Notes: mg/L = milligrams per litre, BCWQG = British Columbia Water Quality Guideline, "<" = result is below the laboratory reporting limit. All results reported to three significant figures.

**Table A.2: Modifying Factors Used in Calculation of Condition-Specific Guidelines for Surface Water Samples from Hazeltine Creek (HAC-13, HAC-05a, HAC-14, HAC-08) and Edney Creek (EDC-01a, W10), 2015 to Present**

| Year | Station | Date | Parameter | Unit | Result | Value for Guideline Calculation | | | BCWQG | |
|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | Hardness (as $CaCO_3$) | Dissolved Organic Carbon | Minimum pH (Field) | Long Term Calculated Value | Short Term Calculated Value |

Notes: mg/L = milligrams per litre, BCWQG = British Columbia Water Quality Guideline, "<" = result is below the laboratory reporting limit. All results reported to three significant figures.

**Table A.2: Modifying Factors Used in Calculation of Condition-Specific Guidelines for Surface Water Samples from Hazeltine Creek (HAC-13, HAC-05a, HAC-14, HAC-08) and Edney Creek (EDC-01a, W10), 2015 to Present**

| Year | Station | Date | Parameter | Unit | Result | Value for Guideline Calculation | | | BCWQG | |
|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | Hardness (as $CaCO_3$) | Dissolved Organic Carbon | Minimum pH (Field) | Long Term Calculated Value | Short Term Calculated Value |
| 2016 | HAC-13 | 17-Aug-16 | Cadmium- Dissolved | mg/L | 0.0000260 | 248 | 13.0 | 8.00 | 0.000410 | 0.000410 |

Notes: mg/L = milligrams per litre, BCWQG = British Columbia Water Quality Guideline, "<" = result is below the laboratory reporting limit. All results reported to three significant figures.

**Table A.2: Modifying Factors Used in Calculation of Condition-Specific Guidelines for Surface Water Samples from Hazeltine Creek (HAC-13, HAC-05a, HAC-14, HAC-08) and Edney Creek (EDC-01a, W10), 2015 to Present**

| Year | Station | Date | Parameter | Unit | Result | Value for Guideline Calculation | | | BCWQG | |
|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | Hardness (as $CaCO_3$) | Dissolved Organic Carbon | Minimum pH (Field) | Long Term Calculated Value | Short Term Calculated Value |

Notes: mg/L = milligrams per litre, BCWQG = British Columbia Water Quality Guideline, "<" = result is below the laboratory reporting limit. All results reported to three significant figures.

**Table A.2: Modifying Factors Used in Calculation of Condition-Specific Guidelines for Surface Water Samples from Hazeltine Creek (HAC-13, HAC-05a, HAC-14, HAC-08) and Edney Creek (EDC-01a, W10), 2015 to Present**

| Year | Station | Date | Parameter | Unit | Result | Value for Guideline Calculation | | | BCWQG | |
|---|---|---|---|---|---|---|---|---|---|---|

Notes: mg/L = milligrams per litre, BCWQG = British Columbia Water Quality Guideline, "<" = result is below the laboratory reporting limit. All results reported to three significant figures.

**Table A.2: Modifying Factors Used in Calculation of Condition-Specific Guidelines for Surface Water Samples from Hazeltine Creek (HAC-13, HAC-05a, HAC-14, HAC-08) and Edney Creek (EDC-01a, W10), 2015 to Present**

| Year | Station | Date | Parameter | Unit | Result | Value for Guideline Calculation | | | BCWQG | |
|---|---|---|---|---|---|---|---|---|---|---|

Notes: mg/L = milligrams per litre, BCWQG = British Columbia Water Quality Guideline, "<" = result is below the laboratory reporting limit. All results reported to three significant figures.

# APPENDIX B
# SEDIMENT QUALITY

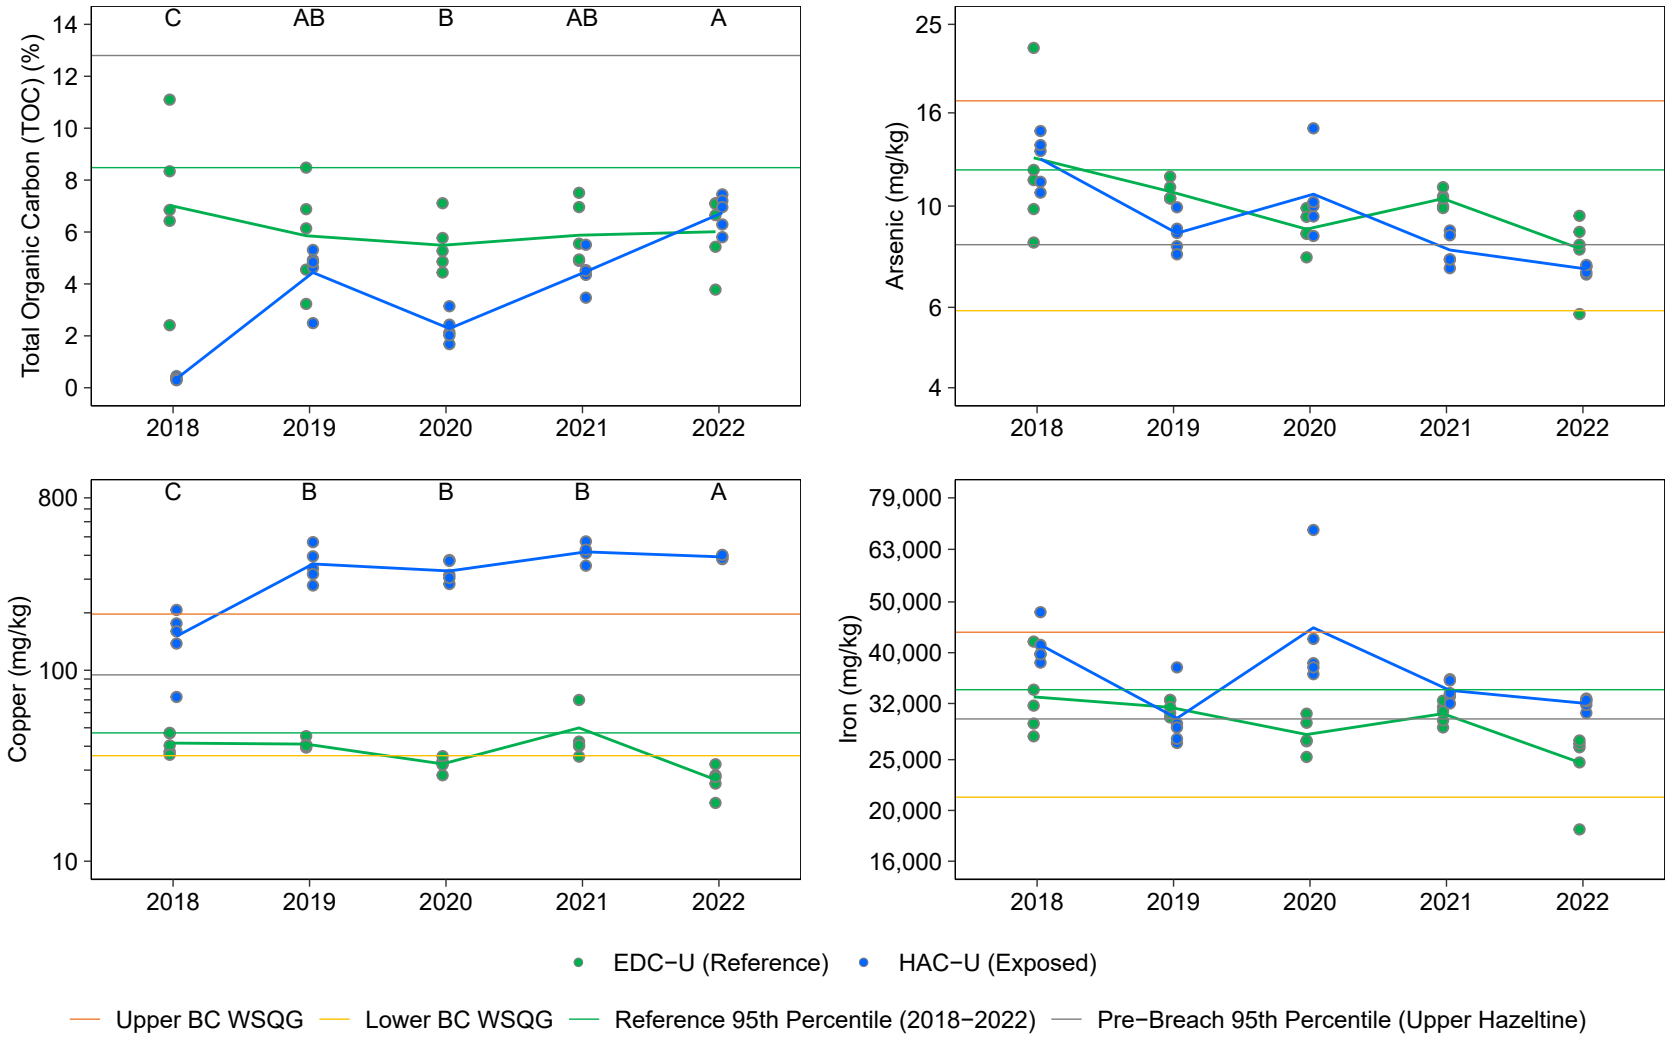

**Figure B.1: Sediment Primary and Secondary Analyte Concentrations (<63 µm Fraction) for Upper Hazeltine Creek (HAC-U; Exposed) and Upper Edney Creek (EDC-U; Reference), 2018 to 2022**

Notes: Concentrations below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. Individual samples are plotted and lines join the least −squares estimated mean values for years included in the statistical analysis (i.e., not <LRL). For Analytes of Interest (identified in Minnow [2023]; copper and selenium) and total organic carbon, statistical analyses were conducted using a two−way ANOVA with factors Area and Year. The models were fit using Maximum Likelihood Estimation with an assumed log−normal distribution. Years that share a letter (e.g., A,B,C) have differences in concentrations (Exposed − Reference) that do not differ significantly (p−value < 0.05) among years.

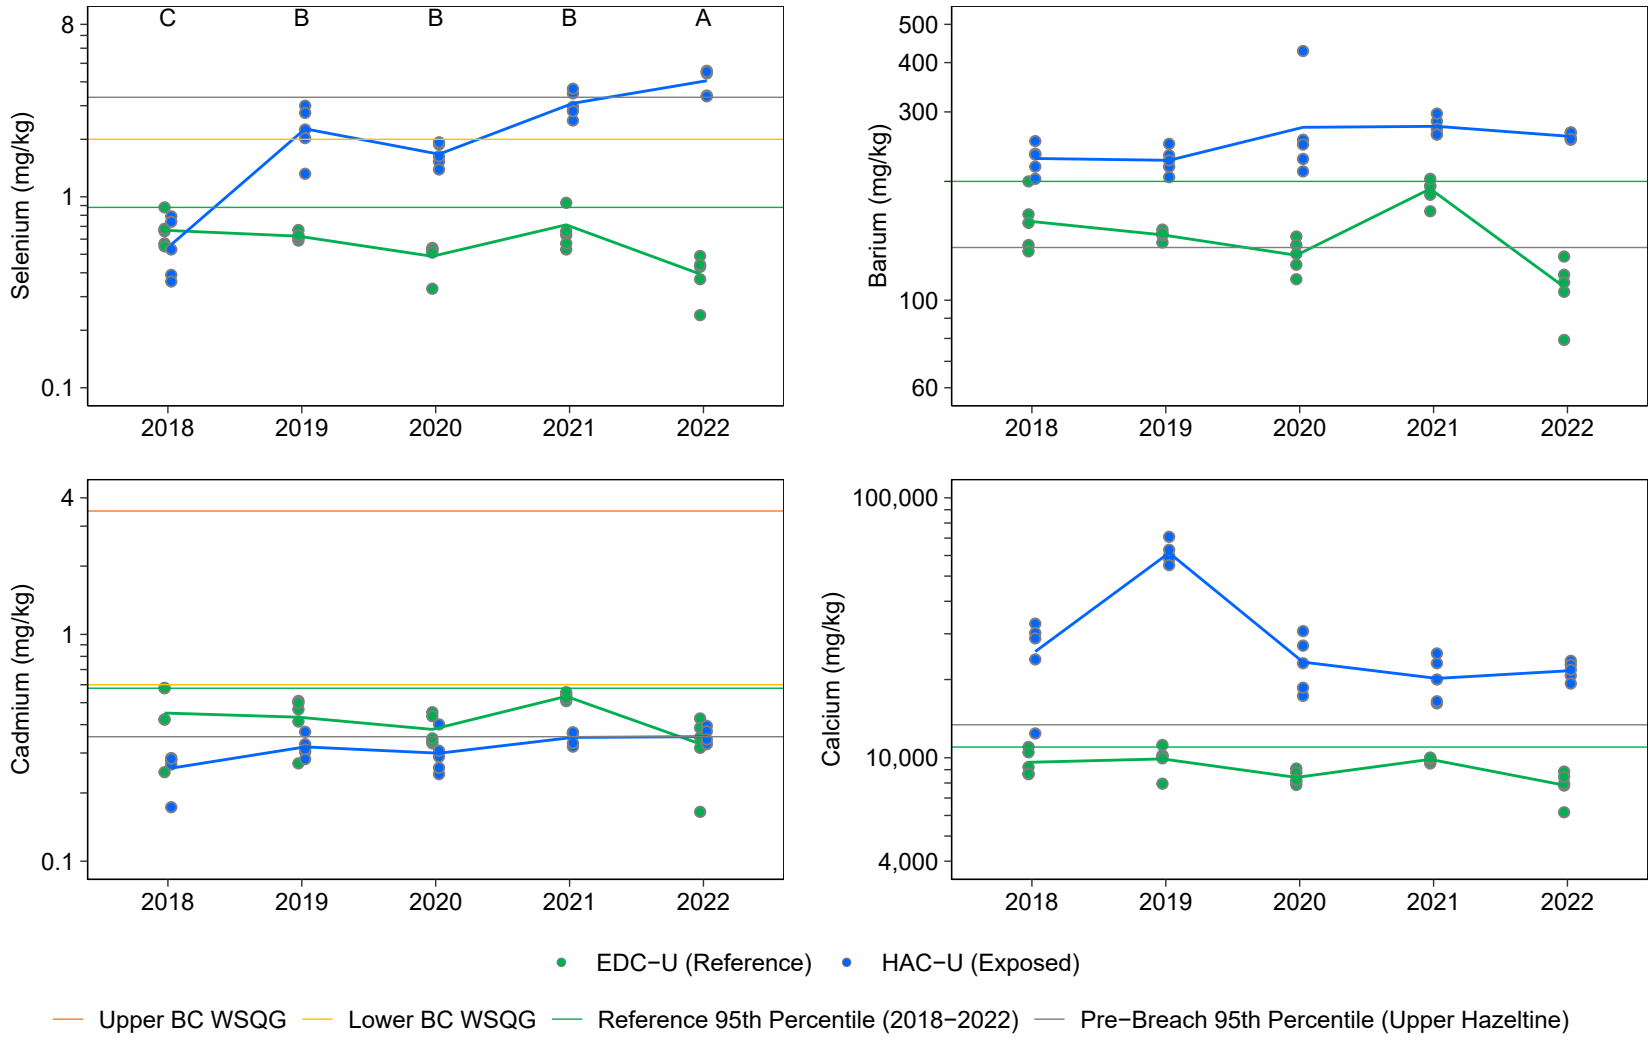

**Figure B.1: Sediment Primary and Secondary Analyte Concentrations (<63 µm Fraction) for Upper Hazeltine Creek (HAC-U; Exposed) and Upper Edney Creek (EDC-U; Reference), 2018 to 2022**

Notes: Concentrations below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. Notes: mg/kg = milligrams per kilogram. % = percent. "-" = data not available. All results are presented as three significant digits.

[a] Particle sizes classified as clay (<4 um), silt (0.063 mm - 4 um), sand (2.0 - 0.063 mm), and gravel (>2 mm).

## Table B.1: Sediment Quality Data for Hazeltine Creek (HAC-R1, HAC-U, HAC-D; Exposed) and Edney Creek (EDC-D, EDC-U; Reference), 2015 to 2022

| Year | Area | Area Type | Station | Clay[a] | Silt[a] | Sand[a] | Gravel[a] | pH (1:2 soil:water) | Aluminum | Antimony | Arsenic | Barium | Beryllium | Bismuth | Boron | Cadmium | Calcium | Chromium |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | % | % | % | % | pH units | mg/kg | mg/kg | mg/kg | mg/kg | mg/kg | mg/kg | mg/kg | mg/kg | mg/kg | mg/kg |

Notes: mg/kg = milligrams per kilogram. % = percent. "-" = data not available. All results are presented as three significant digits.

[a] Particle sizes classified as clay (<4 um), silt (0.063 mm - 4 um), sand (2.0 - 0.063 mm), and gravel (>2 mm).

**Table B.1: Sediment Quality Data for Hazeltine Creek (HAC-R1, HAC-U, HAC-D; Exposed) and Edney Creek (EDC-D, EDC-U; Reference), 2015 to 2022**

Notes: mg/kg = milligrams per kilogram. % = percent. "-" = data not available. All results are presented as three significant digits.

[a] Particle sizes classified as clay (<4 um), silt (0.063 mm - 4 um), sand (2.0 - 0.063 mm), and gravel (>2 mm).

**Table B.1: Sediment Quality Data for Hazeltine Creek (HAC-R1, HAC-U, HAC-D; Exposed) and Edney Creek (EDC-D, EDC-U; Reference), 2015 to 2022**

| Year | Area | Area Type | Station | Sodium mg/kg | Strontium mg/kg | Sulphur mg/kg | Thallium mg/kg | Tin mg/kg | Titanium mg/kg | Total Nitrogen % | Total Organic Carbon % | Total Phosphorus mg/kg | Uranium mg/kg | Vanadium mg/kg | Zinc mg/kg | Zirconium mg/kg |

Notes: ***Bold/Italics*** indicates value is > reference 95th percentile value (<5th percentile value for pH). Pre-breach values that were reported as < the laboratory reporting limit were not used for screening. Sediment metal concentrations are based predominantly on bulk sediment samples, concentrations reported in 1995 and 1996 were for the silt and clay (< 63 µm) fraction only. S = spring. F = fall. mg/kg = milligrams per kilogram. % = percent. "-" = data not available. All results are presented as three significant digits.

[a] Particle sizes classified as clay (<4 um), silt (0.063 mm - 4 um), sand (2.0 - 0.063 mm), and gravel (>2 mm), except for 1999 data, for which the size classes are: gravel (>2 mm), sand (2.0 - 0.050 mm), silt (0.050 - 0.002 mm), clay (<0.002 mm).

[b] Some unusually high sediment metal concentrations were reported for 1996 (HKP 1997) and are suspected errors.

[c] W7 is the historical sampling area associated with HAC-U; W11 is the historical sampling area associated with HAC-D; W6 is the historical sampling area associated with upper Hazeltine (HAC-U, HAC-R1) from 1999.

[d] 95th percentile was calculated using all data (all years) except those from 1996 (HKP 1997; due to suspected errors).

Notes: ***Bold/Italics*** indicates value is > reference 95th percentile value (<5th percentile value for pH). Pre-breach values that were reported as < the laboratory reporting limit were not used for screening. Sediment metal concentrations are based predominantly on bulk sediment samples, concentrations reported in 1995 and 1996 were for the silt and clay (< 63 µm) fraction only. S = spring. F = fall. mg/kg = milligrams per kilogram. % = percent. "-" = data not available. All results are presented as three significant digits.

[a] Particle sizes classified as clay (<4 um), silt (0.063 mm - 4 um), sand (2.0 - 0.063 mm), and gravel (>2 mm), except for 1999 data, for which the size classes are: gravel (>2 mm), sand (2.0 - 0.050 mm), silt (0.050 - 0.002 mm), clay (<0.002 mm).

[b] Some unusually high sediment metal concentrations were reported for 1996 (HKP 1997) and are suspected errors.

[c] W7 is the historical sampling area associated with HAC-U; W11 is the historical sampling area associated with HAC-D; W6 is the historical sampling area associated with upper Hazeltine (HAC-U, HAC-R1) from 1999.

[d] 95th percentile was calculated using all data (all years) except those from 1996 (HKP 1997; due to suspected errors).

## Table B.2: Baseline and Pre-Breach Sediment Quality Data for Hazeltine Creek and Edney Creek, 1995 to 2013

| Year | Area | Replicate | Lead mg/kg | Lithium mg/kg | Magnesium mg/kg | Manganese mg/kg | Mercury mg/kg | Molybdenum mg/kg | Nickel mg/kg | Phosphorus mg/kg | Potassium mg/kg | Selenium mg/kg | Silver mg/kg | Sodium mg/kg | Strontium mg/kg | Sulphur mg/kg | Thallium mg/kg | Tin mg/kg | Titanium mg/kg | Uranium mg/kg | Vanadium mg/kg | Zinc mg/kg |

Notes: ***Bold/Italics*** indicates value is > reference 95th percentile value (<5th percentile value for pH). Pre-breach values that were reported as < the laboratory reporting limit were not used for screening. Sediment metal concentrations are based predominantly on bulk sediment samples, concentrations reported in 1995 and 1996 were for the silt and clay (< 63 µm) fraction only. S = spring. F = fall. mg/kg = milligrams per kilogram. % = percent. "-" = data not available. All results are presented as three significant digits.

[a] Particle sizes classified as clay (<4 um), silt (0.063 mm - 4 um), sand (2.0 - 0.063 mm), and gravel (>2 mm), except for 1999 data, for which the size classes are: gravel (>2 mm), sand (2.0 - 0.050 mm), silt (0.050 - 0.002 mm), clay (<0.002 mm).

[b] Some unusually high sediment metal concentrations were reported for 1996 (HKP 1997) and are suspected errors.

[c] W7 is the historical sampling area associated with HAC-U; W11 is the historical sampling area associated with HAC-D; W6 is the historical sampling area associated with upper Hazeltine (HAC-U, HAC-R1) from 1999.

[d] 95th percentile was calculated using all data (all years) except those from 1996 (HKP 1997; due to suspected errors).

## Table B.2: Baseline and Pre-Breach Sediment Quality Data for Hazeltine Creek and Edney Creek, 1995 to 2013

| Year | Area | Replicate | Lead mg/kg | Lithium mg/kg | Magnesium mg/kg | Manganese mg/kg | Mercury mg/kg | Molybdenum mg/kg | Nickel mg/kg | Phosphorus mg/kg | Potassium mg/kg | Selenium mg/kg | Silver mg/kg | Sodium mg/kg | Strontium mg/kg | Sulphur mg/kg | Thallium mg/kg | Tin mg/kg | Titanium mg/kg | Uranium mg/kg | Vanadium mg/kg | Zinc mg/kg |

Notes: ***Bold/Italics*** indicates value is > reference 95th percentile value (<5th percentile value for pH). Pre-breach values that were reported as < the laboratory reporting limit were not used for screening. Sediment metal concentrations are based predominantly on bulk sediment samples, concentrations reported in 1995 and 1996 were for the silt and clay (< 63 µm) fraction only. S = spring. F = fall. mg/kg = milligrams per kilogram. % = percent. "-" = data not available. All results are presented as three significant digits.

[a] Particle sizes classified as clay (<4 um), silt (0.063 mm - 4 um), sand (2.0 - 0.063 mm), and gravel (>2 mm), except for 1999 data, for which the size classes are: gravel (>2 mm), sand (2.0 - 0.050 mm), silt (0.050 - 0.002 mm), clay (<0.002 mm).

[b] Some unusually high sediment metal concentrations were reported for 1996 (HKP 1997) and are suspected errors.

[c] W7 is the historical sampling area associated with HAC-U; W11 is the historical sampling area associated with HAC-D; W6 is the historical sampling area associated with upper Hazeltine (HAC-U, HAC-R1) from 1999.

[d] 95th percentile was calculated using all data (all years) except those from 1996 (HKP 1997; due to suspected errors).

# APPENDIX C

# PERIPHYTON COMMUNITY AND PRODUCTIVITY

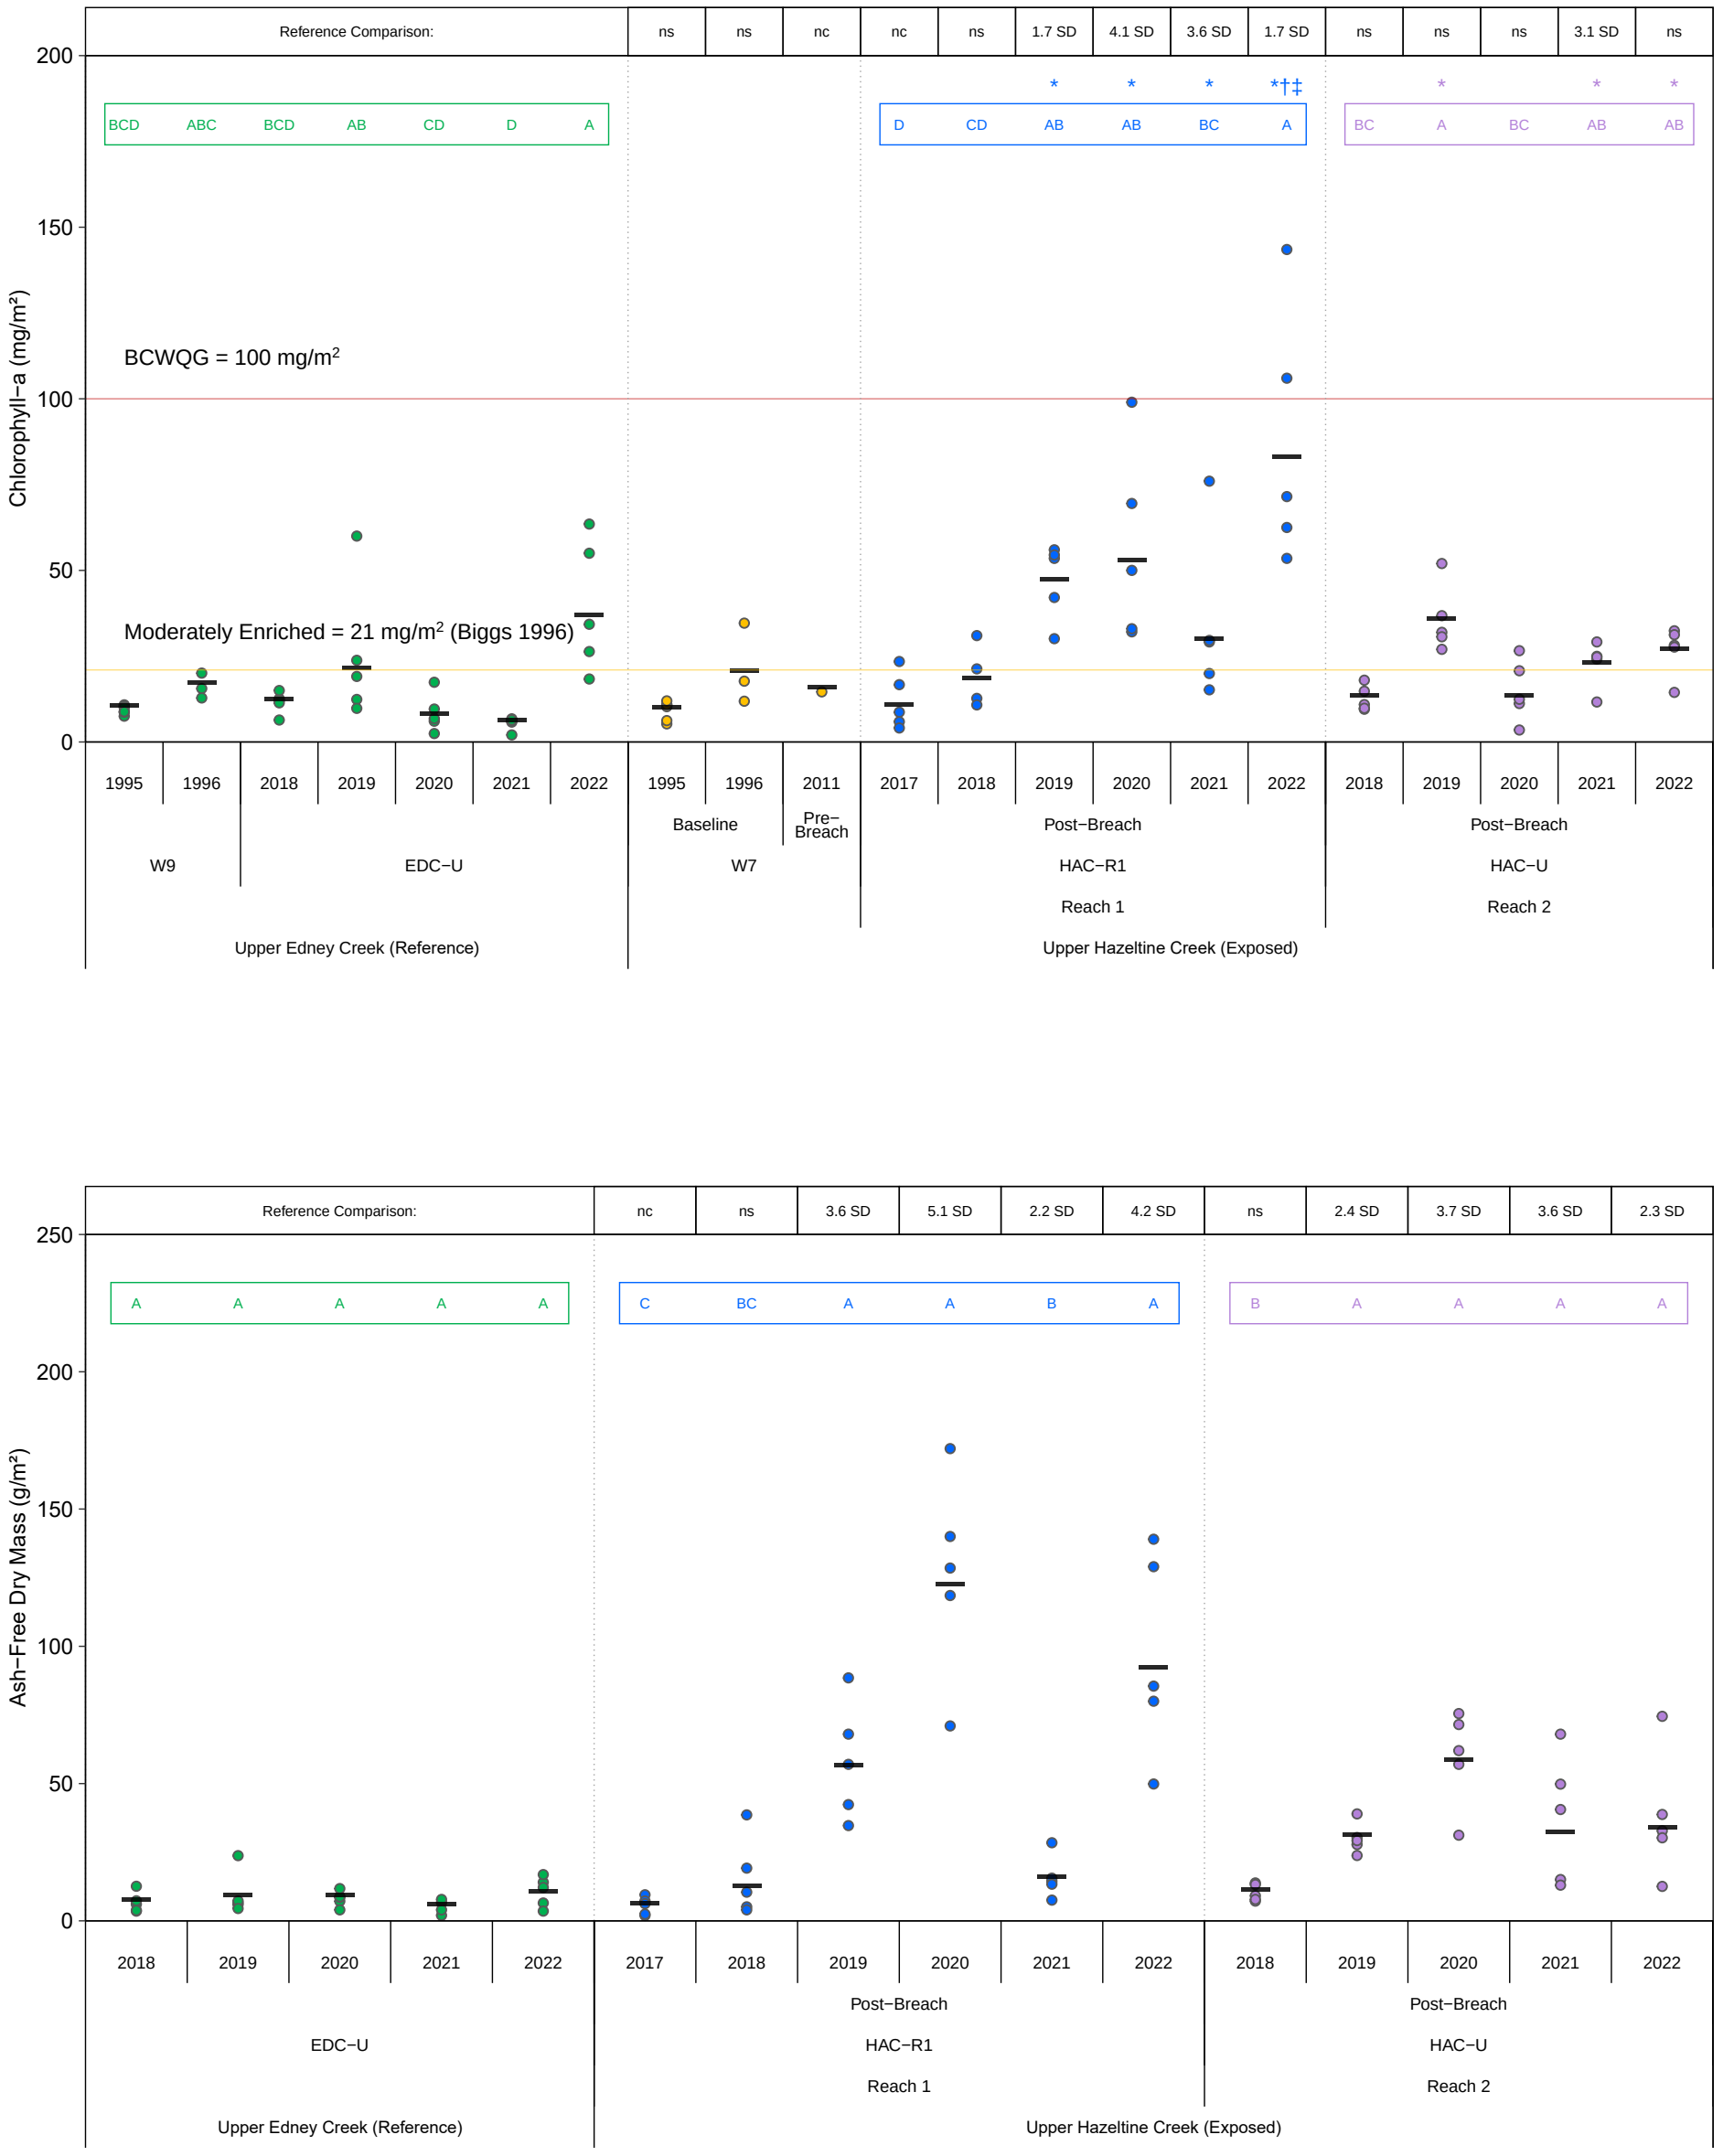

**Figure C.1: Periphyton Productivity Endpoints for Upper Hazeltine Creek (HAC−R1, HAC−U; Exposed) and Upper Edney Creek (EDC−U; Reference), 1995 to 2022**

Notes: Black bars represent measures of central tendency (mean, geometric mean, or median depending on if analysis was conducted on untransformed, log10−transformed or rank−transformed data). Coloured letters represent significant (p−value <0.1) post−hoc comparisons within areas over time; years that share a letter of the same colour (e.g., A, B) within a box of the same colour do not differ significantly within an area. For statistical contrasts of Chlorophyll−a data, the analyses compared post−breach (2017 to 2022) to baseline (1995 and 1996) to pre−breach conditions (2011) at W7. The sampling area W7 (2011) is the pre−breach equivalent of the post−breach sampling areas HAC−R1 and HAC−U (2017 to 2022). Significant differences between HAC−R1 or HAC−U post−breach (2017 to 2022) results compared to baseline (1995 and 1996) or pre−breach (2011) results for W7 are indicated as follows: an * indicates significant differences to W7 in 1995, a † indicates significant differences to W7 in 1996, and a ‡ indicates significant differences to W7 in 2011. A number above the plot indicates significant exposed vs. reference post−hoc comparisons within a given year. The magnitude of difference (MOD) for these significant post−hoc comparisons is expressed in units of standard deviation (SD) or median absolute deviations (MAD; if the data were rank−transformed prior to analysis) relative to reference. 'nc' indicates no comparisons were possible; 'ns' indicates a non−significant contrast; 'nm' indicates that the MOD could not be calculated because MAD = 0.

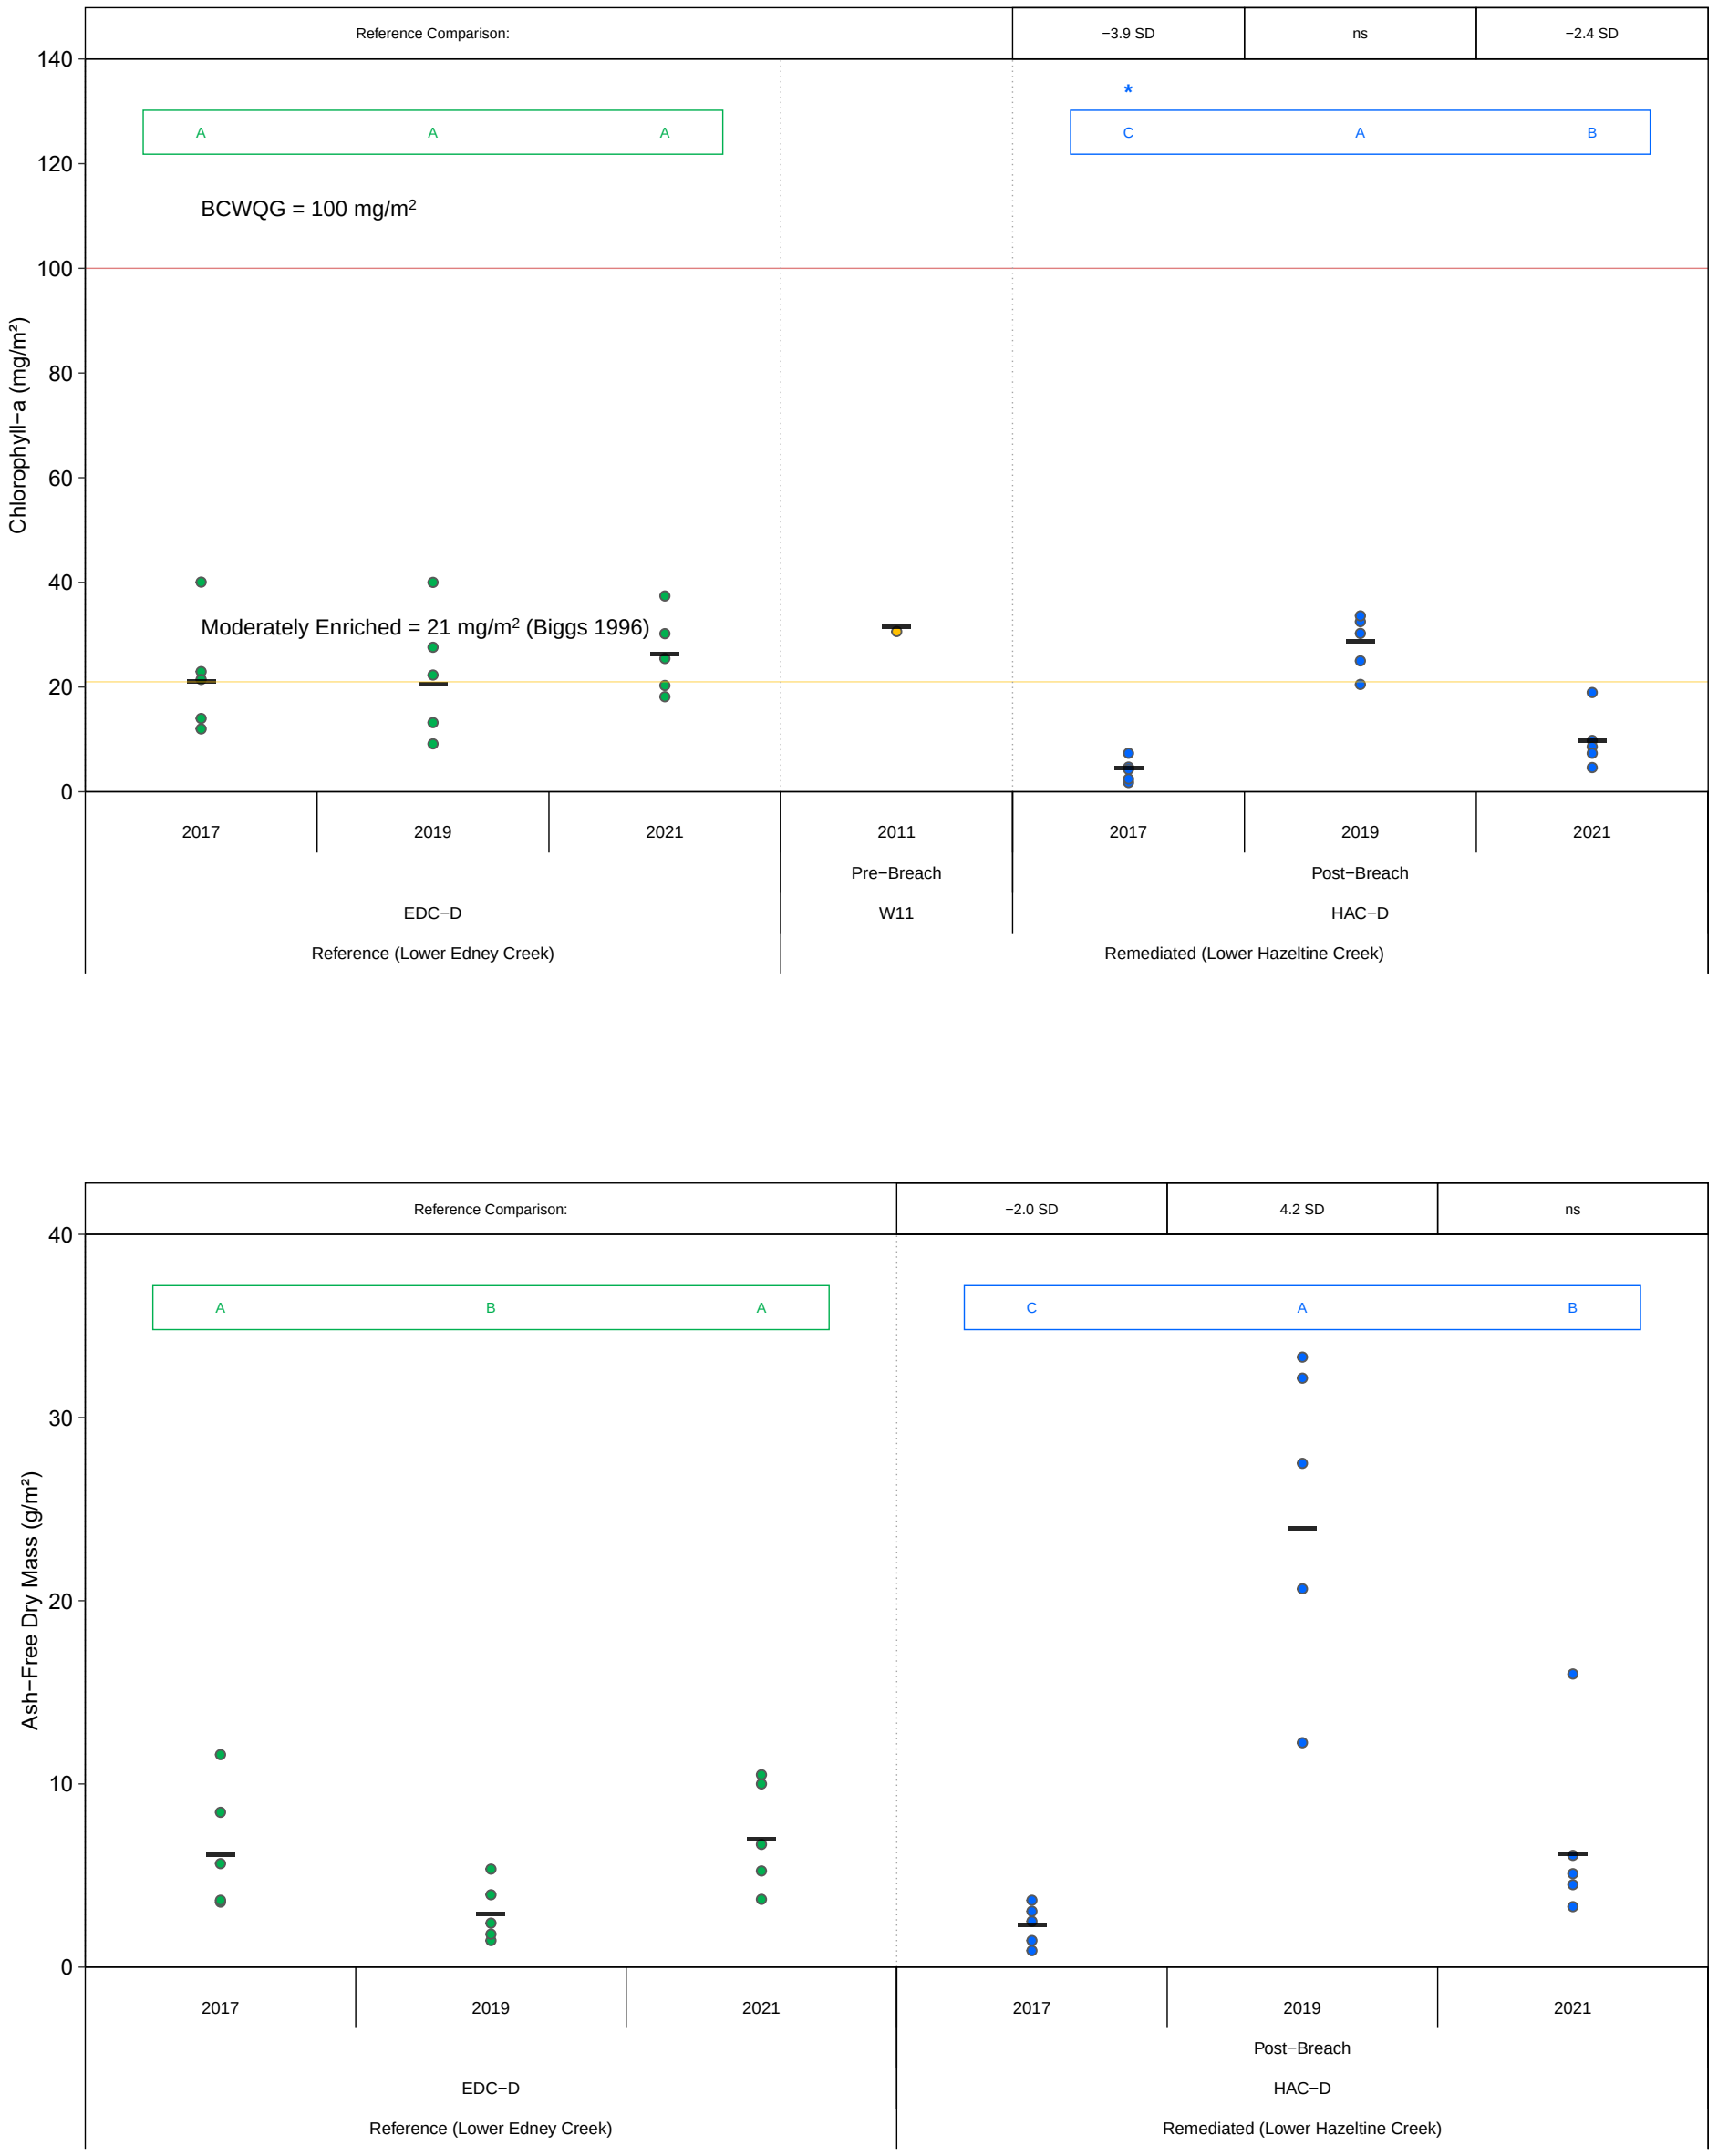

**Figure C.2: Periphyton Productivity Endpoints, Lower Hazeltine Creek and Reference (Lower Edney Creek), 2011 to 2021**

Notes: Black bars represent measures of central tendency (mean, geometric mean, or median depending on if analysis was conducted on untransformed, log10−transformed or rank-transformed data). Coloured letters represent significant (p−value <0.1) post−hoc comparisons within areas over time; years that share a letter of the same colour (e.g., A, B) within a box of the same colour do not differ significantly within an area. For statistical contrasts of Chlorophyll−a, an * indicates a significant difference to W11 in 2011. A number above the plot indicates significant exposed vs. reference post−hoc comparisons within a given year. The magnitude of difference (MOD) for these significant post−hoc comparisons are expressed in units of standard deviation (SD) or median absolute deviations (MAD; if the data were rank−transformed prior to analysis) relative to reference. A 'nc' indicates no comparisons were possible, a 'ns' indicates a non−significant contrast, and a "nm" indicates that the MOD could not be calculated because MAD = 0.

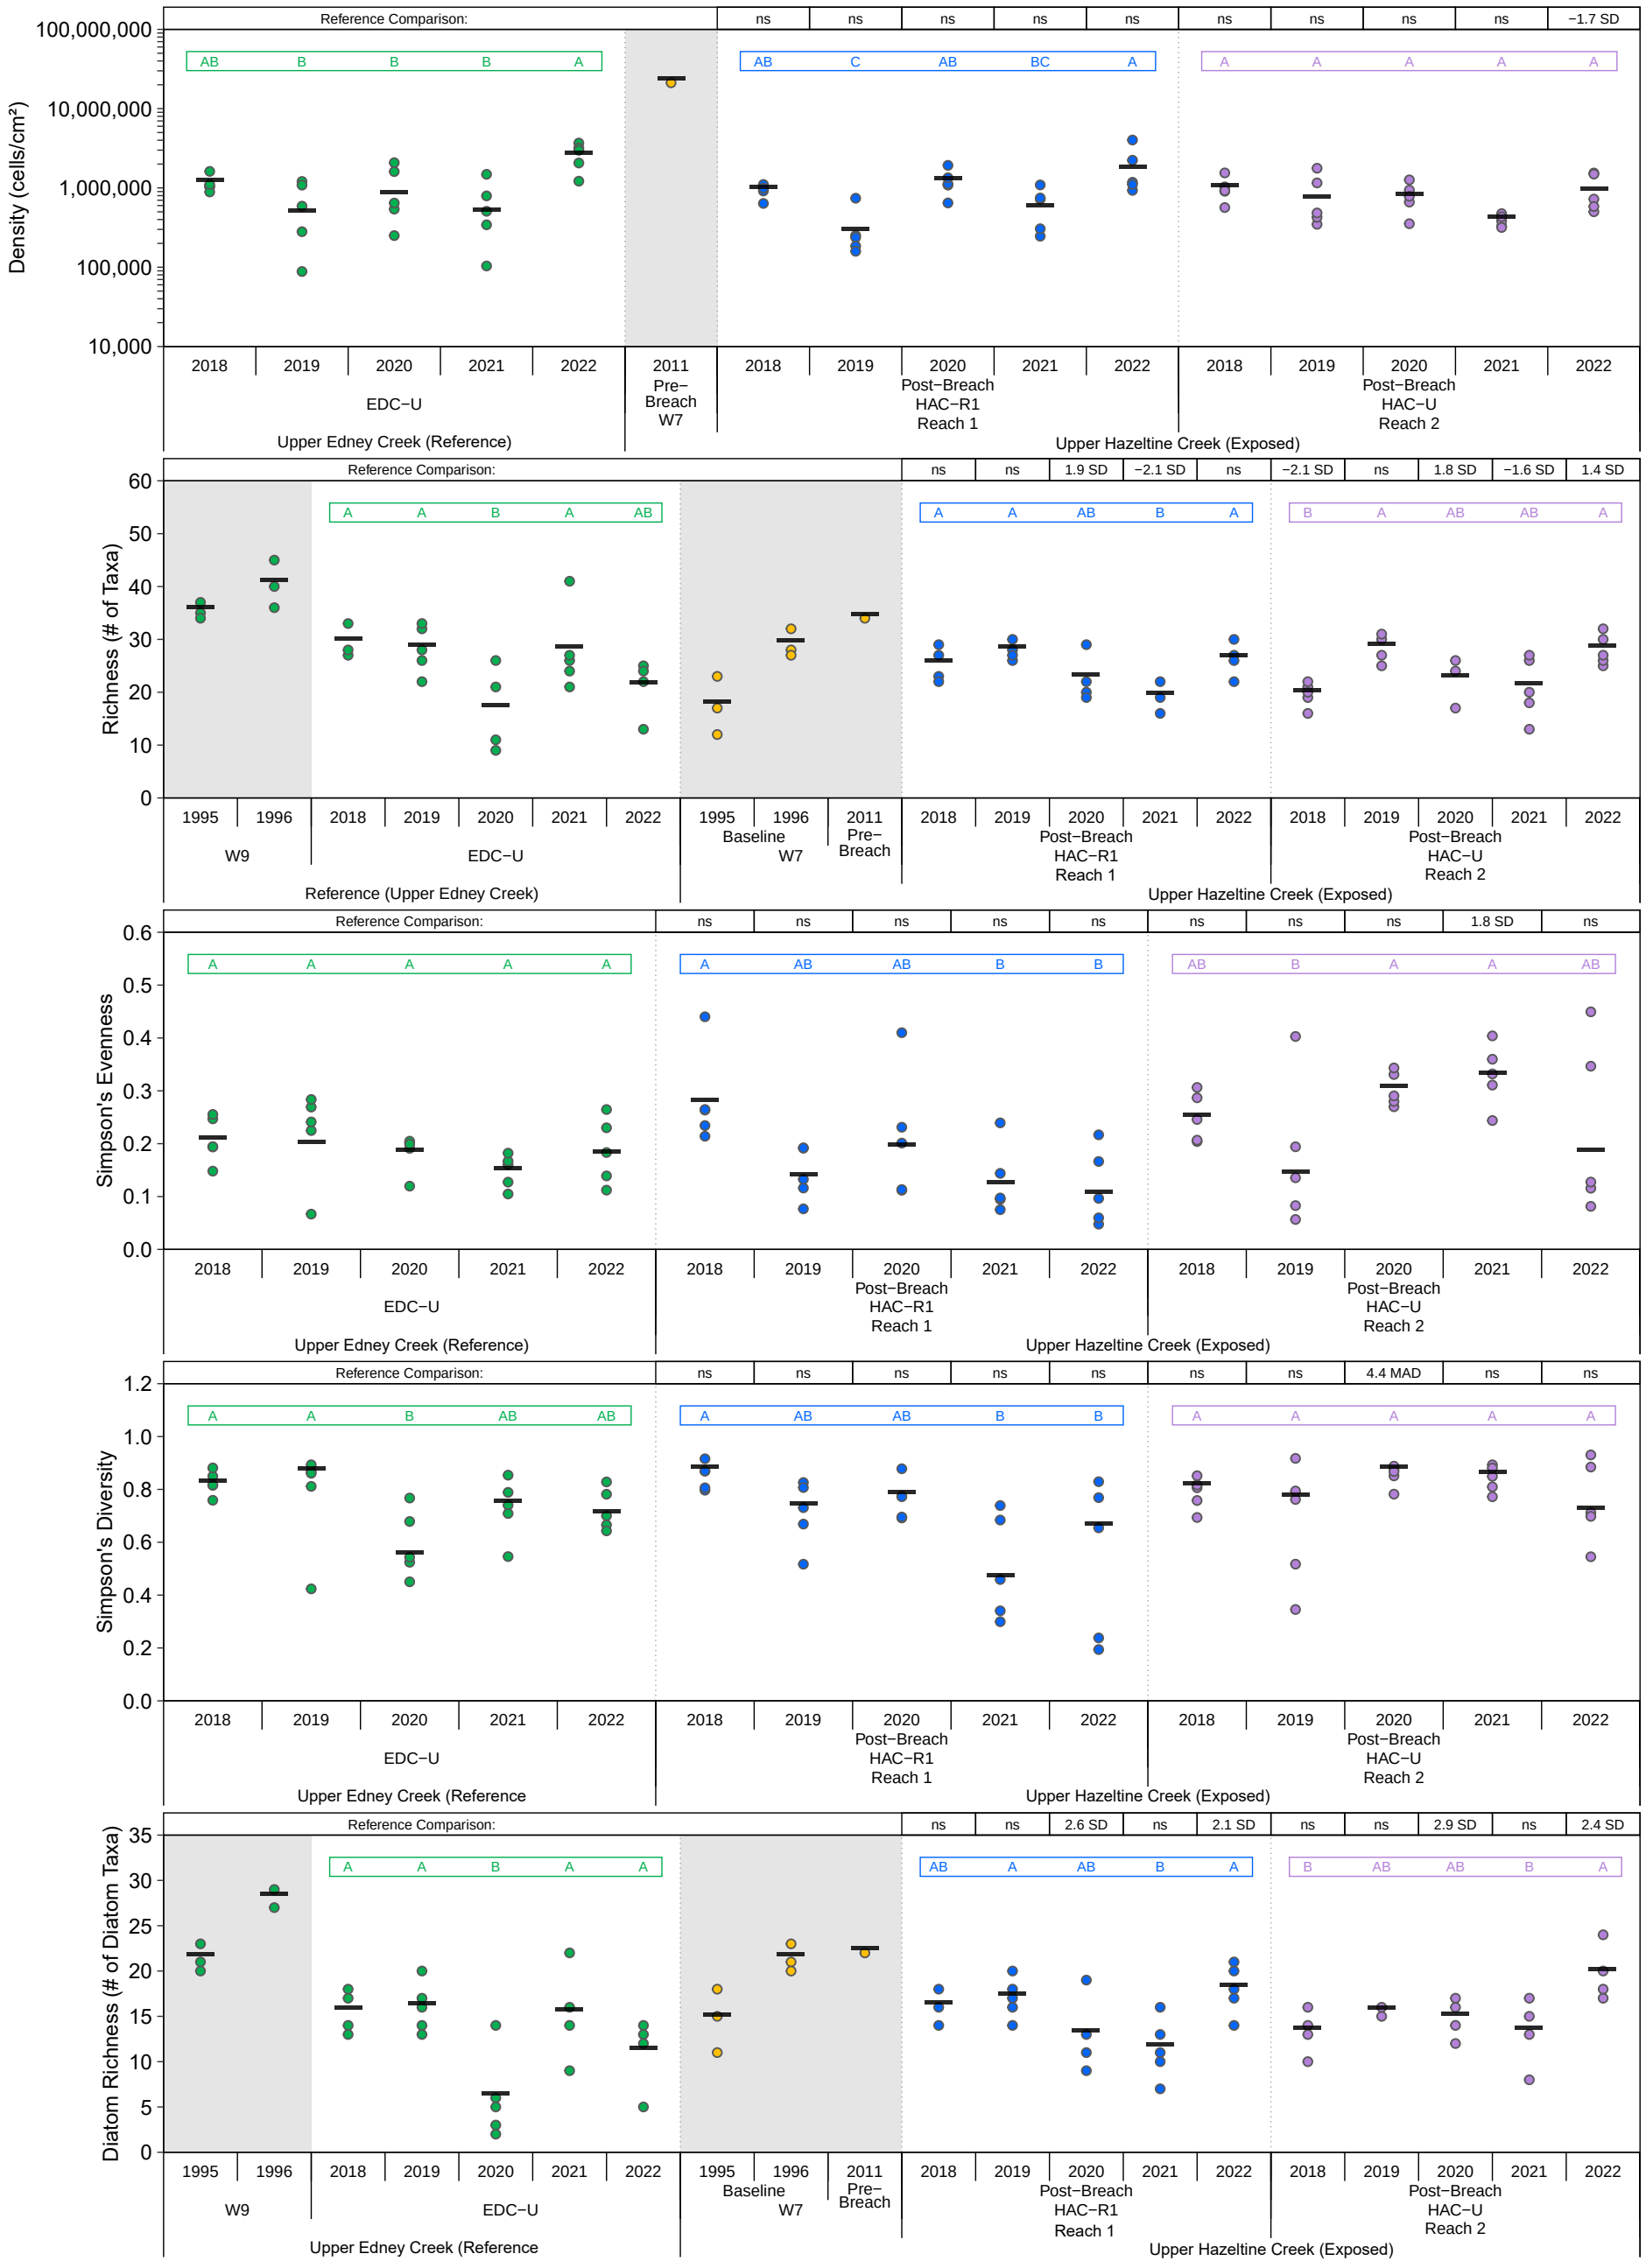

**Figure C.3: Periphyton Community Endpoints for Upper Hazeltine Creek (HAC−R1, HAC−U; Exposed) and Upper Edney Creek (EDC−U; Reference), 1995 to 2022**

Notes: Black bars represent measures of central tendency (mean, geometric mean, or median depending on if analysis was conducted on untransformed, log10−transformed or rank−transformed data). Coloured letters represent significant (p−value <0.1) post−hoc comparisons within areas over time; years that share a letter of the same colour (e.g., A, B) within a box of the same colour do not differ significantly within an area. A number above the plot indicates significant exposed vs. reference post−hoc comparisons within a given year. The magnitude of difference (MOD) for these significant post−hoc comparisons is expressed in units of standard deviation (SD) or median absolute deviations (MAD; if the data were rank−transformed prior to analysis) relative to reference. 'nc' indicates no comparisons were possible; 'ns' indicates a non−significant contrast; 'nm' indicates that the MOD could not be calculated because MAD = 0. Grey shading indicates semi−quantitative data that were not included in statistical comparisons but are shown for visual comparison only.

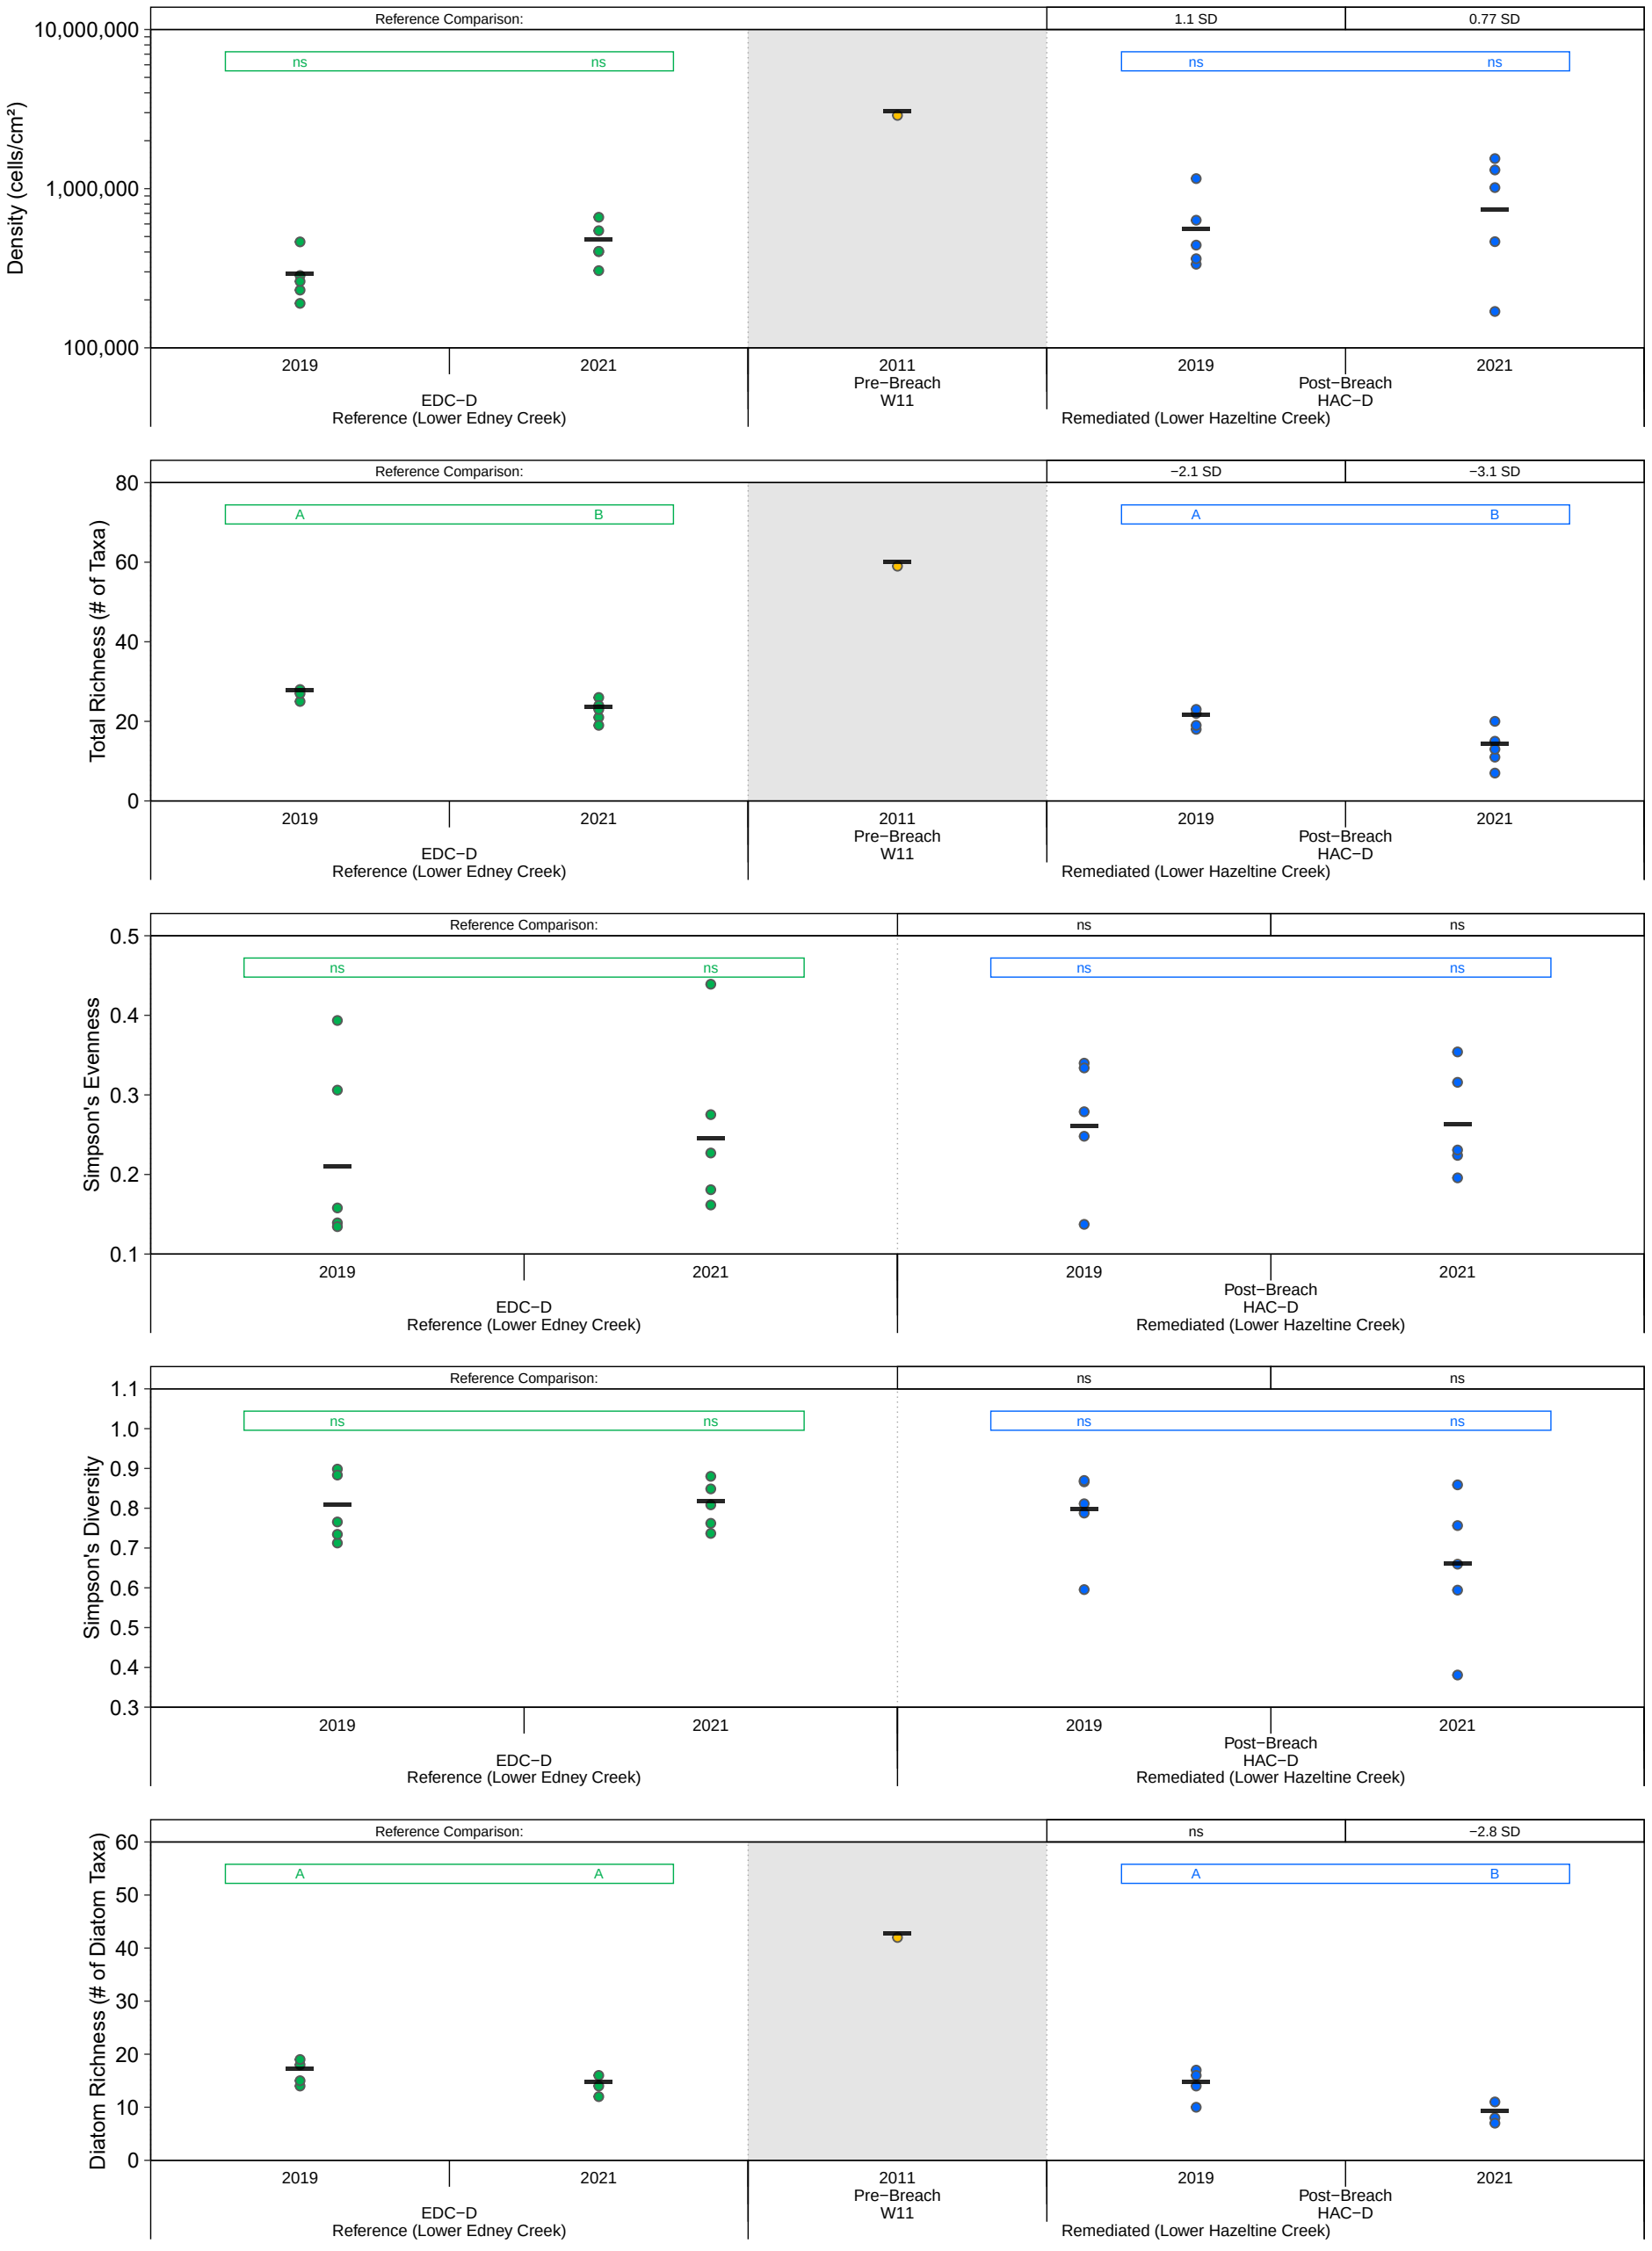

**Figure C.4: Periphyton Community Endpoints, Lower Hazeltine Creek and Reference (Lower Edney Creek), 2011 and 2019 to 2021**

Notes: Black bars represent measures of central tendency (mean, geometric mean, or median depending on if analysis was conducted on untransformed, log10−transformed or rank-transformed data). Coloured letters represent significant (p−value <0.1) post−hoc comparisons within areas over time; years that share a letter of the same colour (e.g., A, B) within a box of the same colour do not differ significantly within an area. A number above the plot indicates significant exposed vs. reference post−hoc comparisons within a given year. The magnitude of difference (MOD) for these significant post−hoc comparisons are expressed in units of standard deviation (SD) or median absolute deviations (MAD; if the data were rank−transformed prior to analysis) relative to reference. A 'nc' indicates no comparisons were possible, a 'ns' indicates a non −significant contrast, and a "nm" indicates that the MOD could not be calculated because MAD = 0. Grey shading indicates semi− quantitative data that were not included in statistical comparisons but are shown for visual comparison only.

## Table C.1: Periphyton Community and Productivity Metrics, Hazeltine Creek (HAC-R1, HAC-U, HAC-D; Exposed) and Edney Creek (EDC-U, EDC-D; Reference), 1995 to 2022

| Year | Area | Type | Station | Chlorophyll-a (mg/m²) | Ash-Free Dry Mass (g/m²) | Density (cells/cm²) | Total Richness (# of Taxa) | Simpson's Evenness | Simpson's Diversity | Diatom Richness (# of Taxa) | Diatom (cells/cm²) | Chlorophytes (cells/cm²) | Chrysophytes (cells/cm²) | Cyanobacteria (cells/cm²) | Dinoflagellates (cells/cm²) | Phaeophytes (cells/cm²) |

Notes: "-" indicates no value. Periphyton community metrics that could be calculated for historical (baseline and pre-breach) data were limited due to the qualitative nature of these data.

[a] W9 is the historical sampling area associated with EDC-U; W7 is the historical sampling area associated with HAC-U; W11 is the historical sampling area associated with HAC-D.

[b] Sampling locations for periphyton productivity were assumed to be the same as periphyton community samples during baseline sampling years.

Notes: "-" indicates no value. Periphyton community metrics that could be calculated for historical (baseline and pre-breach) data were limited due to the qualitative nature of these data.

[a] W9 is the historical sampling area associated with EDC-U; W7 is the historical sampling area associated with HAC-U; W11 is the historical sampling area associated with HAC-D.

[b] Sampling locations for periphyton productivity were assumed to be the same as periphyton community samples during baseline sampling years.

Notes: "-" indicates no value. Periphyton community metrics that could be calculated for historical (baseline and pre-breach) data were limited due to the qualitative nature of these data.

[a] W9 is the historical sampling area associated with EDC-U; W7 is the historical sampling area associated with HAC-U; W11 is the historical sampling area associated with HAC-D.

[b] Sampling locations for periphyton productivity were assumed to be the same as periphyton community samples during baseline sampling years.

## Table C.1: Periphyton Community and Productivity Metrics, Hazeltine Creek (HAC-R1, HAC-U, HAC-D; Exposed) and Edney Creek (EDC-U, EDC-D; Reference), 1995 to 2022

| Year | Area | Type | Station | Rhodophytes (cells/cm²) | Other (cells/cm²) | % Diatoms | % Chlorophytes | % Chrysophytes | % Cyanobacteria | % Dinoflagellates | % Phaeophytes | % Rhodophytes | % Other |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

Notes: "-" indicates no value. Periphyton community metrics that could be calculated for historical (baseline and pre-breach) data were limited due to the qualitative nature of these data.

[a] W9 is the historical sampling area associated with EDC-U; W7 is the historical sampling area associated with HAC-U; W11 is the historical sampling area associated with HAC-D.

[b] Sampling locations for periphyton productivity were assumed to be the same as periphyton community samples during baseline sampling years.

# APPENDIX D

# BENTHIC INVERTEBRATE COMMUNITY AND PRODUCTIVITY

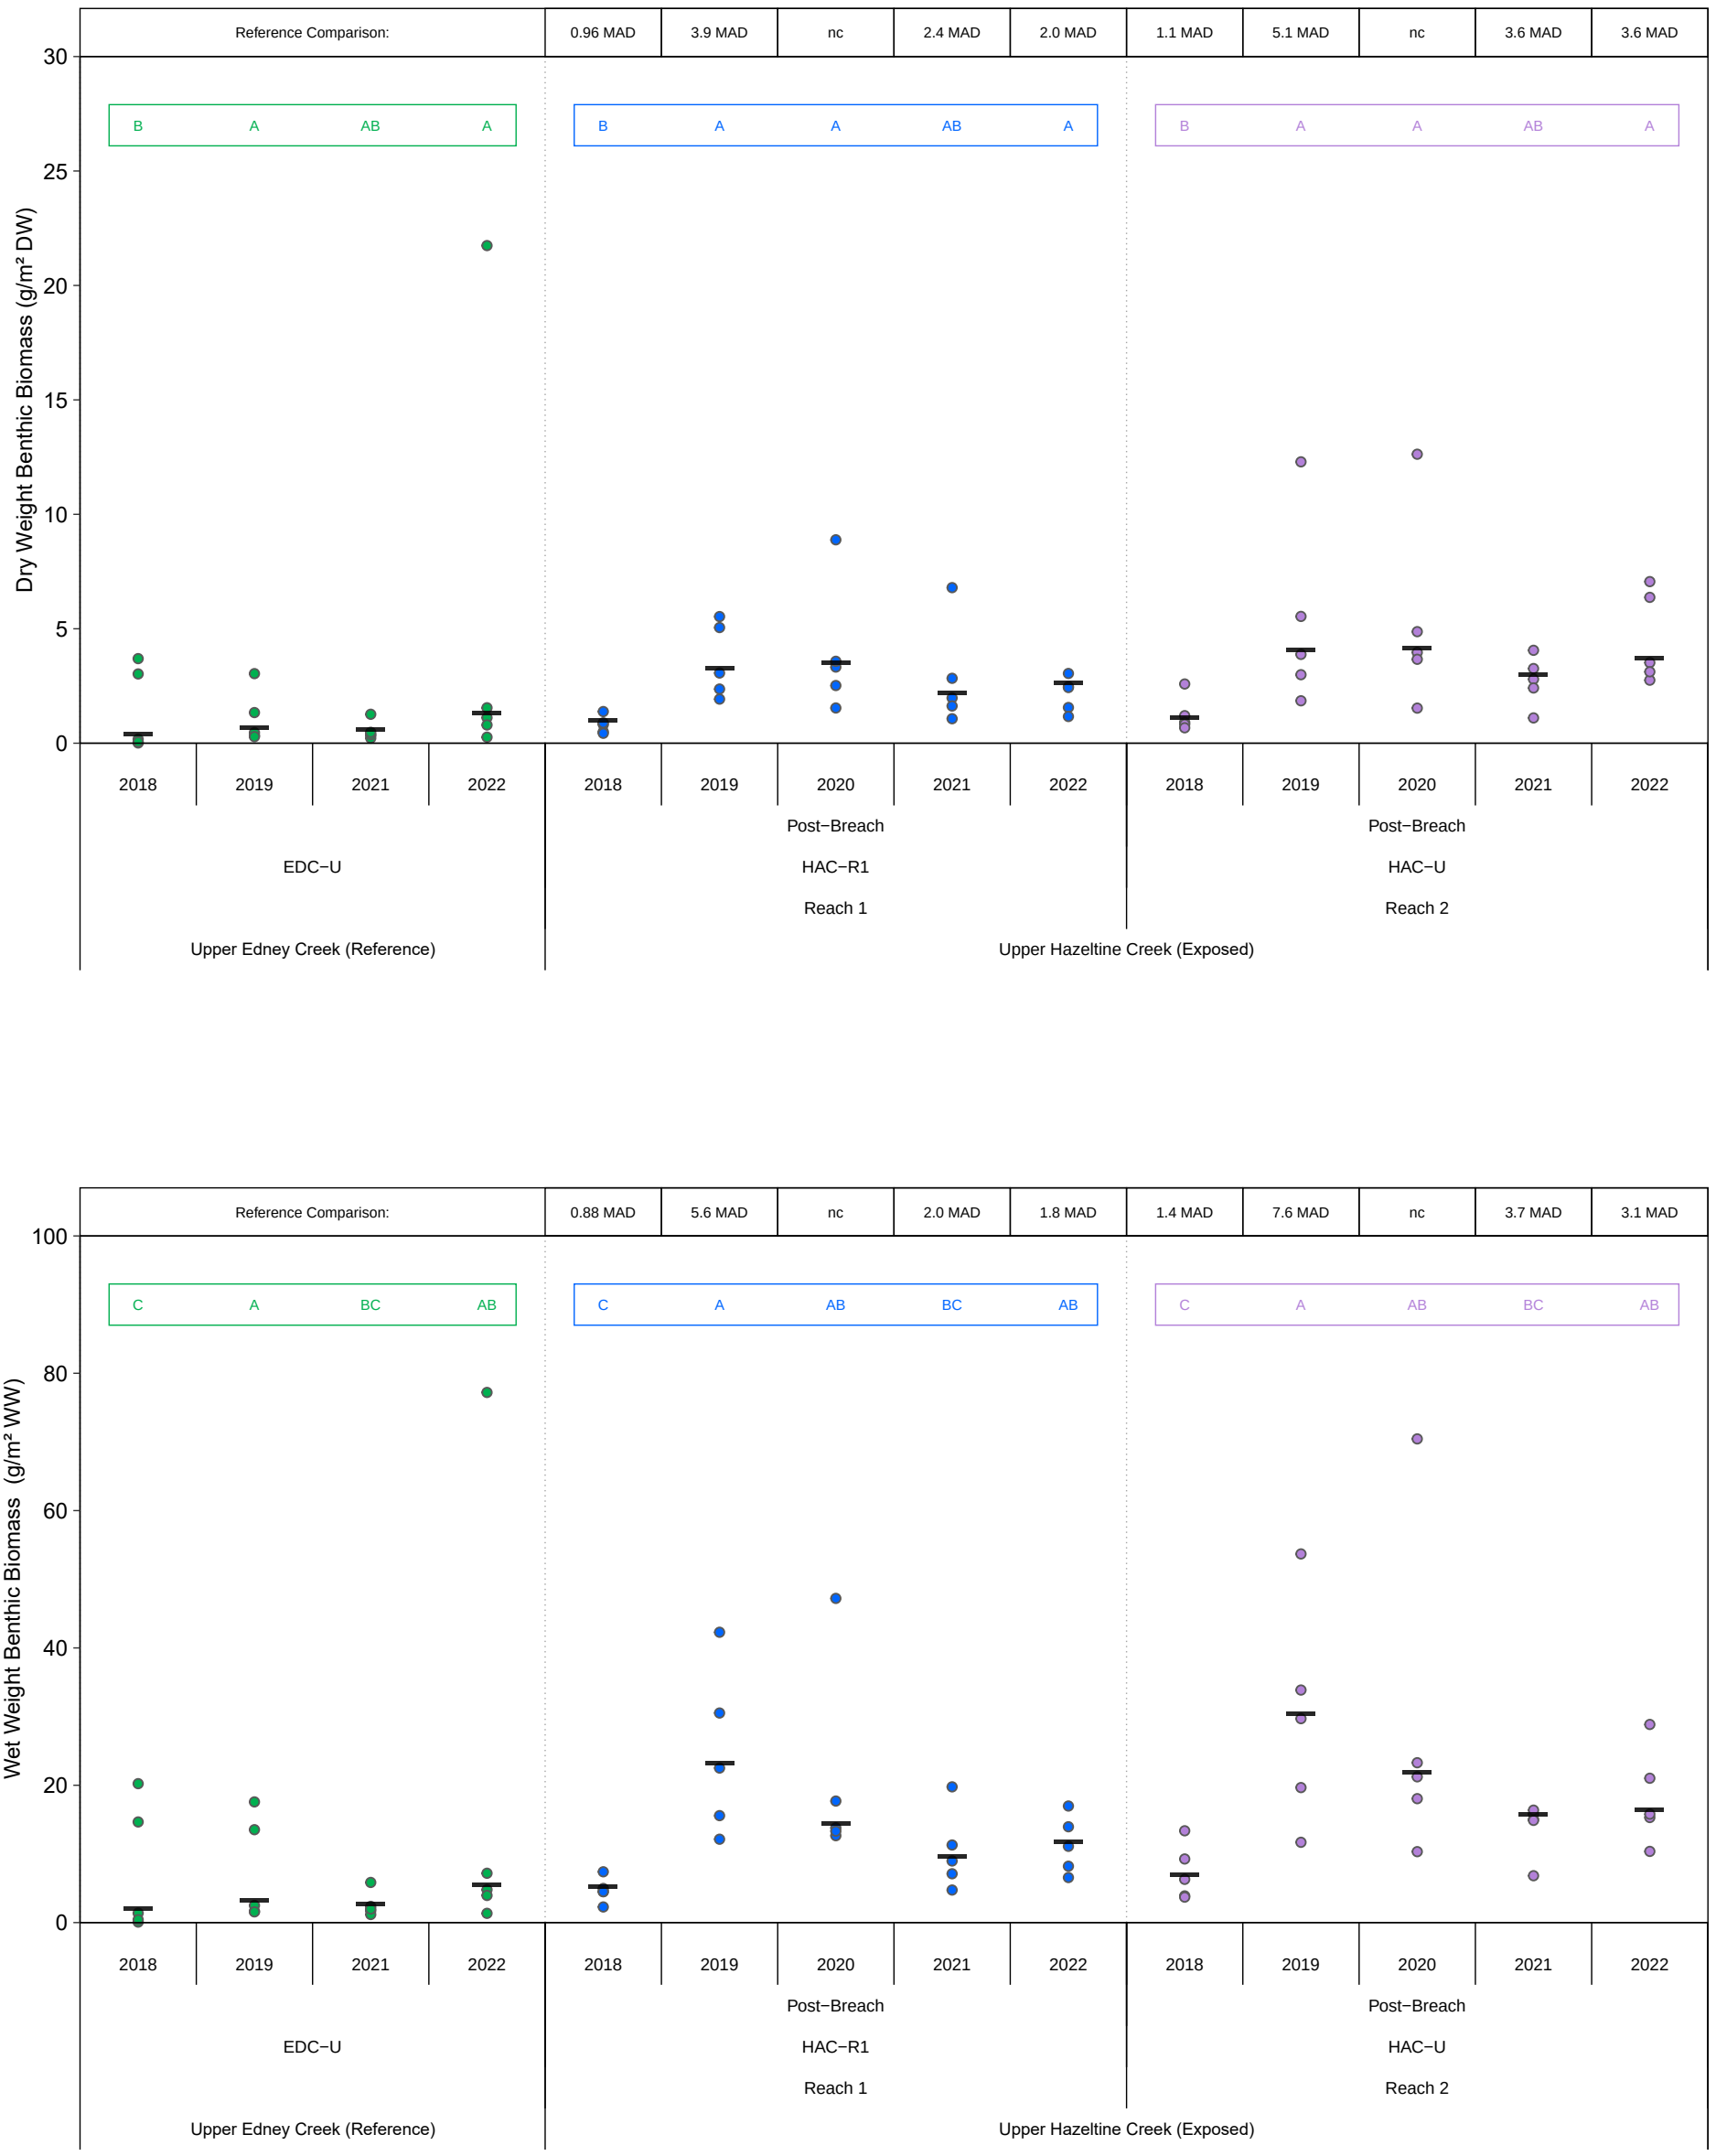

**Figure D.1: Benthic Invertebrate Biomass for Upper Hazeltine Creek (HAC−R1, HAC−U; Exposed) and Upper Edney Creek (EDC−U; Reference), 2018 to 2022**

Notes: Reference area EDC−U was not sampled in 2020 due to habitat differences (in water depth and flow) relative to the remediated areas HAC−R1 and HAC−U. See Section 4.3 for details. Black bars represent measures of central tendency (mean, geometric mean, or median depending on if analysis was conducted on untransformed, $log_{10}$−transformed or rank−transformed data). Coloured letters represent significant (p−value <0.1) post−hoc comparisons within areas over time; years that share a letter of the same colour (e.g., A, B) within a box of the same colour do not differ significantly within an area. A number above the plot indicates significant exposed vs. reference post−hoc comparisons within a given year. The magnitude of difference (MOD) for these significant post−hoc comparisons is expressed in units of standard deviation (SD) or median absolute deviations (MAD; if the data were rank−transformed prior to analysis) relative to reference. 'nc' indicates no comparisons were possible; 'ns' indicates a non−significant contrast; 'nm' indicates that the MOD could not be calculated because MAD = 0.

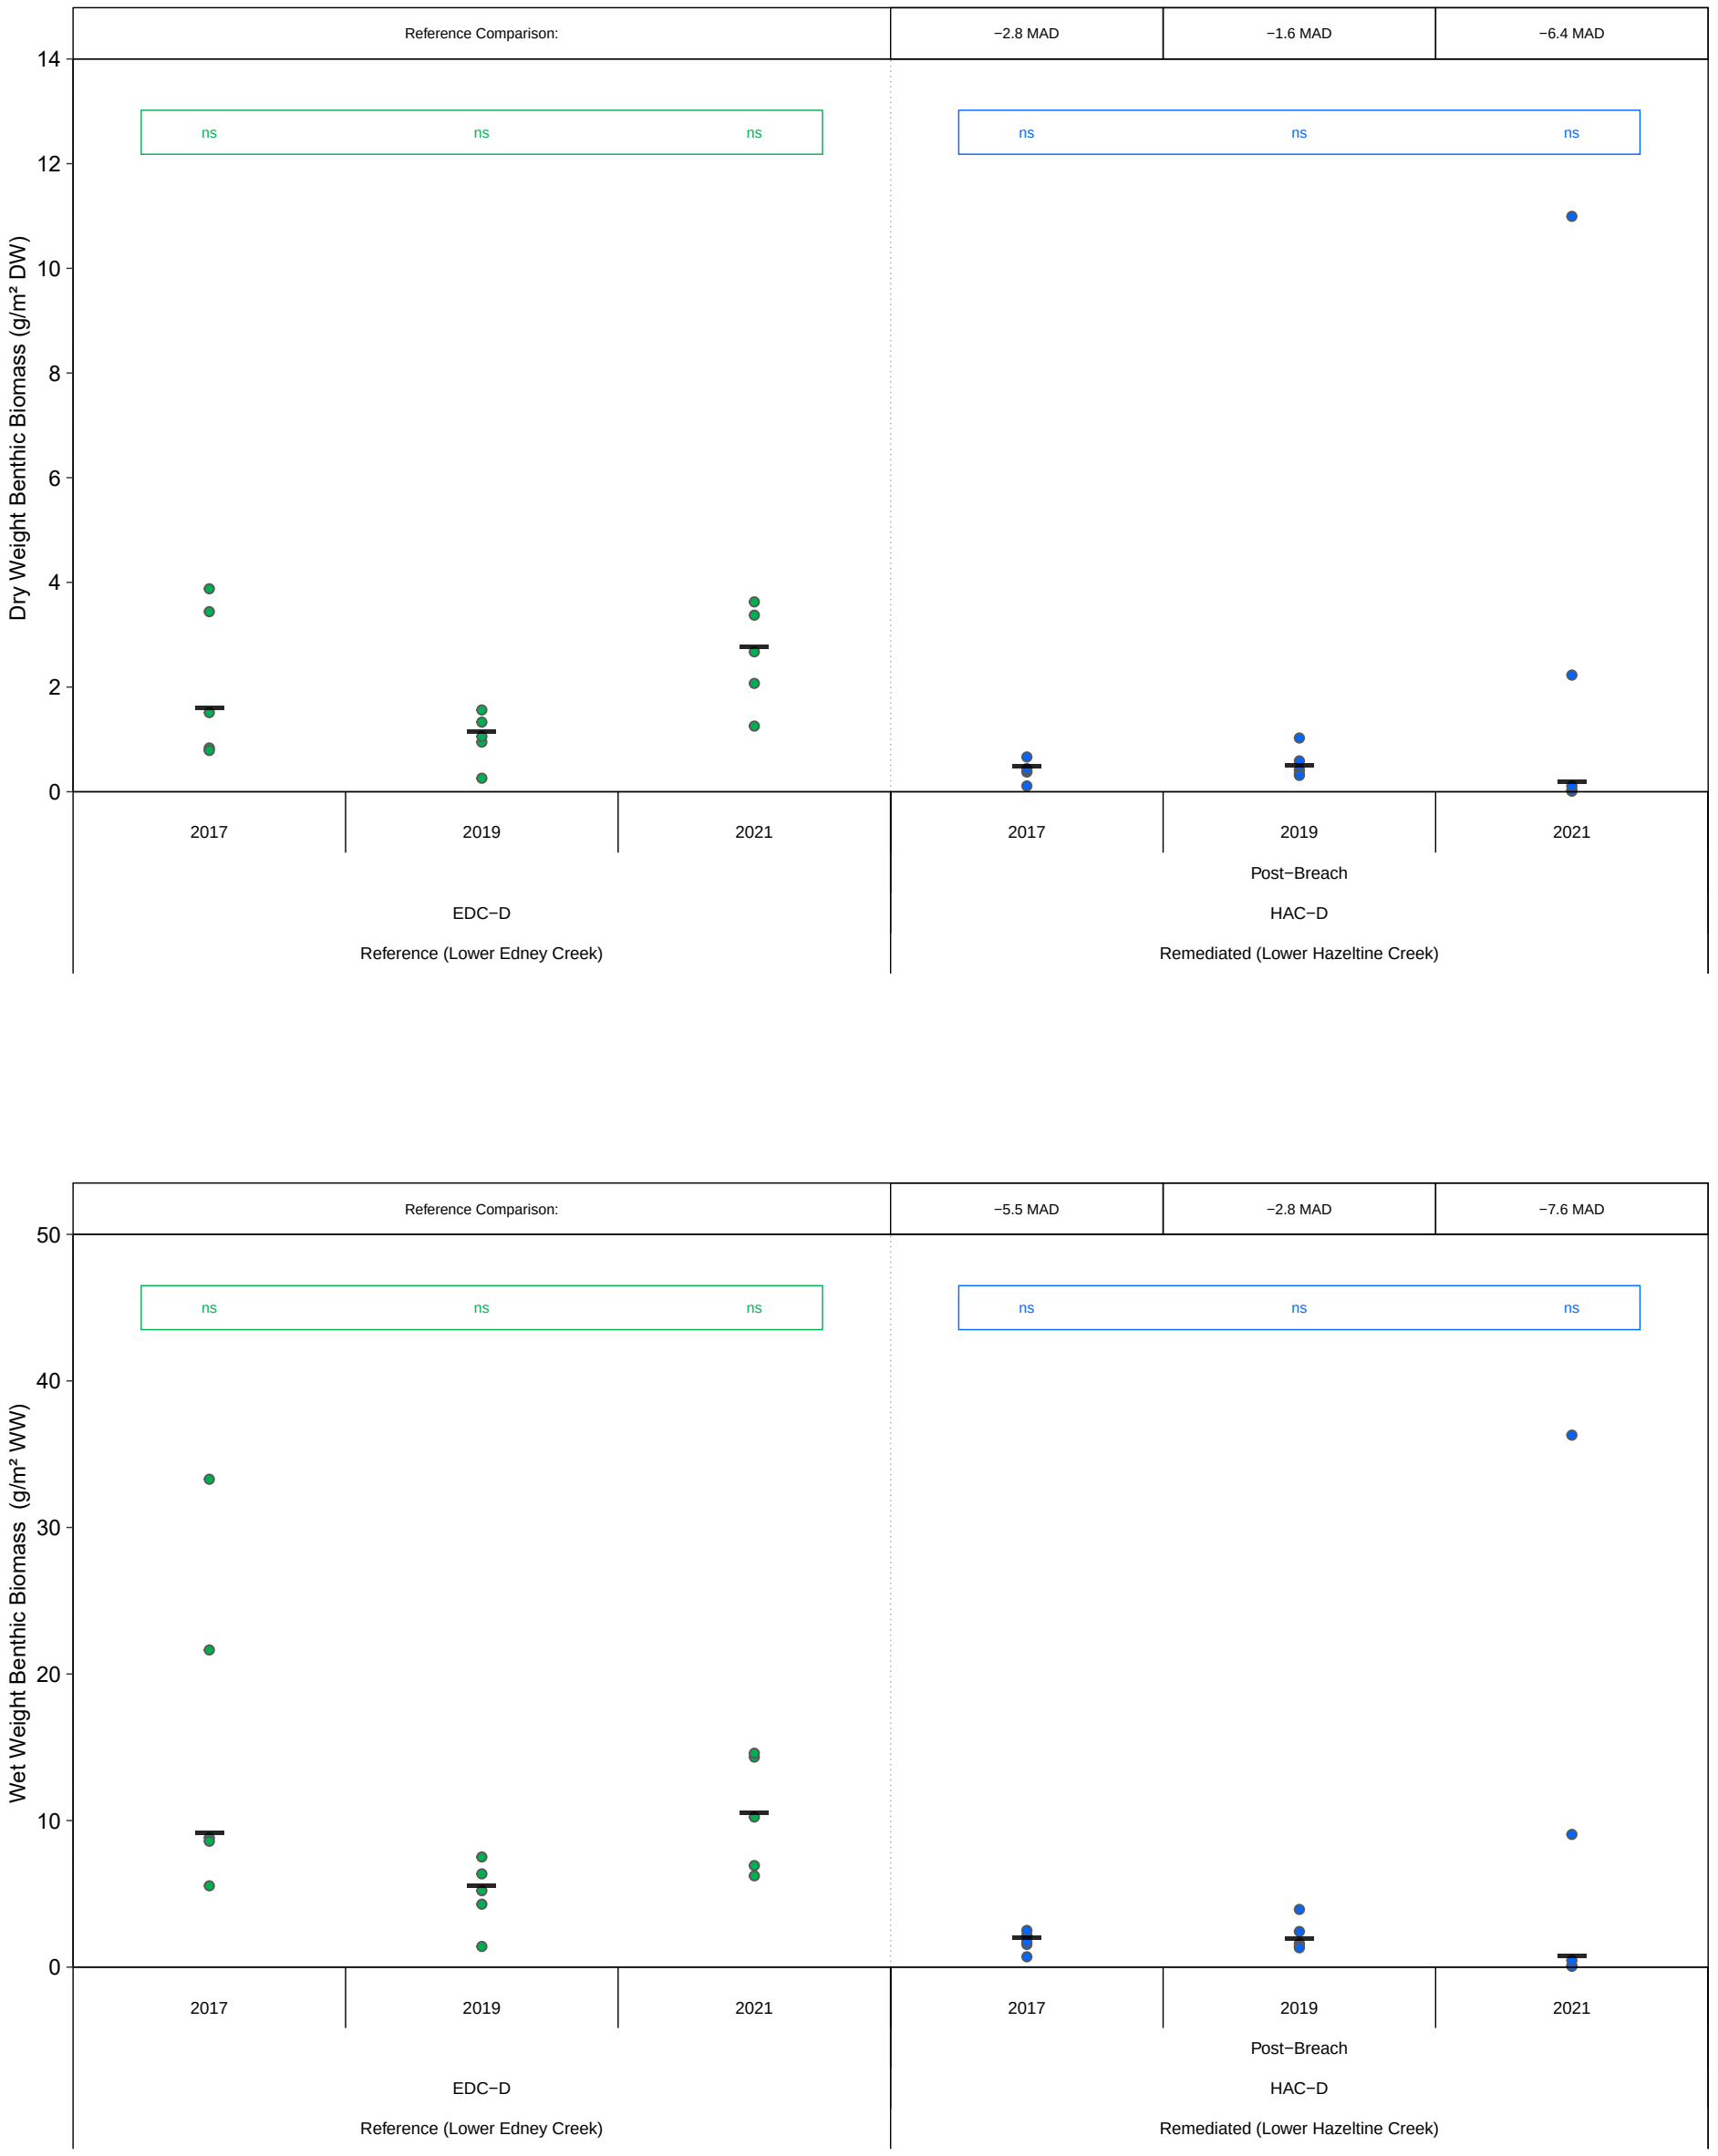

**Figure D.2: Benthic Invertebrate Biomass, Lower Hazeltine Creek and Reference (Lower Edney Creek), 2017 to 2021**

Notes: Black bars represent measures of central tendency (mean, geometric mean, or median depending on if analysis was conducted on untransformed, $\log_{10}$−transformed or rank−transformed data). Coloured letters represent significant (p−value <0.1) post−hoc comparisons within areas over time; years that share a letter of the same colour (e.g., A, B) within a box of the same colour do not differ significantly within an area. A number above the plot indicates significant exposed vs. reference post−hoc comparisons within a given year. The magnitude of difference (MOD) for these significant post−hoc comparisons are expressed in units of standard deviation (SD) or median absolute deviations (MAD; if the data were rank−transformed prior to analysis) relative to reference. A 'nc' indicates no comparisons were possible, a 'ns' indicates a non−significant contrast, and a "nm" indicates that the MOD could not be calculated because MAD = 0.

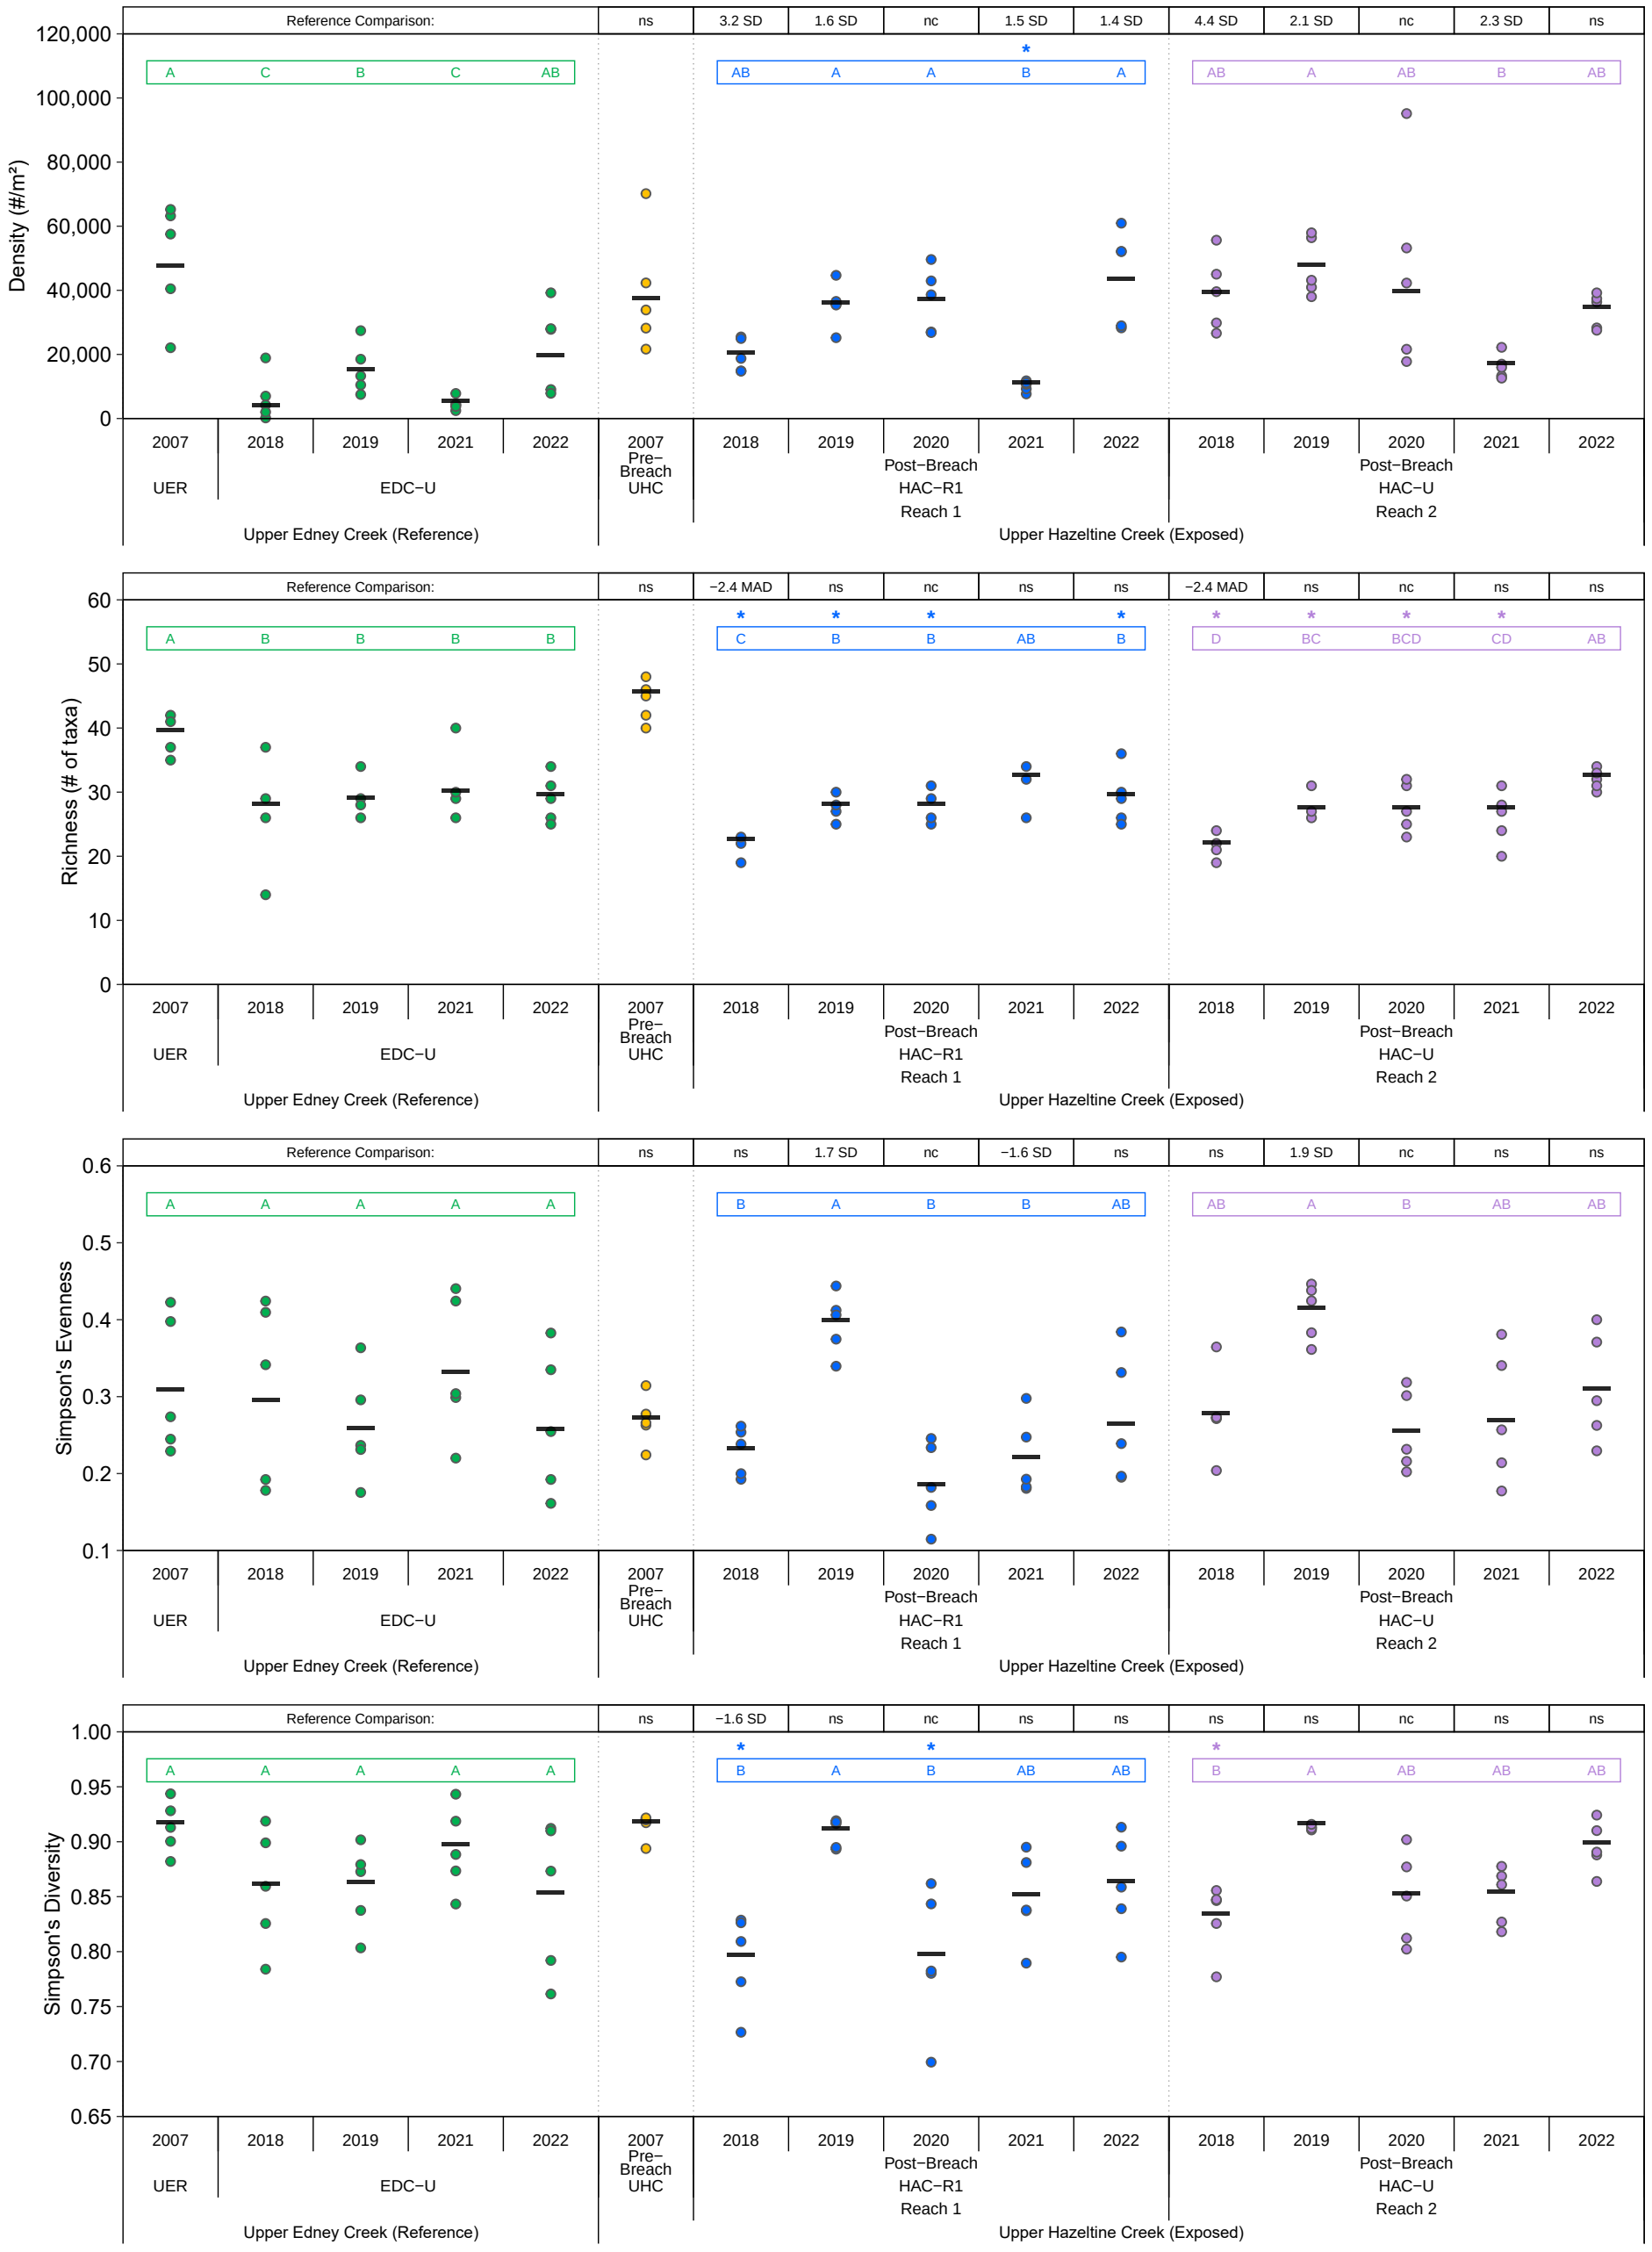

**Figure D.3: Benthic Invertebrate Community Endpoints for Upper Hazeltine Creek (HAC−R1, HAC−U; Exposed) and Upper Edney Creek (EDC−U; Reference), 2007 to 2022**

Notes: Reference area EDC−U was not sampled in 2020 due to habitat differences (in water depth and flow) relative to the remediated areas HAC−R1 and HAC−U. See Section 4.3 for details. Black bars represent measures of central tendency (mean, geometric mean, or median depending on if analysis was conducted on untransformed, log10− transformed or rank−transformed data). Coloured letters represent significant (p−value <0.1) post−hoc comparisons within areas over time; years that share a letter of the same colour (e.g., A, B) within a box of the same colour do not differ significantly within an area. Data from 2007 were used in the analyses to compare post−breach (2018 to 2022) to pre−breach conditions (2007). Post−breach data from HAC−R1 and HAC−U were compared to pre−breach data from UHC, and post−breach data from EDC−U was compared to pre−breach data from UER. An * indicates a significant difference between HAC−R1 or HAC−U and UHC in 2007. A number above the plot indicates significant exposed vs. reference post−hoc comparisons within a given year. The magnitude of difference (MOD) for these significant post −hoc comparisons is expressed in units of standard deviation (SD) or median absolute deviations (MAD; if the data were rank−transformed prior to analysis) relative to reference. 'nc' indicates no comparisons were possible; 'ns' indicates a non−significant contrast; 'nm' indicates that the MOD could not be calculated because MAD = 0.

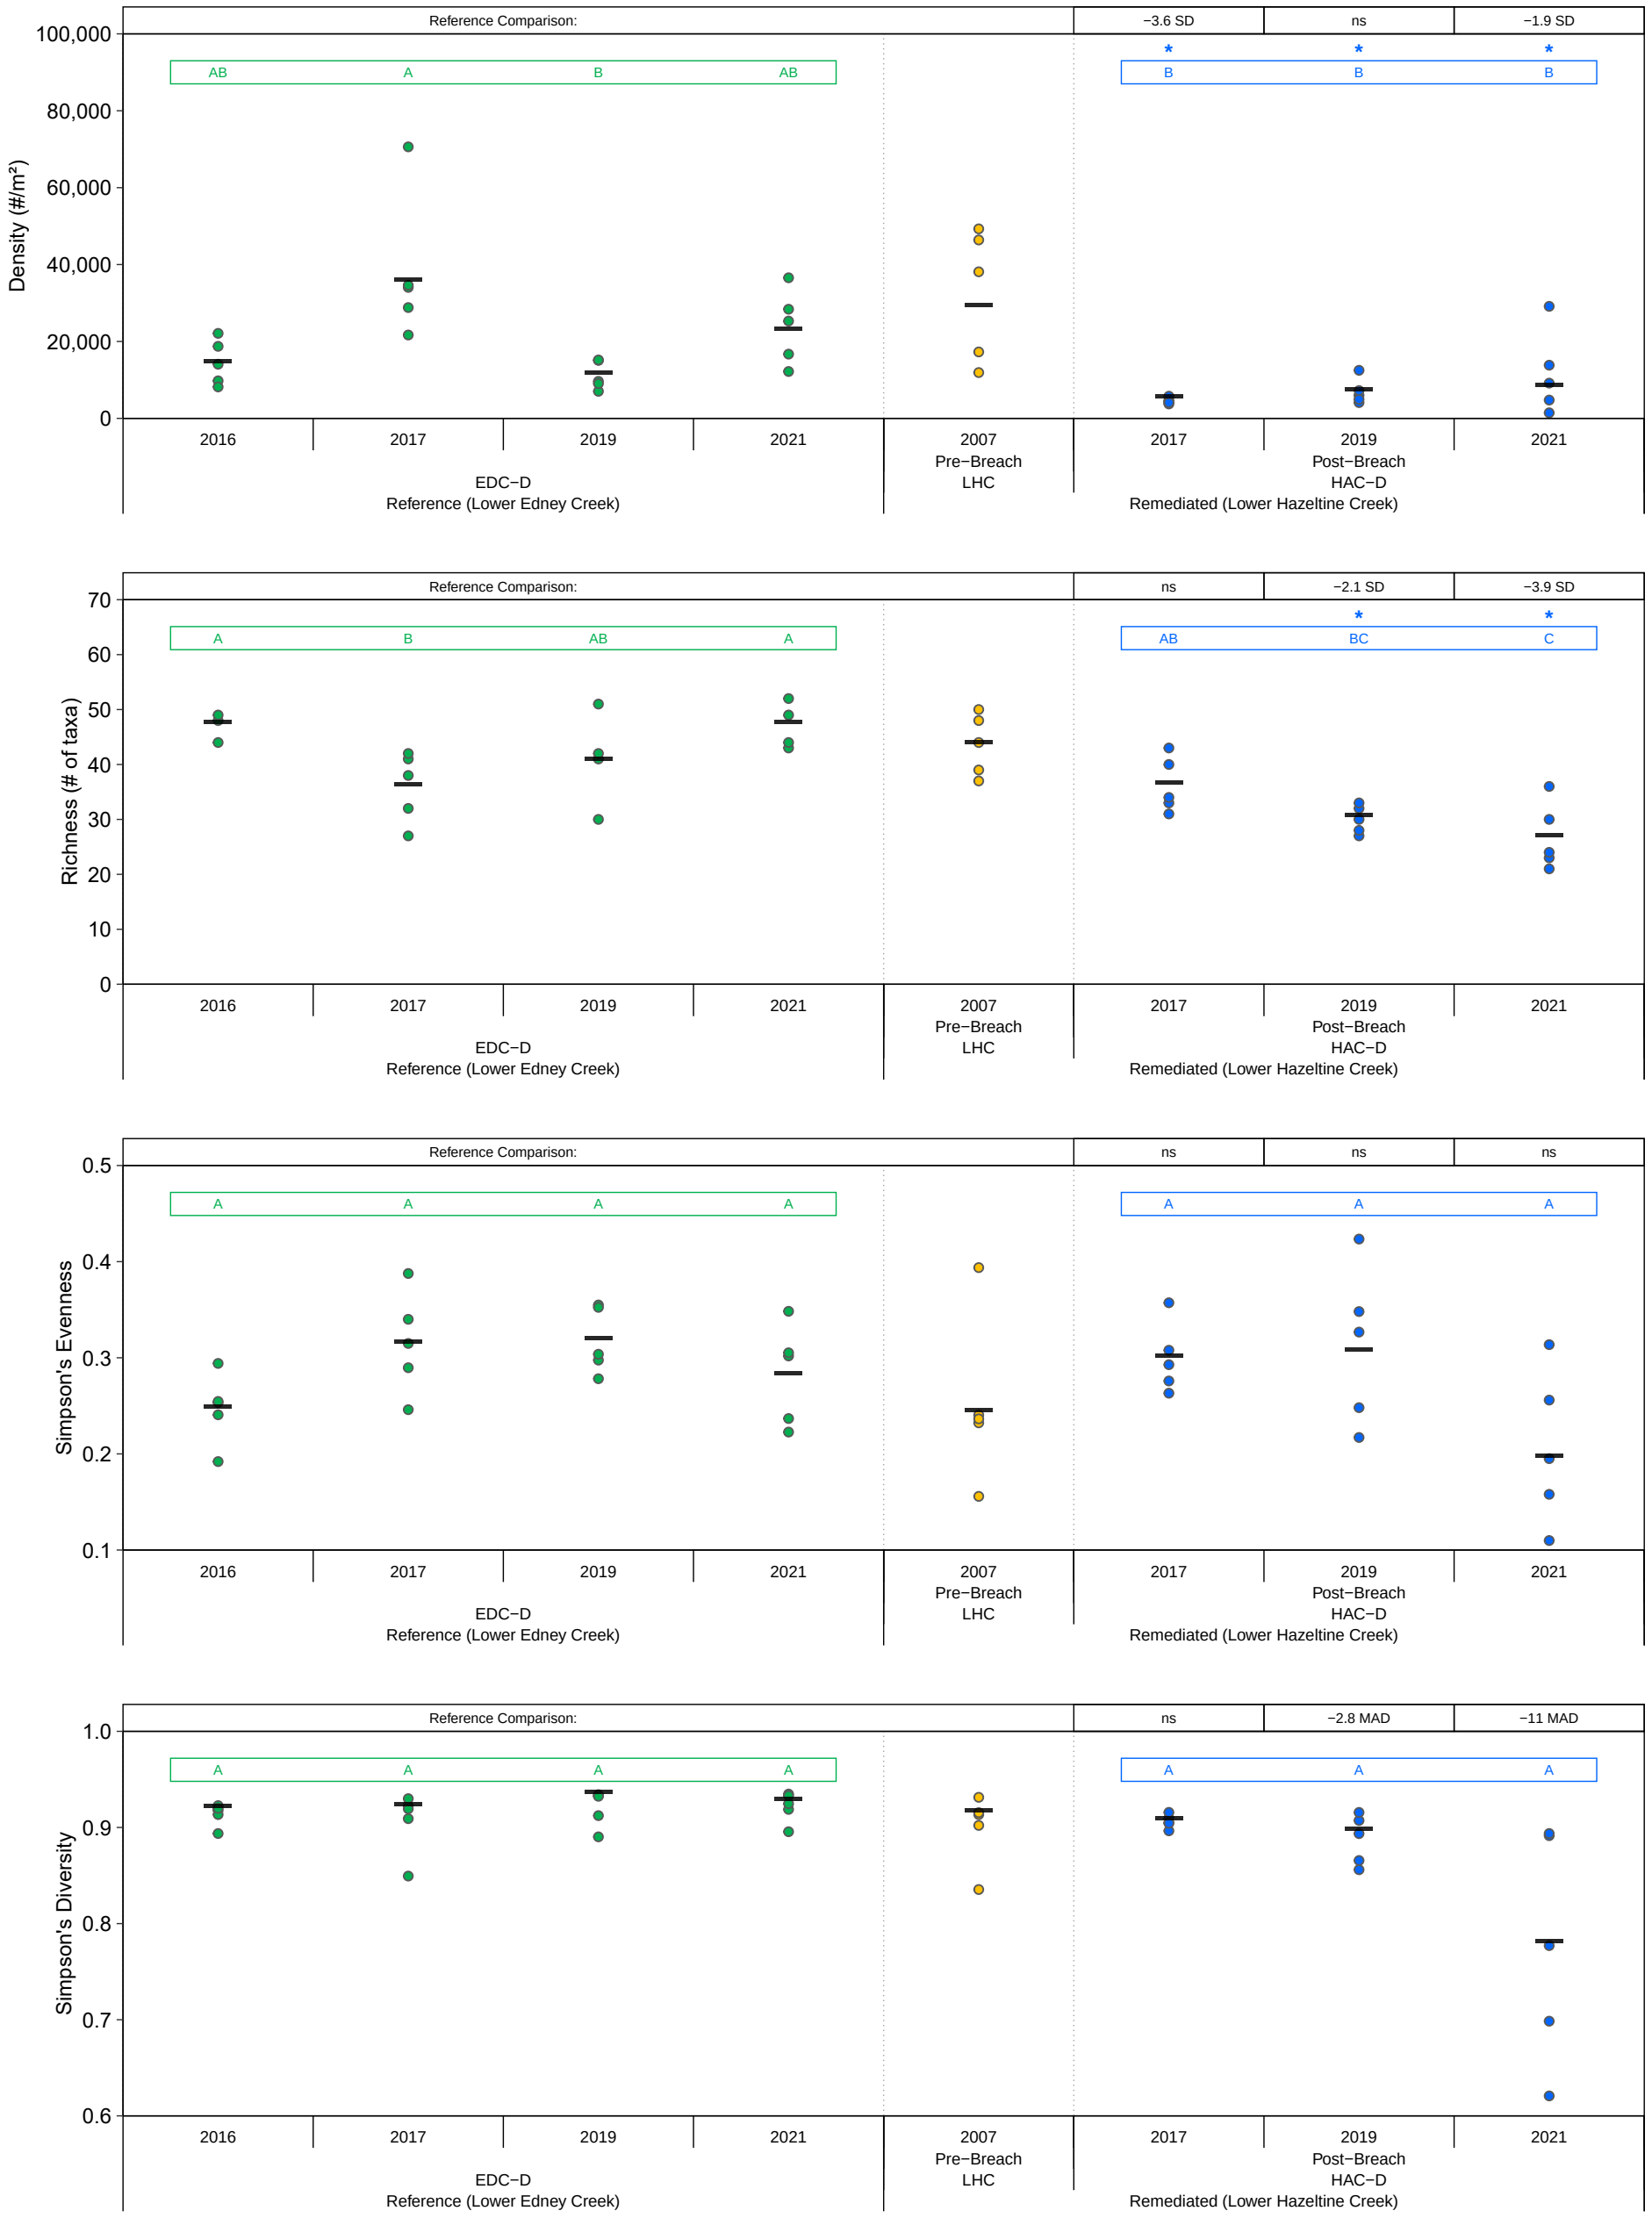

**Figure D.4: Benthic Invertebrate Community Endpoints, Lower Hazeltine Creek and Reference (Lower Edney Creek), 2007 and 2016 to 2021**

Notes: Black bars represent measures of central tendency (mean, geometric mean, or median depending on if analysis was conducted on untransformed, $\log_{10}$− transformed or rank−transformed data). Coloured letters represent significant (p−value <0.1) post−hoc comparisons within areas over time; years that share a letter of the same colour (e.g., A, B) within a box of the same colour do not differ significantly within an area. An * indicates significant differences to LHC in 2007. A number above the plot indicates significant exposed vs. reference post−hoc comparisons within a given year. The magnitude of difference (MOD) for these significant post−hoc comparisons are expressed in units of standard deviation (SD) or median absolute deviations (MAD; if the data were rank−transformed prior to analysis) relative to reference. A 'nc' indicates no comparisons were possible, a 'ns' indicates a non−significant contrast, and a "nm" indicates that the MOD could not be calculated because MAD = 0.

## Table D.1: Benthic Invertebrate Community Metrics for Hazeltine Creek (HAC-R1, HAC-U, HAC-D; Exposed) and Edney Creek (EDC-U, EDC-D; Reference), 2007 to 2022

| Year | Area | Area Type | Station | Density (#/m$^2$) | Richness (# of taxa) | Simpson's Evenness | Simpson's Diversity | Ephemeroptera (#/m$^2$) | Plecoptera (#/m$^2$) | Trichoptera (#/m$^2$) | EPT (#/m$^2$) | Arachnida (#/m$^2$) | Chironomidae (#/m$^2$) | Non-Chironomidae Diptera (#/m$^2$) |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| 2007 | EDC-U (UER)[a] | Reference (Pre- Breach) | EDC-U-1 | 22,075 | 42 | 0.274 | 0.913 | 11,240 | 1,398 | 1,796 | 14,434 | 1,147 | 4,585 | 247 |

Notes: "-" = no data available, EPT = Ephemeroptera, Trichoptera, Plecoptera, DW = dry weight, WW = wet weight. Reference area EDC-U not sampled in 2020 due to habitat differences (in water depth and flow) relative to the remediated areas HAC-R1 and HAC-U.

[a] UHC is the pre-breach sampling area associated with HAC-R1 and HAC-U. UER is the pre-breach sampling area associated with EDC-U. LHC is the historical sampling area associated with HAC-D.

# APPENDIX E
# PERIPHYTON TISSUE QUALITY

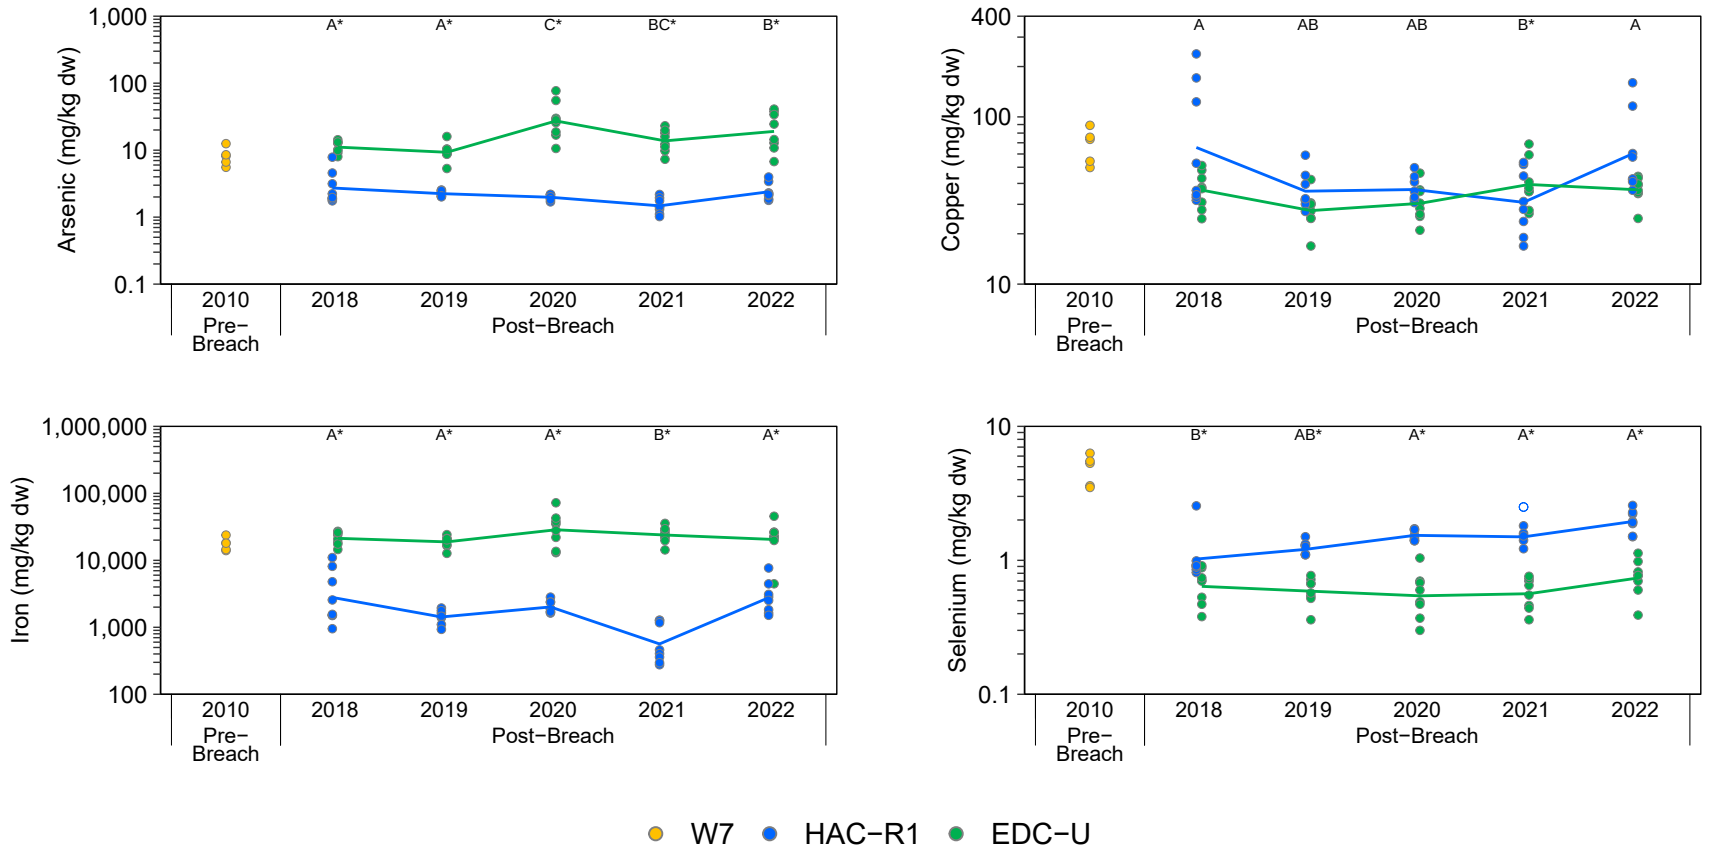

**Figure E.1: Periphyton Tissue Primary and Secondary Analyte Concentrations for Upper Hazeltine Creek (HAC-R1; Exposed) and Upper Edney Creek (EDC-U; Reference), 2010 to 2022**

Notes: Concentrations below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL and the open symbol represents one or more values reported below the LRL. Individual samples are plotted and lines join the least−squares estimated mean values for years included in the statistical analysis (i.e., not <LRL). Statistical analyses were conducted using a two−way ANOVA with factors Area and Year. The models were fit using Maximum Likelihood Estimation with an assumed log−normal distribution. Years that share a letter (e.g., A,B,C) have ratios of concentrations (Exposed:Reference) that do not differ significantly (p−value < 0.05) among years. Letter A was assigned to the year with the highest ratio of concentrations (Exposed:Reference). Only years with samples from both reference and exposed areas are plotted. Letters with a * designate years where the exposed site is different than pre−breach conditions.

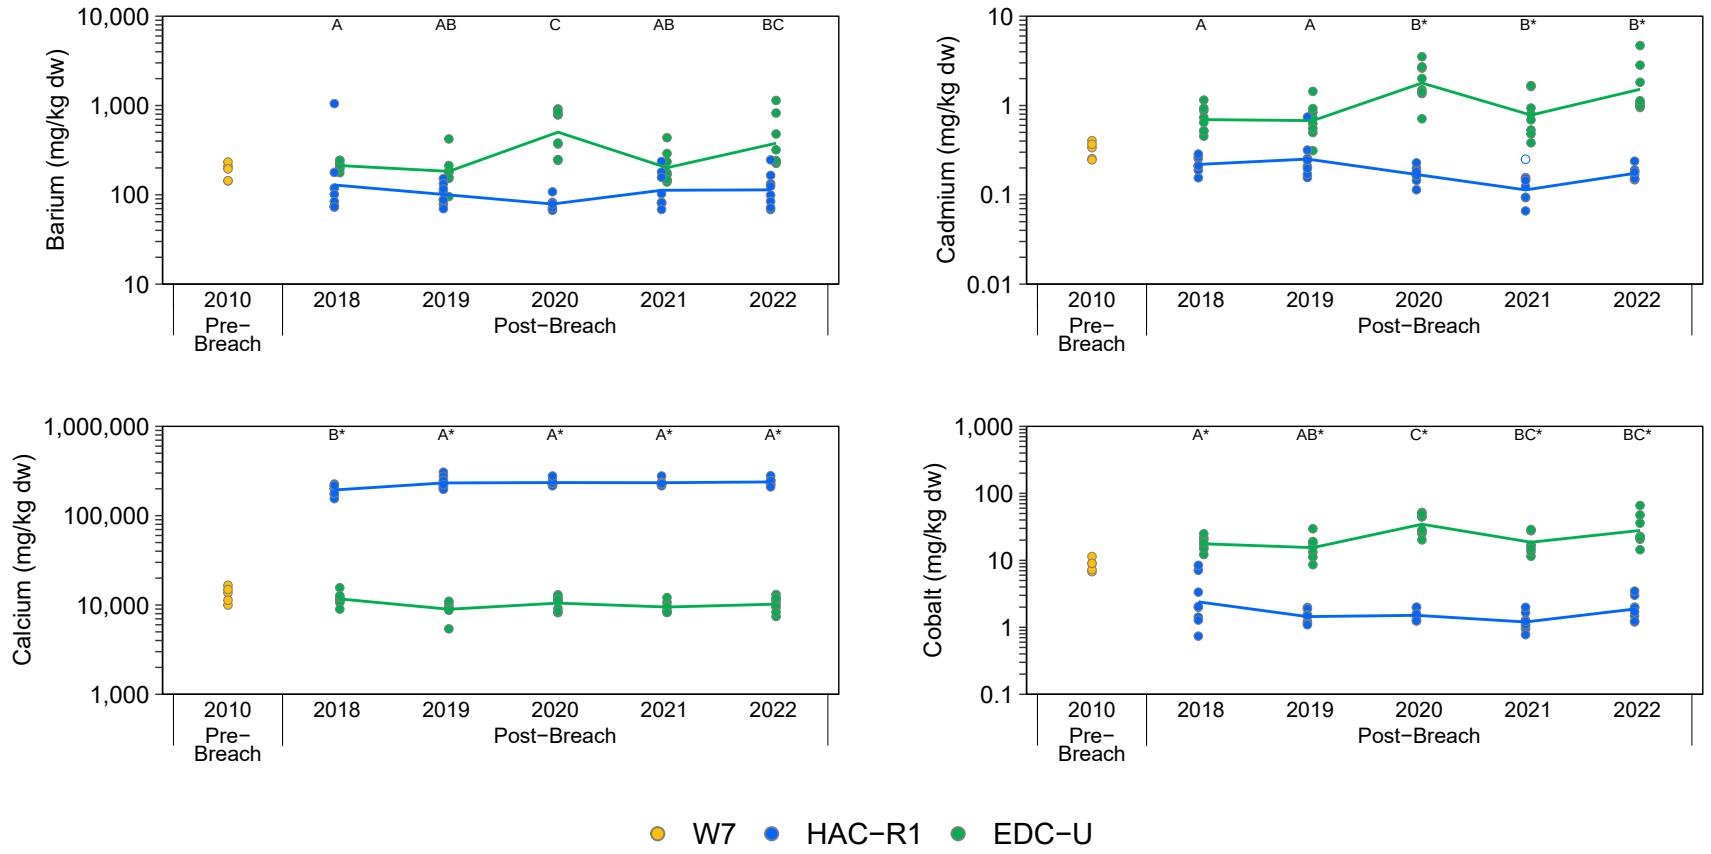

**Figure E.1: Periphyton Tissue Primary and Secondary Analyte Concentrations for Upper Hazeltine Creek (HAC-R1; Exposed) and Upper Edney Creek (EDC-U; Reference), 2010 to 2022**

Notes: Concentrations below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL and the open symbol represents one or more values reported below the LRL. Individual samples are plotted and lines join the least−squares estimated mean values for years included in the statistical analysis (i.e., not <LRL). Statistical analyses were conducted using a two−way ANOVA with factors Area and Year. The models were fit using Maximum Likelihood Estimation with an assumed log−normal distribution. Years that share a letter (e.g., A,B,C) have ratios of concentrations (Exposed:Reference) that do not differ significantly (p−value < 0.05) among years. Letter A was assigned to the year with the highest ratio of concentrations (Exposed:Reference). Only years with samples from both reference and exposed areas are plotted. Notes: mg/kg = milligrams per kilogram dry weight. mg/kg ww = milligrams per kilogram wet weight. "-" = no data available. All results are presented as three significant digits.

[a] UHP is the pre-breach sampling area associated with HAC-R1 and HAC-U. LHC is the historical sampling area associated with HAC-D.

## Table E.1: Periphyton Tissue Chemistry Data from Hazeltine Creek (HAC-R1, HAC-U, HAC-D; Exposed) and Edney Creek (EDC-D, EDC-U; Reference), 2010 to 2022

| Year | Area | Area Type | Replicate | Moisture % | Aluminum mg/kg | Antimony mg/kg | Arsenic mg/kg | Barium mg/kg | Beryllium mg/kg | Bismuth mg/kg | Boron mg/kg | Cadmium mg/kg | Calcium mg/kg | Cesium mg/kg | Chromium mg/kg | Cobalt mg/kg | Copper mg/kg | Gallium mg/kg | Iron mg/kg | Lead mg/kg | Lithium mg/kg | Magnesium mg/kg | Manganese mg/kg |

Notes: mg/kg = milligrams per kilogram dry weight. mg/kg ww = milligrams per kilogram wet weight. "-" = no data available. All results are presented as three significant digits.

[a] UPC is the pre-breach sampling area associated with HAC-R1 and HAC-U. LHC is the historical sampling area associated with HAC-D.

## Table E.1: Periphyton Tissue Chemistry Data from Hazeltine Creek (HAC-R1, HAC-U, HAC-D; Exposed) and Edney Creek (EDC-D, EDC-U; Reference), 2010 to 2022

| Year | Area | Area Type | Replicate | Moisture % | Aluminum mg/kg | Antimony mg/kg | Arsenic mg/kg | Barium mg/kg | Beryllium mg/kg | Bismuth mg/kg | Boron mg/kg | Cadmium mg/kg | Calcium mg/kg | Cesium mg/kg | Chromium mg/kg | Cobalt mg/kg | Copper mg/kg | Gallium mg/kg | Iron mg/kg | Lead mg/kg | Lithium mg/kg | Magnesium mg/kg | Manganese mg/kg |

Notes: mg/kg = milligrams per kilogram dry weight. mg/kg ww = milligrams per kilogram wet weight. "-" = no data available. All results are presented as three significant digits.

[a] UHP is the pre-breach sampling area associated with HAC-R1 and HAC-U. LHC is the historical sampling area associated with HAC-D.

## Table E.1: Periphyton Tissue Chemistry Data from Hazeltine Creek (HAC-R1, HAC-U, HAC-D; Exposed) and Edney Creek (EDC-D, EDC-U; Reference), 2010 to 2022

| Year | Area | Area Type | Replicate | Moisture % | Aluminum mg/kg | Antimony mg/kg | Arsenic mg/kg | Barium mg/kg | Beryllium mg/kg | Bismuth mg/kg | Boron mg/kg | Cadmium mg/kg | Calcium mg/kg | Cesium mg/kg | Chromium mg/kg | Cobalt mg/kg | Copper mg/kg | Gallium mg/kg | Iron mg/kg | Lead mg/kg | Lithium mg/kg | Magnesium mg/kg | Manganese mg/kg |

Notes: mg/kg = milligrams per kilogram dry weight. mg/kg ww = milligrams per kilogram wet weight. "-" = no data available. All results are presented as three significant digits.

[a] UHP is the pre-breach sampling area associated with HAC-R1 and HAC-U. LHC is the historical sampling area associated with HAC-D.

## Table E.1: Periphyton Tissue Chemistry Data from Hazeltine Creek (HAC-R1, HAC-U, HAC-D; Exposed) and Edney Creek (EDC-D, EDC-U; Reference), 2010 to 2022

| Year | Area | Area Type | Replicate | Mercury | | Molybdenum | Nickel | Phosphorus | Potassium | Rhenium | Rubidium | Selenium | Silver | Sodium | Strontium | Tellurium | Thallium | Thorium | Tin | Titanium | Uranium | Vanadium | Yttrium | Zinc | Zirconium |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | mg/kg | mg/kg ww | mg/kg | mg/kg | mg/kg | mg/kg | mg/kg | mg/kg | mg/kg | mg/kg | mg/kg | mg/kg | mg/kg | mg/kg | mg/kg | mg/kg | mg/kg | mg/kg | mg/kg | mg/kg | mg/kg | mg/kg |

# APPENDIX F

# BENTHIC INVERTEBRATE TISSUE QUALITY

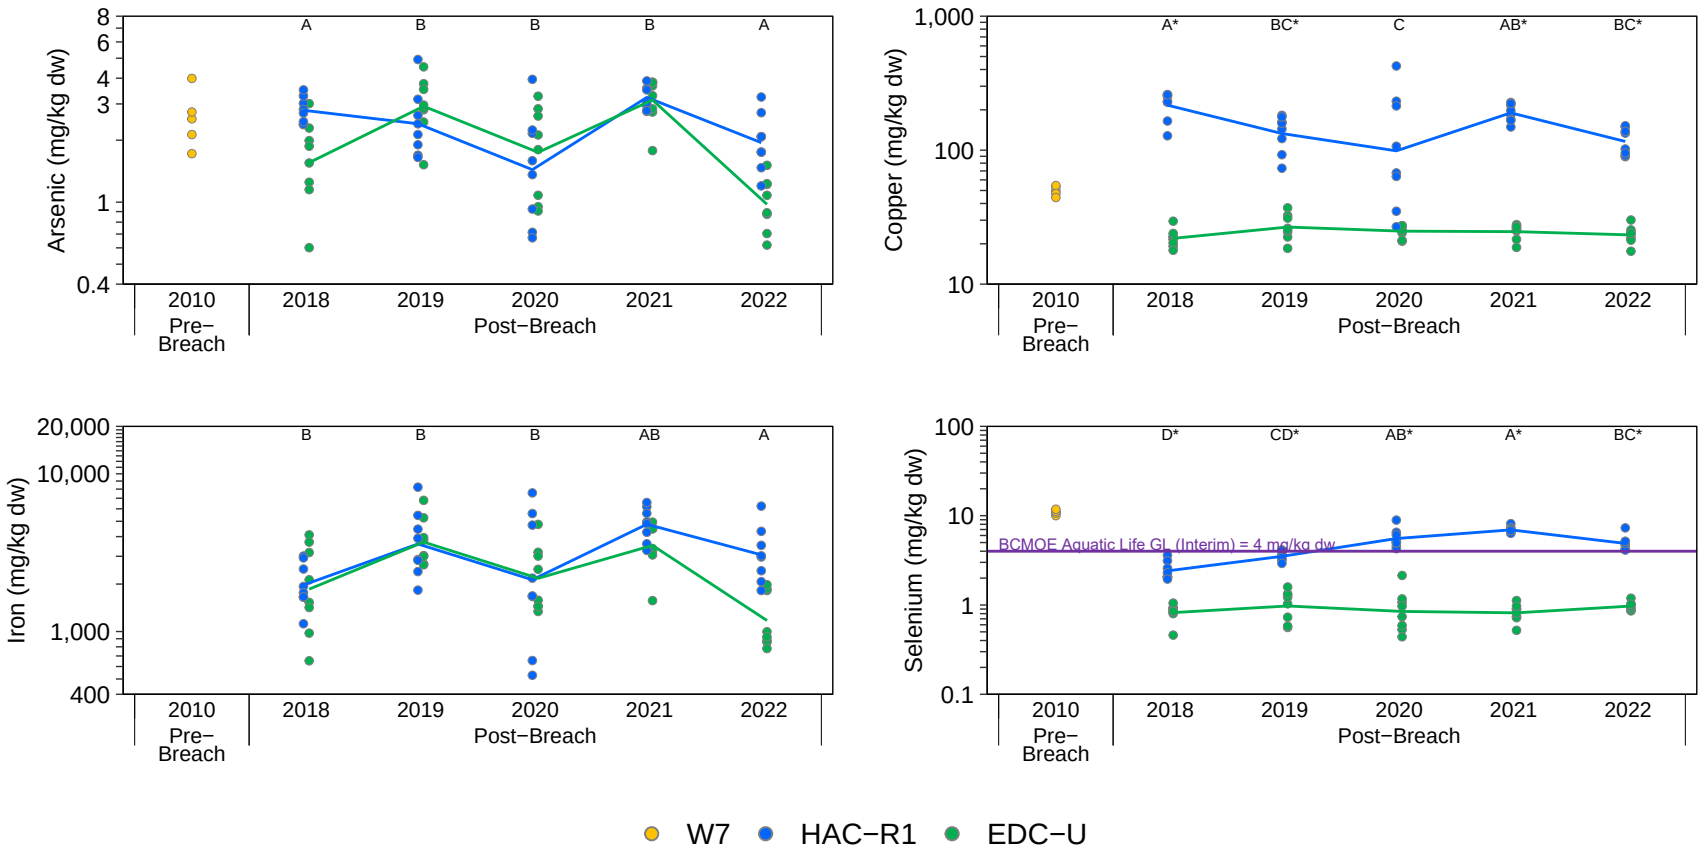

**Figure F.1: Composite-Taxa Benthic Invertebrate Tissue Primary and Secondary Analyte Concentrations for Upper Hazeltine Creek (HAC-R1; Exposed) and Upper Edney Creek (EDC-U; Reference), 2010 to 2022**

Notes: Concentrations below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL and the open symbol represents one or more values reported below the LRL. Individual samples are plotted and lines join the least−squares estimated mean values for years included in the statistical analysis (i.e., not <LRL). Statistical analyses were conducted using a two−way ANOVA with factors Area and Year. The models were fit using Maximum Likelihood Estimation with an assumed log−normal distribution. Years that share a letter (e.g., A,B,C) have ratios of concentrations (Exposed:Reference) that do not differ significantly (p−value < 0.05) among years. Letter A was assigned to the year with the highest ratio of concentrations (Exposed:Reference). Only years with samples from both reference and exposed areas are plotted. Letters with a * designate years where the exposed site is different than pre−breach conditions.

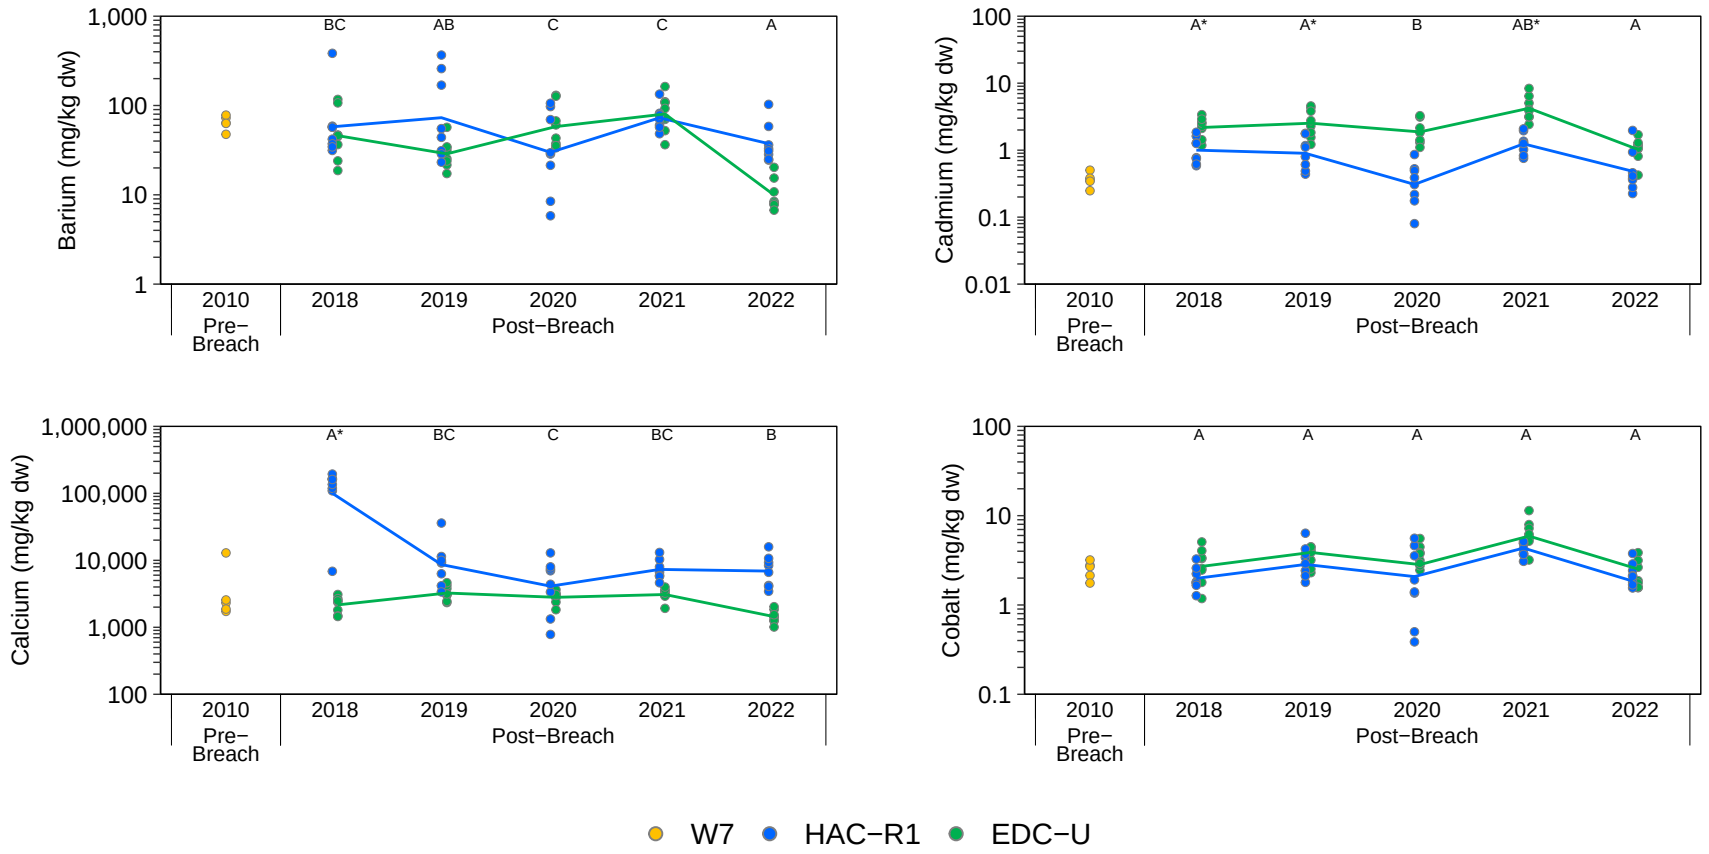

**Figure F.1: Composite-Taxa Benthic Invertebrate Tissue Primary and Secondary Analyte Concentrations for Upper Hazeltine Creek (HAC-R1; Exposed) and Upper Edney Creek (EDC-U; Reference), 2010 to 2022**

Notes: Concentrations below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL and the open symbol represents one or more values reported below the LRL. Individual samples are plotted and lines join the least−squares estimated mean values for years included in the statistical analysis (i.e., not <LRL). Statistical analyses were conducted using a two−way ANOVA with factors Area and Year. The models were fit using Maximum Likelihood Estimation with an assumed log−normal distribution. Years that share a letter (e.g., A,B,C) have ratios of concentrations (Exposed:Reference) that do not differ significantly (p−value < 0.05) among years. Letter A was assigned to the year with the highest ratio of concentrations (Exposed:Reference). Only years with samples from both reference and exposed areas are plotted. Letters with a * designate years where the exposed site is different than pre−breach conditions.

Years that share a letter (e.g., A,B,C) have ratios of concentrations (Exposed:Reference) that do not differ significantly (p−value < 0.05) among years. Letter A was assigned to the year with the highest ratio of concentrations (Exposed:Reference). Only years with samples from both reference and exposed areas are plotted.

**Figure F.6: Caddisfly Tissue Primary and Secondary Analyte Concentrations for Lower Hazeltine Creek (HAC-D; Exposed) and Lower Edney Creek (EDC-D; Reference), 2018 to 2022**

Notes: Concentrations below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL and the open symbol represents one or more values reported below the LRL. Individual samples are plotted and lines join the least−squares estimated mean values for years included in the statistical analysis (i.e., not <LRL). Statistical analyses were conducted using a two−way ANOVA with factors Area and Year. The models were fit using Maximum Likelihood Estimation with an assumed log−normal distribution. Years that share a letter (e.g., A,B,C) have ratios of concentrations (Exposed:Reference) that do not differ significantly (p−value < 0.05) among years. Letter A was assigned to the year with the highest ratio of concentrations (Exposed:Reference). Only years with samples from both reference and exposed areas are plotted.

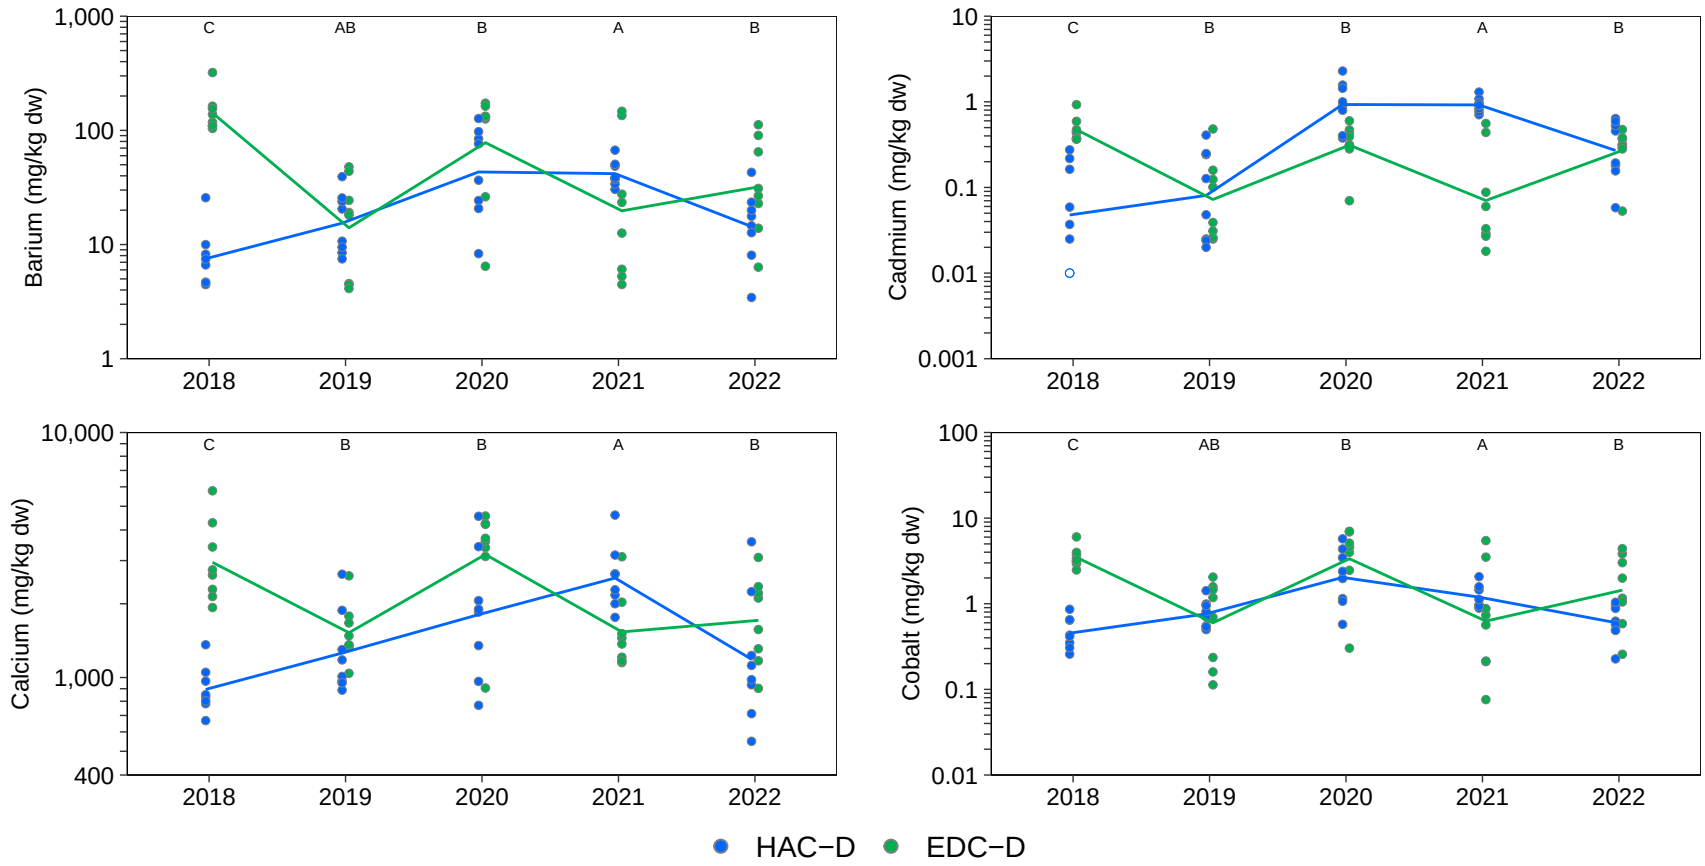

**Figure F.6: Caddisfly Tissue Primary and Secondary Analyte Concentrations for Lower Hazeltine Creek (HAC-D; Exposed) and Lower Edney Creek (EDC-D; Reference), 2018 to 2022**

Notes: Concentrations below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL and the open symbol represents one or more values reported below the LRL. Individual samples are plotted and lines join the least−squares estimated mean values for years included in the statistical analysis (i.e., not <LRL). Statistical analyses were conducted using a two−way ANOVA with factors Area and Year. The models were fit using Maximum Likelihood Estimation with an assumed log−normal distribution. Notes: mg/kg = milligrams per kilogram dry weight. mg/kg ww = milligrams per kilogram wet weight. "-" = no results available. All results are presented as three significant digits.

[a] W7 is the historical sampling area associated with HAC-U; W11 is the historical sampling area associated with HAC-D.

## Table F.1: Composite-Taxa Tissue Chemistry Data from Hazeltine Creek (HAC-R1, HAC-U, HAC-D; Exposed) and Edney Creek (EDC-D, EDC-U; Reference), 2010 to 2022

| Year | Area | Area Type | Replicate | Mercury | | Molybdenum | Nickel | Phosphorus | Potassium | Rhenium | Rubidium | Selenium | Silver | Sodium | Strontium | Tellurium | Thallium | Thorium | Tin | Titanium | Uranium | Vanadium | Yttrium | Zinc | Zirconium |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | mg/kg | mg/kg ww | mg/kg | mg/kg | mg/kg | mg/kg | mg/kg | mg/kg | mg/kg | mg/kg | mg/kg | mg/kg | mg/kg | mg/kg | mg/kg | mg/kg | mg/kg | mg/kg | mg/kg | mg/kg | mg/kg | mg/kg |

Notes: mg/kg = milligrams per kilogram dry weight. mg/kg ww = milligrams per kilogram wet weight. "-" = no results available. All results are presented as three significant digits.

[a] W7 is the historical sampling area associated with HAC-U; W11 is the historical sampling area associated with HAC-D.

## Table F.2: Caddisfly Tissue Chemistry Data from Hazeltine Creek (HAC-R1, HAC-U, HAC-D; Exposed) and Edney Creek (EDC-D, EDC-U; Reference), 2017 to 2022

| Year | Area | Area Type | Replicate | Moisture % | Aluminum mg/kg | Antimony mg/kg | Arsenic mg/kg | Barium mg/kg | Beryllium mg/kg | Bismuth mg/kg | Boron mg/kg | Cadmium mg/kg | Calcium mg/kg | Cesium mg/kg | Chromium mg/kg | Cobalt mg/kg | Copper mg/kg | Gallium mg/kg | Iron mg/kg | Lead mg/kg | Lithium mg/kg | Magnesium mg/kg | Manganese mg/kg |

# APPENDIX G
# QUALIFIED PROFESSIONALS
# DECLARATIONS AND DISCLOSURES

Ministry of
Environment and
Climate Change Strategy

# Declaration of Competency

The Ministry of Environment and Climate Change Strategy relies on the work, advice, recommendations and in some cases decision making of qualified professionals[1], under government's professional reliance regime. With this comes an assumption that professionals who undertake work in relation to ministry legislation, regulations and codes of practice have the knowledge, experience and objectivity necessary to fulfill this role.

1. Name of Qualified Professional Pierre Stecko

   Title Senior Aquatic Scientist / Managing Principal

2. Are you a registered member of a professional association in B.C.? ☑ Yes ☐ No

   Name of Association: College of Applied Biologists Registration # 1709

3. Brief description of professional services:

   Preparation of a technical memo to support permit application.

This declaration of competency is collected under section 26(c) of the *Freedom of Information and Protection of Privacy Act* for the purposes of increasing government transparency and ensuring professional ethics and accountability. By signing and submitting this statement you consent to its publication and its disclosure outside of Canada. This consent is valid from the date submitted and cannot be revoked. If you have any questions about the collection, use or disclosure of your personal information please contact the Ministry of Environment and Climate Change Strategy Headquarters Office at 1-800-663-7867.

# Declaration

I am a qualified professional with the knowledge, skills and experience to provide expert information, advice and/or recommendations in relation to the specific work described above.

Date signed: October 20, 2023

[1] *Qualified Professional, in relation to a duty or function under ministry legislation, means an individual who*

*a) is registered in British Columbia with a professional association, is acting under that organization's code of ethics, and is subject to disciplinary action by that association, and*

b) *through suitable education, experience, accreditation and knowledge, may reasonably be relied on to provide advice within his or her area of expertise, which area of expertise is applicable to the duty or function.*

BRITISH COLUMBIA
Ministry of Environment and Climate Change Strategy

# Conflict of Interest Disclosure Statement

A qualified professional [1] providing services to either the Ministry of Environment and Climate Change Strategy ("ministry"), or to a regulated person for the purpose of obtaining an authorization from the ministry, or pursuant to a requirement imposed under the *Environmental Management Act,* the *Integrated Pest Management Act* or the *Park Act* has a real or perceived conflict of interest when the qualified professional, or their relatives, close associates or personal friends have a financial or other interest in the outcome of the work being performed.

A real or perceived conflict of interest occurs when a qualified professional has

a) an ownership interest in the regulated person's business;

b) an opportunity to influence a decision that leads to financial benefits from the regulated person or their business other than a standard fee for service (e.g. bonuses, stock options, other profit sharing arrangements);

c) a personal or professional interest in a specific outcome;

d) the promise of a long term or ongoing business relationship with the regulated person, that is contingent upon a specific outcome of work;

e) a spouse or other family member who will benefit from a specific outcome; or

f) any other interest that could be perceived as a threat to the independence or objectivity of the qualified professional in performing a duty or function.

Qualified professionals who work under ministry legislation must take care in the conduct of their work that potential conflicts of interest within their control are avoided or mitigated. Precise rules in conflict of interest are not possible and professionals must rely on guidance of their professional associations, their common sense, conscience and sense of personal integrity.

## Declaration

I Pierre Stecko, as a member of the College of Applied Biologists declare

***Select one of the following:***

☑ Absence from conflict of interest

Other than the standard fee I will receive for my professional services, I have no financial or other interest in the outcome of this permit application.
I further declare that should a conflict of interest arise in the future during the course of this work, I will fully disclose the circumstances in writing and without delay to Luc Lachance, erring on the side of caution.

☐ Real or perceived conflict of interest

Description and nature of conflict(s):

_____

_____

_____

I will maintain my objectivity, conducting my work in accordance with my Code of Ethics and standards of practice.

In addition, I will take the following steps to mitigate the real or perceived conflict(s) I have disclosed, to ensure the public interest remains paramount:

_____

_____

_____

Further, I acknowledge that this disclosure may be interpreted as a threat to my independence and will be considered by the statutory decision maker accordingly.

This conflict of interest disclosure statement is collected under section 26(c) of the *Freedom of Information and Protection of Privacy Act* for the purposes of increasing government transparency and ensuring professional ethics and accountability. By signing and submitting this statement you consent to its publication and its disclosure outside of Canada. This consent is valid from the date submitted and cannot be revoked. If you have any questions about the collection, use or disclosure of your personal information please contact the Ministry of Environment and Climate Change Strategy Headquarters Office at 1-800-663-7867.

# Conflict of Interest Disclosure Statement

A qualified professional [1] providing services to either the Ministry of Environment and Climate Change Strategy ("ministry"), or to a regulated person for the purpose of obtaining an authorization from the ministry, or pursuant to a requirement imposed under the *Environmental Management Act,* the *Integrated Pest Management Act* or the *Park Act* has a real or perceived conflict of interest when the qualified professional, or their relatives, close associates or personal friends have a financial or other interest in the outcome of the work being performed.

A real or perceived conflict of interest occurs when a qualified professional has

a) an ownership interest in the regulated person's business;

b) an opportunity to influence a decision that leads to financial benefits from the regulated person or their business other than a standard fee for service (e.g. bonuses, stock options, other profit sharing arrangements);

c) a personal or professional interest in a specific outcome;

d) the promise of a long term or ongoing business relationship with the regulated person, that is contingent upon a specific outcome of work;

e) a spouse or other family member who will benefit from a specific outcome; or

f) any other interest that could be perceived as a threat to the independence or objectivity of the qualified professional in performing a duty or function.

Qualified professionals who work under ministry legislation must take care in the conduct of their work that potential conflicts of interest within their control are avoided or mitigated. Precise rules in conflict of interest are not possible and professionals must rely on guidance of their professional associations, their common sense, conscience and sense of personal integrity.

## Declaration

I Katharina Batchelar, as a member of College of Applied Biologists declare

***Select one of the following:***

☑ Absence from conflict of interest

Other than the standard fee I will receive for my professional services, I have no financial or other interest in the outcome of this permit application.
I further declare that should a conflict of interest arise in the future during the course of this work, I will fully disclose the circumstances in writing and without delay to Luc Lachance, erring on the side of caution.

☐ Real or perceived conflict of interest

Description and nature of conflict(s):

_____

_____

_____

I will maintain my objectivity, conducting my work in accordance with my Code of Ethics and standards of practice.

In addition, I will take the following steps to mitigate the real or perceived conflict(s) I have disclosed, to ensure the public interest remains paramount:

_____

_____

_____

Further, I acknowledge that this disclosure may be interpreted as a threat to my independence and will be considered by the statutory decision maker accordingly.

This conflict of interest disclosure statement is collected under section 26(c) of the *Freedom of Information and Protection of Privacy Act* for the purposes of increasing government transparency and ensuring professional ethics and accountability. By signing and submitting this statement you consent to its publication and its disclosure outside of Canada. This consent is valid from the date submitted and cannot be revoked. If you have any questions about the collection, use or disclosure of your personal information please contact the Ministry of Environment and Climate Change Strategy Headquarters Office at 1-800-663-7867.

# 1.0 INTRODUCTION

At the request of Mount Polley Mining Corporation (MPMC), WSP Canada Inc. (WSP; formerly Golder Associates Ltd. [Golder]) reviewed the results of the 2022 annual groundwater monitoring program for the Mount Polley mine. This monitoring program is part of the Comprehensive Environmental Monitoring Plan (CEMP), and meets the following section of the BC Ministry of Environment and Climate Change Strategy Permit 11678 (the Permit): Section 4.2.3 of the Permit, which requires a groundwater monitoring program review, including sampling, well locations, site water balance, interpretation of trends and possible environmental impacts, and recommendations, if any.

# 2.0 OBJECTIVE AND SCOPE OF WORK

The purpose of this letter is to summarize the results of the annual groundwater monitoring program conducted by MPMC and WSP to support the Permit requirement and annual reporting for 2022. The scope of work is summarized as follows:

- Groundwater sampling and water level monitoring between January and December 2022 (completed by MPMC).
- Review and plot groundwater level and groundwater quality data collected for available monitoring wells. This includes wells associated with the Tailings Storage Facility (TSF) and Springer Pit. Similar to previous annual monitoring reports, chemical analytical results were assessed for trends and compared against the British Columbia (BC) Ministry of Environment and Climate Change Strategy (ENV) Contaminated Site Regulation (CSR) and the BC Water Quality Guidelines (WQG).
- Summarize the results of the annual monitoring program in this letter report, providing recommendations for adjustments to the ongoing monitoring program, if applicable.
- Comment on sampling methods changes, if any.
- Comment on changes in seepage from Springer Pit, if any.

# 3.0 GROUNDWATER MONITORING REQUIREMENTS

Groundwater monitoring requirements were based on those outlined in Permit 11678 and within the CEMP (MPMC 2019) as follows.

## 3.1 Permit 11678 Requirements

Permit 11678 was originally issued on 30 May 1997, and has been amended several times since that date, with the most recent amendment issued 31 December 2020. As specified in the Permit, the objective of the monitoring being completed as part of the CEMP is to evaluate the effects of mine-related activities on various characteristics of surface waters, riparian areas and upland areas within and around the mine site. This report specifically addresses the groundwater monitoring component of the CEMP.

Reporting requirements specifically associated with the groundwater monitoring program consisted of the following:

- Reporting groundwater monitoring sample results required under the Permit.
- Providing an update to any modelling related to the Springer Pit groundwater seepage and its impacts on Bootjack Lake.
- Reporting trend analysis (graphs) of water monitoring data at each site for a minimum of the past five years.

We note that no modelling related to groundwater seepage has been conducted and is therefore not discussed herein.

## 3.2 Existing Monitoring Well Network

Monitoring wells were developed at the site between 1995 and 2016. A summary of wells that are listed in the CEMP as part of the groundwater monitoring program are outlined below, and their locations are shown in Figure 1. Both multi-level and single depth monitoring wells were included in the 2022 groundwater monitoring program as follows.

**Table 1: Monitoring Well Network**

| Year | Well Series | Well Numbers | Comments |
|---|---|---|---|
| 1995 | 95 | R5 | Several wells were drilled in 1995; however, only 95-R5 still exists. |
| 1996 | GW96 | 1b[(a)]; 2a, b; 3a, b[(b)]; 4a, b; and 7 | Initially nine wells were drilled with eight installed as multi-level wells. Currently only six monitoring wells[(c)] are monitored (two multi-level wells and two single well locations). |
| 2000 | GW00 | 1a, b; 2a, and 3a, b | Installed along southeast embankment of TSF. |
| 2005 | GW05 | 1 | GW05-1 was installed as a pumping well to capture groundwater moving from Polley Lake towards the Wight Pit, pumping it back into Polley Lake. |
| 2011 | GW11 | 1a, b; and 2a, b | Two pairs of multi-level wells were installed to monitor potential impacts from newly disturbed areas. |
| 2012 | GW12 | 1a, b; 2a, b; 3a, b; 4a, b; and 5a, b | Five pairs of multi-level wells were installed to collect additional groundwater information. |
| 2014 | GW14 | 1 | Domestic well at Orica site. |
| 2015 | GW15[(d)] | 1a, b; and 2a, b | Two pairs of multi-level wells installed to monitor seepage conditions associated with Springer Pit Lake. |
| 2016 | GW16 | 1a, b; 2a, b; 3a, b; 4a, b; 5a, b; 6a, b; 7; and 8 | Additional monitoring wells installed at various locations to monitor current groundwater quality, and eventually at closure. |

Notes:

In multi-level well installations, “a” represents deep well, and “b” represents shallow well.

Only wells identified in the most recent CEMP (MPMC, 2019) have been identified in the table.

(a) Groundwater monitoring at GW96-1a, and GW96-1b was ceased in 2018 based on Golder’s recommendation, and has been removed from the CEMP sampling requirements, however historical data is included in the chemistry plots.

(b) Groundwater monitoring well is decommissioned.

(c) Currently monitored wells consist of GW96-2a, GW96-2b, GW96-3a, GW96-4a, GW96-4b, and GW96-7.

(d) Only groundwater level was monitored at GW15-1a and GW15-1b.

# 4.0 SITE CONCEPTUAL MODEL

Situated on a topographic high and centred on Polley Mountain is the main mine site, which reaches an elevation of approximately 1250 metres above sea level (masl). Bootjack Lake is located to the southwest of the mine site, and Polley Lake is located to the northeast of the mine site. Infrastructure of note at the mine site consists of the mill, in the approximate centre of the mine site, the tailings storage facility (TSF), located about 3 km southeast of the mill in a topographically low area, several pits (Springer, Cariboo, Wight, and Boundary) and Hazeltine Creek (Figure 1). Hazeltine Creek flows southeast and then east from Polley Lake to Quesnel Lake; Quesnel Lake is located approximately 5 km to the east of the TSF. Numerous groundwater monitoring wells are located throughout the site (see Table 1).

The climate is described as a humid, continental climate with the driest season in spring and the wettest season in summer. Groundwater recharge occurs through the infiltration of precipitation in the topographic high area of Polley Mountain and the surrounding slopes, excluding the existing mine pits. The open pits act as sinks for groundwater flow when they are dewatered, and as both sinks and sources of groundwater seepage when flooded to the spillover elevation. The primary groundwater discharge areas next to the mine site are: Polley Lake to the east, Bootjack Lake to the west, and an area near the TSF and Hazeltine Creek (located to the southeast of the TSF). Bootjack Lake, Polley Lake, and Quesnel Lake, the largest lake in the area located about 5 km to the east of the mine site, strongly control regional groundwater flow and act as significant hydrogeological boundaries.

The mine site is underlain by monzonite bedrock that has been intruded by hydrothermal breccias and intersected by northwest–southeast striking faults. The bedrock in the area of the Springer and Cariboo pits is overlain by a discontinuous and relatively thin (i.e., a few metres) layer of overburden of glacio-lacustrine and glacio-fluvial origin, primarily silt/clay. Near the Wight Pit, a thicker zone of overburden is identified between the southeast crest of the pit and Polley Lake, with coarser and more permeable sand/gravel sediments present at depth directly above bedrock.

The overburden underlying the TSF consists predominantly of glacial till with interbeds of glaciofluvial and glacio-lacustrine sediments. The overburden ranges in thickness from approximately 5 m along a bedrock knoll near the south embankment to approximately 65 m along portions of the main embankment (Golder 2015a and Golder 2015b, Fig. 6 and 9). The underlying shallow bedrock is weathered and/or fractured and predominantly volcanic conglomerate (IMC 1990). The thickness of this weathered bedrock zone is highly variable and is inferred to range from 2 m to 43 m (based on borehole logs for the 1996 series monitoring wells [Knight Piésold Ltd. 1997] and the 2015 series boreholes [Golder 2015d]). Competent bedrock that underlies the weathered zone consists of Nicola Group volcanics that, according to the local geology map (Logan et al. 2007), likely consist of undivided mafic volcanic and volcaniclastic rocks and/or intrusive rocks (pseudoleucite syenite). Drilling observations in the TSF footprint prior to mining indicated predominately volcanic conglomerate bedrock (IMC 1990).

According to MPMC (2017), groundwater flow at the mine site occurs primarily in the bedrock units. Although there is groundwater flow in the overburden units, it is less significant due to its limited thickness and discontinuous nature. Prior to mining of the site, the direction of groundwater flow was inferred to be from areas of topographic high (i.e., the top of the ridge between the Polley Lake and Bootjack Lake) to areas of topographic low (i.e., the lakes). However, after mining commenced, and as a result of mine dewatering, the groundwater flow direction at the mine site has changed. Mine dewatering has lowered the groundwater elevation and created radial flow towards the various pits.

# 5.0 GROUNDWATER SAMPLING METHODS

Groundwater sampling was conducted by MPMC staff in 2022 as per sampling methods described in their QA/QC Manual (MPMC 2020). Between the initiation of the groundwater monitoring program in 2015 until approximately mid-2018, MPMC used a submersible pump (Grundfos) and peristaltic pump to collect groundwater samples from the groundwater monitoring well network. Due to a pump failure in mid-2018, MPMC initiated groundwater sample collection using low-flow sampling with a peristaltic pump for a majority of the monitoring wells, particularly the last two sampling events of 2018. A comparison of pre and post 2018 groundwater data inferred that the change in sampling has not affected the reliability of the analytical results. In 2022, MPMC used a Grundfos pump for wells GW12-2 (a, b), GW15-2 (a, b), GW96-2 (a, b), GW12-4 (a, b), GW16-2 (a, b), GW16-3 (a, b), and GW16-7 and GW16-8. The remainder of the monitoring wells are sampled with a peristaltic pump. MPMC followed similar sampling methods of WSP (formerly Golder) and previous MPMC programs. This includes low-flow technique (using peristaltic pump) for wells with groundwater level less than 10 metres below top of casing (mbtoc) and using submersible pump (i.e., Grundfos pump) for wells with groundwater level greater than 10 mbtoc.

During groundwater sample collection, field parameters were measured (i.e., water level, temperature, pH and conductivity). Select wells were then either purged and sampled on the same day or purged and sampled the next day.

To maintain sample integrity, groundwater samples for laboratory analyses were submitted within the laboratory recommended hold times after collection. Holding times may have been exceeded for preserved and unpreserved samples if the laboratory was unable to initiate testing promptly following sample receipt or if there were delays in sample delivery to the laboratory. Duplicate groundwater samples were collected during select sampling events. Data regarding laboratory and field quality assurance/quality control were not provided to WSP for review by MPMC.

# 6.0 2022 ANNUAL GROUNDWATER MONITORING

Groundwater monitoring has been ongoing at the mine site since 1995 with the objectives to monitor direction, quantity, and quality of groundwater seepage near all mine facilities (MPMC 2019).

Groundwater levels were measured, at a minimum, semi-annually on approximately the same day, and generally more frequently, in monitoring wells to detect changes in groundwater flow directions. Pressure transducers were also installed at GW12-2a and GW12-2b to record changes in pressures every hour. A barologger installed at GW12-2a records barometric pressure at the same frequency, allowing for correction of pressure transducer data for barometric changes.

The groundwater monitoring program outlined in the CEMP (MPMC 2019) currently consists of numerous multi-level monitoring wells (each set consists of deep and shallow wells), and single wells surrounding the mine site, as shown in Figure 1. Not all groundwater monitoring wells outlined in the CEMP were sampled during the 2022 monitoring program. The groundwater sampling frequency for the monitored wells in 2022 was as follows:

- Monitoring wells GW 15-2a and GW12-2 (a, b) were sampled quarterly in 2022.
- The following wells were sampled twice in 2022; once in the spring and once in the fall, to monitor seasonal changes in water quality: Wells 95-R5, GW96-2(a, b), GW96-3a, GW96-4b, GW00-1b, GW00-3b, GW11-1(a, b), GW11-2(a, b), GW12-1 (a, b), GW12-3 (a, b), GW12-4 (a, b), GW12-5(a, b), GW16-1 (a, b), GW16-2 (a, b), GW16-3 (a, b), GW16-4 (a, b), and GW16-5 (a, b), GW16-7, GW96-2(a, b).
- The following wells were sampled once in 2022: GW96-7, GW96-4a, GW00-1a, and GW00-3a.
- Monitoring wells GW15-2b and GW14-1 were sampled three times in 2022.
- The following wells were sampled more than quarterly in 2022: GW16-8, GW16-7, and GW05-01.

The above-mentioned wells were sampled for the following parameters:

- field parameters: pH, conductivity and temperature
- physical tests: conductivity, hardness, and pH
- anion and nutrients: alkalinity, ammonia, chloride, fluoride, nitrate and nitrite, nitrate, nitrite, total nitrogen, total dissolved phosphorus, total phosphorus, and sulphate
- dissolved metals: aluminium, antimony, arsenic, barium, beryllium, bismuth, boron, cadmium, calcium, chromium, cobalt, copper, iron, lead, lithium, magnesium, manganese, molybdenum, nickel, potassium, selenium, silicon, silver, sodium, strontium, thallium, tin, titanium, uranium, vanadium, and zinc

## 6.1 Groundwater Elevations

In 2022, MPMC carried out static water level monitoring from top-of-pipe for the monitoring wells within the monitoring program. Static water levels and associated groundwater elevations (or hydraulic heads) for 2022, and well coordinates and elevations are provided in Table 2; the hydraulic heads over time are shown in plots in Figure 2. Groundwater elevation data recorded at GW12-2a and GW12-2b using pressure transducers are corrected for barometric pressure and plotted for comparison from 23 February 2022 to 30 June 2022 for GW12- 2a, and 7 July 2022 for GW12-2b (Appendix A).

The following observations are provided regarding the 2022 groundwater elevations and historical trends.

## General Observations

Historically, groundwater elevations on the west side of the mine site (980 masl to 1,035 masl) are generally higher than those on the east side of the mine site (905 masl to 980 masl). Groundwater elevations around the TSF historically ranged from 880 masl to 965 masl.

- Groundwater elevations were available for 19 groundwater well pairs in May/June and 11 groundwater well pairs in September/November 2022 (Table 3). Comparison of the shallow versus deeper groundwater elevations at the paired well locations indicated the following:
  - In May 2022, the vertical component of groundwater flow was upwards (from deep to shallow) at six of the 19 locations, and downwards (from shallow to deep) at 13 of the paired locations.
  - In November 2022, out of the 11 paired well locations, two paired wells exhibited an upward hydraulic gradient (from deep to shallow), three wells exhibited no vertical hydraulic gradient, and five paired wells exhibited a marginal downwards (from shallow to deep) hydraulic gradient.
  - Groundwater elevations at GW12-2a and GW12-2b were monitored using a pressure transducer. Due to the gap in data from the dataloggers between 1 January and 23 February 2022, and the lack of data after June 2022, an evaluation of annual groundwater elevations cannot be determined for 2022. However, between February and March, groundwater elevations remained fairly steady at both wells. Groundwater elevations rose approximately 4 m in late March 2022 until early May at both wells, after which time groundwater elevations began slowly dropping again. Pressure transducer data is provided in Appendix A for the period between 23 February and June 2022.

### 6.1.1 Monitoring Wells on the West Side of the Mine Site

- Six paired groundwater wells were monitored for vertical flow direction at this location (Table 3 and Figure 1) during the May/June 2022 groundwater level monitoring program, and four paired groundwater wells during September/November 2022. Five paired wells (GW12-1, GW12-2, GW12-3, GW15-1 and GW15-2) exhibited downward (shallow to deep) groundwater flow in May/June 2022, while GW16-6 exhibited upward (deep to shallow) groundwater flow.
- Groundwater elevations at GW15-1 exhibited a downwards vertical gradient in 2022, while in 2021 the vertical gradient was upwards.
- The remaining monitoring wells on the west side of the mine site remained relatively stable to previous years.
- Based on a review of groundwater elevations on the west side of the mine site, it can be inferred that a groundwater divide between the Springer Pit and Bootjack Lake remains in the area of GW12-2(a,b), GW15-1(a/b) and GW15-2(a,b), as groundwater elevations at these wells remained higher than the surface water elevation in Springer Pit. Monitoring well GW15-1(a,b) generally exhibited groundwater elevations more similar to the elevation of water in Springer Pit in 2022. This groundwater divide results in groundwater flow both towards the east and west from the groundwater divide (shown in Figure 2).
- Surface water elevations in Cariboo Pit starting in June 2022 began to decrease, and during December 2022 was approximately the same surface water elevation as Springer Pit (Table 2 and Figure 2).

### 6.1.2 Monitoring Wells on the East Side of the Mine Site

- Five paired groundwater wells were monitored for vertical flow direction on the east side of the mine site (Table 3 and Figure 1). With the exception of paired wells GW16-7 and GW16-8 (in May and November) and GW16-1(a,b) (in May and November), vertical groundwater gradients exhibited a downward (shallow to deep) groundwater flow direction.
- In 2022, groundwater monitoring wells located on the east side of the mine site remained relatively consistent with groundwater elevations in previous years.
- Monitoring wells GW16-7 and GW16-8 had the lowest groundwater elevations in 2022, between approximately 913 and 915 masl, slightly elevated to previous year's datum which ranged between 906 to 907 masl during winter and spring but increased to elevations similar to 2022 in the summer 2021. These monitoring wells are located at the north end of Polley Lake, between Wight Pit and Polley Lake. These groundwater elevations were lower in elevation than Polley Lake, where the surface water elevation has stayed relatively consistent at approximately 920 masl (between 2015 and 2022). The remaining monitoring wells within the east side of the mine site exhibited groundwater elevations greater than the elevation of Polley Lake.
- The highest groundwater elevations were measured at GW12-4b, to the north/northeast of the southeast rock disposal site (SERDS) area, with elevations of approximately 976 masl.
- Based on a review of the groundwater elevations on the east side of the mine site, groundwater is inferred to flow from higher topographic elevations towards the east, to Polley Lake.

### 6.1.3 Monitoring Wells Around the TSF

- Eight paired groundwater wells were monitored for vertical flow direction in the area around the TSF (Table 3 and Figure 1). With the exception of groundwater flow directions in May at GW96-4(a), and both sampling events in GW00-1(a,b) and GW00-3(a,b), all located on the southwest side of the TSF, the vertical direction of groundwater flow was downward (from shallow to deep).
- Similar to 2021 conditions, monitoring well GW96-3a exhibited flowing artesian conditions each sampling event in 2022, with the exception of 13 June 2022 (water level 0.5 mbgs, and 17 November 2022 (water level frozen at the top of pipe [assumed artesian conditions]).
- Surface water elevations for the TSF have remained relatively stable between 2018 and 2022 (961 to 963 masl). The TSF surface water elevations continue to be higher than the groundwater elevations at the monitoring wells located to the south, southeast and northeast (Figure 2). An exception to this is groundwater elevations observed at GW16-5b, which were very similar to the surface water elevations observed at the TSF; this is consistent with the trends from 2019 to 2021.
- The groundwater flow direction around the TSF is dependent on the height of water within the TSF. Provided that surface water elevations within the TSF are greater than the surrounding wells, flow will be radial from the TSF to the monitoring wells. However, when the surface water elevation at the TSF is less than the groundwater elevations (specifically on the west and southwest side of the TSF), then groundwater will flow through the TSF, discharging towards the northeast and southeast. As shown in Figure 2, and based on groundwater elevations indicated in Table 2, it can be inferred that groundwater flows from the TSF towards the northeast, southeast and southwest, with potentially some inflow into the TSF from the west (i.e., area of GW16-5(b).

## 6.2 Groundwater Quality

MPMC provided their 2022 groundwater quality data files; monitoring changes in groundwater quality focused on nine Parameters of Interest (POIs) that included:

- physical parameters: hardness
- anions: sulphate
- nutrients: nitrate
- dissolved metals: aluminum, arsenic, cadmium, copper, molybdenum, and selenium

Monitoring wells were grouped into the following three mine site areas:

- Monitoring wells located on the west side of the mine site, between the mine site and Polley Lake: GW12-1(a, b), GW11-1(a, b), GW15-1(a, b), GW12-2(a, b), GW15-2(a, b), GW16-6(a, b), GW12-3(a, b), and GW96-7.
- Monitoring wells located on the east side of the mine site, between the mine site and Polley Lake: GW16-8, GW16-7, GW05-01, GW12-5 (a, b), 95-R5, GW12-4 (a, b), GW16-1 (a, b), and GW11-2 (a, b).
- Monitoring wells surrounding the TSF: GW16-2 through 5 (a, b), GW14-1, GW96-2 (a,b), GW96-3a, GW96-4 (a,b), GW00-2a, GW00-3 (a,b), and GW00-1 (a, b).

As per the CEMP (2019), groundwater quality data was compared against the British Columbia (BC) Ministry of Environment and Climate Change Strategy Contaminated Site Regulation (CSR; BC Reg. 375/96, O.C. 1480/96, as updated [includes amendments up to BC Reg. 179/2021, updated to 7 July 2021]) for protection of freshwater aquatic life (BC CSR AW-F) standards (BC 2021) and the BC Water Quality Guidelines for protection of aquatic life (ENV 2021). The result of the groundwater quality data screened against these guidelines was not interpreted beyond what is provided in Appendix C.

The following provides a summary of the water quality in 2022 and a comparison to the historical data. Groundwater chemistry plots are provided in Figure 3 through Figure 5. Note that parameter concentrations reported to be less than the laboratory detection limit are not plotted, and for any wells with less than one year of monitoring data, parameter concentration trends were not discerned.

### 6.2.1 West of Mine Site

Historical and current groundwater quality for monitoring wells located on the west side of the mine site, including those wells located between the mine site and Bootjack Lake, are shown in Figure 3. Select plots (nitrate, sulphate, and copper) are also provided in Appendix B, with a semi-log scale in order to show the lower concentrations. For the west side of the mine site, the following observations regarding water quality are made:

- Historically (2013-2021), hardness concentrations have ranged between approximately 24.8 mg/L at GW15-1a in 2015 to 545 mg/L at GW12-3a in 2018. In 2022, hardness concentrations ranged from a minimum concentration of 48.5 mg/L at GW12-2a in June, to a maximum concentration of 382 mg/L at GW12-1b in June 2022.
- Trends in sulphate concentrations were similar to those noted for hardness, with the greatest concentration fluctuations observed at GW15-1b, GW12-3a and GW12-1b. Although GW12-1b has shown an increasing trend between 2018 and early 2021, since then, sulphate concentrations have remained relatively consistent. A slight increasing trend was observed at GW16-6b, and GW15-2b, and a decreasing trend was observed at GW12-3a. The remaining wells indicated relatively stable concentrations of sulphate. In 2022, the sulphate concentrations ranged from a minimum of 23.4 mg/L at GW11-1b in May to a maximum of 307 mg/L at GW12-1b in May.
- Nitrate (as N) concentrations in monitoring wells between the mine site and Bootjack Lake are generally highest in GW12-3a, which has shown an overall decreasing trend in concentrations between May 2014 to September 2022. In general, nitrate (as N) concentrations have also experienced a decreasing trend at GW12-3a and GW12-2b. A slight increasing trend is observed at GW16-6b since 2019, and at GW12-3b. The remaining wells sampled within the last several years have exhibited a relatively stable trend in nitrate concentrations (as N). In 2022, the nitrate concentrations ranged from a maximum of 2.5 mg/L at GW12-3a in June to less than the laboratory reporting detection limit at several wells (see Figure 3 and nitrate plot provided in Appendix B).
- The following observations were made regarding the dissolved metal POIs:
  - Dissolved aluminum concentrations in 2022 have increased slightly in 2022 as compared to 2021 concentrations. A slight increasing trend is noted at GW12-2a and GW15-2b. An anomalous spike in concentration was observed in GW12-2b and GW96-7 in August 2022, and GW15-2b in November 2022.
  - Although some wells initially exhibited either a slightly increasing or decreasing trend in dissolved arsenic, arsenic concentrations overall have continued to stabilize at wells over the past several years, and no discernable trends are noted. Dissolved arsenic concentrations at GW12-3b have historically been the highest in the west area of site, which continues to exhibit a decreasing trend from 2017 to present. Since 2020, GW16-6a has surpassed arsenic concentrations at GW12-3b, to become the highest concentration of arsenic in the west area of the site.
  - Concentrations of dissolved cadmium at GW12-1b reached a peak in 2021 and decreased in concentration in 2022.
  - Dissolved copper concentrations at GW12-1b peaked in 2020, and since then have trended downwards.

- In general, trends in dissolved molybdenum are similar to previous years. GW12-1b exhibits a decreasing trend with its lowest concentration of dissolved molybdenum (0.011 mg/L) observed in September 2022.
- Dissolved selenium concentrations continue to remain stable or show a decreasing trend compared against historical results. Concentrations of dissolved selenium at GW12-3a show a decreasing trend since reaching a peak concentration in 2018.

### 6.2.2 East of Mine Site

Historical and current groundwater quality for monitoring wells located on the east side of the mine site, between the mine site and Polley Lake, are shown in Figure 4. Select plots (nitrate and aluminum) are also provided in Appendix B, with a semi-log scale in order to show the lower concentrations. The following observations regarding water quality are made:

- Historically, hardness concentrations have been relatively stable at the majority of the monitoring wells, with a slightly decreasing trend observed at GW12-5b overall. Overall, hardness has fluctuated the most at GW11-2 between 2015 and the present. In 2022, hardness concentrations ranged from a minimum of 17 mg/L at GW16-1a in September to a maximum of 594 mg/L at 95-R5 in June 2022.
- Sulphate concentration trends are observed to be generally increasing at GW16-7 and GW16-1b. Decreasing trends are observed at GW12-5b and GW16-8.
- Nitrate (as N) concentrations in monitoring wells between the mine site and Polley Lake were historically highest at GW16-7, with maximum concentrations in 2017 reported to be approximately 0.617 mg/L in June, but have decreased to levels similar to surrounding wells from 2020 to present. Over the last several years, nitrate (as N) concentrations have also been decreasing at GW12-5b. A spike in nitrate concentrations were observed at GW16-8 in 2022, with the highest concentration (0.27 mg/L) in December 2022. The remaining wells indicated relatively stable concentrations of nitrate (as N).
- The following observations were made regarding the dissolved metal POI trends:
  - Dissolved aluminum concentrations are generally less than 0.1 mg/L at all wells, with the exception of concentrations at GW11-2a, which have historically ranged from a peak of 1.44 mg/L (May 2020) to 0.91 mg/L (July 2022).
  - Dissolved arsenic concentrations are generally stable at wells on the east side of the mine site, with the exception of GW16-1a/b (which show opposite trends; 16-1a has been decreasing while 16-1b has been increasing), and 95-R5 (decreasing since 2019).
  - Dissolved cadmium concentrations appear to show seasonal variability at most wells, and no discernable trends are noted. An anomalous spike was observed at GW16-8 in November 2022, before returning to concentrations similar to historical values.
  - Concentrations of dissolved copper generally exhibit seasonal fluctuations which are comparable to concentrations seen in previous years. A peak concentration of dissolved copper was observed in GW11-2a in July 2022.

- Dissolved molybdenum concentrations are generally stable from previous years. An increasing trend is observed at GW11-2a (since 2018), GW12-4a, and GW16-1a.
- Dissolved selenium concentrations at GW16-7 reached a peak concentration in 2021, and since then have shown a decreasing trend. GW05-01 reached a peak concentration in February 2022, and since then have returned to concentrations below historical.

In addition to the above, MPMC staff collected additional groundwater samples from GW16-8 and GW16-7 throughout three sampling events in 2022, to monitor water quality during the filling of Wight Pit, and due to an observed increase in groundwater levels at each well. A more in-depth discussion on Wight Pit chemistry and water levels is included in Appendix D.

### 6.2.3 Surrounding TSF

Historical and current groundwater quality for monitoring wells located around the TSF are shown in Figure 5. Select plots (nitrate and aluminum) are also provided in Appendix B, with a semi-log scale in order to show the lower concentrations. The following observations regarding water quality are made:

- Over the last several years, hardness concentrations have remained relatively stable at the wells surrounding the TSF, with the exception of a slightly increasing trend at GW96-4b and GW16-2b, and a decreasing trend at GW16-3a and GW16-4b. The maximum hardness concentration observed was 633 mg/L at GW96-4b in September 2022, and the minimum concentration observed was 32 mg/L at GW96-3a in September 2022.
- Sulphate concentration trends were observed to be increasing over the last several years at GW96-4b, GW16-2b and GW96-2b. Sulphate concentrations indicated a decreasing trend over the last several years at GW16-3a, GW00-1b, and GW16-4a. The remaining wells indicated relatively stable or slightly decreasing concentrations of sulphate.
- No notable changes in nitrate (as N) concentrations in monitoring wells surrounding the TSF were observed, with the exception of decreasing concentrations observed at GW16-2b since mid-2019, and stabilizing concentrations observed at GW00-1b and GW96-4b, which indicated current concentrations similar to surrounding wells.
- The following observations were made in regards to the dissolved metal POIs over the last several years:
  - Dissolved aluminum concentrations for monitoring wells surrounding TSF have stabilized to concentrations generally below 0.04 mg/L since 2019.
  - Dissolved arsenic, cadmium, copper, molybdenum and selenium concentrations have remained relatively the same at the monitoring wells over the last six years, with the following exceptions:
    - A temporary increase in dissolved arsenic concentration was observed in GW96-3a from 2019 – 2020, and has since decreased in concentration, although it still has the highest dissolved arsenic concentration observed in the TSF.
    - Dissolved cadmium concentrations showed an increasing trend in 2022 at was observed in GW00-1b and GW96-4b in 2022.

- A peak in dissolved copper concentrations was observed in GW00-1b and GW14-1 in 2022. The remaining concentrations appear to exhibit seasonal fluctuations.
- A decreasing trend in dissolved molybdenum since 2013 was observed at GW00-1b, while an increasing trend in dissolved molybdenum concentrations was observed in GW96-2b and GW96-3a.

## 6.3 Springer-Cariboo Pit Groundwater Seepage

Hydrogeological conditions around the Springer-Cariboo Pit are described in Golder (2016) and Golder (2017b). A key hydrogeological feature that affects groundwater movement out of the pit is a groundwater “mound” to the west of the pit. The elevation of the mound rises and falls in response to changes in surrounding water levels, including those in Springer Pit. When water levels in Springer Pit rise above approximately 1,020 masl, a small flux (~10 $m^3$/day) of groundwater toward Bootjack Lake is anticipated. This volume has been estimated to increase to 100 $m^3$/day at an elevation of 1,030 masl and 400 $m^3$/day at 1,050 masl (Golder 2016).

Water levels in Springer Pit in 2022 were reported to range from 982.74 masl (January) to 975.31 masl (December) and showed a general decreasing period throughout the year. In 2022, surface water elevations at Springer Pit were generally lower than the groundwater elevations within monitoring wells associated with the west side of the mine site (Figure 2). GW15-1a generally fell within the same elevation range as Springer Pit during 2022.

Water levels in Cariboo Pit in 2022 were reported to peak in April (1,027.92 masl), after which they steadily declined to an elevation of 976.13 masl (December).

Based on a review of groundwater elevations on the west side of the mine site, it can be inferred that a groundwater divide between the Springer Pit and Bootjack Lake remains in the area of GW12-2(a,b) and GW15-2(a,b), as groundwater elevations at these wells remained higher than the surface water elevation in Springer Pit. This groundwater divide results in groundwater flow both towards the east and west from the groundwater divide (shown in Figure 2).

Based on the information above it can be inferred that groundwater leakage from Springer Pit to Bootjack Lake did not occur in 2022.

# 7.0 CONCLUSIONS

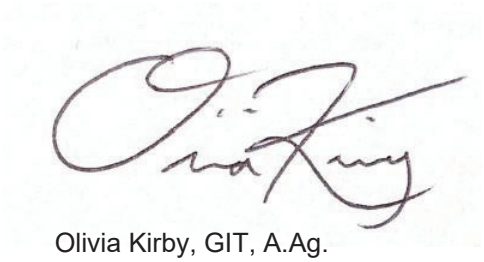
Based on the results of 2022 monitoring program, the following conclusions are provided:

- This report meets the reporting requirements of BC ENV Permit 11678; Section 4.2.3, summarizing the results of the groundwater monitoring program at the Site, including a trend analyses for parameters of concern and groundwater levels.
- A groundwater divide is present in the area of GW15-1(a,b), GW15-2(a,b) and GW12-2(a,b) (located on the west side of the mine site), between Springer Pit and Bootjack Lake. This groundwater divide results in groundwater flowing from these monitoring wells towards the east, to Springer Pit, and towards the west to Bootjack Lake. The presence of this divide, along with a surface water elevation in Springer Pit in 2022, infers that groundwater seepage from Springer Pit to Bootjack Lake is not occurring.
- Slightly increasing and/or decreasing POI concentration trends at some locations were noted; however, significant changes to groundwater quality have not been identified in 2022.
- Based on requirements of monitoring/sampling frequency set out in the CEMP (varies dependent on well), no deficiencies were identified. Although select wells were not monitored/sampled, this was a result of the monitoring wells being dry, or containing an insufficient volume of water, which is not considered a permit deficiency. Wells not monitored/sampled included:
  - GW00-2a – sampling was attempted on 30 May 2022, 13 June 2022, and 13 September 2022; however, the well was not sampled due to insufficient groundwater and the presence of mud within the well. The well was visited again on 17 November 2022, but still no groundwater was present.
  - GW15-2b required quarterly groundwater sampling; however, only three samples were collected in 2022.
  - GW15-1b required quarterly static water level measurements; however, only one measurement was collected in 2022, due to insufficient water volumes.

# 8.0 RECOMMENDATIONS

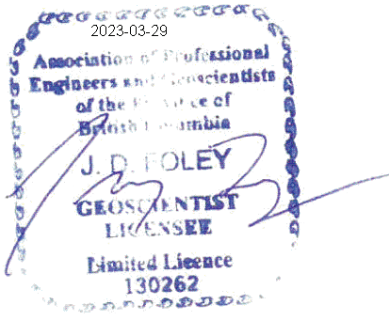
Based on the results of the 2022 annual groundwater monitoring report, the following recommendations are provided.

- Continue the groundwater level and quality monitoring program at the mine site. This includes measuring the depth to groundwater at the various on-site monitoring wells as per the requirement of the 2019 CEMP (preferably on the same day in May and November 2022).
- Static water levels at GW12-2a and GW12-2b should be obtained prior to removing and after replacement of transducers.
- GW00-2a should be redeveloped in the spring/early summer, when sufficient water is available within the well, to remove the sediment within the well bottom.
- Surface water elevations at Polley Lake, Bootjack Lake, and the TSF should be conducted the same day as the groundwater elevations are collected to inform the groundwater contour figure.
- Dissolved organic carbon is a required input parameter to compare dissolved copper against the BC ENV guideline for protection of aquatic life. It is recommended that this parameter is included in the CEMP for select wells in each area (west, east and TSF) and analyzed for in the 2023 sampling program.
- If Wight Pit will continue to be used for temporary storage of dewatered groundwater from contact water sources in 2023, in order to continue assessing groundwater quality impacts resulting from the storage of water in Wight Pit, the following monitoring recommendations are provided:
  - A minimum of monthly water level measurements (i.e., geodetic elevations) should be collected from Wight Pit, GW16-7, GW17-8 and Polley Lake to assess elevations in comparison to local groundwater elevations and Polley Lake surface water elevations.
  - Consideration should be given to installing a pressure transducer and barologger at either GW16-7, GW16-8 or GW05-01, all located between Wight Pit and Polley Lake.
  - As per the CEMP, monitoring wells GW16-7 and GW16-8 should be sampled semi-annually, and GW05- 01 should be sampled quarterly, for the parameters of concern (MPMC 2019).



# 9.0 CLOSURE

The reader is referred to the Study Limitations, which precedes the text and forms an integral part of this report.



We trust the above information is sufficient for your needs at this time. Should you have any questions or require clarification, please do not hesitate to contact the undersigned.

| GW16-8 | E | 18.4 | 907 | | 906.782 | | 907.103 | | 913.973 | |

**Notes:** Negative vertical gradients denote a downward (shallow to deep) hydraulic gradient
If a groundwater elevation was missing for a paired well, or a well depth unknown, a vertical hydraulic gradient was not calculated.
E = monitoring wells located on the east side of the mine site .
W = monitoring wells located on the west side of the mine site .
TSF = monitoring wells located around the Tailings Storage Facility.
0.286 indicates vertical hydarulic gradient between paired wells.
