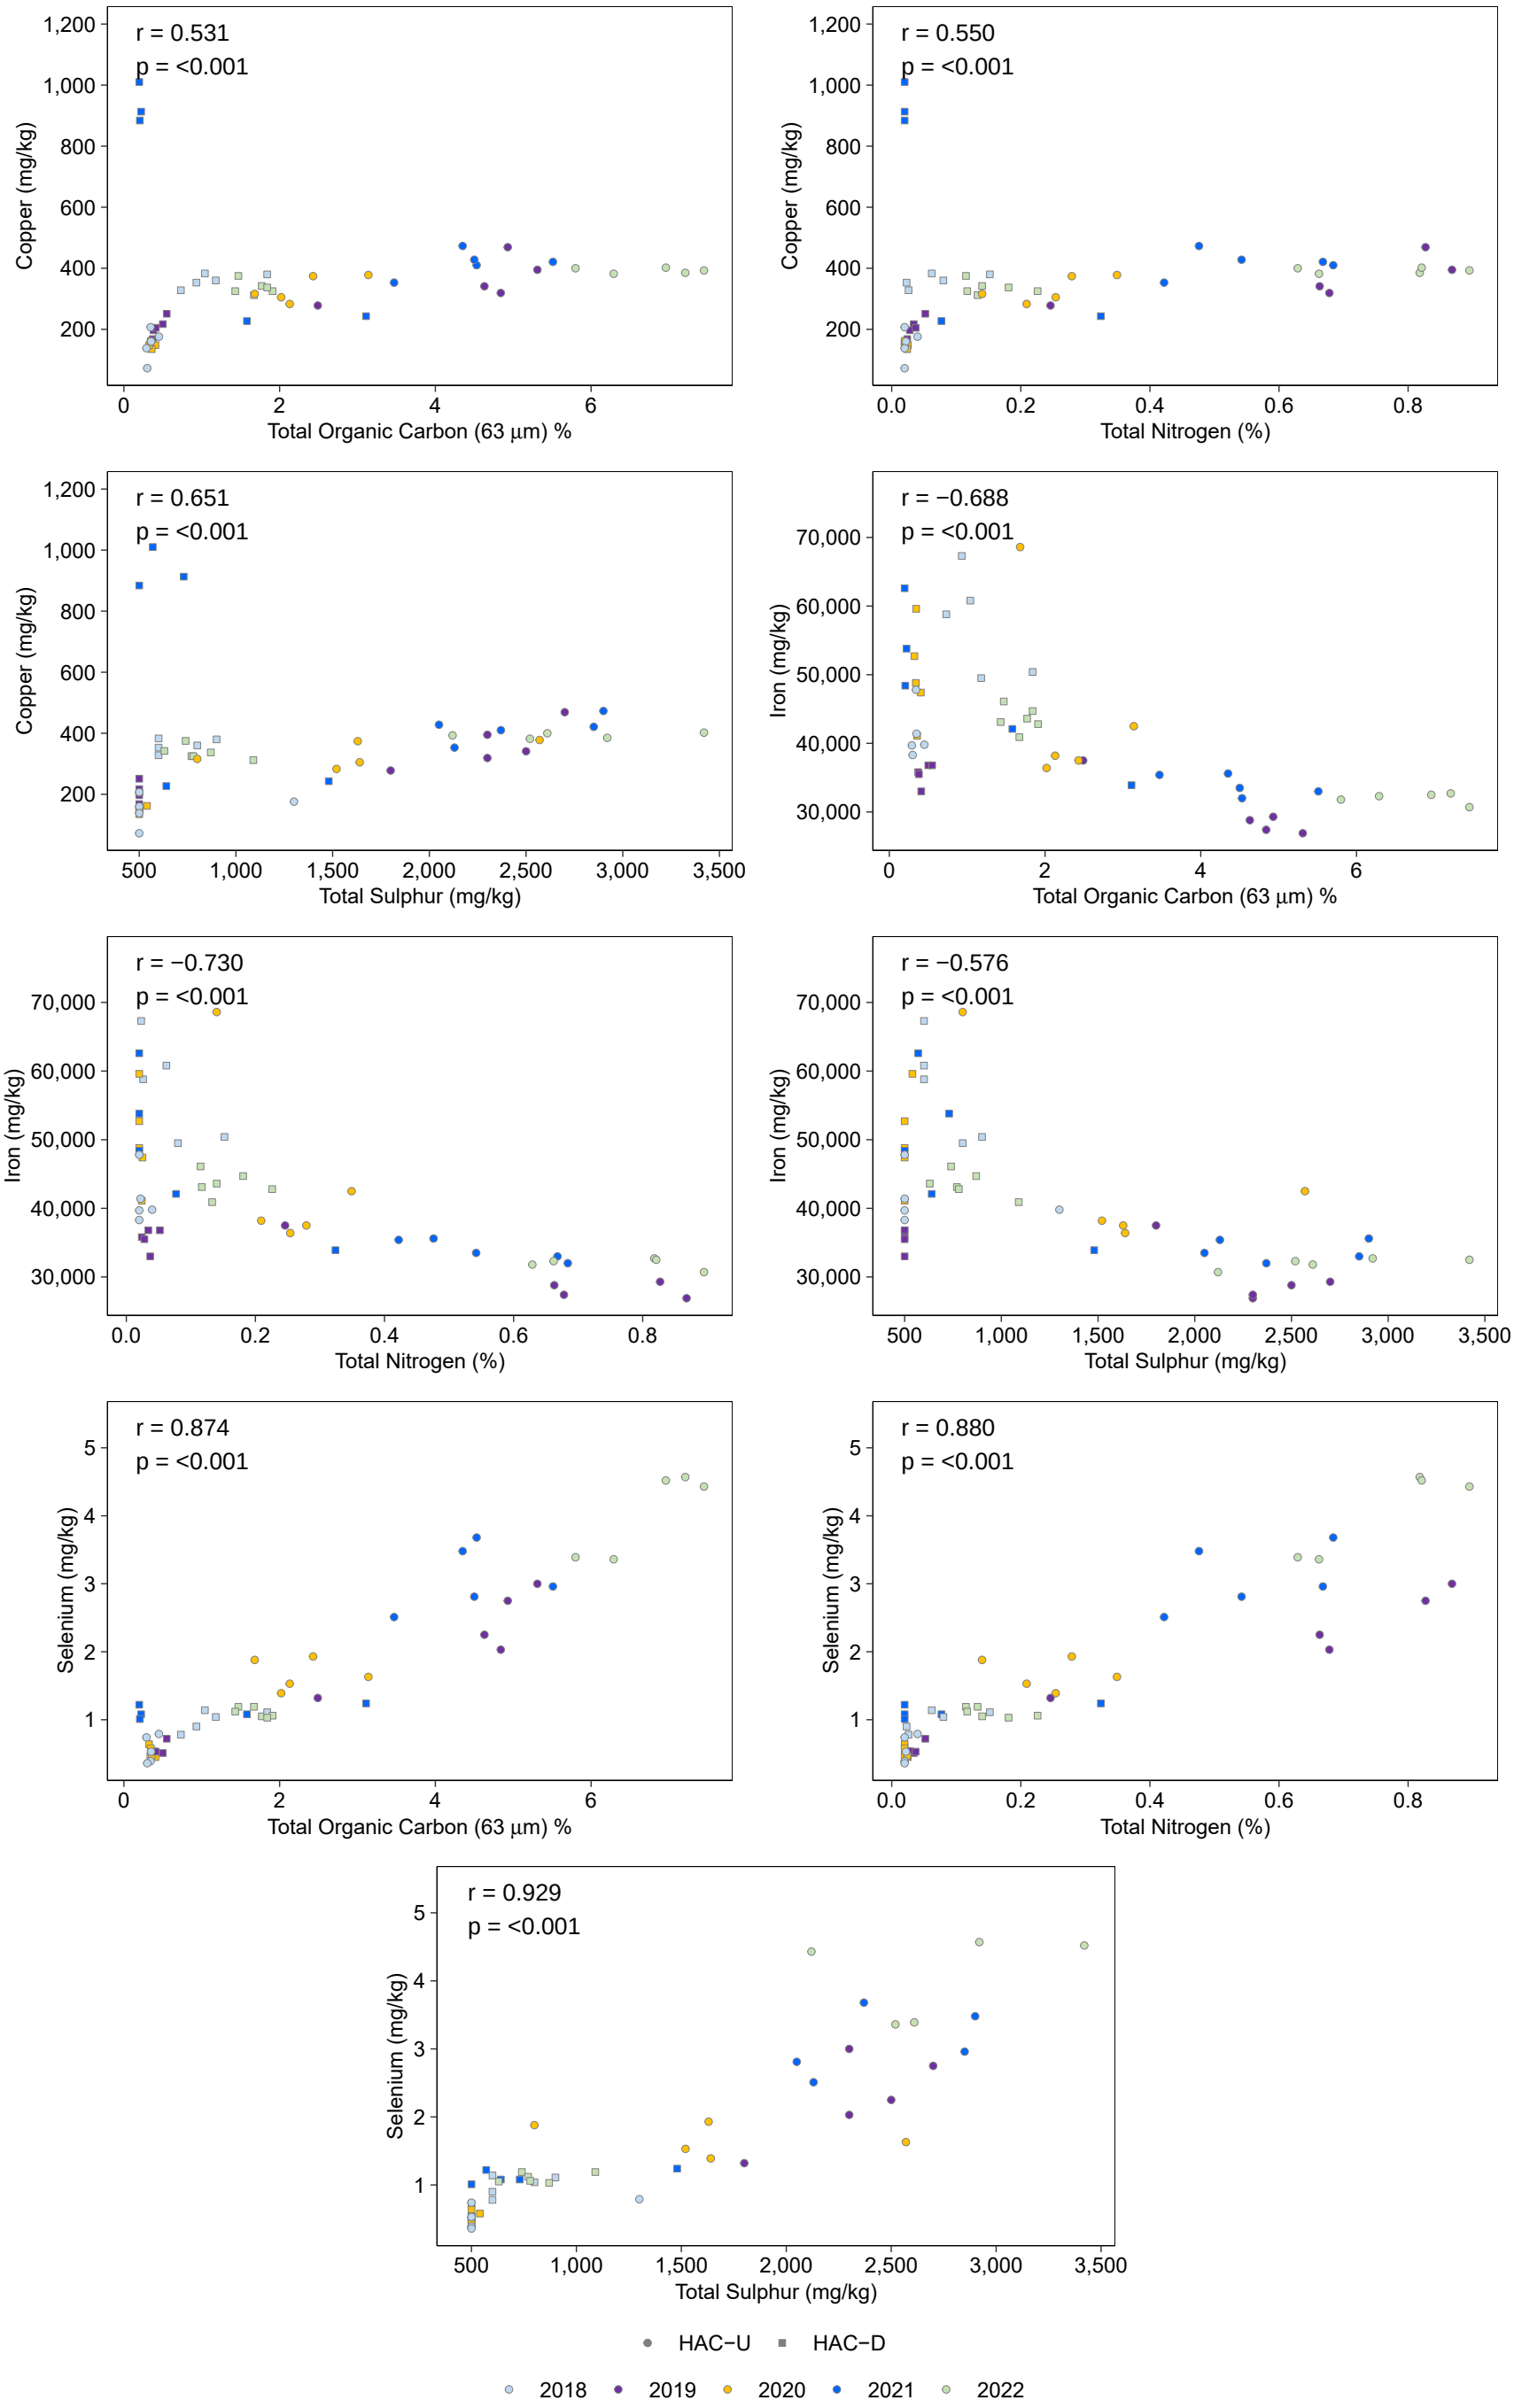

Figure F.1.3: Scatterplots of Significant Spearman's Correlation Relationships (p < 0.0125, Bonferroni Corrected) Between Analyte of Interest Concentrations (<63 µm Fraction) and Sediment Physical and Chemical Parameters for Upper (HAC−U; Exposed) and Lower (HAC−D; Exposed) Hazeltine Creek, 2018 to 2022

Table F.1.1: Statistical Comparisons of Exposed - Reference Relative Differences of Sediment Analyte of Interest Concentrations (<63 µm Fraction) for Upper Hazeltine Creek (HAC-U; Exposed) and Upper Edney Creek (EDC-U; Reference), 2018 to 2022

Notes: "-" indicates comparison not-relevant, "ns" indicates not significant, MOD = Magnitude of Difference, ANOVA = analysis of variance.

[a] Years that share a letter are not significantly different among years.

[b] MOD calculated as $((Observed_{HAC\text{-}D} - Predicted_{EDC\text{-}D})/Predicted_{EDC\text{-}D})*100$. $Predicted_{EDC\text{-}D} = Observed_{EDC\text{-}D} + (Observed_{HAC\text{-}D\ 2018} - Observed_{EDC\text{-}D\ 2018})$.

Table F.1.4: Statistical Comparisons of Spatial and Temporal Differences of Sediment Analyte of Interest Concentrations (<63 µm Fraction) for Lower Hazeltine Creek (HAC-D; Exposed) and Lower Edney Creek (EDC-D; Reference), 2018 to 2022

ANOVA Model						Area	Pairwise Differences Among Years for Each Area[a]					Do Concentrations Differ Over Time? MOD[b]				Do Concentrations Differ Between Areas? HAC-D vs EDC-D[c]				
Parameter	Units	Transformation	Area	Year	Area x Year		2018	2019	2020	2021	2022	2019 vs 2018	2020 vs 2018	2021 vs 2018	2022 vs 2018	2018	2019	2020	2021	2022
Total Organic Carbon	%	none	<0.001	0.001	0.288	EDC-D	AB	AB	B	B	A	ns	ns	ns	ns	-	-	-	-	-
						HAC-D	AB	AB	B	B	A					-67				
Copper	mg/kg	log10	<0.001	<0.001	<0.001	EDC-D	A	A	A	A	A	ns	ns	ns	ns	-	-	-	-	-
						HAC-D	AB	C	C	A	B	-43	-59	ns	ns	966	489	471	1,580	1,089
Iron	mg/kg	log10	<0.001	0.009	<0.001	EDC-D	A	A	A	A	A	ns	ns	ns	ns	-	-	-	-	-
						HAC-D	A	C	AB	AB	BC	-38	ns	ns	-24	108	ns	71	48	57

P-value < 0.05

Indicates negative MOD

Indicates positive MOD

Notes: "-" indicates comparison not-relevant, "ns" indicates not significant, MOD = Magnitude of Difference, ANOVA = analysis of variance.

[a] Years that do not share a letter are significantly different for that area.

[b] MOD is calculated as $((year_{recent} - year_{older})/year_{older})*100$.

[c] MOD calculated as ((HAC-D - EDC-D)/EDC-D)*100.

Table F.1.5: Spearman's Correlation Relationships Between Analyte of Interest Concentrations (<63 µm Fraction) and Sediment Physical and Chemical Parameters for Upper (HAC-U; Exposed) and Lower (HAC-D; Exposed) Hazeltine Creek, 2018 to 2022

Analyte of Interest	Correlation Parameter	Clay (%)[b]	Total Organic Carbon (%)	Total Nitrogen (%)	Total Sulphur (mg/kg)
Copper (mg/kg)	Correlation Coefficient	0.02880	0.531	0.550	0.651
	Sig. (2-tailed)	0.841	<0.001	<0.001	<0.001
Iron (mg/kg)	Correlation Coefficient	0.0925	-0.688	-0.730	-0.576
	Sig. (2-tailed)	0.519	<0.001	<0.001	<0.001
Selenium (mg/kg)	Correlation Coefficient	-0.08310	0.874	0.880	0.929
	Sig. (2-tailed)	0.562	<0.001	<0.001	<0.001

Significant correlation; p-value < 0. 0125 (p<0.05, Bonferroni corrected for 4 independent variables).

Notes: n=51 for all correlations. Analyte of Interest was defined as an analyte at the exposed areas with a mean concentration that exceeded guidelines as well as reference 95th percentile values. Mg/kg = milligrams per kilogram.

[a] Results below the Laboratory Reporting Limit (LRL) were used at the LRL for calculations.

[b] % clay represents the clay proportion of the < 63 µm (silt and clay) sediment fraction that was used for metals analysis. % clay was calculated as: [% clay] / [% silt and clay].

APPENDIX F.2
PERIPHYTON COMMUNITY
& PRODUCTIVITY

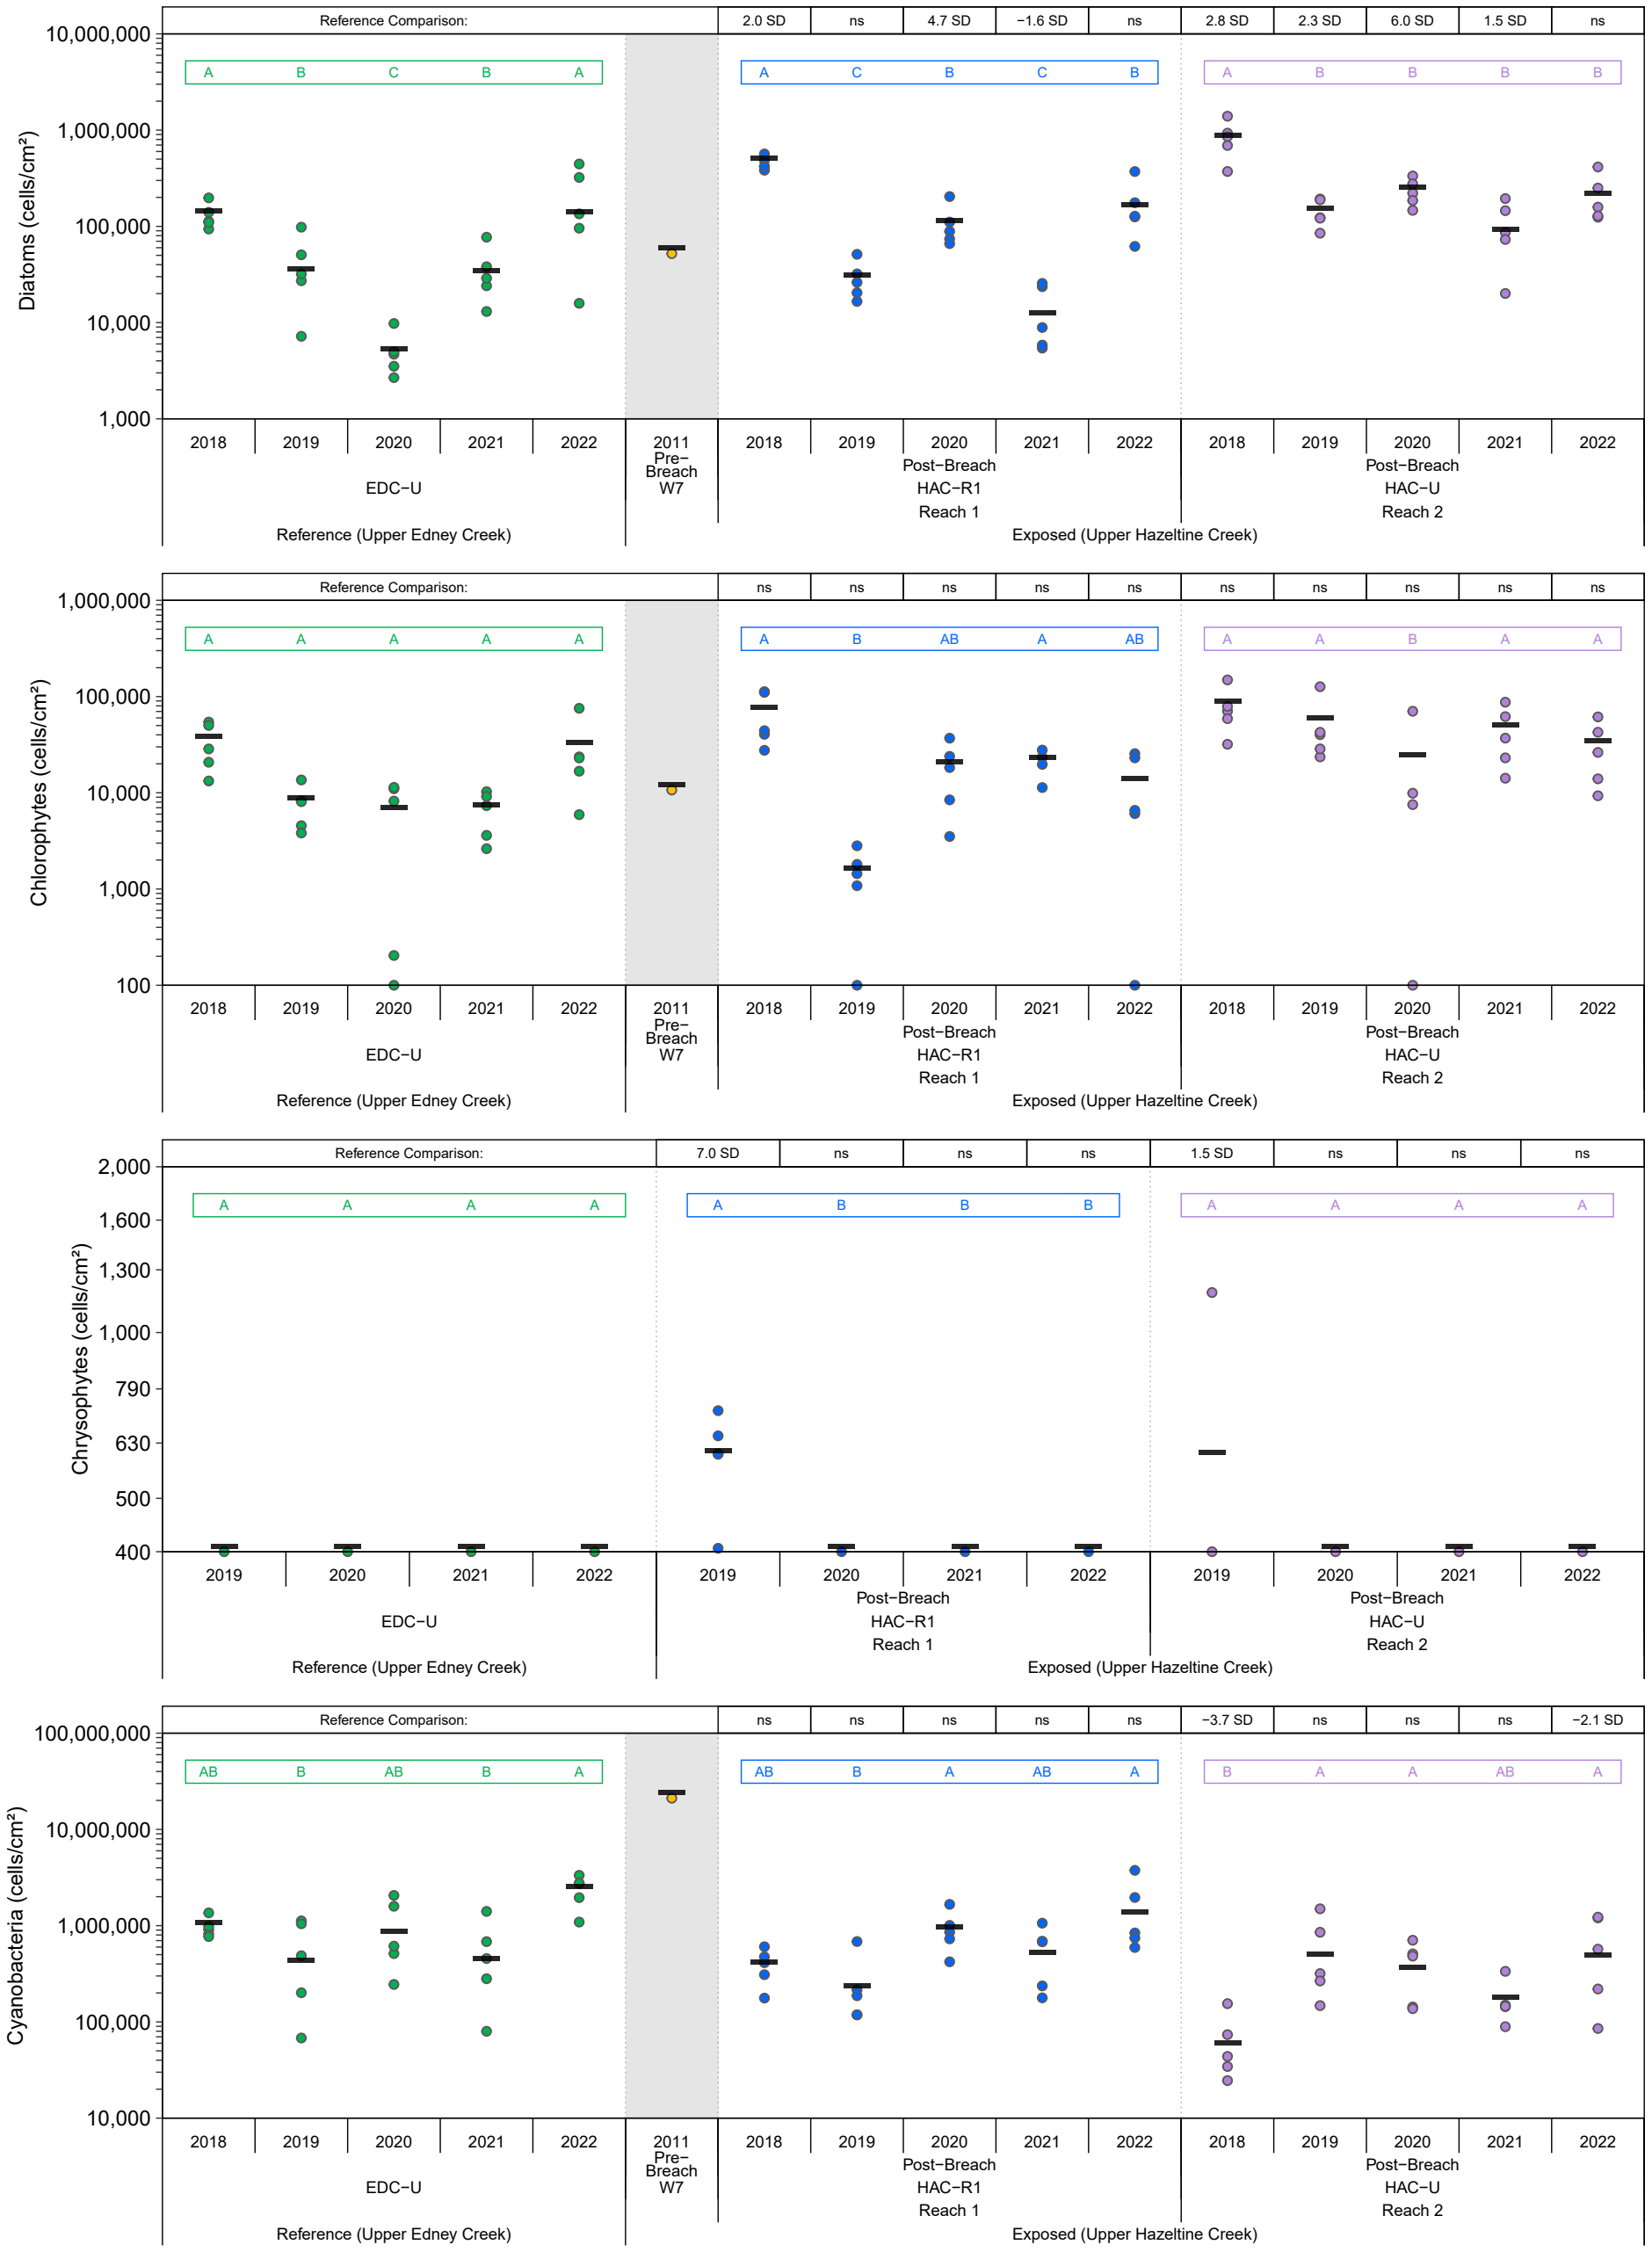

Figure F.2.1: Periphyton Community Endpoints for Upper Hazeltine Creek (HAC−R1, HAC−U; Exposed) and Upper Edney Creek (EDC−U; Reference), 1995 to 2022

Notes: Black bars represent measures of central tendency (mean, geometric mean, or median depending on if analysis was conducted on untransformed, log10−transformed or rank−transformed data). Coloured letters represent significant (p−value <0.1) post−hoc comparisons within areas over time; years that share a letter of the same colour (e.g., A, B) within a box of the same colour do not differ significantly within an area. A number above the plot indicates significant exposed vs. reference post−hoc comparisons within a given year. The magnitude of difference (MOD) for these significant post−hoc comparisons is expressed in units of standard deviation (SD) or median absolute deviations (MAD; if the data were rank−transformed prior to analysis) relative to reference. 'nc' indicates no comparisons were possible; 'ns' indicates a non−significant contrast; 'nm' indicates that the MOD could not be calculated because MAD = 0. Grey shading indicates semi− quantitative data that were not included in statistical comparisons but are shown for visual comparison only. Periphyton data were classified as "Other" taxa in laboratory results issued in 2018 but the taxonomic groups contained in this category were unknown (i.e., unknown taxonomic idenification of these organisms), but suspected to include Phaeophytes, Chrysophytes, and Rhodophytes. Temporal statistical contrasts therefore excluded 2018 data for these taxon groups (Phaeophytes, Chrysophytes, and Rhodophytes) which were reported as absent from all samples in 2018 data. See Minnow 2019a for detailed laboratory results for 2018. Data reported in 2018 for this "Other" category has therefore excluded from data presentation and analyses in the present report. Periphyton taxonomy results have not been reported in an "Other" category by the laboratory since 2018. See report Section 4.2.3.1 for details.

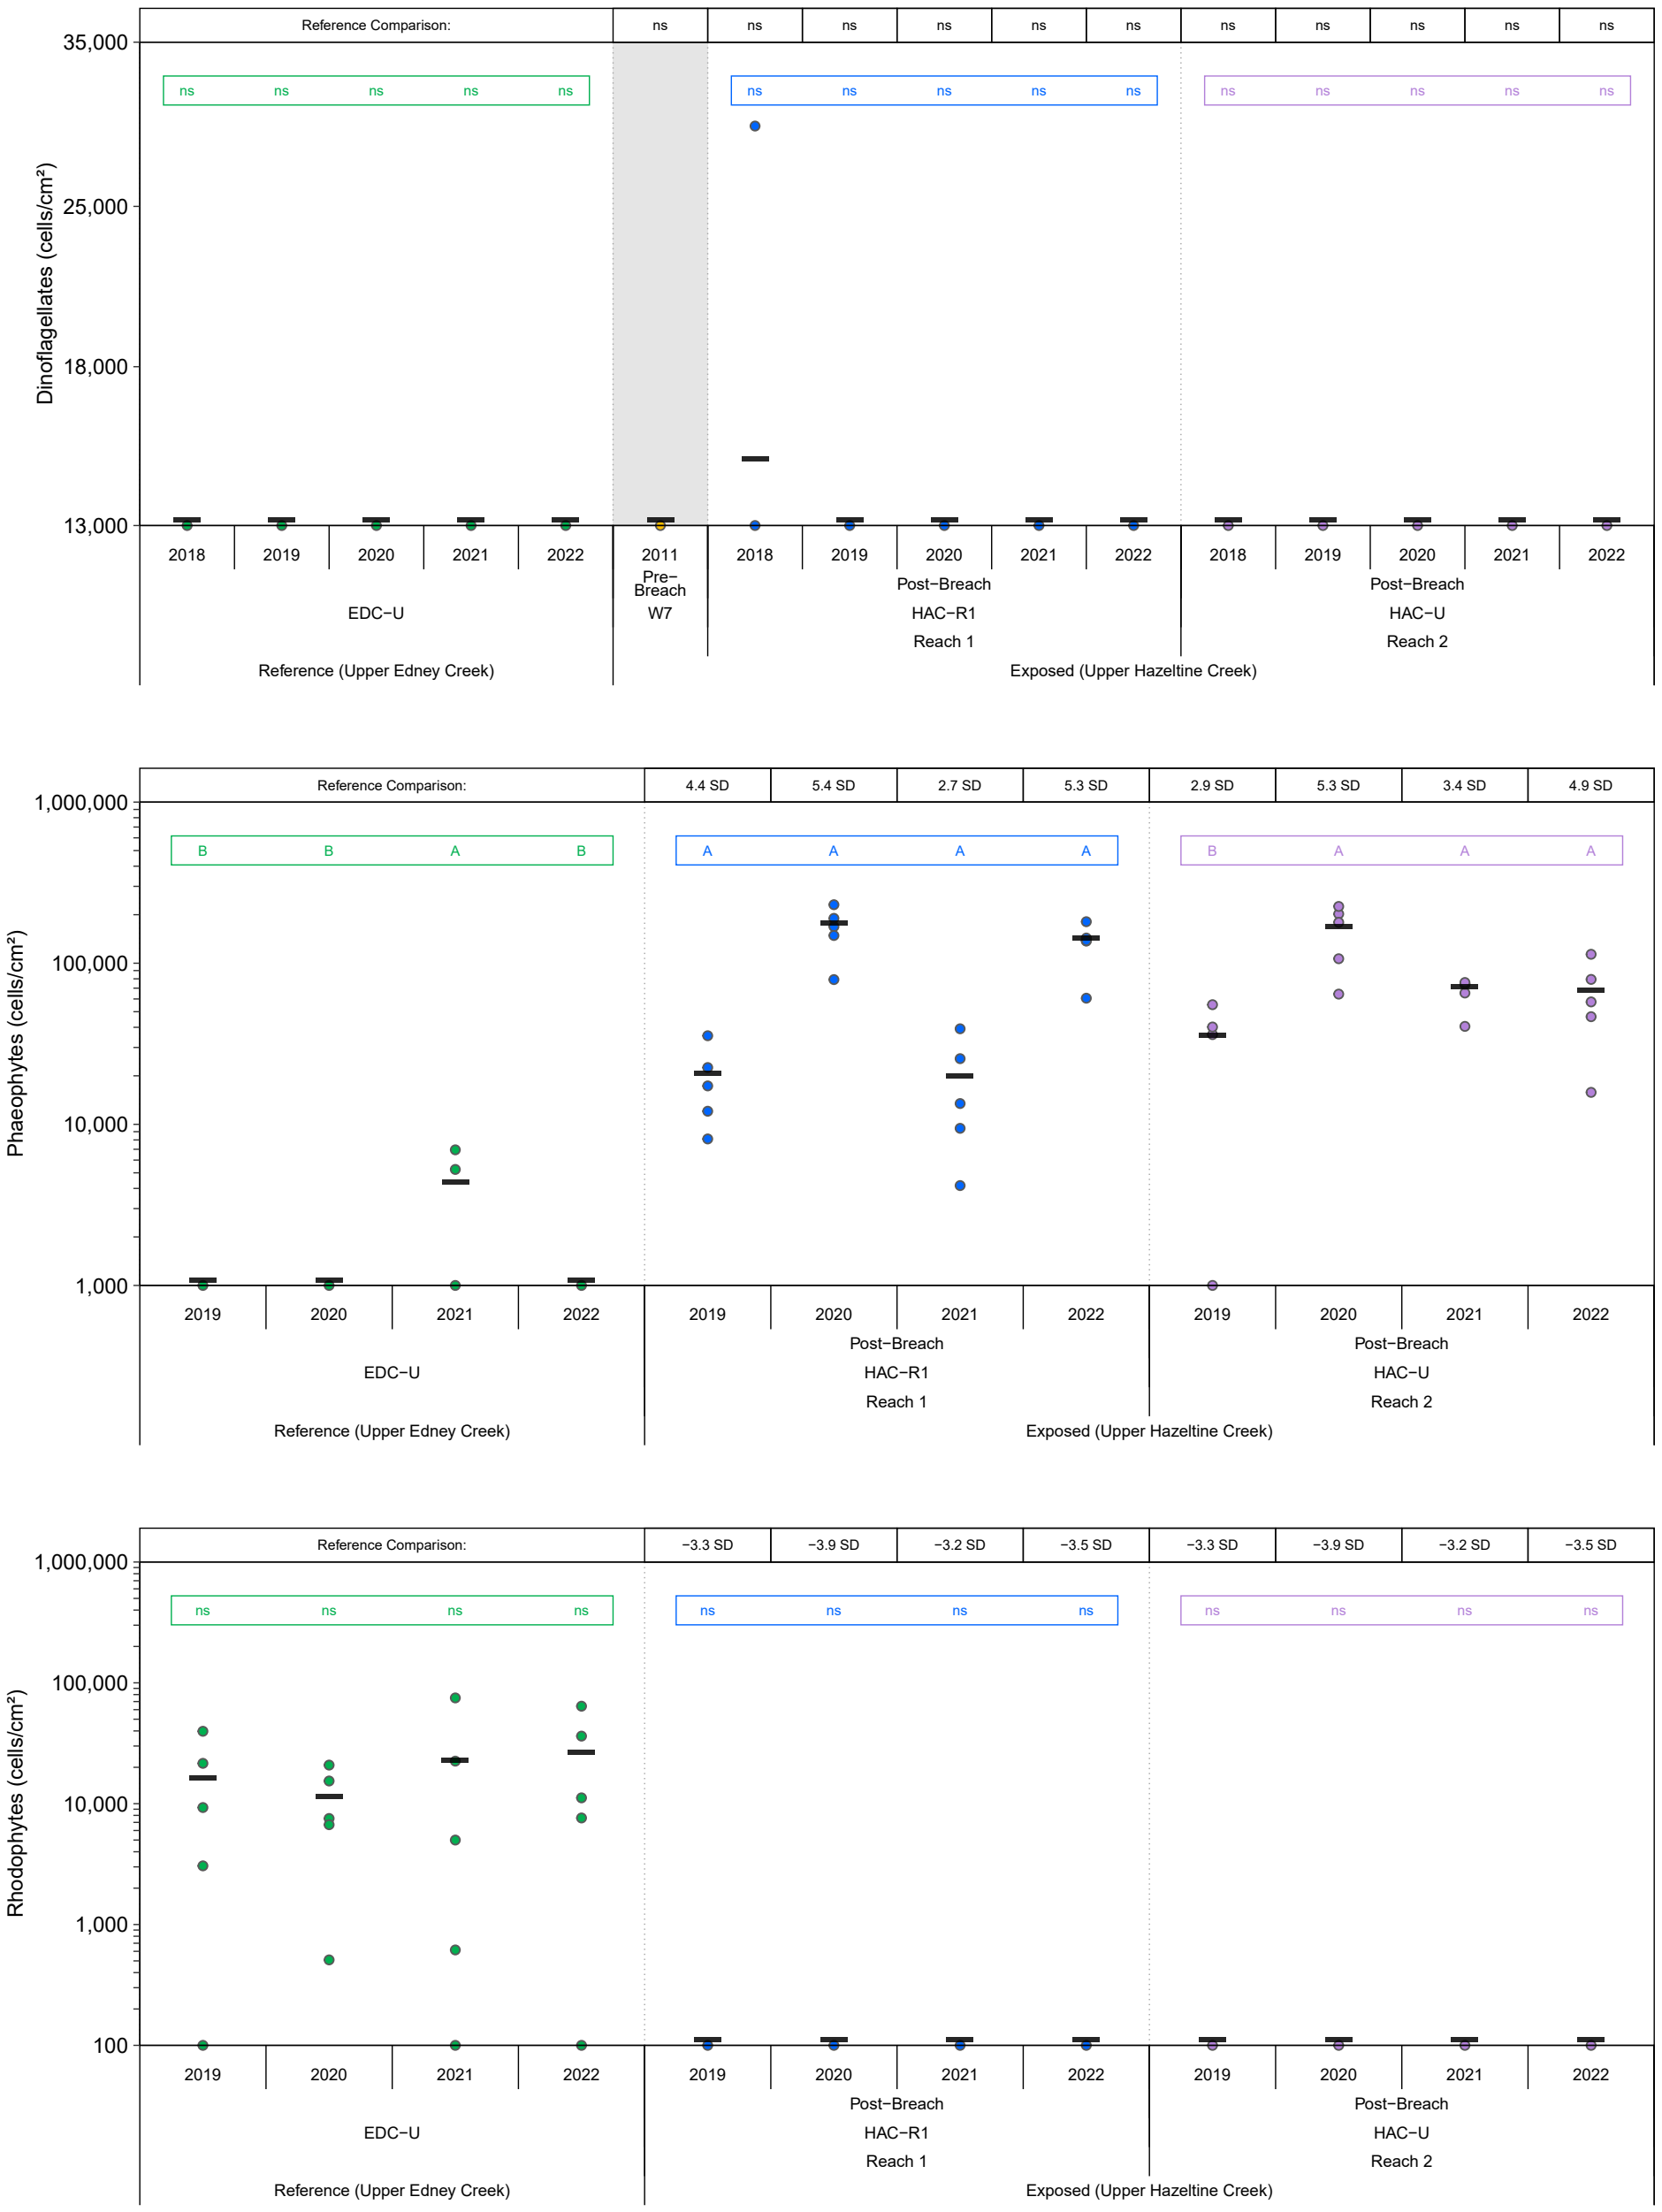

Figure F.2.1: Periphyton Community Endpoints for Upper Hazeltine Creek (HAC−R1, HAC−U; Exposed) and Upper Edney Creek (EDC−U; Reference), 1995 to 2022

Notes: Black bars represent measures of central tendency (mean, geometric mean, or median depending on if analysis was conducted on untransformed, log10−transformed or rank−transformed data). Coloured letters represent significant (p−value <0.1) post−hoc comparisons within areas over time; years that share a letter of the same colour (e.g., A, B) within a box of the same colour do not differ significantly within an area. A number above the plot indicates significant exposed vs. reference post−hoc comparisons within a given year. The magnitude of difference (MOD) for these significant post−hoc comparisons is expressed in units of standard deviation (SD) or median absolute deviations (MAD; if the data were rank−transformed prior to analysis) relative to reference. 'nc' indicates no comparisons were possible; 'ns' indicates a non−significant contrast; 'nm' indicates that the MOD could not be calculated because MAD = 0. Grey shading indicates semi− quantitative data that were not included in statistical comparisons but are shown for visual comparison only. Periphyton data were classified as "Other" taxa in laboratory results issued in 2018 but the taxonomic groups contained in this category were unknown (i.e., unknown taxonomic idenification of these organisms), but suspected to include Phaeophytes, Chrysophytes, and Rhodophytes. Temporal statistical contrasts therefore excluded 2018 data for these taxon groups (Phaeophytes, Chrysophytes, and Rhodophytes) which were reported as absent from all samples in 2018 data. See Minnow 2019a for detailed laboratory results for 2018. Data reported in 2018 for this "Other" category has therefore excluded from data presentation and analyses in the present report. Periphyton taxonomy results have not been reported in an "Other" category by the laboratory since 2018. See report Section 4.2.3.1 for details.

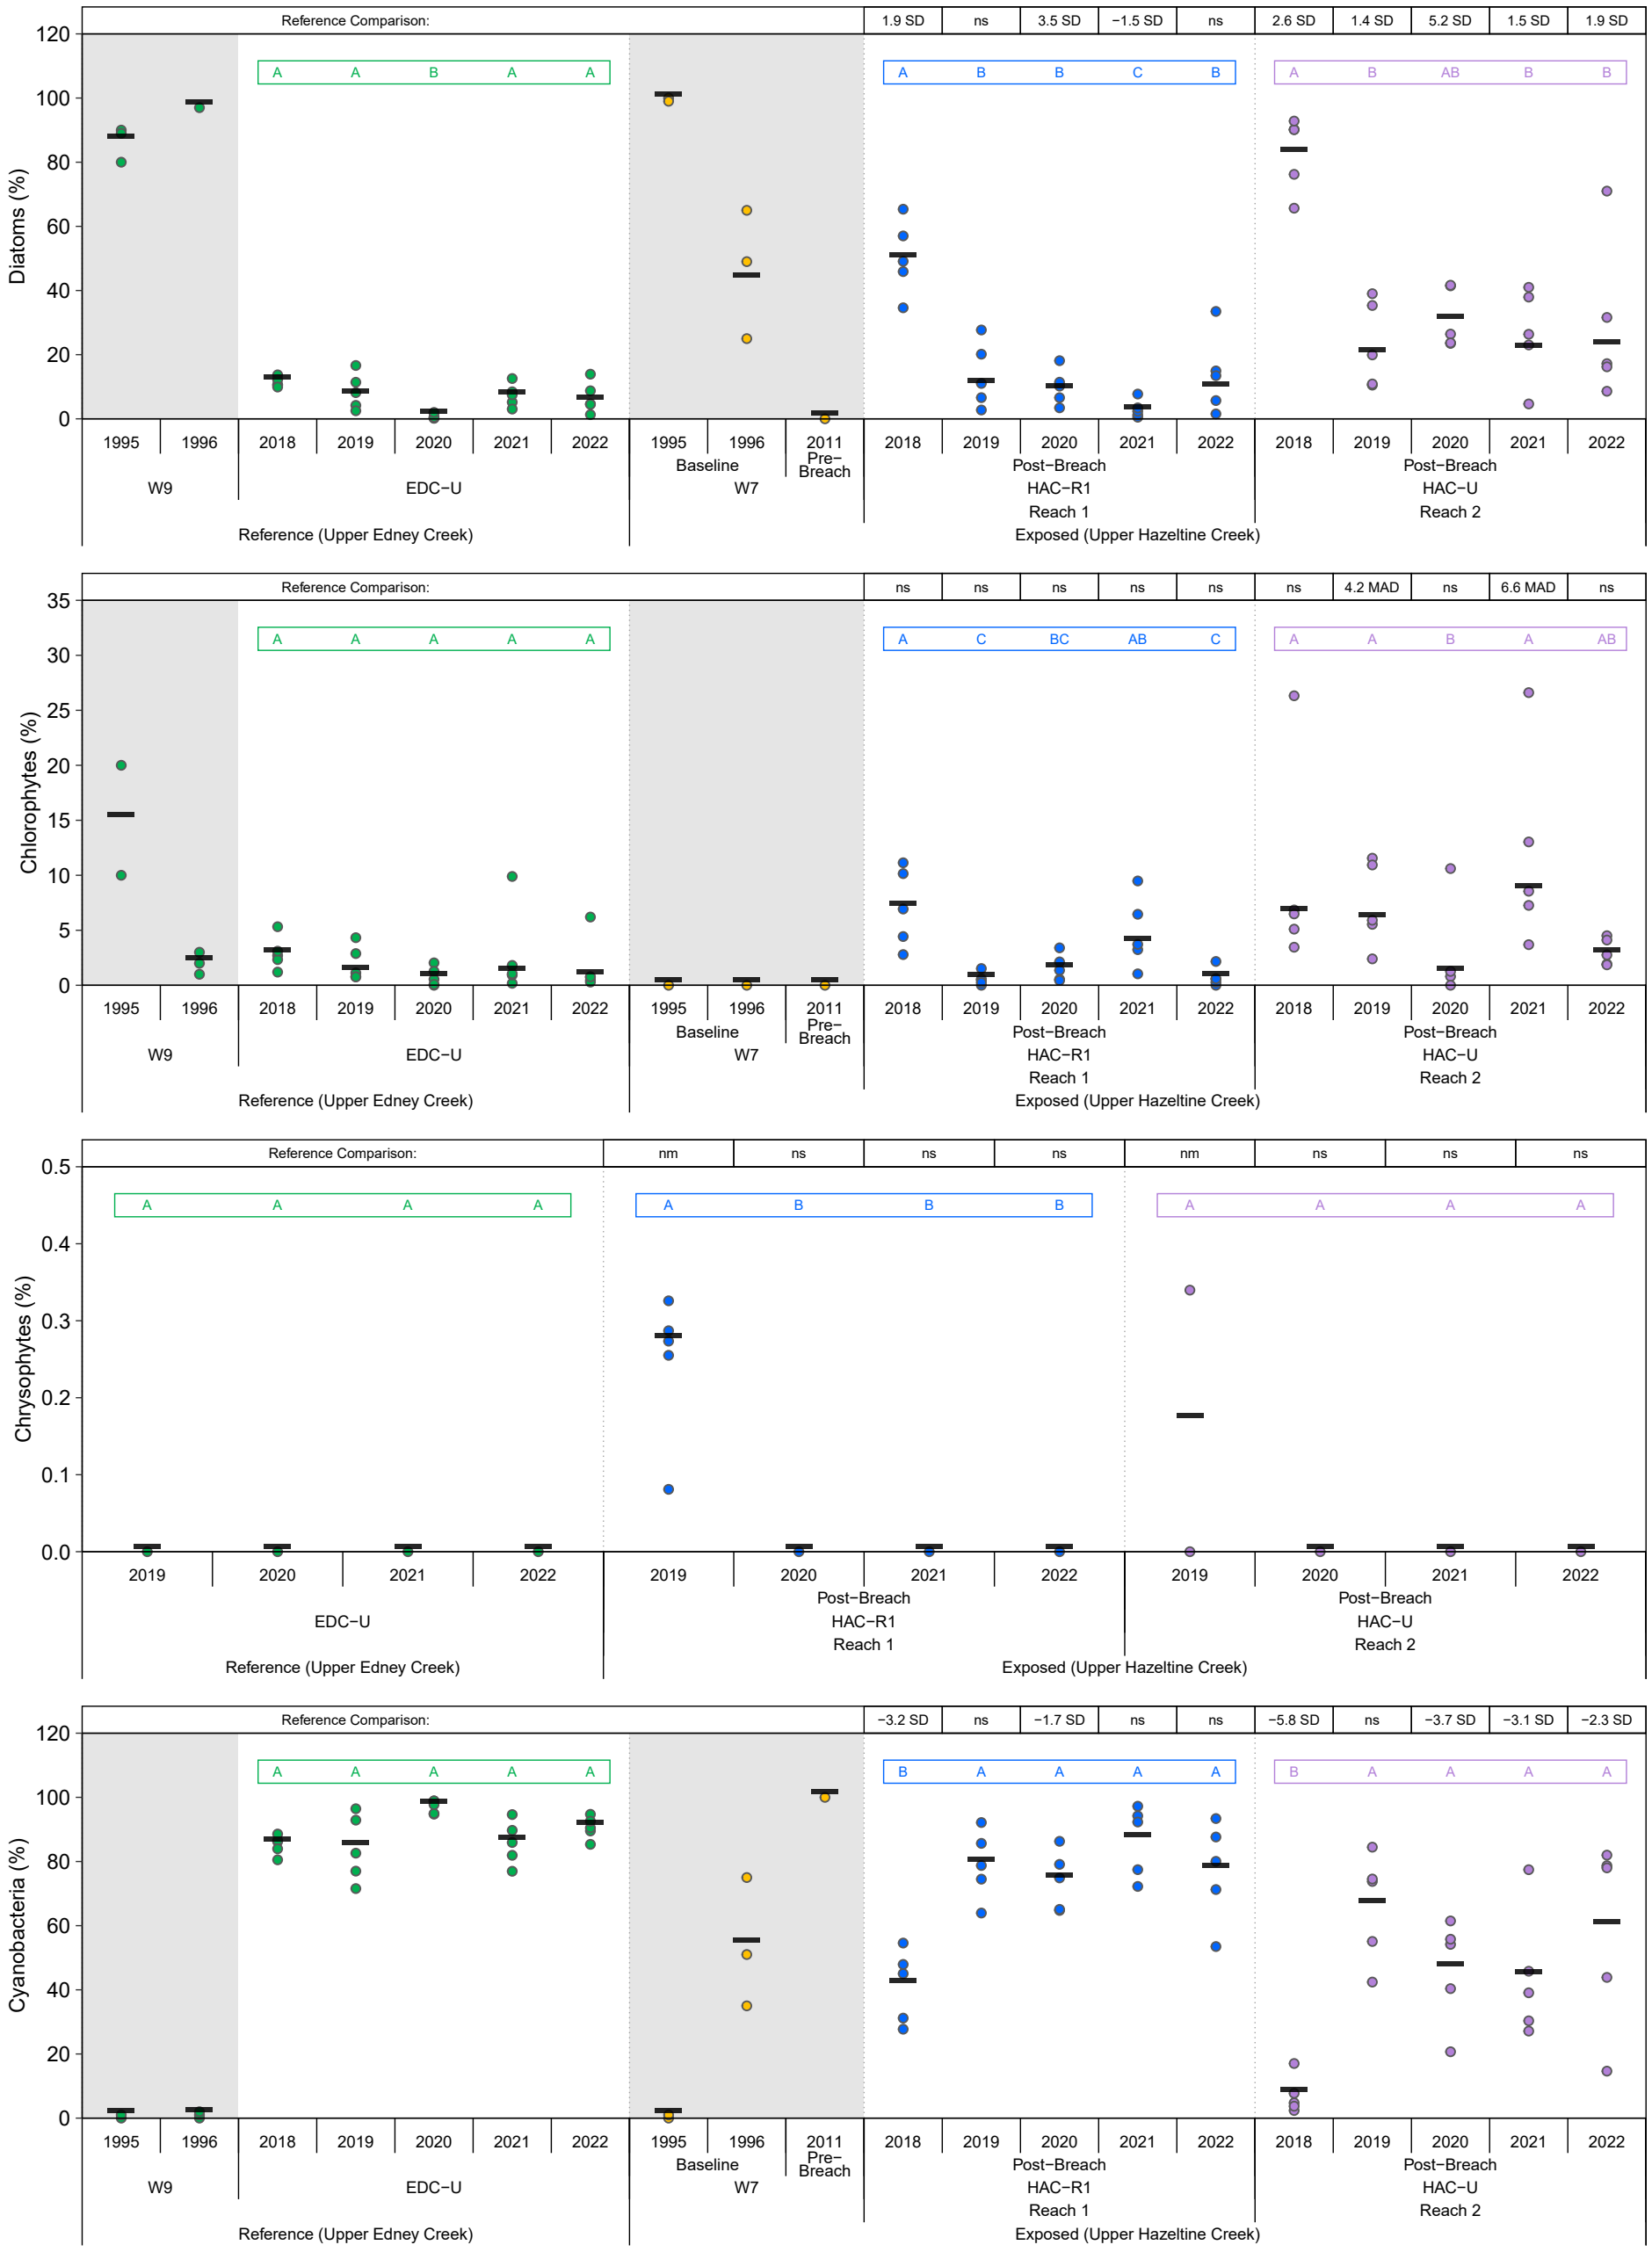

Figure F.2.1: Periphyton Community Endpoints for Upper Hazeltine Creek (HAC−R1, HAC−U; Exposed) and Upper Edney Creek (EDC−U; Reference), 1995 to 2022

Notes: Black bars represent measures of central tendency (mean, geometric mean, or median depending on if analysis was conducted on untransformed, log10−transformed or rank−transformed data). Coloured letters represent significant (p−value <0.1) post−hoc comparisons within areas over time; years that share a letter of the same colour (e.g., A, B) within a box of the same colour do not differ significantly within an area. A number above the plot indicates significant exposed vs. reference post−hoc comparisons within a given year. The magnitude of difference (MOD) for these significant post−hoc comparisons is expressed in units of standard deviation (SD) or median absolute deviations (MAD; if the data were rank−transformed prior to analysis) relative to reference. 'nc' indicates no comparisons were possible; 'ns' indicates a non−significant contrast; 'nm' indicates that the MOD could not be calculated because MAD = 0. Grey shading indicates semi− quantitative data that were not included in statistical comparisons but are shown for visual comparison only. Periphyton data were classified as "Other" taxa in laboratory results issued in 2018 but the taxonomic groups contained in this category were unknown (i.e., unknown taxonomic idenification of these organisms), but suspected to include Phaeophytes, Chrysophytes, and Rhodophytes. Temporal statistical contrasts therefore excluded 2018 data for these taxon groups (Phaeophytes, Chrysophytes, and Rhodophytes) which were reported as absent from all samples in 2018 data. See Minnow 2019a for detailed laboratory results for 2018. Data reported in 2018 for this "Other" category has therefore excluded from data presentation and analyses in the present report. Periphyton taxonomy results have not been reported in an "Other" category by the laboratory since 2018. See report Section 4.2.3.1 for details.

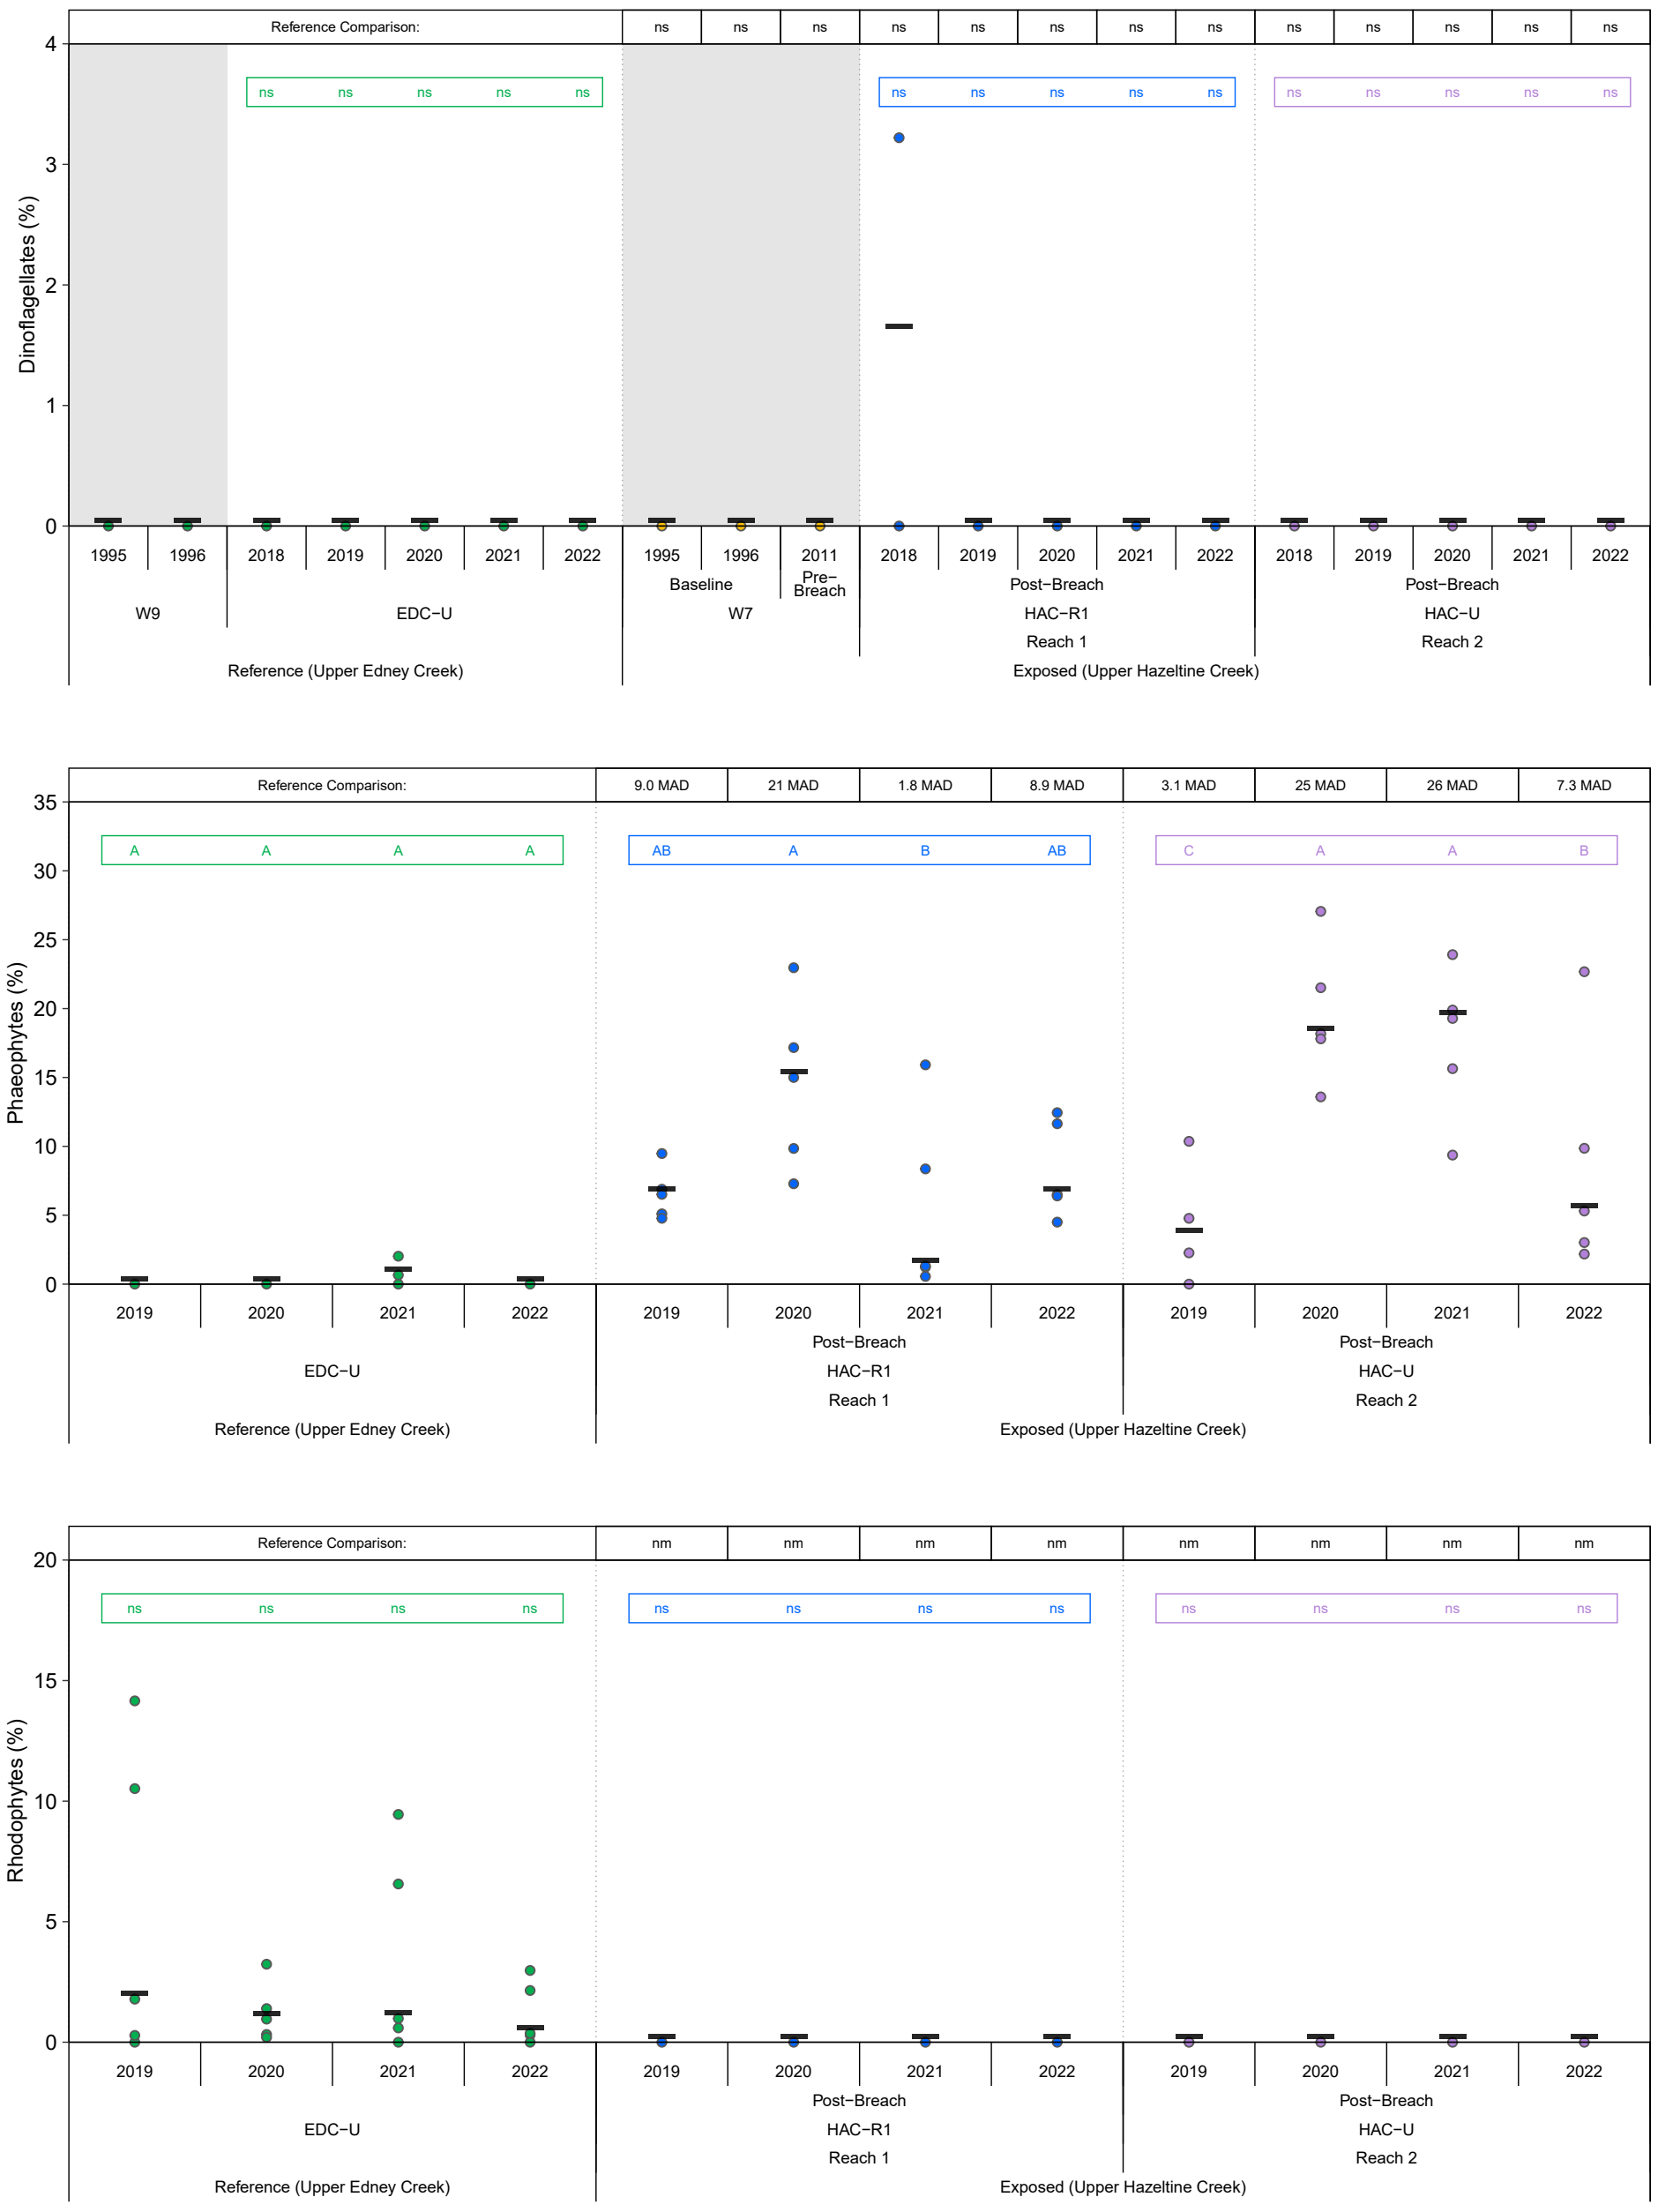

Figure F.2.1: Periphyton Community Endpoints for Upper Hazeltine Creek (HAC−R1, HAC−U; Exposed) and Upper Edney Creek (EDC−U; Reference), 1995 to 2022

Notes: Black bars represent measures of central tendency (mean, geometric mean, or median depending on if analysis was conducted on untransformed, log10−transformed or rank−transformed data). Coloured letters represent significant (p−value <0.1) post−hoc comparisons within areas over time; years that share a letter of the same colour (e.g., A, B) within a box of the same colour do not differ significantly within an area. A number above the plot indicates significant exposed vs. reference post−hoc comparisons within a given year. The magnitude of difference (MOD) for these significant post−hoc comparisons is expressed in units of standard deviation (SD) or median absolute deviations (MAD; if the data were rank−transformed prior to analysis) relative to reference. 'nc' indicates no comparisons were possible; 'ns' indicates a non−significant contrast; 'nm' indicates that the MOD could not be calculated because MAD = 0. Grey shading indicates semi− quantitative data that were not included in statistical comparisons but are shown for visual comparison only. Periphyton data were classified as "Other" taxa in laboratory results issued in 2018 but the taxonomic groups contained in this category were unknown (i.e., unknown taxonomic idenification of these organisms), but suspected to include Phaeophytes, Chrysophytes, and Rhodophytes. Temporal statistical contrasts therefore excluded 2018 data for these taxon groups (Phaeophytes, Chrysophytes, and Rhodophytes) which were reported as absent from all samples in 2018 data. See Minnow 2019a for detailed laboratory results for 2018. Data reported in 2018 for this "Other" category has therefore excluded from data presentation and analyses in the present report. Periphyton taxonomy results have not been reported in an "Other" category by the laboratory since 2018. See report Section 4.2.3.1 for details.

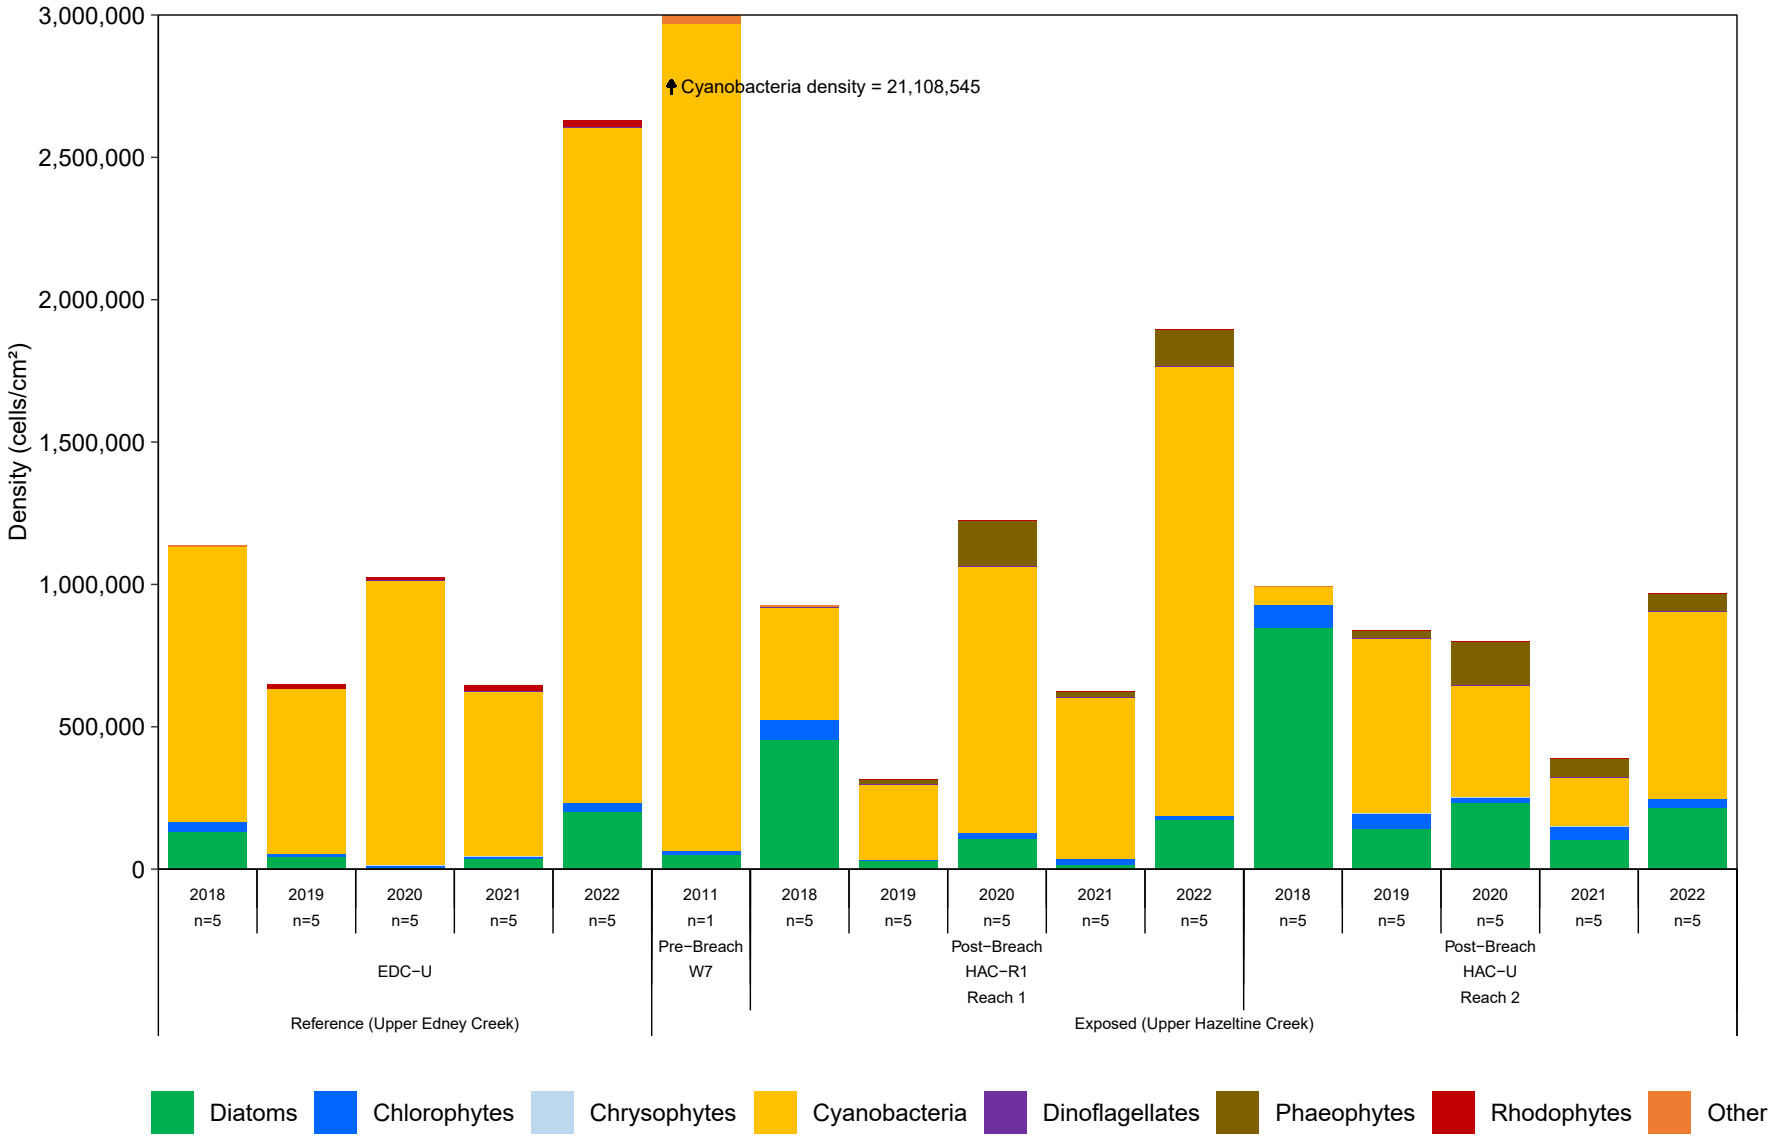

Figure F.2.2: Mean Densities of Major Periphyton Community Taxonomic Groups for Upper Hazeltine Creek (HAC-R1, HAC-U; Exposed) and Upper Edney Creek (EDC-U; Reference), 2011 to 2022

Notes: The sampling area W7 (2011) is the pre-breach equivalent of the post-breach sampling areas HAC-R1 and HAC-U (2018 to 2022). Densities of taxonomic groups are not displayed for baseline (1995 and 1996) results due to the qualitative nature of these data. In 2018 and earlier, Chrysophytes, Phaeophytes, and Rhodophytes are grouped into the 'Other' category. Periphyton data were classified as "Other" taxa in laboratory results issued in 2018 but the taxonomic groups contained in this category were unknown (i.e., unknown taxonomic idenification of these organisms), but suspected to include Phaeophytes, Chrysophytes, and Rhodophytes. See Minnow 2019a for detailed laboratory results for 2018. Periphyton taxonomy results have not been reported in an "Other" category by the laboratory since 2018. See report Section 4.2.3.1 for details.

P-value < 0.1.
Magnitude of Difference (MOD) < -2.
Magnitude of Difference (MOD) > 2.

Notes: "-" = no data available. "nc" = no comparison. "ns" = no significance. "nm" = Contrast MODs could not be calculated because the Median Absolute Deviation (MAD)=0. Results are only displayed for periphyton community endpoints with sufficient data available to complete statistical analyses. Periphyton data were classified as "Other" taxa in laboratory results issued in 2018 but the taxonomic groups contained in this category were unknown (i.e., unknown taxonomic idenification of these organisms), but suspected to include Phaeophytes, Chrysophytes, and Rhodophytes. Temporal statistical contrasts therefore excluded 2018 data for these taxon groups (Phaeophytes, Chrysophytes, and Rhodophytes) which were reported as absent from all samples in 2018 data. See Minnow 2019a for detailed laboratory results for 2018. Data reported in 2018 for this "Other" category has therefore excluded from data presentation and analyses in the present report. Periphyton taxonomy results have not been reported in an "Other" category by the laboratory since 2018. See report Section 4.2.3.1 for details.

[a] MCT = Measure of Central Tendency, which is the mean, geometric mean, or median depending on if analysis was conducted on untransformed, log_{10}-transformed, or rank-transformed data.

[b] Magnitude of difference (MOD) calculated for two-way ANOVA as (Exposed Mean - Reference Mean)/SD (or [Mean - Baseline Mean]/SD for temporal comparisons) on the transformed scale, where SD was the pooled standard deviation of the model residuals. MOD calculated for Kruskal-Wallis (i.e., rank-transformed data) as (Exposed Median - Reference Median)/MAD, where MAD was the pooled median absolute deviation.

							2021	0.0850												
							2022	0.0280												

P-value < 0.1.
Magnitude of Difference (MOD) < -2.
Magnitude of Difference (MOD) > 2.

Notes: "-" = no data available. "nc" = no comparison. "ns" = no significance. "nm" = Contrast MODs could not be calculated because the Median Absolute Deviation (MAD)=0. Results are only displayed for periphyton community endpoints with sufficient data available to complete statistical analyses. Periphyton data were classified as "Other" taxa in laboratory results issued in 2018 but the taxonomic groups contained in this category were unknown (i.e., unknown taxonomic idenification of these organisms), but suspected to include Phaeophytes, Chrysophytes, and Rhodophytes. Temporal statistical contrasts therefore excluded 2018 data for these taxon groups (Phaeophytes, Chrysophytes, and Rhodophytes) which were reported as absent from all samples in 2018 data. See Minnow 2019a for detailed laboratory results for 2018. Data reported in 2018 for this "Other" category has therefore excluded from data presentation and analyses in the present report. Periphyton taxonomy results have not been reported in an "Other" category by the laboratory since 2018. See report Section 4.2.3.1 for details.

[a] MCT = Measure of Central Tendency, which is the mean, geometric mean, or median depending on if analysis was conducted on untransformed, log_{10}-transformed, or rank-transformed data.

[b] Magnitude of difference (MOD) calculated for two-way ANOVA as (Exposed Mean - Reference Mean)/SD (or [Mean - Baseline Mean]/SD for temporal comparisons) on the transformed scale, where SD was the pooled standard deviation of the model residuals. MOD calculated for Kruskal-Wallis (i.e., rank-transformed data) as (Exposed Median - Reference Median)/MAD, where MAD was the pooled median absolute deviation.

Notes: "-" = no data available. "nc" = no comparison. "ns" = no significance. "nm" = Contrast MODs could not be calculated because the Median Absolute Deviation (MAD) =0.

[a] 1995, 1996 and 2011 data from UHC (W7).

[b] MCT = Measure of Central Tendency, which is the mean, geometric mean, or median depending on if analysis was conducted on untransformed, log_{10}-transformed, or rank-transformed data.

[c] Magnitude of difference (MOD) calculated for two-way ANOVA as (Exposed Mean - Reference Mean)/SD (or [Mean - Baseline Mean]/SD for temporal comparisons) on the transformed scale, where SD was the

[d] Pairwise contrasts of post-breach (2017 to 2022) data from HAC-R1 and HAC-U against baseline (1995 and 1996) and pre-breach (2011) data from W7 are indicated with an * for contrasts to 1995 data , † for contrasts to 1996 data, and ‡ for contrasts to 2011 data in Figure 6.5.

[e] Spatial pairwise contrasts between HAC-R1 and HAC-U in 1995, 1996, and 2011 were not calculated because W7 data from these years represents baseline or pre-breach conditions for both HAC-R1 and HAC-U.

APPENDIX F.3
BENTHIC COMMUNITY
AND PRODUCTIVITY

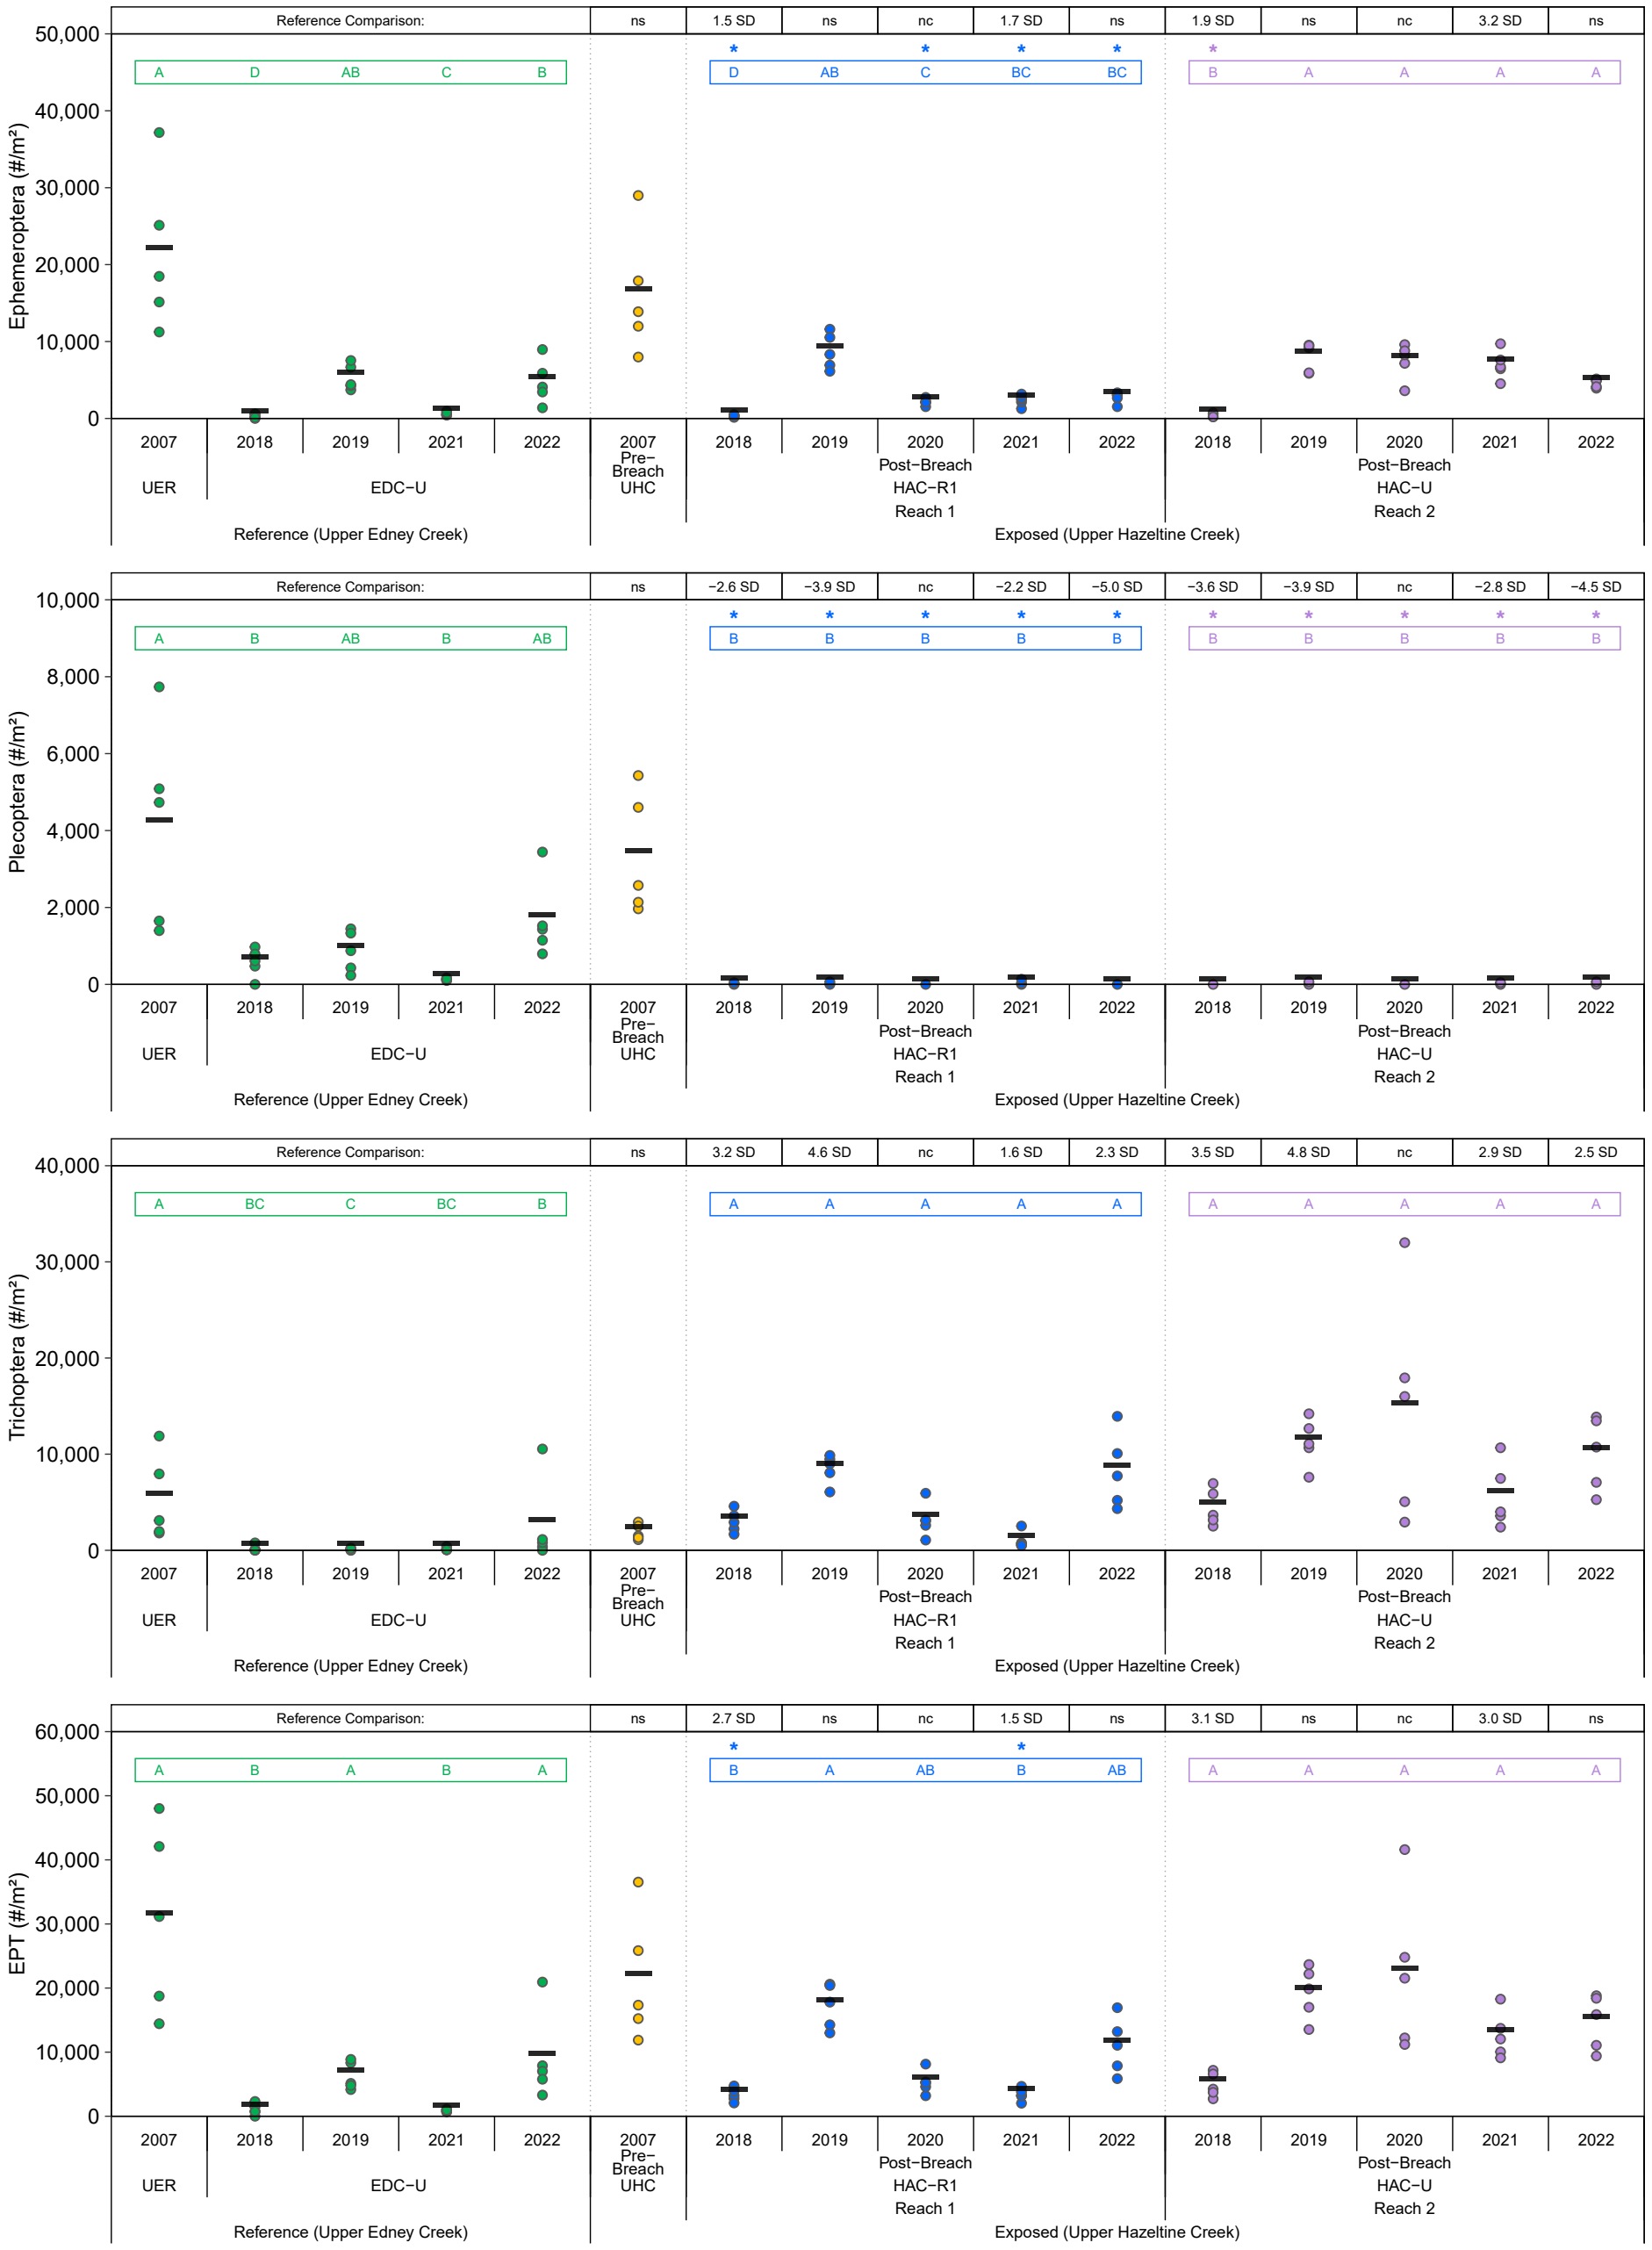

Figure F.3.1: Benthic Invertebrate Community Endpoints for Upper Hazeltine Creek (HAC−R1, HAC−U; Exposed) and Upper Edney Creek (EDC−U; Reference), 2007 to 2022

Notes: Reference area EDC−U was not sampled in 2020 due to habitat differences (in water depth and flow) relative to the remediated areas HAC−R1 and HAC−U. See Section 4.3 for details. Black bars represent measures of central tendency (mean, geometric mean, or median depending on if analysis was conducted on untransformed, log10− transformed or rank−transformed data). Coloured letters represent significant (p−value <0.1) post−hoc comparisons within areas over time; years that share a letter of the same colour (e.g., A, B) within a box of the same colour do not differ significantly within an area. Data from 2007 were used in the analyses to compare post−breach (2018 to 2022) to pre−breach conditions (2007). Post−breach data from HAC−R1 and HAC−U were compared to pre−breach data from UHC, and post −breach data from EDC−U was compared to pre−breach data from UER. An * indicates a significant difference between HAC−R1 or HAC−U and UHC in 2007. A number above the plot indicates significant exposed vs. reference post−hoc comparisons within a given year. The magnitude of difference (MOD) for these significant post−hoc comparisons is expressed in units of standard deviation (SD) or median absolute deviations (MAD; if the data were rank−transformed prior to analysis) relative to reference. 'nc' indicates no comparisons were possible; 'ns' indicates a non−significant contrast; 'nm' indicates that the MOD could not be calculated because MAD = 0.

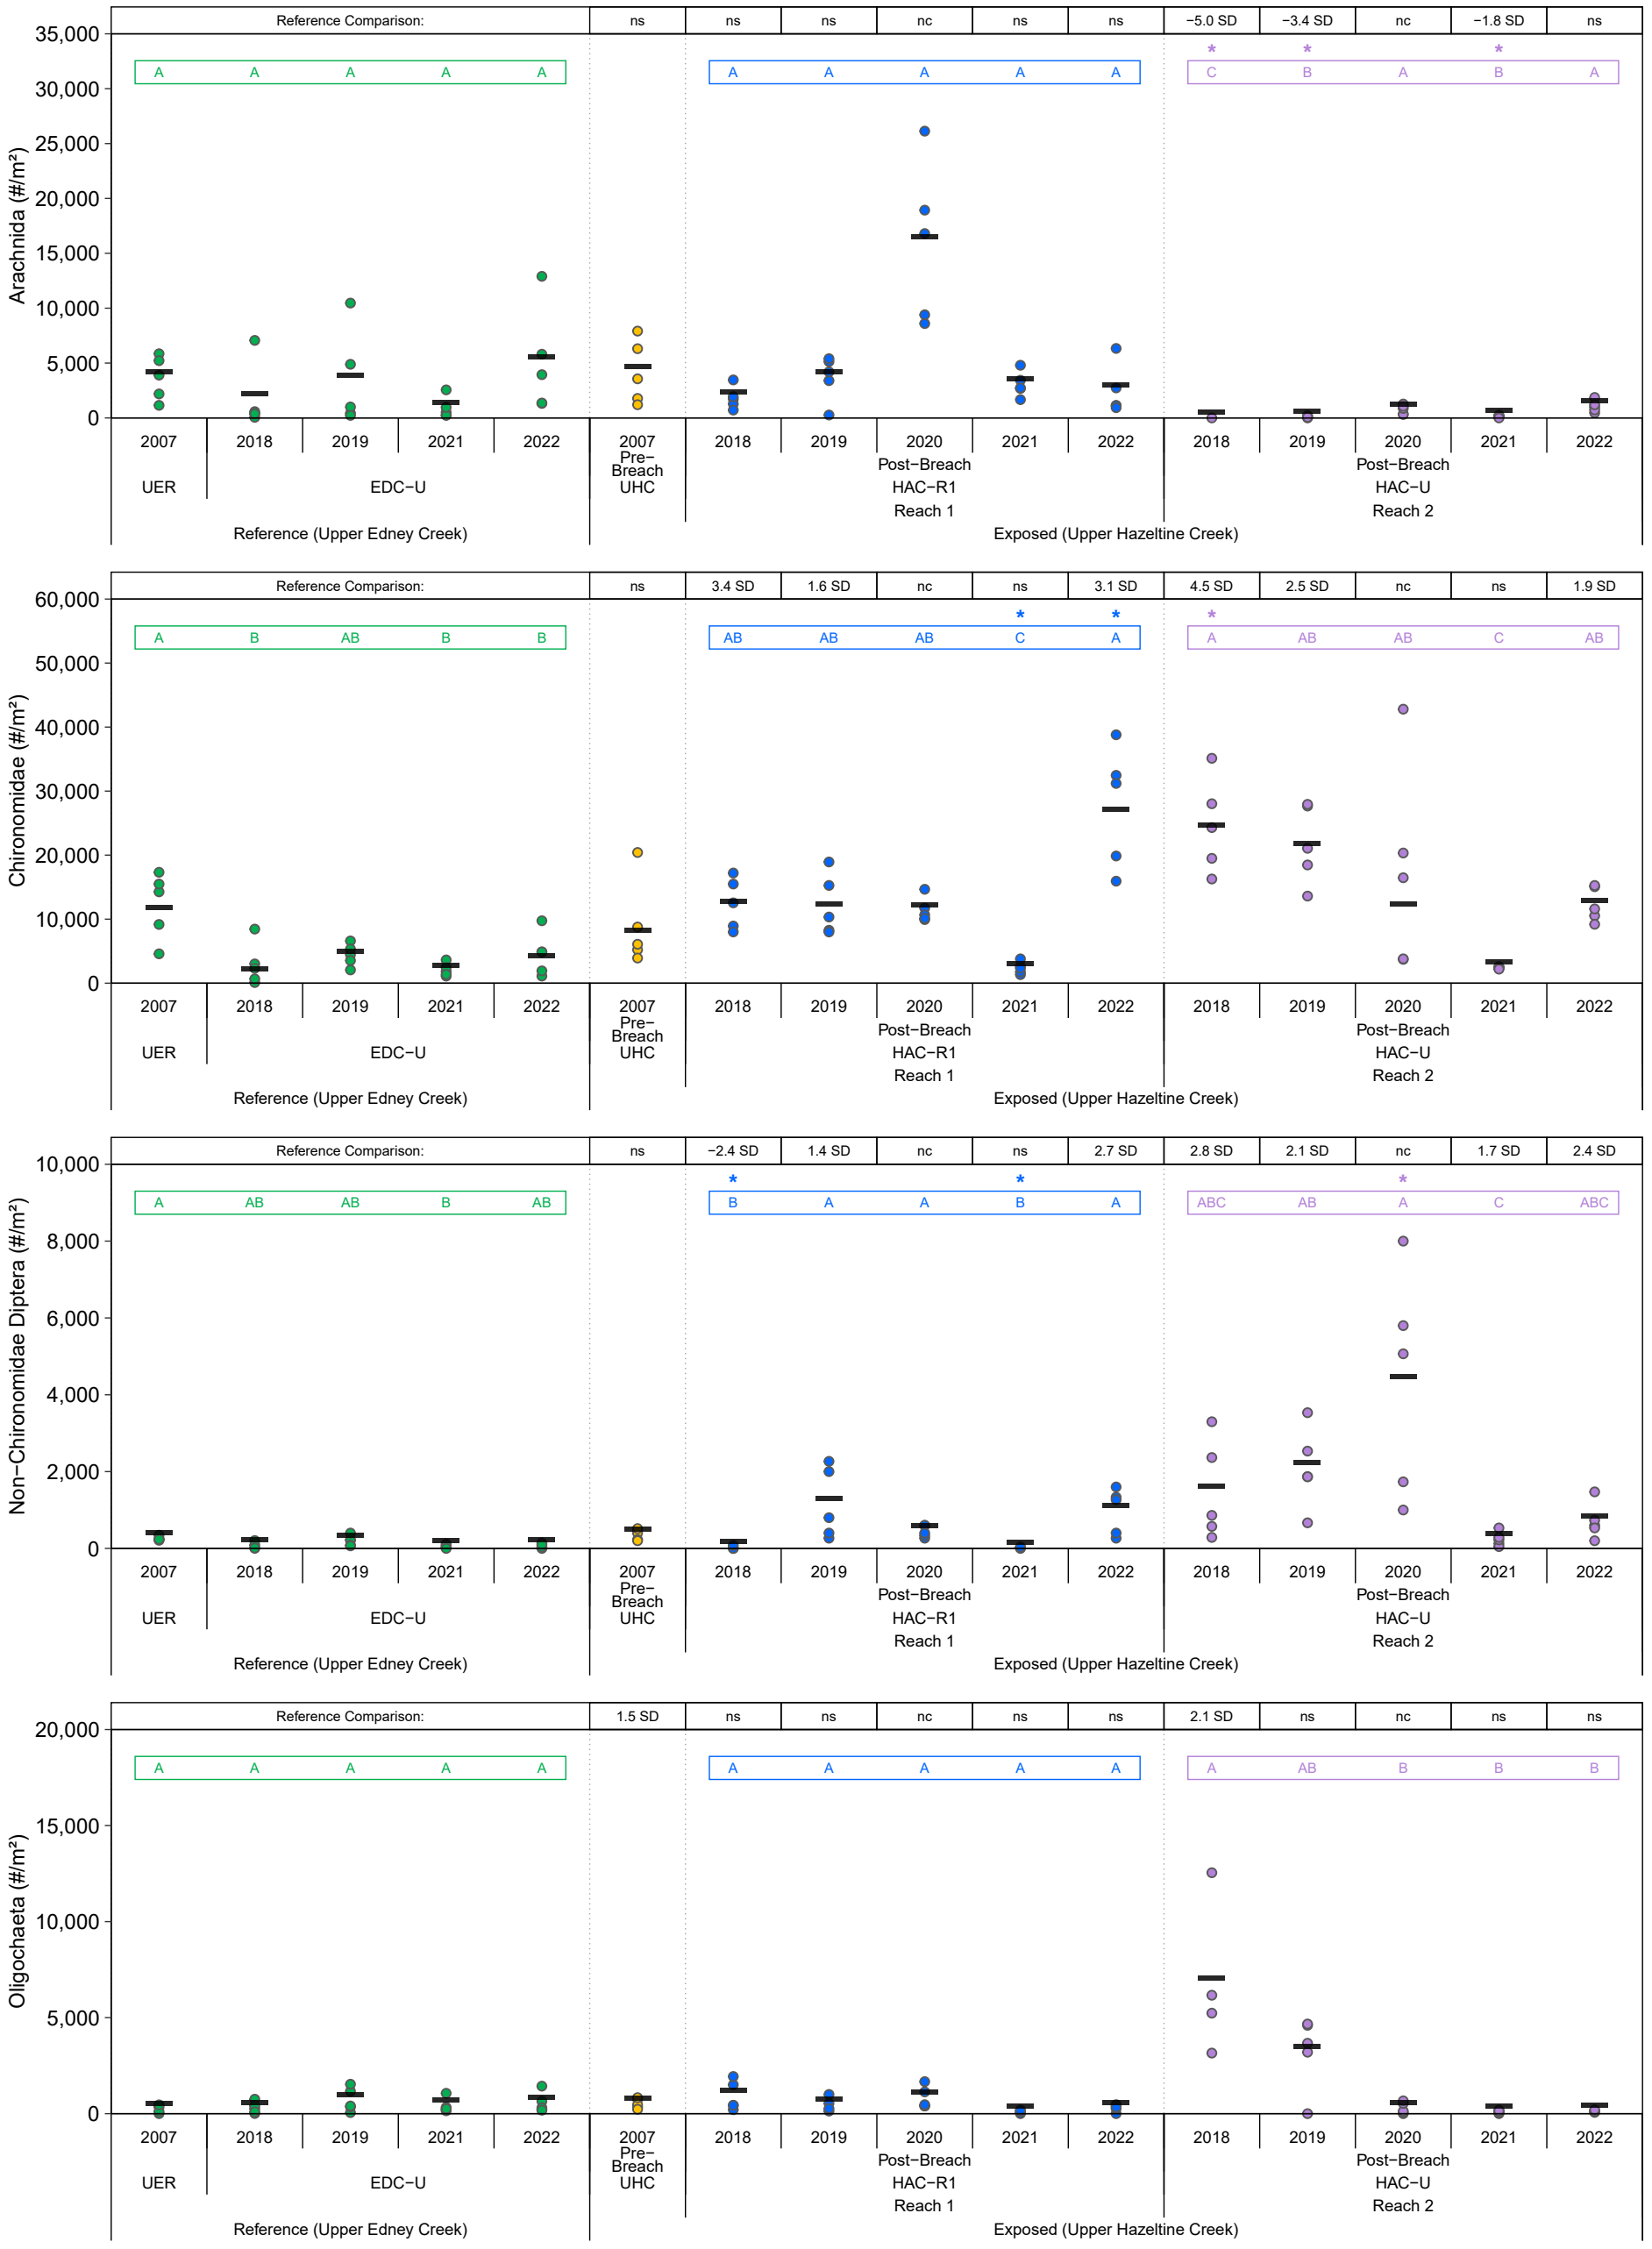

Figure F.3.1: Benthic Invertebrate Community Endpoints for Upper Hazeltine Creek (HAC−R1, HAC−U; Exposed) and Upper Edney Creek (EDC−U; Reference), 2007 to 2022

Notes: Reference area EDC−U was not sampled in 2020 due to habitat differences (in water depth and flow) relative to the remediated areas HAC−R1 and HAC−U. See Section 4.3 for details. Black bars represent measures of central tendency (mean, geometric mean, or median depending on if analysis was conducted on untransformed, log10− transformed or rank−transformed data). Magnitude of Difference (MOD) < -2

Magnitude of Difference (MOD) > 2

Notes: "-" = no data available. nc = no comparison. ns = no significance. nm = Contrast MODs could not be calculated because the Median Absolute Deviation (MAD) = 0. EPT = Ephemeroptera, Plecoptera, Trichoptera. DW = dry weight. WW = wet weight. Reference area EDC-U was not sampled in 2020 due to habitat differences (in water depth and flow) relative to the remediated areas HAC-R1 and HAC-U. See Section 4.3 for details

[a] Data from 2007 were used in the analyses to compare post-breach (2018 to 2022) to pre-breach conditions (2007). Post-breach data from HAC-R1 and HAC-U was compared to pre-breach data from UHC, and post-breach data from EDC-U was compared to pre-breach data from UER.

[b] Mean, geometric mean, or median depending on if analysis was conducted on untransformed, log_{10}-transformed, or rank-transformed data.

[c] Magnitude of difference (MOD) calculated for two-way ANOVA as (Exposed Mean - Reference Mean)/SD (or [Mean - Baseline Mean]/SD for temporal comparisons) on the transformed scale, where SD was the pooled standard deviation of the model residuals. MOD calculated for Kruskal-Wallis (i.e., rank-transformed data) as (Exposed Median - Reference Median)/MAD, where MAD was the pooled median absolute deviation.

[d] Pairwise contrasts of post-breach (2018 to 2022) data from HAC-R1 and HAC-U against pre-breach (2007) data from UHC are indicated with in Figure F.3.2.

[e] Spatial pairwise contrasts between HAC-R1 and HAC-U in 2007 were not calculated because UHC in 2007 represents pre-breach data for both HAC-R1 and HAC-U.

Reference area EDC-U was not sampled in 2020 due to habitat differences (in water depth and flow) relative to the remediated areas HAC-R1 and HAC-U. See Section 4.3 for details

[a] Data from 2007 were used in the analyses to compare post-breach (2018 to 2022) to pre-breach conditions (2007). Post-breach data from HAC-R1 and HAC-U was compared to pre-breach data from UHC, and post-breach data from EDC-U was compared to pre-breach data from UER.

[b] Mean, geometric mean, or median depending on if analysis was conducted on untransformed, log_{10}-transformed, or rank-transformed data.

[c] Magnitude of difference (MOD) calculated for two-way ANOVA as (Exposed Mean - Reference Mean)/SD (or [Mean - Baseline Mean]/SD for temporal comparisons) on the transformed scale, where SD was the pooled standard deviation of the model residuals. MOD calculated for Kruskal-Wallis (i.e., rank-transformed data) as (Exposed Median - Reference Median)/MAD, where MAD was the pooled median absolute deviation.

[d] Pairwise contrasts of post-breach (2018 to 2022) data from HAC-R1 and HAC-U against pre-breach (2007) data from UHC are indicated with in Figure F.3.2.

[e] Spatial pairwise contrasts between HAC-R1 and HAC-U in 2007 were not calculated because UHC in 2007 represents pre-breach data for both HAC-R1 and HAC-U.

Table F.3.1: Results of Statistical Comparisons of Benthic Invertebrate Community Endpoints for Upper Hazeltine Creek (HAC-R1, HAC-U; Exposed) and Upper Edney Creek (EDC-U; Reference), 2007 to 2022

APPENDIX F.4
PERIPHYTON & BENTHOS
TISSUE QUALITY

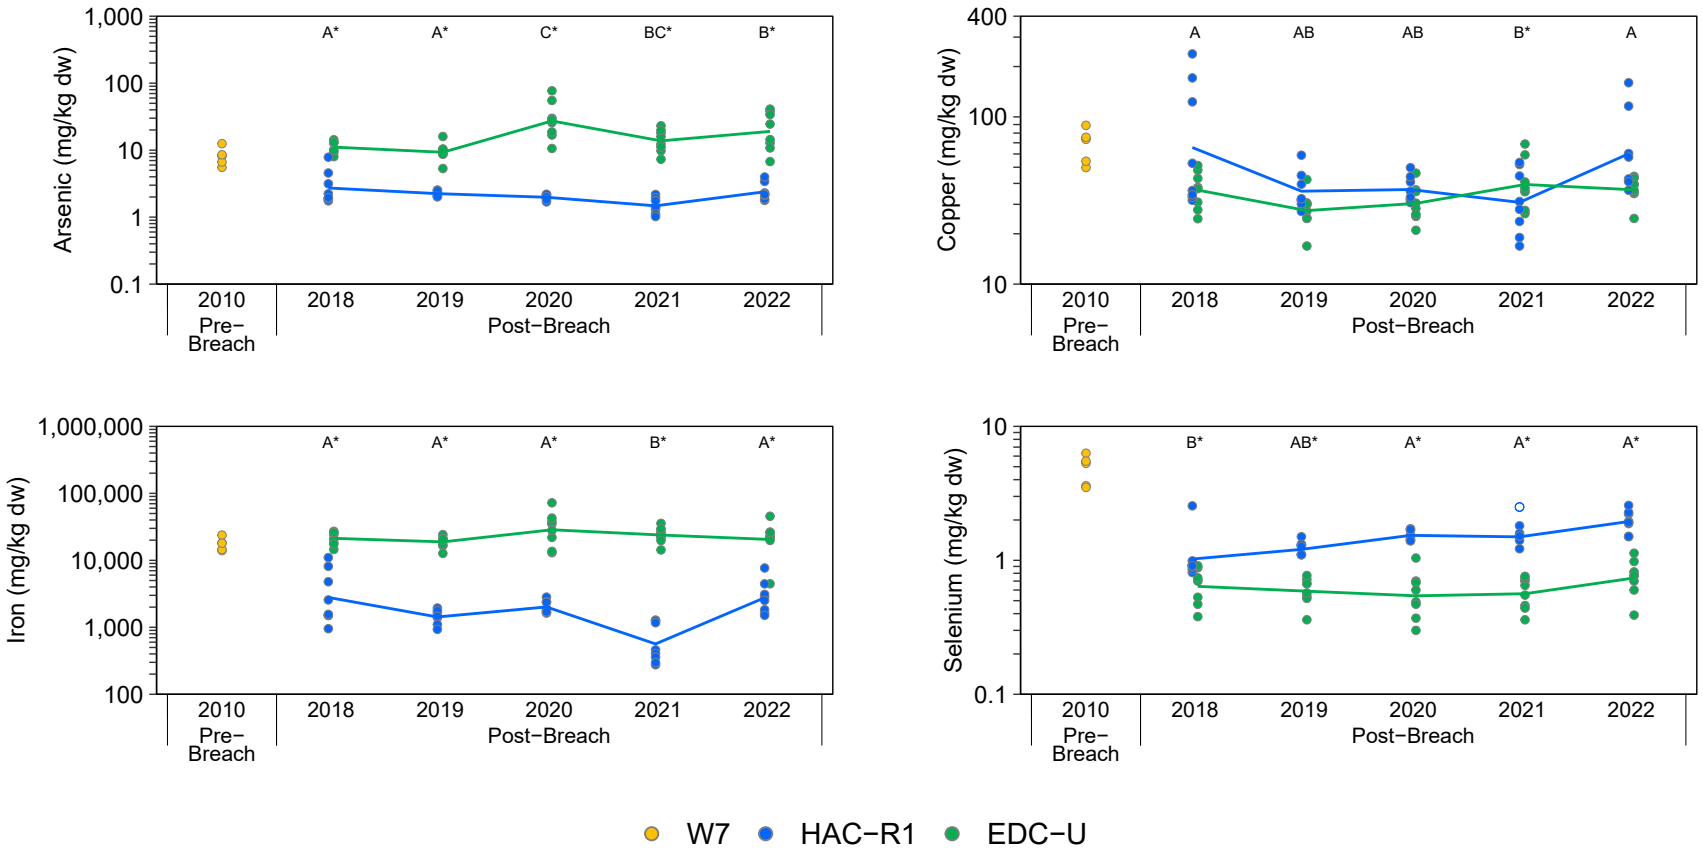

Figure F.4.1: Periphyton Tissue Primary and Secondary Analyte Concentrations with a Significant Area x Year Effect for Upper Hazeltine Creek (HAC-R1; Exposed) and Upper Edney Creek (EDC-U; Reference), 2010 to 2022

Notes: dw = dry weight, <LRL = lower than the laboratory reporting limit (LRL). W7 (2010) is the pre-breach equivalent of HAC-R1. Concentrations below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL and the open symbol represents one or more values reported below the LRL. Individual samples are plotted and lines join the least−squares estimated mean values for years included in the statistical analysis (i.e., not <LRL). Statistical analyses were conducted using a two−way ANOVA with factors Area and Year. The models were fit using Maximum Likelihood Estimation with an assumed log−normal distribution. Years that share a letter (e.g., A,B,C) have ratios of concentrations (Exposed:Reference) that do not differ significantly (p−value < 0.05) among years. Letter A was assigned to the year with the highest ratio of concentrations (Exposed:Reference). Only years with samples from both reference and exposed areas are plotted. Letters with a * designate years where the exposed site is different than pre−breach conditions.

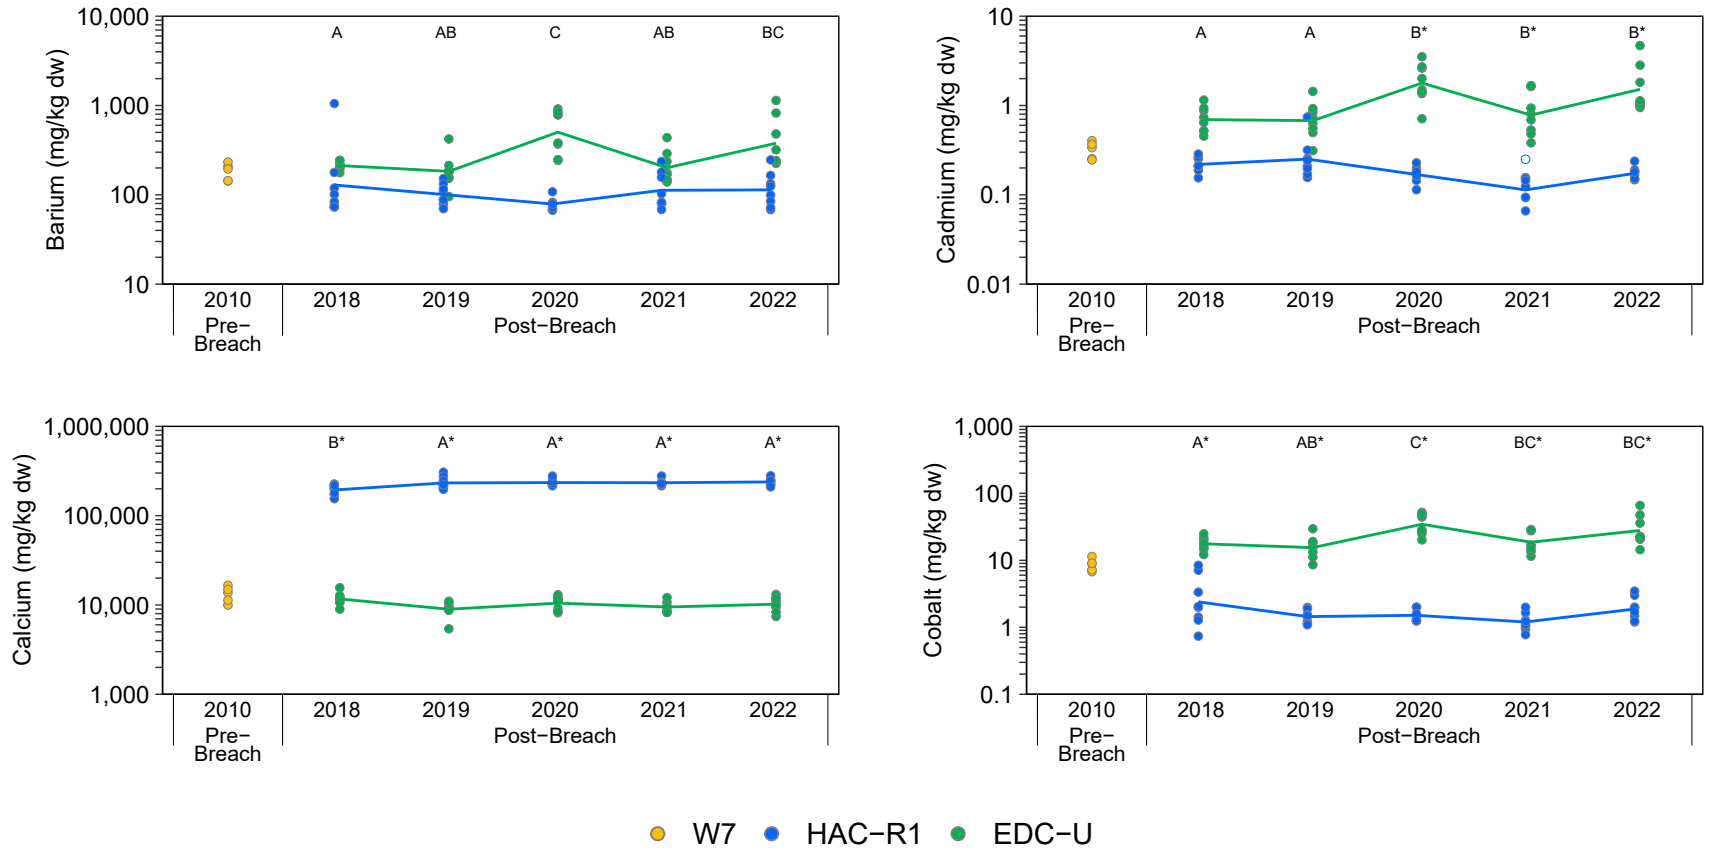

Figure F.4.1: Periphyton Tissue Primary and Secondary Analyte Concentrations with a Significant Area x Year Effect for Upper Hazeltine Creek (HAC-R1; Exposed) and Upper Edney Creek (EDC-U; Reference), 2010 to 2022

Notes: dw = dry weight, <LRL = lower than the laboratory reporting limit (LRL). W7 (2010) is the pre-breach equivalent of HAC-R1. Concentrations below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL and the open symbol represents one or more values reported below the LRL. Individual samples are plotted and lines join the least−squares estimated mean values for years included in the statistical analysis (i.e., not <LRL). Statistical analyses were conducted using a two−way ANOVA with factors Area and Year. The models were fit using Maximum Likelihood Estimation with an assumed log−normal distribution. Concentrations <LRL are plotted as open symbols at the LRL and the open symbol represents one or more values reported <LRL. Individual samples are plotted and lines join the least−squares estimated mean values for years included in the statistical analysis (i.e., not <LRL). Statistical analyses were conducted using a two−way ANOVA with factors Area and Year. The models were fit using Maximum Likelihood Estimation with an assumed log −normal distribution. Years that share a letter (e.g., A,B,C) have ratios of concentrations (Exposed:Reference) that do not differ significantly (p−value < 0.05) among years. Letter A was assigned to the year with the highest ratio of concentrations (Exposed:Reference). Only years with samples from both reference and exposed areas are plotted. Letters with a * designate years where the exposed site is different than pre−breach conditions.

Figure F.4.6: Composite-Taxa Benthic Invertebrate Tissue Primary and Secondary Analyte Concentrations with a Significant Area x Year Effect for Upper Hazeltine Creek (HAC-U; Exposed) and Upper Edney Creek (EDC-U; Reference), 2010 to 2022

Notes: BCMOE = British Columbia Ministry of the Environment; GL = Guideline; dw = dry weight; <LRL = lower than the laboratory reporting limit (LRL). W7 (2010) is the pre-breach equivalent of HAC-U. Concentrations <LRL are plotted as open symbols at the LRL and the open symbol represents one or more values reported <LRL. Individual samples are plotted and lines join the least−squares estimated mean values for years included in the statistical analysis (i.e., not <LRL). Statistical analyses were conducted using a two−way ANOVA with factors Area and Year. The models were fit using Maximum Likelihood Estimation with an assumed log −normal distribution. Individual samples are plotted and lines join the least−squares estimated mean values for years included in the statistical analysis (i.e., not <LRL). Statistical analyses were conducted using a two−way ANOVA with factors Area and Year. The models were fit using Maximum Likelihood Estimation with an assumed log−normal distribution. Years that share a letter (e.g., A,B,C) have ratios of concentrations (Exposed:Reference) that do not differ significantly (p−value < 0.05) among years. Letter A was assigned to the year with the highest ratio of concentrations (Exposed:Reference). Only years with samples from both reference and exposed areas are plotted.

Figure F.4.12: Caddisfly Tissue Primary and Secondary Analyte Concentrations with a Significant Area x Year Effect for Lower Hazeltine Creek (HAC-D; Exposed) and Lower Edney Creek (EDC-D; Reference), 2018 to 2022

Notes: BCMOE = British Columbia Ministry of the Environment, GL = Guideline, dw = dry weight, <LRL = lower than the laboratory reporting limit (<LRL). Concentrations <LRL are plotted as open symbols at the LRL and the open symbol represents one or more values reported <LRL. Individual samples are plotted and lines join the least−squares estimated mean values for years included in the statistical analysis (i.e., not <LRL). Statistical analyses were conducted using a two−way ANOVA with factors Area and Year. The models were fit using Maximum Likelihood Estimation with an assumed log−normal distribution. Years that share a letter (e.g., A,B,C) have ratios of concentrations (Exposed:Reference) that do not differ significantly (p−value < 0.05) among years. Figure F.4.19: Trophic Transfer Factors for Caddisfly Tissue Primary and Secondary Analyte Concentrations with a Significant Area x Year Effect for Lower Edney Creek (E1 [Exposed]; EDC-D [Reference]), 2019 to 2022

Notes: Trophic Transfer Factors (TTFs) were not calculated for analytes with results reported below the laboratory reporting limit (<LRL). Concentrations <LRL are plotted as open symbols at the LRL and the open symbol represents one or more values reported <LRL. Individual samples are plotted and lines join the least−squares estimated mean values for years included in the statistical analysis (i.e., not <LRL). Statistical analyses were conducted using a two−way ANOVA with factors Area and Year. The models were fit using Maximum Likelihood Estimation with an assumed log−normal distribution. Years that share a letter (e.g., A,B,C) have ratios of concentrations (Exposed:Reference) that do not differ significantly (p−value < 0.05) among years. Letter A was assigned to the year with the highest ratio of concentrations (Exposed:Reference). Only years with samples from both reference and exposed areas are plotted.

Figure F.4.20: Trophic Transfer Factors for Composite-Taxa Benthic Invertebrate Tissue Primary and Secondary Analyte Concentrations with a Significant Area x Year Effect for Lower Edney Creek (E1 [Exposed]; EDC-D [Reference]), 2019 to 2022

Notes: Trophic Transfer Factors (TTFs) were not calculated for analytes with results reported below the laboratory reporting limit (<LRL). Concentrations <LRL are plotted as open symbols at the LRL and the open symbol represents one or more values reported <LRL. Individual samples are plotted and lines join the least−squares estimated mean values for years included in the statistical analysis (i.e., not <LRL). Statistical analyses were conducted using a two−way ANOVA with factors Area and Year. The models were fit using Maximum Likelihood Estimation with an assumed log−normal distribution. Years that share a letter (e.g., A,B,C) have ratios of concentrations (Exposed:Reference) that do not differ significantly (p−value < 0.05) among years. Letter A was assigned to the year with the highest ratio of concentrations (Exposed:Reference). Only years with samples from both reference and exposed areas are plotted.

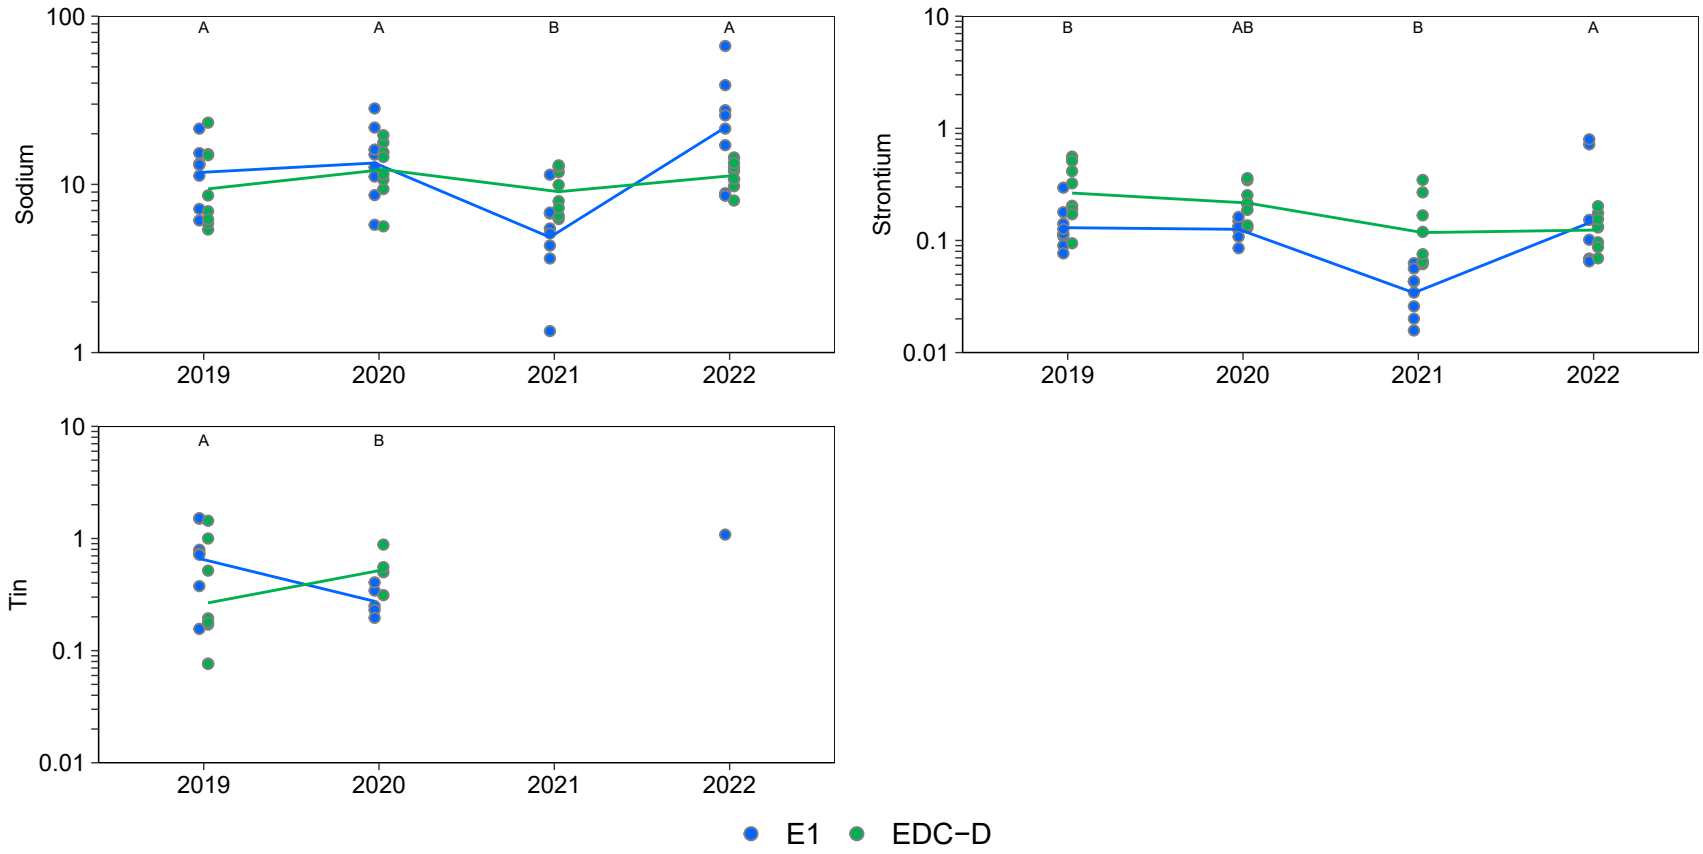

Figure F.4.20: Trophic Transfer Factors for Composite-Taxa Benthic Invertebrate Tissue Primary and Secondary Analyte Concentrations with a Significant Area x Year Effect for Lower Edney Creek (E1 [Exposed]; EDC-D [Reference]), 2019 to 2022

Year P-value < 0.05.

Contrast is significant (α = 0.05) and magnitude of difference is positive.

Contrast is significant (α = 0.05) and magnitude of difference is negative.

Notes: "-" = no data available, nt = not tested because all data were reported below the laboratory reporting limit (<LRL) or because there were only data for a single time period, ns = not significant, LRL = greater than 50% LRL data for both stations so the time period was omitted from the analysis, dw = dry weight, ANOVA = two way analysis of variance, MLE = censored regression using maximum likelihood estimation, MOD = Magnitude of Difference. Data were analysed in units of mg/kg dry weight.

[a] Magnitude of difference (MOD) calculated on backtransformed least-squares means as (Post-breach-Pre-breach)/Pre-breach x 100%.

Area x Year or Area P-value < 0.05.

Contrast is significant (α = 0.05) and magnitude of difference is positive.

Contrast is significant (α = 0.05) and magnitude of difference is negative.

Notes: ANOVA = two way analysis of variance, MLE = censored regression using maximum likelihood estimation, MOD = Magnitude of Difference, "-" = no data available or sample reported below the laboratory reporting limit (<LRL) so TTF ratio was not calculated, nt = not tested because all data were <LRL or because there were only data for a single time period, ns = not significant, baseline= first year of data included in analysis, <LRL = greater than 50% LRL data for both stations so the time period was omitted from the analysis. Merged cells across years indicate that the Area × Time term was not significant, therefore MOD is for all years combined. Only years with samples from both reference and exposed were included in the analysis.

[a] Years that share a letter (e.g., A,B,C) had ratios of concentrations (HAC-R1:EDC-U) that do not differ significantly among years. Letters are assigned such that A is assigned to the year with the highest ratio of concentrations (HAC-R1:EDC-U).

[b] Magnitude of difference (MOD) calculated on backtransformed least-squares means for the observed time period as $(Exp_{observed} - Exp_{predicted})/(Exp_{predicted}) \times 100\%$ where $Exp_{predicted} = Ref_{observed} + (Exp_{baseline} - Ref_{baseline})$.

[c] Magnitude of difference (MOD) calculated on backtransformed least-squares means as (Exp-Ref)/Ref x 100%.

Table F.4.12: **Statistical Comparisons of Exposed - Reference Relative Differences of Trophic Transfer Factors for Composite-Taxa Benthic Invertebrate Tissue Metal Concentrations for Upper Hazeltine Creek (HAC-R1; Exposed) and Upper Edney Creek (EDC-U; Reference), 2018 to 2022**

Area x Year or Area P-value < 0.05.

Contrast is significant (α = 0.05) and magnitude of difference is positive.

Contrast is significant (α = 0.05) and magnitude of difference is negative.

Notes: "-" = no data available or sample reported below the laboratory reporting limit (<LRL) so TTF ratio was not calculated, ANOVA = two way analysis of variance, MLE = censored regression using maximum likelihood estimation, MOD = Magnitude of Difference, nt = not tested because all data were <LRL or because there were only data for a single time period, ns = not significant, baseline= first year of data included in analysis, <LRL = greater than 50% LRL data for both stations so the time period was omitted from the analysis. Merged cells across years indicate that the Area × Time term was not significant, therefore MOD is for all years combined. Only years with samples from both reference and exposed were included in the analysis.

[a] Years that share a letter (e.g., A,B,C) had ratios of concentrations (HAC-U:EDC-U) that do not differ significantly among years. Letters are assigned such that A is assigned to the year with the highest ratio of concentrations (HAC-U:EDC-U).

[b] Magnitude of difference (MOD) calculated on backtransformed least-squares means for the observed time period as $(Exp_{observed} - Exp_{predicted})/(Exp_{predicted})\times 100\%$ where $Exp_{predicted} = Ref_{observed} + (Exp_{baseline} - Ref_{baseline})$.

[c] Magnitude of difference (MOD) calculated on backtransformed least-squares means as (Exp-Ref)/Ref x 100%.

Table F.4.15: **Statistical Comparisons of Exposed - Reference Relative Differences of Trophic Transfer Factors for Composite-Taxa Benthic Invertebrate Tissue Metal Concentrations for Upper Hazeltine Creek (HAC-U; Exposed) and Upper Edney Creek (EDC-U; Reference), 2018 to 2022**

Area x Year or Area P-value < 0.05.

Contrast is significant (α = 0.05) and magnitude of difference is positive.

Contrast is significant (α = 0.05) and magnitude of difference is negative.

Notes: "-" = no data available or samples reported below the laboratory reporting limit (<LRL) so TTF ratio was not calculated, ANOVA = two way analysis of variance, MLE = censored regression using maximum likelihood estimation, MOD = Magnitude of Difference, nt = not tested because all data were reported <LRL or because there were only data for a single time period, ns = not significant, baseline = first year of data included in analysis, <LRL = greater than 50% LRL data for both stations so the time period was omitted from the analysis. Merged cells across years indicate that the Area × Time term was not significant, therefore MOD is for all years combined. Only years with samples from both reference and exposed were included in the analysis.

[a] Years that share a letter (e.g., A,B,C) had ratios of concentrations (HAC-D:EDC-D) that do not differ significantly among years. Letters are assigned such that A is assigned to the year with the highest ratio of concentrations (HAC-D:EDC-D).

[b] Magnitude of difference (MOD) calculated on backtransformed least-squares means for the observed time period as $(Exp_{observed} - Exp_{predicted})/(Exp_{predicted})\times100\%$ where $Exp_{predicted} = Ref_{observed} + (Exp_{baseline} - Ref_{baseline})$.

[c] Magnitude of difference (MOD) calculated on backtransformed least-squares means as (Exp-Ref)/Ref x 100%.

Table F.4.24: Statistical Comparisons of Trophic Transfer Factors for Composite-Taxa Benthic Invertebrate Tissue Metal Concentrations for Lower Hazeltine Creek (HAC-D; Exposed) in Post-Breach Years (2018 to 2022) Relative to Pre-Breach Conditions (2010; W11)

Area x Year or Area P-value < 0.05.

Contrast is significant (α = 0.05) and magnitude of difference is positive.

Contrast is significant (α = 0.05) and magnitude of difference is negative.

Notes: "-" = no data available, ANOVA = two way analysis of variance, MLE = censored regression using maximum likelihood estimation, MOD = Magnitude of Difference, nt = not tested because all data were reported below the laboratory reporting limit (<LRL) or because there were only data for a single time period, ns = not significant, baseline= first year of data included in analysis, <LRL = greater than 50% LRL data for both stations so the time period was omitted from the analysis. Merged cells across years indicate that the Area × Time term was not significant, therefore MOD is for all years combined. Only years with samples from both reference and exposed were included in the analysis. Data were analysed in units of mg/kg dry weight.

[a] Years that share a letter (e.g., A,B,C) had ratios of concentrations (E1:EDC-D) that do not differ significantly among years. Letters are assigned such that A is assigned to the year with the highest ratio of concentrations (E1:EDC-D).

[b] Magnitude of difference (MOD) calculated on backtransformed least-squares means for the observed time period as $(Exp_{observed} - Exp_{predicted})/(Exp_{predicted})\times 100\%$ where $Exp_{predicted} = Ref_{observed} + (Exp_{baseline} - Ref_{baseline})$.

[c] Magnitude of difference (MOD) calculated on backtransformed least-squares means as (Exp-Ref)/Ref x 100%.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Ann Joby	Lab Assistant	Metals, Burnaby, British Columbia
Kim Jensen	Department Manager - Metals	Metals, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Inorganics, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
µg/L	micrograms per litre
µS/cm	Microsiemens per centimetre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Project	: ----	Date Samples Received	: 22-Jun-2022 10:55
PO	: 5590008044 Q2 2022	Issue Date	: 08-Jul-2022 15:48
C-O-C number	: ----		
Sampler	: ----		
Site	: ----		
Quote number	: VA22-MPMC100-006 - Minnow Env. - Water Quality		
No. of samples received	: 2		
No. of samples analysed	: 2		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Matrix: **Water**

Evaluation: × = Holding time exceedance ; ✓ = Within Holding Time

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

EHT: Exceeded ALS recommended hold time prior to analysis.

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = *QC frequency outside specification*; ✓ = *QC frequency within specification.*

Quality Control Sample Type			Count		Frequency (%)

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Vancouver - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Vancouver - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Turbidity by Nephelometry	E121 Vancouver - Environmental	Water	APHA 2130 B (mod)	Turbidity is measured by the nephelometric method, by measuring the intensity of light scatter under defined conditions.
TDS by Gravimetry	E162 Vancouver - Environmental	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at 180 ± 2°C for 16 hours or to constant weight, with gravimetric measurement of the residue.
TSS by Gravimetry (Whole Bottle)	E164 Vancouver - Environmental	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
Chloride in Water by IC	E235.Cl Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Sulfate in Water by IC	E235.SO4 Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Alkalinity Species by Titration	E290 Vancouver - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Vancouver - Environmental	Water	Method Fialab 100, 2018	Ammonia in water is determined by automated continuous flow analysis with membrane diffusion and fluorescence detection, after reaction with OPA (ortho-phthalaldehyde). This method is approved under US EPA 40 CFR Part 136 (May 2021)
Dissolved Organic Carbon by Combustion (Low Level)	E358-L Vancouver - Environmental	Water	APHA 5310 B (mod)	Dissolved Organic Carbon (Non-Purgeable), also known as NPOC (dissolved), is a direct measurement of DOC after a filtered (0.45 micron) sample has been acidified and purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO2. NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of DC (dissolved carbon) is comprised of IC (which is common), this method is more accurate and more reliable than the DOC by subtraction method (i.e. DC minus DIC).
Total Nitrogen by Colourimetry	E366 Vancouver - Environmental	Water	APHA 4500-P J (mod)	Total Nitrogen is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Total Phosphorus by Colourimetry (0.002 mg/L)	E372-U Vancouver - Environmental	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Total Dissolved Phosphorus by Colourimetry (0.002 mg/L)	E375-T Vancouver - Environmental	Water	APHA 4500-P E (mod).	Total Dissolved Phosphorus is determined colourimetrically using a discrete analyzer after filtration through a 0.45 micron filter followed by heated persulfate digestion of the sample.
Dissolved Orthophosphate by Colourimetry (Ultra Trace Level 0.001 mg/L)	E378-U Vancouver - Environmental	Water	APHA 4500-P F (mod)	Dissolved Orthophosphate is determined colourimetrically on a sample that has been lab or field filtered through a 0.45 micron membrane filter. Field filtration is recommended to ensure test results represent conditions at time of sampling.
Total Metals in Water by CRC ICPMS	E420 Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Metals in Water by CRC ICPMS	E421 Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Chlorophyll-a by Fluorometry	E870 Vancouver - Environmental	Water	EPA 445.0 (mod)	Chlorophyll a is determined by solvent extraction followed with analysis by fluorometry using the non-acidification procedure. This method is not subject to interferences from chlorophyll b.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Hardness (Calculated)	EC100 Vancouver - Environmental	Water	APHA 2340B	"Hardness (as CaCO3), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Hardness (Calculated) from Total Ca/Mg	EC100A Vancouver - Environmental	Water	APHA 2340B	"Hardness (as CaCO3), from total Ca/Mg" is calculated from the sum of total Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations. Hardness from total Ca/Mg is normally comparable to Dissolved Hardness in non-turbid waters.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N Vancouver - Environmental	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 Vancouver - Environmental	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Preparation for Dissolved Organic Carbon for Combustion	EP358 Vancouver - Environmental	Water	APHA 5310 B (mod)	Preparation for Dissolved Organic Carbon
Digestion for Total Nitrogen in water	EP366 Vancouver - Environmental	Water	APHA 4500-P J (mod)	Samples are heated with a persulfate digestion reagent.
Digestion for Total Phosphorus in water	EP372 Vancouver - Environmental	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.
Digestion for Dissolved Phosphorus in water	EP375 Vancouver - Environmental	Water	APHA 4500-P E (mod).	Samples are filtered through a 0.45 micron membrane filter and then heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.
Chlorophyll-a Extraction	EP870 Vancouver - Environmental	Water	EPA 445.0 (mod)	Chlorophyll-a solvent extraction.

Ann Joby	Lab Assistant	Vancouver Metals, Burnaby, British Columbia
Kim Jensen	Department Manager - Metals	Vancouver Metals, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Vancouver Inorganics, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Vancouver Metals, Burnaby, British Columbia

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

Drinking Water (DW) Samples[1] (client use)

Are samples taken from a Regulated DW System? ☐ ☐

Are samples for human drinking water use? ☐ ☐

Special Instructions / Specify Criteria to add on report by clicking on the drop-down list below (electronic COC only)

Pls filter + freeze chlorophyll but HOLD for analysis *

Regular analytes for Mount Polley Mine water sample package. Please also report ANIONS-N+N-CALC-VA (calculated nitrate and nitrite)

SAMPLE CONDITION AS RECEIVED (lab use only)

Frozen ☐ | SIF Observations Yes ☐ No ☐

Ice Packs ☐ Ice Cubes ☐ | Custody seal intact Yes ☐ No ☐

Cooling Initiated ☐

INITIAL COOLER TEMPERATURES °C			FINAL COOLER TEMPERATURES °C		
			5.6	8

Project	: ----	Date Samples Received	: 24-Jun-2022 11:20
PO	: 5590008044 Q2 2022	Date Analysis Commenced	: 24-Jun-2022
C-O-C number	: ----	Issue Date	: 11-Jul-2022 14:23
Sampler	: ----		
Site	: ----		
Quote number	: VA22-MPMC100-006 - Minnow Env. - Water Quality		
No. of samples received	: 3		
No. of samples analysed	: 3		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Erin Sanchez		Metals, Burnaby, British Columbia
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Kyle Chang	Lab Assistant	Metals, Burnaby, British Columbia
Miles Gropen	Department Manager - Inorganics	Inorganics, Burnaby, British Columbia
Tracy Harley	Supervisor - Water Quality Instrumentation	Inorganics, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
µg/L	micrograms per litre
µS/cm	Microsiemens per centimetre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Qualifiers

Qualifier	*Description*
DTC	*Dissolved concentration exceeds total. Results were confirmed by re-analysis.*
HTD	*Hold time exceeded for re-analysis or dilution, but initial testing was conducted within hold time.*

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **VA22B4435**	Page	: 1 of 14
Client	: **Mount Polley Mining Corporation**	Laboratory	: Vancouver - Environmental
Contact	: Gabriel Holmes	Account Manager	: Can Dang
Address	: PO Box 12 Likely BC Canada V0L 1N0	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	: ----	Telephone	: +1 604 253 4188
Project	: ----	Date Samples Received	: 24-Jun-2022 11:20
PO	: 5590008044 Q2 2022	Issue Date	: 11-Jul-2022 14:22
C-O-C number	: ----		
Sampler	: ----		
Site	: ----		
Quote number	: VA22-MPMC100-006 - Minnow Env. - Water Quality		
No. of samples received	: 3		
No. of samples analysed	: 3		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Matrix: **Water**

Evaluation: × = Holding time exceedance ; ✓ = Within Holding Time
