**This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.**

**Key**

**Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.**
**CAS Number: Chemical Abstracts Service number is a unique identifier assigned to discrete substances.**
**DQO: Data Quality Objective.**
**LOR: Limit of Reporting (detection limit).**
**RPD: Relative Percent Difference.**

## *Workorder Comments*

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

## *Summary of Outliers*

### *Outliers : Quality Control Samples*

- No Method Blank value outliers occur.
- Duplicate outliers occur - please see following pages for full details.
- Laboratory Control Sample (LCS) outliers occur - please see following pages for full details.
- No Test sample Surrogate recovery outliers exist.

### *Outliers: Reference Material (RM) Samples*

- Reference Material (RM) Sample outliers occur - please see the following pages for full details.

## Outliers : Analysis Holding Time Compliance (Breaches)

- No Analysis Holding Time Outliers exist.

## Outliers : Frequency of Quality Control Samples

- Quality Control Sample Frequency Outliers occur - please see following pages for full details.

## Outliers : Quality Control Samples

*Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes*

Matrix: **Biota**

| Analyte Group | Laboratory sample ID | Client/Ref Sample ID | Analyte | CAS Number | Method | Result | Limits | Comment |
|---|---|---|---|---|---|---|---|---|
| **Duplicate (DUP) RPDs** | | | | | | | | |
| Metals | VA22B2821-013 | POL_LSU-Li-5_2022-05 | chromium | 7440-47-3 | E472 | 0.41 % DUP-H, J | Diff <2x LOR | Low Level DUP DQO exceeded (difference > 2 LOR). |
| Metals | VA22B2821-042 | BOL_LSU-Li-2_2022-05 | chromium | 7440-47-3 | E472 | 0.46 % DUP-H, J | Diff <2x LOR | Low Level DUP DQO exceeded (difference > 2 LOR). |

### Result Qualifiers

| Qualifier | Description |
|---|---|
| *DUP-H* | *Duplicate results outside ALS DQO, due to sample heterogeneity.* |
| *J* | *Duplicate results and limits are expressed in terms of absolute difference.* |

| Laboratory Control Sample (LCS) Recoveries | | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| Metals | QC-MRG8-562335002 | ---- | boron | 7440-42-8 | E472 | 72.6 % MES | 80.0-120% | Recovery less than lower control limit |
| Metals | QC-MRG8-562335002 | ---- | lithium | 7439-93-2 | E472 | 76.0 % MES | 80.0-120% | Recovery less than lower control limit |

### Result Qualifiers

| Qualifier | Description |
|---|---|
| *MES* | *Data Quality Objective was marginally exceeded (by < 10% absolute) for < 10% of analytes in a Multi-Element Scan / Multi-Parameter Scan (considered acceptable as per OMOE & CCME).* |

| Reference Material (RM) Sample | | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| Metals | QC-MRG8-562335003 | ---- | lead | 7439-92-1 | E472 | 69.9 % MES | 70.0-130% | Recovery less than lower control limit |

### Result Qualifiers

| Qualifier | Description |
|---|---|
| *MES* | *Data Quality Objective was marginally exceeded (by < 10% absolute) for < 10% of analytes in a Multi-Element Scan / Multi-Parameter Scan (considered acceptable as per OMOE & CCME).* |

# Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Matrix: **Biota**

Rec. HT: ALS recommended hold time (see units).

# Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Biota**

Evaluation: ✗ = QC frequency outside specification; ✓ = QC frequency within specification.

| Quality Control Sample Type | | | Count | | Frequency (%) | | |
|---|---|---|---|---|---|---|---|
| *Analytical Methods* | *Method* | *QC Lot #* | *QC* | *Regular* | *Actual* | *Expected* | *Evaluation* |
| **Laboratory Duplicates (DUP)** | | | | | | | |

## Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

| Analytical Methods | Method / Lab | Matrix | Method Reference | Method Descriptions |
|---|---|---|---|---|
| Moisture Content by Gravimetry | E144<br><br>Vancouver - Environmental | Biota | Puget Sound Water Quality Authority/CCME PHC in Soil - Tier 1 | Moisture is measured gravimetrically by drying the sample at 105°C. Moisture content is calculated as the weight loss (due to water) divided by the wet weight of the sample, expressed as a percentage. |
| Moisture Content by Gravimetry (Micro) | E144-H<br><br>Vancouver - Environmental | Biota | Puget Sound Water Quality Authority/BC MOE Lab Manual | Moisture is measured gravimetrically by drying the sample at <60°C for a minimum of 3 days to constant weight. Moisture content is calculated as the weight loss (due to water) divided by the wet weight of soil, expressed as a percentage. |
| Metals in Biota by CRC ICPMS (DRY units, Routine) | E440<br><br>Vancouver - Environmental | Biota | EPA 200.3/6020B (mod) | Tissue samples are homogenized and sub-sampled prior to hotblock digestion with HNO3, HCl, and H2O2. Analysis is by Collision/Reaction Cell ICPMS.<br><br>Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered. |
| Silver in Biota by CRC ICPMS (DRY units, Routine) | E440.Ag<br><br>Vancouver - Environmental | Biota | EPA 200.3/6020B (mod) | Tissue samples are homogenized and sub-sampled prior to hotblock digestion with HNO3, HCl, and H2O2. Analysis is by Collision/Reaction Cell ICPMS.<br><br>Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percent Difference (RPD) and Data Quality Objectives
- Reference Material (RM) Report; Recovery and Data Quality Objectives
- Method Blank (MB) Report; Recovery and Data Quality Objectives
- Laboratory Control Sample (LCS) Report; Recovery and Data Quality Objectives

## *Signatories*

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

| *Signatories* | *Position* | *Laboratory Department* |

| Salimah Khimani | Lab Assistant | Vancouver Metals, Burnaby, British Columbia |

## General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

## Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

## Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

## Qualifiers

| Qualifier | Description |
|---|---|
| DUP-H | Duplicate results outside ALS DQO, due to sample heterogeneity. |
| J | Duplicate results and limits are expressed in terms of absolute difference. |

## Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

## Qualifiers

| Qualifier | Description |
|---|---|
| *MBRR* | *Initial MB for this submission had positive results for flagged analyte (data not shown). Low level samples were repeated with new QC (2nd MB results shown). High level results (>5x initial MB level) and non-detect results were reported and are defensible* |

## Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Biota**

## Qualifiers

| Qualifier | Description |
|---|---|
| MES | *Data Quality Objective was marginally exceeded (by < 10% absolute) for < 10% of analytes in a Multi-Element Scan / Multi-Parameter Scan (considered acceptable as per OMOE & CCME).* |

## Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well-established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be ALS long-term mean values (for empirical test methods).

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

## *Signatories*

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

| *Signatories* | *Position* | *Laboratory Department* |
|---|---|---|
| Alex Thornton | Analyst | Metals, Burnaby, British Columbia |
| Kevin Duarte | Supervisor - Metals ICP Instrumentation | Metals, Burnaby, British Columbia |
| Kinny Wu | Lab Analyst | Metals, Burnaby, British Columbia |
| Owen Cheng | | Metals, Burnaby, British Columbia |
| Robin Weeks | Team Leader - Metals | Metals, Burnaby, British Columbia |
| Salimah Khimani | Lab Assistant | Metals, Burnaby, British Columbia |
| Sam Silveira | Lab Assistant | Metals, Burnaby, British Columbia |

## General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

| *Unit* | *Description* |
|---|---|
| % | percent |
| mg/kg | milligrams per kilogram |
| mg/kg wwt | milligrams per kilogram wet weight |

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

## Qualifiers

| *Qualifier* | *Description* |
|---|---|
| *DLB* | *Detection Limit Raised. Analyte detected at comparable level in Method Blank.* |
| *DLIS* | *Detection Limit Adjusted due to insufficient sample.* |

## Analytical Results

**This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.**

**Key**

**Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.**
**CAS Number: Chemical Abstracts Service number is a unique identifier assigned to discrete substances.**
**DQO: Data Quality Objective.**
**LOR: Limit of Reporting (detection limit).**
**RPD: Relative Percent Difference.**

## *Workorder Comments*

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

## *Summary of Outliers*

### *Outliers : Quality Control Samples*

- No Method Blank value outliers occur.
- Duplicate outliers occur - please see following pages for full details.
- Laboratory Control Sample (LCS) outliers occur - please see following pages for full details.
- No Test sample Surrogate recovery outliers exist.

### *Outliers: Reference Material (RM) Samples*

- No Reference Material (RM) Sample outliers occur.

### *Outliers : Analysis Holding Time Compliance (Breaches)*

- No Analysis Holding Time Outliers exist.

## *Outliers : Frequency of Quality Control Samples*

- No Quality Control Sample Frequency Outliers occur.

## Outliers : Quality Control Samples

*Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes*

Matrix: **Biota**

| Metals | VA22C4917-001 | QUL-NHC_NSC-WB-1_2022-10 | Strontium | 7440-24-6 | E440 | 69.9 % DUP-H | 60% | Duplicate RPD does not meet the DQO for this test. |

### Result Qualifiers

| Qualifier | Description |
|---|---|
| *DUP-H* | *Duplicate results outside ALS DQO, due to sample heterogeneity.* |

| | | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| **Laboratory Control Sample (LCS) Recoveries** | | | | | | | | |
| Metals | QC-MRG5-7976180 02 | ---- | Iron | 7439-89-6 | E440 | 122 % MES | 80.0-120% | Recovery greater than upper control limit |

### Result Qualifiers

| Qualifier | Description |
|---|---|
| *MES* | *Data Quality Objective was marginally exceeded (by < 10% absolute) for < 10% of analytes in a Multi-Element Scan / Multi-Parameter Scan (considered acceptable as per OMOE & CCME).* |

# Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Matrix: **Biota**

Evaluation: × = Holding time exceedance ; ✓ = Within Holding Time

**Legend & Qualifier Definitions**

Rec. HT: ALS recommended hold time (see units).

# Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Biota**

Evaluation: × = QC frequency outside specification; ✓ = QC frequency within specification.

| Quality Control Sample Type | | | Count | | Frequency (%) | | |
|---|---|---|---|---|---|---|---|
| *Analytical Methods* | *Method* | *QC Lot #* | *QC* | *Regular* | *Actual* | *Expected* | *Evaluation* |
| **Laboratory Duplicates (DUP)** | | | | | | | |
| Mercury in Biota by CVAAS (DRY units, Micro) | E511 | 805879 | 1 | 17 | 5.8 | 5.0 | ✓ |
| Mercury in Biota by CVAAS (DRY units, Routine) | E510 | 794597 | 8 | 111 | 7.2 | 5.0 | ✓ |
| Mercury in Biota by CVAAS (WET units, Micro) | E511A | 805880 | 1 | 17 | 5.8 | 5.0 | ✓ |

## Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

| Analytical Methods | Method / Lab | Matrix | Method Reference | Method Descriptions |
|---|---|---|---|---|
| Moisture Content by Gravimetry | E144<br><br>Vancouver - Environmental | Biota | Puget Sound Water Quality Authority/CCME PHC in Soil - Tier 1 | Moisture is measured gravimetrically by drying the sample at 105°C. Moisture content is calculated as the weight loss (due to water) divided by the wet weight of the sample, expressed as a percentage. |
| Moisture Content by Gravimetry (Biopsy) | E144A<br><br>Vancouver - Environmental | Biota | Puget Sound Water Quality Authority/CCME PHC in Soil - Tier 1 | This analysis is carried out gravimetrically by drying the sample at < 60 deg. C for a minimum of three days. |
| Moisture Content by Gravimetry (Micro) | E144-H<br><br>Vancouver - Environmental | Biota | Puget Sound Water Quality Authority/BC MOE Lab Manual | Moisture is measured gravimetrically by drying the sample at < 60°C for a minimum of 3 days to constant weight. Moisture content is calculated as the weight loss (due to water) divided by the wet weight of soil, expressed as a percentage. |
| Metals in Biota by CRC ICPMS (DRY units, Routine) | E440<br><br>Vancouver - Environmental | Biota | EPA 200.3/6020B (mod) | Tissue samples are homogenized and sub-sampled prior to hotblock digestion with HNO3, HCl, and H2O2. Analysis is by Collision/Reaction Cell ICPMS.<br><br>Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered. |
| Silver in Biota by CRC ICPMS (DRY units, Routine) | E440.Ag<br><br>Vancouver - Environmental | Biota | EPA 200.3/6020B (mod) | Tissue samples are homogenized and sub-sampled prior to hotblock digestion with HNO3, HCl, and H2O2. Analysis is by Collision/Reaction Cell ICPMS.<br><br>Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered. |
| Titanium in Biota by CRC ICPMS (DRY units, Routine) | E440.Ti<br><br>Vancouver - Environmental | Biota | EPA 200.3/6020B (mod) | Tissue samples are homogenized and sub-sampled prior to hotblock digestion with HNO3, HCl, and H2O2. | Preparation Methods | Method / Lab | Matrix | Method Reference | Method Descriptions |
|---|---|---|---|---|
| Metals and Mercury Biota Digestion | EP440<br>Vancouver - Environmental | Biota | EPA 200.3 | This method uses a heated strong acid digestion with HNO3, HCl, and H2O2 and is intended to provide a conservative estimate of bio-available metals. |
| Metals and Mercury Biota Digestion (Micro) | EP472<br>Vancouver - Environmental | Biota | EPA 200.3 | This method, designed for small sample amounts, uses a heated strong acid digestion with HNO3, HCl, and H2O2 and is intended to provide a conservative estimate of bio-available metals. |
| Metals and Mercury Biota Digestion (Biopsy) | EP475<br>Vancouver - Environmental | Biota | EPA 200.3/200.8 (mod) | Samples are digested with nitric acid, hydrochloric acid, and hydrogen peroxide. Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered. |

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percent Difference (RPD) and Data Quality Objectives
- Reference Material (RM) Report; Recovery and Data Quality Objectives
- Method Blank (MB) Report; Recovery and Data Quality Objectives
- Laboratory Control Sample (LCS) Report; Recovery and Data Quality Objectives

## *Signatories*

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

## General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

## Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

## Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

## Qualifiers

| *Qualifier* | *Description* |
|---|---|
| *DUP-H* | *Duplicate results outside ALS DQO, due to sample heterogeneity.* |

## Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

## Qualifiers

| Qualifier | Description |
|---|---|
| *MBRR* | *Initial MB for this submission had positive results for flagged analyte (data not shown). Low level samples were repeated with new QC (2nd MB results shown). High level results (>5x initial MB level) and non-detect results were reported and are defensible* |

## Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

## Qualifiers

| Qualifier | Description |
|---|---|
| *MES* | *Data Quality Objective was marginally exceeded (by < 10% absolute) for < 10% of analytes in a Multi-Element Scan / Multi-Parameter Scan (considered acceptable as per OMOE & CCME).* |

## Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well-established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be ALS long-term mean values (for empirical test methods).

**Drinking Water (DW) Samples[1] (client use)**

Are samples taken from a Regulated DW System? ☐ YES ☐ NO

Are samples for human drinking water use? ☐ YES ☐ NO

**Special Instructions / Specify Criteria to add on report by clicking on the drop-down list below (electronic COC only)**

If sample is insufficient for regular digestion and analysis, please contact kbatchelar@minnow.ca or pstecko@minnow.ca to discuss analysis options.

**SAMPLE CONDITION AS RECEIVED (lab use only)**

Frozen ☐ SIF Observations Yes ☐ No ☐

Ice Packs ☐ Ice Cubes ☐ Custody seal intact Yes ☐ No ☐

Cooling Initiated ☐

| INITIAL COOLER TEMPERATURES °C | | | FINAL COOLER TEMPERATURES °C | | |

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

## *Signatories*

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

| *Signatories* | *Position* | *Laboratory Department* |
|---|---|---|
| Alex Thornton | Analyst | Metals, Burnaby, British Columbia |
| Dan Gebert | Laboratory Analyst | Metals, Burnaby, British Columbia |
| Kevin Duarte | Supervisor - Metals ICP Instrumentation | Metals, Burnaby, British Columbia |
| Kinny Wu | Lab Analyst | Metals, Burnaby, British Columbia |
| Owen Cheng | | Metals, Burnaby, British Columbia |
| Parnian Sane | Analyst | Metals, Burnaby, British Columbia |
| Salimah Khimani | Lab Assistant | Metals, Burnaby, British Columbia |

## General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

| *Unit* | *Description* |
|---|---|
| % | percent |
| mg/kg | milligrams per kilogram |
| mg/kg wwt | milligrams per kilogram wet weight |

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

## Workorder Comments

***Amendment (16/02/2023): This report has been amended and re-released to allow the reporting of additional analytical data. Includes the analysis data for the sample ALS indentify as VA22C5005-027.***

***Amendment (16/02/2023): This report has been amended to correct the sample collection date.***

***Amendment (16/02/2023): This report has been amended following changes to the analytical data reported. The quality system is being utilised to resolve this issue. The mercury data, for the sample ALS identify as VA22C5005-032, has been modified.***

**This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.**

**Key**

**Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.**
**CAS Number: Chemical Abstracts Service number is a unique identifier assigned to discrete substances.**
**DQO: Data Quality Objective.**
**LOR: Limit of Reporting (detection limit).**
**RPD: Relative Percent Difference.**

## *Workorder Comments*

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

## *Summary of Outliers*

### *Outliers : Quality Control Samples*

- No Method Blank value outliers occur.
- Duplicate outliers occur - please see following pages for full details.
- Laboratory Control Sample (LCS) outliers occur - please see following pages for full details.
- No Test sample Surrogate recovery outliers exist.

### *Outliers: Reference Material (RM) Samples*

- No Reference Material (RM) Sample outliers occur.

## Outliers : Analysis Holding Time Compliance (Breaches)

- No Analysis Holding Time Outliers exist.

## Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

## Outliers : Quality Control Samples

*Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes*

Matrix: **Biota**

| Analyte Group | Laboratory sample ID | Client/Ref Sample ID | Analyte | CAS Number | Method | Result | Limits | Comment |
|---|---|---|---|---|---|---|---|---|
| **Duplicate (DUP) RPDs** | | | | | | | | |
| Metals | VA22C5005-007 | QUR_RB-M-7_2022-10 | Barium | 7440-39-3 | E440 | 41.0 % DUP-H | 40% | Duplicate RPD does not meet the DQO for this test. |
| Metals | VA22C5005-007 | QUR_RB-M-7_2022-10 | Strontium | 7440-24-6 | E440 | 75.3 % DUP-H | 60% | Duplicate RPD does not meet the DQO for this test. |

### Result Qualifiers

| Qualifier | Description |
|---|---|
| *DUP-H* | *Duplicate results outside ALS DQO, due to sample heterogeneity.* |

| Laboratory Control Sample (LCS) Recoveries | | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| Metals | QC-MRG5-7995420 02 | ---- | Boron | 7440-42-8 | E472 | 73.7 % MES | 80.0-120% | Recovery less than lower control limit |
| Metals | QC-MRG5-7905170 02 | ---- | Silver | 7440-22-4 | E472.Ag | 77.3 % MES | 80.0-120% | Recovery less than lower control limit |
| Metals | QC-MRG5-7995420 02 | ---- | Silver | 7440-22-4 | E472.Ag | 79.6 % MES | 80.0-120% | Recovery less than lower control limit |

### Result Qualifiers

| Qualifier | Description |
|---|---|
| *MES* | *Data Quality Objective was marginally exceeded (by < 10% absolute) for < 10% of analytes in a Multi-Element Scan / Multi-Parameter Scan (considered acceptable as per OMOE & CCME).* |

# Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Matrix: **Biota**

Evaluation: × = Holding time exceedance ; ✓ = Within Holding Time

| Analyte Group / Container / Client Sample ID(s) | Method | Sampling Date | Extraction / Preparation | | | | Analysis | | | |

**Legend & Qualifier Definitions**

Rec. HT: ALS recommended hold time (see units).

# Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Biota**

Evaluation: × = QC frequency outside specification; ✓ = QC frequency within specification.

| Quality Control Sample Type | | | Count | | Frequency (%) | | |
|---|---|---|---|---|---|---|---|
| *Analytical Methods* | *Method* | *QC Lot #* | *QC* | *Regular* | *Actual* | *Expected* | *Evaluation* |
| **Laboratory Duplicates (DUP)** | | | | | | | |

## Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

| Analytical Methods | Method / Lab | Matrix | Method Reference | Method Descriptions |
|---|---|---|---|---|
| Moisture Content by Gravimetry | E144<br><br>Vancouver - Environmental | Biota | Puget Sound Water Quality Authority/CCME PHC in Soil - Tier 1 | Moisture is measured gravimetrically by drying the sample at 105°C. Moisture content is calculated as the weight loss (due to water) divided by the wet weight of the sample, expressed as a percentage. |
| Moisture Content by Gravimetry (Biopsy) | E144A<br><br>Vancouver - Environmental | Biota | Puget Sound Water Quality Authority/CCME PHC in Soil - Tier 1 | This analysis is carried out gravimetrically by drying the sample at < 60 deg. C for a minimum of three days. |
| Moisture Content by Gravimetry (Micro) | E144-H<br><br>Vancouver - Environmental | Biota | Puget Sound Water Quality Authority/BC MOE Lab Manual | Moisture is measured gravimetrically by drying the sample at < 60°C for a minimum of 3 days to constant weight. Moisture content is calculated as the weight loss (due to water) divided by the wet weight of soil, expressed as a percentage. |
| Metals in Biota by CRC ICPMS (DRY units, Routine) | E440<br><br>Vancouver - Environmental | Biota | EPA 200.3/6020B (mod) | Tissue samples are homogenized and sub-sampled prior to hotblock digestion with HNO3, HCl, and H2O2. Analysis is by Collision/Reaction Cell ICPMS.<br><br>Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered. |
| Silver in Biota by CRC ICPMS (DRY units, Routine) | E440.Ag<br><br>Vancouver - Environmental | Biota | EPA 200.3/6020B (mod) | Tissue samples are homogenized and sub-sampled prior to hotblock digestion with HNO3, HCl, and H2O2. This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percent Difference (RPD) and Data Quality Objectives
- Reference Material (RM) Report; Recovery and Data Quality Objectives
- Method Blank (MB) Report; Recovery and Data Quality Objectives
- Laboratory Control Sample (LCS) Report; Recovery and Data Quality Objectives

## *Signatories*

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

## General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

## Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

## Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

## Qualifiers

| *Qualifier* | *Description* |
|---|---|
| *DUP-H* | *Duplicate results outside ALS DQO, due to sample heterogeneity.* |

## Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

## Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

## Qualifiers

| Qualifier | Description |
|---|---|
| *MES* | *Data Quality Objective was marginally exceeded (by < 10% absolute) for < 10% of analytes in a Multi-Element Scan / Multi-Parameter Scan (considered acceptable as per OMOE & CCME).* |

## Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well-established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be ALS long-term mean values (for empirical test methods).

# FISH AGING

## AAE Laboratory Report 22-29-3

## (Finalized July 5, 2022)

## 1. SAMPLE SET

AAE Tech Services Inc. (AAE) was contracted by Minnow Environmental to provide ageing structure processing and age estimation services for samples collected under Project 22-29, received June 13, 2022. This included 16 pairs of Rainbow Trout otoliths and 16 Longnose Sucker fin ray clips. A full data spreadsheet, including sample ID, structure type, ageing process used, and age estimation results, is provided in the PDF data sheets accompanying this report.

## 2. AGEING METHOD: OTOLITHS

Sagittal otolith pairs were provided for Rainbow Trout samples in individual enumerated sample envelopes, along with sets of scales as the secondary ageing structure.

All otoliths in this sample set were analyzed using the "Sectioning" method. This method is used primarily for larger otoliths with a deep sulcus or irregular shape. This method was selected only after the "Read Whole" method (non-destructive, often used in smaller otoliths) was found to be inaccurate.

*OTOLITH PREPARATION*

Otolith pairs were examined under magnification and evaluated for any issues related to structural integrity (e.g. cracks, fractures, chips, pieces missing) and deformation (crystallization, misshapen lobes). One otolith is selected for processing and is embedded in Cold Cure epoxy resin. Samples are allowed to cure for 48 hours before sectioning. Samples are marked for sectioning under magnification using a fine tip marker to identify the nucleus (centre) and section plane (cut edge to be examined) for each otolith. Using the marks as a guide, a Buehler Isomet low speed dual-blade saw is used to cut a single section, with the section plane passing through the nucleus. This surface is then polished with a series of lapping film (30, 12, and 0.3 microns) to improve clarity of the section plane.

To carry out age estimation, an otolith section is submerged in water under magnification with the polished surface facing up.

*AGE ESTIMATION*

Annuli are counted outward from the nucleus. Checking (false-annuli) is common in many species, including Rainbow Trout in particular within the first 1-3 years of growth. Annuli are assessed for density (contrast between summer and winter growth), clarity (ability to differentiate individual annuli) and continuity (e.g. segmentation, merging, fading). Photographs under magnification are taken of each sample for reference and revision. Ages are recorded with a Confidence Index (CI) based on the condition of the otolith, annuli assessment, and the confidence of the reader in the age recorded, as described in Table 1.

**Table 1.** Confidence Index (CI) table; applied to each age estimate, reflecting the reader's confidence in the age recorded.

| Confidence Index (CI) | Abbreviation | Qualitative Meaning | Quantitative Meaning |
|---|---|---|---|
| Good | G | Pattern very clear with no interpretational problems | Reader would always get the same age |
| Fairly Good | FG | Pattern is clear with few easy interpretational problems | Reader would get the same age most of the time for fish <20 years |
| Fair | F | Pattern is fairly clear with some areas presenting easy and moderate interpretational problems | Reader would be within one year most of the time for fish <20 years |
| Fairly Poor | FP | Pattern is fairly unclear, presenting a number of difficult interpretational problems | Reader would be within 2-3 years for fish <20 years |
| Poor | P | Pattern is very unclear, presenting significant interpretational problems | Reader has little confidence in repeatability of age |

## 3. AGEING METHOD: FIN RAYS

Fin ray clips for Longnose Sucker samples were provided in individual enumerated sample envelopes, along with sets of scales as the secondary ageing structure.

Fin rays are often used instead of otoliths for age estimation (e.g. non-lethal sampling). Fin rays are the preferred ageing structure in instances where otolith samples are not available; the accuracy and precision of age estimation from fin clips or dorsal spines is much higher than scales. When sampling fish species known to have a consistently low-quality otolith (e.g. Northern Pike, Catostomidae spp.), fin rays are the preferred structure with which to derive age estimates. When possible, AAE should be consulted prior to sample collection or shipment to determine the ideal ageing structure for a particular fish species.

All fin ray clips in this sample set were processed and analyzed using the "Sectioning" method, similar to that used for the otoliths.

*FIN RAY PREPARATION*

Fin rays are embedded in Cold Cure epoxy resin to increase the structural integrity of the sample and prevent damage or degradation of the sample during processing. Samples are cured for 48 hours before sectioning. A fine-tip marker is used to mark a cut line on the sample, following the base of the fin rays and perpendicular to the primary (1$^{st}$) ray. A Buehler Isomet low speed single-blade saw is used to cut three successive sections beginning at the marked base of the rays. Three sections (minimum) are taken to compensate for misalignment or staggering of the rays or spines, due to shifting during the embedding process, or the inherent shape of the structure; the first section may not pass through the base of all three (or more) rays. Each section is enumerated by the order of cut (I, II, III, etc.) directly onto the sample using a fine-tip pencil. The analysis of multiple spines enables age verification and improves the reliability of the age estimate, especially in the case of heavy checking or faint/thin annuli.

The three sections are submerged in a dish of water under magnification with the ageing surface facing up. Orientation is matched across all three sections to ensure accurate comparison.

*AGE ESTIMATION*

Annuli are counted out from the nucleus (center ring) in the first cut section, followed by the second and third; age estimation is based on analysis of all available sections. Photographs under magnification are taken of each sample for reference and revision. Ages are recorded with a Confidence Index (CI) based on the condition of the fin ray section, and the confidence of the reader in the age recorded (Table 1).

## 4. AGEING RESULTS

Age estimates were provided in July 2022 based on the otolith, fin ray, and scale samples provided.

Rainbow Trout age estimates ranged from 3 to 6 years of age, with a modal age of 4 years. CI values were fairly high, with the majority of samples recorded as either F or FG.

Longnose Sucker age estimates ranged from 5 to 13 years of age, with a modal age of 7 years. CI values were also fairly high, with the majority of samples recorded as either F or FG. Noted difficulties included checking, as well as the outer annuli of older fish becoming faint.

Samples were photographed under magnification for reference and revision. Representative photographs of each species are presented in Section 6.

## 5. QA/QC PROTOCOL

AAE's QA/QC protocols have been developed in consultation with Fisheries and Oceans Canada ageing experts to ensure accurate age estimations while addressing potential issues related to confidence index, reader bias, and human error. For this project, due to the low number of samples to be aged, 50% of each species were aged for QA/QC.

## 6. REPRESENTATIVE SAMPLE PHOTOGRAPHS

# FISH AGING

## AAE Laboratory Report 22-29-8

## (Finalized November 10, 2022)

## 1. SAMPLE SET

AAE Tech Services Inc. (AAE) was contracted by Minnow Environmental to provide ageing structure processing and age estimation services for samples collected under Project 22-29, received October 18, 2022. This included 16 Northern Pikeminnow heads, 13 pairs of Peamouth Chub otoliths, 3 sets of Peamouth Chub scales, 14 pairs of Lake Trout otoliths, 2 sets of Lake Trout scales, and 8 pairs of Rainbow Trout otoliths. A full data spreadsheet, including sample ID, structure type, ageing process used, and age estimation results, is provided in the data sheets accompanying this report.

## 2. AGEING METHOD: OTOLITHS

Lapillus otolith pairs were provided for Peamouth Chub, and sagittal otolith pairs were provided for Lake Trout and Rainbow Trout in individual enumerated sample envelopes, along with sets of scales as the secondary ageing structure, for a total of 51 samples. Along with scales as the secondary ageing structure, frozen heads were provided for Northern Pikeminnow samples. The lapillus otoliths were extracted and placed in individual enumerated sample envelopes.

All otoliths in this sample set were analyzed using the "Sectioning" method. This method is used primarily for larger otoliths with a deep sulcus or irregular shape. This method was selected only after the "Read Whole" method (non-destructive, often used in smaller otoliths) was found to be inaccurate.

*OTOLITH PREPARATION*

Otolith pairs were examined under magnification and evaluated for any issues related to structural integrity (e.g. cracks, fractures, chips, pieces missing) and deformation (crystallization, misshapen lobes). One otolith is selected for processing and is embedded in Cold Cure epoxy resin. Samples are allowed to cure for 48 hours before sectioning. Samples are marked for sectioning under magnification using a fine tip marker to identify the nucleus (centre) and section plane (cut edge to be examined) for each otolith. Using the marks as a guide, a Buehler Isomet low speed dual-blade saw is used to cut a single section, with the section plane passing through the nucleus. This surface is then polished with a series of lapping film (30, 12, and 0.3 microns) to improve clarity of the section plane.

To carry out age estimation, an otolith section is submerged in water under magnification with the polished surface facing up.

*AGE ESTIMATION*

Annuli are counted outward from the nucleus. Checking (false-annuli) is common in many species, including Rainbow Trout, particularly within the first 1-3 years of growth. Annuli are assessed for density (contrast between summer and winter growth), clarity (ability to differentiate individual annuli) and continuity (e.g. segmentation, merging, fading). Photographs under magnification are taken of each sample for reference and revision. Ages are recorded with a Confidence Index (CI) based on the condition of the otolith, annuli assessment, and the confidence of the reader in the age recorded, as described in Table 1.

**Table 1.** Confidence Index (CI) table; applied to each age estimate, reflecting the reader's confidence in the age recorded.

| Confidence Index (CI) | Abbreviation | Qualitative Meaning | Quantitative Meaning |
|---|---|---|---|
| Good | G | Pattern very clear with no interpretational problems | Reader would always get the same age |
| Fairly Good | FG | Pattern is clear with few easy interpretational problems | Reader would get the same age most of the time for fish <20 years |
| Fair | F | Pattern is fairly clear with some areas presenting easy and moderate interpretational problems | Reader would be within one year most of the time for fish <20 years |
| Fairly Poor | FP | Pattern is fairly unclear, presenting a number of difficult interpretational problems | Reader would be within 2-3 years for fish <20 years |
| Poor | P | Pattern is very unclear, presenting significant interpretational problems | Reader has little confidence in repeatability of age |

## 3. AGEING METHOD: SCALES

Scales were used to age 3 Peamouth Chub samples. One, QUL-NGC_PCC-1, where the wrong otolith was provided, and the remaining two, QUL-NGC_PCC-2 and QUL-NGC_PCC-3, where no otoliths were found within the sample envelope.

Scales were also used to age 2 Lake Trout samples. QUL-NCP_LT-5, where scales were indicated as the only structure provided, and QUL-NCP_LT-8, where no otoliths were found within the sample envelope.

*SCALE PREPARATION*

Scales were submerged in water and examined under magnification. Individual scales were isolated, examined for completeness and placed on a standard microscope slide. Scales were cleaned of excess tissue as much as possible without damaging the structure. Between six and twelve scales were mounted and pressed between two microscope slides and examined under magnification.

*AGE ESTIMATION*

Annuli were identified as a zone of crowded circuli, particularly around the central part of the scale, and were associated with crossovers of circuli.

## 4. AGEING RESULTS

Age estimates were provided in November 2022 based on the otolith and scale samples provided.

Northern Pikeminnow age estimates ranged from 2 to 6 years of age, with a modal age of 2 years. CI values were fair, with a few samples recorded as FP, but most of the samples recorded as F.

Peamouth Chub age estimates ranged from 3 to 14 years of age, with a bimodal age of 8 and 9 years. CI values were fair, with a few samples recorded as FP, but most of the samples recorded as F.

Lake Trout age estimates ranged from 2 to 9 years of age, with a multimodal age of 3, 10, and 11 years. CI values were fair, with a few samples recorded as FP, but most of the samples recorded as F.

Rainbow Trout age estimates ranged from 2 to 5 years of age, with a bimodal age of 2 and 5 years. CI values were fairly high, with one sample recorded as FG and the remainder recorded as F.

Samples were photographed under magnification for reference and revision. Representative photographs of each species are presented in Section 6.

## 5. QA/QC PROTOCOL

AAE's QA/QC protocols have been developed in consultation with Fisheries and Oceans Canada ageing experts to ensure accurate age estimations while addressing potential issues related to confidence index, reader bias, and human error. For this project 25% of samples were aged for QA/QC.

## 6. REPRESENTATIVE SAMPLE PHOTOGRAPHS

CC: Lee Nikl, Drew Kaiser, and Samantha Lundquist, WSP

**RE: Summary of Hazeltine Creek Water Quality, Sediment Quality, and Aquatic Life Data, 2015 to present**

---

The purpose of this memorandum is to satisfy part of the data request outlined in the Information Request Table (IRT) provided by the British Columbia Ministry of Environment and Climate Change Strategy (ENV) as part of the Springer Pit Expansion Application process for the Mount Polley Mining Corporation (MPMC). The IRT outlined a request for a summary of relevant water quality, sediment quality, and periphyton and benthic invertebrate data (community and productivity, tissue quality) from the receiving environment, including Hazeltine Creek, as detailed below:

1. "*Summarize all receiving environment data including Hazeltine Creek since 2015 to present, and compare it with reference, pre-breach/baseline data. For parameters that require other parameters to calculate guideline, please provide those parameters used to calculate the guideline in the table foot note. For example (e.g., Dissolved copper) provide the pH, DO, and Hardness used to calculate this guideline. When presenting graphs, please indicate the applicable water quality guideline on the graph itself. If the chronic water quality guideline is not applicable to any sampling locations due to monthly sampling, the results still need to be compared with the chronic guideline. The raw data should be provided in an appendix.*"
2. *"Summarize all relevant receiving environment sediment quality data including Hazeltine Creek since 2015 to present, and compare it with reference, pre-breach/baseline data. Also provide all sediment toxicity data available to present in comparison with reference condition."*

3. *"Summarize all relevant periphyton and benthic invertebrate, plankton community measures from the receiving environment including Hazeltine Creek since 2015 to present, and compare it with reference, pre-breach/baseline data. Include all available tissue quality data to present from the applicable receiving environment locations."*

This memorandum serves to specifically address the request for Hazeltine Creek data within the IRT by providing a summary of compiled water, sediment, periphyton, and benthic invertebrate monitoring results from Hazeltine Creek, from 2015 to present. The data are presented both in graphical format, with comparison to British Columbia guidelines, reference, and pre-breach/baseline data where applicable, and in tabular format as raw data. The results compiled within this memorandum summarize those originally presented within the 2021 and 2022 Mount Polley Mine Comprehensive Environmental Monitoring Program – Sediment and Aquatic Life reports (Minnow 2022, 2023), except for water quality data. Routine water quality data summarized herein were originally presented within the Annual Environmental Reports for the Mount Polley Mine from 2015 to present MPMC (2016, 2017, 2018, 2019a, 2020, 2021, 2022, 2023). Data are only presented in this memorandum for monitoring stations and areas that have been monitored routinely from 2015 to present (i.e., routine monitoring areas identified within the Comprehensive Environmental Monitoring Plan [CEMP]; MPMC 2019b).

## Water Quality

Water quality data collected routinely by MPMC from 2015 to present (i.e., over the period requested within the IRT) are presented in this memorandum. The plots provided herein for dissolved and total water quality analytes (Appendix Figures A.1 and A.2, respectively) include available data from Hazeltine Creek (and Edney Creek reference) for 2015 to present with graphical comparisons to British Columbia Water Quality Guidelines (BCWQG; BCMOECCS 2021, 2023). Graphical results are presented for dissolved and total concentrations of primary and secondary analytes only, which are constituents that have been previously identified as being indicative of a mine influence on the receiving environment (Minnow 2020). Appendix Table A.1 presents the tabulated raw data associated with the plots for all analytes reported by the laboratory. For short-term and long-term BCWQG guidelines that are condition specific, guideline values were calculated for each monitoring station and event. Appendix Table A.2 presents the modifying factors used in calculation of the condition-specific guidelines (i.e., hardness dependent or based on the Biotic Ligand Model[1]) and the resulting guideline value calculated for each monitoring station and event. Where data exist for multiple monitoring stations

[1] Dissolved copper guidelines were calculated using concurrent field pH, hardness and dissolved organic carbon and looked up using the calculation provided here: https://www2.gov.bc.ca/assets/gov/environment/air-land-water/water/waterquality/water-quality-guidelines/approved-wqgs/copper/cu_look-up_table.xlsm

on a given date (i.e., multiple guideline values were calculated), the plots display the most conservative (i.e., lowest) guideline values calculated for a given date. Graphical and tabular results are focused on exposed areas of Hazeltine Creek that have been monitored routinely as part of the CEMP: HAC-05a, HAC-08, HAC-13, HAC-14, with comparison to an associated reference area (lower Edney Creek; W10).

Interpretation and discussion of the water quality results for each monitoring year from 2015 to present are contained in the Annual Environmental Reports for the Mount Polley Mine (MPMC 2016, 2017, 2018, 2019a, 2020, 2021, 2022, 2023), and, therefore, are not detailed here.

## Sediment Quality

Sediment quality has been monitored consistently in Hazeltine Creek (and reference) since the initiation of the CEMP in 2018. Upper Hazeltine Creek (and associated reference; upper Edney Creek) and lower Hazeltine Creek (and associated reference; lower Edney Creek) have been monitored annually since 2018 (MPMC 2019b), with select pre-breach monitoring completed prior to 2014. The most recent results available for upper and lower Hazeltine Creek (and associated reference areas) are from 2022 (Minnow 2023). The plots provided herein for sediment quality (Appendix Figures B.1 and B.2) include available data from 2015 to 2022[2] with graphical comparisons to the Working Sediment Quality Guideline (WSQG; BCMOECCS 2021), and reference/pre-breach 95$^{th}$ percentile values and statistical comparisons to reference among years. Appendix Table B.1 presents the tabulated raw data associated with the plots and includes results for all analytes reported by the laboratory. Appendix Table B.2 presents tabulated raw baseline and pre-breach data from upper and lower Hazeltine Creek that were used in calculation of the pre-breach 95$^{th}$ percentile values used for data screening. Graphical results are presented for primary and secondary analytes only, which are constituents that have been previously identified as being indicative of a mine influence on the receiving environment (Minnow 2020). Statistical comparisons within the plots are limited to constituents identified as Analytes of Interest in Minnow (2023) to maintain consistency with the interpretation presented in the most recent report (Minnow 2023). Analytes of interest were identified for each monitoring area as primary or secondary analytes with mean concentrations in sediment in 2023 that exceeded all the following criteria: 1) the WSQG, 2) the associated reference 95$^{th}$ percentile value, and 3) the associated pre-breach 95$^{th}$ percentile value. See Minnow (2022, 2023) for detailed statistical methods and outputs. Graphical and tabular results are focused on sampling areas Hazeltine Creek that have been monitored routinely as part of the CEMP over this period: upper Hazeltine Creek (HAC-U) and an associated reference area (upper Edney Creek; EDC-U),

[2] Although the IRT request was for inclusion of data from 2015 to present, finalized data from 2023 are not yet available. Therefore, data from 2015 to 2022 are presented (the most recent finalized data available).

and lower Hazeltine Creek (HAC-D) and an associated reference area (lower Edney Creek; EDC-D).

Brief summaries of sediment quality results for upper and lower Hazeltine Creek are provided below and are focused on the most recent year of monitoring. See Minnow (2023) for detailed results and interpretation.

Sediment quality monitoring completed in upper and lower Hazeltine Creek in 2022 continued to document the physical and chemical characteristics of sediments from this erosional habitat. Sediments were characterized by concentrations of several analytes that were greater than reference/pre-breach concentrations and WSQG values: copper and selenium in upper Hazeltine Creek, and copper and iron in lower Hazeltine Creek. In both upper and lower Hazeltine Creek in 2022, copper was the most substantially elevated analyte with concentrations higher than the upper WSQG, and higher than reference/pre-breach concentrations.

In upper Hazeltine Creek, mean concentrations of copper and selenium in sediments were significantly higher in 2022 than previously observed (2018 to 2021), when evaluated relative to reference. For both analytes, this change was driven in part by a significant decrease in sediment copper and selenium concentrations at the reference area in 2022 compared to prior years (except 2020 which was similar to 2022). When temporal changes in copper and selenium concentrations from upper Hazeltine Creek sediments were evaluated within the exposed area only (i.e., not evaluated relative to temporal changes at the reference area), copper concentrations were unchanged from 2019 to 2022, and selenium concentrations in 2022 were significantly higher than 2018 to 2020 results (Minnow 2023). The observed increase in selenium in upper Hazeltine Creek sediments in 2022 compared to 2020 when evaluated within the upper Hazeltine Creek area only (i.e., not relative to reference) was associated with higher total organic carbon (TOC) content and lower sand content of these sediments, with TOC significantly higher in 2022 than in 2018 and 2020, relative to reference. Sediment sampling in these erosional habitats is opportunistic due to the limited availability of fine sediments in some monitoring years. This often results in the relocation of sampling locations among years in both exposed and reference areas which can be unavoidable (i.e., sediment is collected where it is present rather than prescribed locations where sediment may be unavailable). The necessity for opportunistic sampling can also result in temporal variability in the sediment physical characteristics to some extent, with sediments having higher TOC content and lower sand content in some years compared to others, depending on sediment availability. This has been illustrated in the sediment quality results for upper Hazeltine Creek which have showed temporal variability in physical characteristics (i.e., TOC content and particle size) that are associated with changes

in sediment chemistry results. The variability in sediment physical characteristics may stabilize as sediment accumulation continues to occur in this remediated system.

In lower Hazeltine Creek, mean sediment concentrations of copper and iron in 2022 were similar to or lower than those observed in 2018, when evaluated relative to reference, indicating sediment concentrations of these analytes have not increased significantly from 2018 to 2022. Similarly, the TOC content of lower Hazeltine Creek sediments has remained unchanged relative to reference from 2018 to 2022. Overall, the results from sediment quality monitoring in 2022 continued to indicate that changes in concentrations of sediment quality parameters (e.g., selenium) are related to variability in sediment physical characteristics (i.e., TOC and sand content) that are driven by the necessity for opportunistic sampling due to limited availability of fine sediments in some monitoring years.

## Periphyton Community and Productivity

Periphyton community and productivity (chlorophyll-a and Ash-Free Dry Mass) have been monitored consistently in Hazeltine Creek since the initiation of the CEMP in 2018. Upper Hazeltine Creek (and associated reference; upper Edney Creek) has been monitored annually since 2018 while lower Hazeltine Creek (and associated reference; lower Edney Creek) has been monitored biennially (i.e., every second year) since 2019 (MPMC 2019b). The most recent results available for upper Hazeltine Creek areas are from 2022, and the most recent results available for lower Hazeltine Creek are from 2021 (Minnow 2022, 2023). The plots provided herein for periphyton productivity (Appendix Figures C.1 and C.2) and periphyton community (Appendix Figures C.3 and C.4) include available data from 2015 to 2022[3] with graphical and statistical comparisons to reference and pre-breach (where applicable) and among years. See Minnow (2022, 2023) for detailed statistical methods and outputs. Appendix Table C.1 presents the tabulated raw data associated with the plots. Graphical and tabular results are focused on sampling areas Hazeltine Creek that have been monitored routinely as part of the CEMP over this period: upper Hazeltine Creek (HAC-R1, HAC-U) and an associated upper Edney Creek reference area (EDC-U), and lower Hazeltine Creek (HAC-D) and an associated lower Edney Creek reference area (EDC-D).

Brief summaries of periphyton community and productivity results for upper and lower Hazeltine Creek areas are provided below and are focused on the most recent year of monitoring. See Minnow (2022, 2023) for detailed results and interpretation.

[3] Although the IRT request was for inclusion of data from 2015 to present, finalized data from 2023 are not yet available. Therefore, data from 2015 to 2022 are presented (the most recent finalized data available).

Mean periphyton productivity (measured as chlorophyll-a; mg/m²) in upper Hazeltine Creek in 2022 was below the BCWQG and above the threshold for moderately enriched streams. Primary productivity as measured by both chlorophyll-a and AFDM at both upper Hazeltine Creek areas (HAC-R1 [Reach 1], HAC-U [Reach 2]) has been similar to or significantly higher than reference since 2018, and higher than pre-breach since 2019 at HAC-R1 and since 2021 at HAC-U. The periphyton community of upper Hazeltine Creek in 2022 was characterized by taxon richness, Simpson's Evenness and Diversity, and diatom richness that were similar to or higher than the reference area. Periphyton densities in 2022 at HAC-R1 and HAC-U were similar to and lower than reference, respectively, but were temporally stable at HAC-U despite being lower than reference in 2022. The similarity (or exceedance) of the primary periphyton community metrics (density, richness, Simpson's Evenness, and Simpson's Diversity) in upper Hazeltine Creek compared to the reference area in most years and/or temporal stability of these metrics are indicative of relatively stable periphyton communities at the remediated upper Hazeltine Creek areas and good periphyton community health.

Mean periphyton productivity (measured as chlorophyll-a; mg/m²) in lower Hazeltine Creek in 2021 was below the BCWQG and below the threshold indicative of moderate enriched streams. Primary productivity as measured by both chlorophyll-a and AFDM in lower Hazeltine Creek decreased significantly between 2019 and 2021, to values that were lower than and similar to reference in 2021, respectively, but that remained higher than in 2017. The periphyton community at HAC-D was characterized in 2019 and 2021 by total density higher than reference, Simpson's Evenness and Diversity similar to reference, and significantly lower total and diatom richness than the reference area. The decrease in productivity between 2019 and 2021, lower taxonomic richness compared to reference in 2019 and 2021, and lower diatom richness in 2021 compared to reference is indicative of ongoing periphyton community recovery. This is consistent with the disturbance of this area for channel remediation works just weeks prior to conducting periphyton monitoring in 2021.

## Benthic Invertebrate Community and Productivity

Benthic invertebrate community and productivity (biomass) have been monitored consistently in Hazeltine Creek (and reference) since the initiation of the CEMP in 2018. Upper Hazeltine Creek (and associated reference; upper Edney Creek) has been monitored annually since 2018 while lower Hazeltine Creek (and associated reference; lower Edney Creek) has been monitored biennially (i.e., every second year) since 2017 (prior to CEMP inception; MPMC 2019b). The most recent results available for upper Hazeltine Creek areas are from 2022, and the most recent results available for lower Hazeltine Creek are from 2021 (Minnow 2022, 2023). The plots provided herein for benthic invertebrate productivity

(Appendix Figures D.1 and D.2) and benthic invertebrate community (Appendix Figures D.3 and D.4) include available data from 2015 to 2022[4] with graphical and statistical comparisons to reference and pre-breach (where applicable) and among years. See Minnow (2022, 2023) for detailed statistical methods and outputs. Appendix Table D.1 presents the tabulated raw data associated with the plots[5]. Graphical and tabular results are focused on sampling areas Hazeltine Creek that have been monitored routinely as part of the CEMP over this period: upper Hazeltine Creek (HAC-R1, HAC-U) and an associated upper Edney Creek reference area (EDC-U), and lower Hazeltine Creek (HAC-D) and an associated lower Edney Creek reference area (EDC-D).

Brief summaries of benthic invertebrate community and productivity results for upper and lower Hazeltine Creek areas are provided below and are focused on the most recent year of monitoring. See Minnow (2022, 2023) for detailed results and interpretation.

The benthic invertebrate community of upper Hazeltine Creek in 2022 was characterized by total density, taxon richness, and Simpson's Evenness and Diversity that were similar between the two areas (HAC-R1 and HAC-U) and that were similar to reference and/or pre-breach conditions. Taxon richness at HAC-R1 in 2022 remained significantly lower than pre-breach conditions but was similar to reference conditions. Benthic invertebrate productivity (dry weight biomass) at both upper Hazeltine Creek areas in 2022 was unchanged since 2019 and was either similar to or higher than reference in each year from 2018 to 2022. Some key differences remained in the benthic community structure at both areas of upper Hazeltine Creek in 2022, compared to pre-breach conditions, which indicated the community composition had not fully recovered to pre-breach conditions. Overall, the results from 2022 indicated that the benthic invertebrate community of both areas of upper Hazeltine Creek had recovered substantially following remediation to a condition that was similar to reference and/or pre-breach conditions based on primary metrics (density, taxon richness, Simpson's Evenness and Diversity), but with some remaining differences in community composition compared to reference and pre-breach.

The benthic invertebrate community of lower Hazeltine Creek in 2021 was characterized by lower density, taxon richness, and productivity (dry weight biomass) compared to the reference area and to pre-breach conditions, and lower Simpson's Diversity compared reference conditions. The key differences in community structure in lower Hazeltine Creek in 2021 compared to reference and to pre-breach conditions included lower relative abundances of sensitive

[4] Although the IRT request was for inclusion of data from 2015 to present, finalized data from 2023 are not yet available. Therefore, data from 2015 to 2022 are presented (the most recent finalized data available).
[5] Only monitoring data with consistent collection methodologies and paired exposed vs. reference results each year were included in plots, and therefore in the tabulated raw data associated with the plots. Data excluded from plots and statistical analyses in Minnow (2023) due to a lack of reference data or inconsistent sampling methods were excluded from Appendix Table D.1.

Ephemeroptera, Plecoptera, and Trichoptera (EPT) taxa and Arachnida and higher relative abundance of Chironomidae in 2021. These differences in primary metrics and community composition in lower Hazeltine Creek compared to reference and pre-breach conditions was consistent with effects expected from recent completion of remediation works at HAC-D in 2021 and suggested that the benthic invertebrate community at this area remained in a state of recovery at the time of sampling.

## Periphyton and Benthic Invertebrate Tissue Quality

Periphyton and benthic invertebrate tissue quality have been monitored consistently in Hazeltine Creek (and reference) since the initiation of the CEMP in 2018. Upper Hazeltine Creek (and associated reference; upper Edney Creek) and lower Hazeltine Creek (and associated reference; lower Edney Creek) have been monitored annually since 2018 (MPMC 2019b), with select monitoring completed prior to 2018, including pre-breach. The most recent results available for upper and lower Hazeltine Creek (and associated reference areas) are from 2022 (Minnow 2023). Benthic invertebrate tissue quality monitoring since 2018 has included two sample types: composite-taxa samples (a mixture of benthic invertebrate taxa representative of the sampling area) and single taxon (caddisfly) samples. The plots provided herein for periphyton (Appendix Figures E.1 to E.3), composite-taxa benthic invertebrate (Appendix Figures F.1 to F.3), and single taxon (caddisfly) benthic invertebrate tissue quality (Appendix Figures F.4 to F.6) include available data from 2015 to 2022[6] with graphical and statistical comparisons to reference and pre-breach (where applicable) and among years. See Minnow (2022, 2023) for detailed statistical methods and outputs. Tabulated raw data associated with the plots[7] are presented in Appendix Table E.1 for periphyton tissue quality, Appendix Table F.1 for composite-taxa benthic invertebrate tissue quality, and Appendix Table F.2 for single taxon (caddisfly) benthic invertebrate tissue quality and include results for all analytes reported by the laboratory. Graphical results are presented for primary and secondary analytes only, which are constituents that have been previously identified as being indicative of a mine influence on the receiving environment (Minnow 2020). Graphical and tabular results are focused on sampling areas Hazeltine Creek that have been monitored routinely as part of the CEMP over this period: upper Hazeltine Creek (HAC-R1, HAC-U) and an associated upper Edney Creek reference area

[6] Although the IRT request was for inclusion of data from 2015 to present, finalized data from 2023 are not yet available. Therefore, data from 2015 to 2022 are presented (the most recent finalized data available).
[7] Only monitoring data with consistent collection and analytical methodologies and paired exposed vs. reference results each year were included in plots, and therefore in the tabulated raw data associated with the plots. Data excluded from plots and statistical analyses in Minnow (2023) due to a lack of reference data or inconsistent sampling or analytical methods were excluded from Appendix Tables E.1, F.1, and F.2.

(EDC-U), and lower Hazeltine Creek (HAC-D) and an associated lower Edney Creek reference area (EDC-D).

Brief summaries of periphyton and benthic invertebrate tissue quality results for upper and lower Hazeltine Creek areas are provided below and are focused on the most recent year of monitoring. See Minnow (2023) for detailed results and interpretation.

Periphyton and benthic invertebrate tissue quality monitoring in upper and lower Hazeltine Creek indicated that the primary analytes arsenic, copper, iron, and selenium had higher tissue concentrations compared to reference in 2022 for which the exposed-reference difference also increased significantly over time. Concentrations of copper and selenium were higher than reference and increased over time and showed some evidence of moderately higher bioavailability and/or trophic transfer of selenium and copper in upper Hazeltine Creek, and selenium in lower Hazeltine Creek. Selenium concentrations in most tissues in Hazeltine Creek (upper and lower) have increased since 2018 compared to reference (except composite-taxa benthic invertebrate samples from lower Hazeltine Creek), suggesting a mine influence on tissue concentrations. In upper Hazeltine Creek, tissue selenium concentrations in 2022 were similar to or lower than pre-breach results in comparable tissues, while those in composite-taxa benthic invertebrate samples from lower Hazeltine Creek in 2022 exceeded pre-breach results. Results indicate that the bioavailability and trophic transfer of selenium has been typically stable over time compared to reference and has not increased due to mine influence, except for increased trophic transfer in caddisflies from Reach 2 of upper Hazeltine Creek. Mean selenium concentrations in benthic invertebrate tissue have exceeded the BC interim guideline since 2020 and 2022 in upper (HAC-R1 and HAC-U) and lower (HAC-D) Hazeltine Creek, suggesting potential selenium-associated risks to aquatic life. Copper was elevated relative to reference in 2022, and higher than pre-breach in most tissues and sampling years; however, the difference relative to reference has been similar to reference over monitoring years except at HAC-U where concentrations in composite taxa-benthic invertebrate tissue samples were higher in 2022 than 2018 to 2021 (relative to reference). Mean trophic transfer of copper was stable or decreasing over time and lower than pre-breach, except for in composite taxa-benthic invertebrates from HAC-U which had mean trophic transfer that increased over time and was higher than pre-breach. The temporal increase in trophic transfer and concentrations of copper in benthic invertebrates in 2022 was limited to composite-taxa benthic invertebrate tissues from Reach 2 (HAC-U) and was not observed in caddisfly tissues from HAC-U nor in benthic invertebrate tissues (caddisfly or composite-taxa) from Reach 1 (HAC-R1) of upper Hazeltine Creek, indicating a potentially localized increase.

In composite-taxa benthic invertebrate samples from upper Hazeltine Creek, mean arsenic, and iron concentrations in tissues from Reach 2 (HAC-U) and Reach 1 (HAC-R1), respectively, were higher in 2022 than previous monitoring years compared to reference, but this was due to a temporal decrease at the reference area rather than an increase in tissues from upper Hazeltine Creek. Elevated concentrations of some secondary analytes in periphyton and/or benthic invertebrate tissues over time were also observed, relative to reference, but evidence was equivocal as to whether these observed increases in tissue concentrations were mine-related, and there was little or no evidence of increased metal bioavailability relative to reference and pre-breach. Comparison of the two benthic invertebrate tissue types (caddisfly and composite-taxa) indicated that although variability exists between the tissues, potential changes in analyte concentrations and trophic transfer in caddisfly tissues would largely be detected if sampling were limited to composite-taxa tissue samples only.

Notes: mg/L = milligrams per litre, % = percent, NTU = nephelometric turbidity units, µs/cm = miscroSiemens per centimeter, "-" = data not available, "<" = results below laboratory reporting limit. Results are displayed to three significant digits.

## Table A.1: Surface Water Samples Collected Routinely from Hazeltine Creek (HAC-13, HAC-05a, HAC-14, HAC-08) and Edney Creek (EDC-01a, W10), 2015 to Present

| Year | Station | Date | Conductivity (*in situ*; µs/cm) | Dissolved Oxygen (*in situ*; %) | Dissolved Oxygen (*in situ*; mg/L) | pH (*in situ*; pH units) | Temperature (*in situ*; °C) | Turbidity (*in situ*; NTU) | Conductivity (µs/cm) | Hardness (as $CaCO_3$; mg/L) | pH (pH units) | Total Dissolved Solids (mg/L) | Total Suspended Solids (mg/L) | Turbidity (NTU) | Alkalinity ($CaCO_3$; mg/L) | Ammonia (as N; mg/L) | Chloride (mg/L) | Fluoride (mg/L) | Nitrate (as N; mg/L) |

Notes: mg/L = milligrams per litre, % = percent, NTU = nephelometric turbidity units, µs/cm = miscroSiemens per centimeter, "-" = data not available, "<" = results below laboratory reporting limit. Results are displayed to three significant digits.

## Table A.1: Surface Water Samples Collected Routinely from Hazeltine Creek (HAC-13, HAC-05a, HAC-14, HAC-08) and Edney Creek (EDC-01a, W10), 2015 to Present

| Year | Station | Date | Conductivity (*in situ*; µs/cm) | Dissolved Oxygen (*in situ*; %) | Dissolved Oxygen (*in situ*; mg/L) | pH (*in situ*; pH units) | Temperature (*in situ*; °C) | Turbidity (*in situ*; NTU) | Conductivity (µs/cm) | Hardness (as $CaCO_3$; mg/L) | pH (pH units) | Total Dissolved Solids (mg/L) | Total Suspended Solids (mg/L) | Turbidity (NTU) | Alkalinity ($CaCO_3$; mg/L) | Ammonia (as N; mg/L) | Chloride (mg/L) | Fluoride (mg/L) | Nitrate (as N; mg/L) |

Notes: mg/L = milligrams per litre, % = percent, NTU = nephelometric turbidity units, µs/cm = miscroSiemens per centimeter, "-" = data not available, "<" = results below laboratory reporting limit. Results are displayed to three significant digits.

## Table A.1: Surface Water Samples Collected Routinely from Hazeltine Creek (HAC-13, HAC-05a, HAC-14, HAC-08) and Edney Creek (EDC-01a, W10), 2015 to Present

| Year | Station | Date | Conductivity (*in situ*; µs/cm) | Dissolved Oxygen (*in situ*; %) | Dissolved Oxygen (*in situ*; mg/L) | pH (*in situ*; pH units) | Temperature (*in situ*; °C) | Turbidity (*in situ*; NTU) | Conductivity (µs/cm) | Hardness (as $CaCO_3$; mg/L) | pH (pH units) | Total Dissolved Solids (mg/L) | Total Suspended Solids (mg/L) | Turbidity (NTU) | Alkalinity ($CaCO_3$; mg/L) | Ammonia (as N; mg/L) | Chloride (mg/L) | Fluoride (mg/L) | Nitrate (as N; mg/L) |

Notes: mg/L = milligrams per litre, % = percent, NTU = nephelometric turbidity units, µs/cm = miscroSiemens per centimeter, "-" = data not available, "<" = results below laboratory reporting limit. Results are displayed to three significant digits.

## Table A.1: Surface Water Samples Collected Routinely from Hazeltine Creek (HAC-13, HAC-05a, HAC-14, HAC-08) and Edney Creek (EDC-01a, W10), 2015 to Present

| Year | Station | Date | Conductivity (*in situ*; µs/cm) | Dissolved Oxygen (*in situ*; %) | Dissolved Oxygen (*in situ*; mg/L) | pH (*in situ*; pH units) | Temperature (*in situ*; °C) | Turbidity (*in situ*; NTU) | Conductivity (µs/cm) | Hardness (as $CaCO_3$; mg/L) | pH (pH units) | Total Dissolved Solids (mg/L) | Total Suspended Solids (mg/L) | Turbidity (NTU) | Alkalinity ($CaCO_3$; mg/L) | Ammonia (as N; mg/L) | Chloride (mg/L) | Fluoride (mg/L) | Nitrate (as N; mg/L) |

Notes: mg/L = milligrams per litre, % = percent, NTU = nephelometric turbidity units, µs/cm = miscroSiemens per centimeter, "-" = data not available, "<" = results below laboratory reporting limit. Results are displayed to three significant digits.

## Table A.1: Surface Water Samples Collected Routinely from Hazeltine Creek (HAC-13, HAC-05a, HAC-14, HAC-08) and Edney Creek (EDC-01a, W10), 2015 to Present

| Year | Station | Date | Conductivity (*in situ*; µs/cm) | Dissolved Oxygen (*in situ*; %) | Dissolved Oxygen (*in situ*; mg/L) | pH (*in situ*; pH units) | Temperature (*in situ*; °C) | Turbidity (*in situ*; NTU) | Conductivity (µs/cm) | Hardness (as $CaCO_3$; mg/L) | pH (pH units) | Total Dissolved Solids (mg/L) | Total Suspended Solids (mg/L) | Turbidity (NTU) | Alkalinity ($CaCO_3$; mg/L) | Ammonia (as N; mg/L) | Chloride (mg/L) | Fluoride (mg/L) | Nitrate (as N; mg/L) |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

Notes: mg/L = milligrams per litre, % = percent, NTU = nephelometric turbidity units, µs/cm = miscroSiemens per centimeter, "-" = data not available, "<" = results below laboratory reporting limit. Results are displayed to three significant digits.

## Table A.1: Surface Water Samples Collected Routinely from Hazeltine Creek (HAC-13, HAC-05a, HAC-14, HAC-08) and Edney Creek (EDC-01a, W10), 2015 to Present

| Year | Station | Date | Conductivity (*in situ*; µs/cm) | Dissolved Oxygen (*in situ*; %) | Dissolved Oxygen (*in situ*; mg/L) | pH (*in situ*; pH units) | Temperature (*in situ*; °C) | Turbidity (*in situ*; NTU) | Conductivity (µs/cm) | Hardness (as $CaCO_3$; mg/L) | pH (pH units) | Total Dissolved Solids (mg/L) | Total Suspended Solids (mg/L) | Turbidity (NTU) | Alkalinity ($CaCO_3$; mg/L) | Ammonia (as N; mg/L) | Chloride (mg/L) | Fluoride (mg/L) | Nitrate (as N; mg/L) |

Notes: mg/L = milligrams per litre, % = percent, NTU = nephelometric turbidity units, µs/cm = miscroSiemens per centimeter, "-" = data not available, "<" = results below laboratory reporting limit. Results are displayed to three significant digits.

## Table A.1: Surface Water Samples Collected Routinely from Hazeltine Creek (HAC-13, HAC-05a, HAC-14, HAC-08) and Edney Creek (EDC-01a, W10), 2015 to Present

| Year | Station | Date | Conductivity (*in situ*; µs/cm) | Dissolved Oxygen (*in situ*; %) | Dissolved Oxygen (*in situ*; mg/L) | pH (*in situ*; pH units) | Temperature (*in situ*; °C) | Turbidity (*in situ*; NTU) | Conductivity (µs/cm) | Hardness (as $CaCO_3$; mg/L) | pH (pH units) | Total Dissolved Solids (mg/L) | Total Suspended Solids (mg/L) | Turbidity (NTU) | Alkalinity ($CaCO_3$; mg/L) | Ammonia (as N; mg/L) | Chloride (mg/L) | Fluoride (mg/L) | Nitrate (as N; mg/L) |

Notes: mg/L = milligrams per litre, % = percent, NTU = nephelometric turbidity units, µs/cm = miscroSiemens per centimeter, "-" = data not available, "<" = results below laboratory reporting limit. Results are displayed to three significant digits.

## Table A.1: Surface Water Samples Collected Routinely from Hazeltine Creek (HAC-13, HAC-05a, HAC-14, HAC-08) and Edney Creek (EDC-01a, W10), 2015 to Present

| Year | Station | Date | Antimony-Dissolved (mg/L) | Arsenic-Dissolved (mg/L) | Barium-Dissolved (mg/L) | Beryllium-Dissolved (mg/L) | Bismuth-Dissolved (mg/L) | Boron-Dissolved (mg/L) | Cadmium-Dissolved (mg/L) | Calcium-Dissolved (mg/L) | Chromium-Dissolved (mg/L) | Cobalt-Dissolved (mg/L) | Copper-Dissolved (mg/L) | Iron-Dissolved (mg/L) | Lead-Dissolved (mg/L) | Lithium-Dissolved (mg/L) | Magnesium-Dissolved (mg/L) | Manganese-Dissolved (mg/L) | Mercury-Dissolved (mg/L) | Molybdenum-Dissolved (mg/L) | Nickel-Dissolved (mg/L) |

Notes: mg/L = milligrams per litre, % = percent, NTU = nephelometric turbidity units, µs/cm = miscroSiemens per centimeter, "-" = data not available, "<" = results below laboratory reporting limit. Results are displayed to three significant digits.

## Table A.1: Surface Water Samples Collected Routinely from Hazeltine Creek (HAC-13, HAC-05a, HAC-14, HAC-08) and Edney Creek (EDC-01a, W10), 2015 to Present

| Year | Station | Date | Antimony-Dissolved (mg/L) | Arsenic-Dissolved (mg/L) | Barium-Dissolved (mg/L) | Beryllium-Dissolved (mg/L) | Bismuth-Dissolved (mg/L) | Boron-Dissolved (mg/L) | Cadmium-Dissolved (mg/L) | Calcium-Dissolved (mg/L) | Chromium-Dissolved (mg/L) | Cobalt-Dissolved (mg/L) | Copper-Dissolved (mg/L) | Iron-Dissolved (mg/L) | Lead-Dissolved (mg/L) | Lithium-Dissolved (mg/L) | Magnesium-Dissolved (mg/L) | Manganese-Dissolved (mg/L) | Mercury-Dissolved (mg/L) | Molybdenum-Dissolved (mg/L) | Nickel-Dissolved (mg/L) |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

Notes: mg/L = milligrams per litre, % = percent, NTU = nephelometric turbidity units, µs/cm = miscroSiemens per centimeter, "-" = data not available, "<" = results below laboratory reporting limit. Results are displayed to three significant digits.

**Table A.1: Surface Water Samples Collected Routinely from Hazeltine Creek (HAC-13, HAC-05a, HAC-14, HAC-08) and Edney Creek (EDC-01a, W10), 2015 to Present**

| Year | Station | Date | Potassium-Dissolved (mg/L) | Selenium-Dissolved (mg/L) | Silicon-Dissolved (mg/L) | Silver-Dissolved (mg/L) | Sodium-Dissolved (mg/L) | Strontium-Dissolved (mg/L) | Thallium-Dissolved (mg/L) | Tin-Dissolved (mg/L) | Titanium-Dissolved (mg/L) | Uranium-Dissolved (mg/L) | Vanadium-Dissolved (mg/L) | Zinc-Dissolved (mg/L) | Hardness (as $CaCO_3$ from total Ca/Mg; mg/L) |

Notes: mg/L = milligrams per litre, % = percent, NTU = nephelometric turbidity units, µs/cm = miscroSiemens per centimeter, "-" = data not available, "<" = results below laboratory reporting limit. Results are displayed to three significant digits.

**Table A.1: Surface Water Samples Collected Routinely from Hazeltine Creek (HAC-13, HAC-05a, HAC-14, HAC-08) and Edney Creek (EDC-01a, W10), 2015 to Present**

| Year | Station | Date | Potassium-Dissolved (mg/L) | Selenium-Dissolved (mg/L) | Silicon-Dissolved (mg/L) | Silver-Dissolved (mg/L) | Sodium-Dissolved (mg/L) | Strontium-Dissolved (mg/L) | Thallium-Dissolved (mg/L) | Tin-Dissolved (mg/L) | Titanium-Dissolved (mg/L) | Uranium-Dissolved (mg/L) | Vanadium-Dissolved (mg/L) | Zinc-Dissolved (mg/L) | Hardness (as $CaCO_3$ from total Ca/Mg; mg/L) |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

Notes: mg/L = milligrams per litre, % = percent, NTU = nephelometric turbidity units, µs/cm = miscroSiemens per centimeter, "-" = data not available, "<" = results below laboratory reporting limit. Results are displayed to three significant digits.

**Table A.1: Surface Water Samples Collected Routinely from Hazeltine Creek (HAC-13, HAC-05a, HAC-14, HAC-08) and Edney Creek (EDC-01a, W10), 2015 to Present**

| Year | Station | Date | Potassium-Dissolved (mg/L) | Selenium-Dissolved (mg/L) | Silicon-Dissolved (mg/L) | Silver-Dissolved (mg/L) | Sodium-Dissolved (mg/L) | Strontium-Dissolved (mg/L) | Thallium-Dissolved (mg/L) | Tin-Dissolved (mg/L) | Titanium-Dissolved (mg/L) | Uranium-Dissolved (mg/L) | Vanadium-Dissolved (mg/L) | Zinc-Dissolved (mg/L) | Hardness (as $CaCO_3$ from total Ca/Mg; mg/L) |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

Notes: mg/L = milligrams per litre, % = percent, NTU = nephelometric turbidity units, µs/cm = miscroSiemens per centimeter, "-" = data not available, "<" = results below laboratory reporting limit. Results are displayed to three significant digits.

**Table A.1: Surface Water Samples Collected Routinely from Hazeltine Creek (HAC-13, HAC-05a, HAC-14, HAC-08) and Edney Creek (EDC-01a, W10), 2015 to Present**

| Year | Station | Date | Potassium-Dissolved (mg/L) | Selenium-Dissolved (mg/L) | Silicon-Dissolved (mg/L) | Silver-Dissolved (mg/L) | Sodium-Dissolved (mg/L) | Strontium-Dissolved (mg/L) | Thallium-Dissolved (mg/L) | Tin-Dissolved (mg/L) | Titanium-Dissolved (mg/L) | Uranium-Dissolved (mg/L) | Vanadium-Dissolved (mg/L) | Zinc-Dissolved (mg/L) | Hardness (as $CaCO_3$ from total Ca/Mg; mg/L) |
