Golder collected groundwater data in 2015 as part of the DSI and in 2016 as part of the DSI Update. The groundwater results from both years of monitoring are presented in Appendix A-4 of the DSI Update and were used to identify COPCs in groundwater.

Golder installed a total of four background monitoring wells, one in 2015 (GW-BKG15-01) and three in 2016 (MW16-11, MW16-12 and MQ16-13). Due to the dry conditions at the Study Area in August 2016, only one of the background wells had sufficient water for sampling.

The DSI Update identified the following metals with concentrations greater than the CSR standard in groundwater:

- Sulphate
- Arsenic
- Iron
- Manganese
- Molybdenum

However, these substances were not retained for further evaluation in the HHRA. The rationale for each substance is provided below.

- The slight exceedance of sulphate in the Polley Flats area (MW16-02) is likely a result of geochemical processes which, according to SRK Consulting (Appendix A), may cause seasonal variation in pH and metal concentrations. The sulphate concentrations in all other monitoring wells were less than the applicable CSR standards.
- The arsenic exceedance was observed at GW15-01 during the 2015 monitoring round and exceeds the CSR standards for DW. GW15-01 was installed within the tailings and is located within the floodplain of the Hazeltine Creek channel. The exceedance is considered to be isolated and delineated, as arsenic concentrations at the other monitoring wells were less than applicable standards during monitoring events in 2015 and in 2016. The arsenic concentration in this well is believed to be related to natural materials and elevated because of reducing conditions (oxidation-reduction potential = -40.5 millivolts).
- Iron concentrations exceeded the CSR DW standard at two monitoring well locations in 2015 (GW15-06 and GW15-01). The monitoring wells installed in 2015 were completed within the tailings; field measurements at the time of sampling noted low dissolved oxygen readings in the groundwater, which may have contributed to precipitation of iron into the shallow groundwater. The exceedances are considered to be isolated and delineated. Dissolved iron concentrations were less than CSR standards for samples that were collected as part of the 2016 monitoring program.
- Manganese exceedances were observed throughout the Study Area in monitoring wells installed within tailings and native under tailings soil. The concentrations exceeded CSR DW standards. Similar to iron, the observed manganese concentrations are likely a result of reducing conditions in the groundwater.
- The maximum measured concentration of molybdenum in groundwater was 0.11 mg/L, which is below the CSR standard of 0.25 mg/L. Therefore, molybdenum was not considered a COPC in groundwater.

The maximum measured concentration of aluminum in groundwater was 0.18 mg/L, which is below the CSR standard of 9.5 mg/L. Therefore, aluminum was not considered a COPC in groundwater.

There are currently no drinking water wells identified in the Hazeltine Creek channel remediation areas, and it is unlikely that drinking water wells will be installed in the future. Therefore, exposure to groundwater as drinking water was not considered an operable exposure pathway in the HHRA (see report Section 3.4).

5.0 SEDIMENT

5.1 Sediment Data

Minnow Environmental Inc. (Minnow) evaluated sediment quality in 2014, 2015 and 2016. The following data were used in the DSI to identify COPCs in sediment:

- Polley Lake (2014, 2015, 2016)
- Lower Hazeltine Creek sedimentation pond (2015, 2016)

- Littoral areas of Quesnel Lake (2014, 2015, 2016)
- Bootjack Lake – Reference (2014, 2015, 2016)
- Quesnel Lake – Reference (2014, 2015, 2016)

The 2014 and 2015 sediment quality results, including the sediment sampling locations, were provided in Minnow (2015[1]). The results from the 2016 sampling program, including the sediment sampling locations, are provided in Appendix A-7 of the DSI Update. Sediment samples from Hazeltine Creek, collected by Minnow in July 2014, were not used for screening because the samples were collected prior to reconstruction of the creek channel, and it is inferred that the material sampled then is no longer present within the Hazeltine Creek channel. The sediment from the sedimentation pond was assumed to represent sediment that has entered the creek channel during and since the completion of channel reconstruction. Sediment collected from the Hazeltine Creek sedimentation pond in 2016 was also analyzed for polycyclic aromatic hydrocarbons (PAHs) as a requirement of the Mount Polley Mining Corporation (MPMC) 2016 Comprehensive Environmental Monitoring Plan. These samples were excluded from the dataset as PAHs were not identified contaminants of concern in the DSI. Concentrations of PAHs were below the laboratory method detection limit. People were not anticipated to come into contact with sediment collected from the deep, profundal areas in Quesnel Lake; therefore, these samples were also excluded from the dataset.

The 95th percentile local reference concentrations were calculated from sediment samples collected pre-dam failure (Minnow 2015[1]) and from sediment samples collected in reference areas in 2014, 2015 and 2016. Based on the interpretation of the impact of the debris flow on Polley Lake, Golder concluded that the tailings-related sediment contamination extends across the entire lake. Therefore, sediment samples collected from Bootjack Lake were used to represent local reference conditions in Polley Lake. Sediment samples were collected from lower and upper Hazeltine Creek prior to the TSF embankment breach. The higher 95th percentile of lower and upper Hazeltine Creek reported in Minnow's 2015 sediment quality report (Minnow 2015[1]) was selected to represent reference conditions in Hazeltine Creek. Sediment samples collected from littoral reference areas in Quesnel Lake were used to represent local reference conditions in littoral areas of Quesnel Lake.

The summary statistics for the local reference samples collected from Bootjack Lake and Quesnel Lake reference locations (all years combined) are presented in Tables C-1-1 and C-1-2, respectively. For non-detect values, the full detection limit was assumed for calculating the 95th percentile reference concentration.

To understand the potential difference between the COPCs in sediment collected from Polley Lake, Hazeltine Creek and Quesnel Lake, the sediment samples from each waterbody were screened separately. The combined data from 2014, 2015 and 2016 for each waterbody were used for screening and to calculate summary statistics, including the 95% UCLMs.

[1] This report was included as Appendix E to the Post-Event Environmental Impact Assessment Report (Mount Polley Mining Corporation 2015) and as Appendix E to the DSI (Golder 2016a).

5.2 Sediment Screening Criteria

The DSI Update identified contaminants of concern in sediment based on a comparison to the CSR Schedule 9 standards, which are protective of aquatic life. The Schedule 9 standards are not considered relevant for human health. The BC MoE recommends the use of the CSR soil standards for identifying sediment COPCs in human health risk assessments. While some differences in exposure may occur, the differences are balanced (e.g., wet sediment sticks onto skin more, but the soles of your feet are thicker and less likely to absorb contaminants) such that the use of soil standard is considered to be appropriate. Therefore, sediment concentrations were compared to health-based soil quality criteria for the direct contact scenario.

Sediment data were compared to the following CSR residential land use (RL)/PL standards:

- CSR Schedule 5 – Matrix Numerical Soil Standards, intake of contaminated soil
- CSR Schedule 4 – Generic Numerical Soil Standards
- CSR Schedule 10 – Generic Numerical Soil and Water Standards

A discussion on the basis of the CSR soil standards is provided in Section 3.2. The CSR AL standards were not considered appropriate for screening sediment data because the AL standards apply to lands where the primary activity is related to food production, such as growing crops and livestock.

5.3 Sediment Screening Results

The sediment screening results, along with summary statistics, are provided in Tables C-1-3 to C-1-5 for Polley Lake, Hazeltine Channel and Quesnel Lake, respectively.

Maximum concentrations of the following substances exceeded the screening criteria and the 95th percentile reference concentration:

- **Polley Lake**: chromium, manganese, molybdenum, selenium and vanadium
- **Hazeltine Channel**: vanadium
- **Quesnel Lake**: selenium and vanadium

These substances were retained for further evaluation, and the results are in Table 3.

Table 3: Identification of Contaminants of Potential Concern in Sediment

Parameter	n	Screening Criteria (basis)	95th Percentile Reference	Maximum	95% UCLM[1]	Retain as a Sediment COPC for Human Health?
Polley Lake						
Aluminum	44	n/a	19,700	29,800	23,864	**Yes**
Chromium	44	100 (I)	57.6	104	29.3	No
Manganese	44	1800 (S)	3188	4340	1610	No
Molybdenum	44	10 (G)	4.82	13.8	7.31	No
Selenium	44	3 (G)	2.79	5.75	2.79	No
Vanadium	44	200 (G)	80.5	219	130	No
Hazeltine Channel						
Aluminum	10	n/a	18,000	26,000	24,149	**Yes**
Vanadium	10	200 (G)	74.5	212	178	No
Quesnel Lake						
Aluminum	40	n/a	22,095	18,600	14,829	**Yes**
Selenium	40	3 (G)	0.70	4.14	1.30	No
Vanadium	40	200 (G)	61.6	869	280	**Yes**

Notes:

Concentrations are in milligrams per kilogram (mg/kg), unless otherwise noted.

% = percent; COPC = contaminant of potential concern; G = generic; I = intake of contaminated soil; n = number of samples; n/a = not available; S = CSR Schedule 10; UCLM = upper confidence limit of the mean.

[1] The 95% UCLM was calculated using ProUCL (US EPA 2016a). For non-detect values, the full detection limit was assumed for calculating the 95% UCLM.

Aluminum is not regulated in soil or sediment under the CSR, but was retained as a COPC at the request of the project reviewers.

With the exception of vanadium in Quesnel Lake, the 95% UCLM concentrations were below the screening criteria and/or 95th percentile local reference concentration. The 95% UCLM concentration of vanadium in Quesnel Lake exceeded the CSR RL/PL standard and the 95th percentile local reference concentration; therefore, vanadium was retained as a COPC in sediment. Minnow noted in their 2016 sediment report (Appendix A-7 of the DSI Update) that the mean vanadium concentration in sediment collected at near-field stations was higher in 2016 than 2014 and 2015 and higher than the 2014, 2015 and 2016 local reference concentrations. These differences may be indicative of the continued movement of fines from the shallow near-field area.

6.0 SURFACE WATER

6.1 Surface Water Data

After the TSF embankment breach, MPMC initiated a water quality monitoring program at several locations in Polley Lake, Hazeltine Creek/Edney Creek, Quesnel Lake and Quesnel River. A number of stations were consistently monitored, either weekly or monthly, while other stations were monitored on a more intermittent basis, or were briefly monitored for a specific purpose. Of the monitoring stations available, 12 representative stations were selected on the basis of adequate spatial representation and sampling frequency (i.e., amount of data available):

- Polley Lake: Station P1 and P2
- Hazeltine Creek: HAC-10, HAC-05/05a, HAC-08/08a and HAC-12 (formerly HAC-01/a/b/c)
- Lower Edney Creek: EDC-01 and EDC-02
- Quesnel Lake: QUL-2/2a, QUL-58 (formerly QUL-55/a and QUL-66/a) and QUL-18
- Quesnel River: QUR-1

Details on the selection of each representative monitoring station and their locations is presented in Appendix A-6 of the DSI Update.

As discussed in the DSI, water quality has changed over the year since the TSF embankment breach occurred. Post-TSF embankment breach changes in surface water quality in near field samples reveal three populations of data, which were representative of the following conditions:

i) immediately following the TSF embankment breach to January 2015, when a spike in turbidity and total metals concentrations was observed, particularly within and near Hazeltine Creek

ii) from January to June 2015 when construction of the creek channel and other restorative activities caused smaller spikes in turbidity and total metals in a localized area near Hazeltine Creek

iii) from June through November 2015, following creek reconstruction when water quality was considered to be representative of longer term conditions

For the purpose of this assessment, the conditions from June through November 2015 were considered representative of current and long term conditions.

The 95th percentile baseline concentrations for Polley Lake, Hazeltine Creek and Quesnel River were determined from the pre-TSF embankment breach surface water data received from the MPMC and BC MoE (Golder 2015[2]). A 95th percentile concentration was not calculated for parameters with less than 10 samples or parameters with greater than 95% non-detect values. Pre-TSF embankment breach data were only available for select substances (e.g., total phosphorus and dissolved silicon) in Quesnel Lake. Therefore, the 95th percentile baseline concentrations for Quesnel Lake were calculated from surface water data measured at QUL-120/120a and QUL-40a, located east of Cariboo Island (Golder 2016a). These reference stations represent the water quality flowing into the West Basin.

[2] This report was included as Appendix D to the DSI (Golder 2016a).

6.2 Surface Water Screening Criteria

Surface water in Quesnel Lake is a source of drinking water. Therefore, surface water data were compared to the CSR Schedule 6 drinking water standards (BC MoE 2016a) to identify COPCs in surface water. The DSI Update did not apply the CSR Schedule 10 Generic Numerical Soil and Water Standards to identify COPCs; therefore, screening against Schedule 10 standards was completed as part of the human health screening. Schedule 10 includes generic drinking water standards for substances that are not included in Schedule 6.

The BC CSR Schedule 6 drinking water standards are generally based on Health Canada's Guidelines for Canadian Drinking Water Quality (Health Canada 2014), which were derived using current, published scientific research related to health effects, aesthetic effects and operational considerations. Health-based guidelines are established on the basis of comprehensive review of the known health effects associated with each contaminant, on exposure levels and on the availability of treatment and analytical technologies (Health Canada 2014). The guidelines (or maximum acceptable concentrations) were generally derived using an average daily intake of 1.5 liters of drinking water by a 70 kilogram adult. However, if appropriate, guidelines were derived based on intake of the most sensitive sub-population (e.g., children). A 20% allocation of the total daily intake to drinking water was generally applied, unless data on the proportion of total intake normally ingested in drinking water was available (Health Canada 1995). The CSR Schedule 10 generic water standards are based on the US EPA preliminary remediation goals for residential tap water.

6.3 Surface Water Screening Results

6.3.1 Contaminants of Concern Identified in the Detailed Site Investigation Update

The DSI Update identified copper as a contaminant of concern in surface water based on exceedance of the BC Water Quality Guideline protective of aquatic life. As discussed above, the DSI Update did not consider CSR Schedule 10; therefore, substances with a Schedule 10 standard were also retained for further evaluation.

6.3.2 Contaminants of Concern Identified for the Human Health Risk Assessment

The screening results are presented in Table 4 below.

Table 4: Identification of Contaminants of Potential Concern in Surface Water

Parameter	n	Screening Criteria (basis)	95th Percentile Reference	Maximum	Retain as a Surface Water COPC for Human Health?
Polley Lake					
Aluminum	69	9.5 (DW)	0.031	0.20	No
Copper	69	1 (DW)	0.0033	0.0068	No
Lithium	69	0.73 (S)	0.0025	0.0013	No
Strontium	69	22 (S)	0.24	0.34	No
Tin	69	22 (S)	0.000091	<0.0001	No
Hazeltine Channel					
Aluminum	62	9.5 (DW)	0.35	3.54	No
Copper	62	1 (DW)	0.0061	0.064	No
Lithium	62	0.73 (S)	0.0025	0.0059	No
Strontium	62	22 (S)	0.29	0.57	No
Tin	62	22 (S)	0.00023	0.00011	No
Quesnel Lake					
Aluminum	110	9.5 (DW)	0.034	0.13	No
Copper	110	1 (DW)	0.0012	0.028	No
Lithium	110	0.73 (S)	0.0012	0.0017	No
Strontium	110	22 (S)	0.14	0.15	No
Tin	110	22 (S)	0.00005	0.00059	No
Quesnel River					
Aluminum	12	9.5 (DW)	0.02	0.067	No
Copper	12	1 (DW)	0.0047	0.0015	No
Lithium	12	0.73 (S)	Not measured	0.0016	No
Strontium	12	22 (S)	Not measured	0.14	No
Tin	12	22 (S)	Not measured	<0.0001	No

Notes:

Concentrations are in milligrams per litre (mg/L), unless otherwise noted.

< = below method detection limit; % = percent; COPC = contaminant of potential concern; DW = drinking water; n = number of samples; S = CSR Schedule 10.

Based on the screening results, no human health contaminants of concern were identified in surface water. The maximum measured concentrations of aluminum, copper, lithium, strontium and tin in Polley Lake, Hazeltine Channel, Quesnel Lake and Quesnel River were below the CSR Schedule 6 and 10 drinking water standards.

7.0 AIR

Further assessment of aluminum, copper and vanadium in ambient air was conducted for at the request of reviewers. It should be noted that copper and vanadium concentrations in soil were below human health-based soil screening criteria and aluminum is not regulated under the CSR.

7.1 Air Data

Ambient air metal concentrations were not measured at the Mine. Therefore, 1-hour, 24-hour and annual ambient concentrations of copper and vanadium in air were predicted using data from the dustfall monitoring stations at the operational area of the Mine and data from the particulate matter monitoring program completed by Golder in 2015 (Appendix C-2). Data from the operational area of the mine were considered to be a very conservative evaluation of air quality due to the relatively high volume of truck traffic in the vicinity of the air quality monitoring stations compared to what occurs along the Hazeltine Channel. The methods used to predict ambient metals concentrations are described in Appendix C-1.

Local reference concentrations for ambient metals were not available. The nearest monitoring station with metals data is located in Quesnel. However, this station is influenced by local urban and industrial sources that are not present at the Mine. Without representative local reference concentrations, air data were compared to the screening criteria only to identify COPCs in air.

7.2 Air Screening Criteria

Several sources were consulted for air screening criteria. A description of each source is provided in this section.

Agency for Toxic Substances and Disease Registry

The ATSDR is a federal public health agency of the United States Department of Health and Human Services. The ATSDR derives Minimal Risk Levels (MRLs) for non-carcinogenic health effects (ATSDR 2016). The MRLs are based on data that identify the target organ(s) of effect or the most sensitive health effect(s) for a specific duration for a given route of exposure to the substance. The ATSDR generally uses the No Observed Adverse Effect Level/Uncertainty Factor approach to derive MRLs. Physiologically-based pharmacokinetic modelling and benchmark dose modelling have also been used in deriving MRLs. Acute MRLs were derived for exposure durations of 1 to 14 days. The chronic MRLs were derived for exposure durations greater than or equal to 365 days.

The ATSDR MRLs are generally based on the most sensitive endpoint considered to be of relevance to humans. The ATSDR applies a protective approach (i.e., application of margins of safety) to address uncertainty in particular for people who might be most sensitive (e.g., infants, elderly and nutritionally or immunologically compromised). Supporting documentation is available for the MRLs used in this assessment.

United States Environmental Protection Agency Regional Screening Levels

The US EPA has developed residential air regional screening levels (RSLs) (US EPA 2016b) for the protection of human health. The RSLs are risk-based concentrations derived from standardized equations combining exposure information assumptions with US EPA toxicity data. The RSLs were adjusted for residential scenario exposure factors based on default assumptions for an adult. The RSLs are considered by the US EPA to be protective for human exposure (including sensitive groups) over a lifetime. Chemical concentrations above the RSL do not automatically constitute a health risk; however, exceeding an RSL indicates that further evaluation of the potential risks is appropriate. The US EPA RSLs for non-carcinogens are based on a hazard quotient (HQ) of 1.0, and for carcinogens are based on a risk level of 1 in 1,000,000. The carcinogenic RSLs were multiplied by a factor of 10 to adjust to a risk level of 1 in 100,000.

World Health Organization

The World Health Organization (WHO) has developed air quality guidelines to provide a basis for protecting public health from adverse effects of air pollution (WHO 2000). The guidelines are intended to provide background information and guidance to governments in making risk management decisions, particularly in setting standards. These guidelines may also be used in planning processes and various management decisions at a community or regional level. Supporting documentation is available for the WHO guidelines. The air quality guidelines for non-carcinogens were based on a HQ of 1.0, and for carcinogens, are provided for a cancer risk level of 1 in 100,000.

Ontario Ministry of Environment

In the province of Ontario, the Ontario Ministry of the Environment (OMOE) has developed Ambient Air Quality Criteria (AAQC), which may be used in environmental assessments to assess air quality (OMOE 2012). An AAQC is a desirable concentration of a contaminant in air, based on protection against adverse effects on health or the environment. The AAQC are set with different averaging times (e.g., 24-hour, 1 hour and 10 minutes) appropriate for the effect that they are intended to protect against. The effects considered may be health, odour, vegetation, soiling, visibility, corrosion or other effects.

The OMOE has also derived air quality standards used to assess emissions from non-mobile sources of air pollution in Ontario. The Ontario air quality standards are desirable concentrations of air contaminants set at levels protective of the natural environment and sensitive populations (e.g., children, the elderly). The OMOE considers available toxicological information and supporting environmental information to establish effects-based air standards based on the limiting or critical effects (health or environmental considerations) of that chemical.

In general, the OMOE air standards for carcinogens were set at an incremental lifetime cancer risk of one incidence in one million individuals; the OMOE standards were multiplied by a factor of 10 to derive a screening value for a risk level of 1 in 100,000 for the purposes of this screening exercise. Air standards for non-carcinogens were generally derived from reference concentrations (chosen based on available peer-reviewed toxicological information and key studies with associated limiting or critical effect[s]). The air standards for non-carcinogens were generally set at a target HQ of 1.0.

California Office of Environmental Health Hazard Assessment

The California Office of Environmental Health Hazard Assessment (Cal OEHHA) Reference Exposure Levels (RELs) are concentrations of a chemical at or below which adverse non-carcinogenic health effects are not anticipated to occur for a specific exposure duration (Cal OEHHA 2016). The RELs are used in risk assessments to evaluate the potential for adverse non carcinogenic public health effects from facility emissions or similar localized sources in the Air Toxics Hot Spots Program, and from widespread exposures in the Toxic Air Contaminants program. The REL is an exposure at or below which adverse non carcinogenic health effects are not expected to occur in a human population, including sensitive subgroups (e.g., infants and children). Supporting documentation is available for most of the RELs. The chronic RELs for non-carcinogens are based on a HQ of 1.0.

The Cal OEHHA does not develop RELs or air quality guidelines or objectives for carcinogens. Rather, the Cal OEHHA has developed inhalation unit risks (IURs) for use in cancer risk assessments (Cal OEHHA 2009). The Cal OEHHA was contacted regarding the use of their inhalation unit risk factors for screening purposes. Mr. Chris Halm of the California Environmental Protection Agency Air Resources Board indicated that IURs can be adjusted based on an applicable cancer risk level and used as screening values (Halm 2010, pers. comm.). The Cal OEHHA IURs are based on a cancer risk level of 1 in 1,000,000; this level was divided by the IUR and multiplied by a factor of 10 to derive a screening value for a risk level of 1 in 100,000.

Texas Commission on Environmental Quality

The Texas Commission on Environmental Quality (TCEQ) has developed acute (1-hour) short-term and long-term Effects Screening Levels (ESLs) that are used in the air permitting process to evaluate short-term and long-term emissions predicted by air dispersion modelling (TCEQ 2016). The TCEQ has developed a guidance document titled “TCEQ Guidelines to Develop Toxicity Factors” (TCEQ 2015) that outlines the approach and methods used to derive the ESLs, and their application. The short-term ESLs are based on health effects, the potential for odours to be a nuisance, effects on vegetation and corrosive effects. The ESLs are used in the air permit review process, for review of air permit applications, where emissions of one constituent from one site are evaluated at a time (emissions from multiple sites or multiple chemicals are not evaluated).

The TCEQ adjusts short-term reference values to a HQ of 0.3 to derive ESLs protective of cumulative and aggregate exposure. Other jurisdictions do not typically use an HQ approach in their derivation of short-term exposure limits or thresholds. The TCEQ ESLs (which are based on an HQ of 0.3) were conservatively used in the screening process without HQ adjustment (to an HQ of 1.0). However, in cases where TCEQ used the same primary study as another jurisdiction in their derivation of an ESL, preference was given to screening criteria that had not been HQ adjusted.

The long-term ESLs are based on data concerning chronic health and vegetation effects. They are not ambient air standards. If predicted airborne levels of a constituent do not exceed the screening level, adverse health effects are not expected. If predicted ambient levels of constituents in air exceed the screening levels, it does not necessarily indicate a problem but rather triggers a more detailed review.

The chronic ESLs for non-carcinogens are based on a HQ of 0.3, and for carcinogens, the ESLs are based on a risk level of 1 in 100,000. The non-carcinogenic ESLs were multiplied by a factor of 1.0/0.3 (i.e., 3.333) to adjust to a HQ of 1.0.

The acute 1-hour and 24-hour health-based criteria were preferentially obtained from the following agencies:

- ATSDR
- WHO

The lowest health-based criteria was generally selected for use in the screening process. Consideration was also given to relevant test species (i.e., human data versus animal data), study endpoint, quality of the data and date of the study.

The chronic annual health-based screening criteria were preferentially obtained from the following agencies:

- ATSDR
- US EPA
- WHO

Where a health-based screening criteria was not available from the agencies listed above, acute 1-hour, 24-hour and chronic annual health-based criteria from the following agencies were used:

- OMOE
- Cal OEHHA
- TCEQ

Specific details on the derivation of the copper and vanadium screening criteria for the 1-hour, 24-hour and annual averaging times are provided in Table 5 to Table 7, respectively. The selected criteria used in the screening process are highlighted in grey and bolded.

Table 5: Acute 1-Hour Screening Criteria

Substance	Cal OEHHA REL	TCEQ ESL	Toxicological Endpoints and Derivations
Aluminum	-	**90**	**TCEQ**: Criterion based on a health endpoint (interim, supporting documentation not available), as aluminum metal and insoluble aluminum (50 µg/m^3).
Copper	100	**10**	**Cal OEHHA**: Criterion based on a NOAEL of 1 mg copper/m^3 in a study where workers indicated exposure to copper dust was detectable by taste but no other symptoms occurred following exposure to 1 to 3 mg/m^3 copper for an unspecified amount of time (Whitman 1957; as cited in Cal OEHHA 2008). No extrapolation for continuous exposure was applied because the exposure duration was not clearly specified in the reports. An uncertainty factor for intraspecies variability (10) was applied.
			TCEQ: Criterion based on a health endpoint (interim, supporting documentation not available), as copper dusts and mists.
Vanadium	30	**20**	**Cal OEHHA**: Criterion based on respiratory effects (increased respiratory mucus production that was cleared by coughing) in humans exposed to vanadium pentoxide for 8 hours. The LOAEL was 0.25 mg/m^3 and the NOAEL was 0.1 mg/m^3 (Zenz and Berg 1967; as cited in Cal OEHHA 2008). The equivalent 1-hour concentration was determined to be 0.3 mg/m^3 using the following equation: $C^2 = [0.1\ mg/m^3]^2 \times 8\ hours)/1\ hour)$. An uncertainty factor of 10 was applied (1 for use of a LOAEL, 1 for interspecies variation, and 10 for intraspecies variation).
			TCEQ: Criterion based on a health endpoint (interim, supporting documentation not available), as vanadium metal and compounds in PM_{10} as a particulate.

Notes:

Concentrations are in micrograms per cubic metre (µg/m^3), unless otherwise noted.

Bold and shaded text indicates selected screening criteria.

"-" = screening criteria not available; Cal OEHHA = California Office of Environmental Health Hazard Assessment.

ESL = Effects Screening Level; LOAEL = lowest observed adverse effect level; mg/m^3 = milligram per cubic metre.

NOAEL = no observed adverse effect level; PM_{10} = particulate matter with a mean aerodynamic diameter of 10 microns or less.

REL = Reference Exposure Level TCEQ = Texas Commission on Environmental Quality.

Table 6: Acute 24-Hour Screening Criteria

Substance	ATSDR MRL	WHO	OMOE AAQC	Toxicological Endpoints and Derivations
Aluminum	-	-	**120**	**OMOE**: Threshold for aluminum oxide, based on a health endpoint for chemical sorbed to particulates (supporting documentation not available).
Copper	-	-	**50**	**OMOE**: Criterion for copper based on a health endpoint (supporting documentation not available).
Vanadium	0.8	**1**	2	**ATSDR**: Criterion based on a LOAEL of 0.56 mg/m^3 for lung inflammation in rats exposed to vanadium pentoxide for 6 hours/day, 5 days/week for 13 days (ATSDR 2012). The LOAEL was adjusted for continuous exposure (0.1 mg/m^3) and to a human equivalent concentration (HEC) (0.073 mg/m^3). An uncertainty factor of 90 (3 for using minimal LOAEL, 3 for animal to human extrapolation and 10 for human variability) was applied to the HEC.
				WHO: Criterion based on human occupational studies indicating that the LOAEL for vanadium can be assumed to be 20 µg/m^3, based on chronic upper respiratory tract symptoms. The adverse nature of the observed effects including irritation, coughing, and effects on the pharynx, were minimal at 20 µg/m^3 compared to the higher exposures of 1 mg/m^3 where more serious effects such as chronic bronchitis and pneumonia were observed. A susceptible subpopulation was not identified and an uncertainty factor of 20 (to account for use of a concentration where only minimal effects to the respiratory tract were seen and for lack of identification of a susceptible subpopulation) was selected. The WHO value was selected because the criteria was based on a human study.
				OMOE: Criterion for vanadium based on a health endpoint (supporting documentation not available).

Notes:

Concentrations are in micrograms per cubic metre (µg/m^3), unless otherwise noted.

Bold and shaded text indicates selected screening criteria.

µg/m^3 = microgram per cubic metre; "-" = screening criteria not available; AAQC = Ambient Air Quality Criteria.

ATSDR = Agency for Toxic Substances and Disease Registry; HEC = human equivalent concentration.

LOAEL = lowest observed adverse effect level; mg/m^3 = milligram per cubic metre; MRL = Minimal Risk Level.

OMOE = Ontario Ministry of the Environment; WHO = World Health Organization.

Table 7: Chronic Annual Screening Criteria

Substance	Carcinogen Classification	ATSDR MRL	US EPA	TCEQ ESL	Toxicological Endpoints and Derivations
Aluminum	NC	-	**5.2**	6.7 (2)	**US EPA**: Threshold based on a provisional reference concentration of 0.005 mg/m^3 for neurotoxic effects (psychomotor and cognitive impairment) in occupationally exposed workers (US EPA 2006). Workers were exposed to a time-weighted average concentration of 4.6 to 11.5 mg/m^3 for an average of 12 years. The lowest observed adverse effect level (LOAEL) of 4.6 mg/m^3 based on an 8-hour exposure was adjusted for continuous exposure and corrected for a human equivalent concentration (HEC). The LOAEL HEC is 1.64 mg/m^3. An uncertainty factor of 300 (10 for intra-human variability, 10 for using a LOAEL and 3 for an incomplete database) was applied. A residential scenario exposure factor was applied to the reference concentration to derive the screening level.
					TCEQ: Threshold based on a health endpoint (supporting documentation not available). The threshold of 2 µg/m^3 is based on aluminum chloride in PM_{10}. The TCEQ also provides a threshold of 5 µg/m^3 for aluminum metals and soluble aluminum salts in PM_{10}; however the more conservative value of 2 µg/m^3 was chosen for screening.
Copper	NC	-	-	**3.3 (1)**	**TCEQ**: Criterion based on a health endpoint (interim, supporting documentation not available), as copper dusts and mists in PM_{10}.
Vanadium	NC	**0.1**	**0.1**	6.7 (2)	**ATSDR**: Criterion based on degeneration of respiratory epithelium of the epiglottis in mice exposed to vanadium pentoxide for 6 hours/day, 5 days/week for 104 weeks (ATSDR 2012). The human equivalent benchmark concentration lower confidence limit corresponding to the lower 10% incidence of effect of 0.003 mg/m^3 was used and an uncertainty factor of 30 (3 for extrapolating from animals to humans and 10 for human variability) was applied to calculate 0.1 µg/m^3 as the criteria for vanadium pentoxide.
					US EPA: Criterion based on the ATSDR study (see above).
					TCEQ: Criterion based on a health endpoint (interim, supporting documentation not available) as vanadium, metal and compounds in PM_{10}.

Notes:

Concentrations are in micrograms per cubic metre (µg/m^3), unless otherwise noted.

Bold and shaded text indicates selected screening criteria.

µg/m^3 = microgram per cubic metre; % = percent; "-" = screening criteria not available.

ATSDR = Agency for Toxic Substances and Disease Registry; ESL = Effects Screening Level; mg/m^3 = milligram per cubic metre.

MRL = Minimal Risk Level; NC = non-carcinogen; PM_{10} = particulate matter with a mean aerodynamic diameter of 10 microns or less.

TCEQ = Texas Commission on Environmental Quality; US EPA = United States Environmental Protection Agency.

7.3 Air Screening Results

The COPC screening summary for aluminum, copper and vanadium for the 1-hour, 24-hour and annual averaging times is provided in Table 8 to Table 10, respectively.

Table 8: Identification of Contaminants of Potential Concern in Air – Acute 1-Hour

Substance	1-Hour Air Screening Criteria	Summary Statistics for Predicted Concentrations			Retain as an Air COPC for Human Health?
		Minimum	Average	Maximum	
Aluminum	90	0	0.24	6.97	No
Copper	10	0	0.014	0.42	No
Vanadium	20	0	0.0028	0.082	No

Notes:

Concentrations are in micrograms per cubic metre (µg/m^3), unless otherwise noted.

COPC = contaminant of potential concern.

Table 9: Identification of Contaminants of Potential Concern in Air – Acute 24-Hour

Substance	24-Hour Air Screening Criteria	Summary Statistics for Predicted Concentrations			Retain as an Air COPC for Human Health?
		Minimum	Average	Maximum	
Aluminum	120	0.0017	0.12	2.1	No
Copper	50	0.00010	0.0070	0.13	No
Vanadium	1	0.000021	0.0014	0.025	No

Notes:

Concentrations are in micrograms per cubic metre (µg/m^3), unless otherwise noted.

COPC = contaminant of potential concern.

Table 10: Identification of Contaminants of Potential Concern in Air – Chronic Annual

Substance	Annual Air Screening Criteria	Predicted Annual Average Concentration	Retain as an Air COPC for Human Health?
Aluminum	5.2	0.24	No
Copper	3.3	0.014	No
Vanadium	0.1	0.0028	No

Notes:

Concentrations are in micrograms per cubic metre (µg/m^3), unless otherwise noted.

COPC = contaminant of potential concern.

The maximum predicted aluminum, copper and vanadium concentrations in ambient air were below the air screening criteria for the 1-hour, 24-hour and annual averaging times. Therefore, risks associated with aluminum, copper and vanadium in ambient air are acceptable.

7.4 Particulate Matter

Golder completed bi-weekly monitoring of particulates between 7 July and 29 September 2015 as part of a fugitive dust management plan for the Mount Polley Mine TSF and the Polley Flats area. Four DustTRAK™ monitoring stations were set up around the TSF (Figure 13 in Appendix C-2). Twenty-four hour total suspended particulate, particulate matter with a mean aerodynamic diameter of 10 microns or less (PM_{10}) and particulate matter with a mean aerodynamic diameter of 2.5 microns or less ($PM_{2.5}$) measurements from these stations were compared to the BC Ambient Air Quality Objectives (AAQOs) (BC MoE 2014[3]). Monitoring data were also compared to 24-hour particulate concentrations from nearby towns, Quesnel and Williams Lake, for context. The Quesnel Lake station was located at Quesnel Senior Secondary, approximately 76 kilometers northwest of the Mine. The Williams Lake station was located at Williams Lake Columneetza School, approximately 60 kilometers southwest of the Mine.

The results of the continuous particulate monitoring program are provided in (Appendix C-2). In summary:

- Of the 82 days monitored, 3 days had PM_{10} and $PM_{2.5}$ concentrations greater than the AAQOs. However, these exceedances were attributed to regional forest fires rather than site activities. Twenty-four-hour particulate concentrations monitored on the Study Area showed similar trends to those measured in Quesnel and Williams Lake, indicating that monitored concentrations were influenced by regional trends as opposed to potential localized emission sources.
- The continuous monitoring data indicated that the dust management measures appear to be effective at managing dust in the TSF and Polley Flats.

Airborne particulate matter is considered to a non-threshold acting substance such that a concentration below which no adverse effects are expected is not likely to exist (WHO 2006). However, the continuous particulate monitoring results from 2015 indicated that elevated particulate concentrations appeared to be related to forest fires and not the TSF embankment breach. Therefore, the dust management measures appeared to be effective at managing dust in the active area of the Mine. Dust production downgradient of the active area of the mine would be expected to be far less than in the active area as there is significantly more truck traffic in and around the active mine area. Therefore, further evaluation of exposure to particulate matter was not conducted as there was no significant exposure pathway to dust.

8.0 VEGETATION

Further assessment of potential contamination in vegetation was conducted for aluminum, copper and vanadium at the request of reviewers.

[3] The 2014 BC MoE AAQOs were superseded by a 2016 update; however, the 24-hour objectives for total suspended particulate, PM_{10} and $PM_{2.5}$ used in the continuous particulate monitoring program did not change.

8.1 Vegetation Data

Vegetation samples (berries, conifers, grasses and shrubs), along with co-located soil samples, were collected in 2015 and 2016 from the floodplain and halo areas around Hazeltine Channel after the TSF embankment breach. Edible plants were collected in support of the human health and ecological risk assessments and included:

- Berries: brambleberry, bunchberry, highbush cranberry, raspberry, Saskatoon berry, thimbleberry
- Conifers: spruce needles
- Grasses: barley, bunchgrass, lolium sp., Poa sp., rye, stiff needle, tufted hairgrass
- Shrubs: willow (MacCalla's, MacKenzie's, pacific, Sitka), devil's club

Background vegetation samples collected in 2015 and 2016 included:

- Berries: baneberry, black currant, black twinberry, bunchberry, false Solomon's seal berry, highbush cranberry, raspberry, thimbleberry
- Conifers: spruce needles
- Grasses: barley, Lolium sp. rye
- Shrubs: willow (Bebb's, MacCalla's, Scouler's, Sitka, variable), devil's club

Baseline vegetation data were also available. Sampling was conducted in 1989, 1995 and 1996 to document pre-mine concentrations of metals in plants on or near the mine site in areas including the Central and West Pits (now the Cariboo and Springer Pits), the Mill Site and the TSF (Golder 2016b). Aluminum and vanadium were not measured in the historic plant samples, and berry samples were not collected in the baseline study. Soil samples were not collected with baseline plant samples.

The 2015 and 2016 co-located soil and vegetation results were used to evaluate whether concentrations of aluminum, copper and vanadium in plant tissue have increased as a result of tailings deposition along the Hazeltine Channel (Appendix E-1).

8.2 Vegetation Screening Approach

Currently, human health-based screening criteria for vegetation are not available. A statistical analysis of aluminum, copper and vanadium in plant tissue was completed to determine if concentrations of these metals in plants had increased as a result of the TSF embankment breach. Concentrations of aluminum, copper and vanadium in plant tissues were compared to reference and baseline plant tissue concentrations. The results of the statistical analysis are provided in Appendix E-1 and summarized below. The analysis was designed to evaluate temporal and spatial differences in metals concentrations in plants. Specifically, the analysis was used to address the following question in support of the HHRA: are metal concentrations in plants collected from exposed areas statistically higher than concentrations measured in plants from background areas and the pre-mine baseline study?

Tissue data were first separated into different populations based on tissue type, sample area (e.g., background, baseline, halo or floodplain), and collection year (baseline data was not separated by year). Background and baseline data were not pooled as the samples were collected at least 19 years apart from different parts of the mine area. Floodplain and halo data were kept as separate populations as there are differences between these two areas, namely; i) growth medium – plants growing in the halo are generally rooted in native soils underlying tailings while floodplain plants have been planted directly into the deposited tailings till mixture, and ii) age of plants – plants growing in the halo are generally well established and have been growing for several years, while all plants in the floodplain have been planted post-TSF embankment breach as part of restoration efforts.

Aluminum, copper and vanadium concentrations in plant tissue were also compared to the co-located soil samples to determine tissue to soil ratios (i.e., bioaccumulation factors).

8.3 Vegetation Results

There were no statistical differences between 2015 and 2016 data, with the exception of selenium concentrations in floodplain grasses. However, there was no environmental or geochemical reason to suggest that selenium concentrations would differ between the two years. Therefore, data collected in both years were pooled for the same area and tissue type to evaluate whether aluminum, copper and vanadium concentrations in plant tissues were elevated in areas impacted by tailings deposition.

The results for aluminum, copper and vanadium are summarized as follows:

- Copper concentrations in grass and shrubs from the floodplain were statistically higher than concentrations in background and baseline samples, although the concentrations measured in the floodplain samples were generally within the range of normal for copper concentrations in plants. Copper concentrations in conifers from the halo were statistically higher than concentrations in background samples, but were not statistically higher than in baseline samples. Copper concentrations in berries from the halo were not statistically higher than in background samples (no baseline data was available for berries).
- Vanadium concentrations in grass and shrubs from the floodplain were significantly higher than background samples. Vanadium concentrations in conifers and berries from the halo area were significantly higher than background samples. Vanadium was not analyzed in baseline samples.
- In general, plant tissue concentrations of aluminum were highest in the floodplain, and were higher in the halo than the background forest. However, the range of aluminum concentrations in plants from the halo and background area overlapped. The generally greater concentrations observed in floodplain than halo plants may be attributed to their younger age and the lower organic matter of the substrate they were planted into.
- Soil to plant bioaccumulation factors for copper and vanadium were below one and decreased with increasing soil concentration, indicating a non-linear relationship between copper concentrations in soil and plants. Soil to plant bioaccumulation factors for aluminum were also below one.

Based on the above results, aluminum, copper and vanadium were retained as COPCs in vegetation and carried forward in the HHRA.

9.0 FISH TISSUE

Fish tissue samples (carcass, gills, kidney, liver, muscle, ovary and whole body) were collected from several fish species (burbot [*Lota lota*], kokanee [*Oncorhynchus nerka*], lake trout [*Salvelinus namaycush*], largescale sucker [*Catostomus macrocheilus*], longnose dace [*Rhinichthys cataractae*], longnose sucker [*Catostomus catostomus*], mountain whitefish [*Prosopium williamsoni*], northern pikeminnow [*Ptychocheilus oregonensis*], peamouth chub [*Mylocheilus caurinus*], rainbow trout [*Oncorhynchus mykiss*], redside shiner [*Richardsonius balteatus*] and sockeye salmon [*Oncorhynchus nerka*]) after the TSF embankment breach. The tissue chemistry results from 2014, 2015 and a subset from spring 2016 are presented Appendix D-1. The data were divided into exposure and reference sites, and subdivided by species, tissue type and year to help determine if there has been a change in metal concentrations in fish as a result of the TSF embankment breach. The results are summarized as follows:

- Copper concentrations in lake trout muscle samples (2014) and rainbow trout muscle samples (2014 and 2015) were similar among reference and exposed sites.
- Vanadium concentrations in lake trout and rainbow trout muscle tissue were generally below the detection limit.
- For copper and vanadium, concentrations in fish tissues did not appear to be different in exposed compared to reference sites.

Minnow also collected fish tissue samples in 2016, and the results are reported in Appendix D-2[4].

Fish tissue screening criteria are currently not available. Therefore, the COPCs retained in other media were also retained for fish tissue. Lake trout and rainbow trout were considered to be representative fish species consumed by people. The summary statistics for lake trout and rainbow trout are presented in Table 11.

Table 11: Fish Tissue Summary Statistics

COPC	Waterbody	n	95th Percentile Reference[1]	Maximum
Lake trout				
Aluminum	Quesnel Lake	61	0.76	3.96
Copper	Quesnel Lake	61	0.63	0.95
Vanadium	Quesnel Lake	61	0.020	0.030
Rainbow trout				
Aluminum	Quesnel Lake	2	0.40	0.88
Copper	Quesnel Lake	2	0.36	0.32
Vanadium	Quesnel Lake	2	0.02	0.16
Aluminum	Polley Lake and Frypan Creek	40	0.40	16
Copper	Polley Lake and Frypan Creek	40	0.36	0.99

[4] Will be included with the terrestrial ecological risk assessment and aquatic ecological risk assessment submission.

COPC	Waterbody	n	95th Percentile Reference[1]	Maximum
Vanadium	Polley Lake and Frypan Creek	40	0.02	0.086
Aluminum	Quesnel River	20	0.40	4.7
Copper	Quesnel River	20	0.36	9.35
Vanadium	Quesnel River	20	0.02	0.42

1) The reference samples for lake trout were collected from Quesnel Lake-East. The reference samples for rainbow trout were collected from Bootjack Lake and Trio Lake (the lower of the two is presented).

COPC = contaminant of potential concern; n = number of samples.

10.0 SUMMARY OF CONTAMINANTS OF POTENTIAL CONCERN

Based on the results of the DSI Update and the human health screening completed for soil, groundwater, sediment and surface water, vanadium was identified as a COPC in sediment and retained for further analysis in the HHRA. Aluminum was evaluated at the request of project reviewers and was retained as a COPC in the HHRA. Further assessment of potential contamination in air and vegetation was conducted for aluminum, copper and vanadium at the request of reviewers. Concentrations of copper and vanadium in grass and shrubs were statistically greater in the Study Area than background. Concentrations of aluminum were generally higher in halo than in background. Therefore, aluminum, copper and vanadium were retained for further analysis in the HHRA.

95th Percentile Adult Freshwater Fish Consumption Rate							46.42	**Adult Freshwater Fish Consumption Rate**						9.29

Notes:

"-" = data not available; g = grams per day.

1) 95th percentil consumption rates were not available for these fish species; therefore the average consumption rates were used.

APPENDIX B-3

Food Chain Model Inputs and Outputs for Estimating Tissue Concentrations

Food Chain Model Outputs - Mule Deer
MPMC - Human Health Risk Assessment

Mule Deer		Aluminum Channel	Copper Channel	Vanadium Channel
% Diet	Dose (mg/d)			
0.20	Grass	3.79E+02	2.10E+01	2.79E+00
0.80	Leaves	8.40E+02	2.93E+01	4.69E+00
Food Dose (mg/d)		1.22E+03	5.03E+01	7.49E+00
x Bioavailability Factor		1.00E+00	1.00E+00	1.00E+00
= Adjusted Dose		1.22E+03	5.03E+01	7.49E+00
Soil Dose (mg/d)		1.05E+03	5.18E+01	1.24E+01
x Bioavailability Factor		1.00E+00	1.00E+00	1.00E+00
= Adjusted Dose		1.05E+03	5.18E+01	1.24E+01
Water Dose (mg/d)		3.46E+00	1.46E-01	1.78E-02
x Bioavailability Factor		1.00E+00	1.00E+00	1.00E+00
= Adjusted Dose		3.46E+00	1.46E-01	1.78E-02
Food + Soil + Water (mg/d)		2.28E+03	1.02E+02	2.00E+01
BW Adjusted (mg/kg/d)		1.90E+01	8.52E-01	1.66E-01
HR Adjusted (mg/kg/d)		1.90E+01	8.52E-01	1.66E-01
SC Adjusted (mg/kg/d)		1.90E+01	8.52E-01	1.66E-01
Final Daily Dose (mg/kg/day)		1.90E+01	8.52E-01	1.66E-01

Model Parameters		
Body Weight (BW; kg)	1.20E+02	Eder and Pattie (2001); mean body weight
Fraction of Moisture in Food	5.74E-01	
Food Ingestion (kg/d ww)	8.25E+00	US EPA (1993); converted to ww
Water Ingestion (L/d)	7.36E+00	US EPA (1993)
Soil/Sediment Ingestion (kg/d)	7.03E-02	Beyer et al. (1994); Assumed to be 2% of FIR
Habitat Range (ha)	3.00E+01	Environment Canada (2012)
Habitat Range (HR) Factor	1.00E+00	
Soil Cap (SC) Factor	1.00E+00

Notes:
COPC = contaminant of potential concern; n/a = not applicable, this exposure pathway was not applicable for the receptor and COPC combination.
[1] The infant was the most sensitive receptor used to evaluate the ingestion of berry and/or traditional plant pathways. The toddler was the most sensitive receptor used to evaluate the sediment exposure and ingestion of wild game pathways.

APPENDIX B-5
Sample Calculation

1.0 SAMPLE CALCULATION

A sample calculation, including exposure dose and hazard quotient, was conducted for the adult subsistence and traditional land user exposed to vanadium from the remediation area via incidental sediment and soil ingestion, sediment and soil dermal contact, inhalation of soil particulates, ingestion and dermal contact with surface water and traditional food ingestion.

2.0 INCIDENTAL SEDIMENT/SOIL INGESTION DOSE RATE

$$DR_{SI} = \frac{C_S \times IR_S \times RAF_O \times D_1 \times D_2}{BW}$$

Where:

DR_{SI} = estimated dose rate from ingestion of COPC in sediment/soil (mg/kg BW/day)

C_S = COPC concentration in sediment/soil (mg/kg)

IR_S = sediment/soil ingestion rate (kg/day)

RAF_{Oral} = bioavailability via sediment/soil ingestion, i.e., relative absorption factor from the gastrointestinal tract (unitless)

D_1 = days per week exposed / 7 days

D_2 = weeks per year exposed / 52 weeks (assumed to be 52 weeks; no amortization for weeks per year)

BW = body weight (kg)

Incidental ingestion of vanadium in sediment from the remediation area for the adult subsistence and traditional land user:

$$DR_{SedI} = \frac{280 \text{ mg/kg} \times 0.00002 \text{ kg/day} \times 1 \times 5 \text{ days} / 7 \text{ days} \times 52 \text{ weeks} / 52 \text{ weeks}}{70.7 \text{ kg}}$$

DR_{SedI} = 5.66E-05 mg/kg bw/day

Hazard quotient for inadvertent ingestion of vanadium from sediment in the remediation area for the adult subsistence and traditional land user:

$$HQ = \frac{DR}{RfD}$$

Where:

DR = dose rate (mg/kg bw/day)

RfD = reference dose (mg/kg bw/day)

$$HQ_{SedI} = \frac{5.66E\text{-}05 \text{ mg/kg BW/day}}{5.0E\text{-}03 \text{ mg/kg BW/day}}$$

HQ_{SedI} = 1.13E-02

Incidental ingestion of vanadium in soil from the remediation area for the adult subsistence and traditional land user:

DR_{SI} = 176.5 mg/kg × 0.00002 kg/day × 1 × 5 days / 7 days × 52 weeks / 52 weeks
70.7 kg

DR_{SI} = 6.06E-07 mg/kg bw/day

Hazard quotient for inadvertent ingestion of vanadium from soil in the remediation area for the adult subsistence and traditional land user:

HQ_{SI} = 3.57E-05 mg/kg BW/day
5.0E-03 mg/kg BW/day

HQ_{SI} = 7.13E-03

3.0 INHALATION OF SOIL PARTICULATES

$$DR_{Inh} = \frac{C_A \times IR_A \times RAF_{Inh} \times D_1 \times D_2 \times D_3}{BW}$$

Where:

DR_{Inh} = estimated dose rate from inhalation of COPC in air (mg/kg bw/day)
C_A = COPC concentration in air (mg/m^3)
IR_A = inhalation rate (m^3/day)
RAF_{Inh} = bioavailability via inhalation (unitless)
D_1 = hours per day exposed / 24 hours
D_2 = days per week exposed / 7 days
D_3 = weeks per year exposed / 52 weeks (assumed to be 52 weeks; no amortization for weeks per year)
BW = body weight (kg)

Inhalation of vanadium in soil particulates from the remediation area for the adult subsistence and traditional land user:

DR_{Inh} = 3E-6 mg/m^3 × 16.6 m^3/day × 1 × 10 hours/ 24 hours × 5 days / 7 days × 52 weeks / 52 weeks
70.7 kg

DR_{Inh} = 2.10E-07 mg/kg bw/day

Hazard quotient for inhalation of vanadium from soil in the remediation area for the adult subsistence and traditional land user:

HQ_{Inh} = 2.10E-07 mg/kg BW/day
5.0E-03 mg/kg BW/day

HQ_{Inh} = 4.19E-05

4.0 SEDIMENT/SOIL DERMAL CONTACT DOSE RATE

$$DR_{DC} = \frac{C_S \times [(SA_H \times SL_H) + \sum(SA_O \times SL_O)] \times RAF_D \times D_1 \times D_2}{BW}$$

Where:

DR_{DC} = estimated dose rate from dermal contact with COPC in sediment/soil (mg/kg BW/day)
C_S = COPC concentration in sediment/soil (mg/kg)
SA_H = skin surface area available for dermal contact (hands) (m^2)
SL_H = sediment/soil loading to exposed skin (hands) ($kg/m^2/day$)
SA_O = skin surface area available for dermal contact (other than hands) (m^2)
SL_O = sediment/soil loading to exposed skin (other than hands) ($kg/m^2/day$)
RAF_{Dermal} = bioavailability via dermal contact (unitless)
D_1 = days per week exposed / 7 days
D_2 = weeks per year exposed / 52 weeks (assumed to be 52 weeks; no amortization for weeks per year)
BW = body weight (kg)

Dermal contact with vanadium in sediment from the remediation area for the adult subsistence and traditional land user:

$$DR_{DC\text{-}sediment} = \frac{280\ mg/kg \times [(0.089\ m^2 \times 0.0049\ kg/m^2/d) + (0.125\ m^2 \times 0.0017\ kg/m^2/d) + (0.5720 \times 0.007\ kg/m^2/d) + (0.1271\ m^2 \times 0.21\ kg/m^2/d)] \times 0.01 \times 1 \times 5\ days / 7\ days \times 52\ weeks / 52\ weeks}{70.7\ kg}$$

$DR_{DC\text{-}sediment}$ = 8.87E-04 mg/kg BW/day

Hazard quotient for dermal contact with vanadium in sediment from the remediation area for the adult subsistence and traditional land user:

$$HQ_{DC\text{-}sediment} = \frac{8.87E\text{-}04\ mg/kg\ BW/day}{5.0E\text{-}03\ mg/kg\ BW/day}$$

$HQ_{DC\text{-}sediment}$ = 1.77E-01

Dermal contact with vanadium in soil from the remediation area for the adult subsistence and traditional land user:

$$DR_{DC\text{-}soil} = \frac{176.5\ mg/kg \times [(0.089\ m^2 \times 0.001\ kg/m^2/d) + (0.250\ m^2 \times 0.0001\ kg/m^2/d) + (0.5720 \times 0.0001\ kg/m^2/d)] \times 0.01 \times 1 \times 5\ days / 7\ days \times 52\ weeks / 52\ weeks}{70.7\ kg}$$

$DR_{DC\text{-}soil}$ = 3.05E-06 mg/kg BW/day

Hazard quotient for dermal contact with vanadium in soil from the remediation area for the adult subsistence and traditional land user:

$$HQ_{DC\text{-}soil} = \frac{3.05E\text{-}06\ mg/kg\ BW/day}{5.0E\text{-}03\ mg/kg\ BW/day}$$

$HQ_{DC\text{-}soil}$ = 6.11E-04

5.0 FOOD INGESTION EXPOSURE DOSE RATE

$$DR_{FI} = \frac{\sum(C_{Foodi} \times IR_{Foodi}) \times RAF_{O}}{BW}$$

Where:

DR_{FI} = estimated dose rate from ingestion of COPC in food (mg/kg BW/day)

C_{foodi} = COPC concentration in food i (mg/kg ww)

IR_{foodi} = receptor ingestion rate for food i (kg ww/day)

RAF_{Oral} = relative absorption factor from the gastrointestinal tract (i.e., bioavailability via food ingestion) (unitless)

D_i = days per year during which consumption of food i will occur

BW = body weight (kg)

Ingestion of vanadium in fish, berries, plants, deer, moose, grouse, and cattle from the remediation area for the adult subsistence and traditional land user:

$$DR_{FI} = \frac{[(0.0332\ mg/kg \times 0.046\ kg/day) + (0.21\ mg/kg \times 0.035\ kg/day) + (0.71\ mg/kg \times 0.0069\ kg/day) + (0.051\ mg/kg \times 0.077\ kg/day) + (0.069\ mg/kg \times 0.0074\ kg/day) + (0.052\ mg/kg \times 0.14\ kg/day) + (1.27\ mg/kg \times 0.0061\ kg/day) + (0.00036\ mg/kg \times 0.0033\ kg/day) + (0.074\ mg/kg \times 0\ kg/day)] \times 1}{70.7\ kg}$$

DR_{FI} = 5.35E-04 mg/kg BW/day

Hazard quotient for ingestion of vanadium in traditional food for the adult subsistence and traditional land user:

$$HQ_{FI} = \frac{5.35E\text{-}04\ mg/kg\ BW/day}{5.0E\text{-}03\ mg/kg\ BW/day}$$

HQ_{FI} = 1.07E-01

6.0 INGESTION OF SURFACE WATER (AS DRINKING WATER)

$$DR_{WI} = \frac{C_W \times IR_W \times RAF_O \times D_1 \times D_2}{BW}$$

Where:

DR_{WI} = estimated dose rate from ingestion of COPC in surface water (mg/kg bw/day)

C_W = COPC concentration in surface water (mg/L)

IR_W = water ingestion rate (L/day)

RAF_O = bioavailability via water ingestion (i.e., relative absorption factor from the gastrointestinal tract) (unitless)

D_1 = days per week exposed / 7 days

D_2 = weeks per year exposed / 52 weeks (assumed to be 52 weeks; no amortization for weeks per year)

BW = body weight (kg)

Ingestion of vanadium from surface water in the remediation area used as drinking water for the adult subsistence and traditional land user:

$$DR_{WI} = \frac{0.00056\ mg/L \times 1.5L/d \times 1 \times 7\ days / 7\ days \times 52\ weeks / 52\ weeks}{70.7\ kg}$$

DR_{WI} = 1.19E-05 mg/kg BW/day

Hazard quotient for Ingestion of vanadium from surface water in the remediation area used as drinking water for the adult subsistence and traditional land user:

$$HQ_{WI} = \frac{1.19E\text{-}5\ mg/kg\ BW/day}{5.0E\text{-}03\ mg/kg\ BW/day}$$

HQ_{WI} = 2.37E-03

7.0 DERMAL CONTACT WITH SURFACE WATER (WHILE SWIMMING)

$$DAD = \frac{DA_{event} \times SA \times EF \times D_1 \times D_2}{BW}$$

Where:

DAD = dermally absorbed dose (mg/kg/day)

DA_{event} = absorbed dose per event (mg/cm^2/event); see below for equation

SA = skin surface area (cm^2)

EF = exposure frequency (events/day)

D1 = days per week exposed / seven days

D2 = weeks per year exposed / 52 weeks (assumed to be 52 weeks; no amortization for weeks per year)

$$DA_{event} = k_p \times C_W \times t_{event}$$

Where:

DA_{event} = absorbed dose per event (mg/cm^2/event)

Kp = dermal permeability coefficient (cm/hour)

C_W = COPC concentration in water (mg/cm^3)

t_{event} = event duration (hour/event)

Dermal contact with vanadium in surface water from the remediation area for the adult subsistence and traditional land user:

DA_{event} = 0.001 cm/hour × 5.6E-7 mg/cm^3 ×1 hour/event

DA_{event} = 5.6E-10 mg/cm^2-event

$$DAD = \frac{\text{5.6E-10 mg/cm}^2\text{-event} \times \text{17640 cm}^2 \times \text{1 event/day} \times \text{5 days / 7 days} \times \text{52 weeks / 52 weeks}}{\text{70.7 kg}}$$

DAD = 9.98E-08 mg/kg bw/day

Hazard quotient for Ingestion of vanadium from surface water in the remediation area used as drinking water for the adult subsistence and traditional land user:

$$HQ_{DAD} = \frac{\text{9.98E-8 mg/kg BW/day}}{\text{5.0E-03 mg/kg BW/day}}$$

HQ_{DAD} = 2.0E-05

HAZARD INDEX

Hazard index from exposure to vanadium via ingestion of sediment, dermal contact with sediment and ingestion of traditional food from the remediation area for the adult subsistence and traditional land user:

Hazard Index = $HQ_{SedI} + HQ_{SI} + HQ_{Inh} + HQ_{DC\text{-}sediment} + HQ_{DC\text{-}soil} + HQ_{FI} + HQ_{WI} + HQ_{DAD}$

Hazard Index = 1.13E-02 + 7.13E-03 + 4.19E-05 + 1.79E-01 + 6.11E-04 + 1.07E-01 + 2.4E-03 + 2.05E-05

Hazard Index = 0.31

COPC	Carcinogen Classification			Assessed as a Carcinogen?	Oral/Dermal TRV[1]						
	Health Canada (2010)	IARC (2016)	US EPA (2016)		RfD mg/kg/day	SF (mg/kg/day)$^{-1}$	Target Organ/Effect	Source	Oral RAF Sediment/ Soil[2]	Oral RAF Food[3]	Dermal RAF[4]
Aluminum	NC	NC	Group D[5]	No	1	n/a	Neurotoxicity: Decreased forelimb and hindlimb grip strength and decreased thermal sensitivity	ATSDR (2008)	0.12	1	0.01[b]
Copper	NC	NC	Group D	No	0 to 6 months: 0.091 7 months to 4 years: 0.091 5 to 11 years: 0.110 12 to 19 years: 0.126 ≥20 years: 0.141	n/a	Hepatotoxicity, gastrointestinal effects	Health Canada (2010)	0.45	1	0.06
Vanadium	NC	NC	NC	No	0.005[a]	n/a	Decreased hair cysteine	US EPA (1988)	0.017	1	0.01[b]

Notes:

COPC = contaminant of potential concern; IARC = International Agency on Cancer Research; mg/kg/day = milligram per kilogram per day; n/a = not applicable; NC = not classified; RAF = relative absorption factor; RfD = reference dose; SF = slope factor; TRV = toxicity reference value; US EPA = United States Environmental Protection Agency.

[1] Oral TRV adopted as dermal TRV if dermal TRV is not available.

[2] Oral RAFs for the sediment and soil exposure pathways in the remediation's areas were adjusted using the physiologically based extraction test results.

[3] Oral RAFs for the food exposure pathways were assumed to be 1 (Health Canada 2010).

[4] Dermal RAFs were obtained from Health Canada (2010), unless otherwise noted.

[5] US EPA (2008).

[a] The vandium RfD was derived from the oral RfD for vanadium pentoxide (0.009 mg/kg/day) based upon the proportion of the compound that is vanadium metal (i.e., 0.009 mg/kg/day x 56% = 0.005 mg/kg/day).

[b] A default value of 0.01 was assigned as a dermal RAF based on the geometric mean of an analysis of the dermal RAF of other inorganics with sufficient available information (OMOE 2011).

Methodology

Sample Preparation

All soil samples received were dried at laboratory ambient temperatures (<40^{O}C) until constant weight and sieved to <250 µm using USA Standard Testing Sieve ASTM E11 series and a Meinzer II Sieve Shaker. Laboratory data is given in Table 2.

Table 2: Mass of Wet, Dried and Sieved Soil Samples

Sample ID	Wet Soil Used (g)	Dry Soil (g)	Moisture (%)	Soil Sieved (g)	<250 um Soil (g)	<250 µm Content (%)
00807-01	486.8	382.0	222.1	382.0	214.7	56.2
00807-02	139.0	106.2	97.3	106.2	43.0	40.5

00807-07	516.4	416.8	204.8	416.8	354.1	85.0

Metals in Soil

The sieved soil samples were analyzed at Maxxam Analytics, Burnaby, BC by ICP-MS using an Agilent Model 7500ce Collision Cell ICPMS, United States Environmental Protection Agency (US EPA) Method 200.8 (US EPA, 2005). Soil digestion was accomplished with a nitric-hydrochloric acid mixture which solubilized the solid matter and removed organic material by oxidation and volatilization. The concentrations of metals in the soils are reported in mg/kg and are given in the appended Excel spreadsheet.

PBET Extraction

The extraction protocol was based on the Standard Operating Procedure for an In Vitro Bioaccessibility Assay (IVBA) for Lead in Soil, US EPA Method 9200.1-86 (US EPA, 2008). This IVBA protocol has been validated for arsenic and lead through studies that show good correlation between the in vivo relative bioavailability (RBA) and in vitro assays (Juhasz et al., 2014; US EPA 2007). The relationship for arsenic is expressed by Juhasz et al. (2014) as:

$$\text{As RBA (\%)} = 0.84\ \text{As IVBA (\%)} + 3.56;\ n = 25$$

For lead the relationship based on USEPA (2007) is:

$$\text{Pb RBA} = 0.878\ \text{Pb IVBA (\%)} - 2.8$$

The sieved soil sample was weighed by difference (1.00 ± 0.05 g) into a 125 ml acid cleaned HPDE bottle. An aliquot of 100 ± 0.5 ml of extraction fluid was measured and added to the bottle. This yielded a sample mass to fluid ratio of 1:100. The pH of the soil/extraction fluid mixture was measured. The extraction solution consisted of 30 g/L glycine (Calbiochem) adjusted to a pH of 1.5 with concentrated HCl (Fisher Scientific, trace metal grade). The bottle was then sealed and placed into the extractor in batches of eight and rotated end-over-end in a $37^{O} \pm 2^{O}$ C water bath for 1h. After the extraction was completed, the bottles were removed. Each extract was drawn directly into a disposable 20 ml plastic syringe with a luer slip (National Scientific). A 0.45 µm cellulose acetate filter (25 mm diameter, Cole Palmer) was attached to the syringe and the extract was filtered into a clean 20 ml polyethylene scintillation vial (Wheaton). QA/QC included a procedure blank and a laboratory control sample.

The laboratory batch data is given in Table 3.

Table 3: Laboratory Extraction Batch Summary

Batch 1					
Date of Extraction:					13-Aug-15
Start Time:					10:40 AM
Stop Time:					11:40 AM
Initial temp of water bath (^{o}C):					37.6
Final temp of water bath (^{o}C):					37.6
Sample ID	RRU ID	Weight (g)	Initial pH	Final pH	Comments
00807-01	EXT20-1	1.0142	1.51	1.54	
00807-02	EXT20-2	1.0691	1.48	1.49	
00807-03	EXT20-3	1.0196	1.52	1.53	
00807-04	EXT20-4	1.0060	1.49	1.51	
00807-05	EXT20-5	1.0129	1.52	1.53	
00807-06	EXT20-6	1.0146	1.50	1.53	
00807-07	EXT20-7	1.0099	1.52	1.53	
SR18	SR20	1.0241	1.52	1.55	NIST 2711
BL18	BL20	0.0000	1.48	1.50	Procedure blank

Analysis for Metals in Extracts

The filtered extract was stored at 4^{o}C and subsequently shipped to Maxxam Analytics, Burnaby, BC and analyzed for metals using an Agilent Model 7500ce Collision Cell ICPMS based on US EPA Method 200.8 (US EPA 2005). Metal concentrations in the extracts are expressed in µg/L and presented in the appended Excel spreadsheet.

Bioaccessibility Calculations

Metal bioaccessibility was calculated as follows:

$$Bioaccessibility,\ \% = \frac{(concentration\ in\ extract,\ \mu g/L)\ x\ (vol\ of\ extract,\ L)}{(concentration\ in\ soil,\ mg/kg)\ x\ (mass\ of\ soil\ used,\ g)}\ x\ 100$$

The results of the analysis are given in Table 1.

Quality Assurance/Quality Control (QA/QC)

The QA/QC program comprised a procedure blank (BL20) and a laboratory control sample (SR20). The procedure blank consisted of running an aliquot of the extraction fluid through the complete extraction procedure. Arsenic and lead concentrations in the blanks were within the control limits (Table 4). Lead and arsenic concentrations were also within the control limits for the National Institute of Standards and Technology (NIST) Standard Reference Material (NIST

2711, Montana Soil) that was used as the laboratory control sample. The values for other parameters are not certified.

Table 4: Metal Concentrations (µg/L) and Control Limits for Procedure Blank (BL20) and NIST 2711 Standard Reference Material (SR20)

Total Metals	BL20	Control Limits	SR20	Control Limits
Aluminum (Al)	<50		16500

Air Quality

APPENDIX C-1
Air Quality Prediction Methods Memo

TECHNICAL MEMORANDUM

DATE 9 May 2017 **REFERENCE No.** 1662612-067-TM-Rev1-22347

TO 'Lyn Anglin (IMC) and Colleen Hughes
Mount Polley Mining Corporation

CC Don Parsons and Art Frye (MPMC)

FROM Jeffrey Ramkellawan and Rachel Wyles **EMAIL** Jeffrey_Ramkellawan@golder.com; Rachel_Wyles@golder.com

MOUNT POLLEY HEALTH ASSESSMENT – PARTICULATE AND METAL AMBIENT AIR CONCENTRATIONS – MOUNT POLLEY MINE

This memorandum outlines the methods used to establish ambient particulate and metal concentrations for 2015 at the Mount Polley Mine (the Mine) to support the human health assessment.

Particulate sizes of interest include total suspended particulates (TSP), particulates with a nominal aerodynamic diameter of less than 10 microns (PM_{10}), and particulates with a nominal aerodynamic diameter of less than 2.5 microns ($PM_{2.5}$). Metals of interest include aluminum, copper, and vanadium.

1.0 BACKGROUND

In the summer of 2015 (7 July to 29 September 2015), four continuous ambient air particulate monitors (DustTRAKs) were situated at monitoring locations A4, A7, A8 and A9 (Table 1). DustTRAK monitoring at this time was undertaken to determine ambient particulate concentrations in the vicinity of the Tailings Storage Facility (TSF) and the Polly Flats.

Table 1: Particulate Monitoring Station Locations

Station Name	Easting (m)	Northing (m)
A4	595,215	5,821,275
A7	595,146	5,818,104
A8	596,807	5,817,945
A9	595,744	5,820,806

Regional continuous ambient particulate monitoring is undertaken by the BC Ministry of Environment (MOE) at Quesnel Senior Secondary and Williams Lake Columneetza School (Williams Lake). These are the closest continuous government monitoring stations located to the Mine. Data from these stations were included in the assessment to assist in contextualizing the onsite particulate concentration data.

Ambient air concentrations from the DustTRAK monitoring and the regional monitoring datasets have been used to estimate ambient particulate and metals concentrations (aluminum, copper, and vanadium) at the Mine for the 2015 calendar year.

2.0 SUMMARY OF METHODS

This section describes the methods used to establish 1 hour, 24 hour, and annual particulate and metal ambient air concentrations for 2015.

As described in Section 1.0, background particulate concentrations were measured at the Mine from 7 July to 29 September 2015. Based on the observations within Golder Associates Ltd. (Golder) (2015a, 2015b, 2015c, 2015d and 2015e) it was found that PM_{10} concentrations showed similar large scale trends to ambient particulate concentrations recorded at the BC MOE Williams Lake station. Since PM_{10} concentrations exhibited similar trends, the average PM_{10} ratios between the onsite monitoring stations (A4, A7, A8 and A9) and Williams Lake during the summer monitoring period (7 July to 29 September 2015) were established. The average PM_{10} ratios were derived by establishing the ratio between the onsite monitoring stations (A4, A7, A8 and A9) and Williams Lake data for each individual hour over the summer monitoring period. The hourly ratios were then averaged over the entire summer monitoring period which resulted in an average PM_{10} ratio for each onsite monitoring station.

The ratios were used to convert the Williams Lake 2015 calendar year particulate data (PM_{10} and $PM_{2.5}$) into an extrapolated annual dataset for A4, A7, A8 and A9. This allows the on-site data to be extrapolated to an annual dataset that incorporates considerations of likely seasonal trends that will impact ambient particulates concentrations. Concentrations of TSP were not monitored at Williams Lake; therefore, the TSP:PM_{10} ratio from the DustTRAK data for the summer monitoring period at each station was used to convert the 2015 extrapolated annual PM_{10} concentrations into an annual TSP dataset.

The station (A4, A7, A8 and A9) and the method (summer monitoring versus extrapolated 2015 dataset) that resulted in the highest 1-hour and 24-hour particulate concentrations (for TSP, PM_{10} and $PM_{2.5}$) were used to establish the ambient concentrations for the purposes of the health risk assessment.

Annual concentrations were calculated from the 2015 extrapolated datasets for each onsite station; similarly the station that had the highest annual concentration was used to establish ambient annual concentrations for the purposes of the health risk assessment.

Ambient metal concentrations were derived from TSP concentrations for each averaging period (1-hour, 24-hour and annual). It has been assumed that all ambient particulate matter has been emitted from the TSF and Polley Flats; therefore, the metal assay of the tailings was used to derive the ambient metals concentrations. For example, the copper content in tailings is 0.14% by mass; therefore, ambient copper concentrations were calculated by multiplying the ambient TSP concentrations by copper's 0.14% content by mass. The metal assay was provided by the Mount Polley Mining Corporation (MPMC) (Table 2).

Table 2: Metal Composition Provided by MPMC

Metal	Composition (g metal/g tailings)
Aluminum	0.0236
Copper	0.0014
Vanadium	0.0003

3.0 RESULTS

The maximum ambient 1-hour, 24-hour and annual concentrations along with the respective station (A4, A7, A8, and A9) and calculation method (summer 2015 versus composite annual) are provided in Table 3. Statistics provided for the human health assessment including the minimum, maximum, mean and 25th, 50th, 75th, 90th, 95th, 98th and 99th percentile concentrations are provided in Attachment A. The station (A4, A7, A8, and A9) versus Williams Lake 1-hour PM_{10} ratios (ratios used to generate the extrapolated 2015 datasets) are also provided in Attachment A. The stations' 1-hour TSP: PM_{10} ratios (used to generate the TSP extrapolated datasets) are also provided in Attachment A.

Table 3: Maximum Ambient Concentrations

Particulate and Metal	1-hour			24-hour			Annual	
	Concentration (µg/m^3)	Station	Method	Concentration (µg/m^3)	Station	Method	Concentration (µg/m^3)	Station
TSP	295.2	A9	(a)	88.7	A7	(b)	10.1	A9
PM_{10}	284.5	A9	(a)	88.6	A7	(b)	9.8	A9
$PM_{2.5}$	196.2	A9	(b)	88.3	A7	(b)	8.6	A9
Aluminum	6.968	A9	(a)	2.093	A7	(b)	0.240	A9
Copper	0.416	A9	(a)	0.125	A7	(b)	0.014	A9
Vanadium	0.082	A9	(a)	0.025	A7	(b)	0.003	A9

a) Data used from composite 2015 calendar year.

b) Data used from summer of 2015 (7 July to 29 September 2015).

4.0 CLOSURE

The reader is referred to the Study Limitations, which follows the text and forms an integral part of this memorandum.

We trust the above meets your present requirements. If you have any questions or requirements, please contact the undersigned.

APPENDIX C-2

Continuous Particulate Monitoring at Mount Polley 17 to 29 September 2015: Summary of Particulate Monitoring 7 July to 29 September 2015

TECHNICAL MEMORANDUM

DATE June 14, 2016 **REFERENCE No.** 1411734-091-TM-Rev3-1500

TO Ralph Adams, Air Quality Meteorologist
Ministry of Environment

FROM Taishi Baba, Jeffrey Ramkellawan, and Rachel Wyles **EMAIL** tbaba@golder.com; jramkellawan@golder.com; rwyles@golder.com

CONTINUOUS PARTICULATE MONITORING AT MOUNT POLLEY SEPTEMBER 17 TO 29, 2015: SUMMARY OF PARTICULATE MONITORING JULY 7 TO SEPTEMBER 29, 2015

Golder Associates Ltd. (Golder) was retained by Mount Polley Mining Corporation (MPMC) to prepare *Fugitive Dust Management Plan* (Dust Management Plan) (Golder 2015a), and to provide interpreted summaries of bi-weekly/monthly monitoring data for the period of July through September, 2015. To date, four technical memoranda have been submitted to the BC Ministry of Environment (MOE), the last dated September 24, 2015. This is the final memorandum, which summarizes monitoring data from September 17 to 29, 2015 and also presents a summary of the data for the entire summer monitoring period from July 7 to September 29, 2015. This memorandum also provides recommended updates to the Dust Management Plan, in consideration of the monitoring data and seasonal conditions observed at the site over the summer monitoring period. The memorandum was updated in June 2016 to include further review and summary of the monitoring data in response to the MOE's review of the document summarized in a memorandum from Mr. Ralph Adams dated January 29, 2016 (MOE 2016a).

The current commitment to undertake continuous monitoring until October 2015 has been fulfilled and the DustTRAK monitors have now been removed from site due to onsite temperatures approaching zero degrees, which is the lower end of the operational range of the monitors. The BC MOE were in agreement with the removal of the monitors.

The memorandum presents the following:

1) A summary of the following for the September monitoring period:
    a) the visual dust observations at the Tailing Storage Facility (TSF) and Plug area;
    b) particulate monitoring data; and
    c) meteorological observations including wind and rainfall data.

2) A summary of the particulate, dustfall, wind speed, and direction, and rainfall data for the summer monitoring period.

3) Recommended updates to the Dust Management Plan for the TSF/Plug area.

The raw monitoring data was forwarded as a separate email attachment to Mr. Ralph Adams (BC MOE), as has been done with the monitoring data to date.

A brief update is also provided on the inclusion of the particulate monitoring data into the human health risk assessment work that is currently ongoing.

1.0 SEPTEMBER MONITORING PERIOD

This section presents a summary of the monitoring and meteorological data for the period September 17 through 29, 2015.

1.1 Visual Observations at the TSF and Plug Area

Visual inspections of Hazeltine Creek and the breach area were undertaken daily and logged using the TSF/Water Management Inspection Checklist (Attachment 1). Visual observations are provided for September 15 to 29, 2015. No dust generation was noted for the monitoring period.

1.2 Particulate Data

The 24-hour average concentrations from DustTRAK Stations A4, A7, A8, and A9 are presented in Figure 1 through Figure 3. For context, PM_{10} and $PM_{2.5}$ concentration data from Quesnel Senior Secondary and Williams Lake Columneetza School (BC MOE 2015) are plotted on Figure 2 and Figure 3. Quesnel Senior Secondary is a shared BC MOE and National Air Pollution Surveillance Program (NAPS) station located 76 km northwest of Mount Polley, and Williams Lake Columneetza School is a BC MOE station located 60 km southwest of Mount Polley. TSP is not monitored in the BC MOE air quality network; therefore, no additional data are plotted on Figure 1.

The red lines on Figure 1 through Figure 3 represent the BC Ambient Air Quality Objectives (AAQO) (BC MOE 2016b) for the 24-hour averaging period for TSP, PM_{10}, and $PM_{2.5}$, respectively. The AAQO have been established by the BC MOE as indications of good air quality; concentrations are frequently measured above the AAQO values at many monitoring stations throughout BC. DustTRAK stations (A4, A7, A8, and A9) are located on an industrial site (a mine) where industrial activities will influence the monitored data, and therefore are not considered compliance measurement locations. The criteria are included for reference purposes only; if the monitored values are above the relevant AAQO, then further assessment may be necessary. For example the $PM_{2.5}$ air quality objective is based on the 24-hour 98^{th} percentile concentration from a year of data, short term (daily) monitored values above the AAQO may be recorded; however, the area may still be considered to have good air quality.

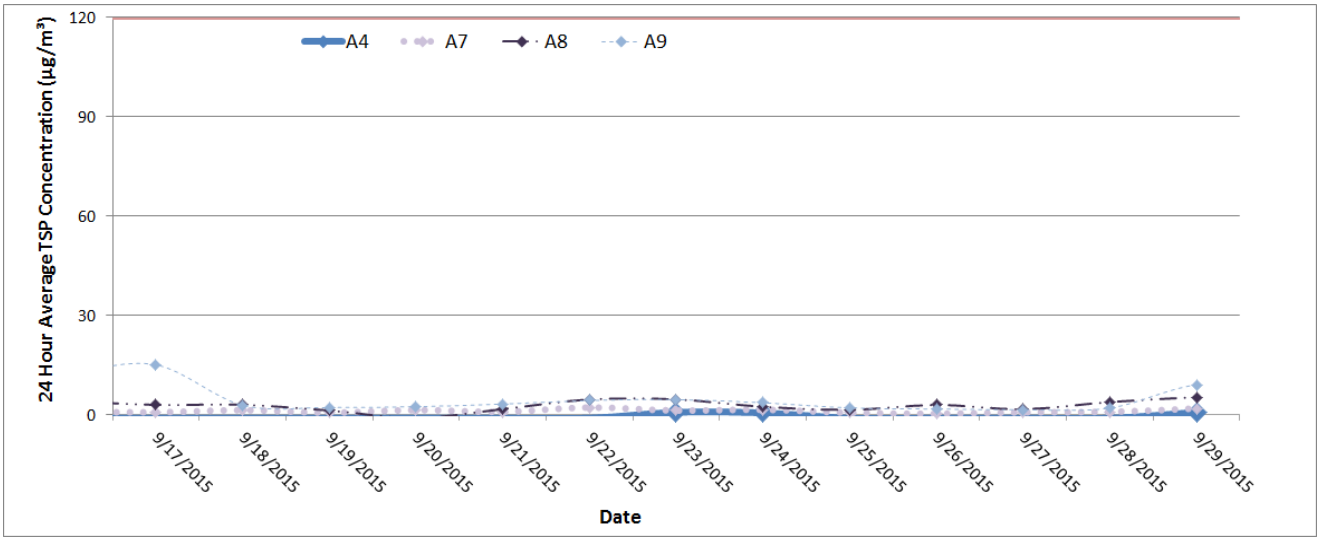

Figure 1: 24-Hour Average TSP Concentrations at MPMC Stations

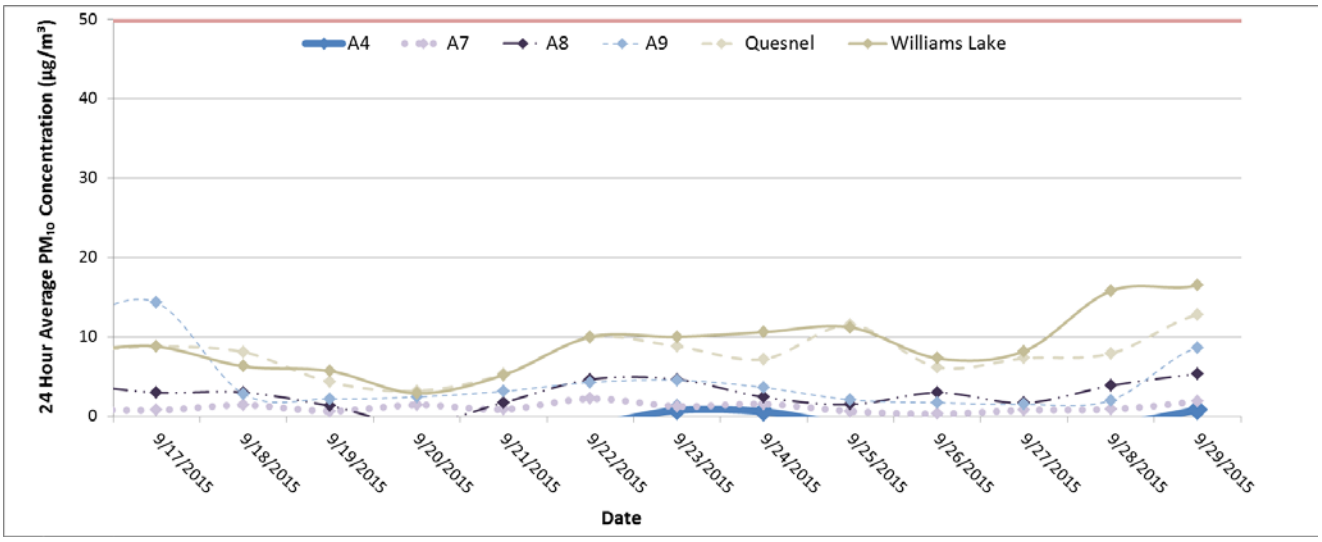

Figure 2: 24-Hour Average PM_{10} Concentrations at MPMC and Surrounding BC MOE Stations

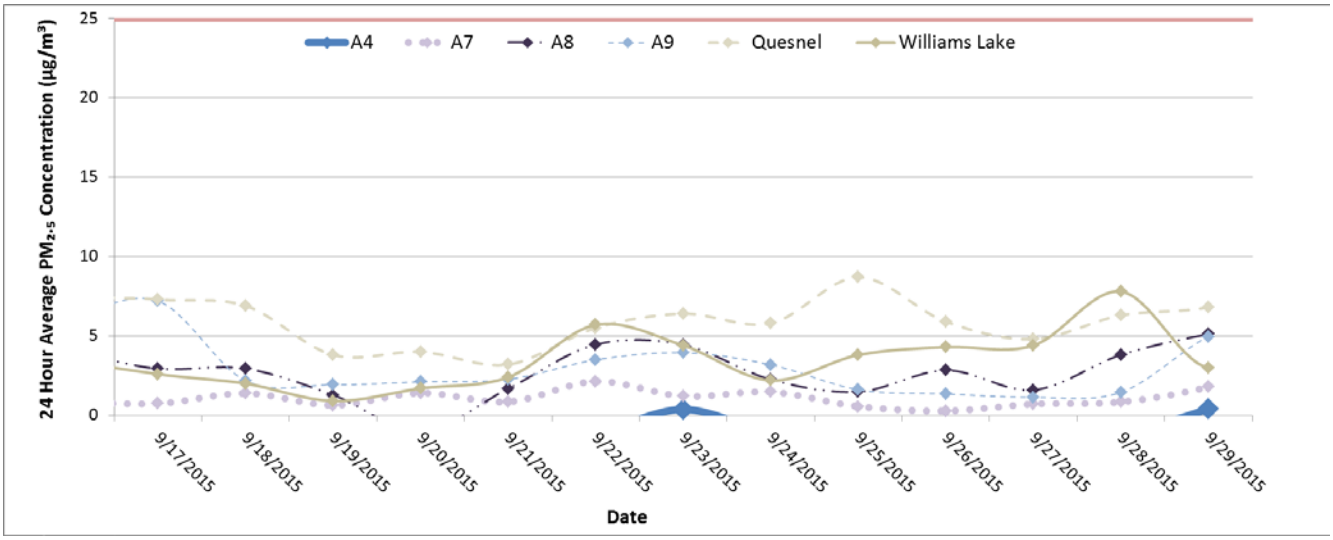

Figure 3: 24-Hour Average $PM_{2.5}$ Concentrations at MPMC and Surrounding BC MOE Stations

As shown in Figures 1 through 3, the monitored values are consistently below the AAQO's for TSP, PM_{10} and $PM_{2.5}$ throughout the September 17 to 29, 2015 monitoring period at the Mount Polley Mine site as well as at Quesnel and Williams Lake (TSP is not available for the latter two stations).

Regional forest fires may result in elevated particulate concentration readings at the DustTRAK and BC MOE monitors. The BC Wildfire Service website provides a list of active wildfires within BC (BC Wildfire Service 2015a). During the monitoring period (September 17 to 29, 2015) no forest fires of note were reported in the Cariboo region (BC Wildfire Service 2015b). However, three small forest fires, all 80 to 150 km east of MPMC (BC Wildfire Service 2015a), were active at some point during the monitoring period. One forest fire, approximately 120 km east of the site, may have been of sufficient size (33 hectares) to influence ambient particulate concentrations. However, the other two fires were likely too small (0.009 hectares) to influence ambient air quality in the vicinity of the site.

A summary of the 2-minute (as collected), hourly average and 24-hour average monitoring data for each DustTRAK station is contained in Attachment 2 of this memorandum. A summary of the data for each time averaging period are presented as box and whisker plots.

A MS Excel file which contains data downloaded from the A4, A7, A8, and A9 DustTRAKs was forwarded as a separate email attachment to BC MOE.

1.3 Meteorological Conditions

This section outlines the wind and rainfall patterns observed on site during the September 17 to 29, 2015 monitoring period.

1.3.1 Winds

Wind data from Meteorological Station #2 (meteorological station adjacent to the TSF) during the monitoring period are illustrated in a wind rose (Figure 4). The wind rose shows a predominance of southerly winds during the monitoring period. Based on the 5-minute data from Station #2 there was a high predominance (67%) of calms, periods with wind speed less than 1 m/s during the September 17 to 29, 2015 period. Calm periods from the previous bi-weekly and monthly monitoring (5-minute averaging periods) reports ranged between 43.8 and 54.8%. This high predominance of calms indicates stagnant wind conditions that are less prone to result in ambient particulate concentrations as a result of wind erosion.

The combined September wind data for 2013 and 2014 generally shows a dominance of northerly winds (winds blowing from the north-north-west and north-north-east for 32.2% of the time) and a secondary dominance of southerly winds (winds blowing from the south-south-west and south-south-east for 25.1% of the time), refer to Figure 8 in Golder (2015a). The predominance of southerly winds observed during the 13 day monitoring period in September 2015 is different from the predominant northerly winds in the combined September wind data for 2013 and 2014 (for reference the wind rose for the entire month of September 2015 is presented in Section 2.3). However, the 2013 and 2014 data for the summer months, specifically August and July, illustrate a predominance of southerly winds. Therefore, the wind patterns during the 13 day monitoring period in September 2015 may be different from the combined September 2013 and 2014 wind patterns, but a predominance of southerly winds is consistent with historical summer wind patterns.

Two DustTRAKs were located north (A4 and A9) and two were located south (A7 and A8) of the TSF. DustTRAKs were located, in part, based on the historical summer wind roses (data from November 2012 to March 2015) from an on-site meteorological station (Station #2); these wind roses were presented in Figure 8 in Golder (2015a). Historical wind patterns show a strong northerly and southerly directionality (refer to Section 2.3); therefore, the DustTRAKs generally always captured up-wind and down-wind conditions of the TSF.

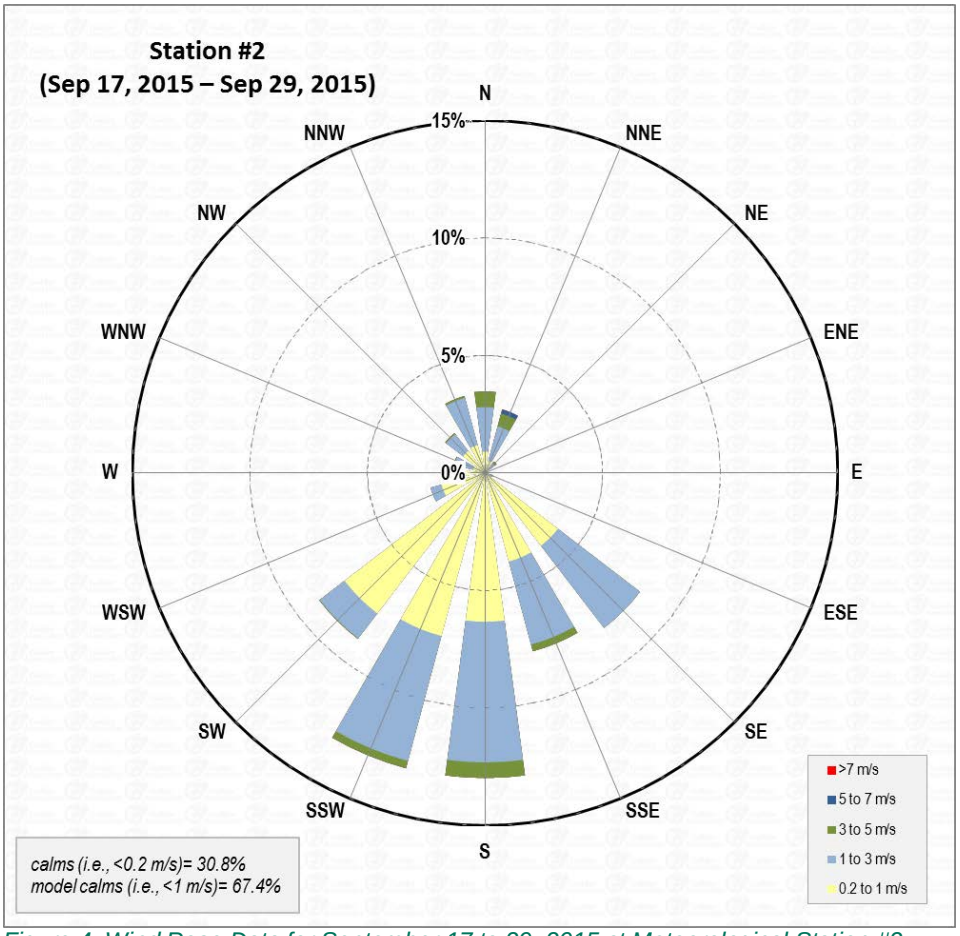

Figure 4: Wind Rose Data for September 17 to 29, 2015 at Meteorological Station #2

1.3.2 Rainfall

Rain acts as a natural dust suppressant, reducing wind erosion effects off of the TSF and Plug area. Rainfall data measured at Meteorological Station #1 (near the Mill area) are summarized in Figure 5. Measureable rainfall was recorded onsite for seven days during the September 17 to 29, 2015 monitoring period. Since seven of the thirteen days had recordable rainfall amounts, there were no extended dry periods (periods greater than a week, 7 days) during September 17 to 29, 2015 where the surface of the TSF may extensively dry and therefore be more prone to wind erosion. During this monitoring period both the absence of extended dry periods and the high predominance of calm periods resulted in meteorological conditions that contributed to the abatement of wind erosion.

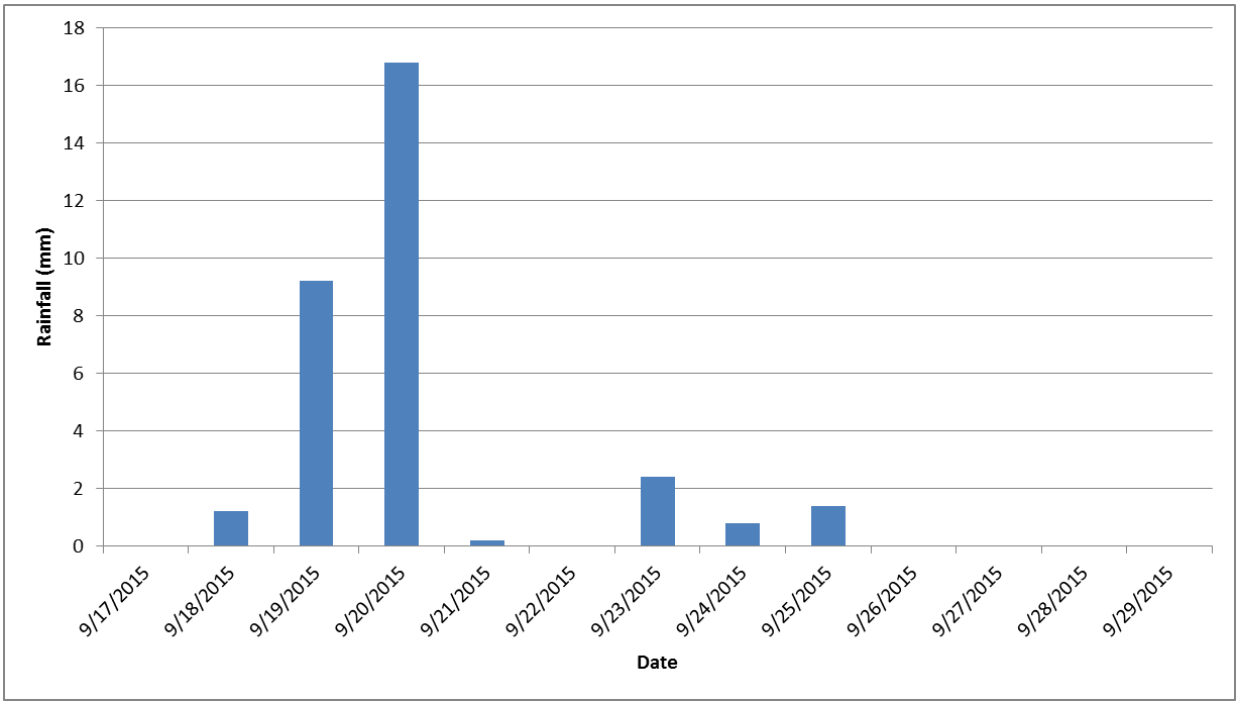

Figure 5: Daily Rainfall for September 17 to 29, 2015 at Station #1

2.0 SUMMER MONITORING PERIOD

This section presents the particulate concentration, dustfall, wind speed and direction, and rainfall data monitored over the summer monitoring period (July 7 to September 29, 2015).

2.1 Particulate Data

The data completeness for all monitoring locations are summarized in Table 1. Due to the monitoring methods used, the data completeness of TSP, PM_{10}, and $PM_{2.5}$ are the same.

Table 1: Particulate Concentration Data Completeness (24-hours)

Location	Data Completeness			
	July	August	September	Entire Monitoring Period
A4	40.0%	54.8%	23.3%	39.5%
A7	60.0%	96.8%	100.0%	87.2%
A8	76.0%	80.6%	86.7%	81.4%
A9	88.0%	100.0%	100.0%	96.5%

Location A4 had a significant amount of data missing over the monitoring period, with a data completeness of 40%, 55%, and 23% for July, August, and September respectively. Within this section summaries and statistics have been presented for location A4, however due to the relatively low data completeness for A4 meaningful statistical comparisons to the other locations (A7, A8, and A9) was not possible.

The 24-hour particulate concentrations for the summer monitoring period are summarized in Figure 6 to Figure 8.

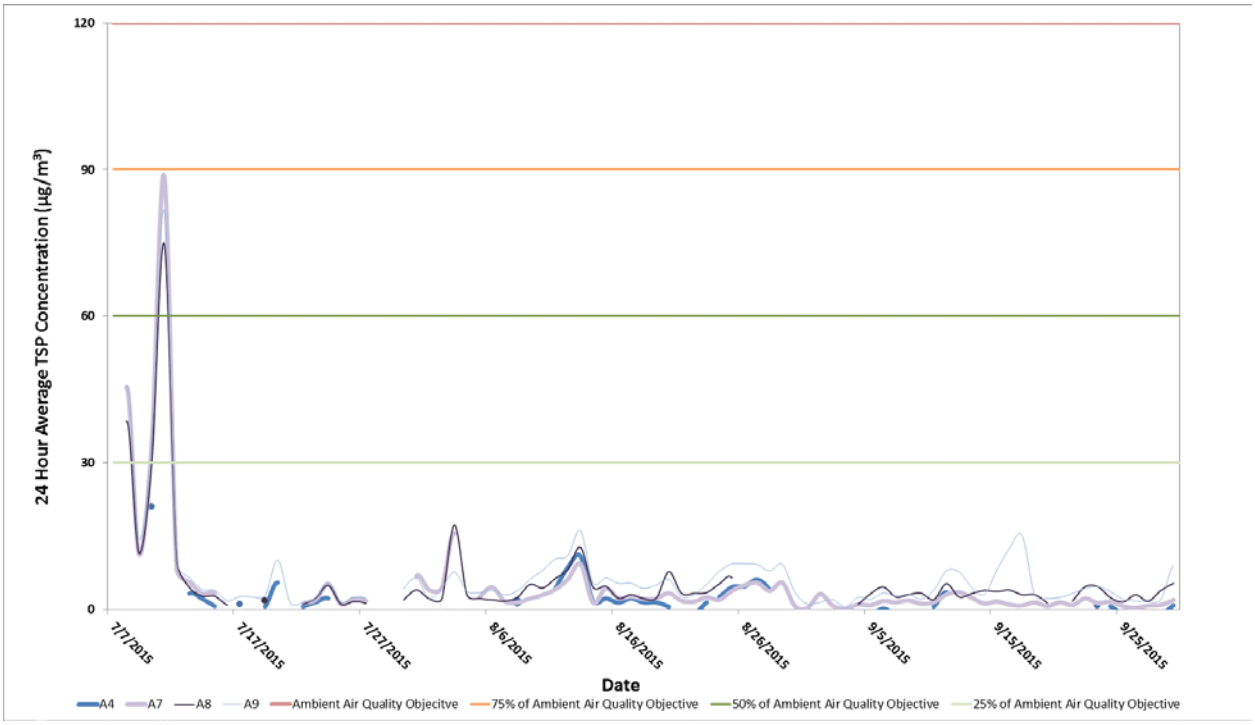

Figure 6: 24-Hour Average TSP Concentrations at MPMC Stations July 7 to September 29, 2015

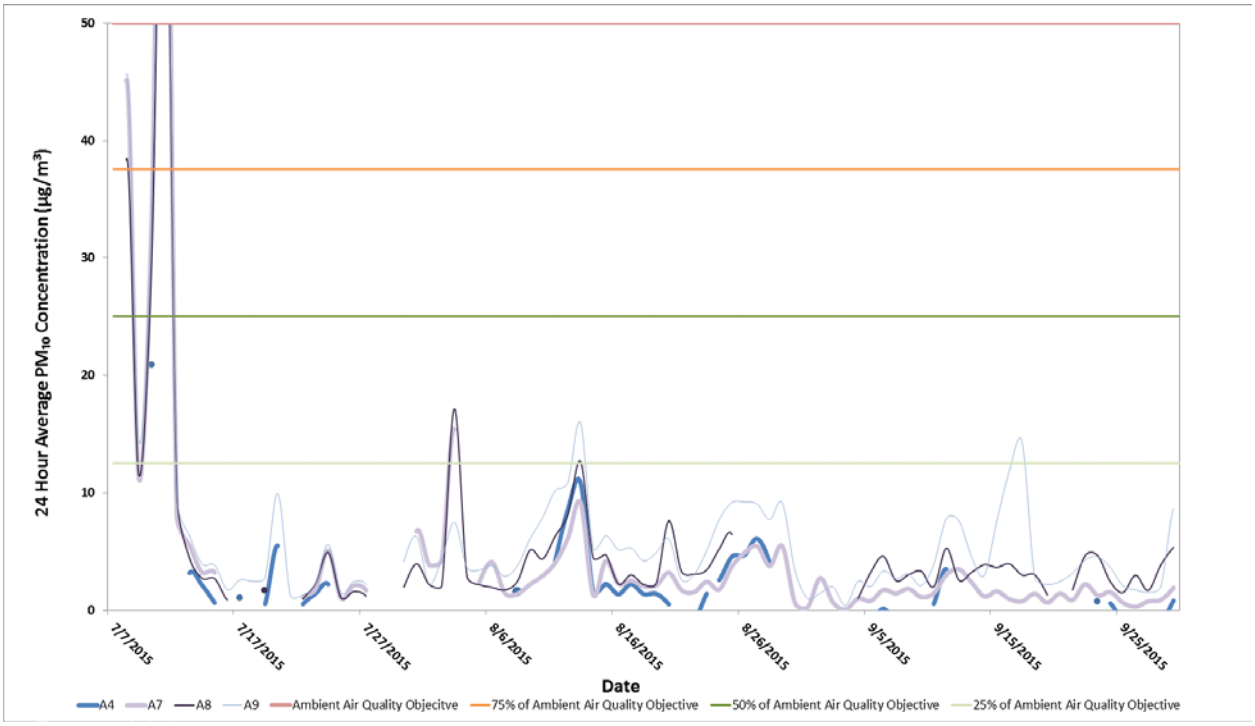

Figure 7: 24-Hour Average PM_{10} Concentrations at MPMC Stations, July 7 to September 29, 2015

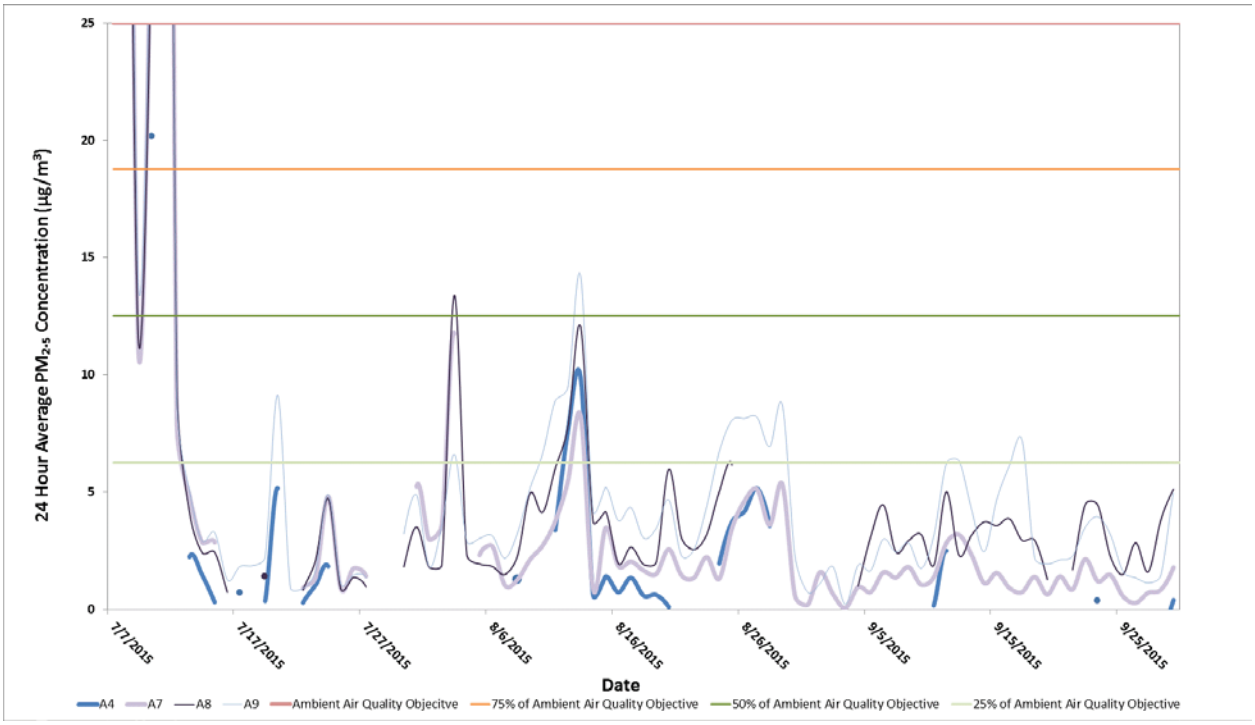

Figure 8: 24-Hour Average $PM_{2.5}$ Concentrations at MPMC Stations, July 7 to September 29, 2015

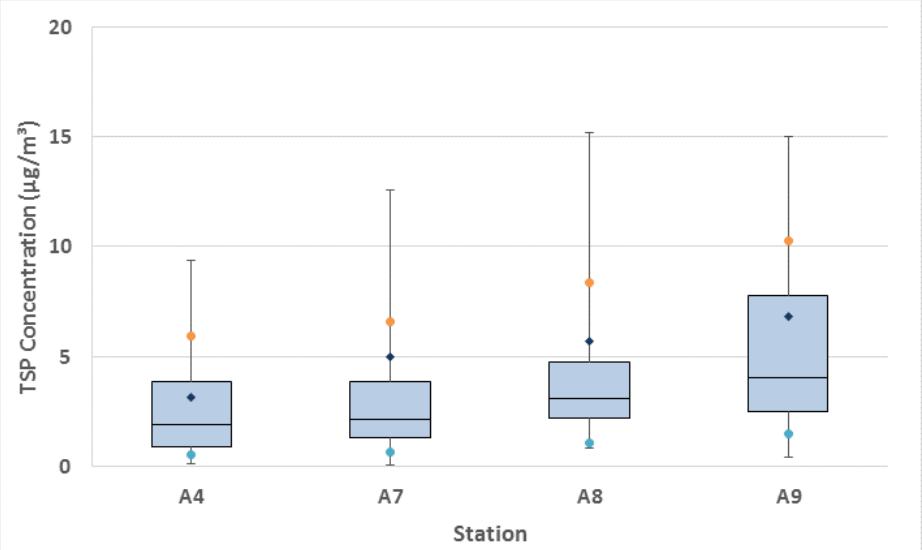
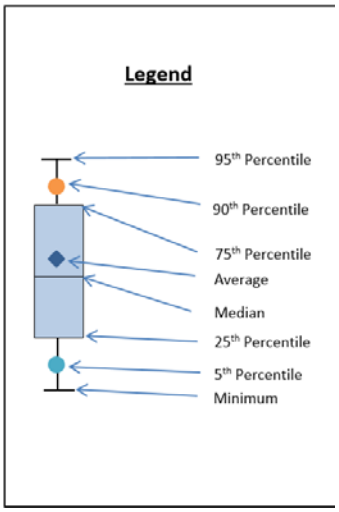
For all monitoring locations, at least 94% of 24-hour TSP, PM_{10}, and $PM_{2.5}$ concentrations are below 50% of the relevant AAQO. Of the 82 days monitored, only 3 days were found to have PM_{10} and $PM_{2.5}$ concentrations greater than the AAQO's. However, as noted in the July 29, 2015 bi-weekly monitoring memorandum (Golder 2015b) the exceedances in the AAQO are most likely a result of regional forest fires rather than a result of site activities.

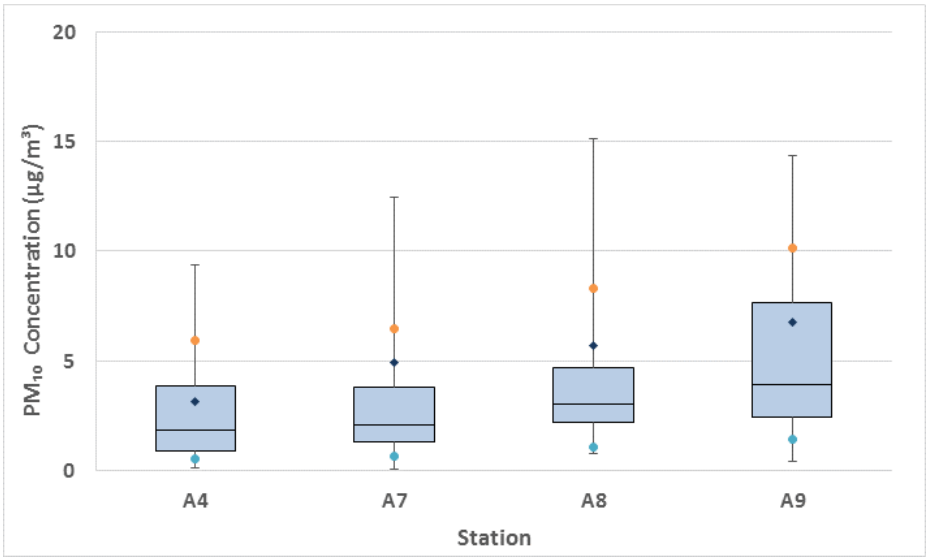
Modified box and whisker plots illustrating the statistical TSP, PM_{10}, and $PM_{2.5}$ concentration data for all locations for the entire monitoring period are illustrated in Figure 9, Figure 10 and Figure 11. For presentation purposes the upper percentile presented on the figures is the 95th percentile. A table follows Figure 9, Figure 10 and Figure 11 that summarizes the maximum, 99th percentile and 98th percentile concentrations; these statistics are presented in tabulated format. Monthly TSP, PM_{10}, and $PM_{2.5}$ statistics (maximum, minimum, mean, standard deviation and 5th, 25th, 50th, 75th, 90th, 98th, and 99th percentile concentrations) for all locations are presented in Attachment 3.

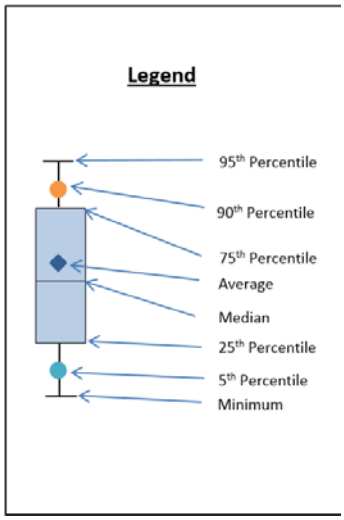




Statistic	A4	A7	A8	A9
Maximum	20.9	88.7	74.8	81.5
99th percentile	17.6	56.6	49.7	52.2
98th percentile	14.3	39.6	35.0	38.5

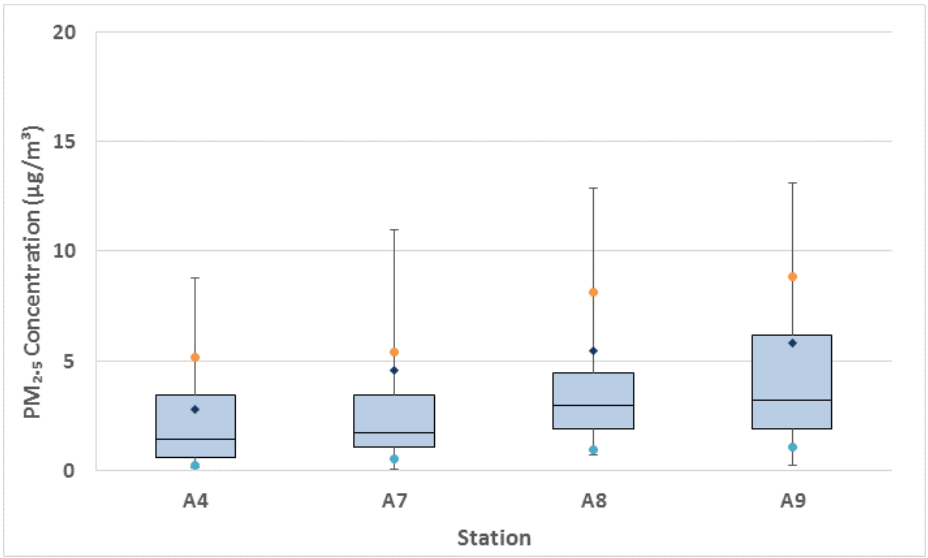
Figure 9: Modified Box and Whisker Plot of TSP Concentrations over the Monitoring Period

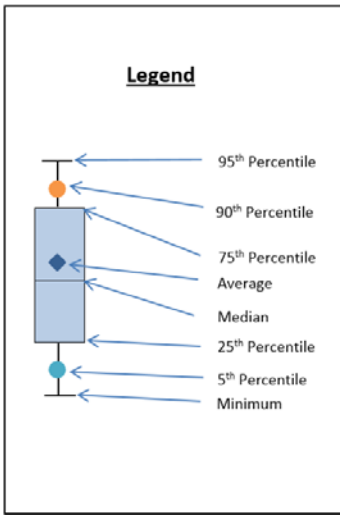




Statistic	A4	A7	A8	A9
Maximum	20.9	88.6	74.8	81.1
99th percentile	17.6	56.4	49.6	51.9
98th percentile	14.3	39.4	35.0	38.4

Figure 10: Modified Box and Whisker Plot of PM_{10} Concentrations over the Monitoring Period





Statistic	A4	A7	A8	A9
Maximum	20.2	88.3	74.5	80.3
99th percentile	17.1	54.8	49.7	50.7
98th percentile	14.0	38.0	34.8	37.2

Figure 11: Modified Box and Whisker Plot of $PM_{2.5}$ Concentrations over the Monitoring Period

The TSP, PM_{10}, and $PM_{2.5}$, concentrations observed at location A7 tend to be lower than those observed at A8 and A9; location A9 generally observed the highest concentrations.

With regards to month to month variability, the tables in Attachment 3 indicate that July was observed to have the highest TSP, PM_{10}, and $PM_{2.5}$ concentrations over the three months across all monitoring locations. Concentrations for all particulate sizes are lower in August than in July, and further decrease in September. In general, location A7 recorded the lowest TSP, PM_{10}, and $PM_{2.5}$ concentrations compared to A8 and A9, with the exception of July; the higher particulates reading for location A7 in July is most likely a result of forest fires. Location A9 was observed to generally have higher TSP, PM_{10}, and $PM_{2.5}$ concentrations for August and September than A7 and A8.

Hourly concentration versus concurrent hourly wind speed are illustrated in Figure 12 for TSP, PM_{10}, and $PM_{2.5}$ for all locations (A4, A7, A8, and A9) over the entire monitoring period. The plots in Figure 12 are comprised of the monitored 1-hour particulate concentration (y-axis) plotted against measured 1-hour Meteorological Station #2 wind speed (x-axis) over the same time period. For the purposes of data presentation, the x-axis (wind speed axis) in the plots presented in Figure 12 have been limited to 5 m/s, because 99% of the 1-hour wind speeds were less than 5 m/s. Similarly, the y-axis (concentration axis) have been limited to 50 µg/m^3 because for all parameters and all stations 97% of the 1-hour average concentrations were less than 50 µg/m^3. The plots in Figure 12 illustrate that for all parameters monitored and for the entire monitoring period there is not a strong correlation between concentration and wind speed (i.e., concentrations do not consistently increase with increasing wind speed).

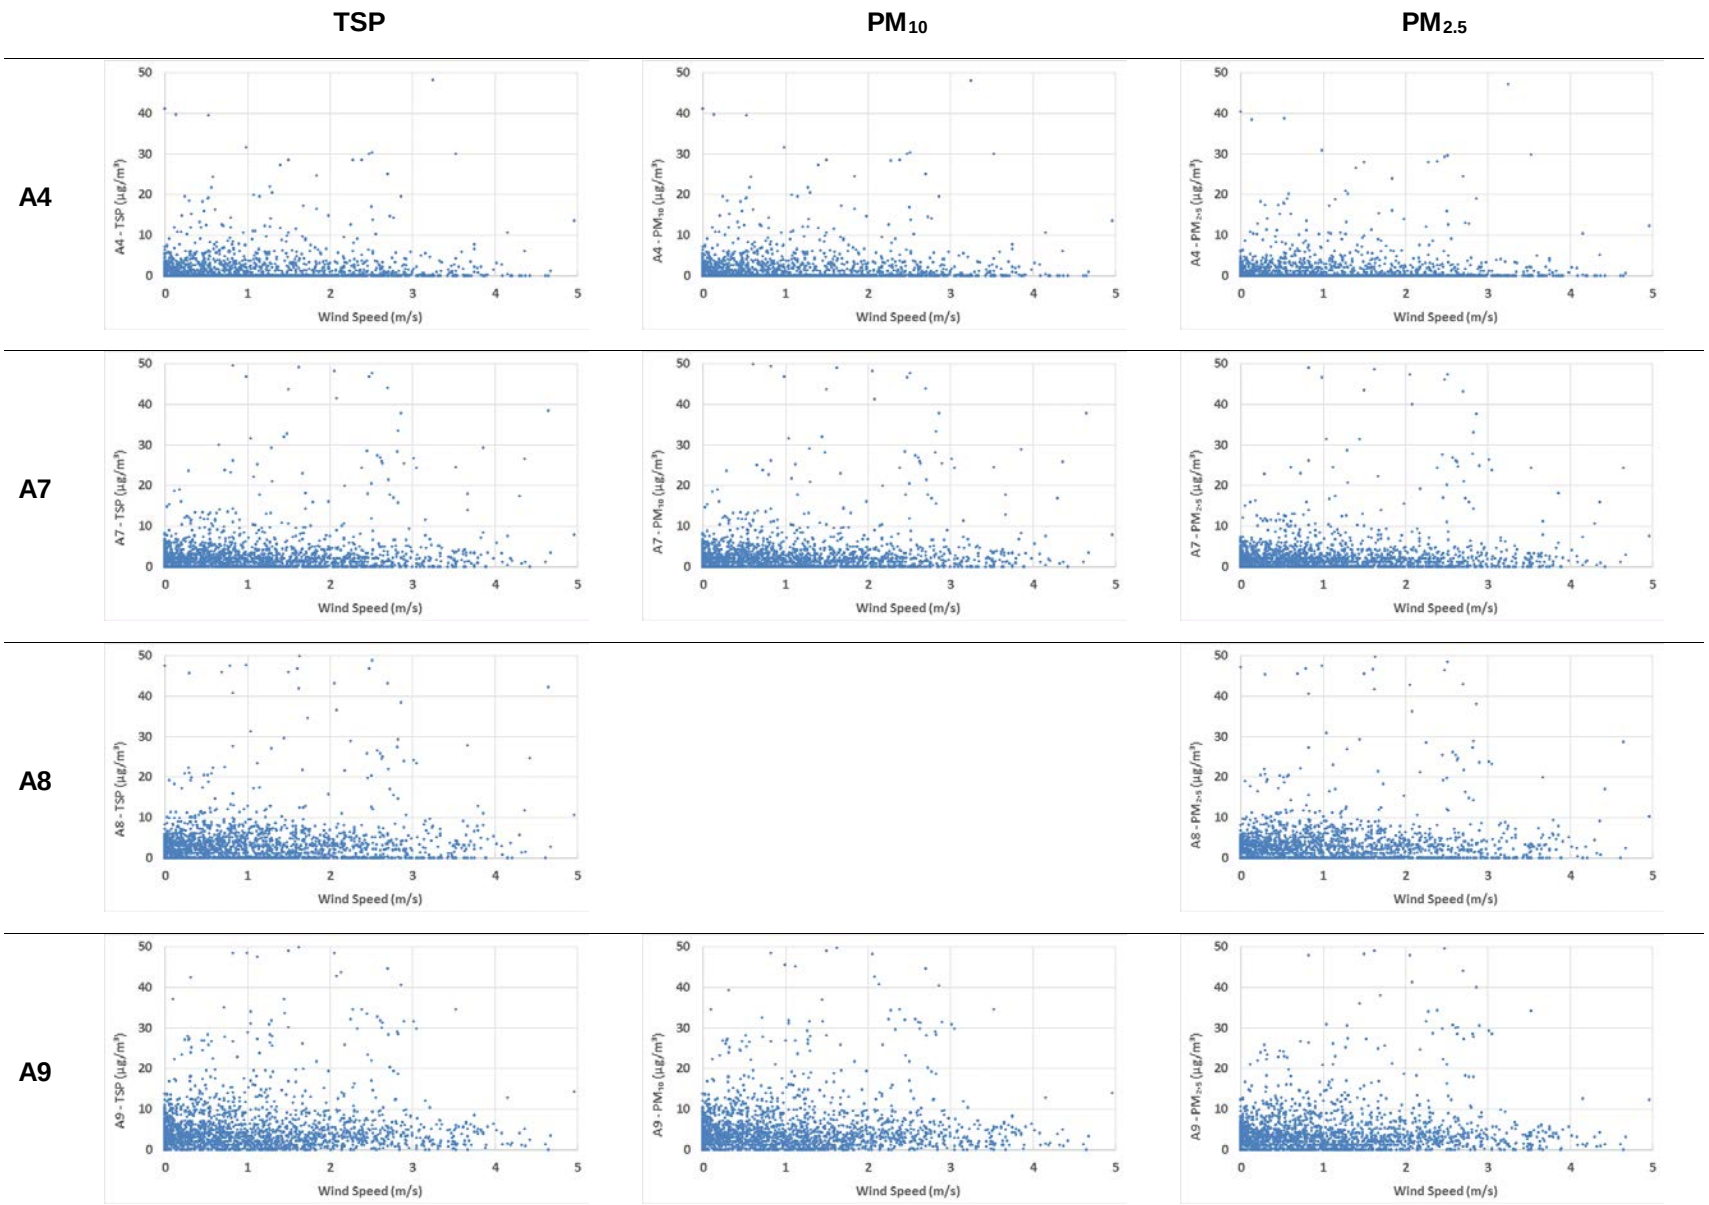


Figure 12: Hourly Average Particulate Concentration versus Hourly Average Wind Speed Plots

Over the entire monitoring period there were six hourly occurrences where the wind speed was greater than 5.4 m/s, the wind erosion threshold as defined in Golder (2015a). The wind speed for these 6 occurrences are shown in Table 2 along with the corresponding TSP, PM_{10}, and $PM_{2.5}$ concentrations monitored at each location.

Table 2: Particulate Concentrations when Hourly Wind Speeds Were Greater than 5.4 m/s

Wind Speed (m/s)		5.5	5.8	6.0	6.5	6.7	8.7
TSP (µg/m³)	A4	—[(a)]	—	—	0.9	0.8	—
	A7	3.1	—	156.1	4.7	8.6	28.4
	A8	—	1.7	245.0	16.7	57.7	10.6
	A9	<0.1	1.6	7.5	6.0	5.8	11.3
PM_{10} (µg/m³)	A4	—	—	—	0.8	0.8	—
	A7	2.9	—	154.2	4.6	8.2	28.0
	A8	—	1.5	243.0	16.6	57.2	10.4
	A9	<0.1	1.5	6.2	5.9	5.7	11.1
$PM_{2.5}$ (µg/m³)	A4	—	—	—	<0.1	<0.1	—
	A7	1.4	—	102.0	3.6	5.9	20.6
	A8	—	0.9	171.8	12.4	40.8	8.9
	A9	<0.1	1.1	3.8	4.7	4.7	9.0

Notes:

a) "—" indicates no concentration data available

The TSP, PM_{10}, and $PM_{2.5}$ concentrations in Table 2 which correspond to winds speeds greater than 5.4 m/s, are generally greater than the 50th percentile readings for the respective particulate size and station location (Figure 9, Figure 10, and Figure 11). Although a strong correlation is not observed for all concentrations and wind speeds (Figure 12), for wind speeds greater than 5.4 m/s corresponding concentrations tend to be in the upper 50th percentile range of all monitored data, which is what would be expected.

2.2 Dustfall

Dustfall was monitored at eight locations, four of which are in the vicinity of the TSF/Plug area (A4, A7, A8, and A9), as illustrated in Figure 13. The remaining four stations are located in the northern section of the mine, in excess of 3 km from the TSF/Plug area. Despite the distance from the TSF/Plug area, data from these stations have been included here for comparison purposes. For context, dustfall data have been compared to the BC AAQO for dustfall. Since the monitoring locations in the vicinity of the TSF/Plug area are located on an industrial site (a mine) where industrial activities will influence the monitored data, they therefore are not considered compliance measurement locations and hence comparison to the criteria is presented for reference purposes only. The AAQO for mining operations is a range of values between 1.7 and 2.9 mg/dm^2/day; however, MPMC waste discharge permit PA-15087 (BC MOE 1997), specifies a Ministry objective of 2.9 mg/dm^2/day (upper dustfall AAQO) to be used for comparison.

Monitored dustfall values are presented in Table 3; the stations located in the vicinity of the TSF/Plug area are highlighted in grey.

Table 3: Summer Dustfall Data for 2015 (mg/dm^2/day)

Location	July	August	September	Summer Average
A1	1.60	0.52	0.18	0.77
A2	1.16	0.28	0.26	0.57
A3	0.30	0.13	0.14	0.19
A4[(b)]	1.10	0.60	0.88	0.86
A6	0.10[(a)]	0.10[(a)]	0.13	0.11
A7	1.26	2.86	0.43	1.52
A8	1.09	0.48	0.10[(a)]	0.56
A9	0.50	0.21	0.18	0.30

Notes:

(a) Deposition monitored at or below detection limit of 0.10 mg/dm^2/day

(b) Grey highlights indicate stations that were co-located with DustTRAK stations.

Dustfall values are generally low and are consistently below the upper dustfall AAQO and the Ministry objective (waste discharge permit PA-15087) of 2.9 mg/dm^2/day.

For five dustfall monitoring stations, historical data was available from summer months from previous years for comparison. However, only one station (A4) in the vicinity of the TSF/Plug area had historical data. Historical data for this station is presented in Figure 14.

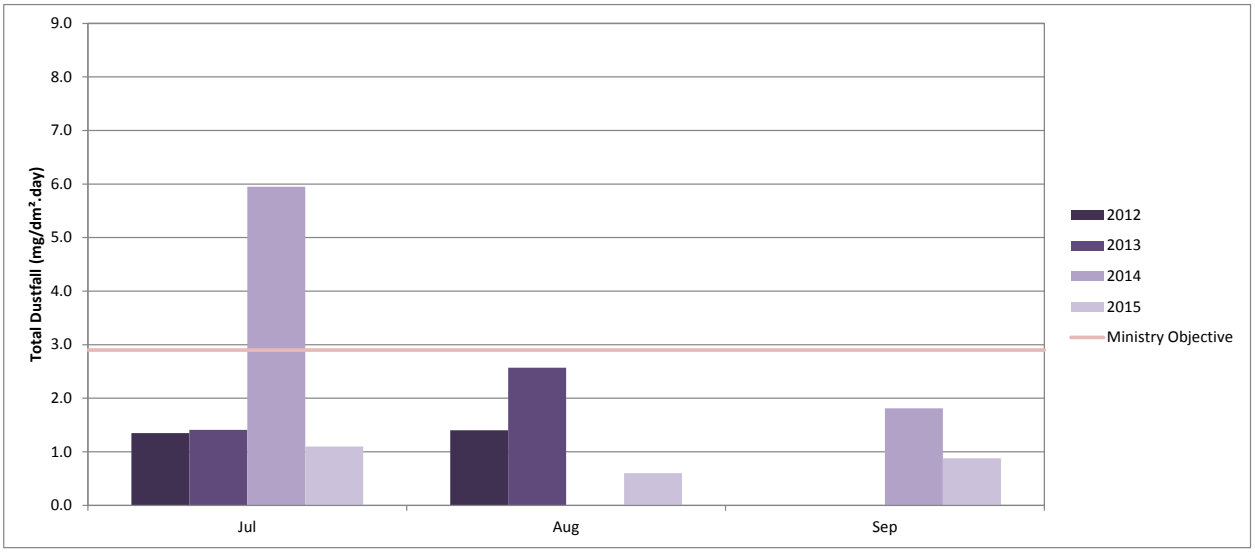

Figure 14: Summer Dustfall Data - Station A4

In general, the limited data shows that dustfall levels are lower in 2015 than in the same months in previous years.

For the dustfall stations with historical data that are located in the northern area of the site (A1, A2, A3, and A6), the year to year data are plotted in Figure 15 to Figure 18.

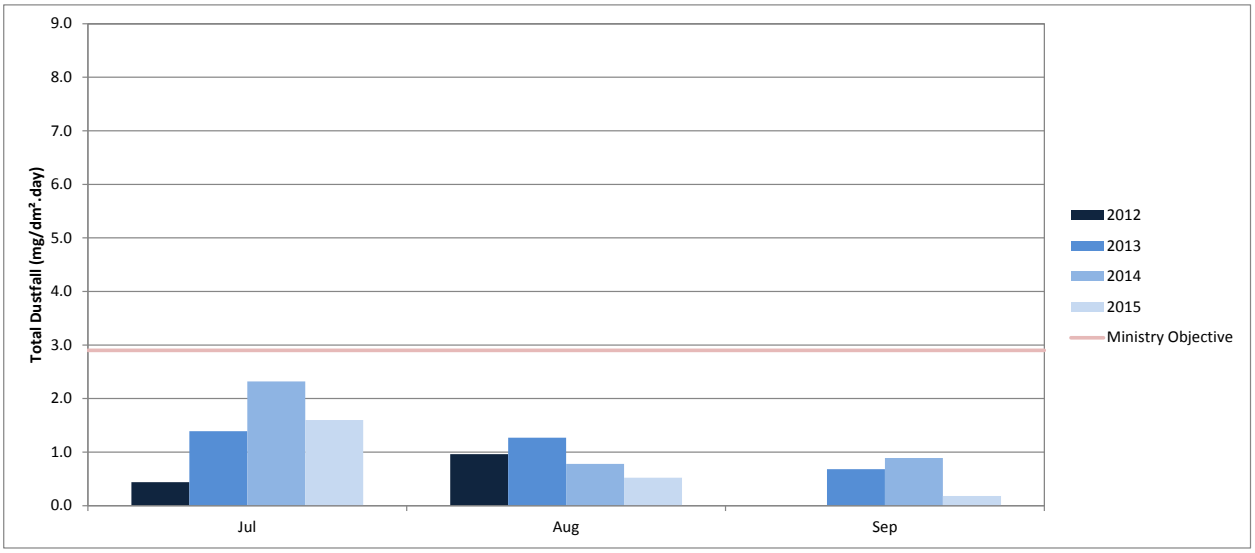

Figure 15: Summer Dustfall Data - Station A1

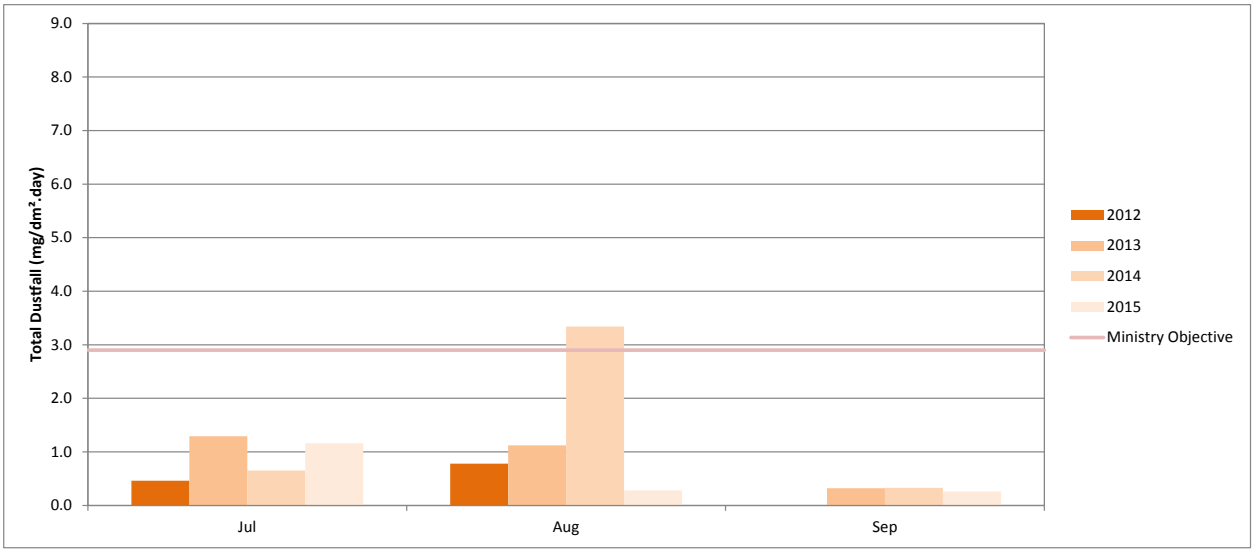

Figure 16: Summer Dustfall Data - Station A2

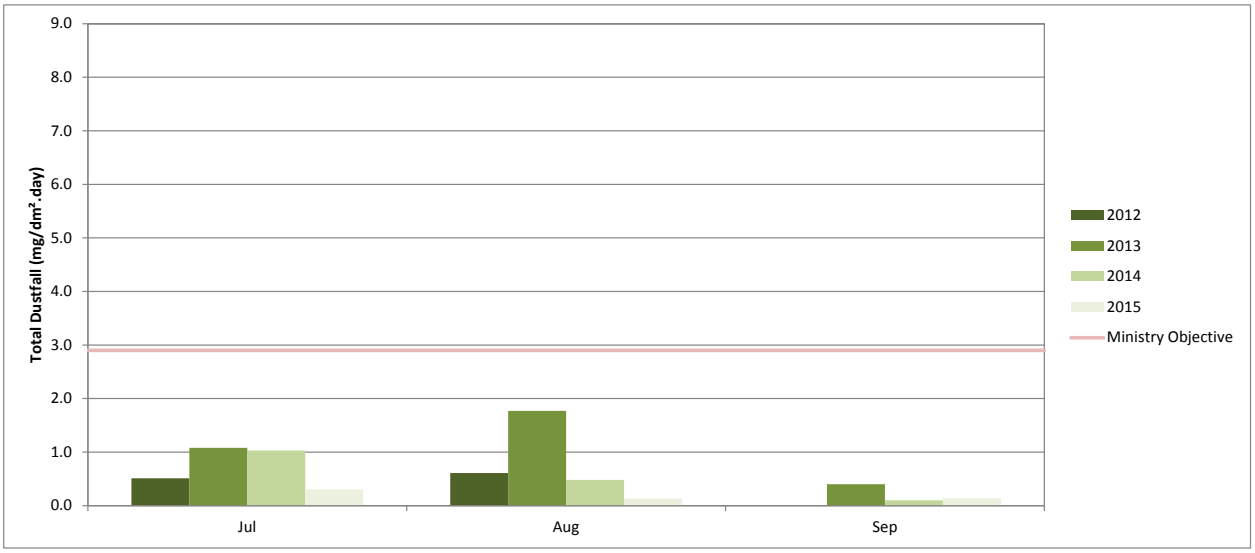

Figure 17: Summer Dustfall Data - Station A3

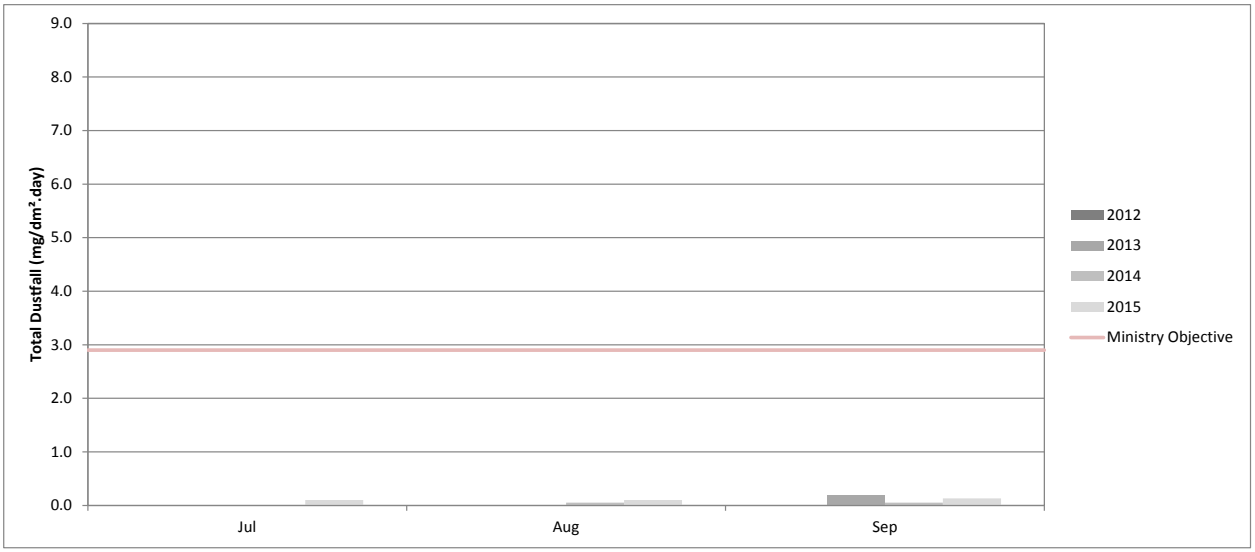

Figure 18: Summer Dustfall Data - Station A6

Similar to the pattern observed in A4, generally dustfall levels in 2015 are lower than in previous years.

2.3 Wind Speed and Direction

Wind roses for Station #2 (meteorological station adjacent to the TSF) based on 1-hour average wind speeds are illustrated for the previous two years combined (July through September 2013 and 2014) in Figure 19 and for the summer monitoring period (July to September 2015) in Figure 20.

The wind roses indicate that while the month to month winds varied between the previous years (2013 and 2014) and the summer monitoring period (2015), the monthly wind roses both indicate dominant northerly and southerly wind directions which is most likely topography driven (Golder 2015a). During the summer of 2015 there was a higher occurrence (76%) of calm winds, wind speeds less than 1 m/s, compared to the previous two years of summer data (45%). This higher predominance of calms indicates stagnant wind conditions, less prone to cause wind erosion.

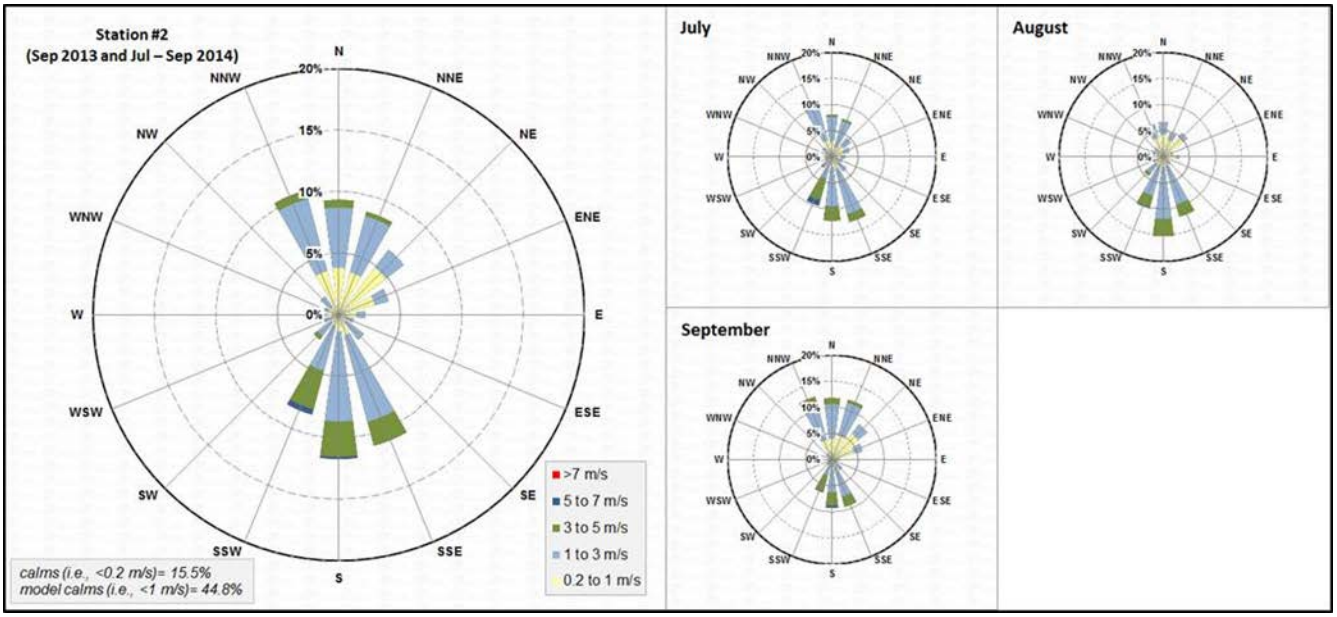

Figure 19: Station #2 Summer (July, August and September) Average and Monthly Wind Roses (2013-2014)

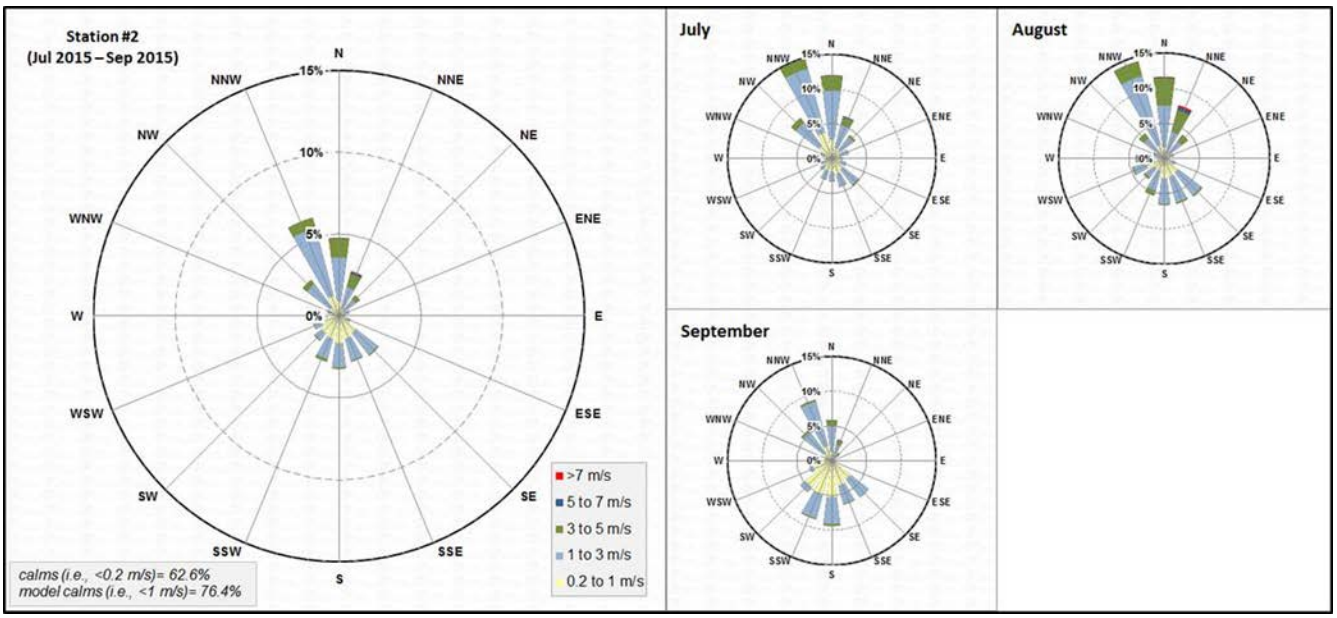

Figure 20: Station #2 Summer (July, August and September) Average and Monthly Wind Roses (2015)

It is expected that when winds reach a threshold velocity, fugitive emissions would result from wind erosion of exposed areas such as stockpiles and exposed tailings. When no source tested data is available, the United States Environment Protection Agency (US EPA) (1988) has used a threshold velocity of 5.4 m/s for aggregate material stockpiles (coal and other exposed materials), which has been applied to the exposed tailings area.

Table 4 and Table 5 present the frequency in which hourly wind speeds were greater than 5.4 m/s at Station #1 and Station #2 from the spring and summer of 2012 to 2015; 2015 includes data both prior to (May and June), and during the monitoring period. Station #2 is considered representative of the TSF and Plug; however, Station #2 was down in May 2015, so data for Station #1 has been provided for reference. Data for May and June have been provided to assist in identifying the potential frequency of wind erosion prior to the commencement of the summer monitoring period. A dash indicates no available data in that month.

Table 4: Frequency of Winds above 5.4 m/s at Station #1

Year	May	Jun	Jul	Aug	Sep
2012	—	—	—	—	11.9%[(a)]
2013	4.8%	0.8%	4.6%	0.7%	10.4%
2014	1.1%	2.8%	2.4%	0.0%	—
2015	1.2%	1.1%	1.6%	5.3%	1.9%

Notes:

(a) Based on a limited dataset comprised of data onwards of September 25, 2012.

Table 5: Frequency of Winds above 5.4 m/s at Station #2

Year	May	Jun	Jul	Aug	Sep
2012	—	—	—	—	—
2013	—	—	—	—	0.1%
2014	0.1%	1.0%	0.8%	0.0%	0.3%
2015	—	0.3%	0.3%	0.7%	0.2%

During the summer monitoring period (July to September 2015), the frequency of winds above 5.4 m/s at Station #1 was lower than in previous years in July and September and higher in August.

The frequency of winds above 5.4 m/s at Station #2 was found to be low (<1%) during all summer months, consistent with the limited amount of data available from previous years.

For the months of May and June 2015, summer months prior to the start of particulate monitoring, both meteorological stations generally observed similar or lower frequency of winds greater than 5.4 m/s in 2015 than in previous years. Wind speeds greater than 5.4 m/s for May and June 2015 are generally in the same order of magnitude as wind speeds greater than 5.4 m/s measured in July to September, 2015; this indicates that wind erosion potential in May and June 2015 is similar to the wind erosion potential during the particulate monitoring period.

2.4 Rainfall

Monthly rainfall amounts measured at Meteorological Station #1 are presented in Table 6. For comparison purposes the monthly 20 year average (1996-2015) rainfall at Mount Polley Mine is provided along with monthly rainfall (historical average) from Environment Canada's Likely station.

Table 6: Monthly Rainfall Data (mm)

Month	Mount Polley Mine Site Station #1 2015	Mount Polley Mine Site 1996-2015	Likely 1974-1993
July	63.8	56.7	59.7
August	20.8	35.3	67.2
September	61.6	46.5	51.6
Total Rainfall	146.2	138.5	178.5

During the summer months (July to September 2015), 146 mm of rainfall was recorded at the site. Between July and September, the Mount Polley Mine on average receives approximately 139 mm of rainfall (based on data from 1996 to 2014). This indicates that the total summer 2015 rainfall amount is consistent with the long term averages.

However, August 2015 was a relatively dry month compared to longer term averages. August received 15 mm less rainfall than the 20 year average, which equates to approximately 40% less rainfall in 2015 than the longer term 20 year average. The historical 20 year average data from the Likely station shows that on average there are 14 days with measurable rainfall (>0.2 mm of rainfall) in August. In August 2015 there were only 6 days with measurable rainfall, which also indicates that August 2015 was a relatively dry month.

2.5 Human Health Risk Assessment

A human health risk assessment problem formation has been conducted of conditions downgradient of the TSF following the tailings dam breach in 2014 (Golder 2016). A sampling and analysis plan was developed and implemented to support a multipathway exposure assessment for people who may use areas impacted by the tailings dam breach (Golder 2015c). Sampling included a range of possible contaminants in soil, sediment, groundwater, surface water, plants and fish tissues and both direct contact and indirect contaminant exposure pathways. A number of potential human health exposure scenarios were evaluated, including:

- Backcountry Recreation User (Hiker/Camper)
- Subsistence and Traditional Land User
- Backcountry Recreation User (ATV/Snowmobile Users)
- Boater/Kayaker
- Sport Fisher
- Hunter/Trapper
- Quesnel Lake Resident
- Logger
- Mine/Rehabilitation Worker

In response to regulatory input, the air quality particulate concentration data collected in the summer of 2015 will be included in the human health risk assessment. The 24-hour PM_{10} and $PM_{2.5}$ concentrations at each station will be screened against the BC's air quality objectives, as well as the background locations (Quesnel and Williams Lake). The results of the particulate matter assessment will be included in the 2016 post-event environmental impact assessment (PEEIA) report.

3.0 UPDATES TO DUST MANAGEMENT PLAN

The following section outlines the recommended updates to the *Fugitive Dust Management Plan, Mount Polley* (Golder 2015a) for the TSP/Plug area (referred as Dust Management Plan), and presents the supporting rationale.

Recommendation #1: Fugitive dust emissions management is continued as outlined in the dust management plan.

Rationale: The continuous monitoring data during the summer period of 2015 indicate that the dust management measures (as outlined in the dust management plan) appear to be effective at managing dust in the TSF and Plug area. The monitored results show that of the 82 days monitored, only 3 days were found to have PM_{10} and $PM_{2.5}$ concentrations greater than the AAQO; however, these exceedances are most likely attributable to local and regional forest fires.

Recommendation #2: Monitoring requirements outlined in the dust management plan are amended to ongoing dustfall monitoring, as required by permit conditions. There is no further requirement for temporary monitoring using DustTRAKs.

Rationale: The continuous monitoring data during the summer period indicates that the dust management measures (as outlined in the dust management plan) appear to be effective at managing dust in the TSF and Plug area.

Particulate concentrations (24-hour) monitored onsite (A4, A7, A8, and A9) and particulate concentrations measured at Quesnel and Williams Lake show similar large scale trends, which indicates that monitored concentrations are influenced by regional trends, not just potential localized emission sources.

Although the focus of the air quality monitoring was to try and capture the effect of wind erosion off of the TSF and Plug, the particulate concentrations monitored by the DustTRAKs could have come from a number of different regional (e.g., forest fires) and local sources, sometimes in close proximity to the monitoring locations, (e.g., construction, material handling, fugitive road dust, and vehicle combustion). Furthermore, meteorological conditions such as rainfall and low wind speeds, and mitigation measures, such as watering during dry and high wind events, would also limit the erodibility of the TSF and Plug material; therefore, establishing definitive links between wind speed and particulate concentration are not necessarily straight forward. A strong correlation was not observed in the monitoring data between wind speed and particulate concentrations at any of the locations; however, for very limited number of hours (6) during the monitoring period where wind speeds were greater than 5.4 m/s, particulate concentrations tended to be in the upper 50^{th} percentile range. Based on this analysis it is concluded that there is not one major source (e.g., the TSF/Plug) that is contributing to the monitored particulate concentrations, and therefore fugitive dust control measures were effective in the TSF and Plug area.

The analysis of the meteorological data over the monitoring period compared to available historical data showed that despite August 2015 being a dry month when compared to historical averages, particulate concentration data showed fugitive dust control measures were effective in the TSF and Plug area. The distribution of wind speeds

observed during the 2015 monitoring period showed similar dominant wind directions (from the north and south) to historic wind data; however, winds from the south were observed less frequently in summer 2015. This is not considered to be significant because monitoring locations were located both to the south and north of the TSF/Plug area. A higher incidence of calm periods was observed in the summer 2015 data than in the historical data (76% compared to 45%). This higher predominance of calms indicates stagnant wind conditions, less prone to cause wind erosion. However, analysis of the frequency of wind greater than 5.4 m/s, the criteria used to determine potential dusting events, measured over the summer 2015 monitoring period appears to be similar to previous years for metrological Station #2, the meteorological station most representative of the TSF and Plug. The difference in wind rose patterns and calm periods could be a result of inter-year variability, particularly since summer 2015 was compared to a very limited (two previous summers) historical dataset.

In addition, it is expected that there are around 108 days during the year where there are either subfreezing ground conditions or days where there is at least 1 cm of snow on the ground (Likely station). Therefore winter conditions will act as natural dust suppression for many months of the year (November to March).

Dustfall monitoring and associated annual reporting to the MOE will continue, and will be used to inform MPMC on the ongoing success of dust mitigation efforts.

Recommendation #3: The TSF/Plug area dust management plan is modified at a future date, prior to the TSF/Plug area becoming operational.

Rationale: Ongoing activities on site are generally the same as those considered as emission sources in the current dust management plan. Significant changes in the fugitive dust emissions sources in the TSF/Plug area are not expected until permitting has been completed, and the area becomes operational. It is anticipated that fugitive emissions from the TSF/Plug area will decrease once operational due to the removal and revegetation of tailings material from the Plug area, and water covering part of the TSF area.

4.0 CLOSURE

We trust that this memorandum meets your present needs. Please do not hesitate to contact us should you have any questions or comments regarding the above.

ATTACHMENT 2
TSP, PM_{10} and $PM_{2.5}$ Concentrations for A4, A7, A8, and A9

1.0 DUSTTRAK PARTICULATE DATA

This attachment outlines the particulate concentrations observed at DustTRAK stations A4, A7, A8, and A9.

Daily, hourly, and 2-minute data for TSP, PM_{10}, and $PM_{2.5}$ are summarized using a simplified box and whisker plot. The simplified box and whisker plot has been used to present trends and statistical data. The box on the figures represents the bounds of the middle (50th percentile) of the 1 hour data points, with the top of the box representing the 1 hour 75th percentile concentration and the bottom of the of box representing the 1 hour 25th percentile concentration. The green diamond represents the 24-hour average concentration. The "whiskers" extend up to the maximum hourly and down to the minimum hourly concentration. The upper dotted grey line represents the 2-minute maximum data, and the lower dotted grey line represents the minimum 2-minute data; the upper dashed green line represents the 75th percentile for the 2-minute data and the lower dashed green line represents the 25th percentile of the 2-minute data. The legend for Figure 2 through Figure 13 is illustrated in Figure 1.

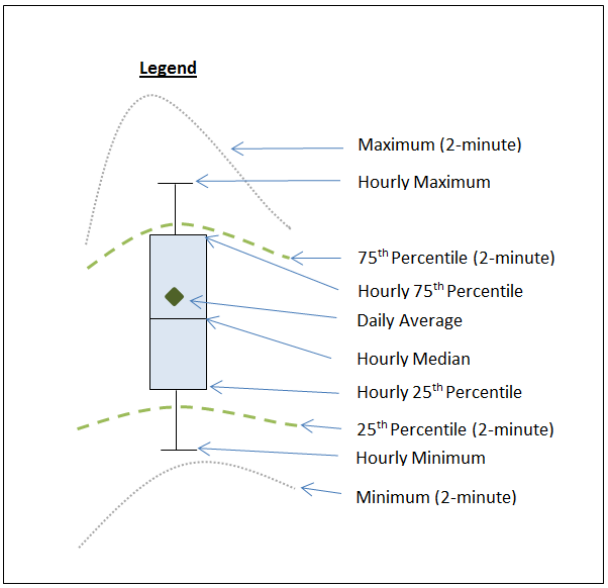

Figure 1: Simplified Box-Whisker Plot Legend

The raw monitored data were screened against the criteria listed below; data that met the following criteria were removed and not presented in the following sections and within the main technical memorandum:

- 2-minute concentrations less than zero;
- data outside of the instrument's monitoring range (0 to 150,000 µg/m^3 for TSP, PM_{10} and $PM_{2.5}$);
- errors indicated within the raw data file including:
  - flow error;
  - laser error; and
  - filter error.

- less than 75% data completeness for hourly and 24-hour averaged values:
  - any hour with less than 23 samples of 2-minute data were was excluded from the hourly dataset (23 samples of 2-minute data over an hour represents a 75% complete hourly dataset); and
  - any 24-hour period with less than 540 samples of 2-minute data were excluded from the 24-hour dataset (540 samples of 2-minute data over 24-hours represents a 75% complete 24-hour dataset).

1.1 A4

Monitored concentrations of TSP, PM_{10}, and $PM_{2.5}$ at A4 are shown in Figure 2 to Figure 4.

Many days' worth of TSP, $PM_{10,}$ and $PM_{2.}5$ concentration data from DustTRAK station A4 met the criteria listed in Section 1.0. Specifically, the 2-minute concentrations were less than zero and hourly and 24-hour data had data completeness of less than 75%. Dates that met the criteria listed in Section 1.0 included September 17 to 22, and 25 to 28, 2015 for TSP and PM_{10}.

Of the valid data, 24-hour concentrations for TSP, PM_{10}, and $PM_{2.5}$ were below BC's ambient air quality objectives (BC AAQO).

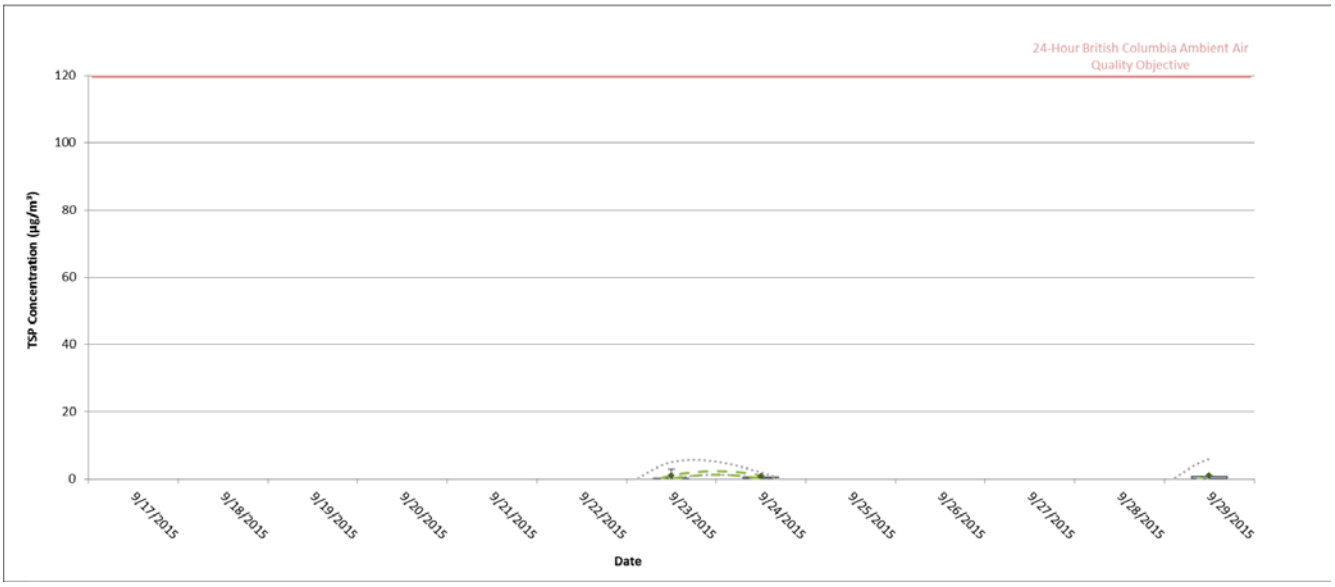

Figure 2: TSP Concentrations at A4, September 17 to 29, 2015

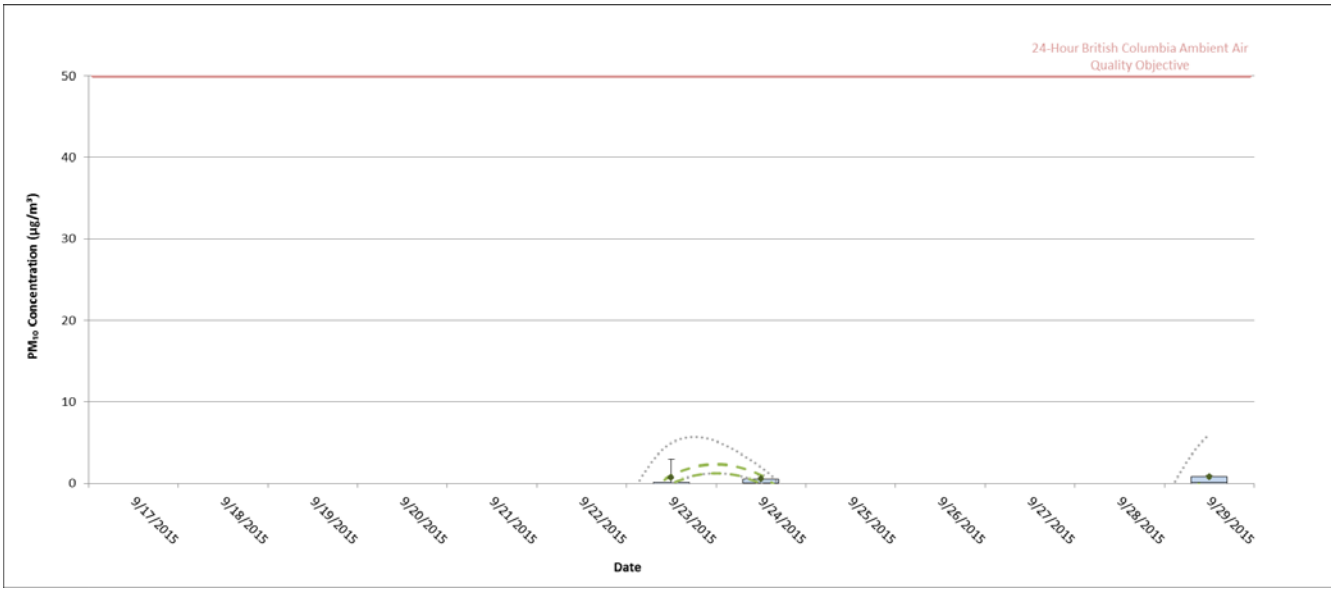

Figure 3: PM_{10} Concentrations at A4, September 17 to 29, 2015

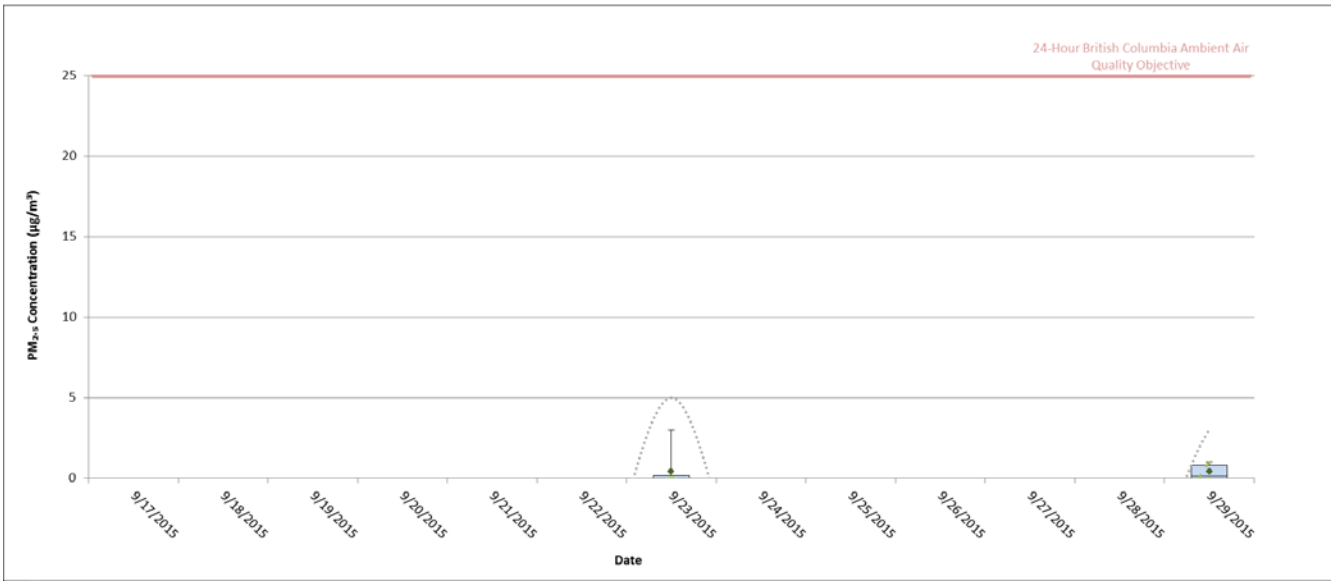

Figure 4: $PM_{2.5}$ Concentrations at A4, September 17 to 29, 2015

1.2 A7

Monitored concentrations of TSP, PM_{10}, and $PM_{2.5}$ measured at A7 are illustrated in Figure 5 to Figure 7.

All monitoring data was considered valid during the September 17 to 29, 2015 monitoring period.

TSP, PM_{10}, and $PM_{2.5}$ 24-hour concentrations were below BC's AAQO throughout the monitoring period.

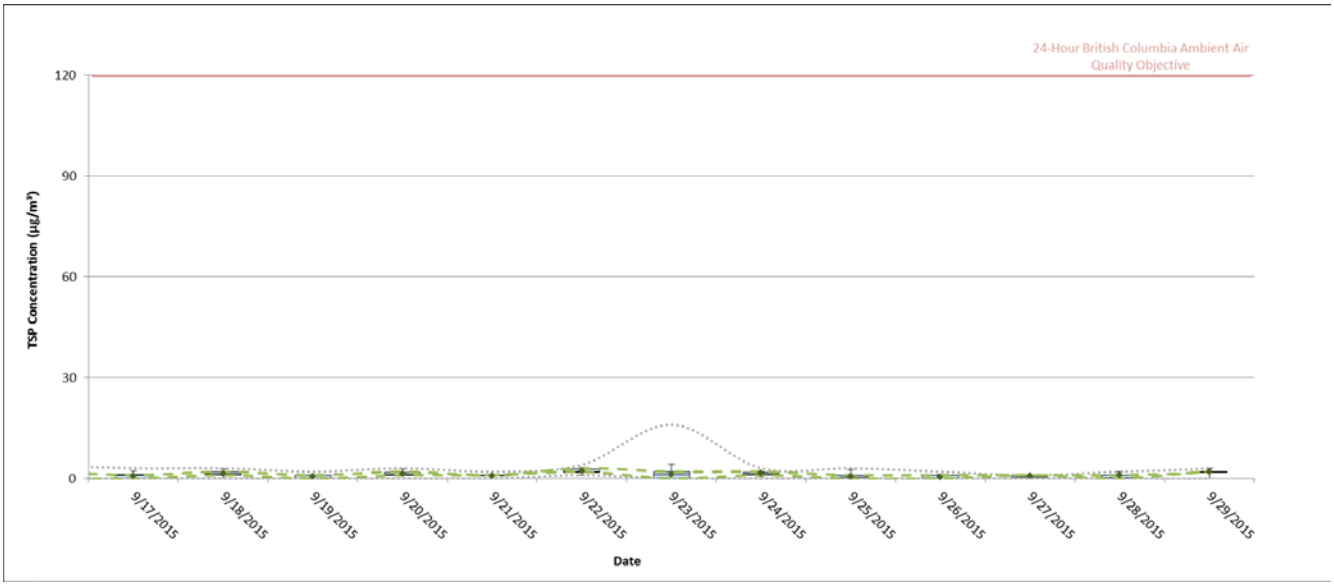

Figure 5: TSP Concentrations at A7, September 17 to 29, 2015

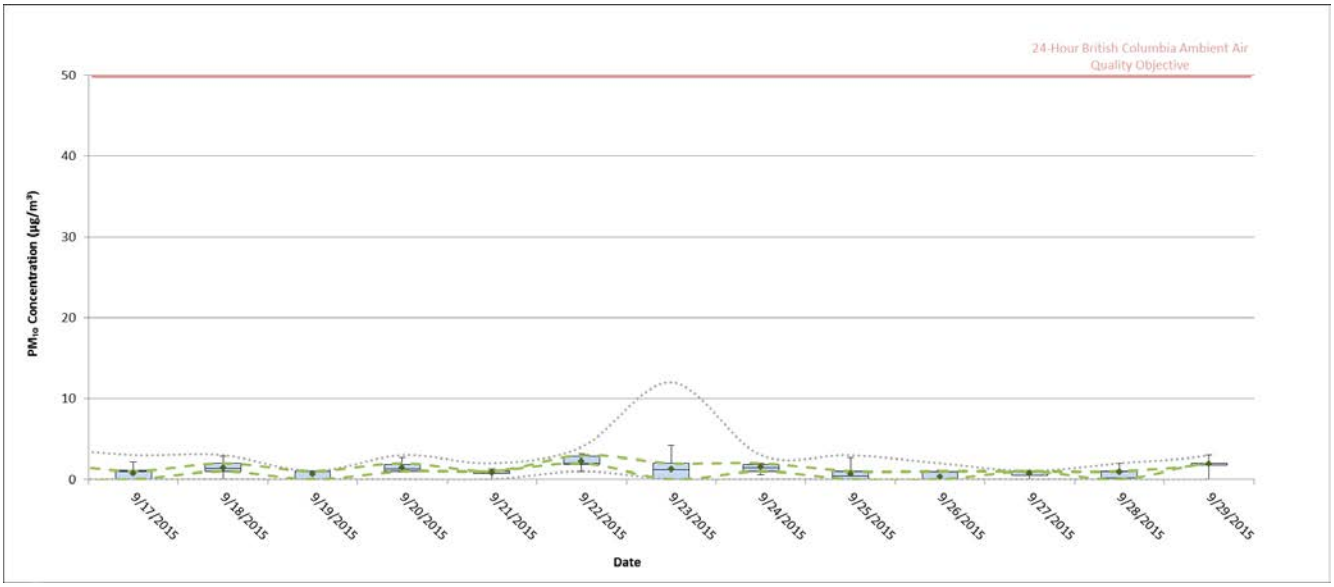

Figure 6: PM_{10} Concentrations at A7, September 17 to 29, 2015

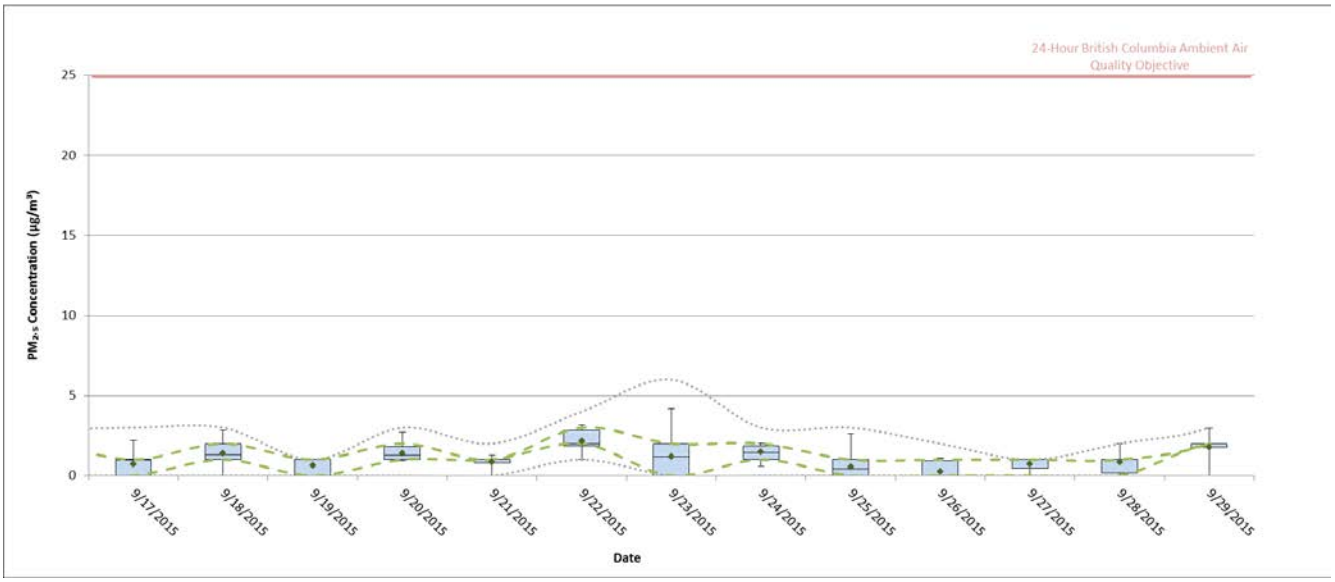

Figure 7: $PM_{2.5}$ Concentrations at A7, September 17 to 29, 2015

1.3 A8

Monitored concentrations of TSP, PM_{10}, and $PM_{2.5}$ measured at A8 are illustrated in Figure 8 to Figure 10.

Concentration data on September 20, 2015 data met the criteria listed in Section 1.0.

Of the valid data, TSP, PM_{10}, and $PM_{2.5}$ 24-hour concentrations were below BC's AAQO for all days monitored.

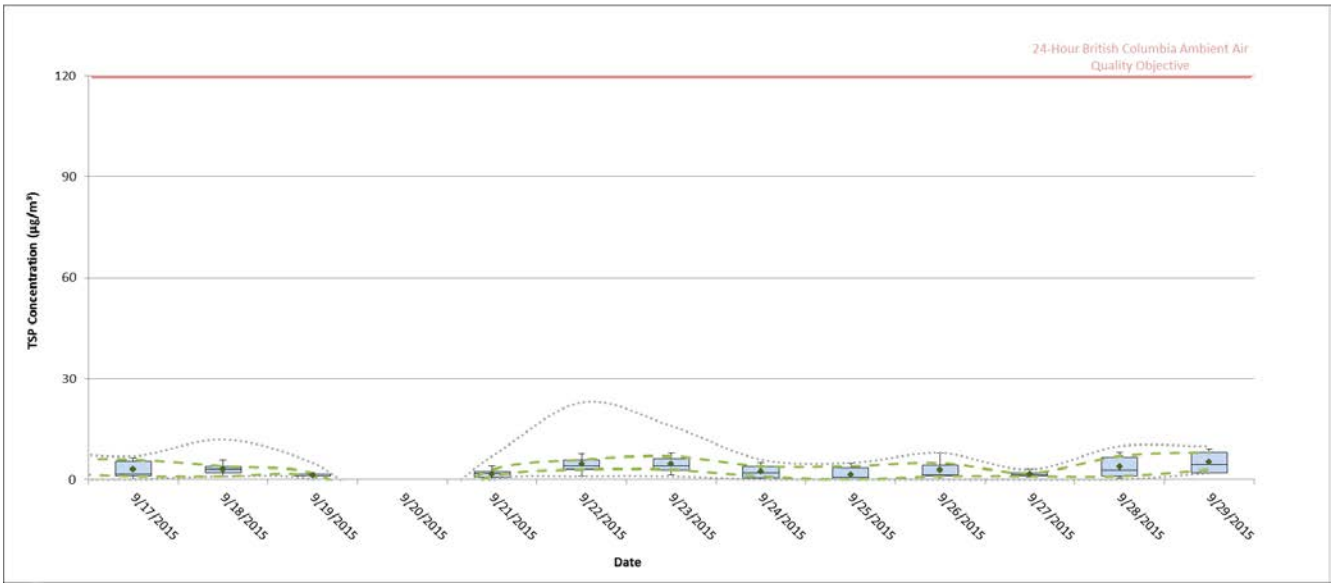

Figure 8: TSP Concentrations at A8, September 17 to 29, 2015

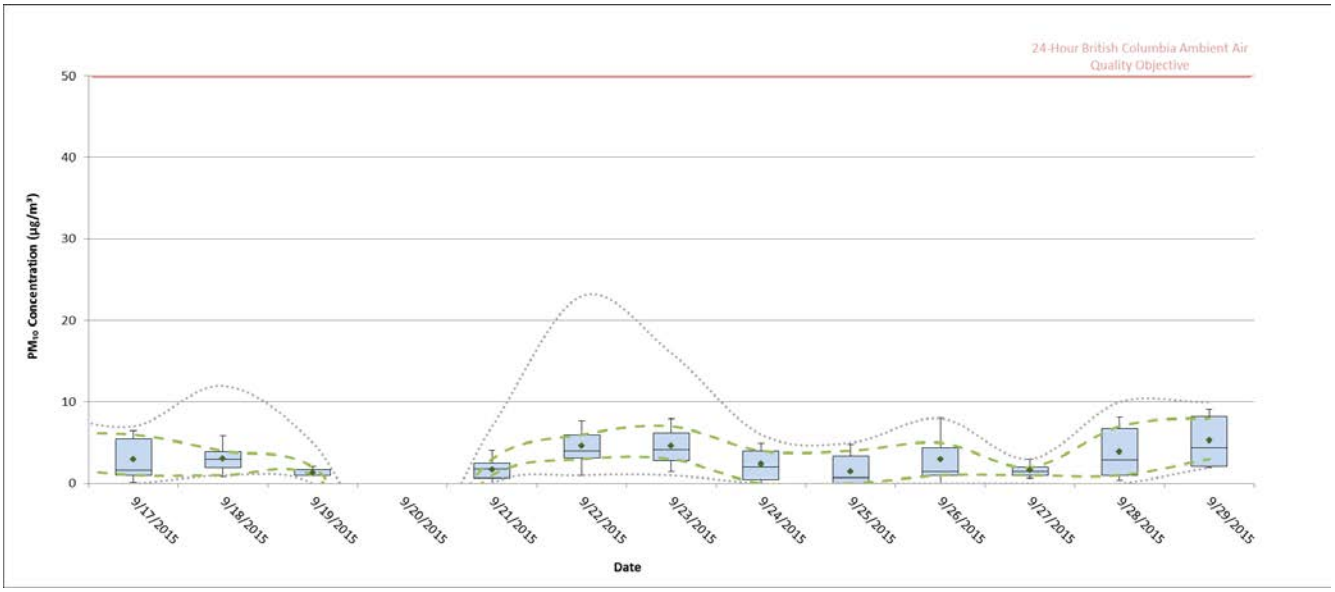

Figure 9: PM_{10} Concentrations at A8, September 17 to 29, 2015

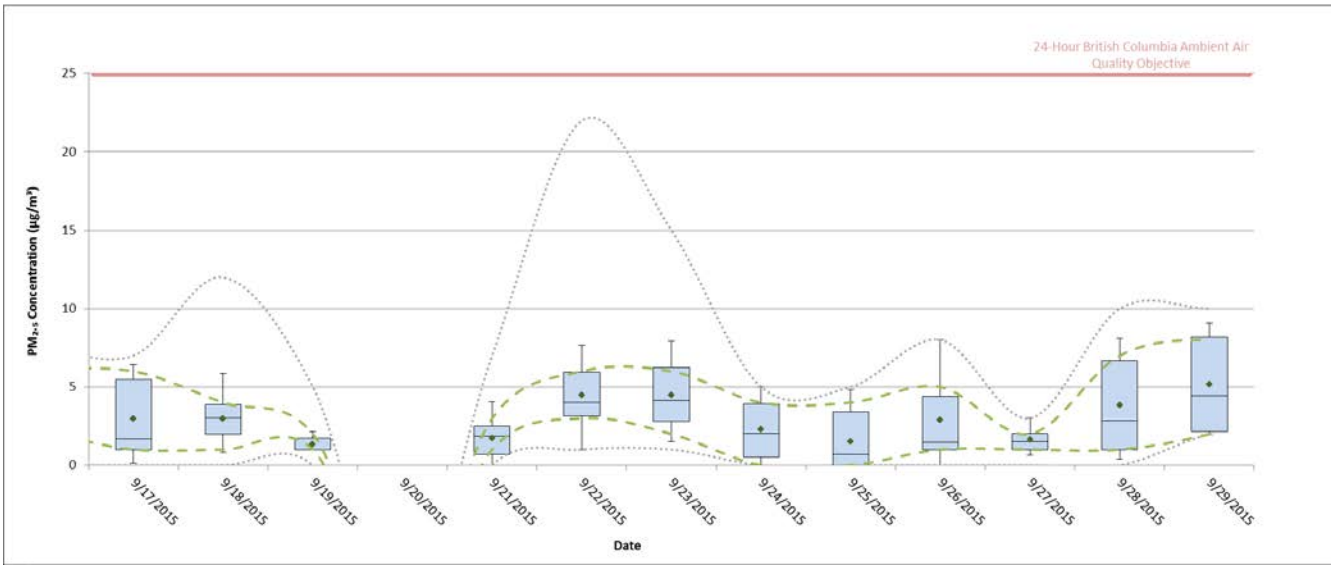

Figure 10: $PM_{2.5}$ Concentrations at A8, September 17 to 29, 2015

1.4 A9

Concentration patterns for TSP, PM_{10}, and $PM_{2.5}$ measured at A9 are illustrated in Figure 11 to Figure 13.

All data were considered to be valid during the September 17 to September 29, 2015 monitoring period.

TSP, PM_{10}, and $PM_{2.5}$ 24-hour concentrations were below BC's AAQO for all days monitored.

Short-term 2-minute TSP concentrations (greater than 120 µg/m³) were measured on September 17, and 29, 2015 for a period of 50, and 22 minutes. Short-term PM_{10} 2-minute concentrations (greater than 50 µg/m³) were monitored on September 17, 18, and 29, 2015 for a period of 130, 4, and 34 minutes respectively. Short term 2-minute $PM_{2.5}$ concentrations (greater than 25 µg/m³) were monitored on September 17, 18, and 29, 2015 for a period of 128, 4, and 32 minutes respectively.

SUMMARY OF AVAILABLE FISH TISSUE CHEMISTRY DATA (2014 – 2015) FOR ASSESSMENT OF POTENTIAL CHANGES IN CONCENTRATIONS RELATED TO THE MOUNT POLLEY TAILINGS DAM FAILURE

1.0 EXECUTIVE SUMMARY

This technical memorandum provides a summary of fish tissue chemistry collected after the release of tailings as a result of a foundation failure of the Tailings Storage Facility at the Mount Polley Mine in British Columbia, Canada, on August 4, 2014. All available fish tissue chemistry data collected subsequent to the tailing release was consolidated into a single data set to facilitate future interpretative efforts, including a small number of samples from the spring of 2016 which were analyzed on a rush basis. Additional 2016 fish tissue samples are still being processed by the analytical laboratory. Golder has prepared the following preliminary summary of the nature of the available fish tissue data (e.g., sample locations, number of species and types of tissues sampled). The data were divided into exposure and reference sites, and subdivided by species, tissue type and year to facilitate a high-level exploratory analysis. Basic descriptive statistics were calculated and boxplots were visually examined to provide a preliminary view of the available data in light of relevant exposure pathways. Based on this visual examination, Golder's preliminary view is:

- Selenium concentrations in Polley Lake rainbow trout ovary tissue in 2015 showed a substantial increase that appeared anomalous relative to other species, locations and years. This increase in selenium concentrations was not present in rainbow trout samples collected in 2016. Further work to validate the potentially anomalous data with the analytical laboratory is on-going. Regardless, measured concentrations in a number of rainbow trout ovary samples from Polley Lake in a number of samples in 2014 and 2016 have exceeded the applicable guideline of 11 mg/kg dw, and whole-body and/or muscle concentrations have also exceeded the applicable guideline of 4 mg/kg dw in a number of samples in all three years. Further evaluation is recommended.
- Arsenic accumulation in fish may also be occurring. There were no exceedances of the applicable guideline observed in tissue samples that would be typically consumed by humans (e.g., muscle samples), but there were increases observed in some organ-specific analysis that may be a precursor for accumulation in muscle tissue over time.
- For other metals, the pattern of accumulation in tissues was inconsistent.

Although a sizeable number of fish have been collected, sampling has been generally opportunistic. Data are also currently limited to two years of sampling and bioaccumulation may change over time for different metals as restoration of the food web continues. Further evaluation of the 2016 fish tissue chemistry as it becomes available is recommended.

Golder emphasizes that the value of this type of a data set is enhanced when it is based on a sampling program that consistently targets specific locations along a representative exposure gradient and focuses on specific species (or functional groups of species) and tissue types with a sufficient number of samples to allow for statistical analysis (i.e., to test specific hypotheses). A minimum sample size of 8 and a preferred sample size of 20 or more should be considered in future sampling programs to support quantitative statistical analyses. These analyses are central to both the initial quantitative risk assessment (i.e., a realistic worst-case exposure concentration is typically based on a 95% upper confidence limit of the mean) as well as future monitoring programs (i.e., trends in fish tissue concentrations over time; statistical differences between exposure and reference sites). Golder cautions that sampling effort for reference sites will need to be reviewed, given that some samples from reference sites were also elevated relative to numerical guidelines (e.g., mercury).

2.0 CONTEXT OF DATA SOURCES

This technical memorandum provides a summary of fish tissue chemistry collected after the release of tailings as a result of the failure of the Tailings Storage Facility (TSF) at the Mount Polley Mine (the Mine) in British Columbia, Canada, on August 4, 2014. Multiple stakeholders collected fish tissue samples following the release of tailings. This technical memorandum is intended to consolidate the data from these multiple sources into a single data set to facilitate future interpretative efforts, and consists of the following three elements:

- A narrative preliminary summary of the nature of the available fish tissue data is provided (e.g., sample locations, number of species and types of tissues sampled). Data were divided into exposure and reference sites, and subdivided by species, tissue type and year.
- Basic descriptive statistics (e.g., sample size (n); mean; standard deviation) and censored boxplots of concentrations) have been calculated for all substances measured in fish tissue data. Each censored boxplot considers one classification of data (e.g., difference in tissue concentration of a metal[1] in a given species by exposure/reference site or by year) resulting in a large number of individual boxplots.
- Observations are summarized for those specific combinations of metals and fish tissues that have been identified for the ecological and human health risk assessment to frame future statistical analyses that may be conducted. A preliminary summary based on the fish tissue chemistry data collected to date and provides important early context about the nature of the available data, and highlights several sources of uncertainty that will need to be considered in greater detail as the monitoring program progresses.

[1] For the purposes of this memo, the tern “metals” includes metalloids (e.g., arsenic) and non-metals (e.g. selenium).

3.0 METHODS

This section provides an overview of the methods used to view the fish tissue chemistry data and the quality assurance/quality control (QA/QC) measures taken by Golder Associates to consolidate the data into a single data set.

- Analytical chemistry reports and field collection notes were provided by Mount Polley Mining Corporation (MPMC) and their consultants, the British Columbia Ministry of Environment (BC MoE), and the Department of Fisheries and Oceans (DFO). Golder has relied on the information provided by others and has not conducted independent verification of those data or field information beyond a QA/QC check that analytical data were correctly transcribed and that there were no obvious errors in fish collection methodology as described in the field notes.
- Fish were collected from multiple locations within the study area by the various parties (Figure 1). Fish were collected by the various stakeholders in coordination with local First Nations groups, lodge owners, and guide outfitters. A wide variety of sampling methods were used, including electrofishing units, multi-panel gill nets, trap nets, gee minnow traps, and angling.
- Fish tissue samples include both whole-body and muscle tissues, as well as specific organs (Tables 1 and 2). Some samples were a composite of multiple individual fish. Species include lake trout (*Salvelinus namaycush*), peamouth chub (*Mylocheilus caurinus*), sockeye salmon (*Oncorhynchus nerka*), rainbow trout (*Oncorhynchus mykiss*), burbot (*Lota lota*), kokanee (*Oncorhynchus nerka*), largescale sucker (*Catostomus macrocheilus*), northern pikeminnow (*Ptychocheilus oregonensis*), redside shiner (*Richardsonius balteatus*), longnose dace (*Rhinichthys cataractae*), longnose sucker (*Catostomus catostomus*), and mountain whitefish (*Prosopium williamsoni*). A general trend was that samples for small-body fish tended to be either composite or whole-body, while samples for large-body fish tended to focus on muscle or other organs. In a limited number of instances, field duplicate samples were available (e.g., two muscle samples from the same fish) as part of QA/QC protocols, but these samples were not included in the data analyses to avoid pseudo-replication.
- Fish tissue samples were submitted to ALS Environmental (ALS) in Burnaby, British Columbia. Detection limits (DL) are summarized in Table 3. All laboratory results, including confirmation of detection limits and parameter lists, were reviewed by Golder upon receipt. Golder conducted a review of the certificates of analysis and examined data distributions to verify the validity of the data. Golder concluded the data are reliable based on consideration of the reported qualifiers related to the laboratory QA/QC methods (i.e., relative percent differences; recovery of certified reference samples) and consistency in data distribution among samples (i.e., no large magnitude differences among samples, or unexplained outliers)[2].
- Tissue chemistry results were reported in milligrams per kilogram (mg/kg) and expressed in terms of wet weight (ww), with the exception of selenium which is expressed in terms of dry weight (dw). Selenium is expressed in terms of dw to allow direct comparisons to the BC MoE selenium guideline, which is presented in dw. If a parameter was reported below the analytical DL, a value of one half the DL was used to calculate summary statistics.
- Data was provided to Golder in electronic form by the various stakeholders and was compiled into a master spreadsheet for data evaluation. Tables containing data summaries (e.g., summary statistics) underwent a 10% QA check by a second, independent person.

[2] One peamouth chub sample was removed as an outlier due to field notes that indicated the sample was contaminated. One northern pikeminnow sample was excluded because the collection site could not be determined.

The primary method for data evaluation was to subdivide the data into location (i.e., exposure versus reference), species and year. Differences amongst each classification (location, species, tissue type, year) were examined visually using boxplots. A key consideration is sample collection was conducted to support a variety of sampling objectives and/or preliminary hypotheses. There was no integrative *a priori* study design or associated objectives regarding sample collection (i.e., target species, fish age, tissue types, or sample sizes). Fish tissue sample collection should be considered as opportunistic, and in many of the sample classifications, there are insufficient data to allow for meaningful comparisons.

Table-1: Site naming convention and classification of sampling locations

Site Name	Description of Location	Fish Species Collected in 2014	Fish Species Collected in 2015	Collecting Agency
Bootjack Lake [A]	Reference site located East of Polley Lake.	Rainbow Trout	Rainbow Trout	MPMC
Hazeltine Creek	Considered a reference site because samples were collected prior to the event.	Rainbow Trout (pre-event)	n/a	MPMC
Horsefly River	Exposed site located South of Quesnel Lake (i.e., migratory exposure as fish moved through Quesnel Lake to this location).	Sockeye Salmon (adult)	n/a	DFO
Polley Lake [A]	Exposed site located North of the TSF.	Longnose Sucker, Rainbow Trout[1], Redside Shiner	Rainbow Trout	MPMC, BC MoE
Quesnel Lake East [B]	Reference site located in the East arm of Quesnel Lake	Sockeye Salmon (juvenile)	Burbot, Lake Trout, Sockeye Salmon	MPMC, DFO
Quesnel Lake Hazeltine Creek Confluence [B]	Exposed site located at the confluence of Hazeltine Creek and Quesnel Lake	Burbot, Lake Trout, Longnose Dace, Longnose Sucker, Mountain Whitefish[2], Northern Pikeminnow, Peamouth Chub, Redside Shiner	Burbot, Lake Trout, Largescale Sucker, Northern Pikeminnow, Peamouth Chub, Redside Shiner	MPMC, BC MoE
Quesnel Lake Horsefly River Confluence [B]	Exposed site located at the confluence of Horsefly River and Quesnel Lake	Burbot, Longnose Dace, Northern Pikeminnow, Peamouth Chub	n/a	MPMC
Quesnel Lake near Quesnel River [B]	Exposed site located in north-west Quesnel Lake near the lake-to-river transition zone	Burbot, Kokanee, Mountain Whitefish, Northern Pikeminnow, Peamouth Chub, Rainbow Trout	Kokanee	MPMC, BC MoE
Quesnel Lake North [B]	Reference site located in the North arm of Quesnel Lake; also includes fish captured at the Wasco Creek and Grain Creek confluences.	Kokanee, Northern Pikeminnow, Peamouth Chub, Sockeye Salmon (juvenile)	Largescale Sucker, Peamouth Chub, Sockeye Salmon	MPMC, BC MoE, DFO
Quesnel Lake Middle [B]	Potentially exposed site, located in Quesnel Lake, east of the Horsefly River Confluence, but west of the North and East Arms	Sockeye Salmon (juvenile)	Sockeye Salmon	DFO
Quesnel Lake West [B]	Exposed site located in Quesnel Lake, NW of the Hazeltine Creek Confluence	Sockeye Salmon (juvenile)	Sockeye Salmon	DFO
Quesnel River [B]	Exposed site located in Quesnel River, downstream of Likely	Rainbow Trout	Rainbow Trout	MPMC
Soda Creek	Reference site	Sockeye Salmon (adult)	n/a	DFO
Trio Lake [A]	Reference site located west of Bootjack Lake	n/a	Rainbow Trout	MPMC

Notes: *BC MoE = British Columbia Ministry of Environment; DFO = Department of Fisheries and Oceans; MPMC = Mount Polley Mining Corporation; n/a = not applicable*

[1] Rainbow trout collected in 2015 were collected from Frypan Creek, a tributary on the north side of Polley Lake. Samples were pooled with Polley Lake because rainbow trout move between the creek and lake, and use Frypan Creek as spawning habitat.

[2] Fish species was not provided, field notes indicated "whitefish"; species was therefore assumed to be Mountain Whitefish.

[A, B] The focus of comparisons between reference and exposed sites are amongst small lake sites (A) or within Quesnel Lake (B)

DL = Detection Limit; % = percent; mg/kg ww = milligrams per kilogram wet weight; - = all samples above DL.
Note: Parameters with DL ranges indicate more than two DL were reported.

4.0 SYNTHESIS

4.1 Narrative Summary

A total of 1073 samples were submitted for fish tissue chemistry analysis: 663 samples were collected in 2014, and 286 samples were collected in 2015. The narrative summaries in Tables 1 and 2 highlight that:

- Many samples were collected from the exposure site in Quesnel Lake near the mouth of Hazeltine Creek. Several species/tissue types were collected in both 2014 and 2015 from this location, with sample sizes of more than 10 samples.
- Many of the remainder of the fish tissue data in terms of sample location, fish species, and tissue type had limited number of samples, which will likely reduce statistical power in any future analysis of spatial or temporal patterns. It may be necessary to group data (e.g., a general comparison of exposure to reference in lieu of specific locations correlated by proximity to the tailings release).
- Different types of tissue are used in the ecological and human health risk assessments. The general practice is that ecological risk assessments for piscivores would focus on whole-body and organ-specific tissue chemistry, while human health risk assessment would focus on muscle tissue data. The diversity of tissue types will need to be considered in the calculation of representative worst case concentrations for different receptor groups.

As part of the compilation of the various datasets, it was necessary to make several inferences due to an ambiguity in the accompanying field notes. These assumptions are listed in Attachment 1.

4.2 Basic Descriptive Statistics

4.2.1 Summary Statistics and Magnitude of Difference

Summary statistics for the available fish tissue chemistry data are provided in Attachment 2, and include:

- Number of samples (n);
- Percent of samples with a concentration greater than the detection limit;
- Minimum, median and maximum concentration; and
- Mean concentration, standard deviation, and standard error.

Attachment 2 also includes a comparison between exposure and reference and/or year for a subset of sites, species, and tissue types, where sufficient data was available. The magnitude of the difference (as a percentage of the median) was calculated if:

- Greater than (>) 50 percent (%) of samples were > DL;
- There were at least four samples in each data set available for comparison.

As an example, the magnitude difference between exposure and reference sites was calculated as follows:

$$Magnitude\ Difference\ (\%) = \frac{(Exposure\ Median - \ Reference\ Median)}{Reference\ Median} \times 100$$

4.2.2 Censored Boxplots

Fish tissue chemistry data were plotted for each metal by species, tissue type and waterbody using censored boxplots as described in Barrett et al. (2014). Boxplots are provided in Attachment 3, and focused on the following three broad comparisons:

- Exposure versus reference based on 2014 data;
- Exposure versus reference based on 2015 data; and
- 2014 data versus 2015 data.

Censored boxplots were created as follows:

- Data sets with six or more samples were plotted using censored boxplots. Data sets with less than six samples, or when few samples had concentrations greater than the detection limit were plotted as individual values. This approach was used because boxplots can provide a misleading representation of the data distribution when sample sizes are small.
- The box of the boxplot was defined as the 25th percentile, the 75th percentile, and the median. The lower whisker was defined as the minimum concentration within 1.5 times the interquartile range (IQR) below the 25th percentile; the upper whisker was defined as the maximum concentration within 1.5 times the IQR above the 75th percentile. Concentrations outside of the range of the whiskers were plotted as individual values.
- The boxplots were censored at the DL (Helsel 2005) using the maximum DL if multiple detection limits exist within the dataset. Concentrations below the DL were represented by open symbols at half the DL. The approximate proportion (e.g., <25% or 25% to 50%) of concentrations below DL can be determined by the sections of the boxplot that are censored (and are reported in Attachment 2).

The purpose of these boxplots was to provide a visual representation of the available fish tissue chemistry data in an exploratory format and to identify obvious changes in tissue chemistry. Subdivision of the data by species, sample type, location and year produced a substantial number of boxplots. The boxplots are not considered to be a statistical analysis, but are provided to facilitate a visual inspection of the data. When summarizing the observations from the data, if the boxplots overlapped between reference and exposed sites, this was taken to indicate that the populations were similar. When boxplots did not overlap, this was considered an indication that the populations may be different. Preliminary observations included:

- Boxplots were not created for a number of fish species and/or sites because there was insufficient samples. As noted above in Section 4.1, the available data was collected opportunistically, and as a result, some of the data are insufficient to draw conclusions about metal concentrations for a given location or species.
- Beryllium and lithium concentrations were below DL in greater than 50% of samples in all species, while chromium, lead, nickel, and vanadium were below DL in greater than 50% of samples in many fish species. From a statistical perspective, a large proportion of non-detectable values means that further detailed analysis is unlikely to be defensible. From a toxicological perspective, a large number of non-detectable values in multiple species, and in both reference and exposed locations, suggests that bioaccumulation of those specific metals is limited.
- Silver and titanium were only analyzed for a small subset of samples submitted to the laboratory by BC MoE in 2014; therefore, no comparisons could be made for these metals (and no boxplots were created).

4.2.3 Regression Analysis

Censored boxplots are presented for mercury and selenium in Attachment 2. A linear regression analysis for tissue concentration against fish length as a covariate was conducted (Attachment 4). Regression plots were created in Excel; outliers were removed if the standardized residual was >3. A statistical significance, or P-value (P), of <0.1 was used to identify statistically significant regression relationships. The purpose of performing the regression analyses was to account for variability in fish size as potential source of bias in the comparison of fish tissue chemistry. Both selenium and mercury have the potential to biomagnify in the food web and differences in fish size could reflect differences in fish diet that could influence the apparent difference (or lack thereof) in the comparison between exposure and reference sites. A statistically significant regression relationship between fish length and metal concentration supports the conclusion that differences in fish size would need to be considered as a potential bias. If the size of fish collected overlap, and the regression is significant, the magnitude of the difference between exposure and reference (or between years) in metal concentrations is determined visually by examining the regression plots (Attachment 4). If the size of the fish collected do not overlap between groups, differences in mercury and selenium concentrations cannot be fully assessed. If the size of the fish do overlap, but the regression was not significant, the magnitude of the difference between exposure and reference (or between years) in metal concentrations is determined visually by examining the censored boxplots (Attachment 2), and/or by consideration of the magnitude calculations. General observations of the regression analyses include:

- The mercury-length regression was most often significant in muscle and whole-body tissue samples of piscivorous species (e.g., lake trout and northern pikeminnow). In some instances, mercury-length regressions were also significant in liver and kidney tissue samples of these species.
- The selenium-length regression was not significant in the majority of species and tissue types; selenium-length regressions were only significant in kokanee (muscle, liver and ovary from reference sites only), lake trout (only in kidney tissue), northern pikeminnow (whole body from reference sites only), and sockeye (muscle, and whole body from reference sites only).
- Of those regressions that were significant, both mercury and selenium relationships were positive for the majority of analyses, with the exceptions of kokanee (ovary, exposure sites only), northern pikeminnow (whole body, exposure sites only), and sockeye salmon (muscle, reference sites only).
    - The mercury-length regression relationships were significant (P <0.1) at one or more sites in kokanee (2014 muscle and ovary), lake trout (all years, muscle, liver, and kidney), largescale sucker (2015 muscle), northern pikeminnow (2014 whole body), rainbow trout (all years, muscle, liver and kidney), and sockeye salmon (2014, muscle liver, and whole body).
    - The selenium-length regression relationships were significant (P<0.1) at one or more sampling sites in kokanee (2014 liver and ovary, 2014 and 2015 muscle), lake trout (2015 kidney), northern pikeminnow (2014 whole body), and sockeye salmon (2014 muscle, liver and whole body).
- A regression analysis for peamouth chub collected in 2015 was not conducted because fish length data were not available.

These observations highlight that a definitive conclusion about whether or not mercury or selenium have increased in fish tissue in the study area as a result of the tailings deposit will need to consider the site-specific ecology in the context of the variability between tissues, species, and sites. This level of analysis would typically be conducted in the detailed quantitative risk assessment. Boxplots for selenium and mercury should be considered in this context, and are intended primarily to illustrate if there are gross differences in concentration that would highlight a topic for further evaluation.

4.3 Guideline Comparisons

Fish tissue metal concentrations were compared to provincial and national guidelines when available. There are guidelines for arsenic, mercury and selenium.

- Fish protein is subject to Canadian Food Inspection Agency (CFIA, 2015) guidelines concerning the sale of fishery products for human consumption: arsenic concentrations must be below 3.5 mg/kg ww for human consumption. Golder notes that the Health Canada guideline for protein concentrate is being used to screen intact fish tissues; therefore, it is used for preliminary comparisons only.
- The CFIA and Health Canada guidelines state that fish collected for commercial use may contain a maximum of 0.5 mg/kg ww mercury to be approved for human consumption (CFIA 2015).
- The BC MoE (2014) in collaboration with the Ministry of Health recommended screening values for selenium concentrations in fish for human consumption. The screening values are 7.3 ug/g dw for subsistence consumers, 14.5 ug/g dw for the general population and 75 ug/g dw based on the recommended two servings of fish per week.
- BC MoE also contains tissue-based guidelines for selenium for fish ovary, whole body and muscle (BC MoE 2016) for environmental protection: 11 mg/kg dw for fish ovary and 4 mg/kg dw for whole body and muscle. For the purposes of comparison to the BC MoE guideline, selenium data are presented in mg/kg dw herein. All other metal concentrations are presented in mg/kg ww. From a toxicological perspective, the preferred tissue for evaluating the potential for adverse effects to fish populations will be eggs and ripe ovary tissues (McDonald and Chapman 2007l Janz 2012). BCMOE (2014) derived the guideline of 11 mg/kg dw by applying a 2-fold safety factor to a toxicological effects threshold of approximately 22 mg/kg dw observed for cold-water salmonids such as rainbow trout. This guideline is intended to provide a protective screening value in the absence of a detailed site-specific evaluation. Golder notes that the approach for deriving site-specific science-based benchmarks for quantitative risk assessment of selenium is an evolving topic.

The proportion of samples above guidelines is reported by species (including all species for which data are available) and tissue type. The primary comparison for arsenic and mercury is for muscle tissue because this sample type is the most frequently consumed portion of the fish. However, liver and kidney may be consumed by some populations, and therefore, Golder has conservatively retained those comparisons in this data summary. General observations regarding the number of exceedances of these guideline values are as follows.

- There were no arsenic guideline exceedances observed in lake trout, peamouth chub, rainbow trout, or sockeye salmon from the study area in 2014 or 2015. There was one burbot liver sample (Quesnel Lake Hazeltine Creek Confluence, collected in 2014) with an arsenic concentration of 5.1 mg/kg ww.
- Mercury concentrations exceeded the CFIA guideline of 0.5 mg/kg ww in 30 fish tissue samples collected from the study area in 2014, and in 19 samples collected from the study area in 2015 (Table 4). Some of these exceedances occurred in fish from the reference areas. Mercury concentrations that were greater than the CFIA mercury guideline in 2014 ranged from 0.506 to 2.5 mg/kg ww. This does not necessarily imply a risk to human health: fish consumption advisories consider both the magnitude and frequency of exceedances using an aggregate measure of fish consumption over time.

Table 4: Summary of Mercury Tissue Exceedances

Year	Species	Location	Type and Number
2014	Burbot	Quesnel Lake Horsefly River Confluence (exposure)	1 of 1 muscle
	Burbot	Quesnel Lake Hazeltine Creek Confluence (exposure)	4 of 12 muscle and 2 of 12 liver samples
	Lake trout	Quesnel Lake Hazeltine Creek Confluence (exposure)	5 of 51 muscle, 15 of 51 liver, and 1 of 33 ovary sample
	Rainbow trout	Quesnel Lake near Quesnel River (exposure)	1 of 2 muscle and 1 of 2 liver sample
2015	Burbot	Quesnel Lake East (reference)	1 of 7 muscle
	Lake trout	Quesnel Lake Hazeltine Creek Confluence (exposure)	1 of 10 muscle, 1 of 10 liver, and 2 of 9 kidney
	Lake trout	Quesnel Lake East (reference)	1 of 10 muscle, 2 of 10 liver, and 5 of 10 kidney
	Rainbow trout	Trio Lake (reference)	1 of 8 muscle, 2 of 8 liver, and 3 of 8 kidney

Selenium concentrations that exceed the BC MoE screening values for the protection of First Nation subsistence consumers and the general population are outlined in Table 5. The screening value for the protection of First Nation subsistence consumers of 7.3 ug/g dw was based on a fish ingestion rate of 220 g/day (Health Canada, 2004). The screening value for the protection of the general population of 17.5 ug/g dw was based on a fish ingestion rate of 111 g/day (Health Canada, 2004). Concentrations of selenium in muscle, liver and ovary tissue were compared to the guidelines. Further input is needed from the Williams Lake and Soda Creek First Nations regarding appropriate fish tissue to consider for local consumption.

Table-5: Summary of Selenium Exceedances in Fish Tissue Samples Compared to Screening Values for the Protection of Human Health.

Guideline	Year	Species	Location	Type and Number
Low Fish Intake (75 mg/kg dw) Recreational Fishers	2014	Rainbow Trout	Bootjack Lake (reference)	2 of 8 liver
		Rainbow Trout	Polley Lake (exposure)	3 of 15 liver
		Rainbow Trout	Quesnel Lake near Quesnel River (exposure)	1 of 2 liver
		Rainbow Trout	Quesnel River (exposure)	1 of 12 liver
		Sockeye Salmon (adult)	Horsefly River (exposure)	8 of 30 liver
		Sockeye Salmon (adult)	Soda Creek (reference)	3 of 30 liver
	2015	Kokanee	Quesnel Lake near Quesnel River (exposure)	1 of 8 liver
		Rainbow Trout	Polley Lake (exposure)	3 of 8 liver
Moderate Fish Intake (14.5 mg/kg dw) General Population	2014	Burbot	Quesnel Lake Hazeltine Creek (exposure)	2 of 12 liver
		Kokanee	Quesnel Lake near Quesnel River (exposure)	10 of 10 liver
		Kokanee	Quesnel Lake North Arm (reference)	10 of 10 liver
		Lake Trout	Quesnel Lake Hazeltine Creek (exposure)	1 of 51 liver
		Rainbow Trout	Bootjack Lake (reference)	6 of 8 liver
		Rainbow Trout	Polley Lake (exposure)	14 of 15 liver

		Rainbow Trout	Quesnel River (exposure)	2 of 3 ovary, 8 of 12 liver, 1 of 12 muscle
		Sockeye Salmon (adult)	Soda Creek (reference)	30 of 30 liver
		Sockeye Salmon (adult)	Horsefly River (exposure)	30 of 30 liver
	2015	Kokanee	Quesnel Lake near Quesnel River (exposure)	8 of 8 liver
		Rainbow Trout	Bootjack Lake (reference)	1 of 8 liver
		Rainbow Trout	Polley Lake (exposure)	8 of 8 ovary, 8 of 8 kidney, 8 of 8 liver
		Rainbow Trout	Quesnel River (exposure)	6 of 8 liver
		Rainbow Trout	Trio Lake	8 of 8 liver
		Sockeye Salmon (juvenile)	Quesnel Lake East (reference)	1 of 3 liver
		Sockeye Salmon (juvenile)	Quesnel Lake North Arm (reference)	1 of 3 liver
		Sockeye Salmon (juvenile)	Quesnel Lake Middle (exposure)	1 of 4 liver
		Sockeye Salmon (juvenile)	Quesnel Lake West (exposure)	1 of 7 liver

Guideline	Year	Species	Location	Type and Number
High Fish Intake (7.3 mg/kg dw) First Nation Subsistence	2014	Burbot	Quesnel Lake Hazeltine Creek (exposure)	1 of 8 ovary, 2 of 12 liver
		Kokanee	Quesnel Lake Quesnel River (exposure)	10 of 10 liver
		Kokanee	Quesnel Lake North Arm (reference)	10 of 10 liver
		Lake Trout	Quesnel Lake Hazeltine Creek (exposure)	36 of 51 liver
		Longnose Sucker	Polley Lake (exposure)	3 of 16 whole body
		Mountain Whitefish	Quesnel Lake Hazeltine Creek (exposure)	3 of 3 ovary, 3 of 4 liver
		Rainbow Trout	Bootjack Lake (reference)	1 of 1 ovary, 8 of 8 liver
		Rainbow Trout	Polley Lake (exposure)	1 of 2 ovary, 14 of 15 liver
		Rainbow Trout	Quesnel Lake near Quesnel River (exposure)	2 of 2 liver
		Rainbow Trout	Quesnel River (exposure)	3 of 3 ovary, 10 of 12 liver, and 1 of 12 muscle
		Sockeye Salmon (adult)	Horsefly River (reference)	30 of 30 liver
		Sockeye Salmon (adult)	Soda Creek (reference)	4 of 30 ovary, 30 of 30 liver
		Sockeye Salmon (juvenile)	Quesnel Lake North Arm (reference)	3 of 3 liver
		Sockeye Salmon (juvenile)	Quesnel Lake Middle (exposure)	1 of 3 liver
		Sockeye Salmon (juvenile)	Quesnel Lake West (exposure)	6 of 6 liver
	2015	Burbot	Quesnel Lake Hazeltine Creek (exposure)	1 of 1 ovary
		Kokanee	Quesnel Lake Quesnel River (exposure)	8 of 8 liver
		Lake Trout	Quesnel Lake Hazeltine Creek (exposure)	2 of 9 kidney, 1 of 10 liver
		Lake Trout	Quesnel Lake East (reference)	3 of 10 kidney, 2 of 10 liver
		Rainbow Trout	Bootjack Lake (reference)	7 of 8 liver
		Rainbow Trout	Polley Lake (exposure)	8 of 8 ovary, 8 of 8 kidney, 8 of 8 liver
		Rainbow Trout	Quesnel River (exposure)	1 of 1 ovary, 7 of 8 kidney, 8 of 8 liver
		Rainbow Trout	Trio Lake	3 of 8 kidney, 8 of 8 liver
		Sockeye Salmon (juvenile)	Quesnel Lake North Arm (reference)	3 of 3 liver
		Sockeye Salmon (juvenile)	Quesnel Lake Middle (exposure)	4 of 4 liver
		Sockeye Salmon (juvenile)	Quesnel Lake West (exposure)	7 of 7 liver
		Sockeye Salmon (juvenile)	Quesnel Lake East (reference)	3 of 3 liver

Note: Samples from Polley Lake rainbow trout in 2015 are potentially anomalous.

Selenium concentrations that exceed the BC MoE guideline for Environmental Protection are outlined in Table 6. Selenium concentrations in 2014 exceeded BC MoE guidelines in 4 ovary samples (12.6 to 18.1 mg/kg dw), 3 muscle samples (4.3 to 18.1 mg/kg dw) and 21 whole body samples (4.2 to 8.5 mg/kg dw). Selenium concentrations in 2015 exceeded BC MoE guidelines in 8 ovary samples (19.3 to 55.7 mg/kg dw), 6 muscle samples (4.6 to 6.9 mg/kg dw) and 1 whole-body sample (4.1 mg/kg dw). Data from eight rainbow trout collected from Polley Lake in the spring of 2016 were also analyzed on a rush basis. Selenium concentrations in these 2016 fish exceeded or met BC MoE guidelines in 3 ovary samples (11 to 14.2 mg/kg dw). Data from other tissues, species and sampling locations are still being processed by the analytical laboratory. Further validation of the 2015 rainbow trout ovary samples is being conducted by the analytical laboratory in light of the potential anomaly (i.e., ovary concentrations in Polley Lake rainbow trout are substantially higher in 2015 than in either 2014 or 2016). Additional context about the potentially anomalous data is provided below in Section 5.3.2.

Table 6: Summary of Selenium Tissue Exceedances for Environmental Protection

Year	Species	Location	Type and Number
2014	Longnose sucker	Polley Lake (exposure)	1 of 1 muscle
	Rainbow trout	Polley Lake (exposure)	1 of 15 muscle and 1 of 2 ovary
	Rainbow trout	Quesnel River (exposure)	1 of 12 muscle and 3 of 3 ovary
	Rainbow trout	Quesnel Lake near Quesnel River (exposure)	1 of 2 muscle
	Longnose Sucker	Polly Lake (exposure)	16 of 16 whole-body
	Northern Pikeminnow	Quesnel Lake Hazeltine Creek Confluence (exposure)	2 of 36 whole-body
	Northern Pikeminnow	Quesnel Lake Horsefly River Confluence (exposure)	1 of 10 whole-body
	Northern Pikeminnow	Quesnel Lake North Arm (reference)	1 of 31 whole-body
	Rainbow trout	Polly Lake (exposure)	1 of 3 whole-body
2015	Largescale Sucker	Quesnel Lake Hazeltine Creek Confluence (exposure)	1 of 8 muscle
	Peamouth Chub	Quesnel Lake Hazeltine Creek Confluence (exposure)	1 of 8 whole-body
	Rainbow trout	Polley Lake (exposure)	5 of 8 muscle and 8 of 8 ovary
2016	Rainbow trout	Polley Lake (exposure)	3 of 8 ovary

Note: Additional fish tissue samples from 2016 are being analyzed. Ovary samples from Polley Lake rainbow trout in 2015 are potentially anomalous.

5.0 FURTHER EVALUATION OF SELECTED SPECIES AND METALS

5.1 Risk Assessment and Toxicological Context

As noted in Section 2, fish tissue chemistry data were reviewed in further detail for selected combinations of metals and fish species and/or sample types to provide early context for how the data will be integrated into the ecological and human health risk assessment. The risk assessment focuses on evaluating source, exposure pathways and receptors that are retained for quantitative analysis at the completion of the problem formulation. Fish tissue chemistry data would typically be used to develop a realistic, worst-case exposure estimate for each receptor being evaluated. This receptor-specific evaluation means that different parts of the fish tissue chemistry data set would be used for each receptor, depending on a variety of factors such as fish ecology, variability in the data, and the strength of association between the chemistry data and the underlying assessment endpoint. Ultimately, fish tissue can be used as part of the following three measurement endpoints:

- Bioaccumulation by fish – Increased accumulation of metals in fish tissue can cause adverse effects to the fish themselves.
- Consumption of fish by humans --- Increased metals concentrations in muscle samples from large bodied fish caught for recreation or sustenance can contribute to risks to human receptors. Further input is needed from the Williams Lake and Soda Creek First Nations regarding appropriate fish tissue to consider for local consumption.
- Consumption of fish by ecological receptors – Increased metals concentrations in whole-body samples from smaller fish can contribute to risks to piscivorous fish and wildlife. Increased metals concentrations in muscle or organ samples can also contribute to increased risk to higher trophic level wildlife such as bears or raptors which might preferentially feed on these parts of this fish instead of consuming the whole body.

Metal uptake varies among fish species and tissue types, and is dependent upon source (i.e., exposure from the water, food, or both), environmental conditions (e.g., water temperature, pH, hardness), exposure frequency, exposure duration (i.e., acute or chronic), and tissue function (e.g., storage versus elimination capacity). Key factors that need to be considered in the risk assessment in terms of selecting specific fish species or tissue types to generate the realistic worst-case exposure estimates include:

- For metals that have the potential to biomagnify (e.g., mercury and selenium), fish age, size, or trophic level will influence tissue concentrations (Jezierska and Witeska 2006). Food-borne metal concentrations will have larger influences on exposure than the concentrations of these metals in the water (Wood et al. 2012).Trophic level is important in selecting species for monitoring and evaluating exposure scenarios.
- For nutritionally essential metals (e.g., copper, selenium, and zinc), physiological mechanisms exist for uptake of the metals from the environment and depuration, because they are required in trace amounts for biological life (i.e., due to their participation in metabolic reactions; Jeffrey 2001 in Wood et al. 2012).
- Some metals are known to accumulate to a greater degree in specific tissues. In some instances, tissue-specific samples are more relevant for evaluating the potential for direct effects to fish than muscle tissue or whole-body samples. Some general considerations include:
  - Arsenic –- The potential for arsenic to be taken up from the water may be substantially different among fish species, varying by orders of magnitude (Wood et al. 2012). Upon uptake by fish, arsenic tends to accumulate primarily in liver, and to a lesser degree in the muscle and kidney tissue (Oladimeji et al. 1979 in Wood et al. 2012).

- Cadmium – Cadmium is rapidly absorbed in fish first by the liver, and then by the kidney (Chowdhury et al. 2003 in Wood et al. 2012); however, the primary organ for long-term storage of cadmium in fish is the kidney. Cadmium has also been shown to accumulate in the gills and intestine, but not significantly in muscle tissue (Wood et al. 2012).
- Copper – Copper primarily accumulates in the liver, accounting for 40%-90% of whole-body copper concentrations in fish (Miller et al., 1992; 1993).
- Mercury - Mercury is primarily accumulated in muscle tissue of fish; however, mercury accumulates first in the gills, intestine, kidney, and liver tissues following water- or food-borne exposures. Mercury is incorporated into the tertiary structure of proteins, so is not easily depurated over time.
- Selenium - Fish primarily accumulate selenium in the liver and kidney, followed by the ovary, muscle and bone (Muscatello et al. 2006 in Wood et al. 2012); however, the most important organ with respect to fish health is the ovary. This is because selenium is maternally transferred to developing eggs, leading to toxicity to developing larvae (BC MoE 2016).

- Fish mobility (i.e., home range size) will also influence bioaccumulation. Fish with large home ranges may avoid impacted areas and thereby reduce their overall exposure. Some species (i.e., adult sockeye salmon) are transitory and would only be in contact with impacted waters as they migrate to their natal streams. Salmon are unlikely to be feeding during their migration which will further reduce their dietary exposure. Conversely, fish with small home range sizes (e.g., small-bodied fish) are more likely to remain in direct contact with the impacted area, and therefore, their exposure will be more closely linked to the water-borne and dietary exposure conditions within their home range. If a fish was captured from an immediately impacted area (e.g., Quesnel Lake at the Hazeltine Creek confluence), they will most reflect the conditions of exposure in that area if they have a small home range size.

5.2 Selection of Representative Fish Species and Locations

For the purposes of this preliminary evaluation, Golder selected a subset of fish species for which there were adequate data (e.g., at least 8 samples in both exposure and reference sites; sampled in both years) and focused on species that represent small-bodied fish that are more likely to reflect local conditions and large bodied fish that likely reflect exposure in a larger area and are valued for human consumption. The following species were selected:

- Peamouth chub and juvenile sockeye salmon were selected as a representative small-bodied fish that are expected to occupy a smaller home range (relative to large-bodied fish such as lake trout or rainbow trout) and would be consumed by piscivorous fish. Definitive data regarding peamouth chub home range size are not currently available, but literature supports this assumption (e.g., Environment Canada 1995). There is also an adequate number of peamouth chub samples from both exposed and reference sites in both years. Juvenile sockeye salmon were also considered to occupy a smaller home range, although they move from their spawning habitats out in to the open lakes as they mature.
- Lake trout and rainbow trout were selected as representative larger-bodied fish that are likely to be consumed by humans (and potentially, by large piscivorous wildlife). There are also adequate numbers of lake trout and rainbow trout samples from both exposed and reference sites in both years.
- Adult sockeye salmon were excluded because the duration and frequency of their time in impacted areas is limited to migration back to their natal streams. Feeding during this time is expected to be minimal. Juvenile sockeye are included because they would be residents within the study area and are of concern to many stakeholders.

The primary focus of the comparison was between locations that shared a similar ecology. For example, fish samples from Polley Lake were compared to samples from Bootjack Lake or Trio Lake. Fish samples from exposed sites in Quesnel Lake were compared to reference sites in Quesnel Lake.

5.3 Findings

5.3.1 Consumption by Humans

Figure 2 provides a summary of the available boxplots for specific metals in the muscle samples from large-bodied fish species. As described above, lake trout, rainbow trout and juvenile sockeye salmon were identified as a reasonable surrogate for the preliminary consideration of this pathway. Individual boxplots with pair-wise comparisons for different sites, species and years are provided in Attachment 2. The purpose of Figure 2 is to highlight whether there are obvious changes in metal accumulation between reference and exposed sites, or between years that would indicate that there has been a change in tissue concentrations. In brief, results are summarized as follows:

- Arsenic concentrations in muscle samples were variable among reference and the exposed sites. Samples from Polley Lake rainbow trout appeared to be similar to Bootjack and Trio Lake rainbow trout, as well as rainbow trout collected from Hazeltine Creek prior to the release of tailings. The boxplots for rainbow trout and lake trout caught in exposed sites in Quesnel Lake overlapped with the boxplots for lake trout collected from the reference sites in Quesnel Lake, indicating that there was not a significant increase in fish tissue concentrations observed. All measured concentrations were less than the tissue guideline.
- Copper concentrations in muscle samples were similar among reference and exposed sites.
- Mercury concentrations in muscle samples appeared to be similar between exposed sites and reference sites. The maximum observed concentrations were observed in Trio Lake[3] and Quesnel Lake (East) which were sampled as reference areas. About 10% lake trout muscle samples from both exposed and reference areas of Quesnel Lake had tissue concentrations that exceeded the muscle tissue guideline for the protection of human health.
- Selenium concentrations in rainbow trout muscle from 2015 Frypan Creek (tributary to Polley Lake) were frequently higher than the tissue guideline for environmental protection, and appear to be elevated relative to the applicable references sites (i.e., Bootjack Lake, Trio Lake). These samples are part of the same certificate of analysis as the anomalous ovary data and data validation has not yet been completed. The selenium concentrations measured in Frypan Creek rainbow trout muscle did not exceed the screening value for First Nation subsistence fish consumers. Selenium concentrations in Polley Lake rainbow trout muscle appear similar to those observed in Hazeltine Creek rainbow trout, which were collected prior to the release of tailings.
- Zinc concentrations in muscle tissue appeared to be generally consistent between exposed and reference sites, and were also lower than the median concentrations measured in Hazeltine Creek rainbow trout, which were collected prior to the release of tailings.

[3] Based on the metals concentrations found in fish tissue from Trio Lake, it was observed that Trio Lake should be reviewed as a reference location

5.3.2 Bioaccumulation by Fish

Figure 3 to 5 provide summaries of the available fish tissue chemistry data for organ-specific samples presented as censored boxplots for the specific metals identified. Individual censored boxplots showing comparisons of exposure and reference sites, species and years are provided in Attachment 2. The purpose of the five summary figures presented herein is to highlight changes in metal concentrations between reference and exposed sites, or between years in tissues that have been associated with metal accumulation. In brief, results are summarized as follows:

- For arsenic and copper, liver concentrations were generally consistent between the exposed and reference sites (e.g., Polley Lake compared to Bootjack and Trio Lakes; Quesnel Lake (Quesnel River) compared to Quesnel Lake (East)). One potential exception is juvenile sockeye salmon from Quesnel Lake (West) which tended to have higher liver arsenic and copper concentrations than those observed in other species. There are no juvenile sockeye salmon liver samples from reference sites, and therefore, it is not clear whether this is a species-specific difference (i.e., sockeye accumulate more arsenic in their liver than rainbow trout) or a potential site-specific influence. For arsenic in kidney samples, there may be an increased concentration in the exposed site (Quesnel River) compared to the relevant reference site (Quesnel Lake – East). This was not observed in the Polley Lake to Trio Lake comparison. Kidney concentrations were generally consistent for other metals (i.e., boxplots tended to overlap).
- Mercury concentrations in fish liver were variable for both the reference sites and exposed sites. Some of these concentrations exceeded the fish tissue guideline. Liver tissue is not commonly consumed, but Golder would welcome input on this from the Williams Lake and Soda Creek First Nations.
- For zinc, a similar pattern was observed in sockeye salmon livers as was observed for arsenic and copper (i.e., zinc concentrations in juvenile sockeye are higher than those observed in other species). There was no relevant reference site for sockeye salmon. There was no visually evident difference in zinc liver concentrations for the other species. There may be an increase in zinc kidney concentrations based on the lack of overlap in the boxplots for Quesnel River versus Quesnel Lake (East); however, the magnitude of this difference is quite low.
- Concentrations of vanadium in fish liver samples were generally consistent between reference and exposed sites and between 2014 and 2015 and many concentrations were below the detection limit.

A potential anomaly for selenium was identified. Specifically, ovary concentrations in rainbow trout collected from Polley Lake (Frypan Creek) in 2015 showed a substantial increase relative to ovary concentrations in rainbow trout collected from Hazeltine Creek or Bootjack Lake in 2014 (Figure 5). A similar increase was noted in rainbow trout kidney (Figure 4) and muscle samples (Figure 2) for the same individual fish. These data was contained in a single certificate of analysis, and therefore, the analytical laboratory was requested to provide further validation (currently in progress). No obvious calculation errors have been found to this point, and further validation checks are underway. These concentrations were considered potentially anomalous based on the magnitude of the increase, the lack of a similar magnitude of increase in water or fish dietary concentrations, and:

- Consideration of rainbow trout muscle and ovary data for a broader range of dates. Data were assembled from monitoring data collected prior to the tailings release, and a rush analysis was requested for rainbow trout samples collected in the spring of 2016. Figure 7 provides plots of the individual fish concentrations grouped by year and sampling location. The 2015 ovary samples were markedly elevated in the context of both pre-tailings monitoring, as well as two of the three years of post-tailings data. The concentrations in 2015 were not duplicated in the 2016 sampling, despite the fact that a number of the 2016 fish were collected from the same location as those collected in 2015.

- Consideration of the ratio of egg:muscle samples. The ratios of concentrations were calculated for individual fish and are summarized in Figure 8. The median ratio for all rainbow trout (excluding the potential anomalous fish) was 2.2, which is consistent with the median ratio of 2.3 observed for rainbow trout measured from a range of selenium-impacted sites (deBruyn and Costa 2015). The median ratio observed for the potentially anomalous fish (i.e., the eight 2015 rainbow trout from Polley Lake) was 7.9. Although site-specific variation in the ratio would be expected, the magnitude of the departure for the specific subset of potentially anomalous fish relative to the overall population of fish throughout the watershed provides further evidence that the rainbow trout data from 2015 may not be representative of the population as a whole.

Golder is also pursuing the alternative hypothesis that the data from 2015 are valid and potentially representative by expanding on the preliminary analysis summarized in Figures 7 and 8. Notwithstanding the potential for anomalous data in a subset of the available data, Golder recommends further evaluation of long-term trends in selenium concentrations and their potential for adverse effects to aquatic populations because there have been several other rainbow trout with an ovary concentration greater than the guideline value of 11 mg/kg, and a number of muscle or whole-body samples from a variety of species with a tissue concentration greater than the guideline value of 4 mg/kg dw. An exceedance of the generic guideline does not necessarily indicate that there is a risk to fish populations because guidelines are based on a conservative evaluation of the available scientific literature. Toxicological thresholds will vary for different species, and the available rainbow trout ovary concentrations (excluding the potential anomalous data) does not exceed the lowest reported species-specific EC10 value of 21 mg/kg dw cited by BCMOE (2014; various re-analysis of Holm et al 2005). Further evaluation of the potential effects of selenium on aquatic communities will need to consider a variety of field- and laboratory-based lines of evidence and establish that there is a cause-effect relationship between increased selenium in the environment from mine influences and a relevant population-level effect for fish (cf. McDonald and Chapman 2007 for an example of a weight-of-evidence framework designed for selenium).

5.3.3 Consumption by Piscivores

Figure 6 provides a summary of the available boxplots for specific metals in the available whole body peamouth chub and juvenile sockeye salmon samples. As described above, peamouth chub and juvenile sockeye salmon were considered reasonable surrogates for the preliminary consideration of potential risks to piscivorous wildlife. Individual boxplots with pair-wise comparisons for different sites, species and years are provided in Attachment 2. The purpose of this summary figure is to highlight whether there are obvious changes in metal accumulation between reference and exposed sites, or between years that would indicate that this pathway is operable. An operable pathway would require further in-depth evaluation as part of the detailed risk assessment.

Cadmium, mercury and selenium concentrations may be elevated in whole body peamouth chub samples collected from Quesnel Lake at Hazeltine Creek relative to Quesnel Lake in the North Arm, based on the lack of overlap in their boxplots. Conversely, the box plots overlapped for zinc and copper, indicating that the concentrations were similar between exposed and reference fish. This comparison is limited to one exposed site (Quesnel Lake – Hazeltine Creek) compared to one reference site (Quesnel Lake – North Arm).

For juvenile sockeye salmon, arsenic concentrations may be higher in whole body samples from exposed compared to reference and also higher in 2015 compared to 2014. For mercury, a difference in fish length did not allow a comparison between exposed and reference fish. There were no apparent spatial or temporal trends in the whole body concentrations of copper, cadmium, selenium and zinc in juvenile sockeye salmon.

6.0 CONCLUSIONS AND NEXT STEPS

The primary objective of this assignment was to integrate fish tissue data collected by a variety of parties into a single data set, and to complete a basic exploratory analyses of the available data to help determine if there has been a change in metal concentrations in fish as a result of the tailings dam failure. The potential for increased metal concentrations to be present in muscle and whole-body samples is relevant to risks to humans and ecological receptors that feed on fish. Concentrations of metals in liver, kidney or ovary tissues may be a concern for human health if these tissue are consumed, but are generally used to indicate exposure and the potential to lead to chronic effects on fish, either as a result of direct toxicological effects, or as an indirect result as an increased proportion of their metabolic energy is spent on detoxification, storage or excretion processes.

Basic descriptive statistics were calculated and boxplots were visually examined to provide early context about the nature of the available data in light of relevant exposure pathways. Based on this visual examination, Golder concluded:

- Selenium in Polley Lake rainbow trout ovary tissue in 2015 was one of the few metal/tissue combinations that suggest a significant increase in metal accumulation may be present; however, a portion of the data set may be anomalous relative to the preponderance of available selenium tissue data and was not duplicated by data collected in the spring of 2016. Golder recommends further evaluation of long-term trends in selenium concentrations and their potential for adverse effects to aquatic populations. Further effort to determine if the potentially anomalous data are valid is on-going.
- About 10% of lake trout muscle samples from both exposed and reference areas of Quesnel Lake had tissue mercury concentrations that exceeded the muscle tissue guideline for the protection of human health.
- These is some indication that arsenic concentrations may be elevated in liver tissue. There were no exceedances of the Food Directorate guideline observed in muscle tissue samples that would be typically consumed by humans, but there were increases observed in some liver and whole body samples (juvenile sockeye salmon) that suggest concentrations should be monitored over time.
- Whole-body concentrations of mercury and selenium appeared to be elevated in whole body peamouth chub samples collected from Quesnel Lake at Hazeltine Creek relative to Quesnel Lake in the North Arm.
- For copper and vanadium, concentrations in fish tissues did not appear to be different in exposed compared to reference sites.
- For other metal and tissue combinations considered in the above evaluation, this preliminary examination of the data did not reveal a trend.

These observations should be considered in the context of the limitations of the data set. Although a sizeable number of fish have been collected, sampling has been opportunistic and not necessarily connected to a specific hypothesis or study design. Opportunistic sampling has the advantages of providing initial coverage for a wider area with a large number of species, and acts to highlight that bioaccumulation is ultimately based on a large number of inter-dependent species- and location-specific factors. Data are also limited to two years of sampling, even though impacted areas have not necessarily been fully recolonized by aquatic invertebrates that interact directly with deposited tailings and form the base of the food web for the fish community.

The value of this type of a data set is enhanced when it is based on a sampling program that targets specific locations along a representative exposure gradient and focuses on specific species (or functional groups of species) and tissue types with a sufficient number of samples to allow for statistical analysis. A minimum sample size of 8 and a preferred sample size of 20 or more should be considered in future sampling programs to support quantitative statistical analyses. These analyses are central to both the quantitative risk assessment (i.e., a realistic worst-case exposure concentration is typically based on a 95% upper confidence limit of the mean) as well as future monitoring programs (i.e., trends in fish tissue concentrations over time; statistical differences between exposure and reference sites). Sampling effort for reference sites will need to be considered, given that some samples from reference sites were also elevated relative to numerical guidelines.

7.0 CLOSURE

We trust that the information contained in this technical memo is sufficient for your needs at this time. If you have any questions or concerns, please do not hesitate contact us.

FIELD DATA ASSUMPTIONS

1.0 FIELD DATA ASSUMPTIONS

As a result of multiple agencies collecting fish tissue chemistry samples, a number of uncertainties exist regarding details for some of the samples. Where information was uncertain, the following assumptions were made:

- BC MoE data collected on August 9 & 10 2014 was not specific on the sampling location for fish collections, and no effort information could be found for those dates. It was assumed that sampling occurred in the same area that was sampled on August 8 (i.e., near the Hazeltine Creek Confluence).
- BC MoE recorded a sample collected as being “Whitefish”. It was assumed this was a Mountain Whitefish.
- The MPMC sample naming convention was assumed to be in relation to the sampling area (e.g., sample ID “NSC-2, 3 HAZ-2” was sampled near the Hazeltine Creek Confluence). The sampling locations were confirmed with the data sheets wherever possible.
- Any recorded fish lengths that did not have specified fork length or total length were assumed to be fork length, unless the fish species does not have a fork, in which case it is assumed total length (e.g., Burbot).
- Sockeye Salmon lengths and weights were found in an attachment to an ALS sample submission form (i.e., COC); these lengths were assumed to be valid and were used within this technical memo.
- Assumptions were made regarding tissue types collected and submitted for fish tissue chemistry analyses as follows: Largescale Sucker had muscle collected, and Peamouth Chub and Redside Shiner had whole body collected.
- Final age was provided by MPMC and were assumed to be valid; however, age data were not used and are, therefore, not presented.

Units = mg/kg ww except selenium * (i.e., mg/kg dw)

n = sample size; nd = no data collected; < = less than; % > DL = percent of samples greater than detection limit; Min = minimum ; Med = median; Max = maximum; SD = standard deviation; SE = standard error; - = not calculated due to %>DL; -- = not calculated due to small sample size; % = percent

Table 15: Summary Statistics for Kidney Tissues of all Fish Species Captured in the Exposure Sites in 2015

	Polley Lake									Quesnel Lake- Hazeltine Creek									Quesnel Lake- Hazeltine Creek								Quesnel Lake- near Quesnel River								Quesnel River

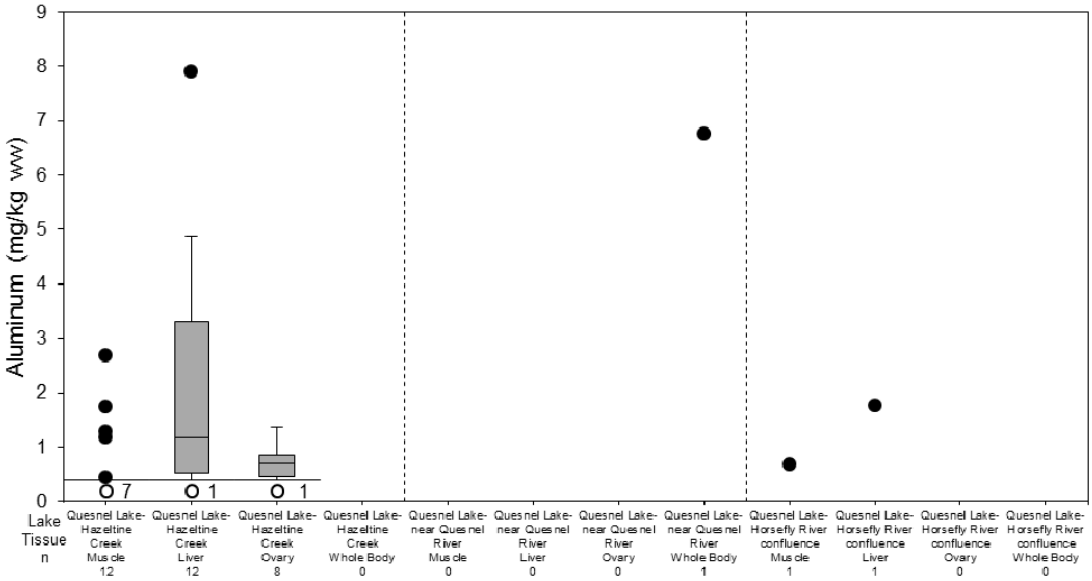
Zinc	-	-	--	-	--	↓(a)(b) -	-	↑(b)	- -	-	↑(e)

(a) muscle tissue only
(b) liver tissue only
(c) kidney tissue only
(d) ovary tissue only
(e) multiple tissue types
(f) whole body
(g) gills
(h) carcass
(i) fish sizes do not overlap or length data is not available, will not be able to compare statistically; result of visual assessment of concentrations (without length consideration) indicated where appropriate
(k) no regression relationship evident with length
DL based on proportion of samples above DL
¯ / - = direction of difference between exposure and reference sites, or 2014 and 2015 data. E.g., - in the EXP vs REF column indicates the exposure site(s) have a greater concentration of metal than the reference site(s) for the given metal, ¯ in the 2014 vs 2015 column indicates 2014 metal concentration is less than the 2015 concentration for the given metal.
- = no difference
-- = insufficient or no data
* The side to which the arrow is placed in the 2014 + 2015 pcolumn indicates which year the difference was observed, if the arrow is placed in the middle, the results were consistent in both years.
NOTE: limited to no data for titanium or silver (not analyzed by the laboratory)

1.0 BURBOT

1.1 Aluminum

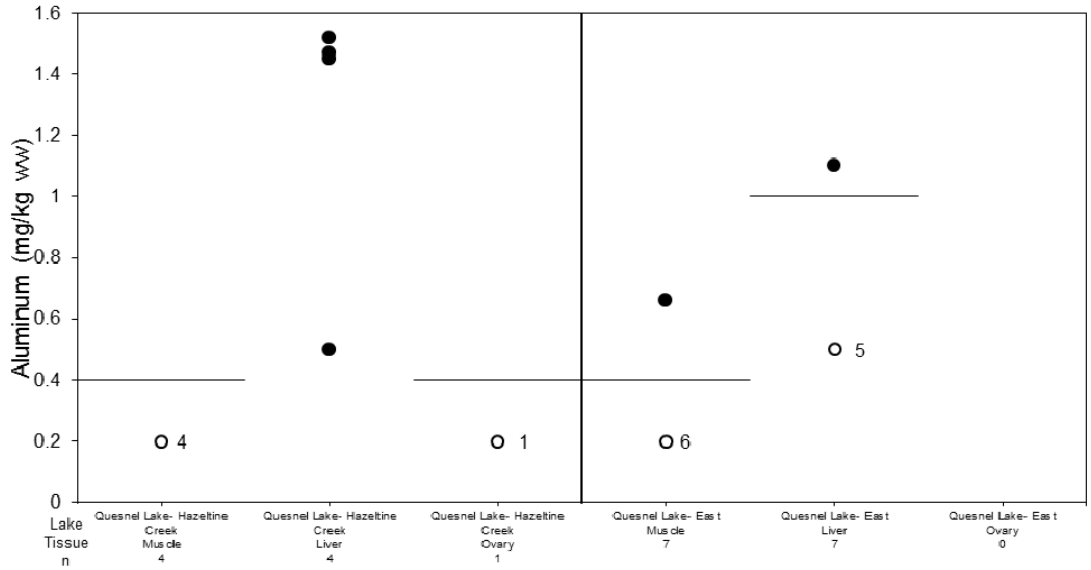
Figure 1: Aluminum Concentrations in Burbot Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

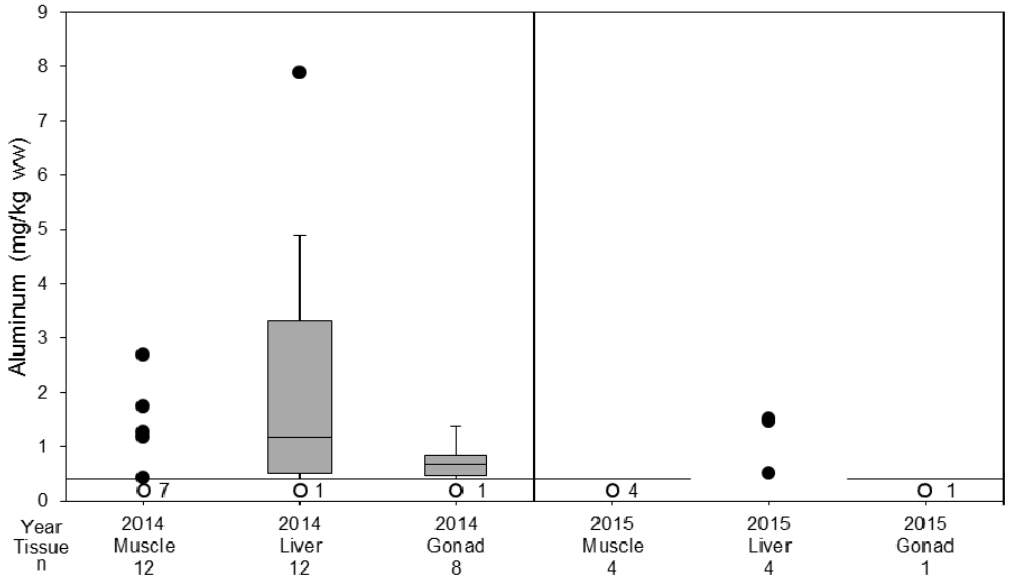
Figure 2: Aluminum Concentrations in Burbot Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 3: Aluminum Concentrations in Burbot Tissues Collected from the Quesnel Lake – Hazeltine Creek Confluence in 2014 and 2015

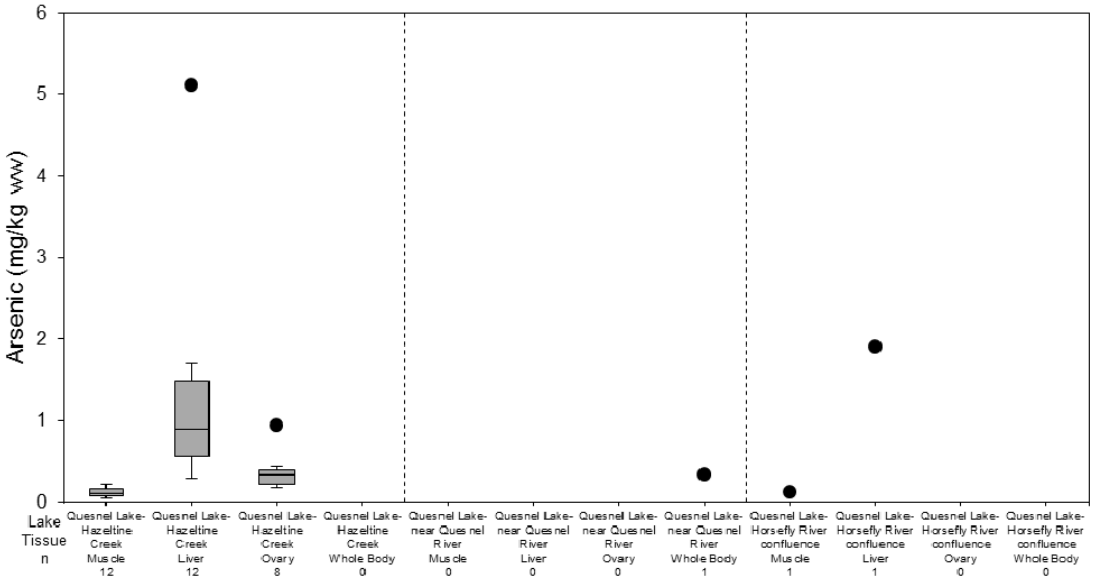


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

1.2 Arsenic

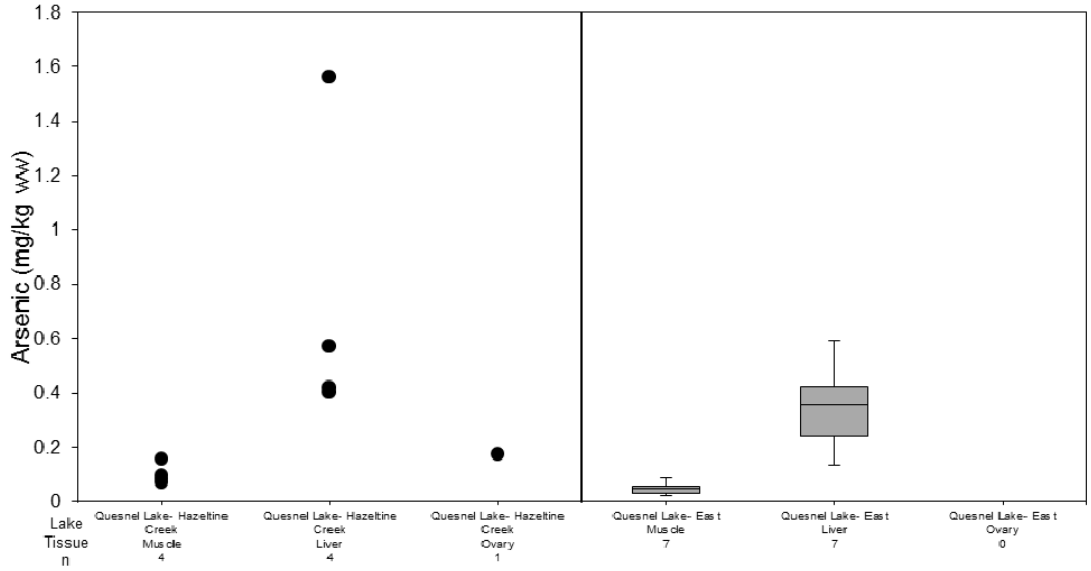
Figure 4: Arsenic Concentrations in Burbot Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

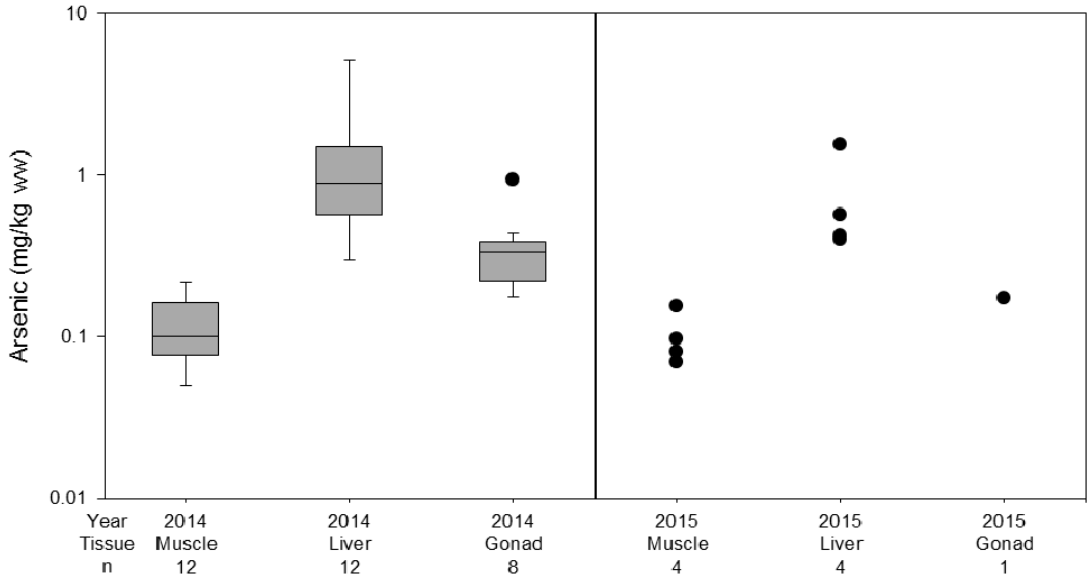
mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 5: Arsenic Concentrations in Burbot Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.
mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

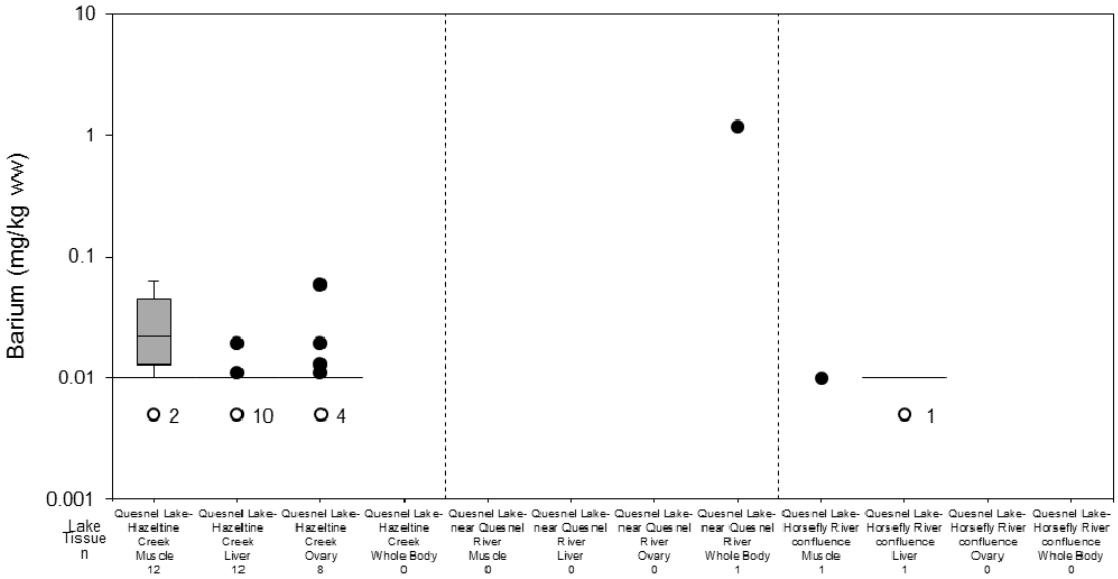
Figure 6: Arsenic Concentrations in Burbot Tissues Collected from the Quesnel Lake – Hazeltine Creek Confluence in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.
mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

1.3 Barium

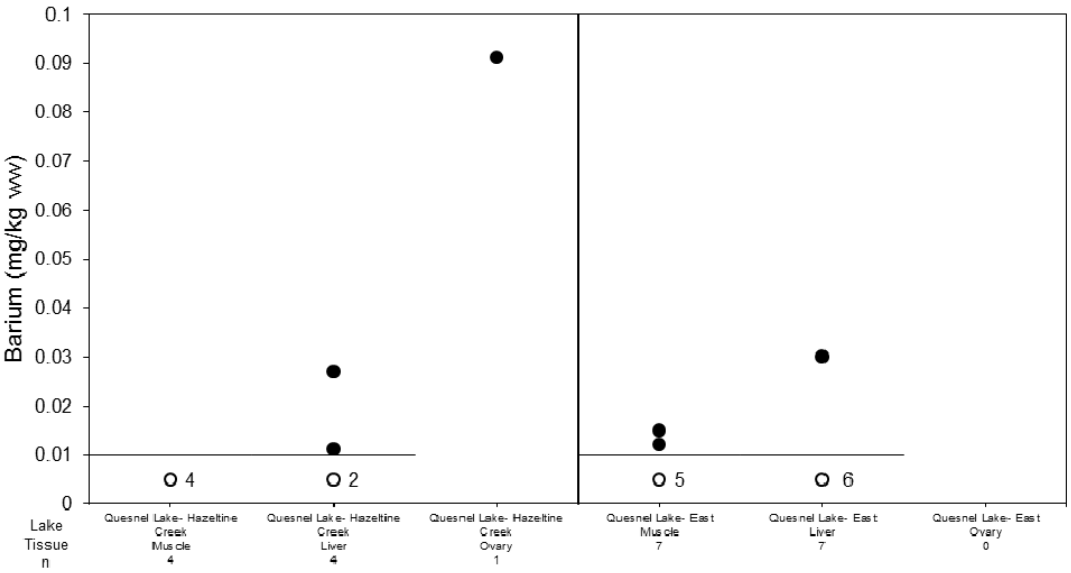
Figure 7: Barium Concentrations in Burbot Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

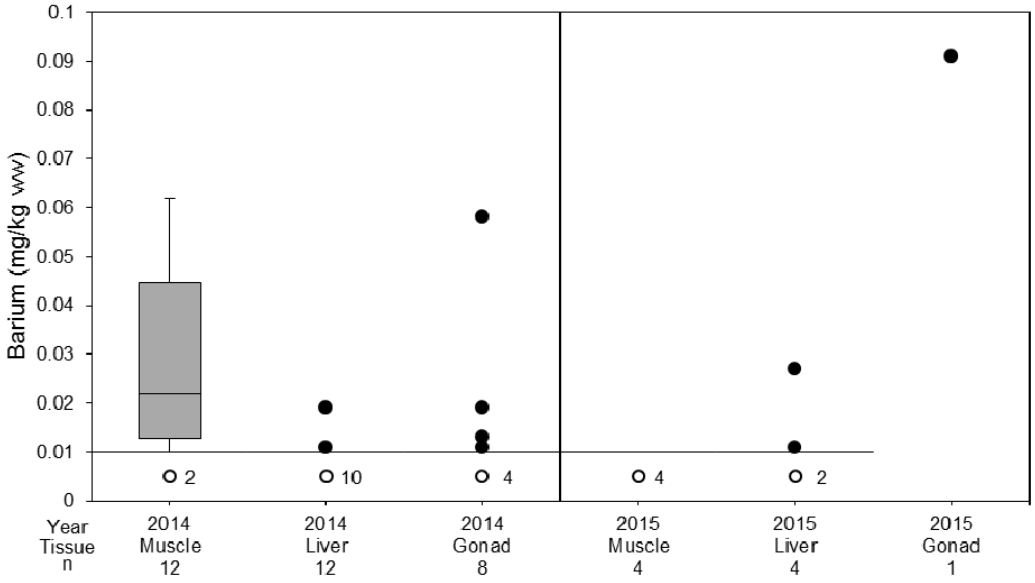
Figure 8: Barium Concentrations in Burbot Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 9: Barium Concentrations in Burbot Tissues Collected from the Quesnel Lake – Hazeltine Creek Confluence in 2014 and 2015

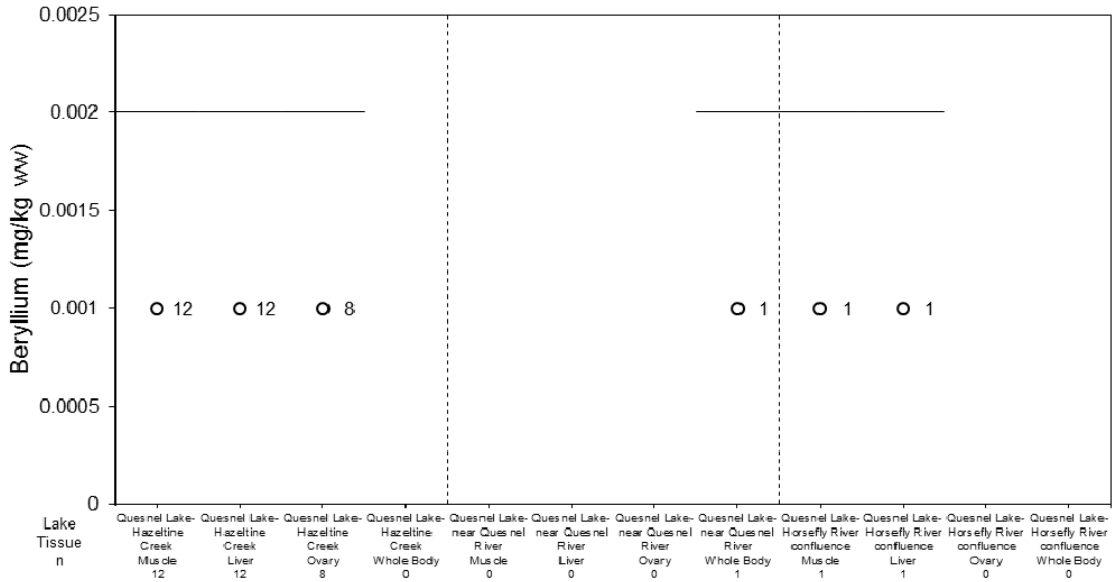


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

1.4 Beryllium

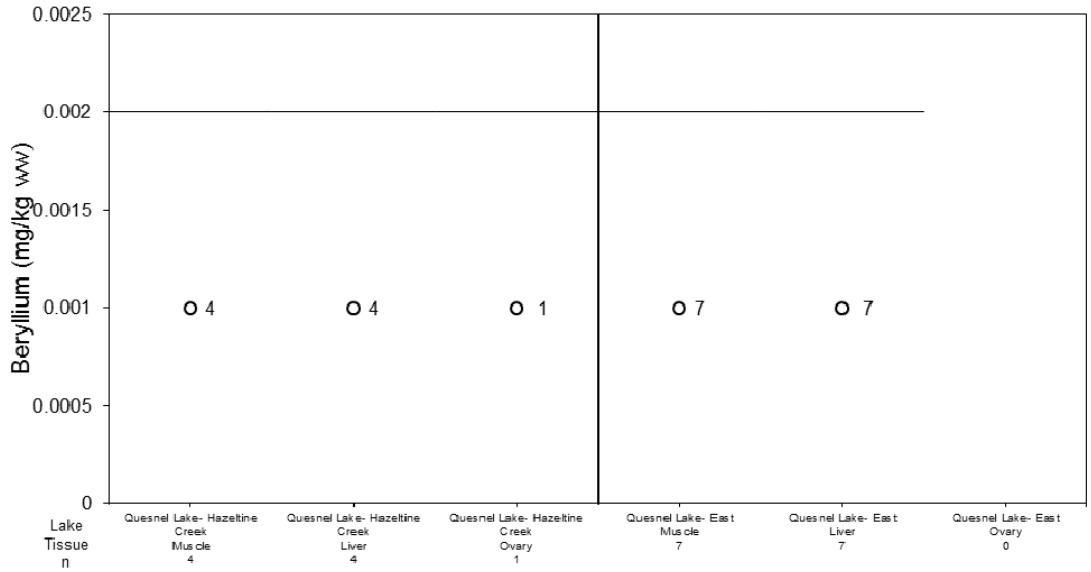
Figure 10: Beryllium Concentrations in Burbot Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 11: Beryllium Concentrations in Burbot Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

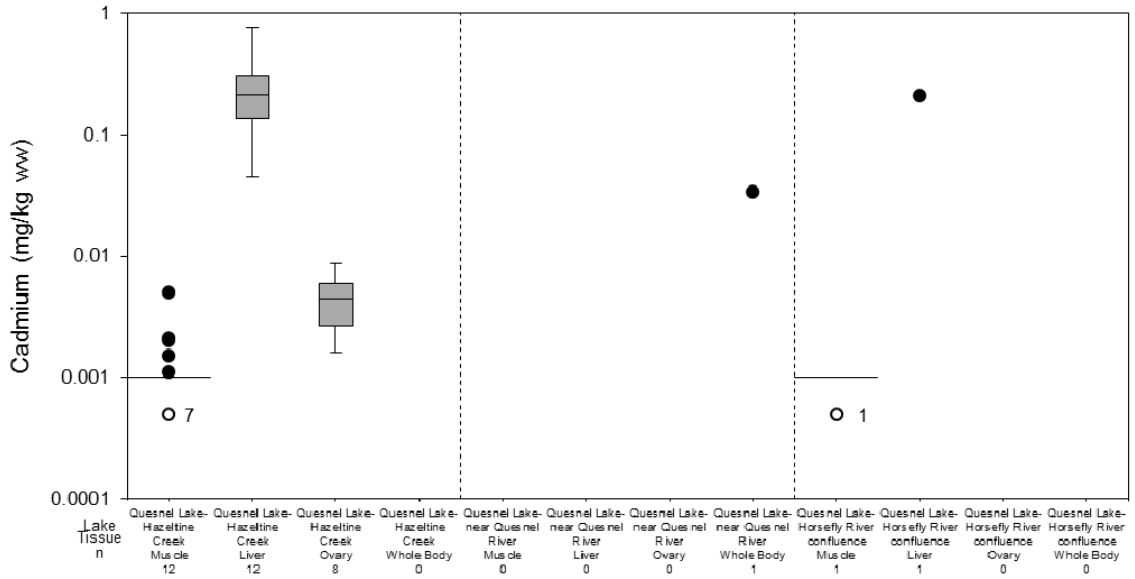
Figure 12: Beryllium Concentrations in Burbot Tissues Collected from the Quesnel Lake – Hazeltine Creek Confluence in 2014 and 2015

Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

1.5 Cadmium

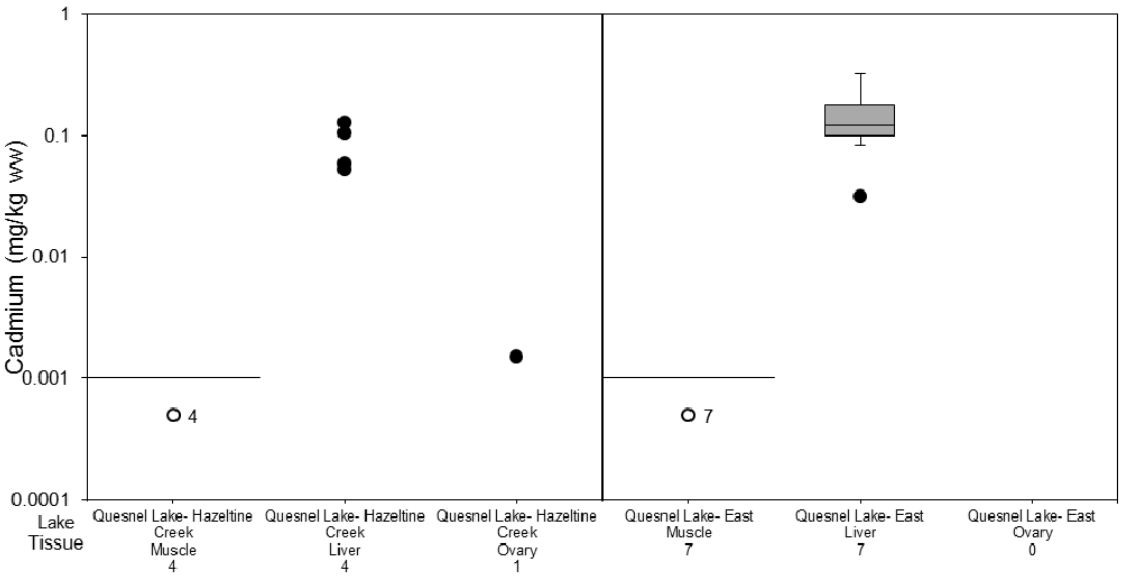
Figure 13: Cadmium Concentrations in Burbot Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

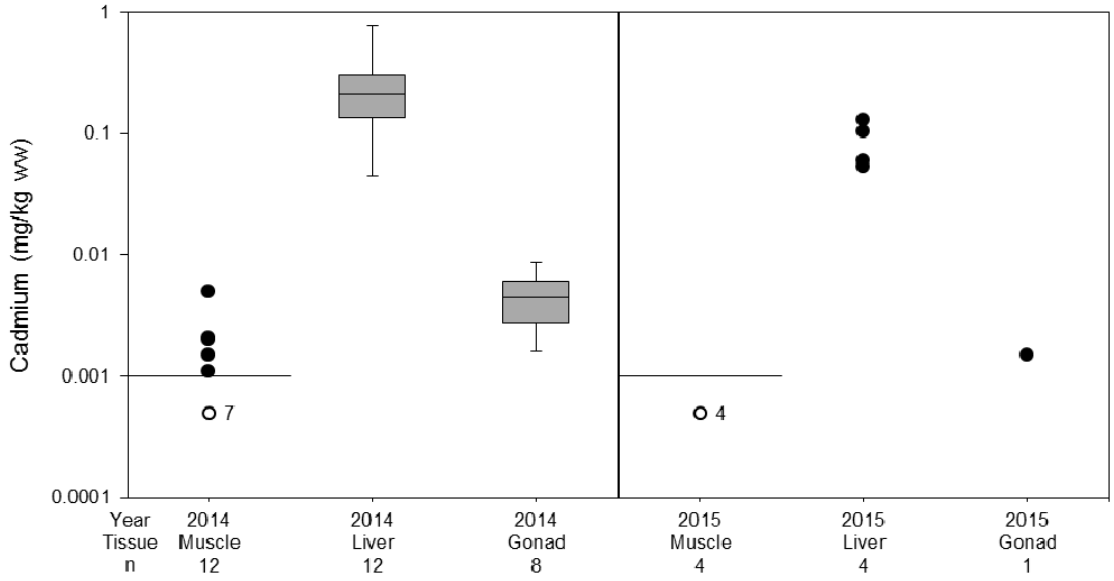
Figure 14: Cadmium Concentrations in Burbot Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 15: Cadmium Concentrations in Burbot Tissues Collected from the Quesnel Lake – Hazeltine Creek Confluence in 2014 and 2015

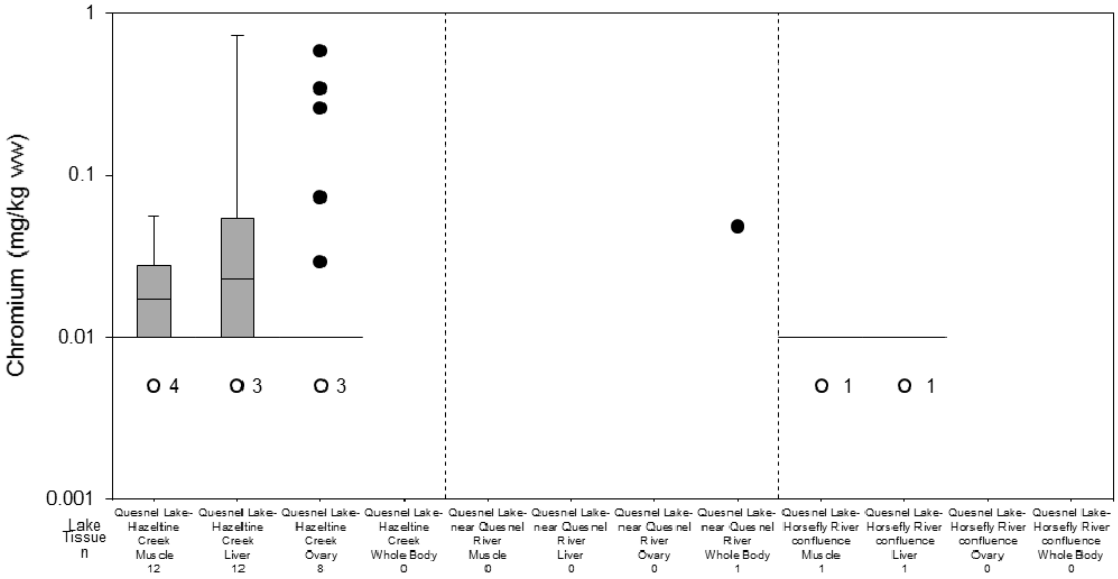


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

1.6 Chromium

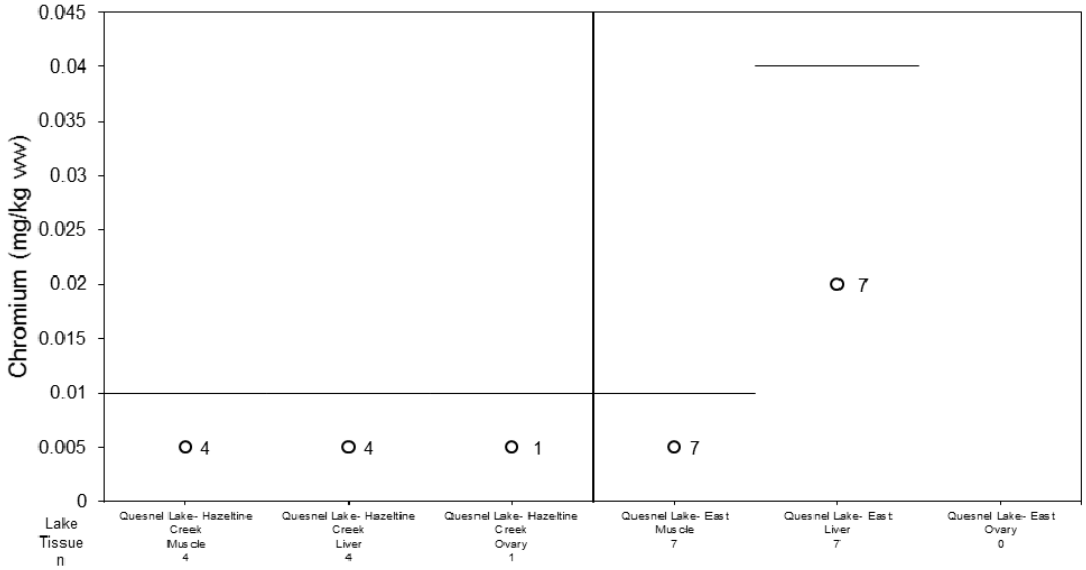
Figure 16: Chromium Concentrations in Burbot Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

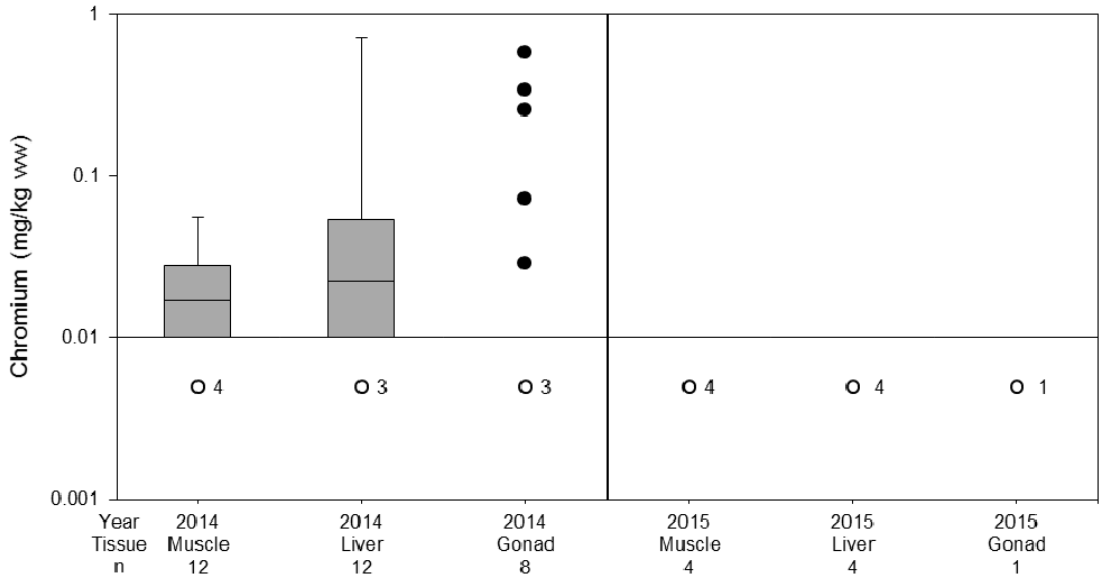
Figure 17: Chromium Concentrations in Burbot Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 18: Chromium Concentrations in Burbot Tissues Collected from the Quesnel Lake – Hazeltine Creek Confluence in 2014 and 2015

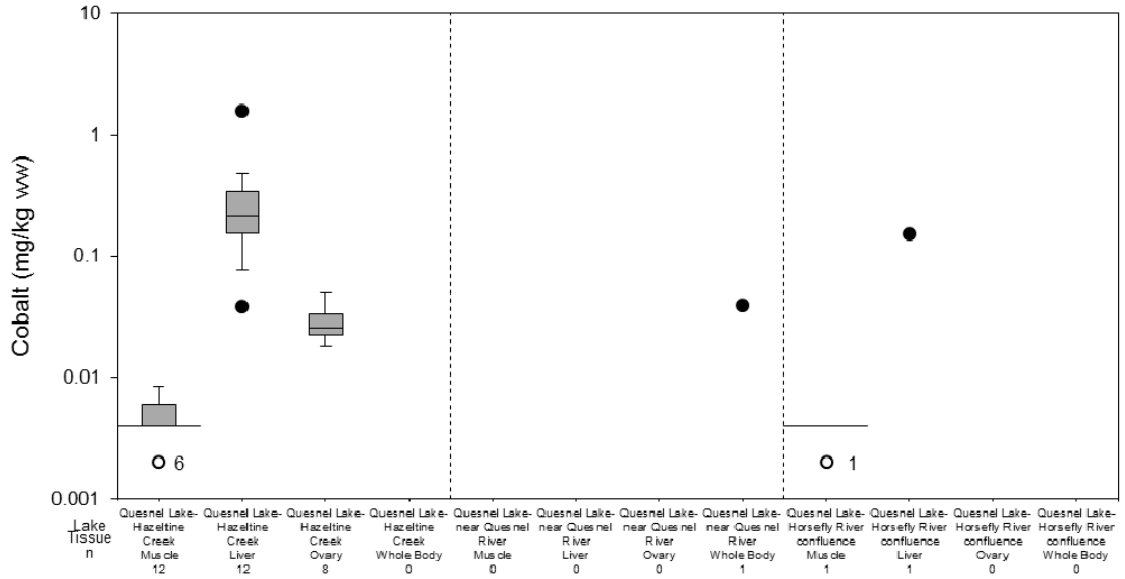


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

1.7 Cobalt

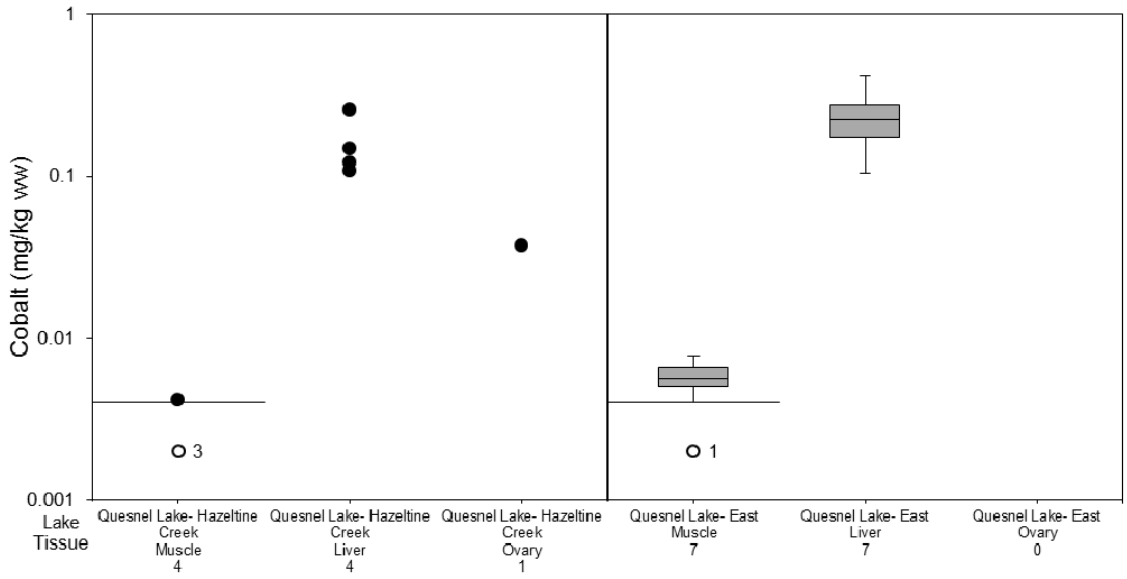
Figure 19: Cobalt Concentrations in Burbot Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

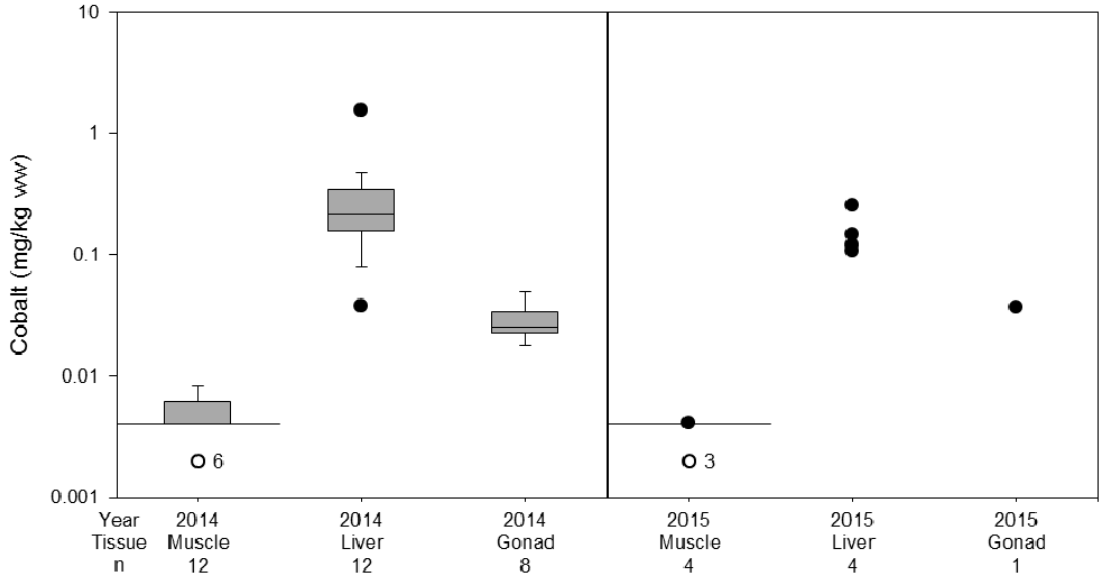
Figure 20: Cobalt Concentrations in Burbot Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 21: Cobalt Concentrations in Burbot Tissues Collected from the Quesnel Lake – Hazeltine Creek Confluence in 2014 and 2015

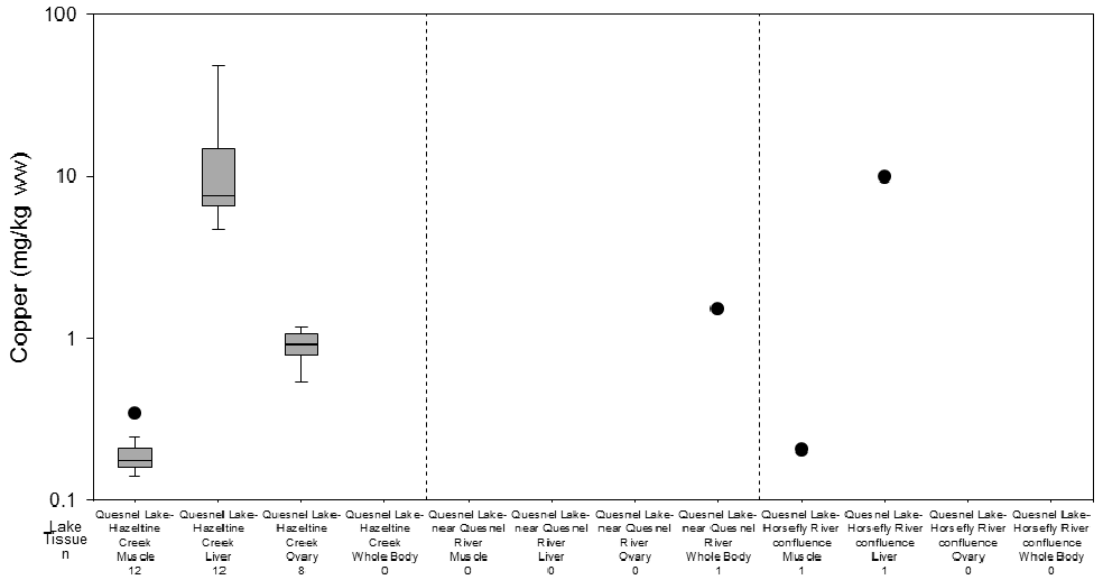


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

1.8 Copper

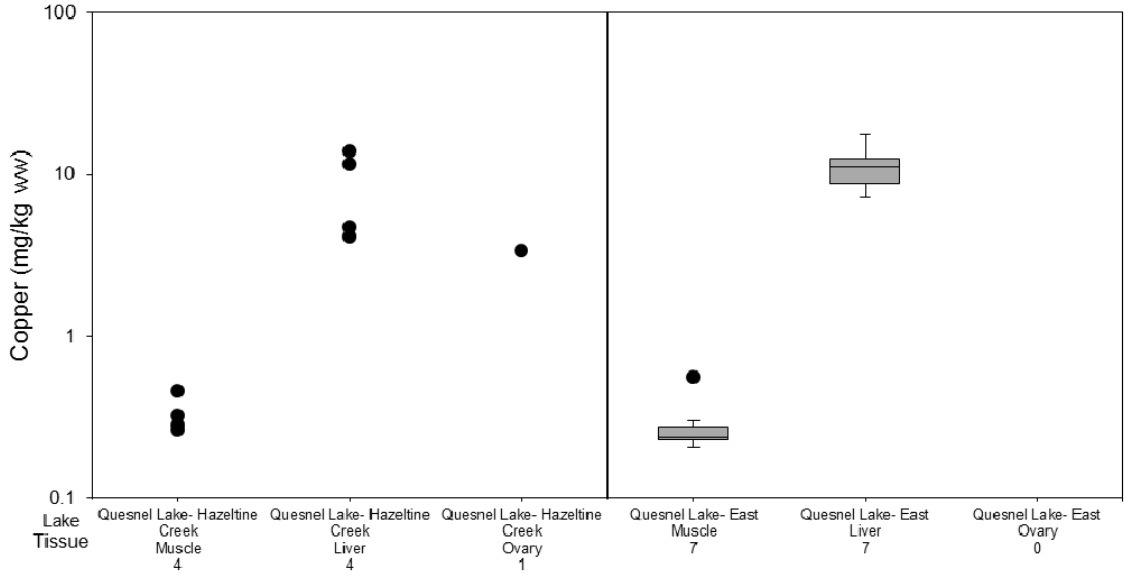
Figure 22: Copper Concentrations in Burbot Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

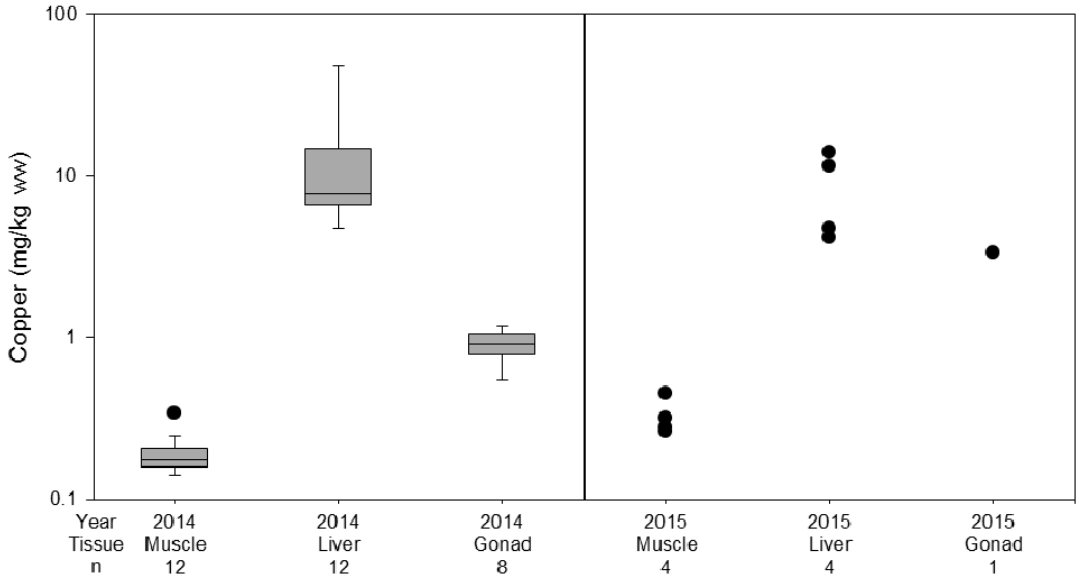
Figure 23: Copper Concentrations in Burbot Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 24: Copper Concentrations in Burbot Tissues Collected from the Quesnel Lake – Hazeltine Creek Confluence in 2014 and 2015

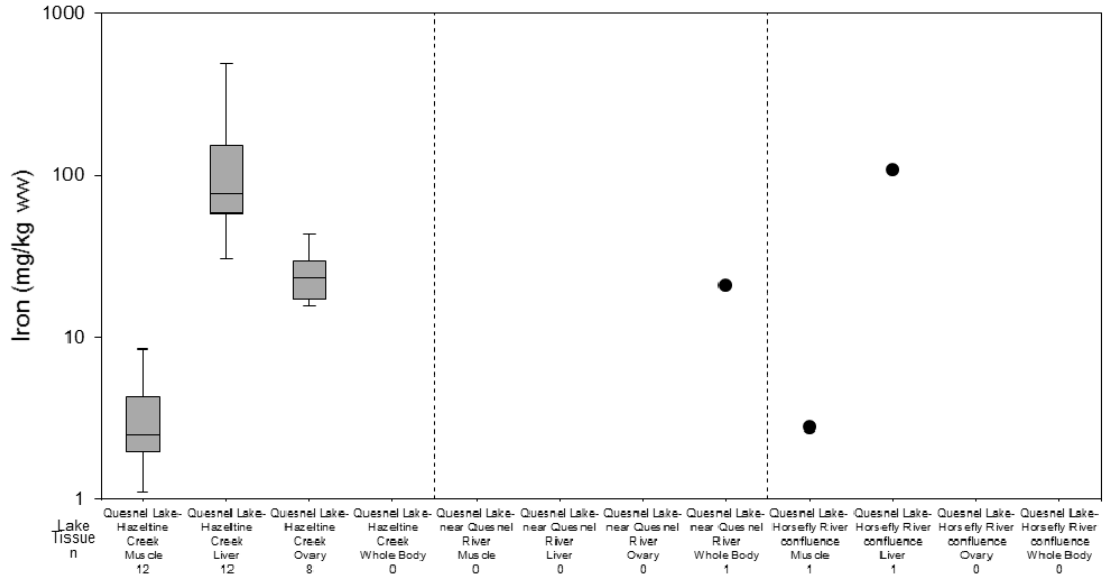


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

1.9 Iron

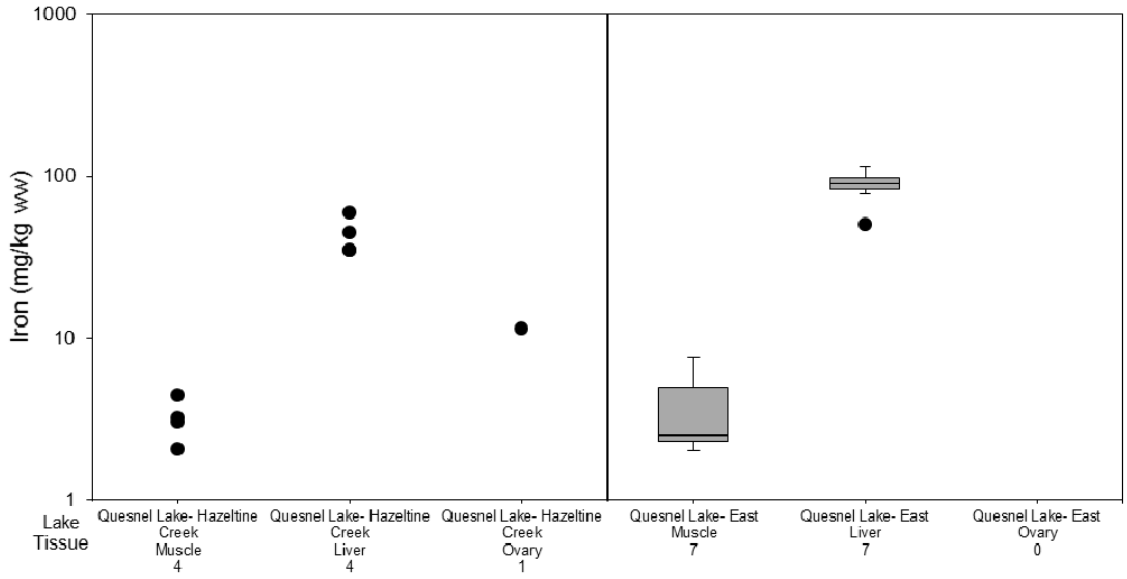
Figure 25: Iron Concentrations in Burbot Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

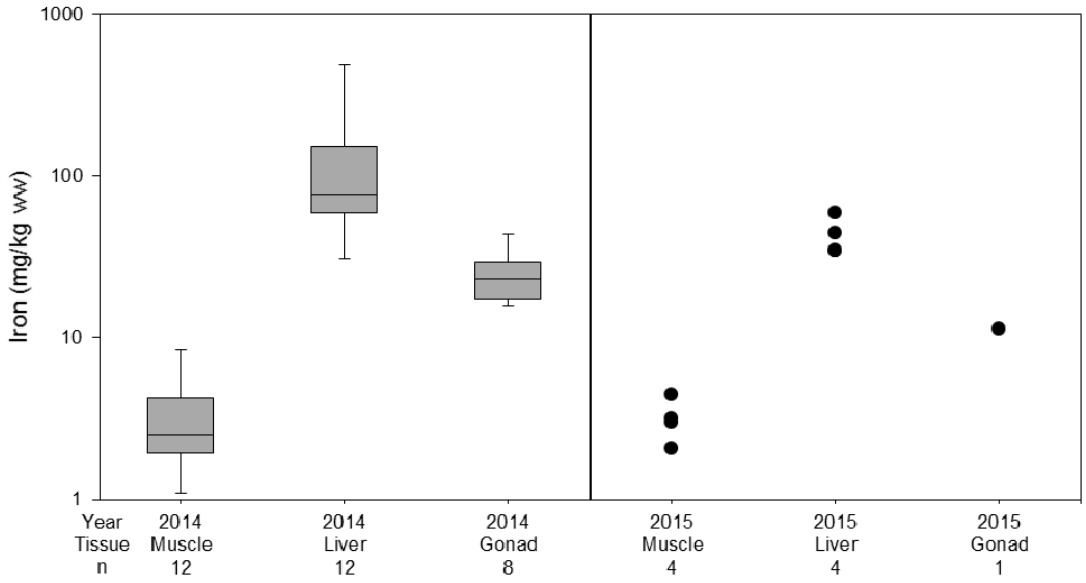
Figure 26: Iron Concentrations in Burbot Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 27: Iron Concentrations in Burbot Tissues Collected from the Quesnel Lake – Hazeltine Creek Confluence in 2014 and 2015

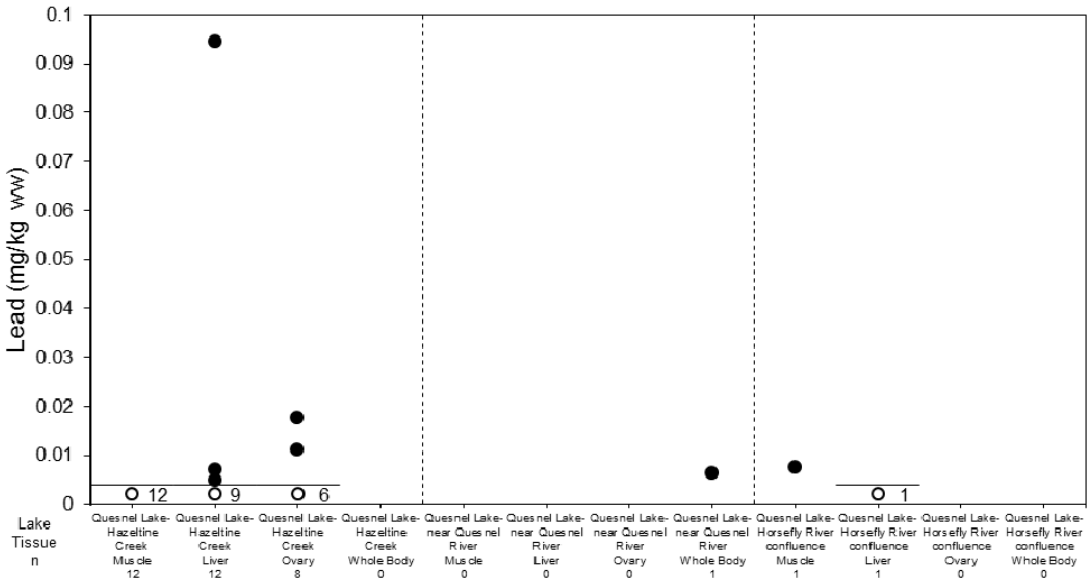


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

1.10 Lead

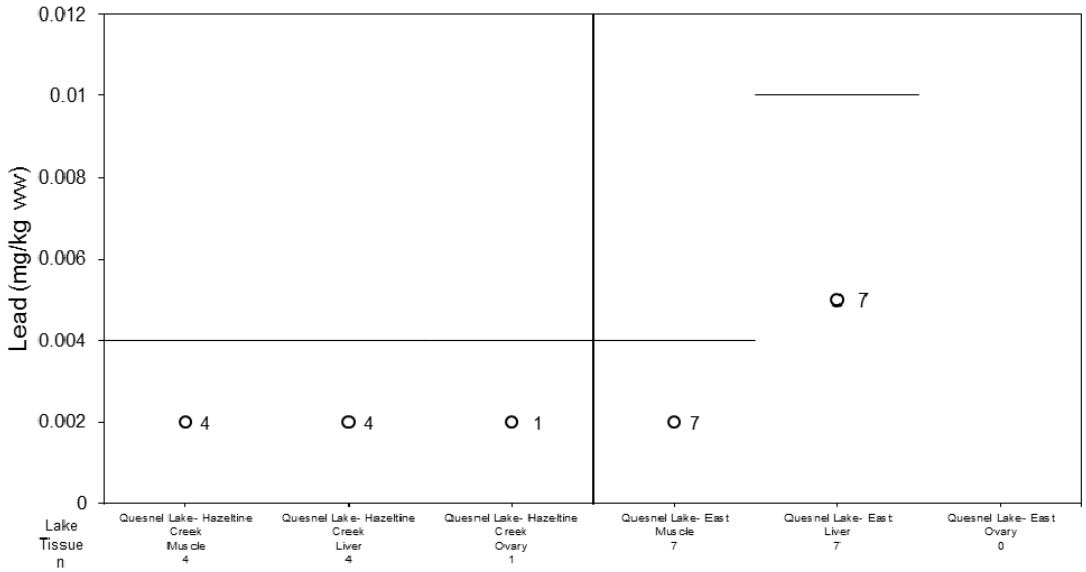
Figure 28: Lead Concentrations in Burbot Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

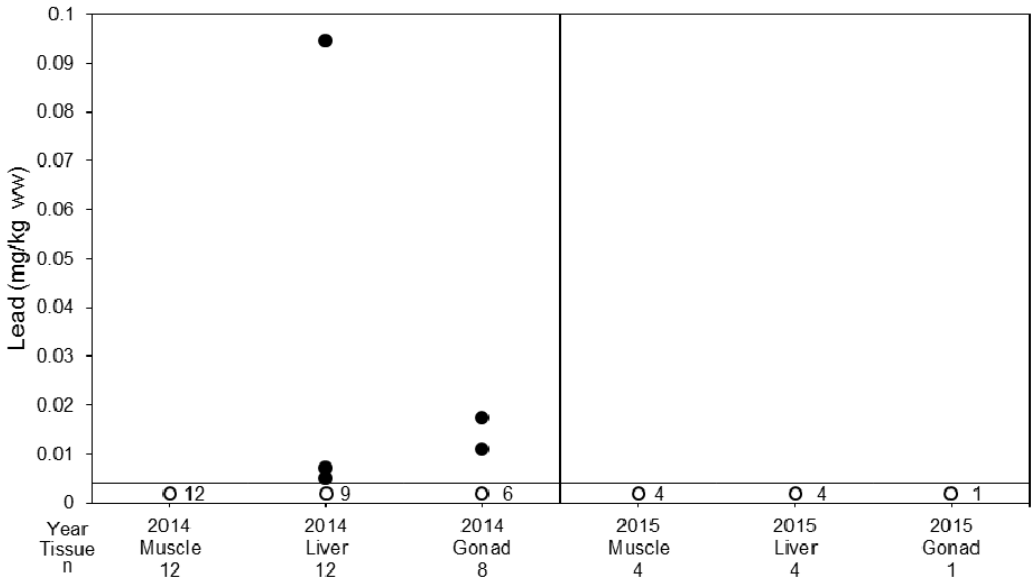
Figure 29: Lead Concentrations in Burbot Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 30: Lead Concentrations in Burbot Tissues Collected from the Quesnel Lake – Hazeltine Creek Confluence in 2014 and 2015

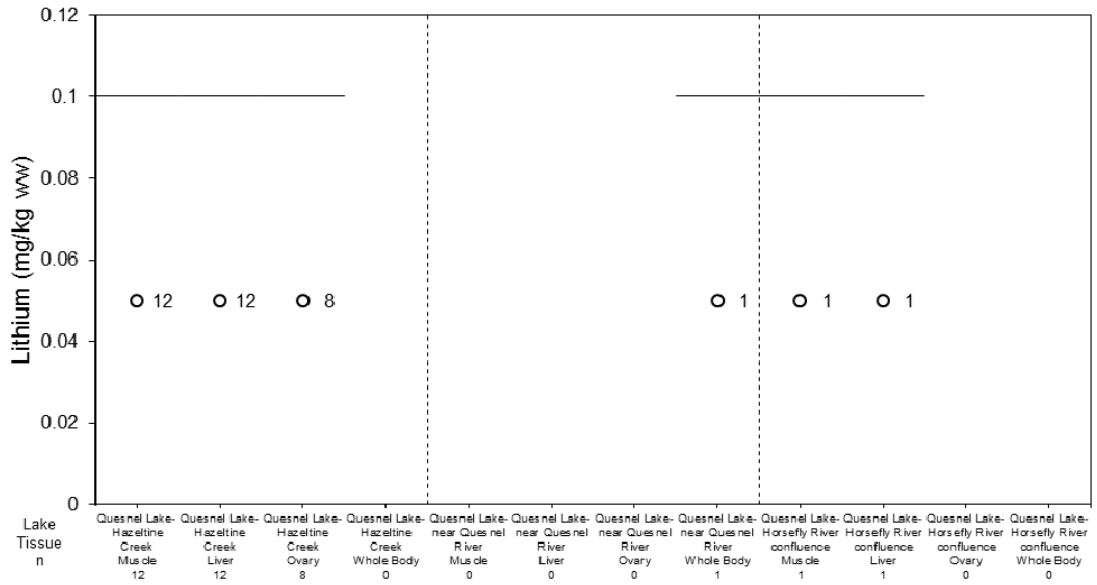


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

1.11 Lithium

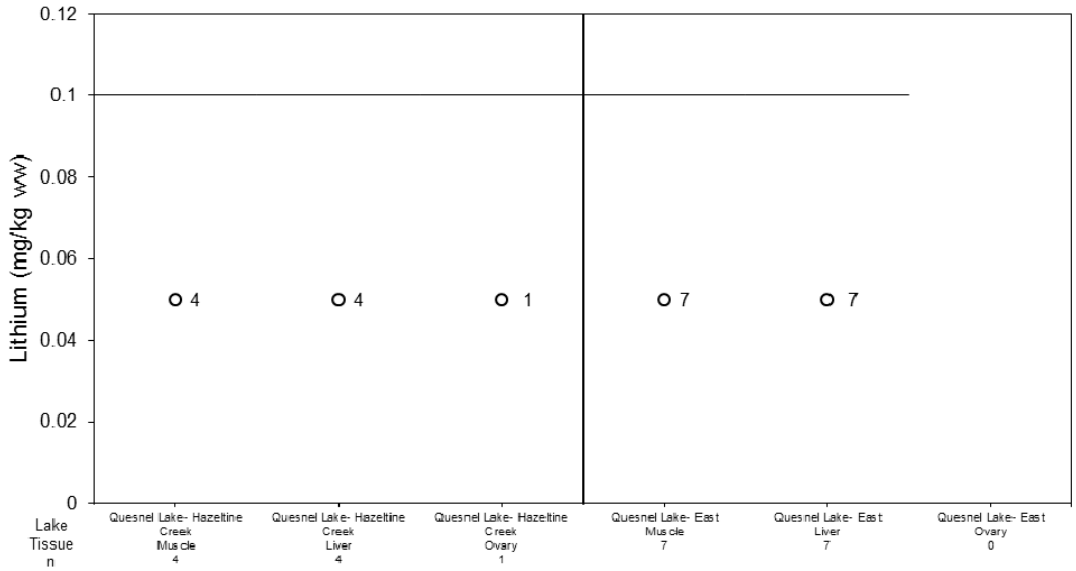
Figure 31: Lithium Concentrations in Burbot Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

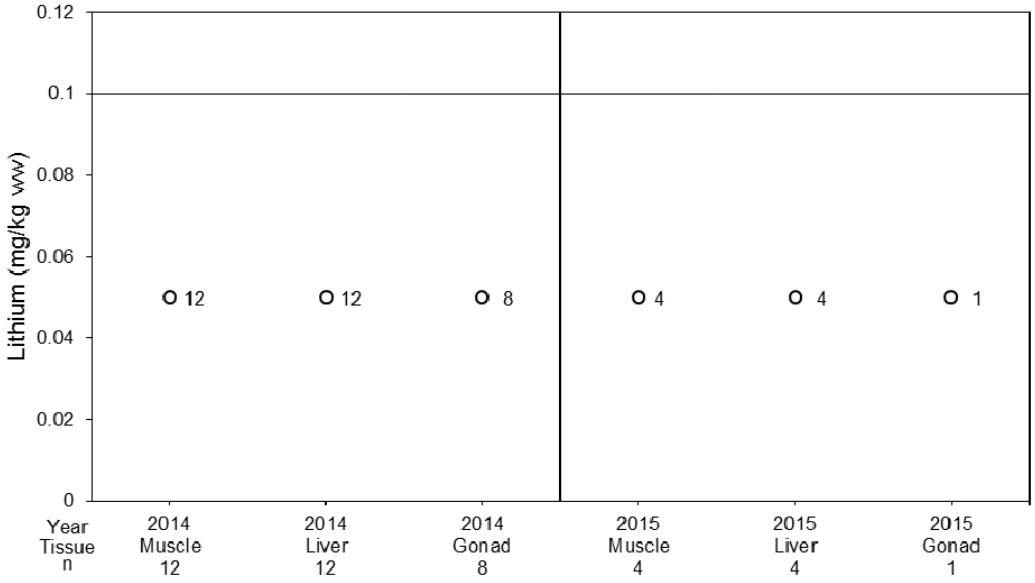
Figure 32: Lithium Concentrations in Burbot Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 33: Lithium Concentrations in Burbot Tissues Collected from the Quesnel Lake – Hazeltine Creek Confluence in 2014 and 2015

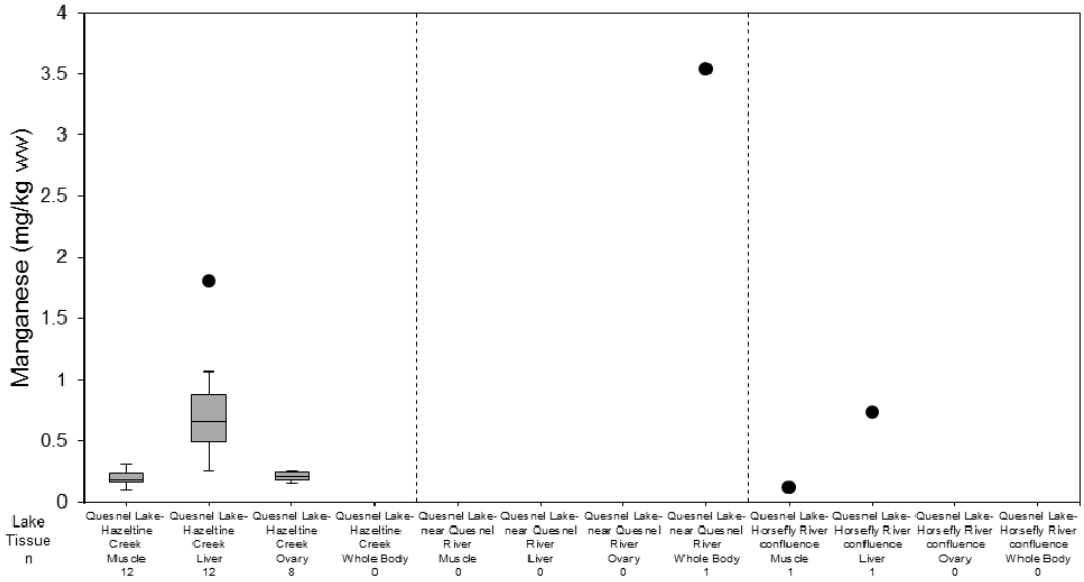


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

1.12 Manganese

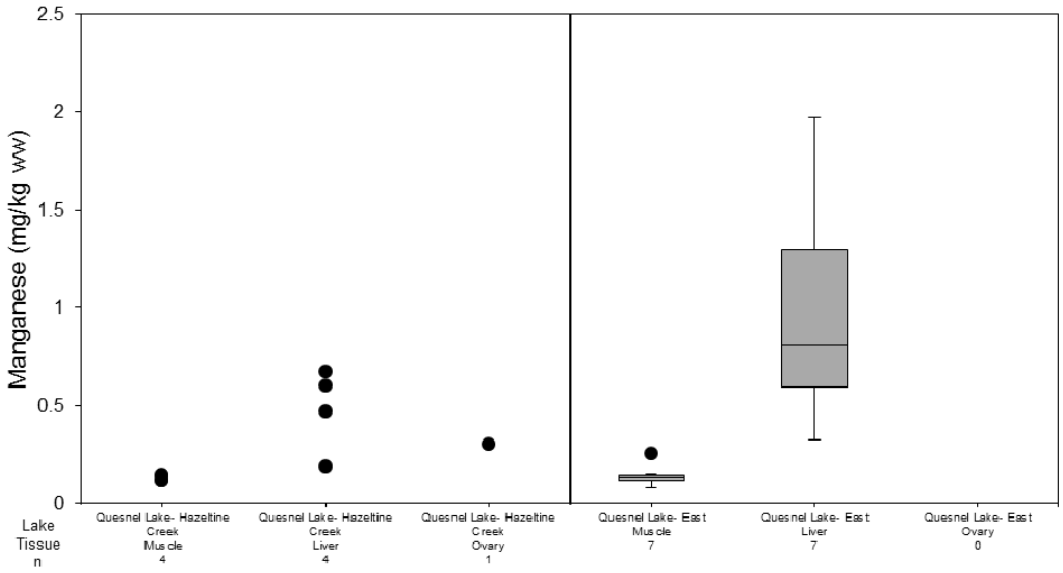
Figure 34: Manganese Concentrations in Burbot Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

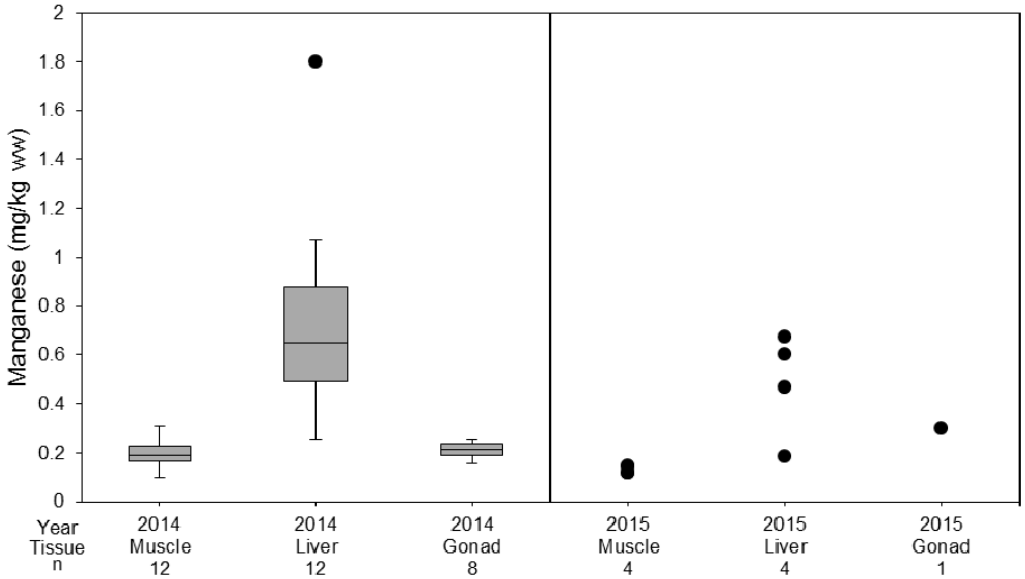
Figure 35: Manganese Concentrations in Burbot Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 36: Manganese Concentrations in Burbot Tissues Collected from the Quesnel Lake – Hazeltine Creek Confluence in 2014 and 2015

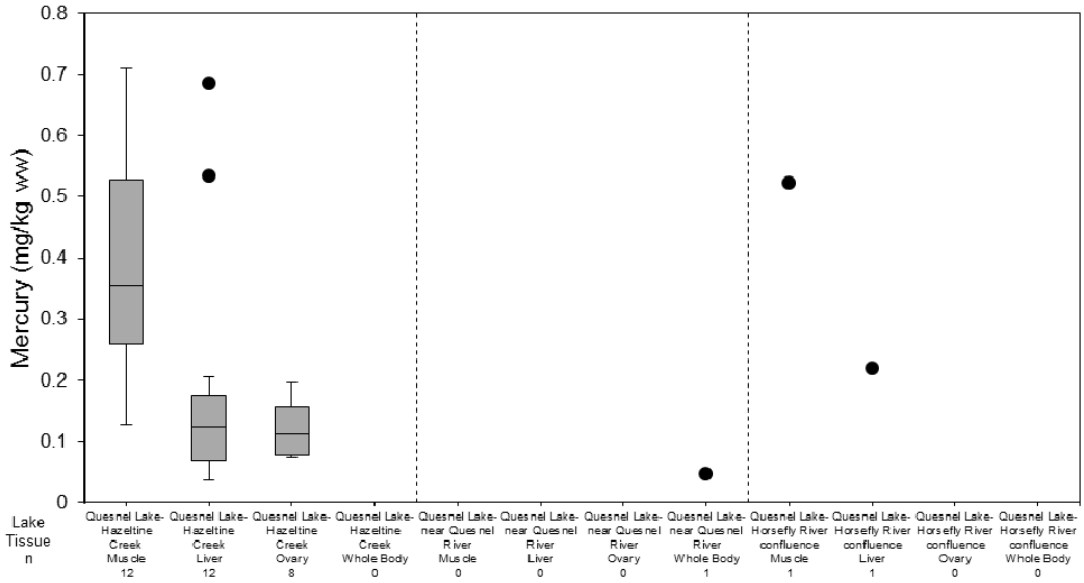


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

1.13 Mercury

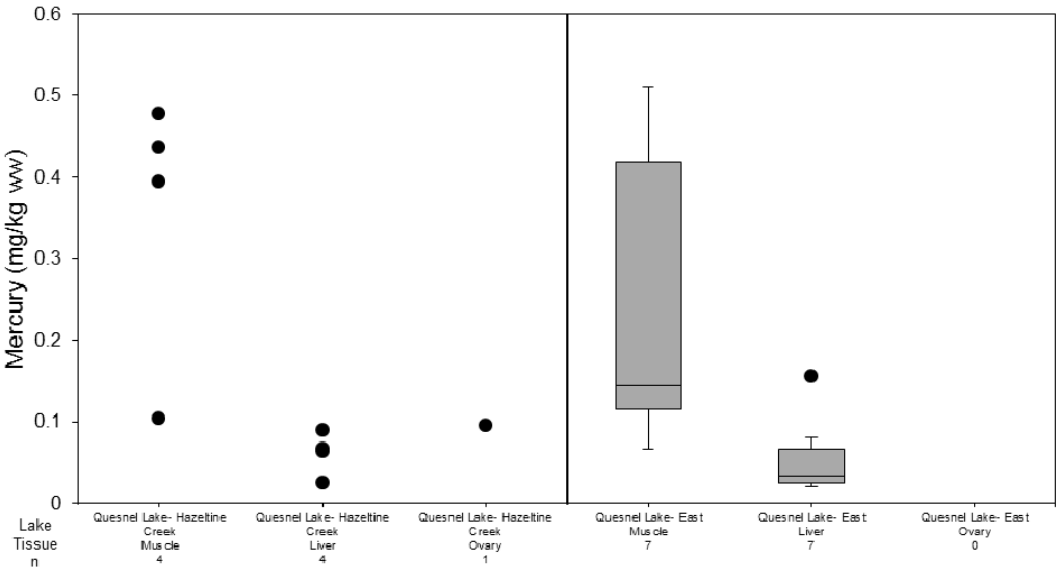
Figure 37: Mercury Concentrations in Burbot Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

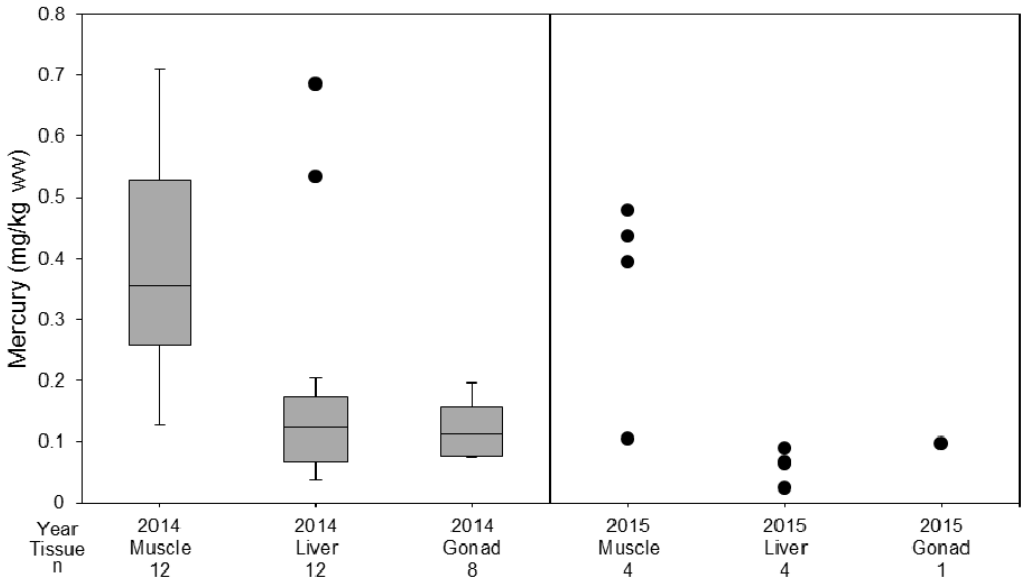
Figure 38: Mercury Concentrations in Burbot Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 39: Mercury Concentrations in Burbot Tissues Collected from the Quesnel Lake – Hazeltine Creek Confluence in 2014 and 2015

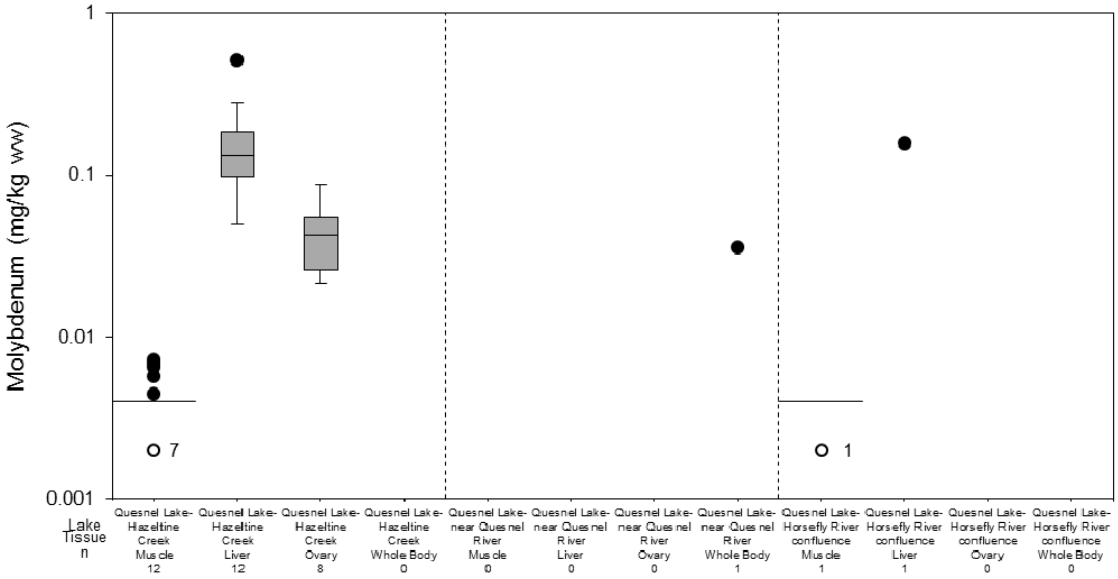


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

1.14 Molybdenum

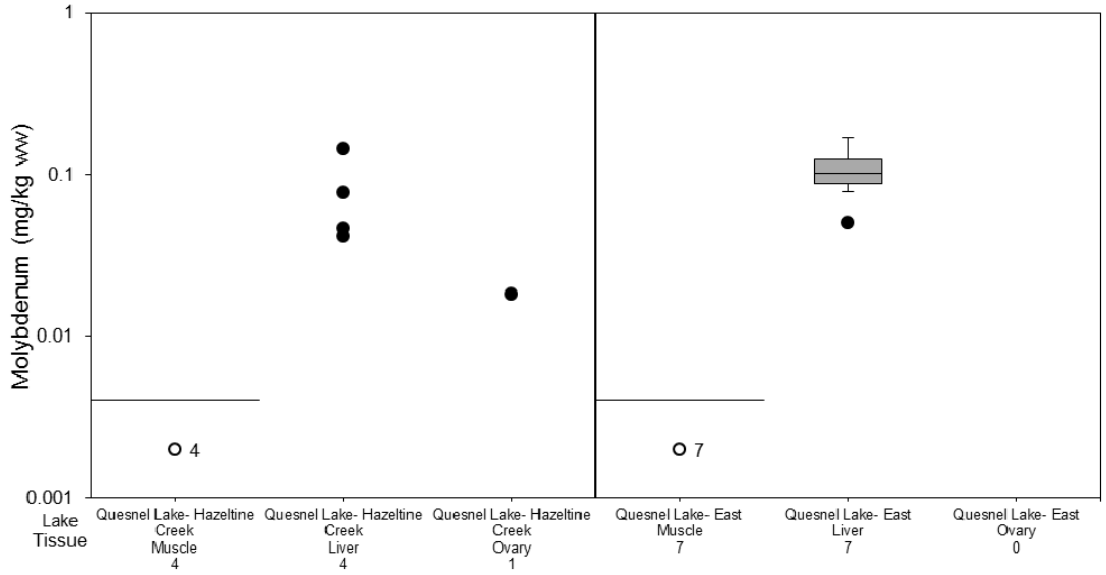
Figure 40: Molybdenum Concentrations in Burbot Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

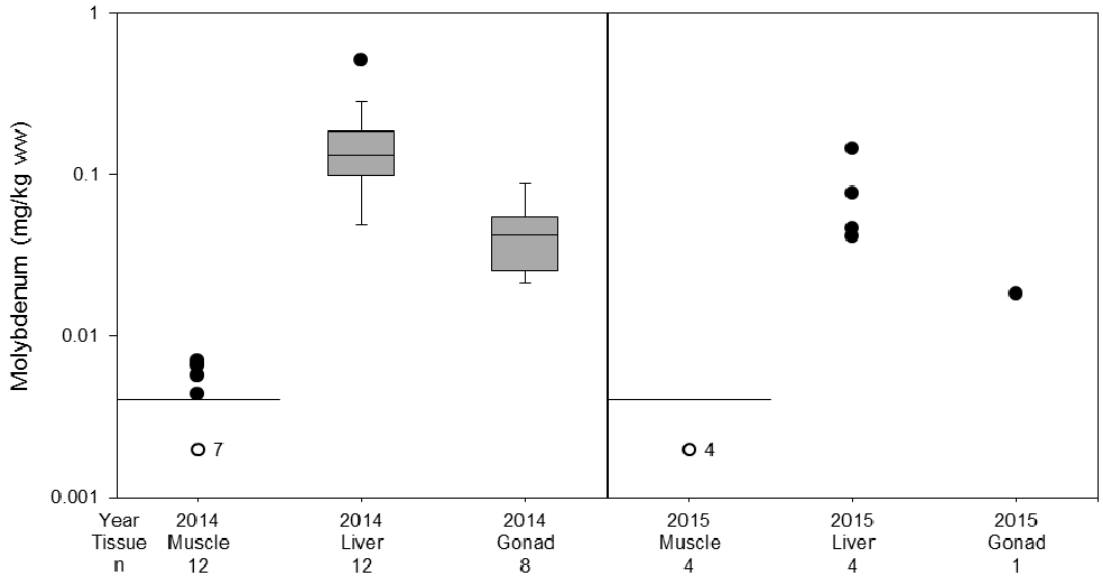
Figure 41: Molybdenum Concentrations in Burbot Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 42: Molybdenum Concentrations in Burbot Tissues Collected from the Quesnel Lake – Hazeltine Creek Confluence in 2014 and 2015

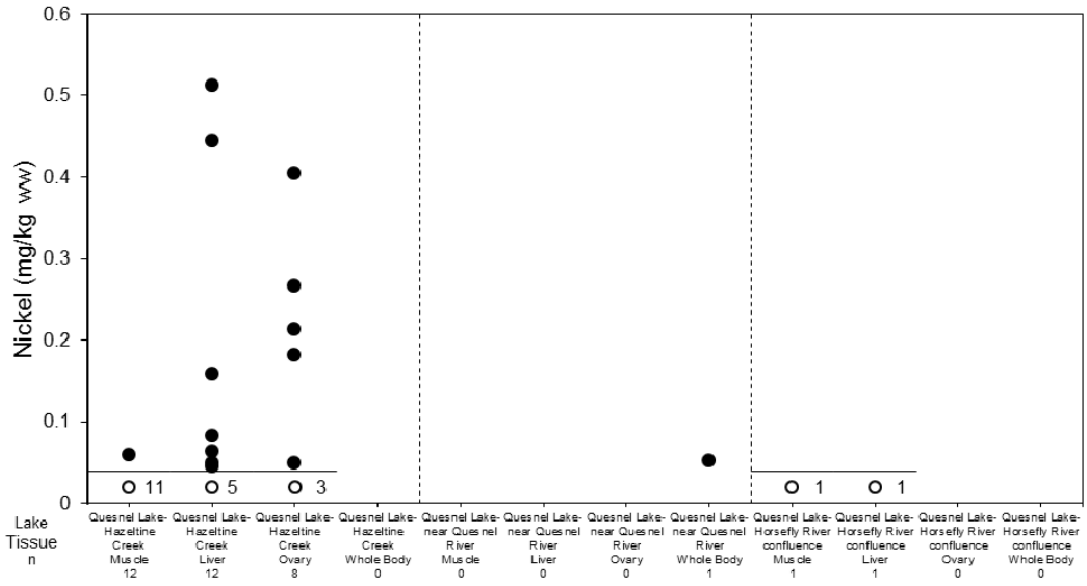


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

1.15 Nickel

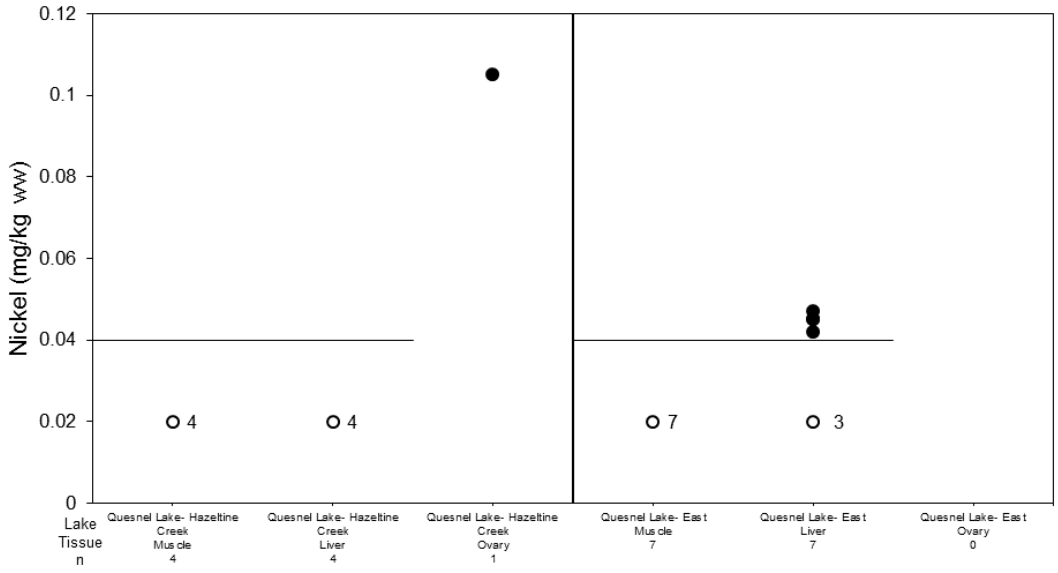
Figure 43: Nickle Concentrations in Burbot Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

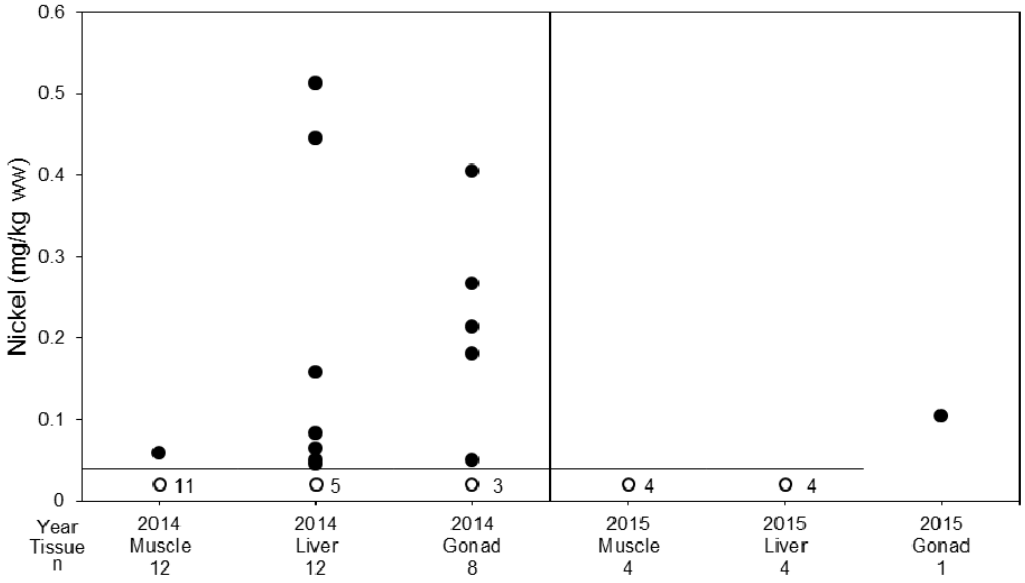
Figure 44: Nickle Concentrations in Burbot Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 45: Nickle Concentrations in Burbot Tissues Collected from the Quesnel Lake – Hazeltine Creek Confluence in 2014 and 2015

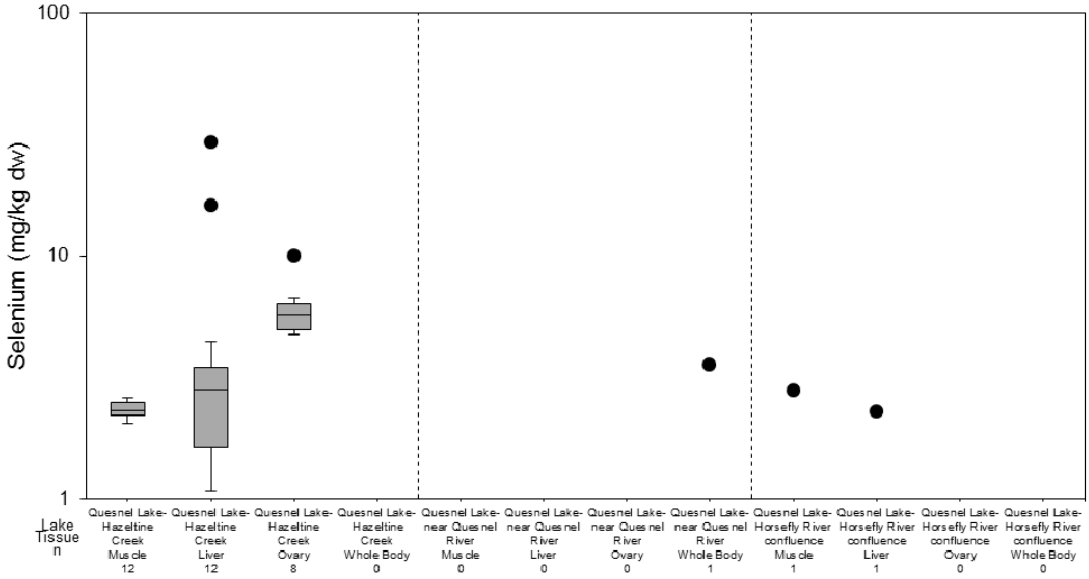


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

1.16 Selenium

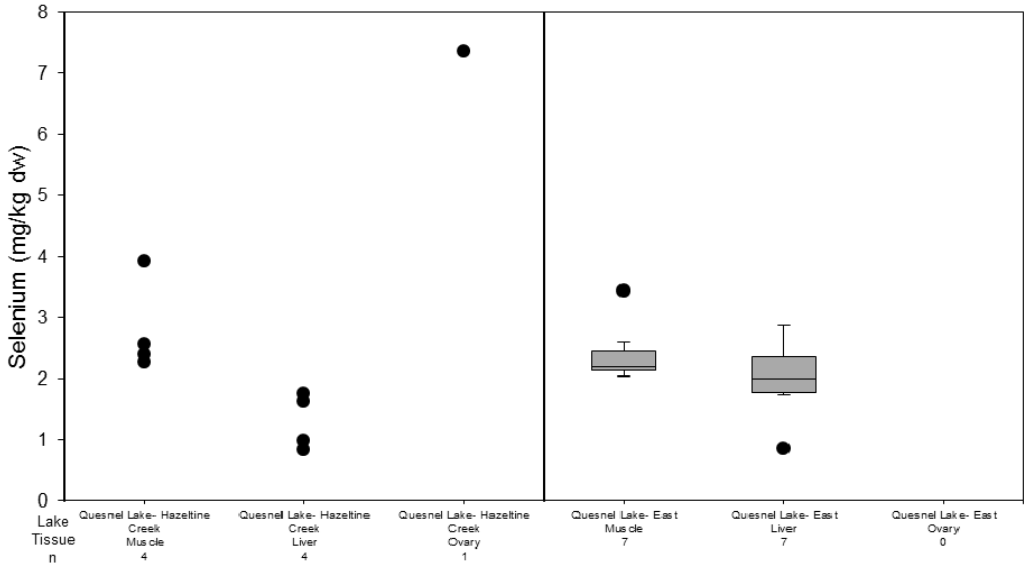
Figure 46: Selenium Concentrations in Burbot Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg dw = milligrams per kilogram dry weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

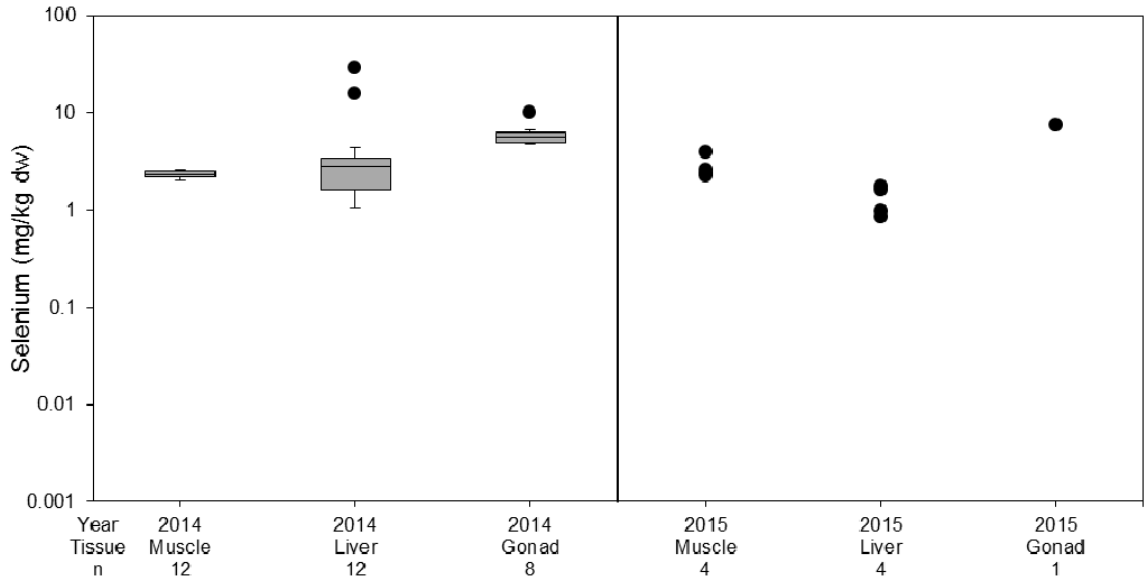
Figure 47: Selenium Concentrations in Burbot Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg dw = milligrams per kilogram dry weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 48: Selenium Concentrations in Burbot Tissues Collected from the Quesnel Lake – Hazeltine Creek Confluence in 2014 and 2015

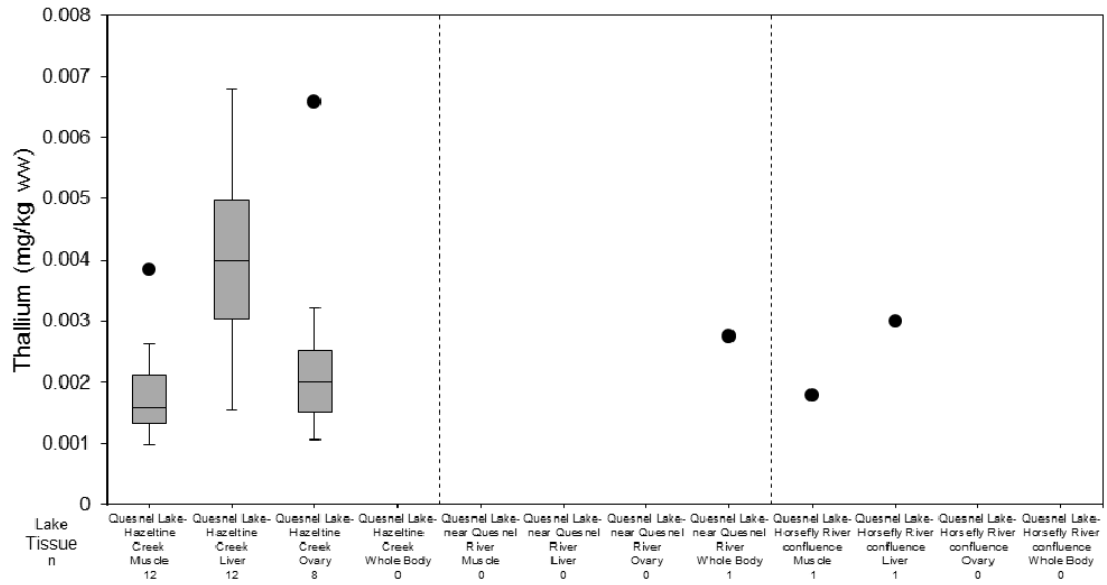


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg dw = milligrams per kilogram dry weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

1.17 Thallium

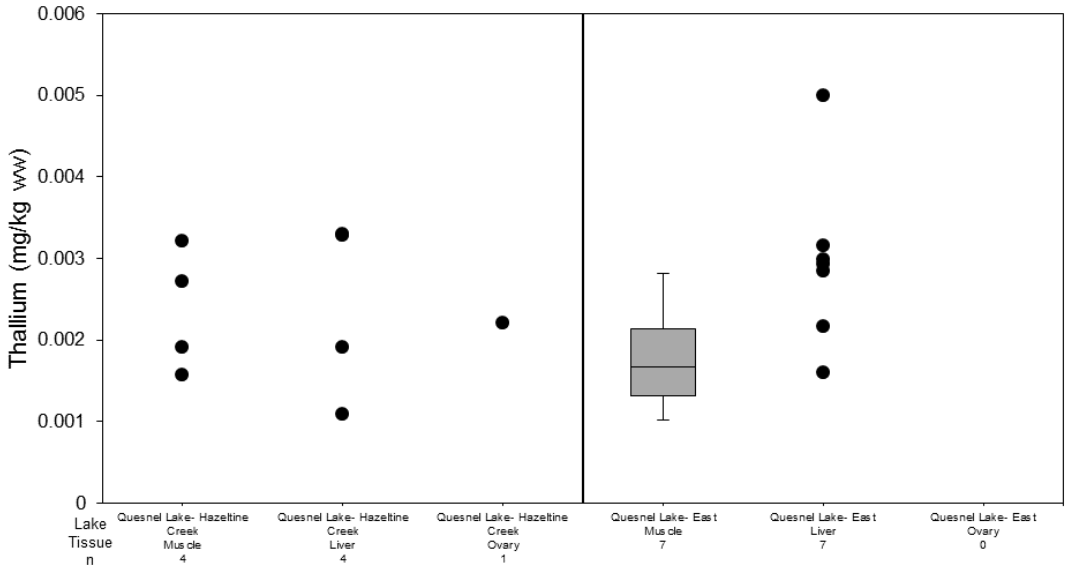
Figure 49: Thallium Concentrations in Burbot Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

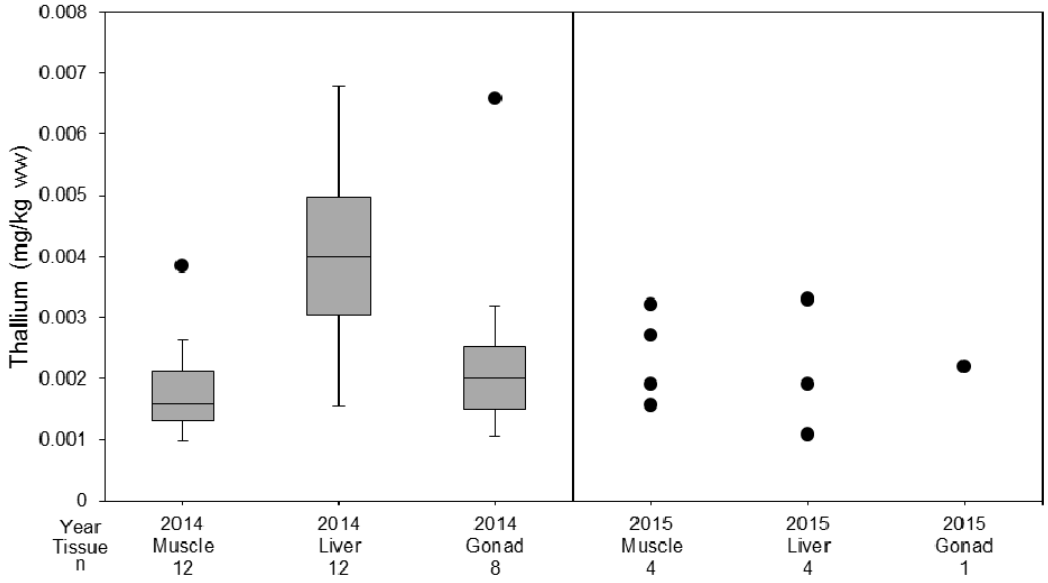
Figure 50: Thallium Concentrations in Burbot Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 51: Thallium Concentrations in Burbot Tissues Collected from the Quesnel Lake – Hazeltine Creek Confluence in 2014 and 2015

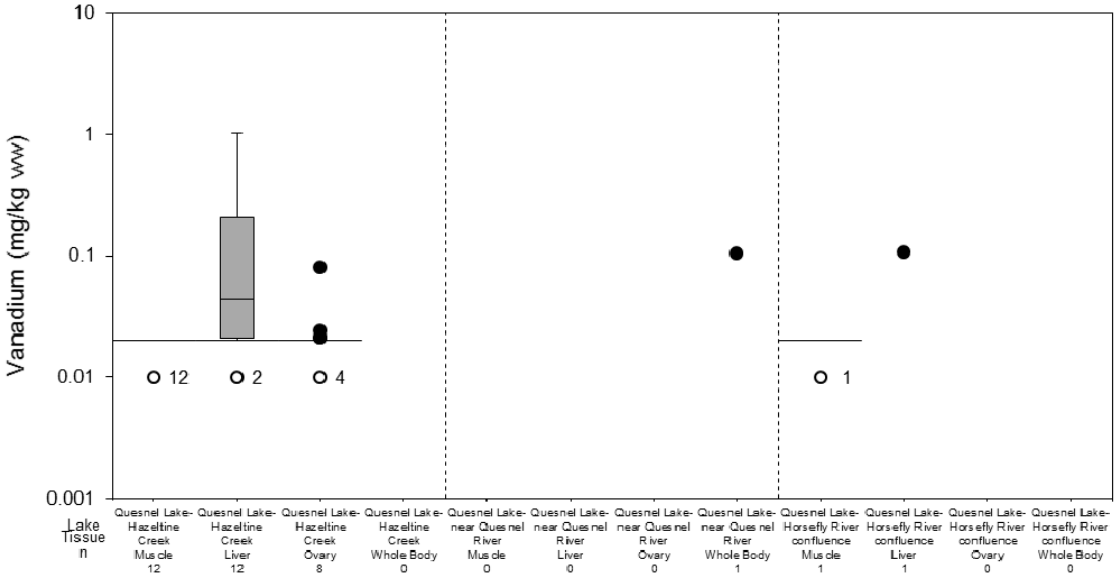


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

1.18 Vanadium

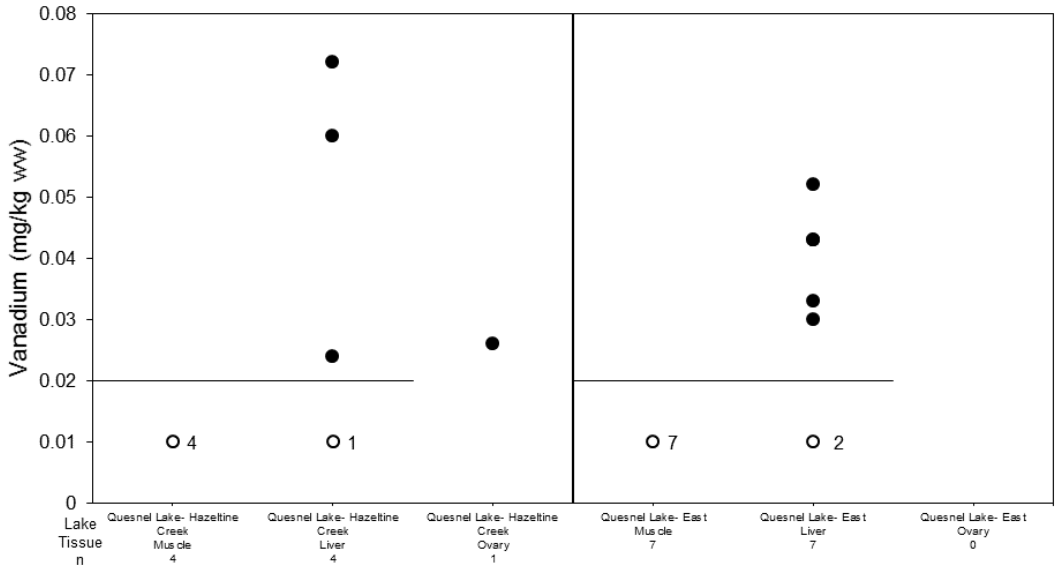
Figure 52: Vanadium Concentrations in Burbot Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

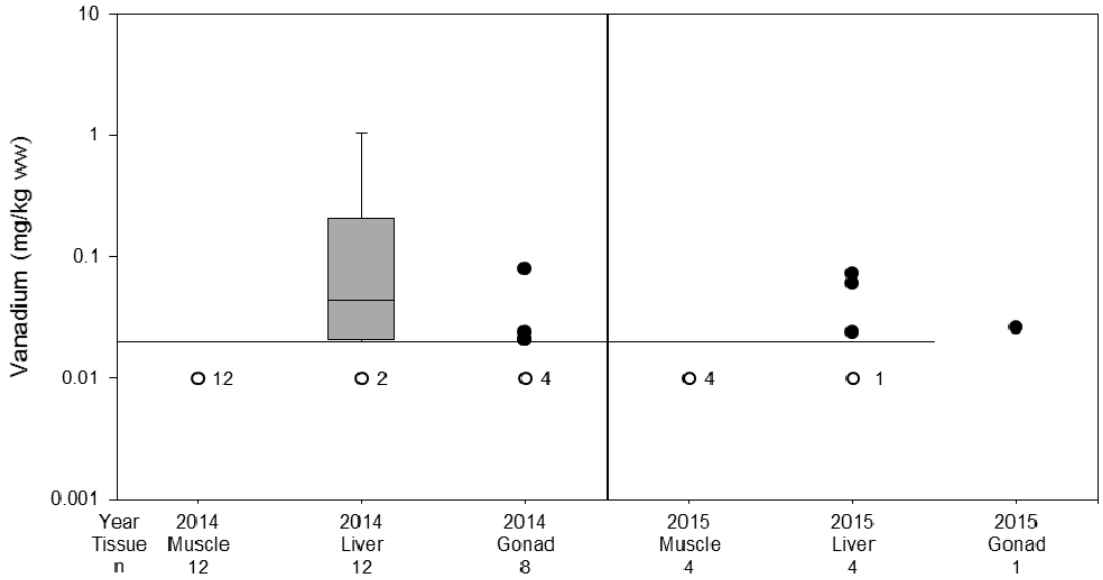
Figure 53: Vanadium Concentrations in Burbot Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 54: Vanadium Concentrations in Burbot Tissues Collected from the Quesnel Lake – Hazeltine Creek Confluence in 2014 and 2015

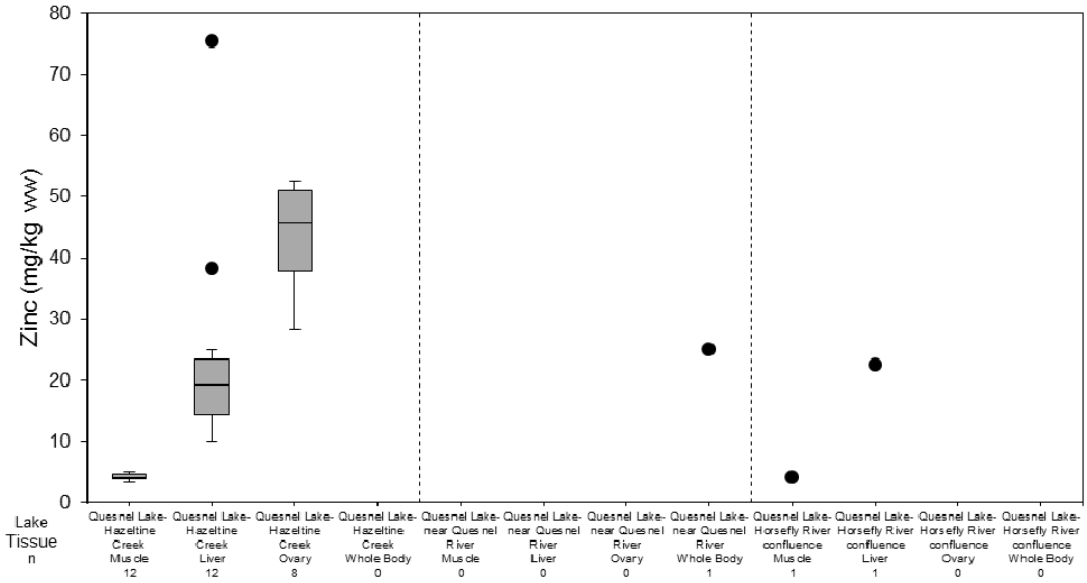


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

1.19 Zinc

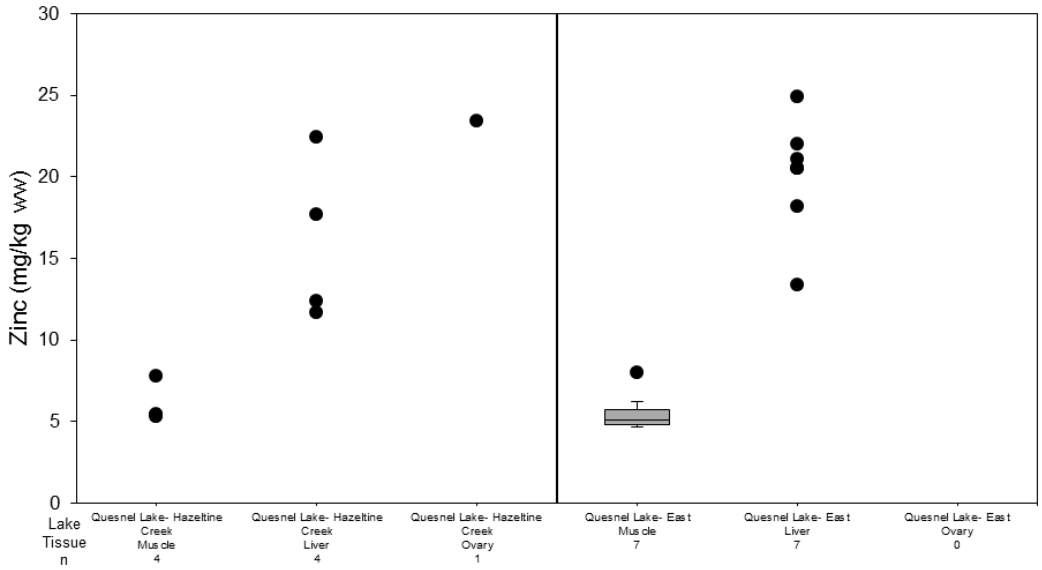
Figure 55: Zinc Concentrations in Burbot Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

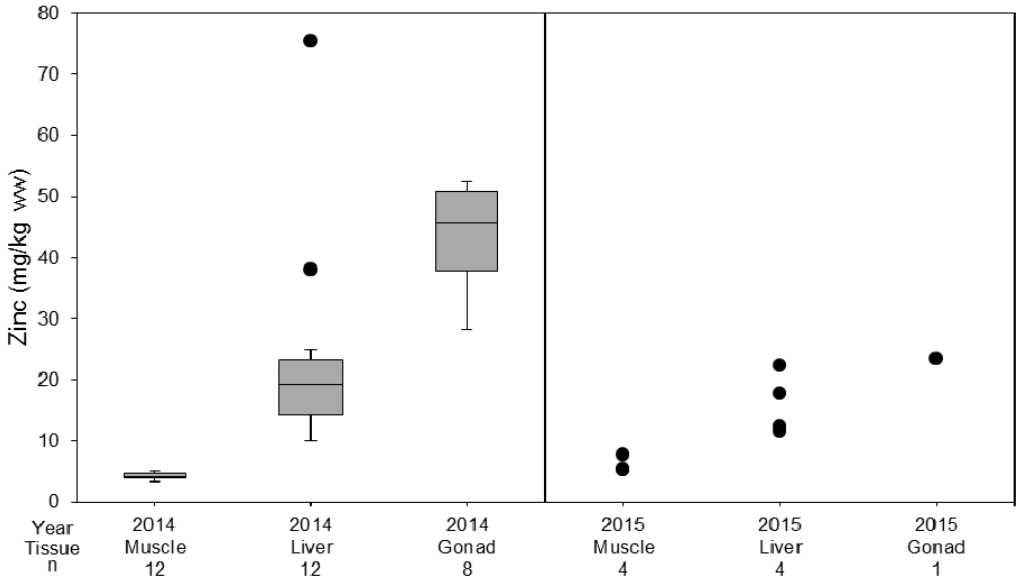
Figure 56: Zinc Concentrations in Burbot Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 57: Zinc Concentrations in Burbot Tissues Collected from the Quesnel Lake – Hazeltine Creek Confluence in 2014 and 2015



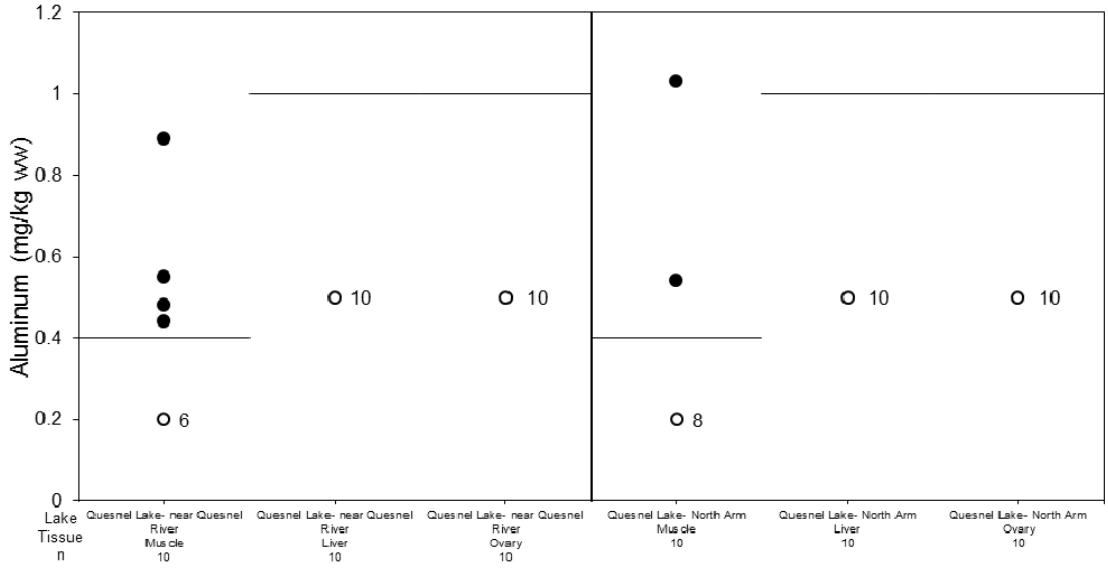
Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

2.0 KOKANEE

2.1 Aluminum

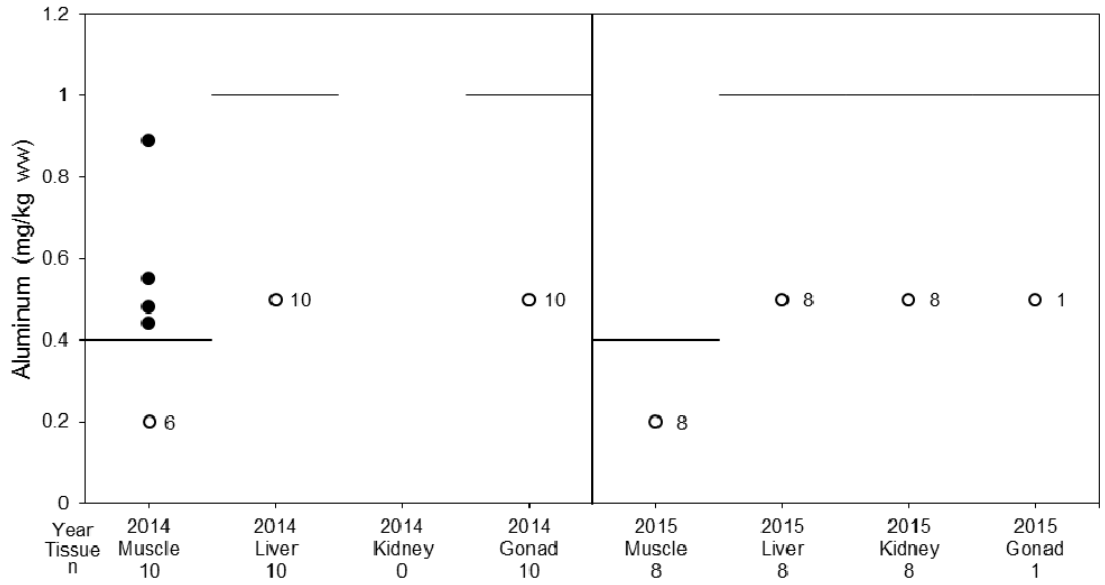
Figure 58: Aluminum Concentrations in Kokanee Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 59: Aluminum Concentrations in Kokanee Tissues Collected from Quesnel Lake near Quesnel River in 2014 and 2015

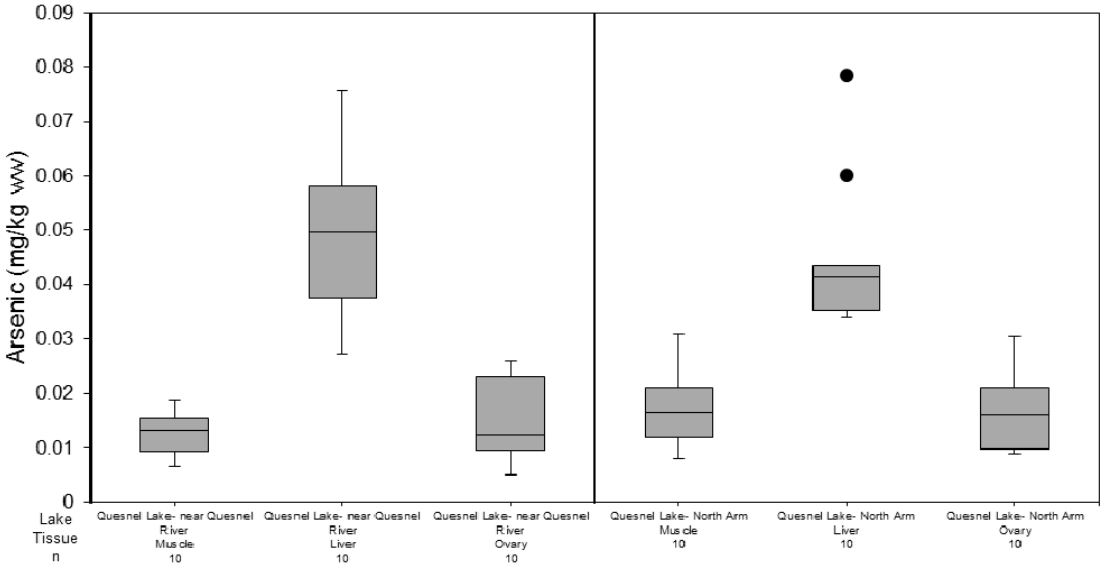


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

2.2 Arsenic

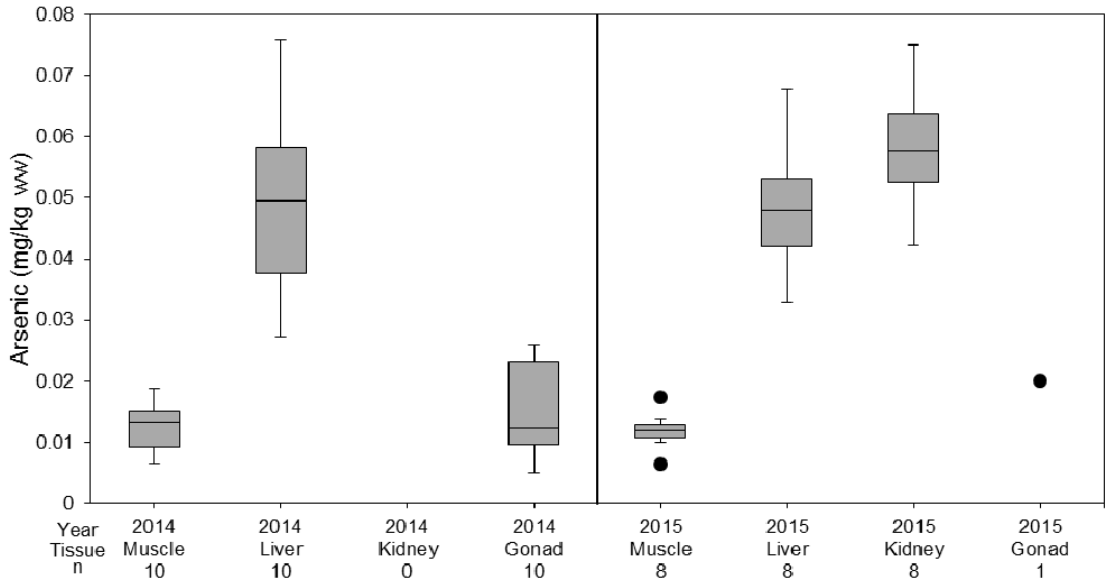
Figure 60: Arsenic Concentrations in Kokanee Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 61: Arsenic Concentrations in Kokanee Tissues Collected from Quesnel Lake near Quesnel River in 2014 and 2015

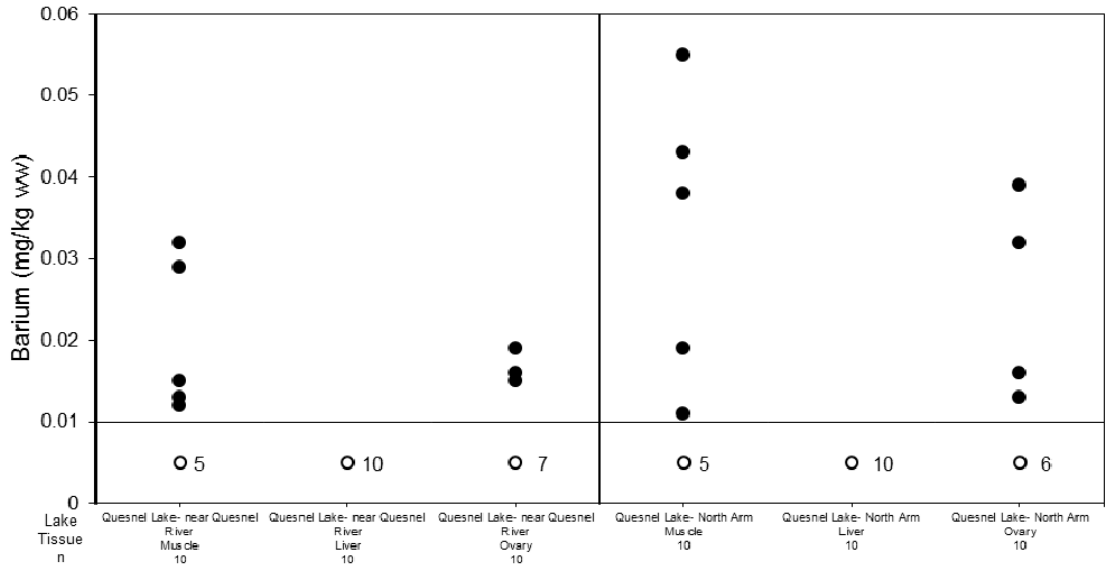


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

2.3 Barium

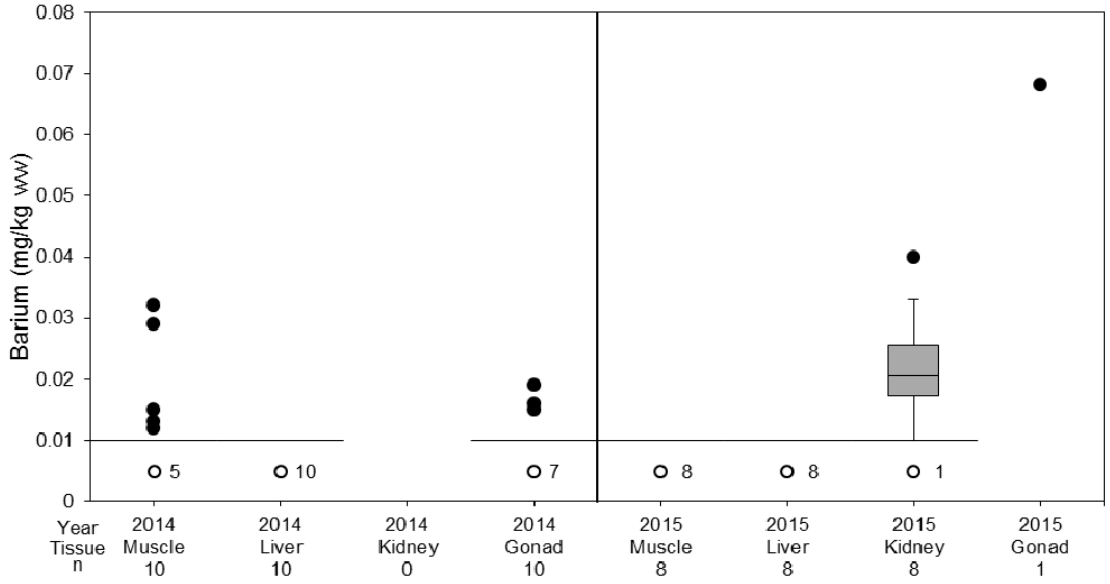
Figure 62: Barium Concentrations in Kokanee Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 63: Barium Concentrations in Kokanee Tissues Collected from Quesnel Lake near Quesnel River in 2014 and 2015

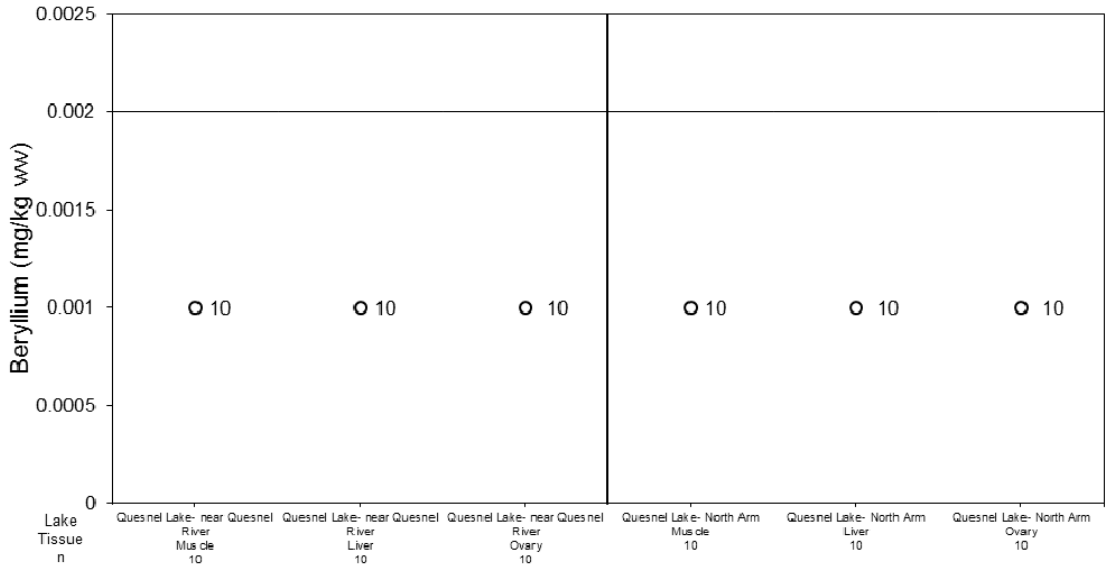


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

2.4 Beryllium

Figure 64: Beryllium Concentrations in Kokanee Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

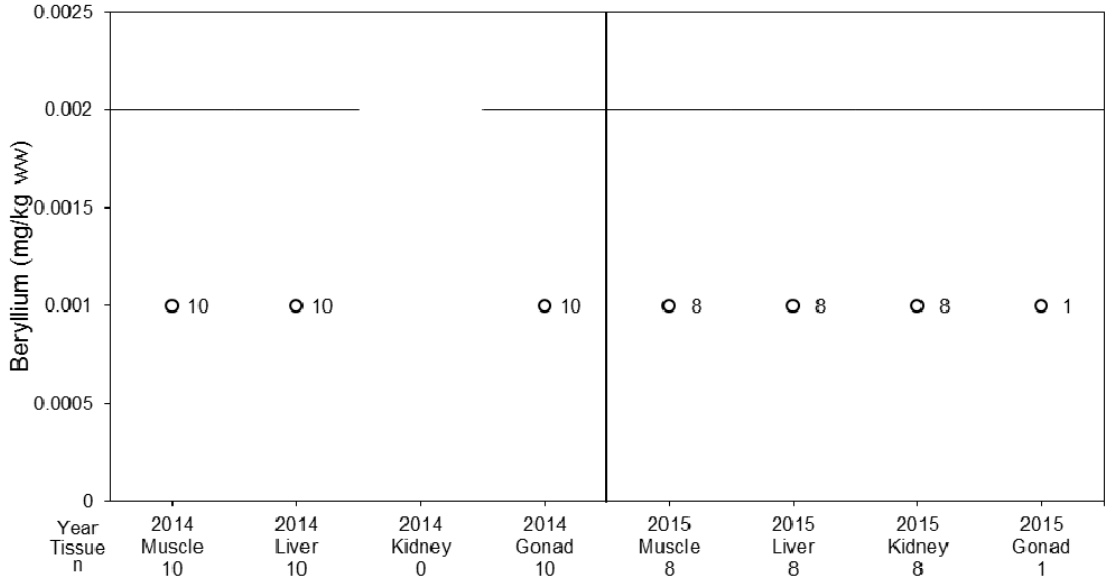
Figure 65: Beryllium Concentrations in Kokanee Tissues Collected from Quesnel Lake near Quesnel River in 2014 and 2015

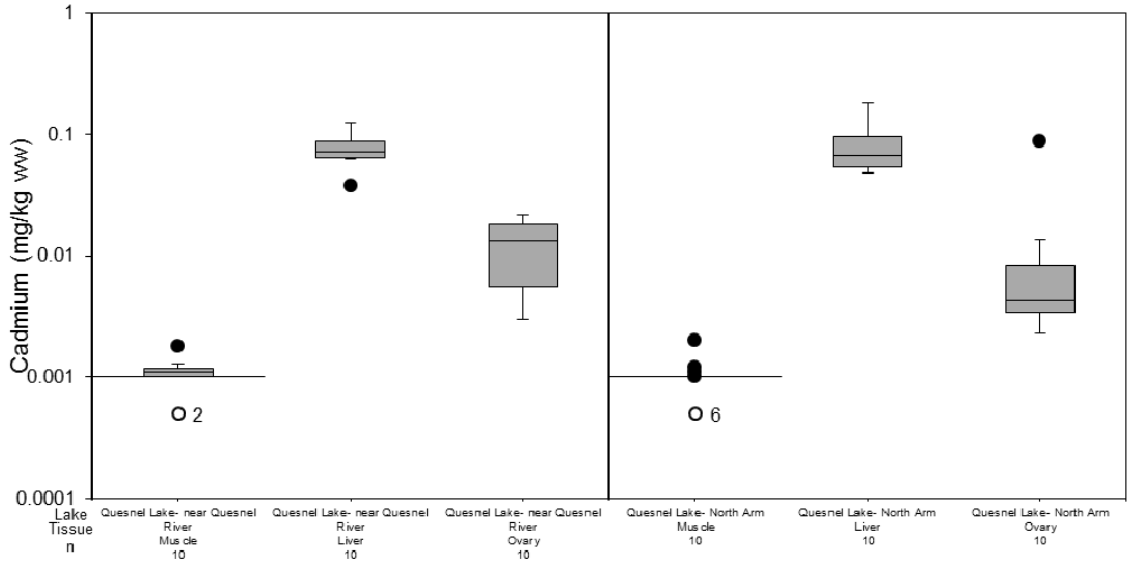


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

2.5 Cadmium

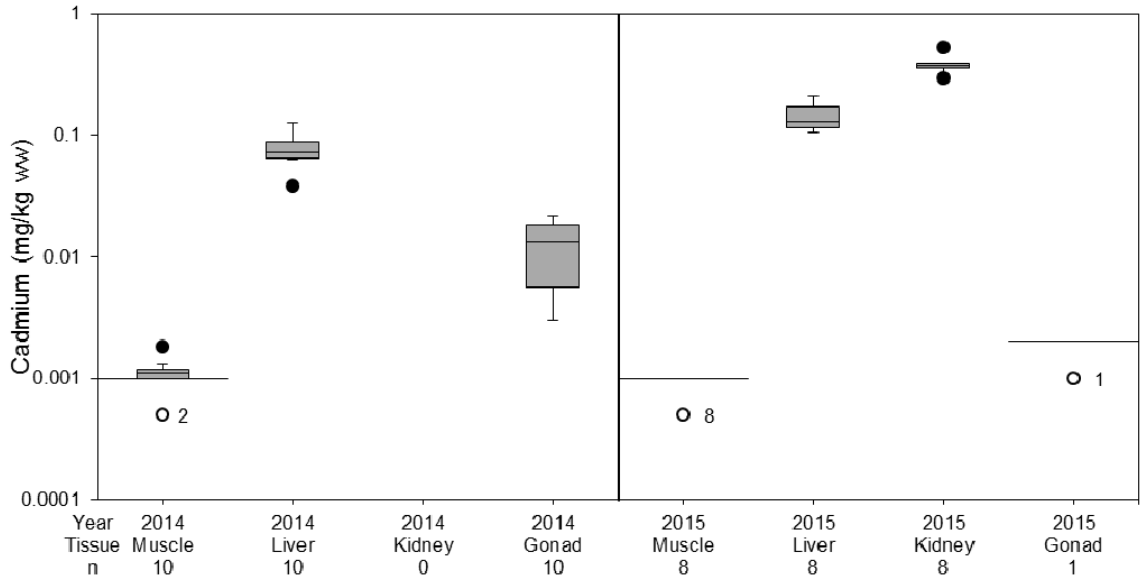
Figure 66: Cadmium Concentrations in Kokanee Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 67: Cadmium Concentrations in Kokanee Tissues Collected from Quesnel Lake near Quesnel River in 2014 and 2015

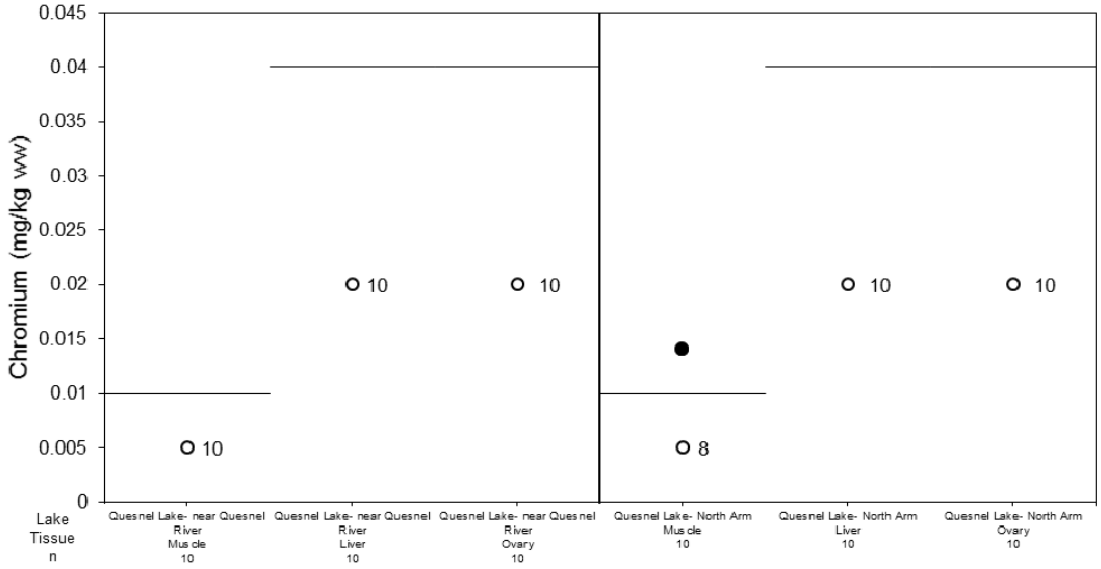


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

2.6 Chromium

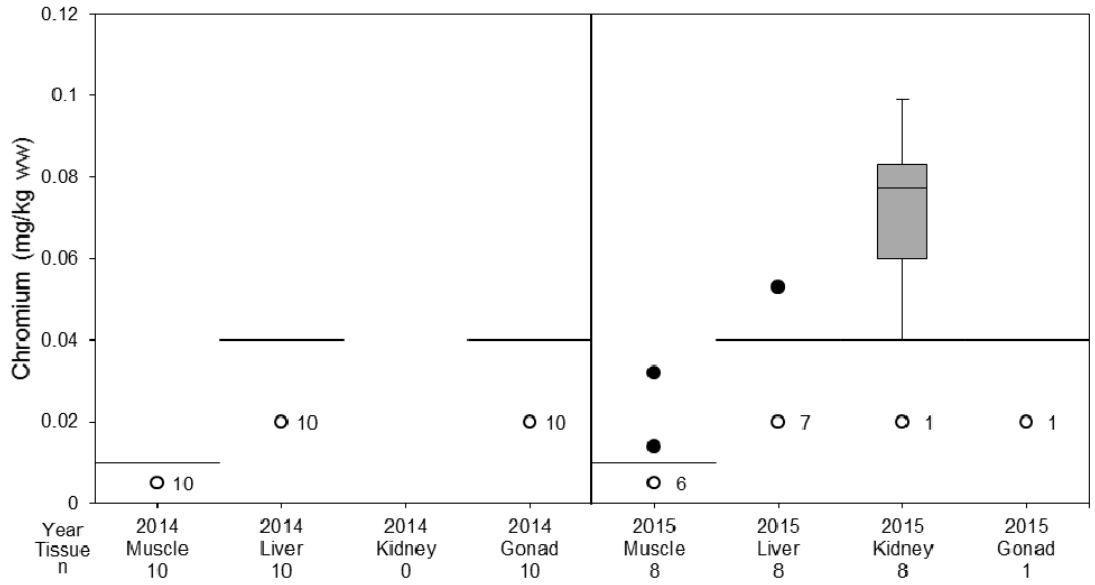
Figure 68: Chromium Concentrations in Kokanee Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 69: Chromium Concentrations in Kokanee Tissues Collected from Quesnel Lake near Quesnel River in 2014 and 2015

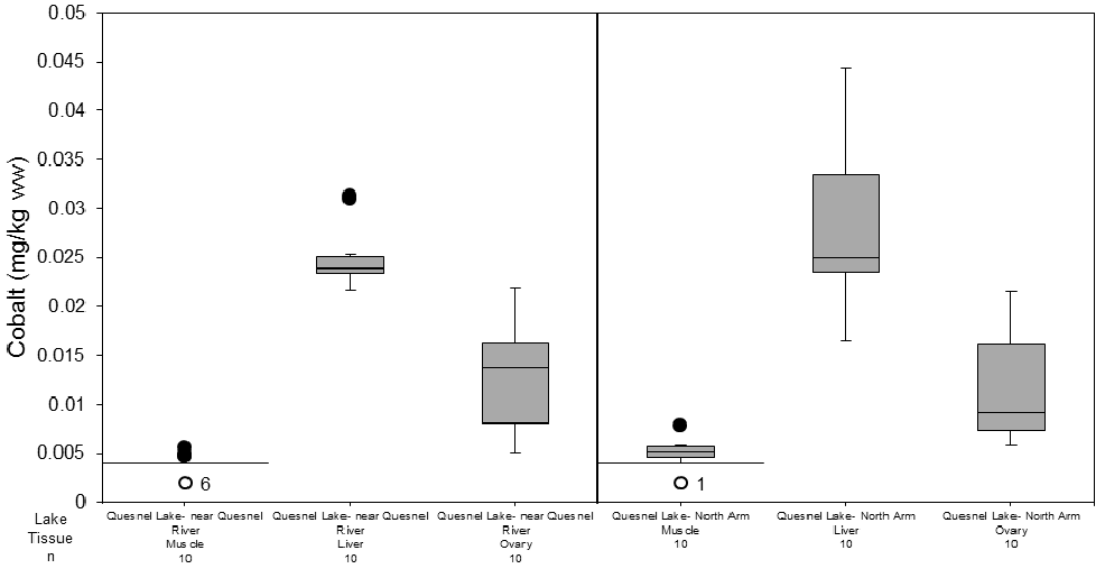


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

2.7 Cobalt

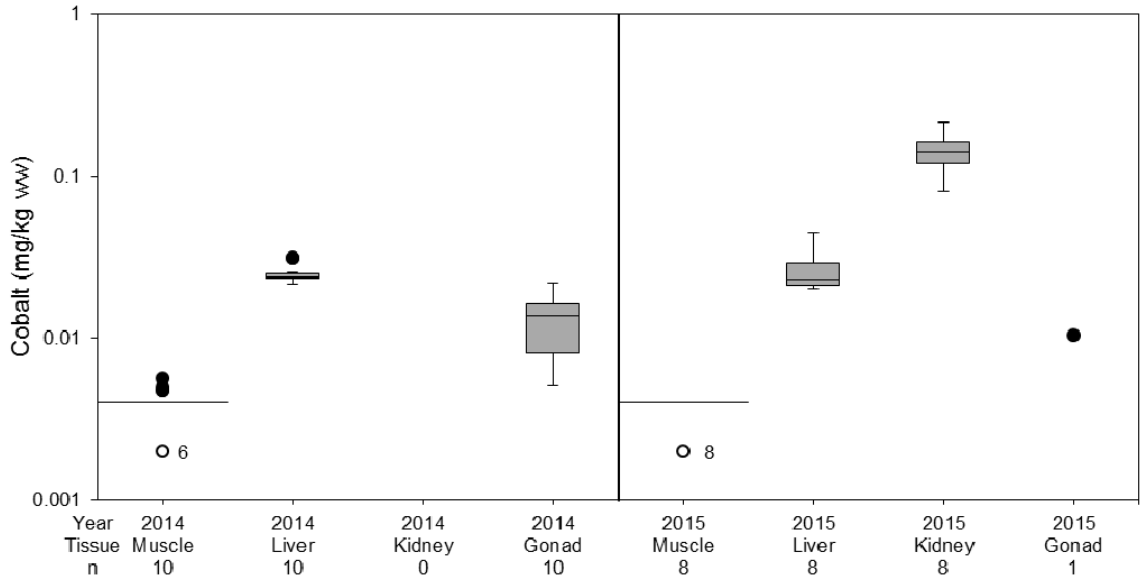
Figure 70: Cobalt Concentrations in Kokanee Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 71: Cobalt Concentrations in Kokanee Tissues Collected from Quesnel Lake near Quesnel River in 2014 and 2015

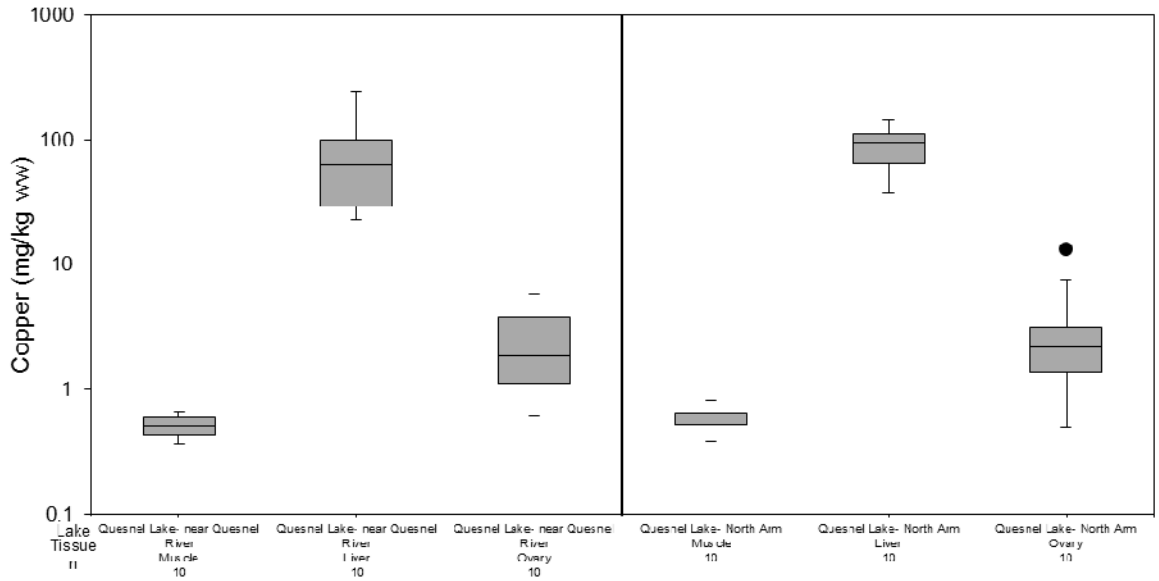


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

2.8 Copper

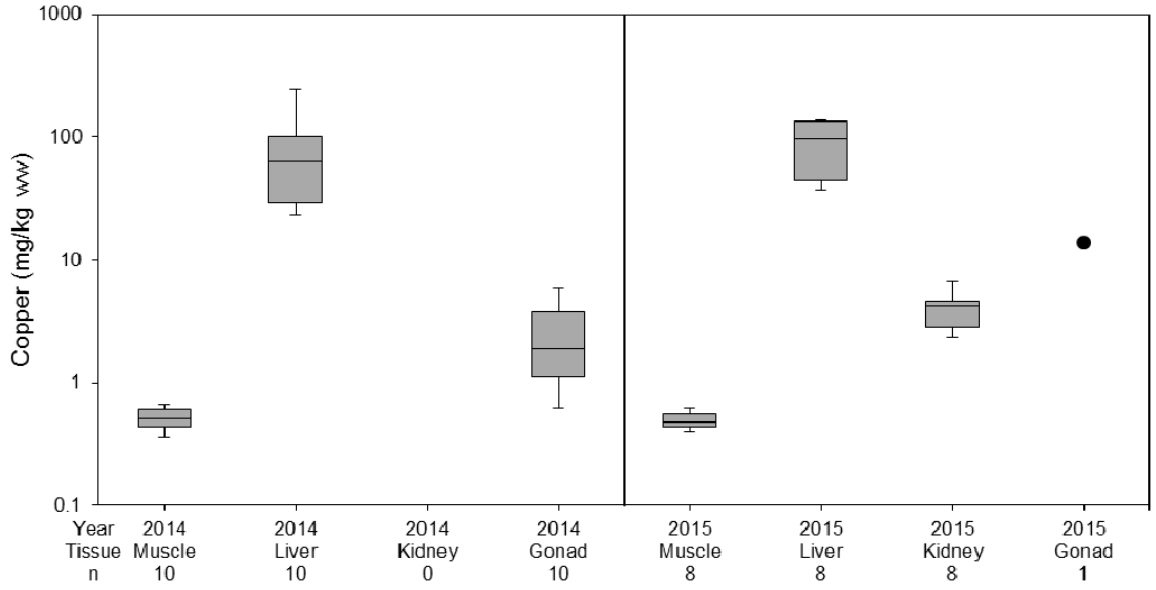
Figure 72: Copper Concentrations in Kokanee Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 73: Copper Concentrations in Kokanee Tissues Collected from Quesnel Lake near Quesnel River in 2014 and 2015

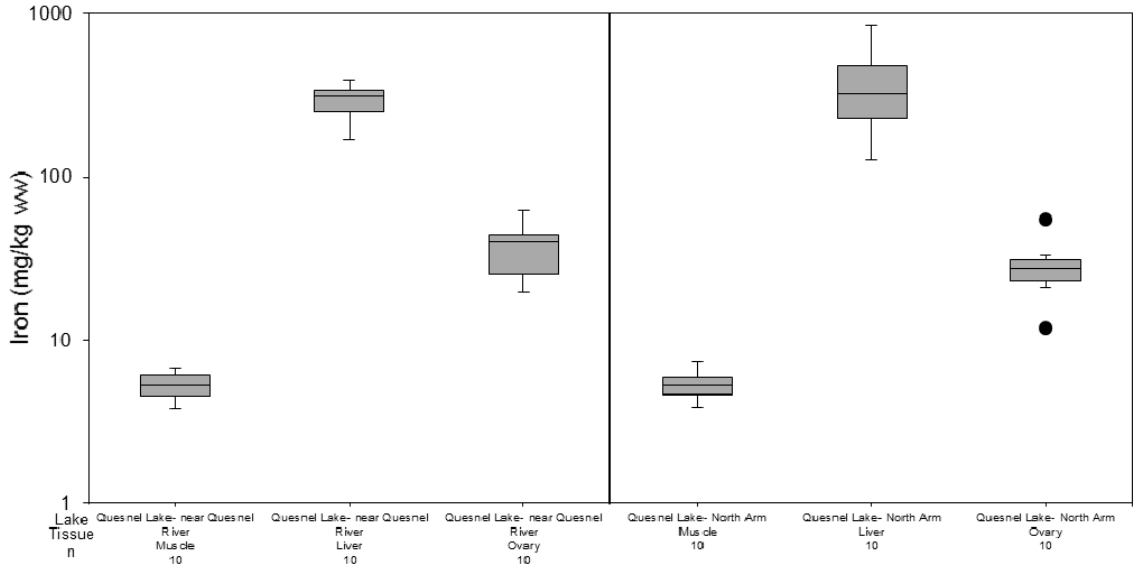


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

2.9 Iron

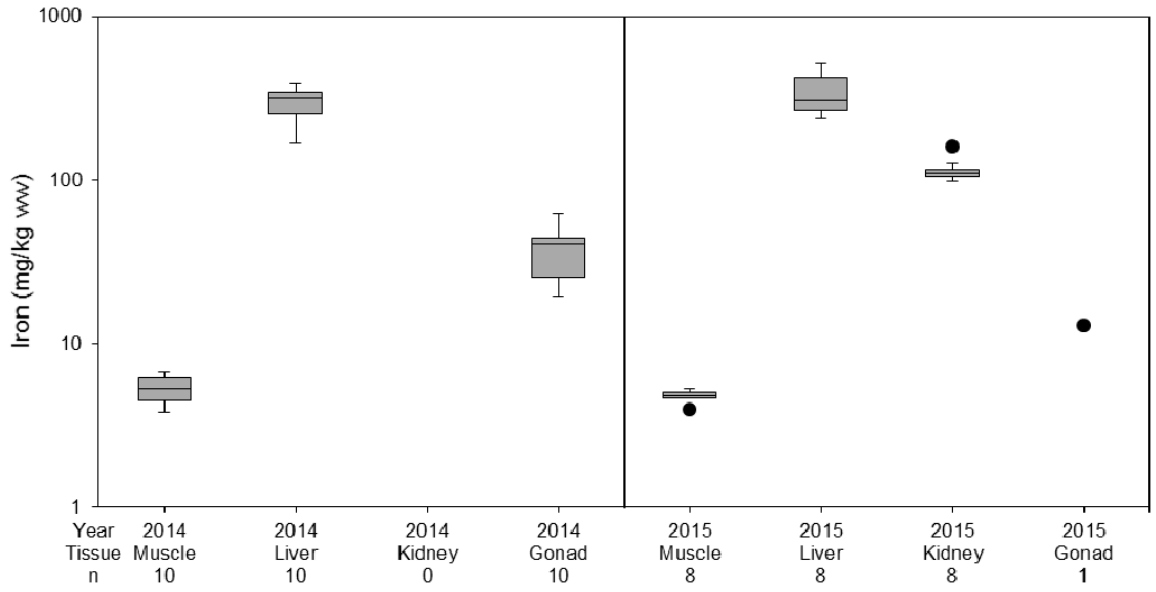
Figure 74: Iron Concentrations in Kokanee Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 75: Iron Concentrations in Kokanee Tissues Collected from Quesnel Lake near Quesnel River in 2014 and 2015

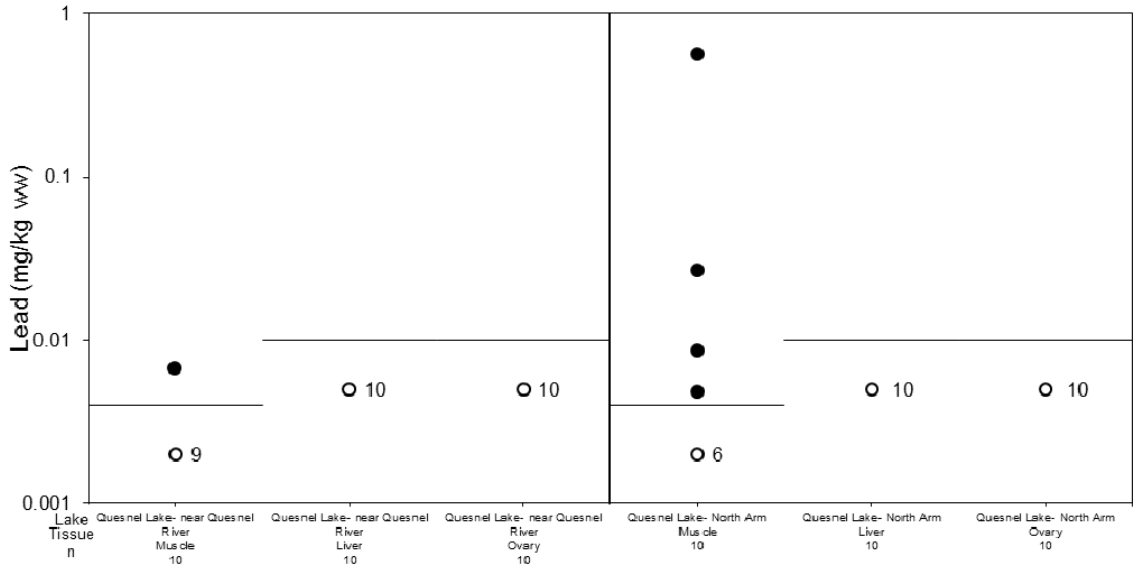


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

2.10 Lead

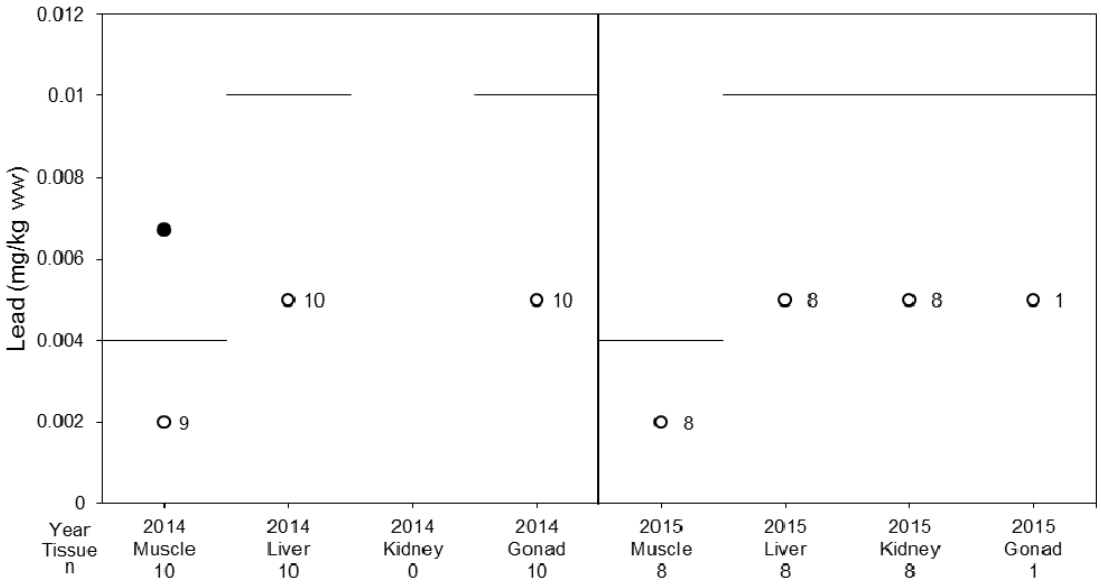
Figure 76: Lead Concentrations in Kokanee Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 77: Lead Concentrations in Kokanee Tissues Collected from Quesnel Lake near Quesnel River in 2014 and 2015

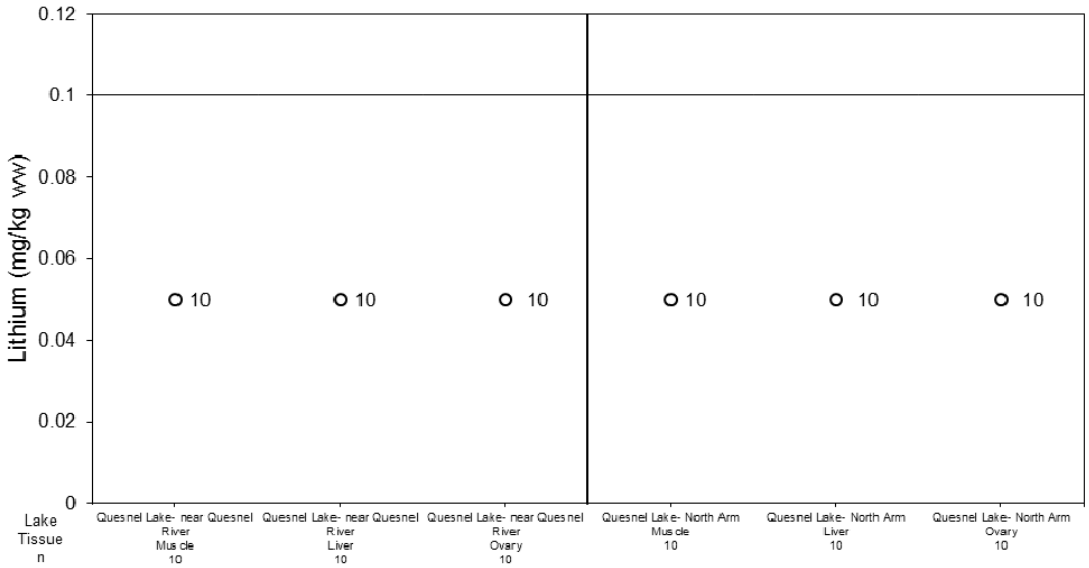


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

2.11 Lithium

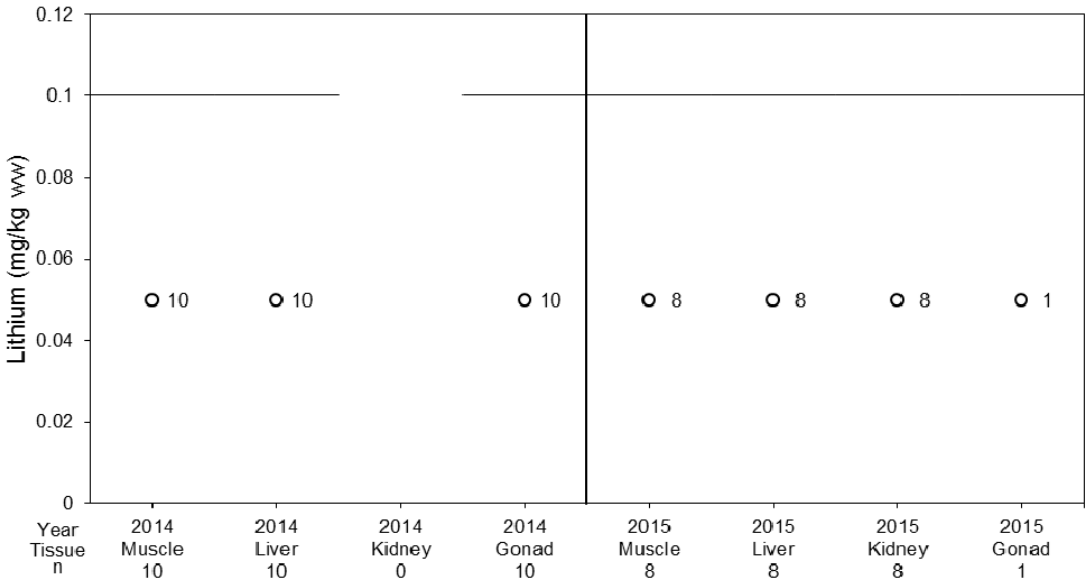
Figure 78: Lithium Concentrations in Kokanee Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 79: Lithium Concentrations in Kokanee Tissues Collected from Quesnel Lake near Quesnel River in 2014 and 2015

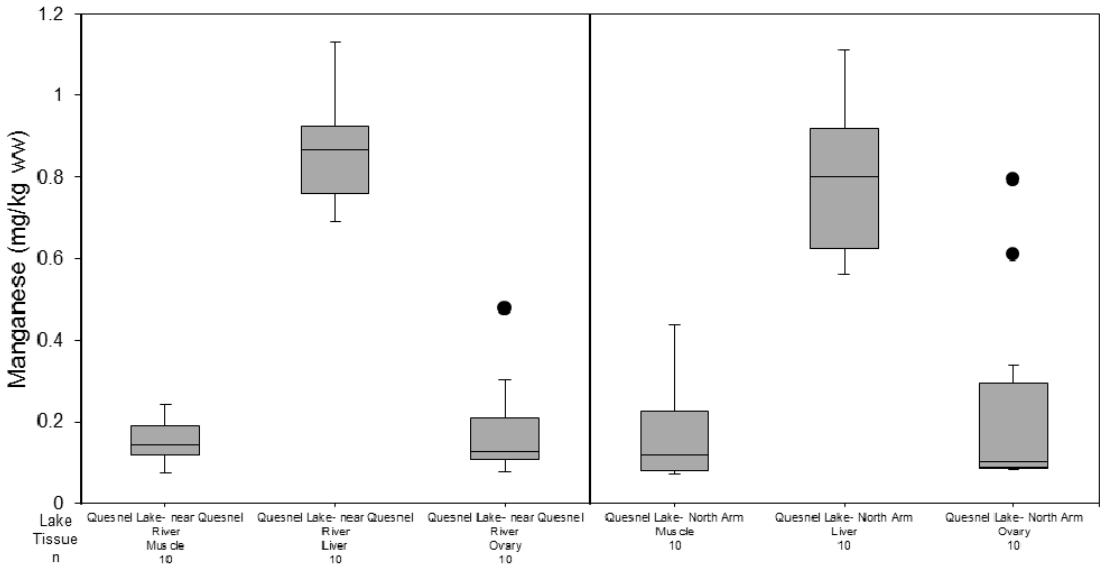


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

2.12 Manganese

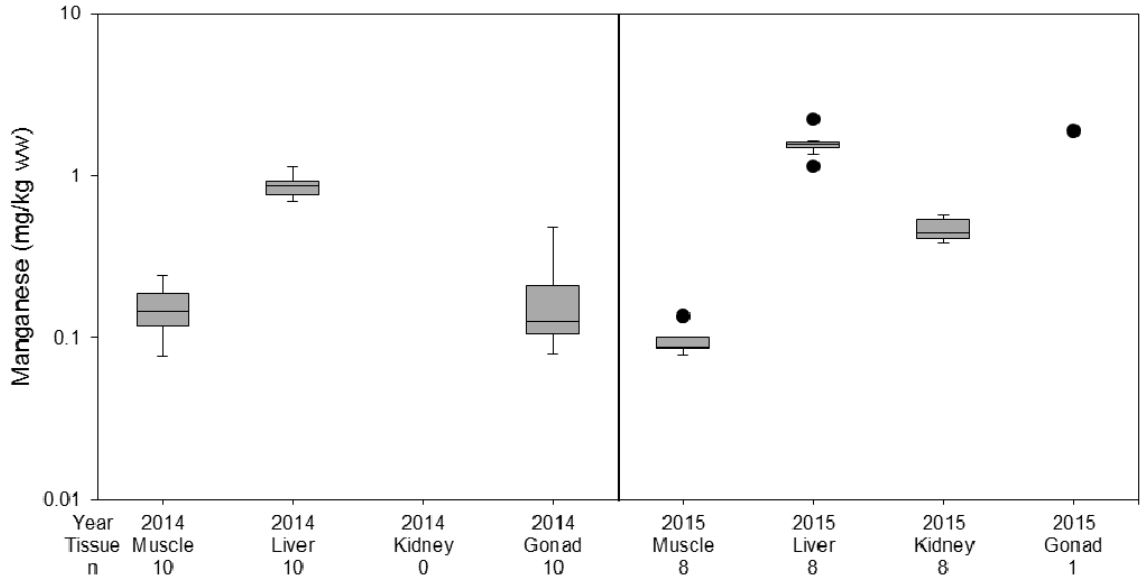
Figure 80: Manganese Concentrations in Kokanee Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 81: Manganese Concentrations in Kokanee Tissues Collected from Quesnel Lake near Quesnel River in 2014 and 2015

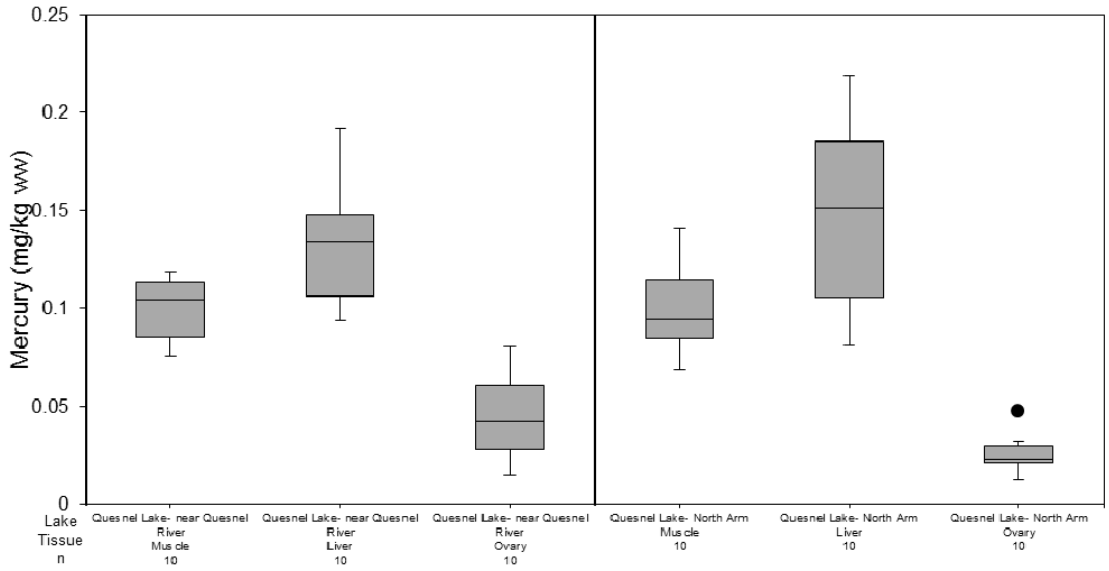


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

2.13 Mercury

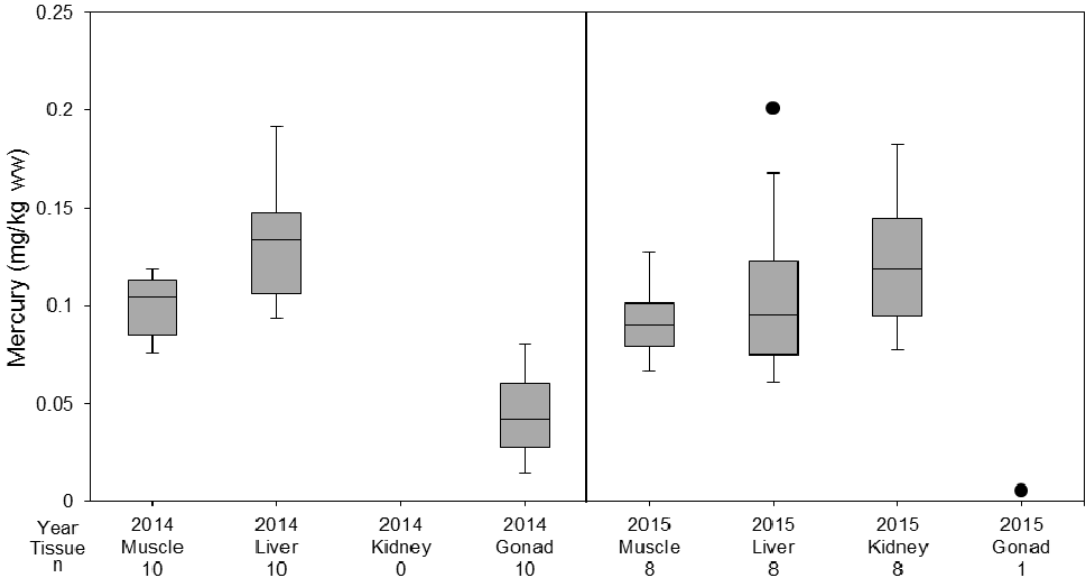
Figure 82: Mercury Concentrations in Kokanee Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 83: Mercury Concentrations in Kokanee Tissues Collected from Quesnel Lake near Quesnel River in 2014 and 2015

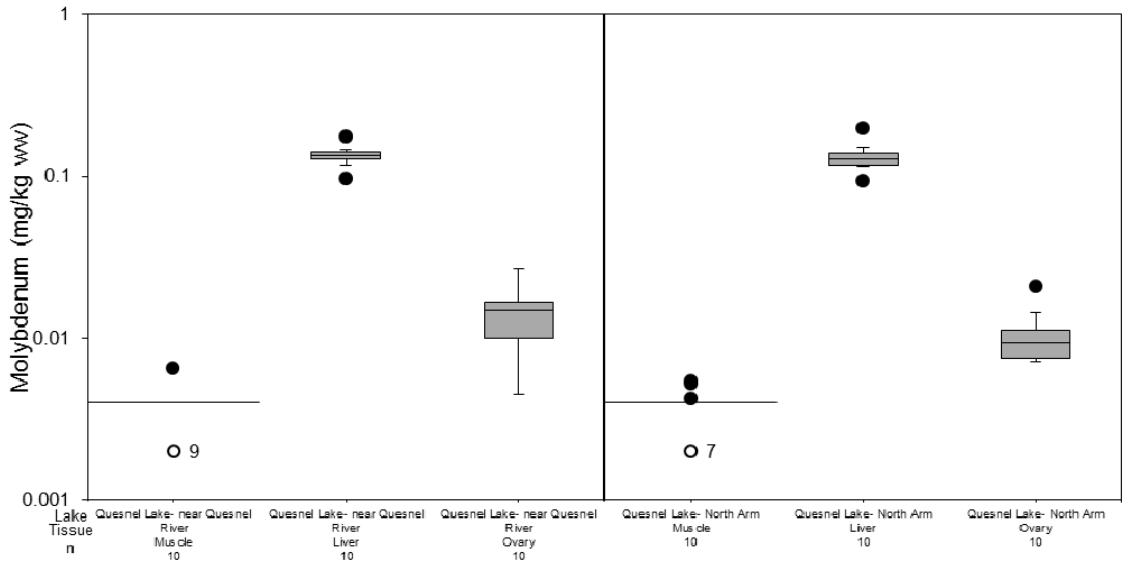


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

2.14 Molybdenum

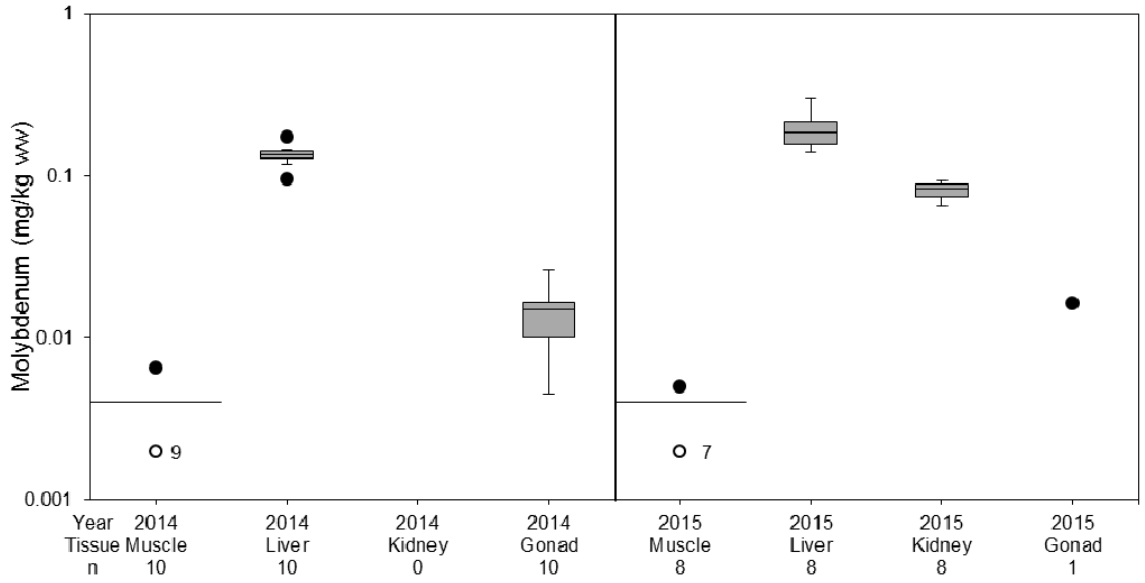
Figure 84: Molybdenum Concentrations in Kokanee Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 85: Molybdenum Concentrations in Kokanee Tissues Collected from Quesnel Lake near Quesnel River in 2014 and 2015

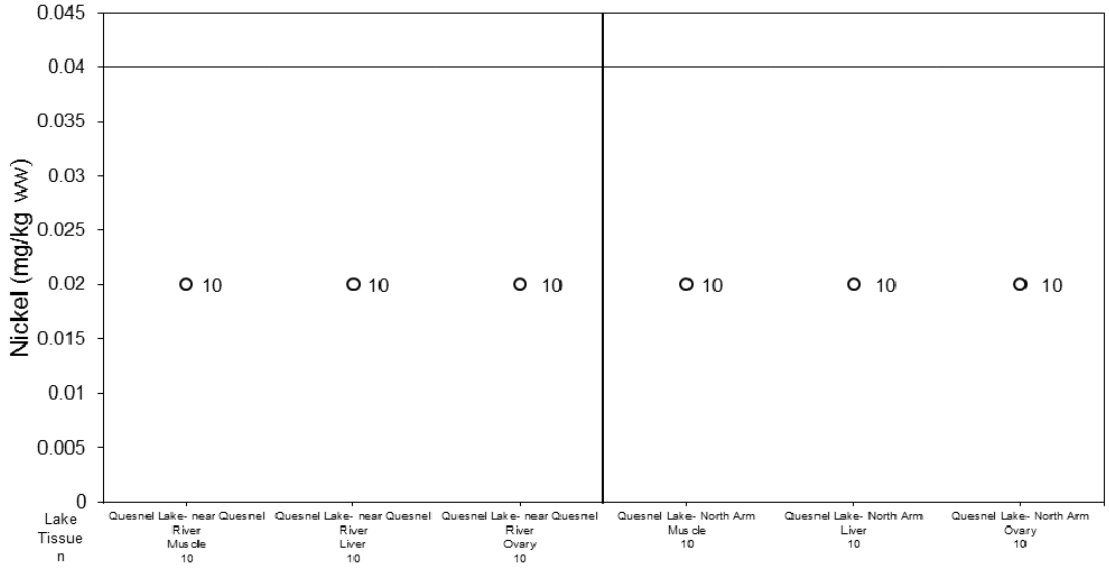


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

2.15 Nickel

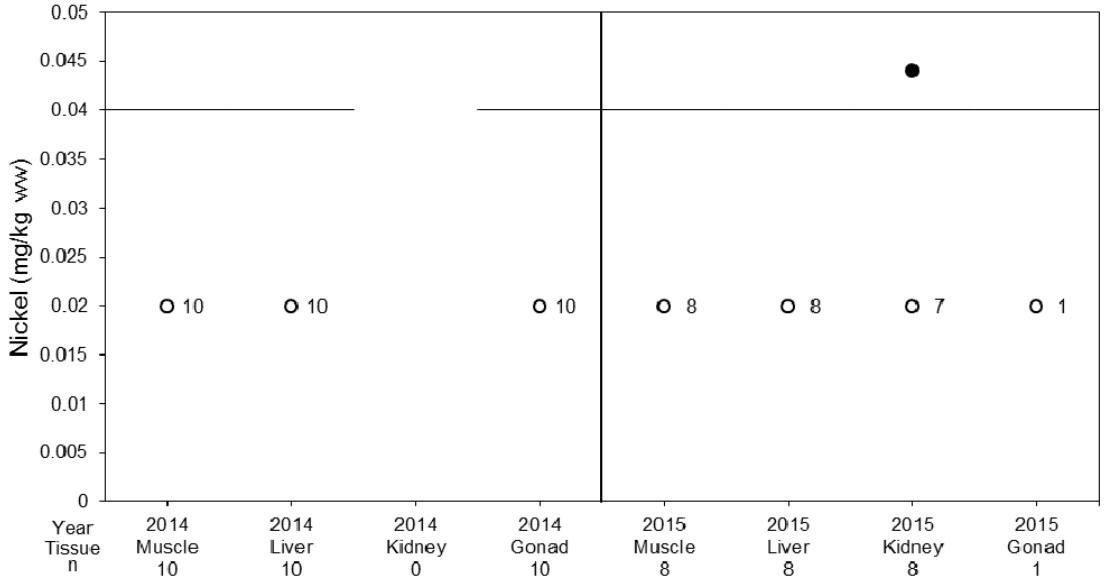
Figure 86: Nickel Concentrations in Kokanee Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 87: Nickel Concentrations in Kokanee Tissues Collected from Quesnel Lake near Quesnel River in 2014 and 2015

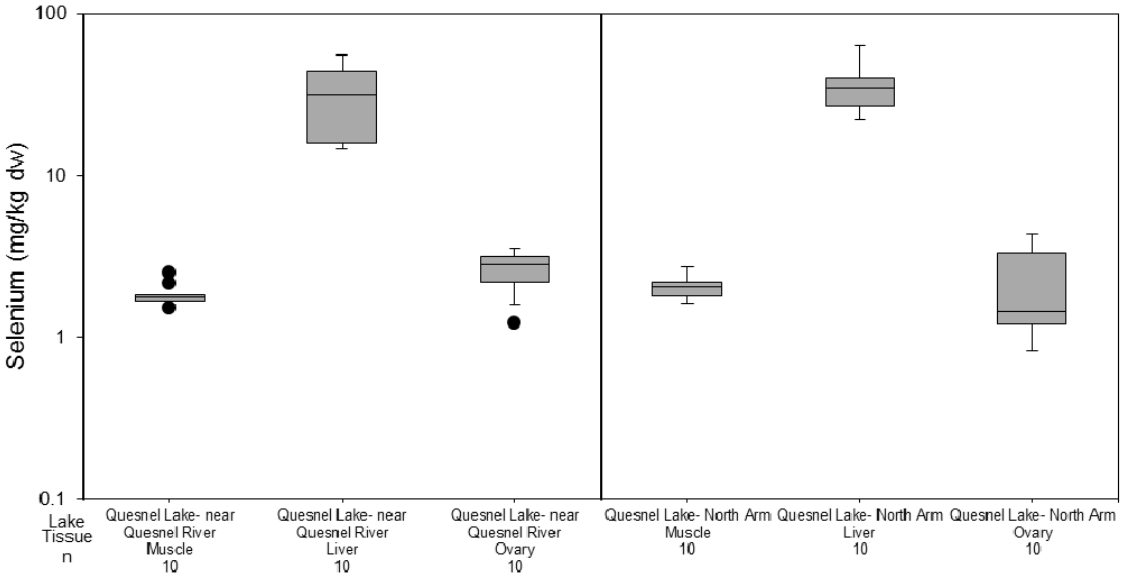


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

2.16 Selenium

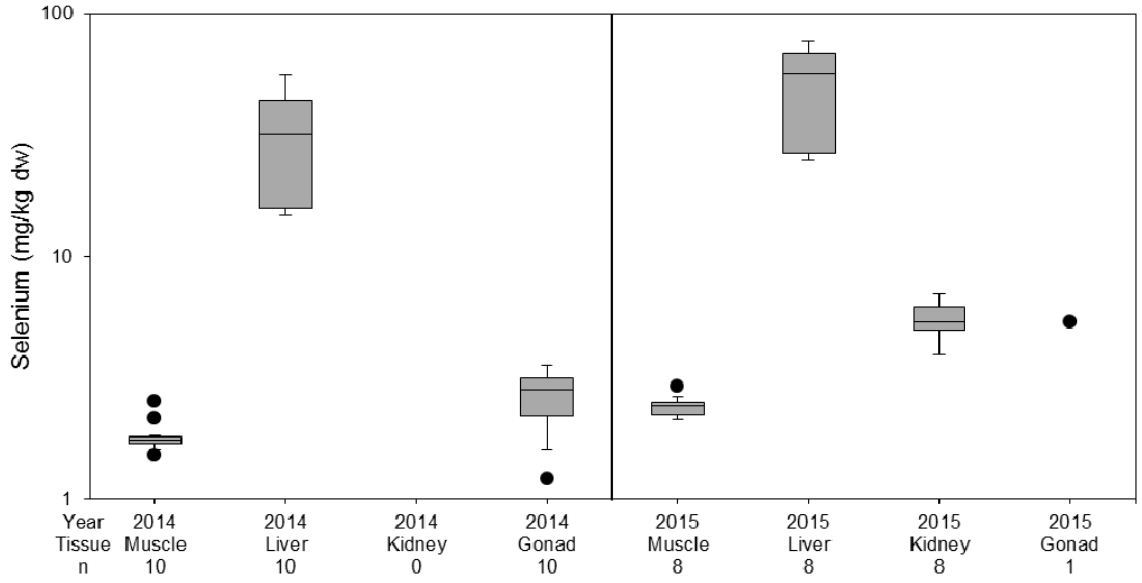
Figure 88: Selenium Concentrations in Kokanee Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 89: Selenium Concentrations in Kokanee Tissues Collected from Quesnel Lake near Quesnel River in 2014 and 2015

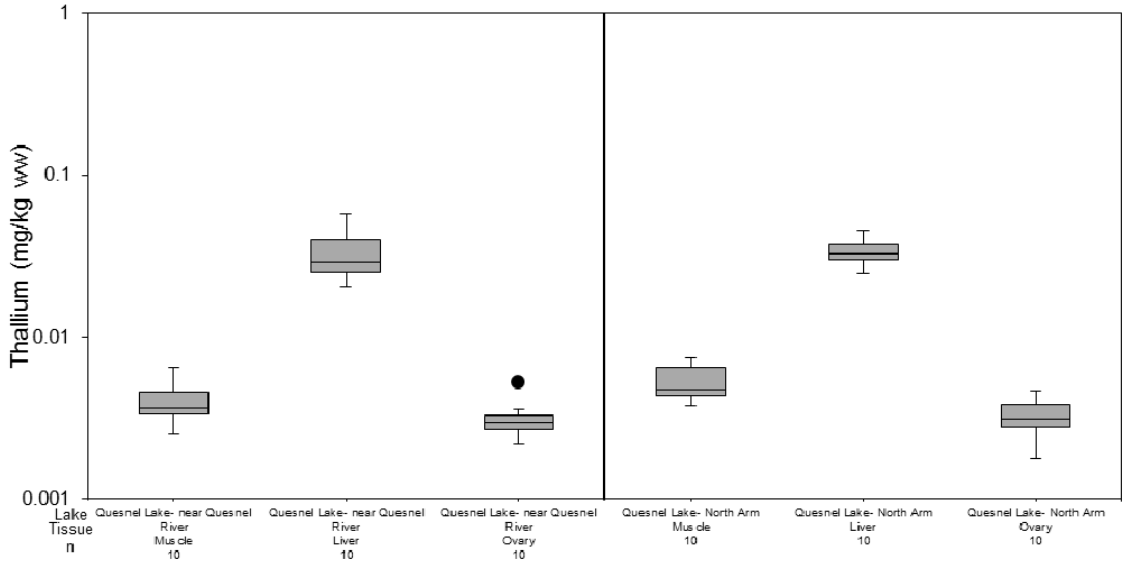


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg dw = milligrams per kilogram dry weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

2.17 Thallium

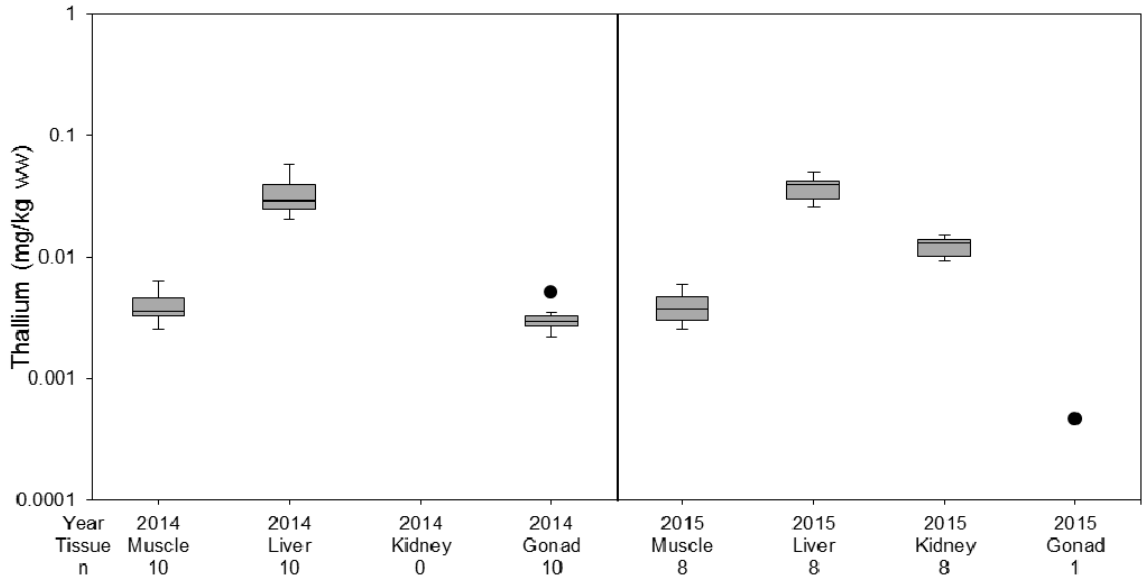
Figure 90: Thallium Concentrations in Kokanee Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 91: Thallium Concentrations in Kokanee Tissues Collected from Quesnel Lake near Quesnel River in 2014 and 2015

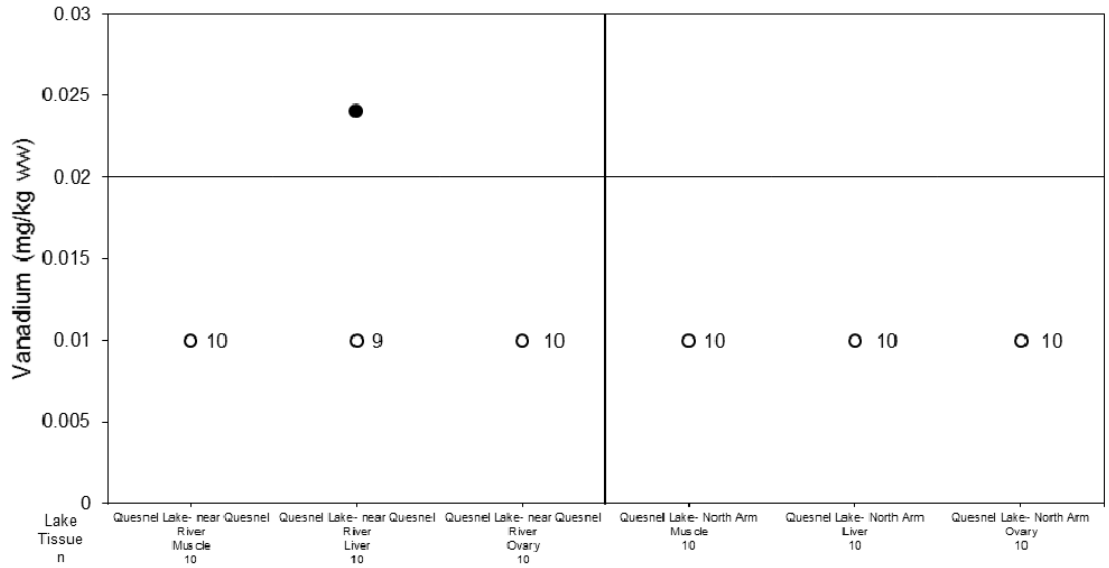


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

2.18 Vanadium

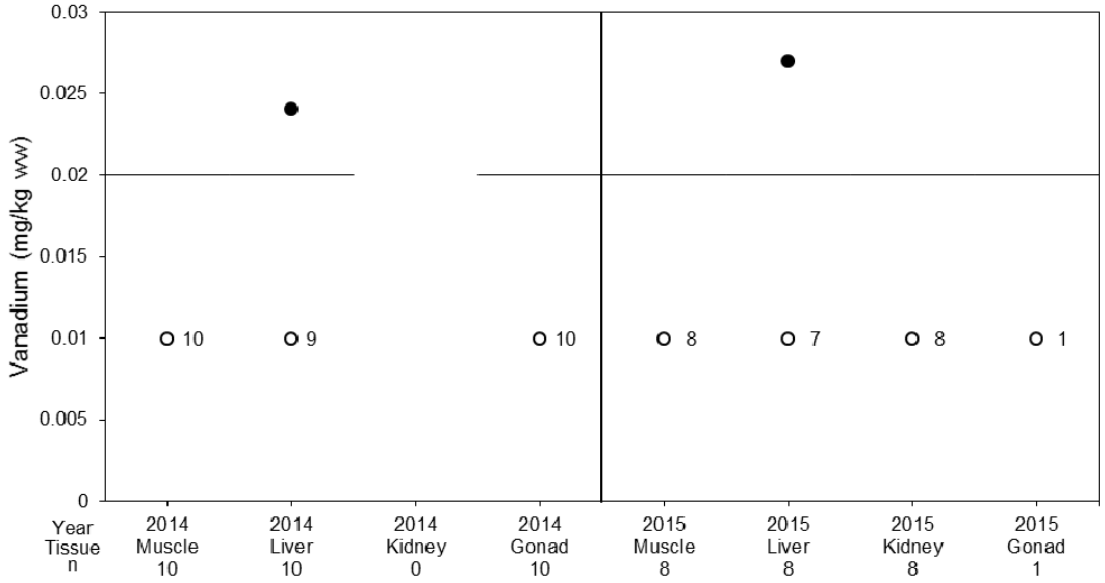
Figure 92: Vanadium Concentrations in Kokanee Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 93: Vanadium Concentrations in Kokanee Tissues Collected from Quesnel Lake near Quesnel River in 2014 and 2015

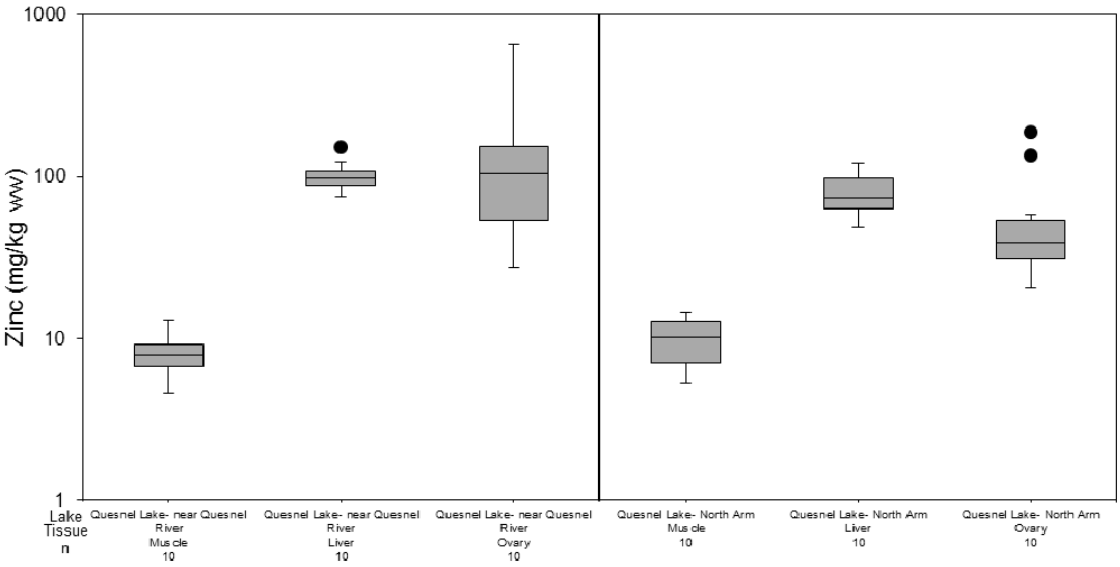


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

2.19 Zinc

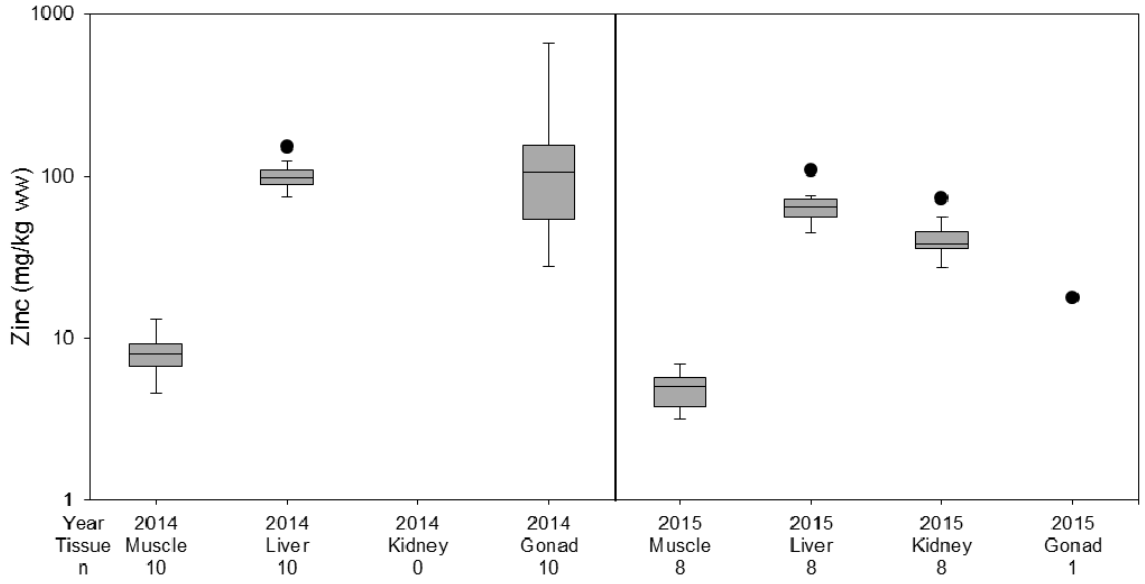
Figure 94: Zinc Concentrations in Kokanee Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 95: Zinc Concentrations in Kokanee Tissues Collected from Quesnel Lake near Quesnel River in 2014 and 2015



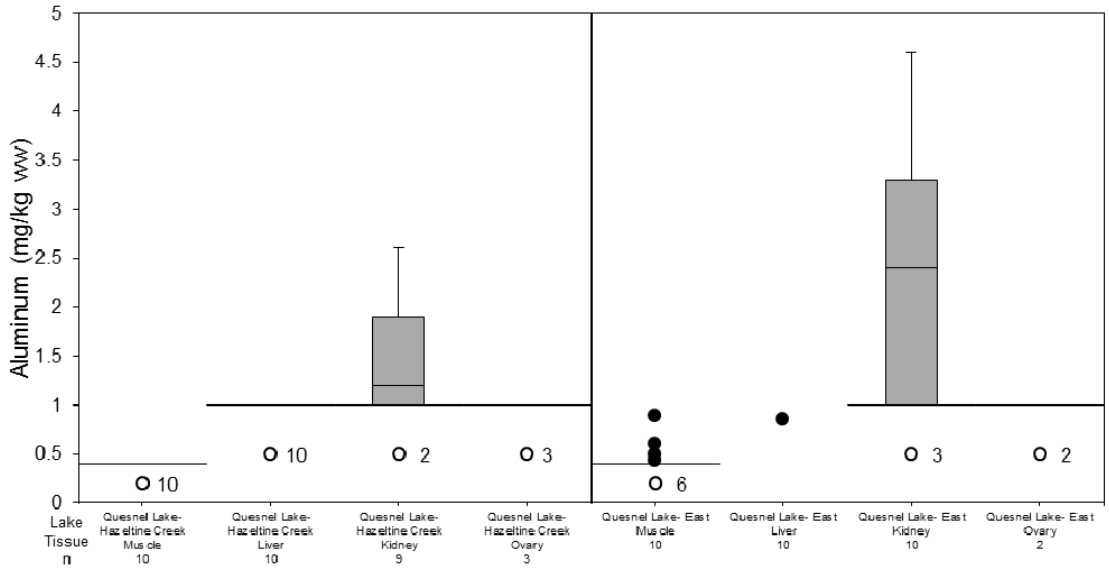
Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

3.0 LAKE TROUT

3.1 Aluminum

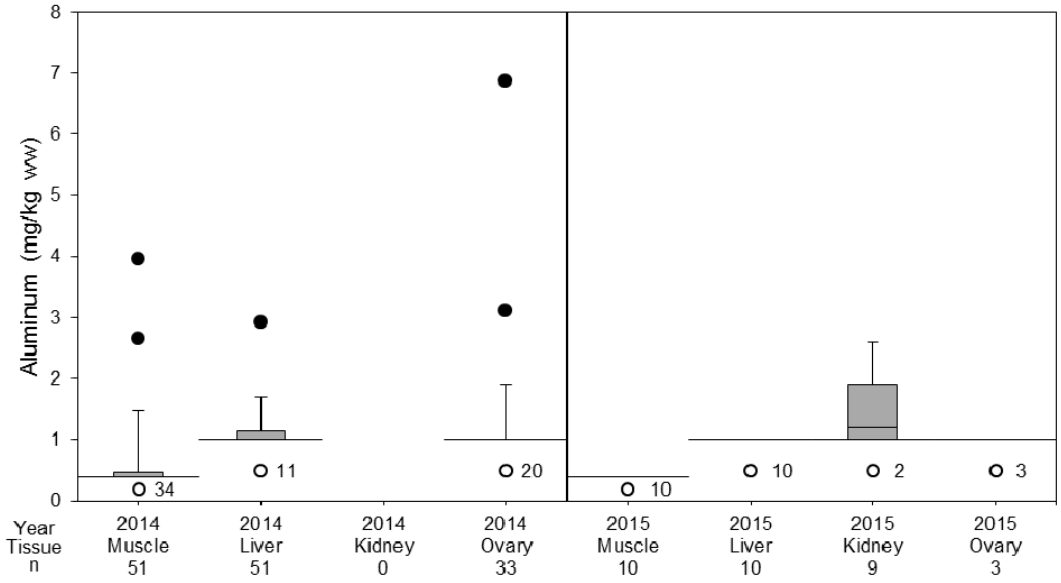
Figure 96: Aluminum Concentrations in Lake Trout Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 97: Aluminum Concentrations in Lake Trout Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

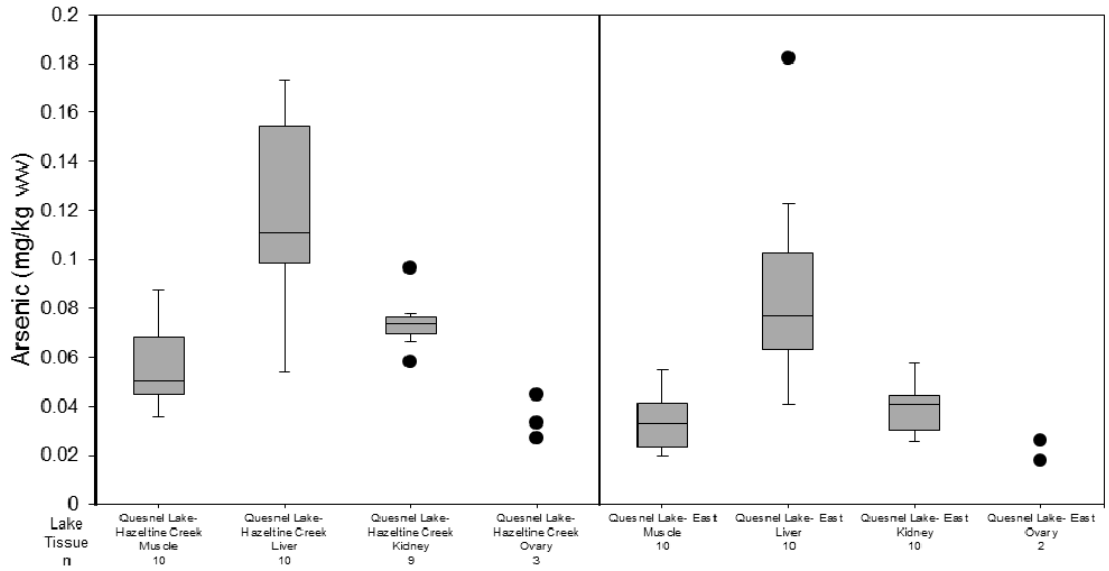


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

3.2 Arsenic

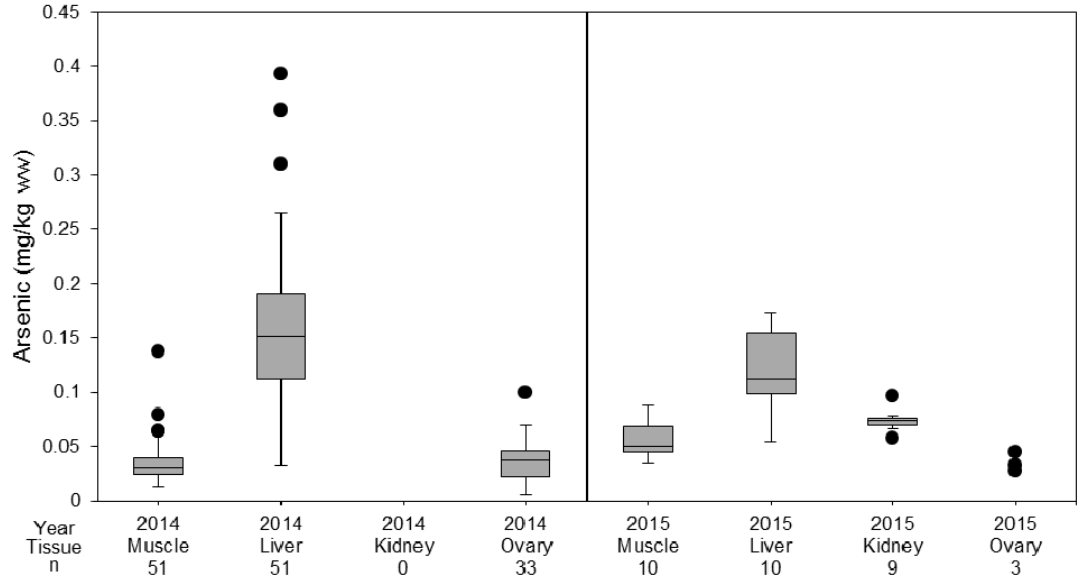
Figure 98: Arsenic Concentrations in Lake Trout Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 99: Arsenic Concentrations in Lake Trout Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

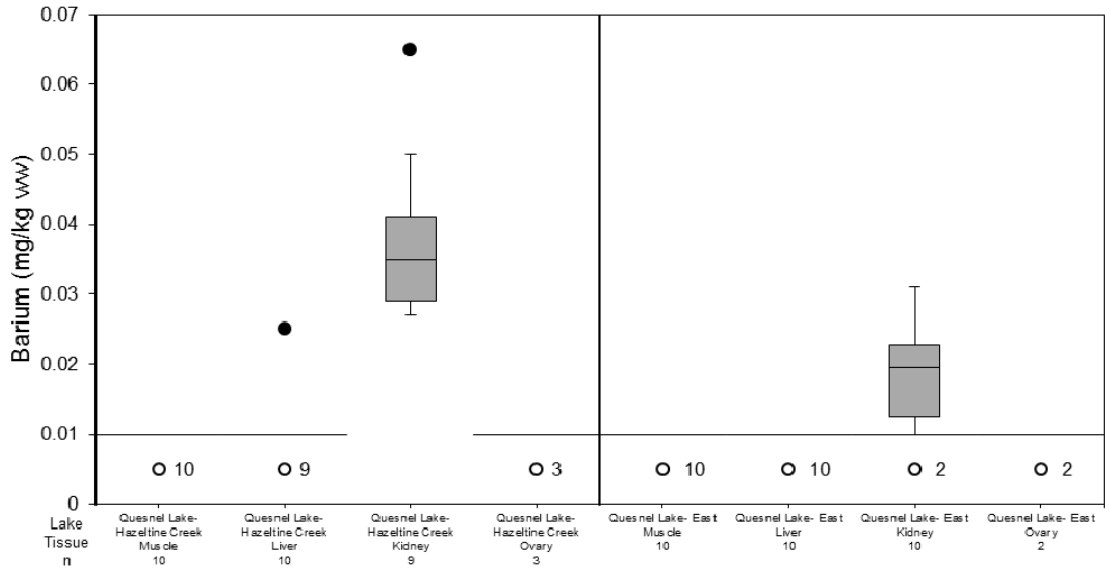


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

3.3 Barium

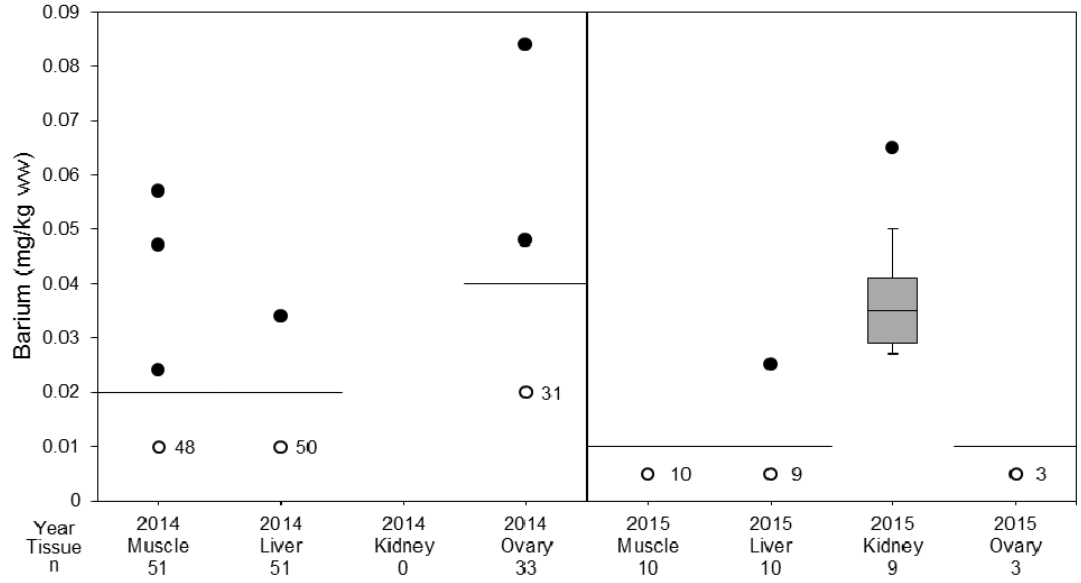
Figure 100: Barium Concentrations in Lake Trout Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 101: Barium Concentrations in Lake Trout Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

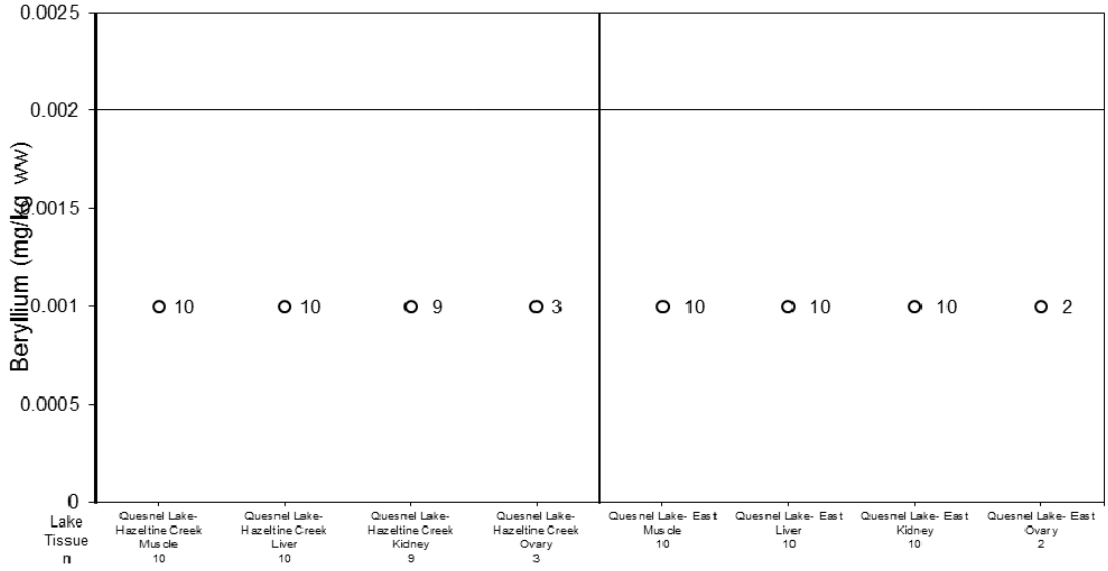


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

3.4 Beryllium

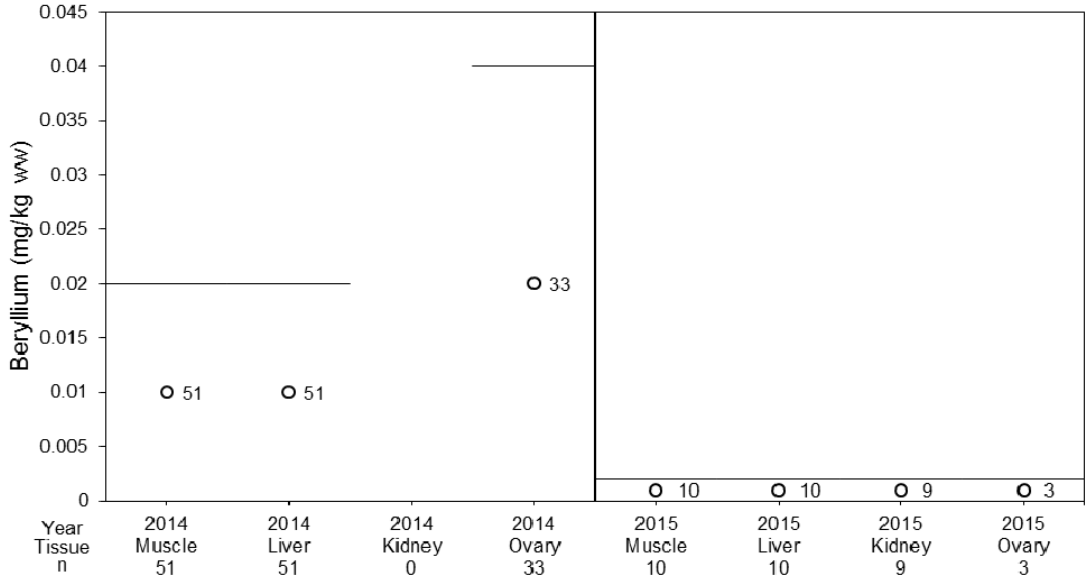
Figure 102: Beryllium Concentrations in Lake Trout Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 103: Beryllium Concentrations in Lake Trout Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

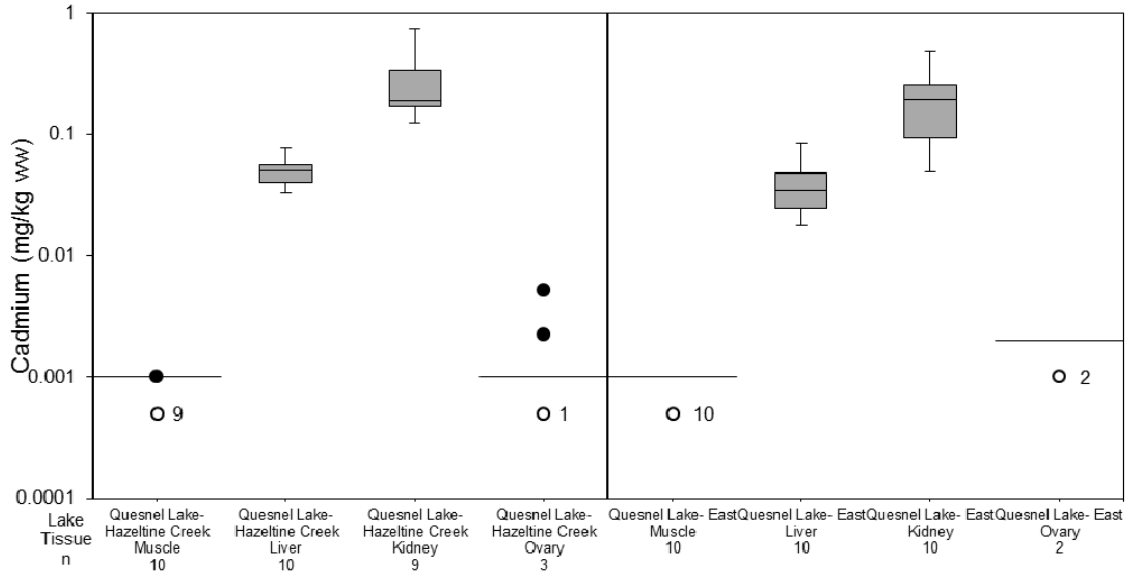


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

3.5 Cadmium

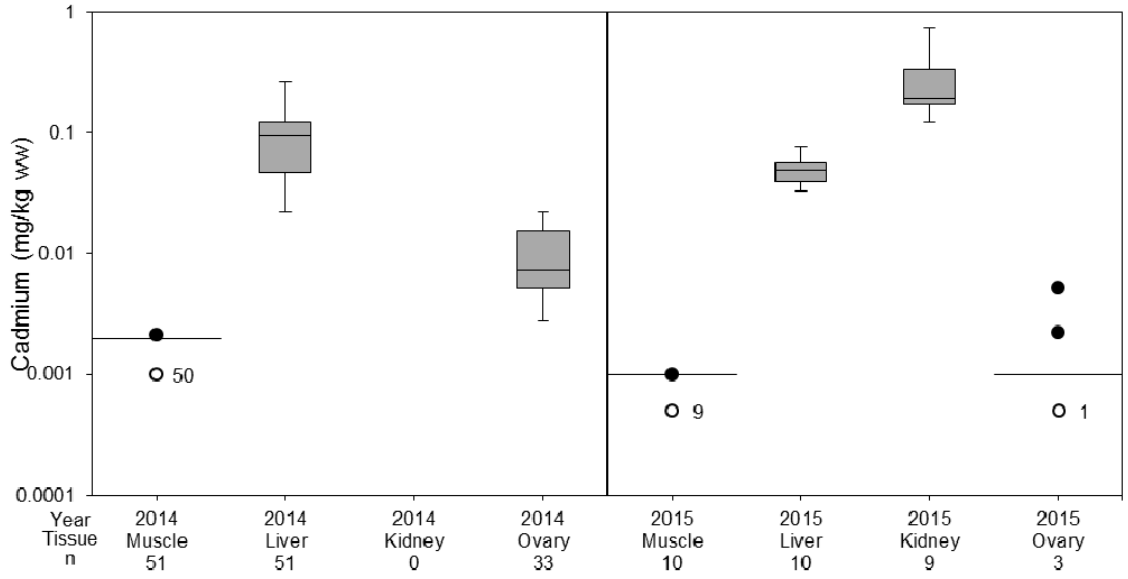
Figure 104: Cadmium Concentrations in Lake Trout Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 105: Cadmium Concentrations in Lake Trout Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

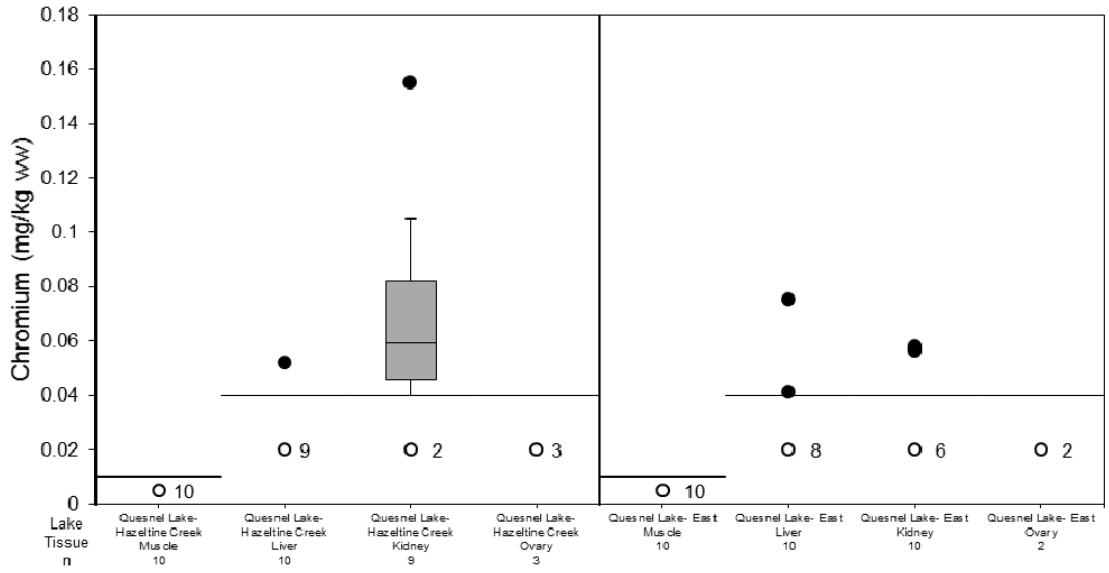


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

3.6 Chromium

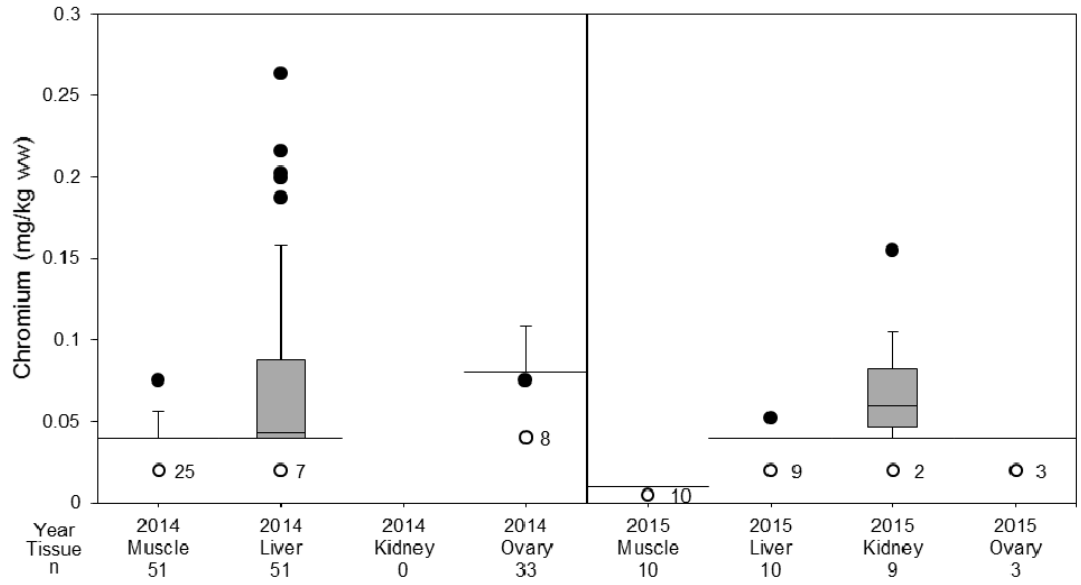
Figure 106: Chromium Concentrations in Lake Trout Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 107: Chromium Concentrations in Lake Trout Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

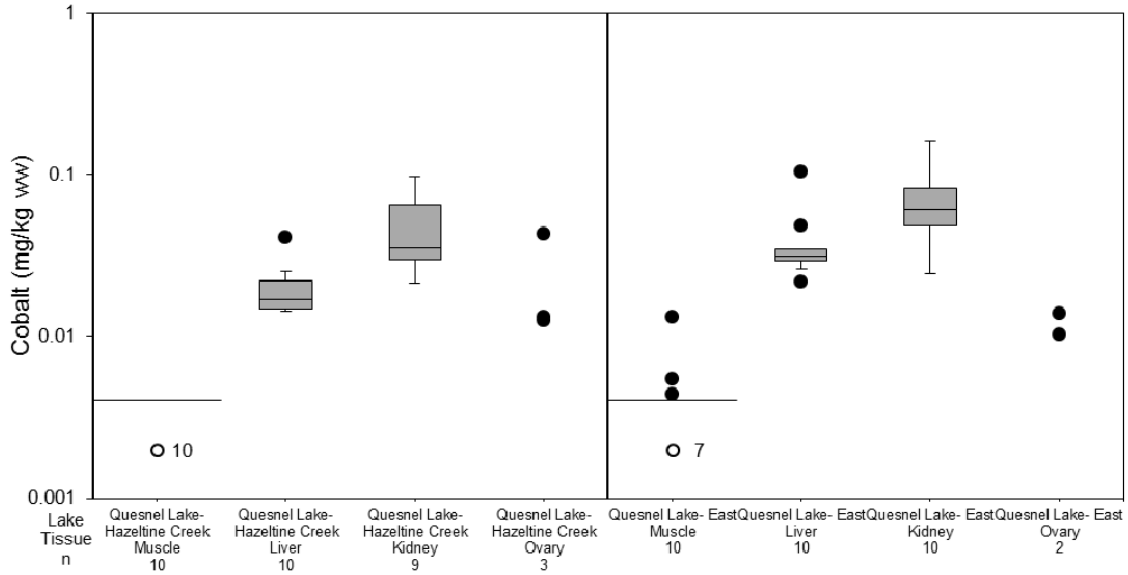


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

3.7 Cobalt

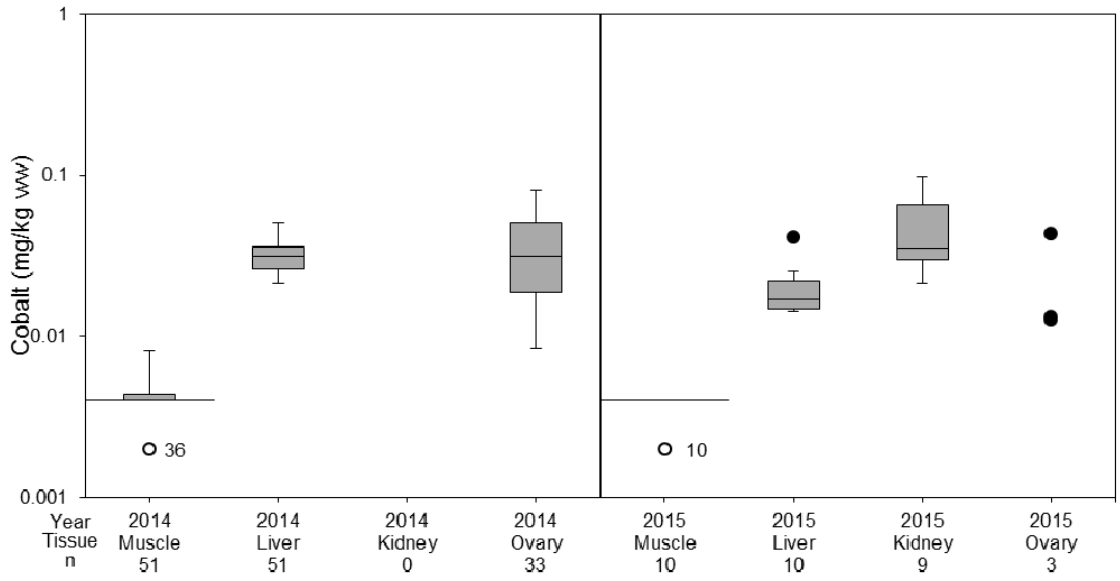
Figure 108: Cobalt Concentrations in Lake Trout Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 109: Cobalt Concentrations in Lake Trout Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

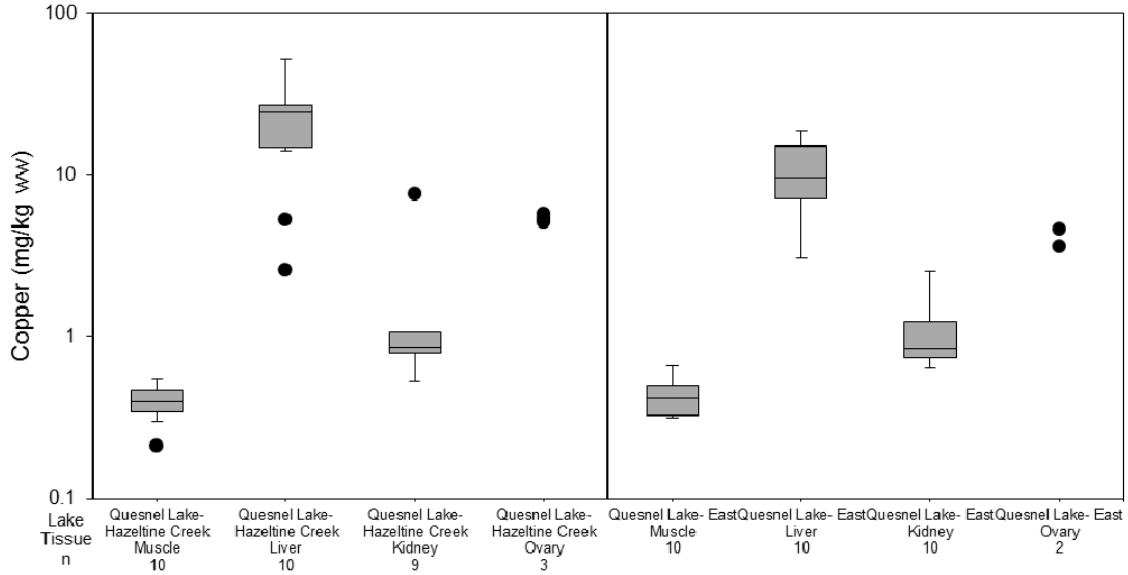


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

3.8 Copper

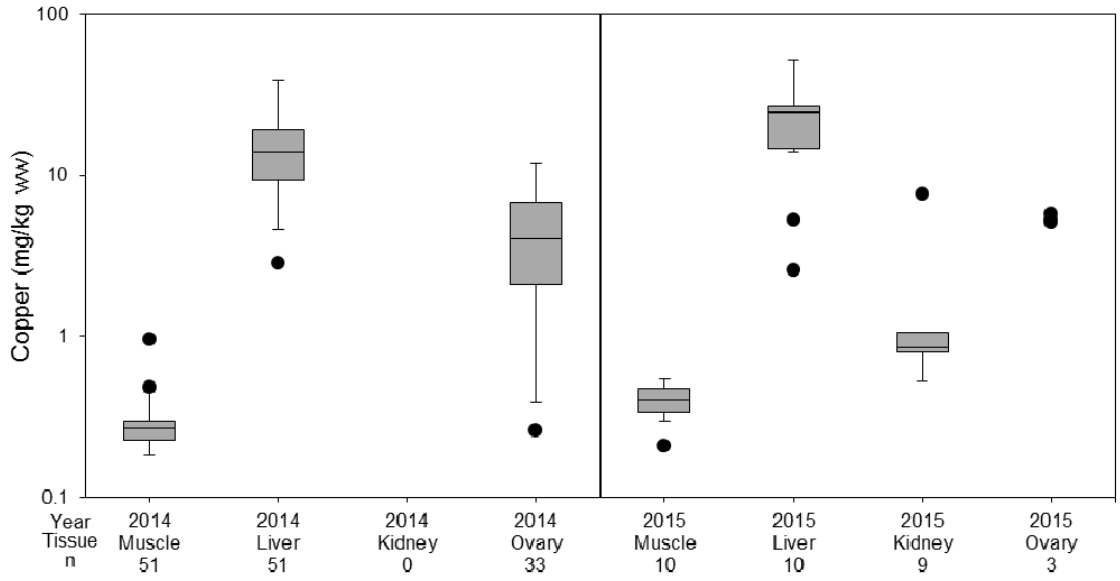
Figure 110: Copper Concentrations in Lake Trout Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 111: Copper Concentrations in Lake Trout Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

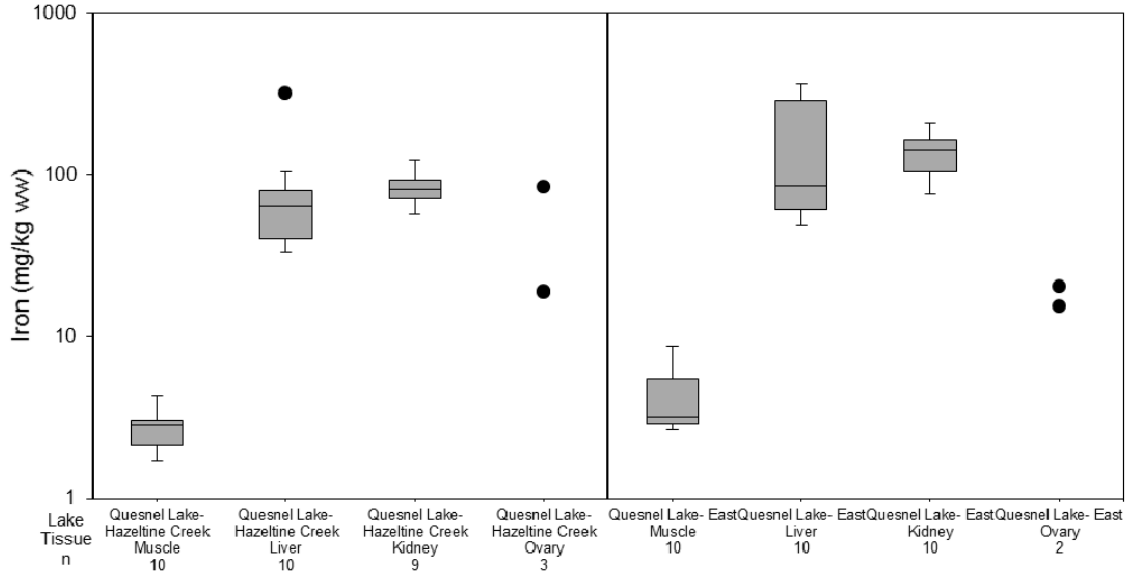


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

3.9 Iron

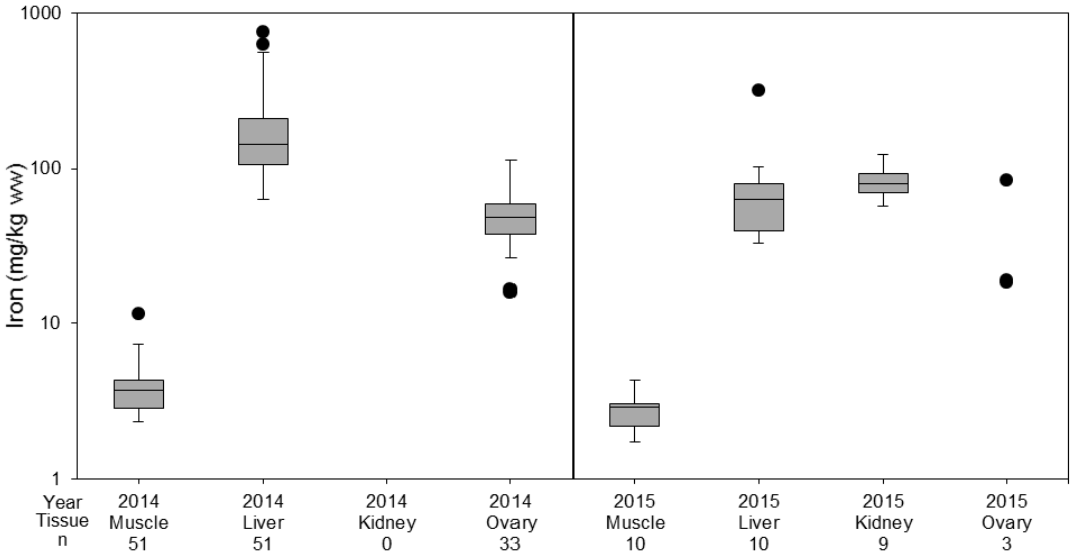
Figure 112: Iron Concentrations in Lake Trout Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 113: Iron Concentrations in Lake Trout Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

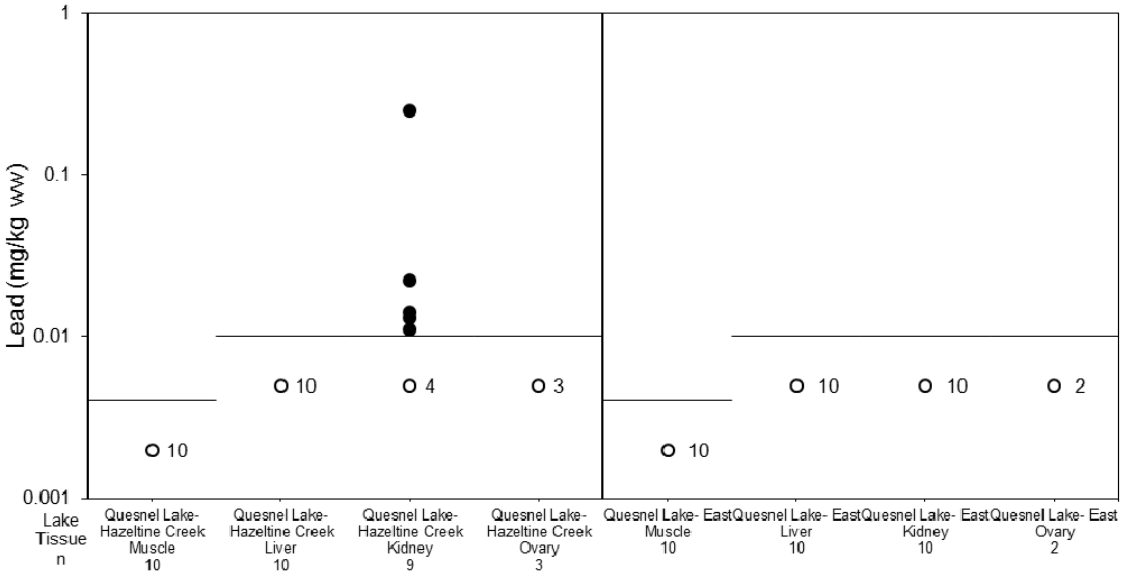


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

3.10 Lead

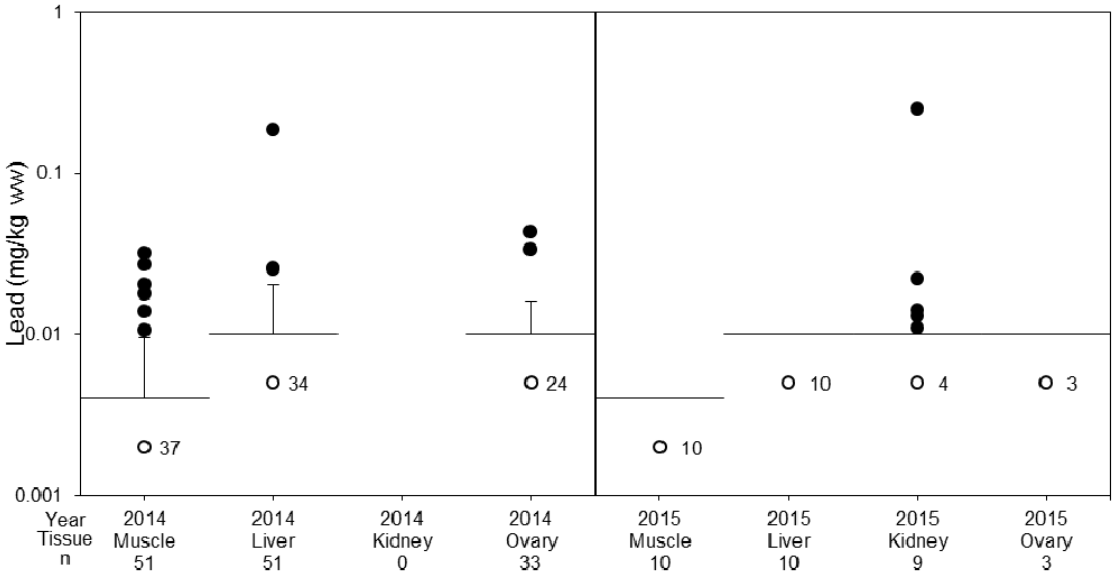
Figure 114: Lead Concentrations in Lake Trout Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 115: Lead Concentrations in Lake Trout Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

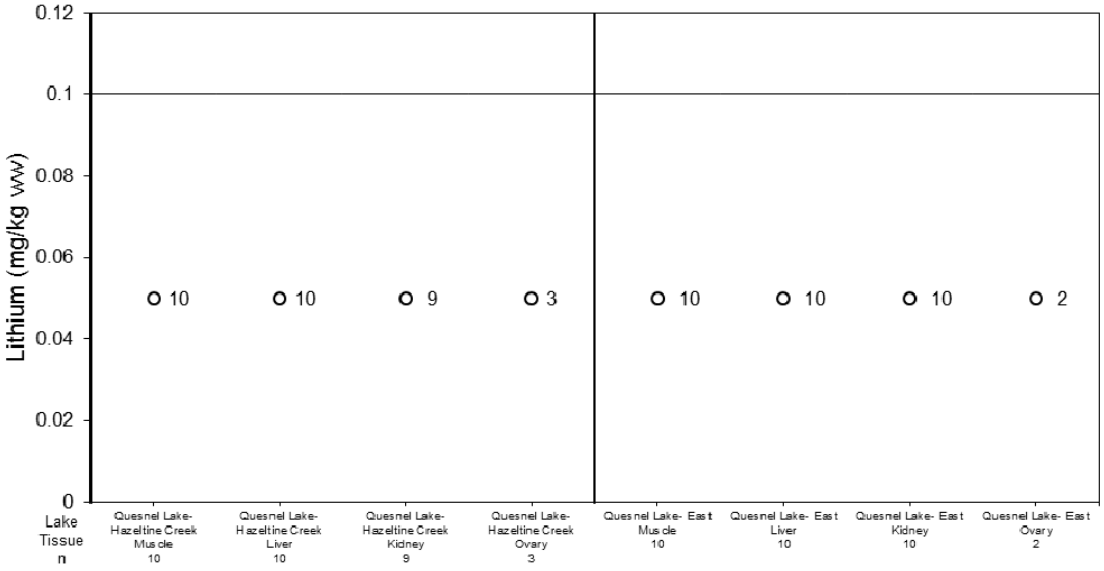


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

3.11 Lithium

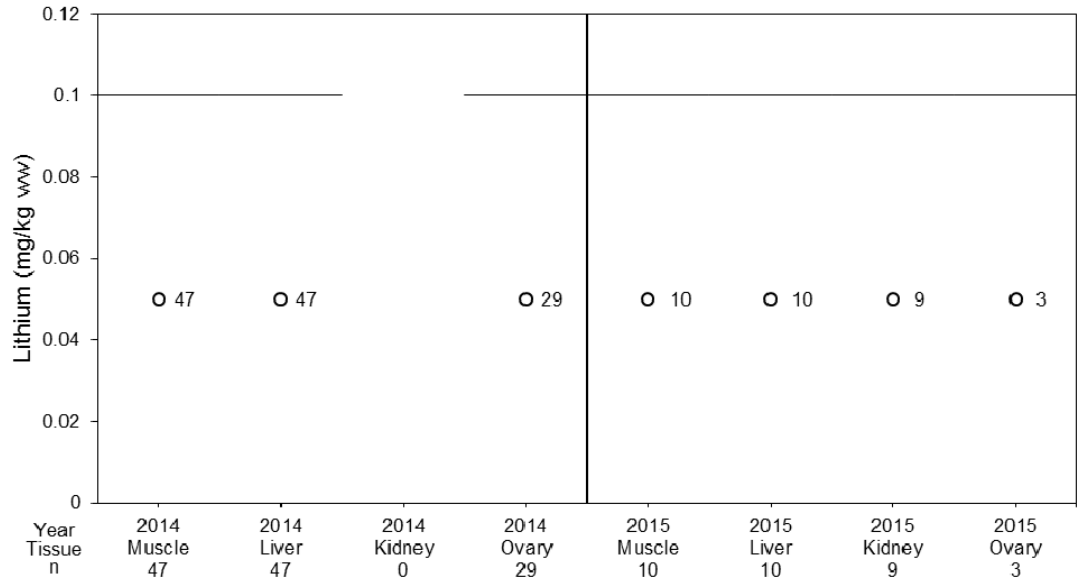
Figure 116: Lithium Concentrations in Lake Trout Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 117: Lithium Concentrations in Lake Trout Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

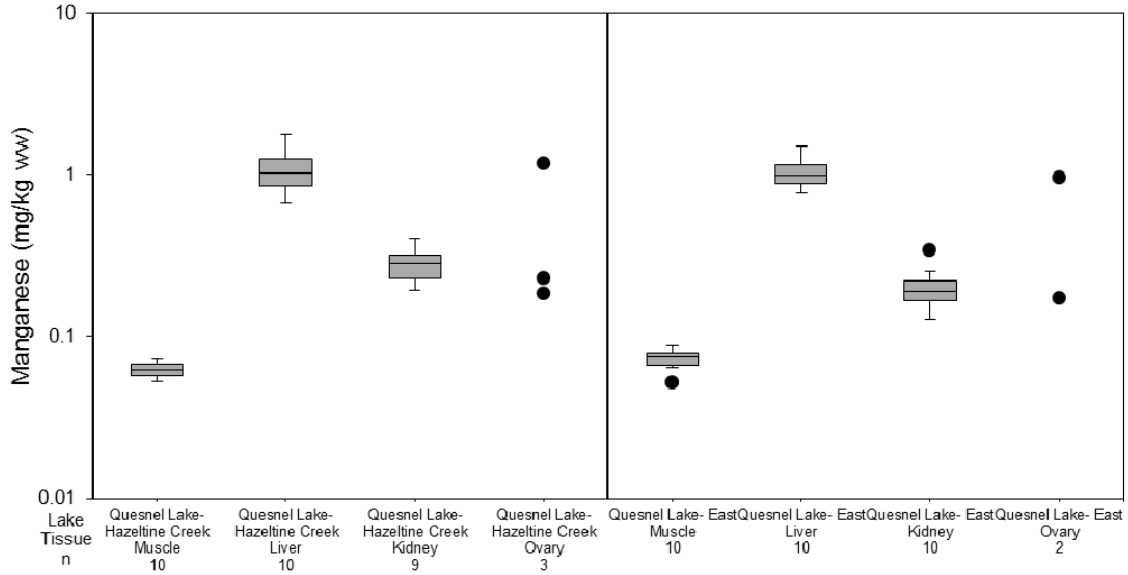


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

3.12 Manganese

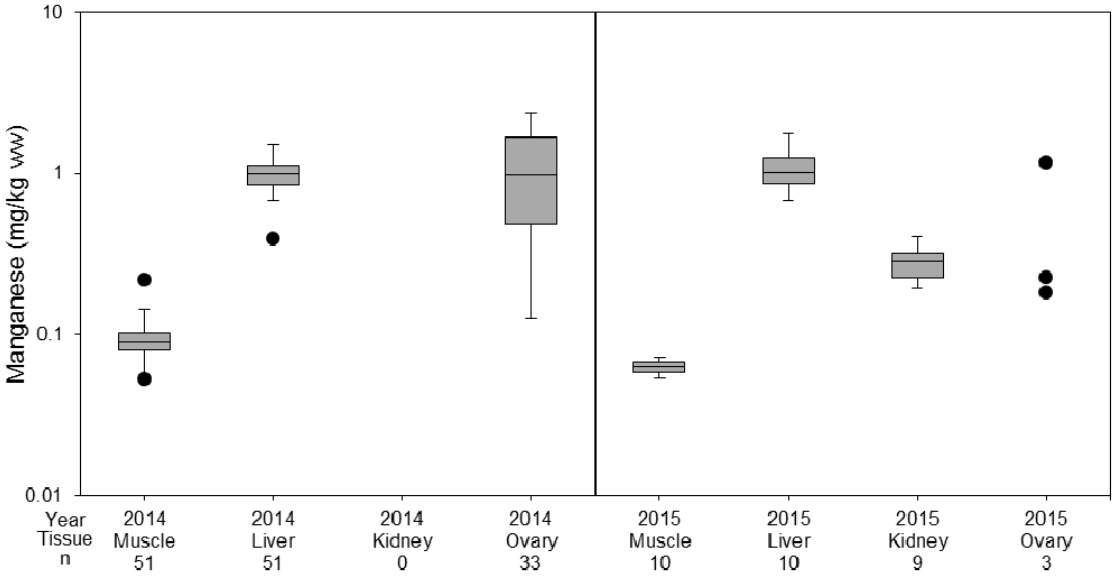
Figure 118: Manganese Concentrations in Lake Trout Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 119: Manganese Concentrations in Lake Trout Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

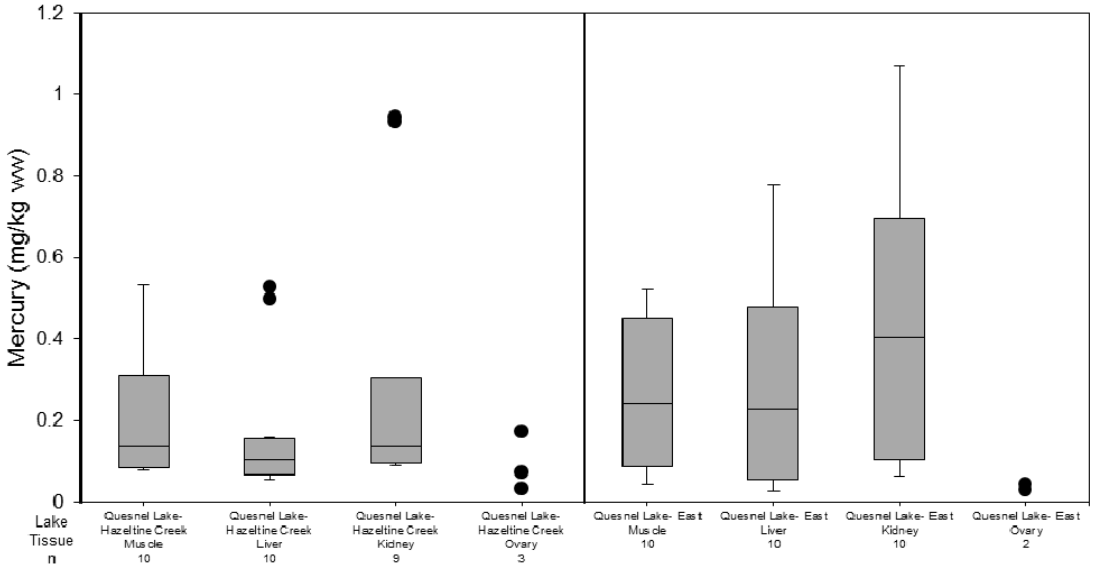


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

3.13 Mercury

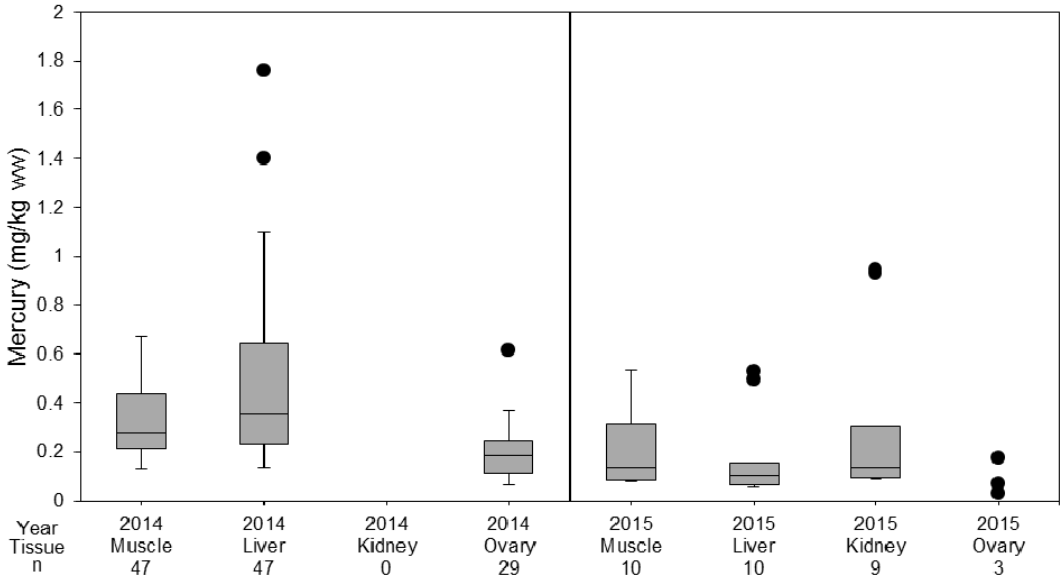
Figure 120: Mercury Concentrations in Lake Trout Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 121: Mercury Concentrations in Lake Trout Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

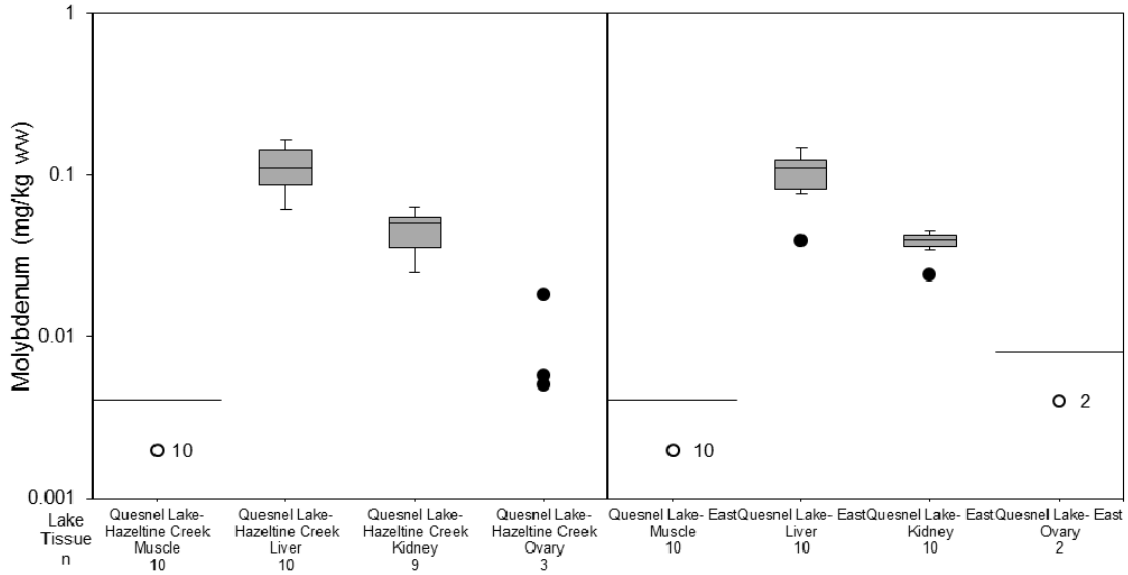


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

3.14 Molybdenum

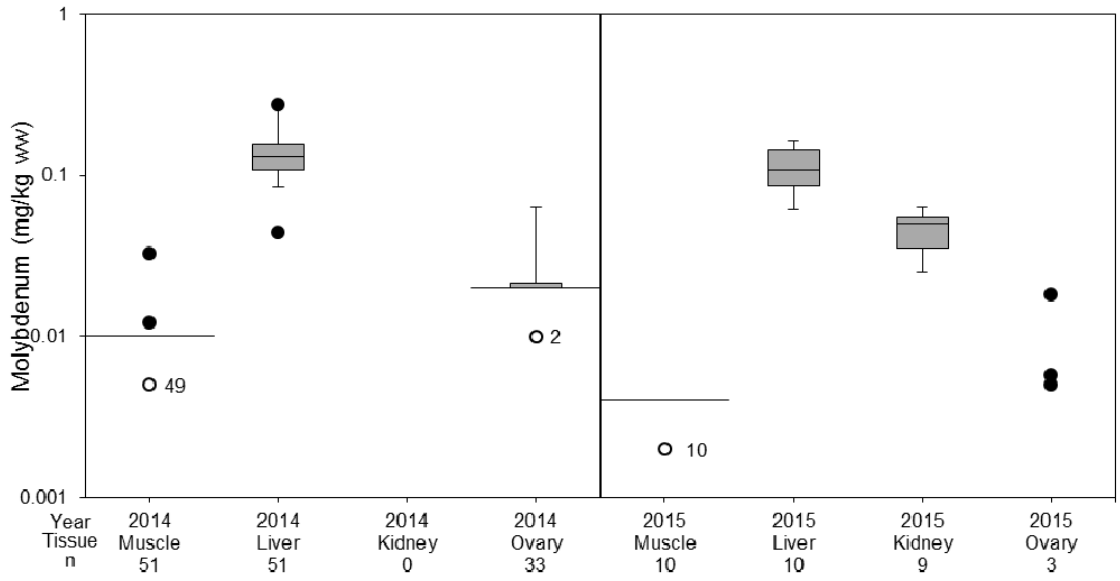
Figure 122: Molybdenum Concentrations in Lake Trout Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 123: Molybdenum Concentrations in Lake Trout Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

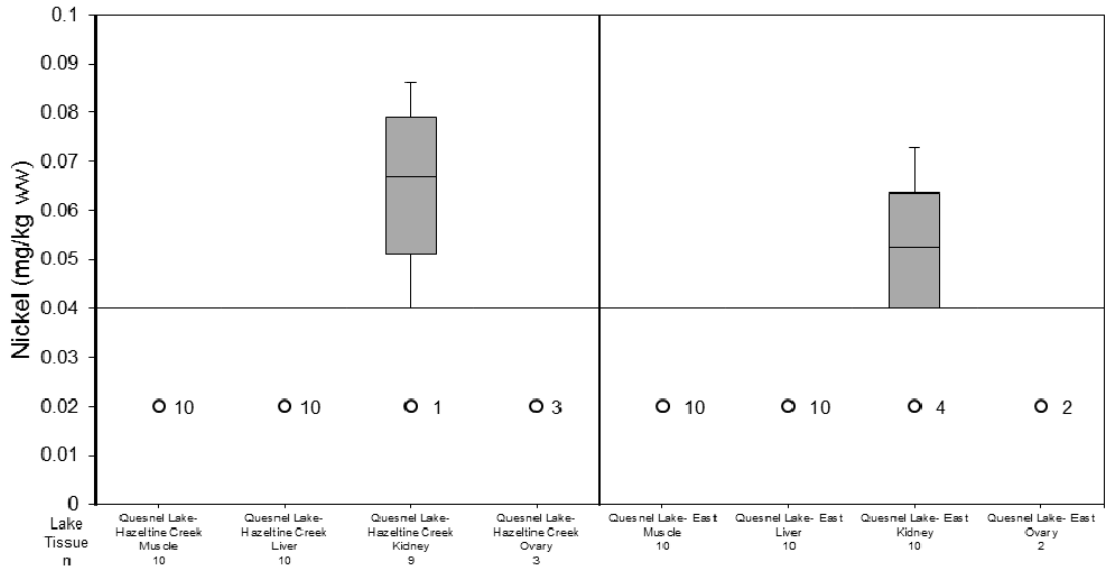


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

3.15 Nickel

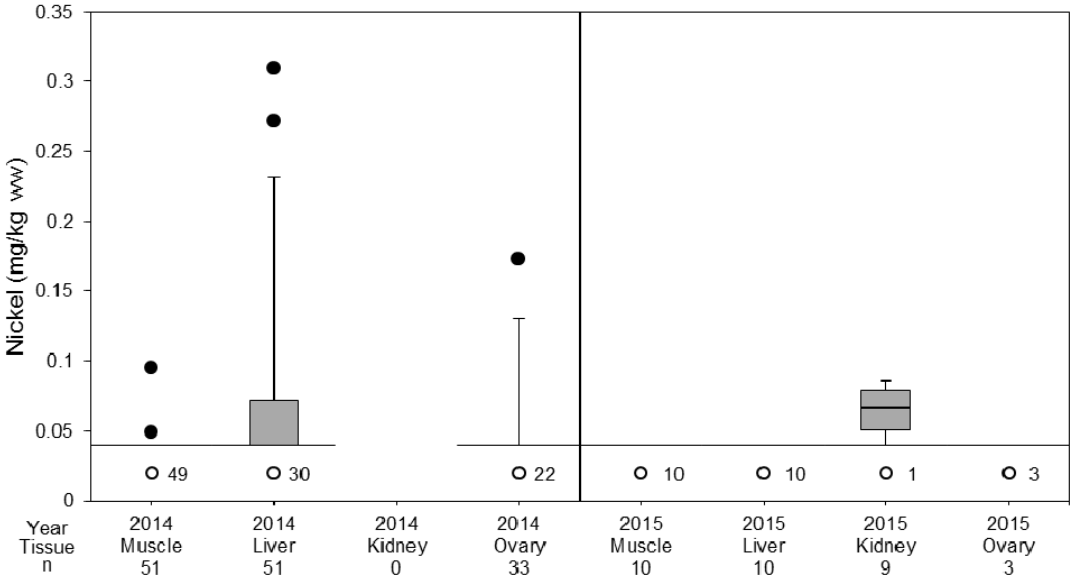
Figure 124: Nickel Concentrations in Lake Trout Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 125: Nickel Concentrations in Lake Trout Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

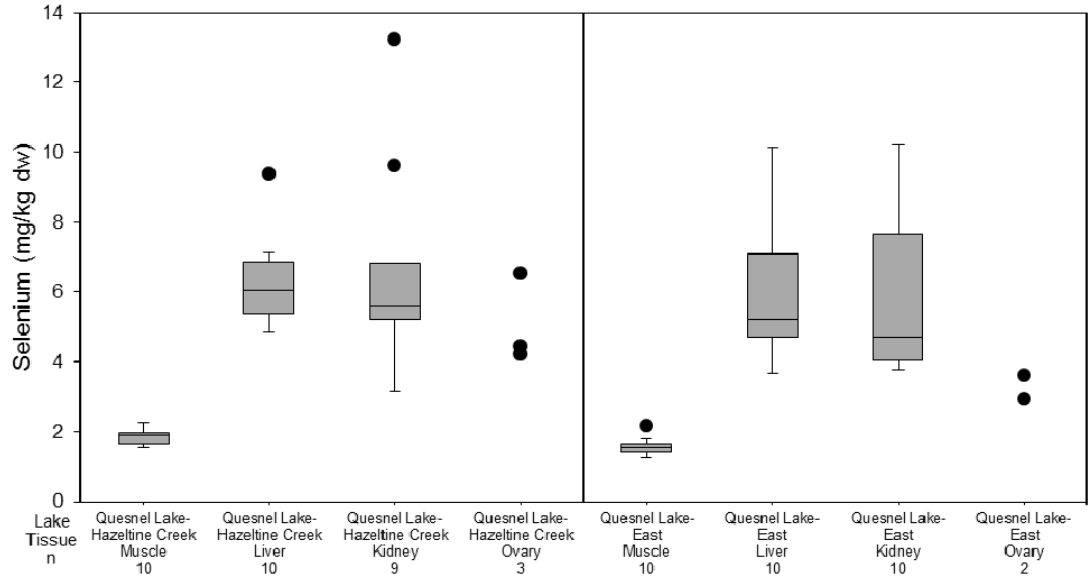


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

3.16 Selenium

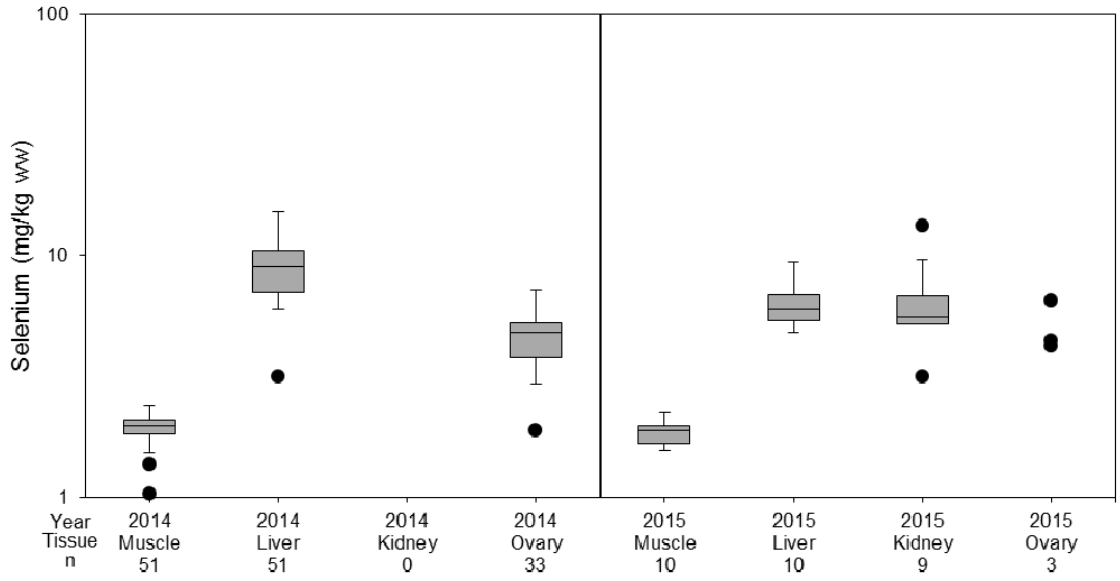
Figure 126: Selenium Concentrations in Lake Trout Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg dw = milligrams per kilogram dry weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 127: Selenium Concentrations in Lake Trout Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

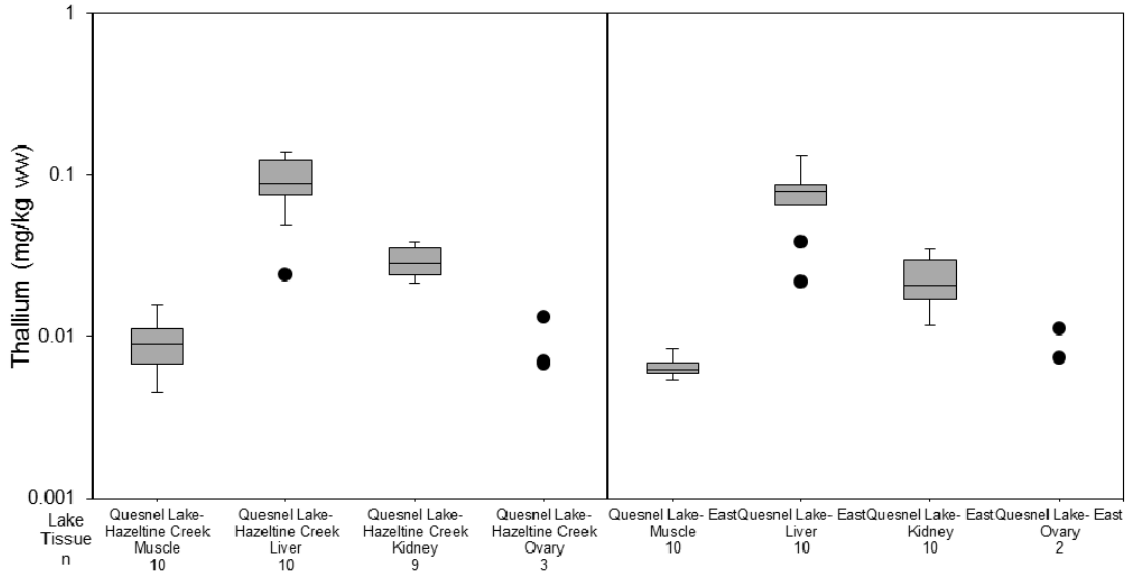


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg dw = milligrams per kilogram dry weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

3.17 Thallium

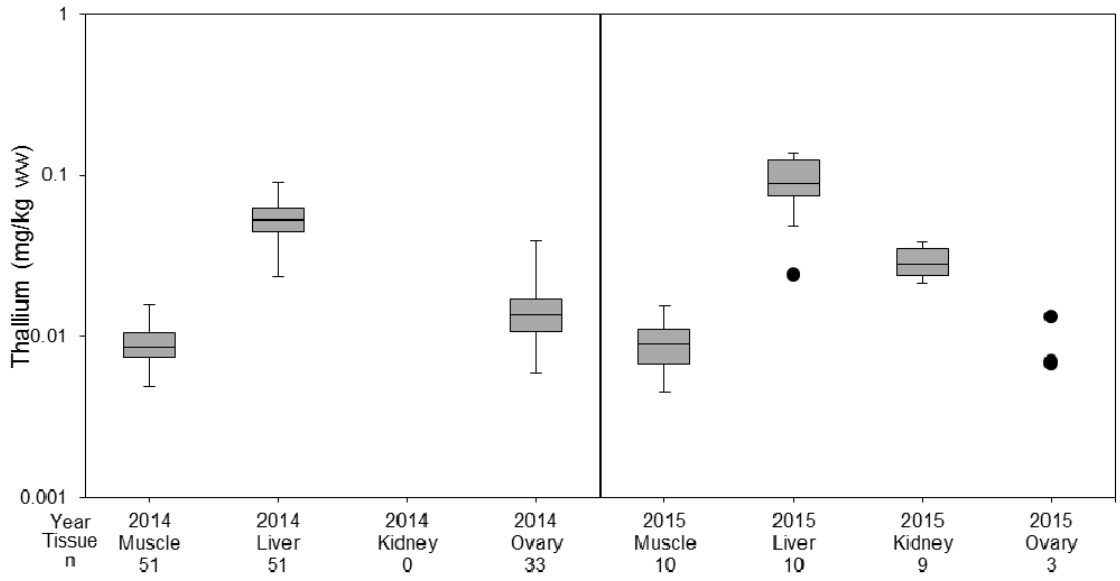
Figure 128: Thallium Concentrations in Lake Trout Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 129: Thallium Concentrations in Lake Trout Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

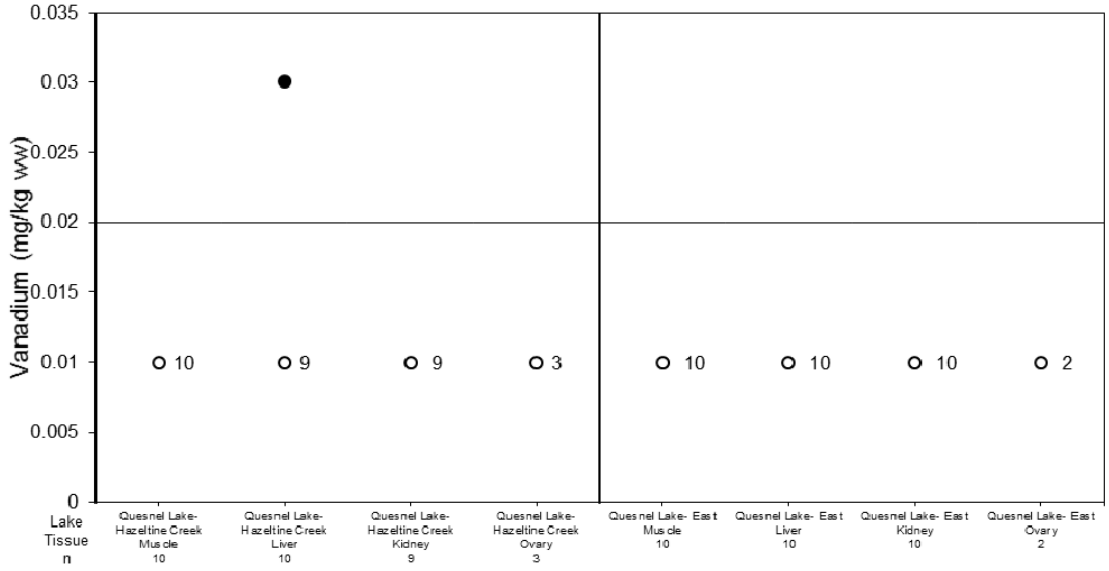


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

3.18 Vanadium

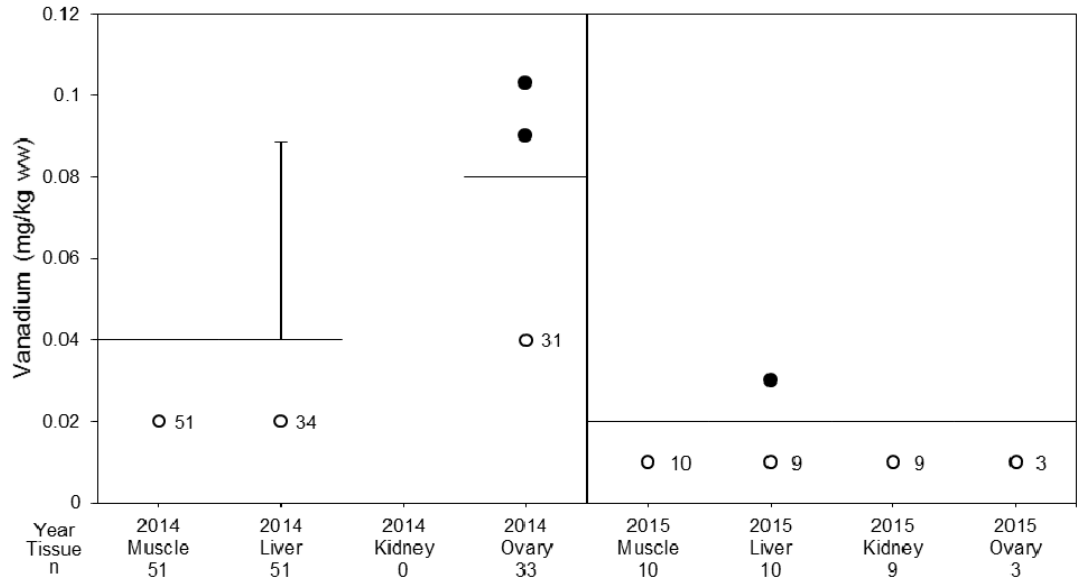
Figure 130: Vanadium Concentrations in Lake Trout Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 131: Vanadium Concentrations in Lake Trout Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

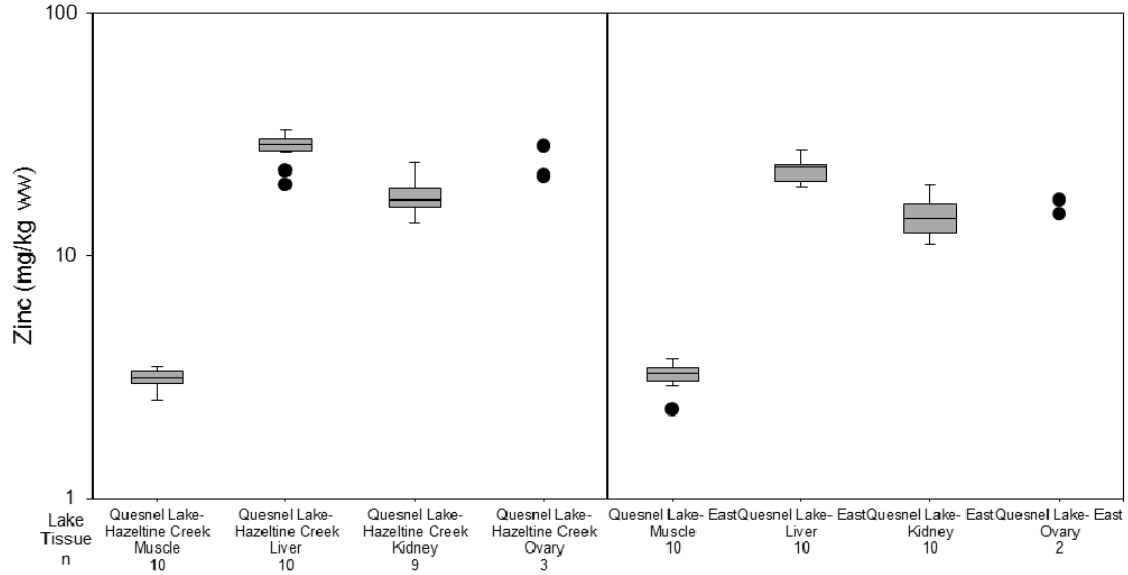


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

3.19 Zinc

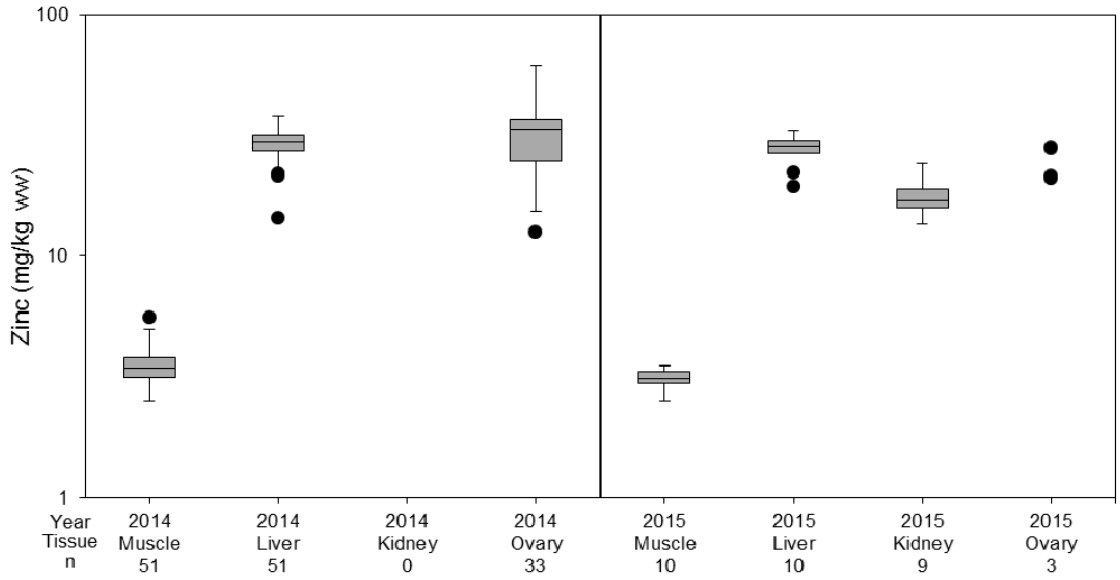
Figure 132: Zinc Concentrations in Lake Trout Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 133: Zinc Concentrations in Lake Trout Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015



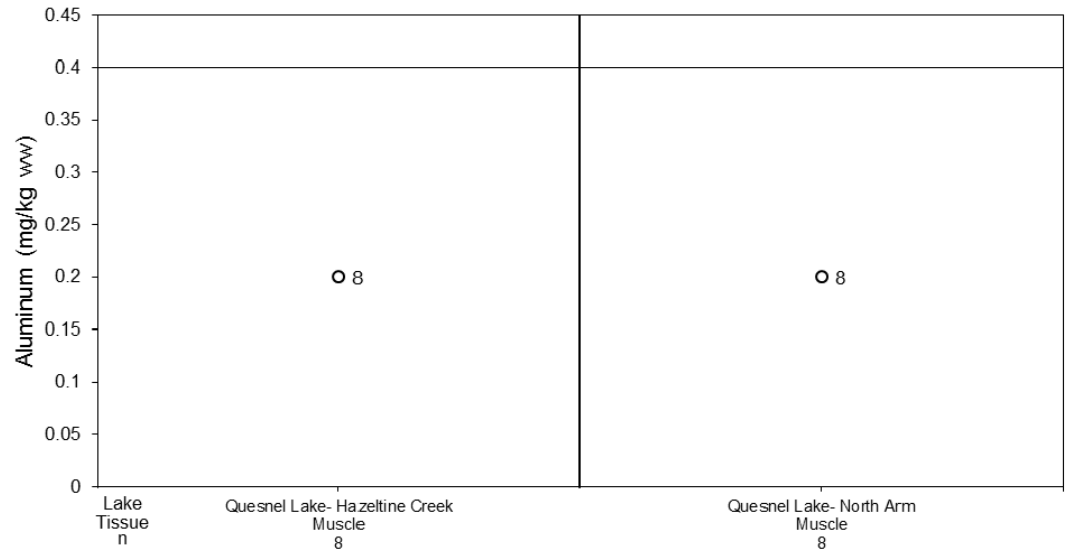
Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

4.0 LARGESCALE SUCKER

4.1 Aluminum

Figure 134: Aluminum Concentrations in Largescale Sucker Tissues Collected in 2015

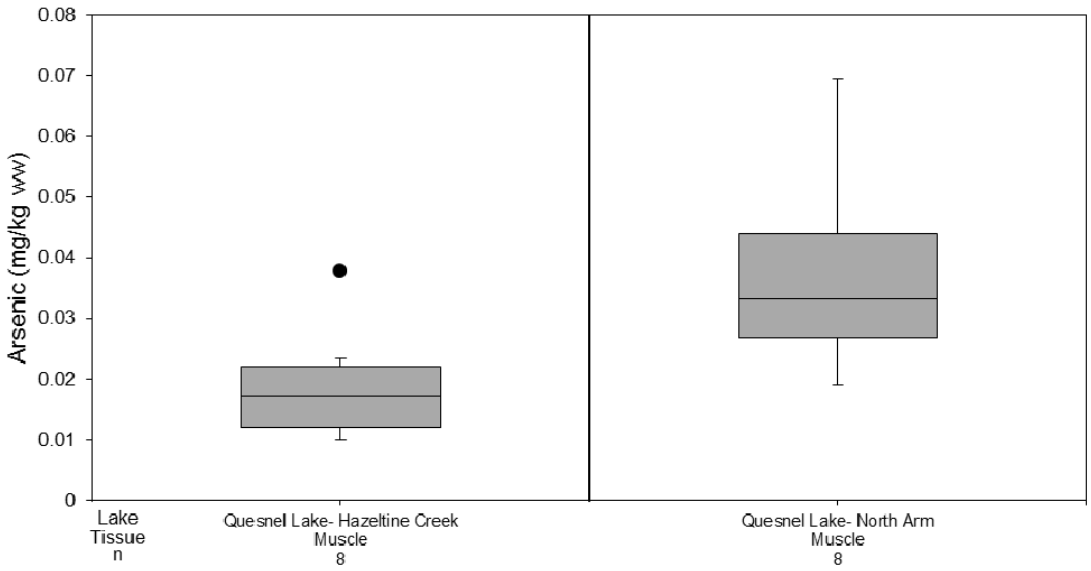


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

4.2 Arsenic

Figure 135: Arsenic Concentrations in Largescale Sucker Tissues Collected in 2015

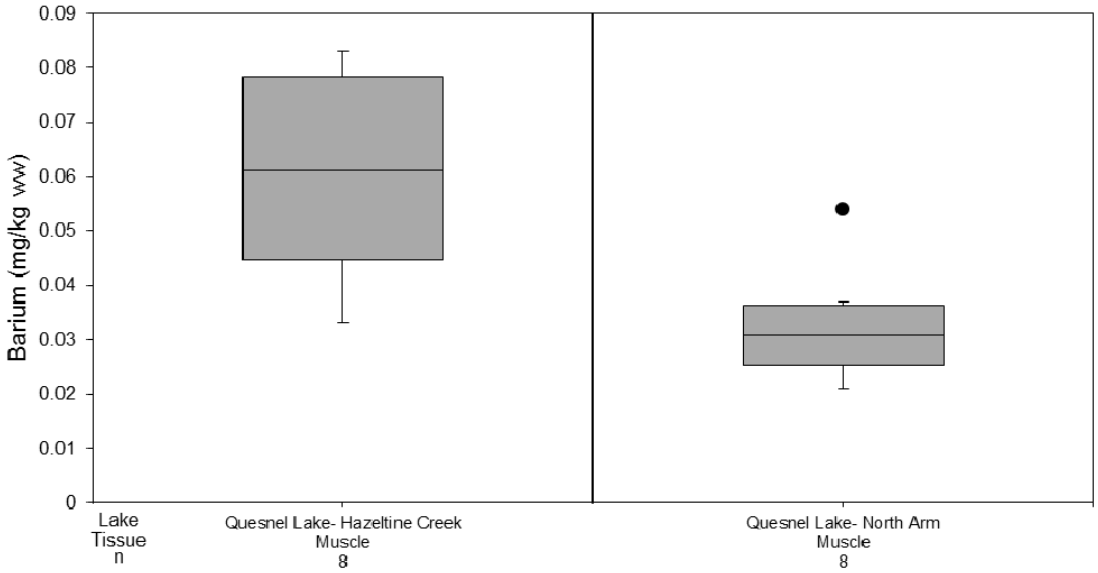


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

4.3 Barium

Figure 136: Barium Concentrations in Largescale Sucker Tissues Collected in 2015

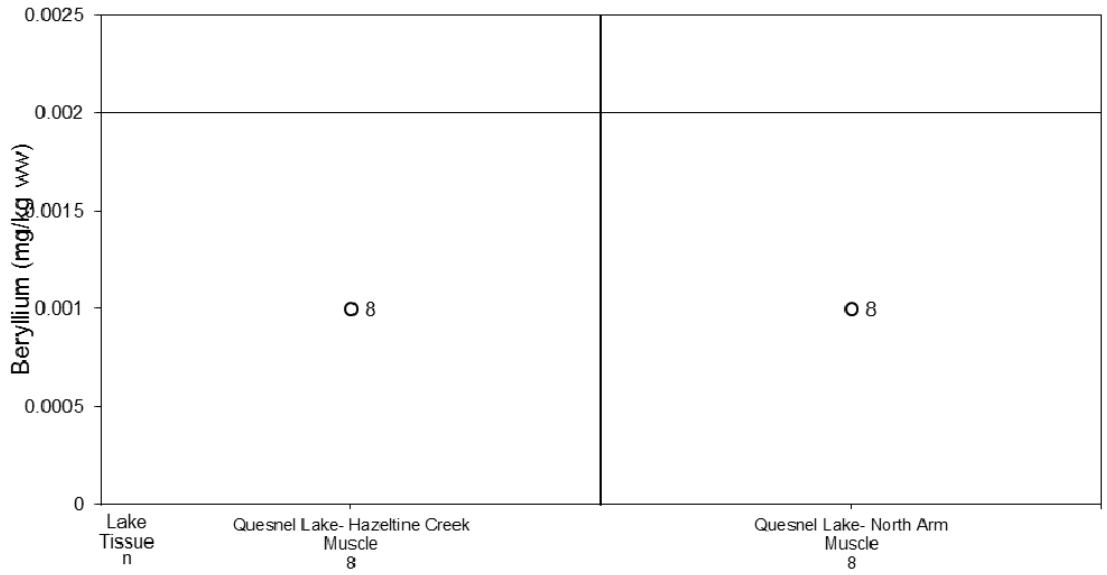


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

4.4 Beryllium

Figure 137: Beryllium Concentrations in Largescale Sucker Tissues Collected in 2015

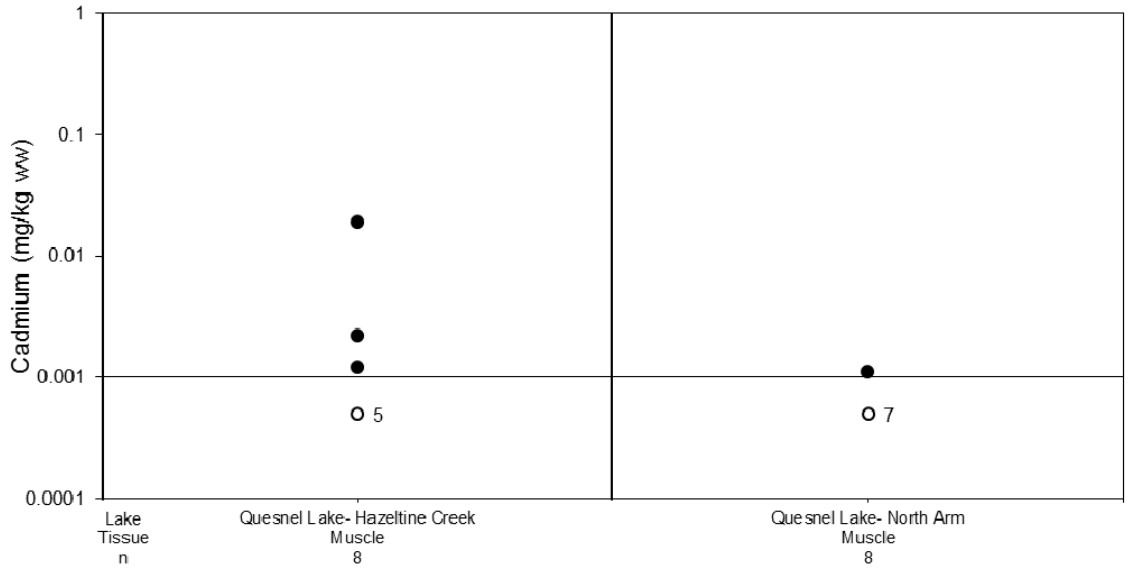


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

4.5 Cadmium

Figure 138: Cadmium Concentrations in Largescale Sucker Tissues Collected in 2015

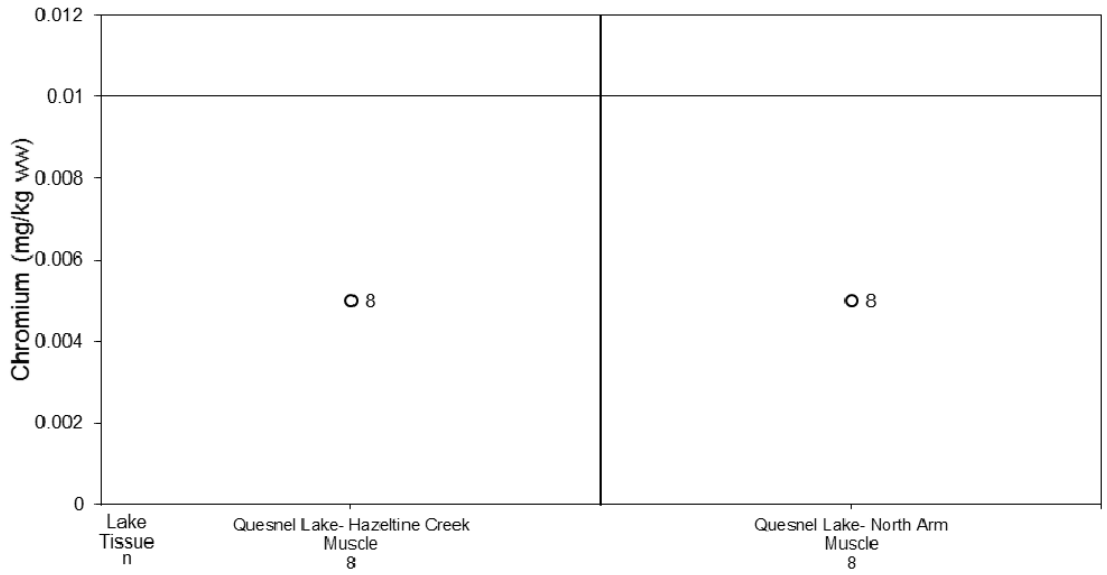


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

4.6 Chromium

Figure 139: Chromium Concentrations in Largescale Sucker Tissues Collected in 2015

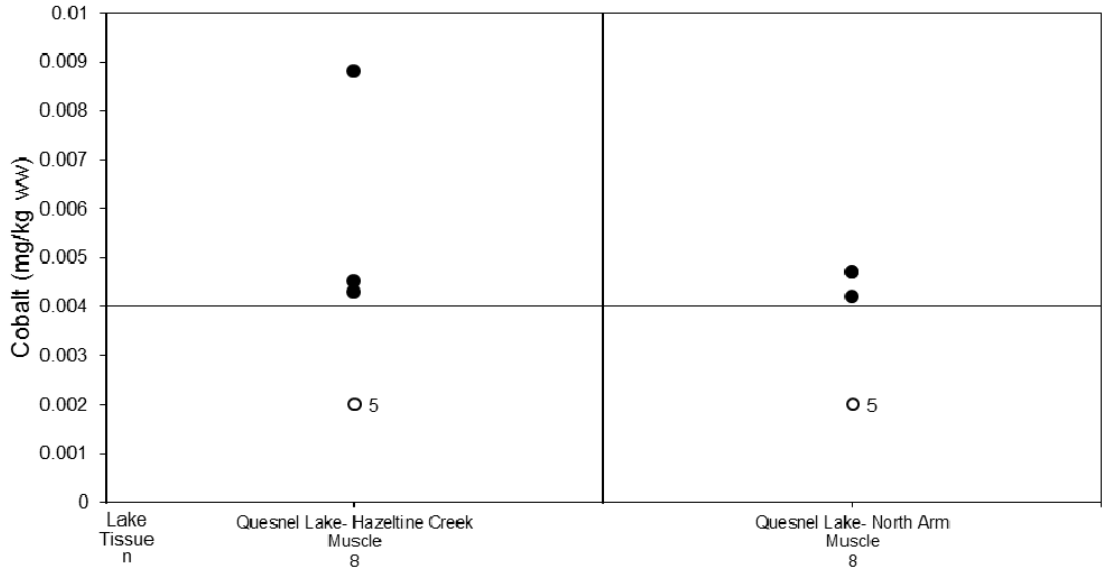


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

4.7 Cobalt

Figure 140: Cobalt Concentrations in Largescale Sucker Tissues Collected in 2015

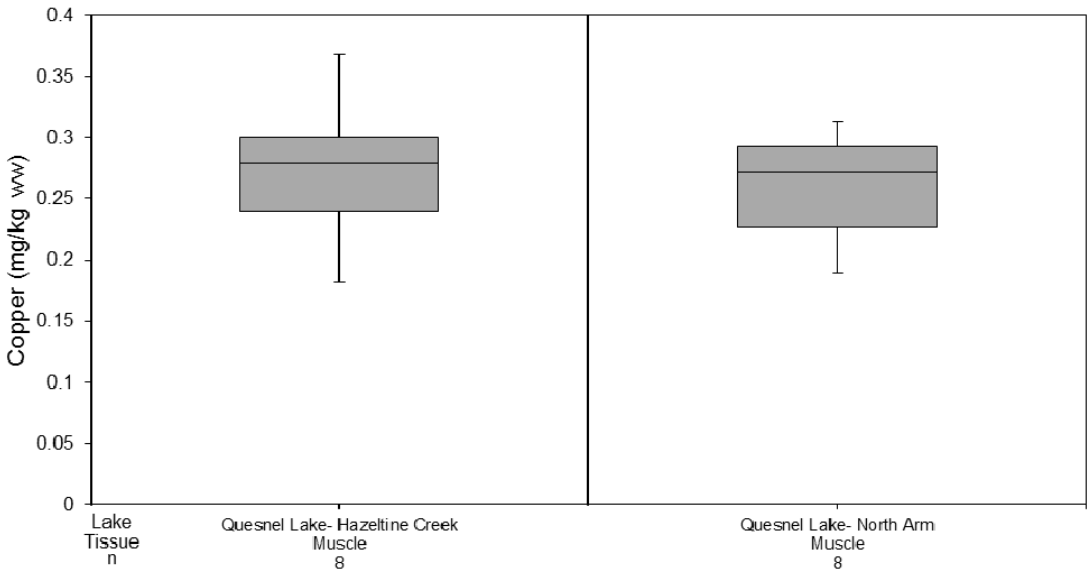


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

4.8 Copper

Figure 141: Copper Concentrations in Largescale Sucker Tissues Collected in 2015

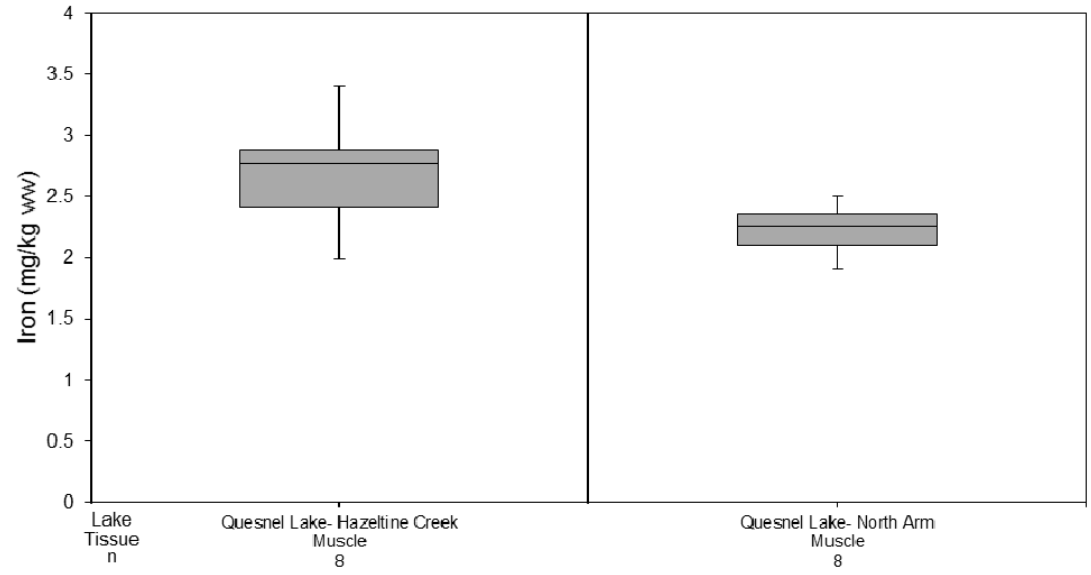


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

4.9 Iron

Figure 142: Iron Concentrations in Largescale Sucker Tissues Collected in 2015

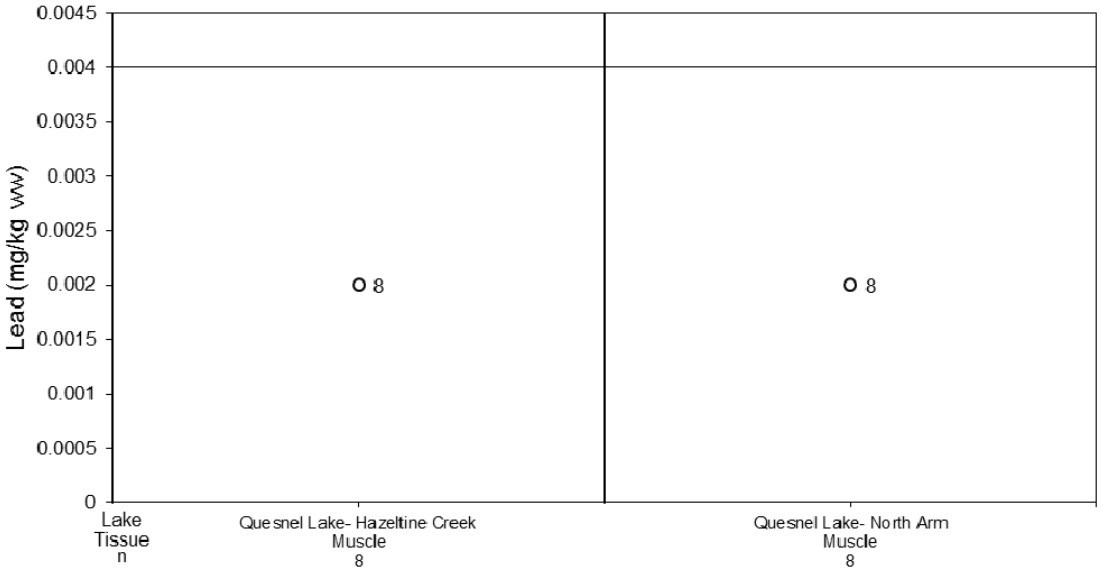


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

4.10 Lead

Figure 143: Lead Concentrations in Largescale Sucker Tissues Collected in 2015

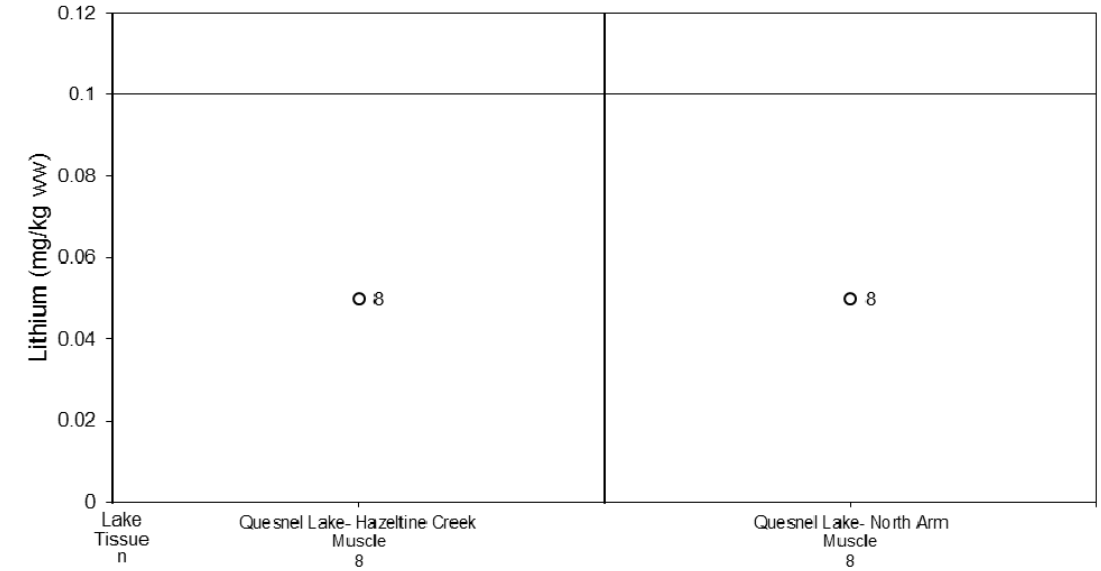


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

4.11 Lithium

Figure 144: Lithium Concentrations in Largescale Sucker Tissues Collected in 2015

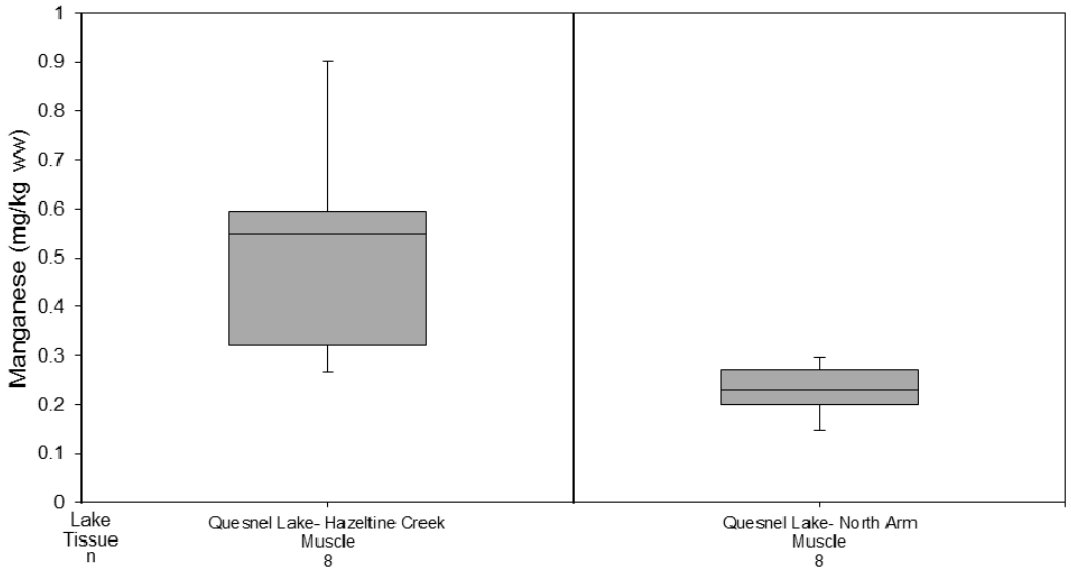


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

4.12 Manganese

Figure 145: Manganese Concentrations in Largescale Sucker Tissues Collected in 2015

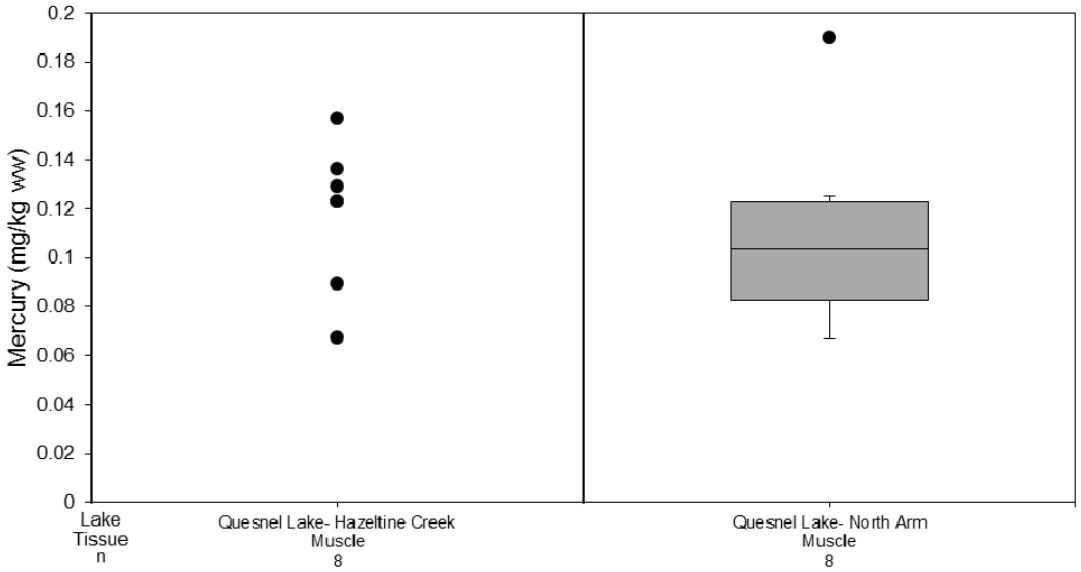


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

4.13 Mercury

Figure 146: Mercury Concentrations in Largescale Sucker Tissues Collected in 2015

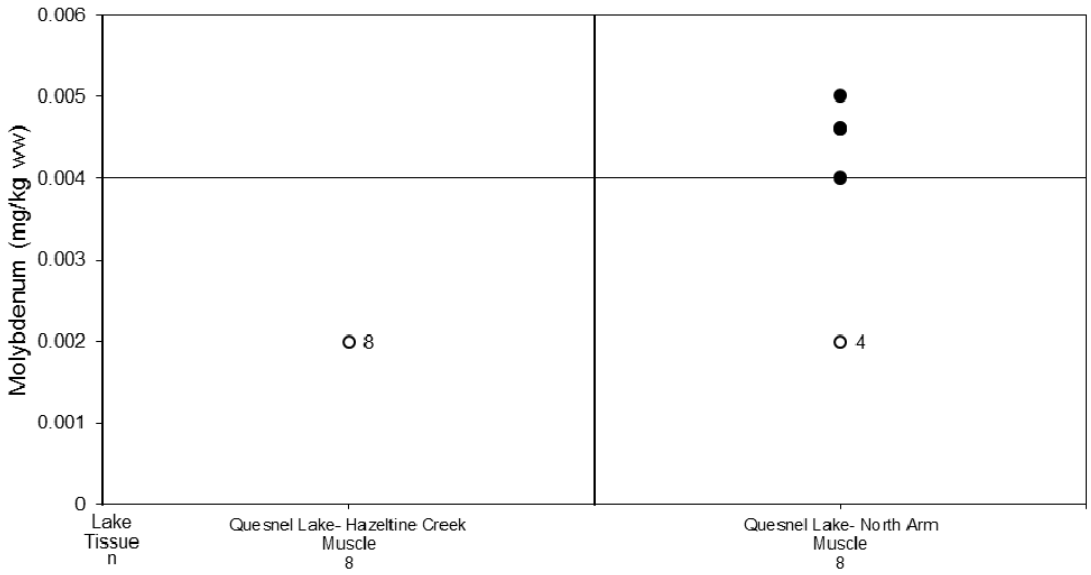


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

4.14 Molybdenum

Figure 147: Molybdenum Concentrations in Largescale Sucker Tissues Collected in 2015

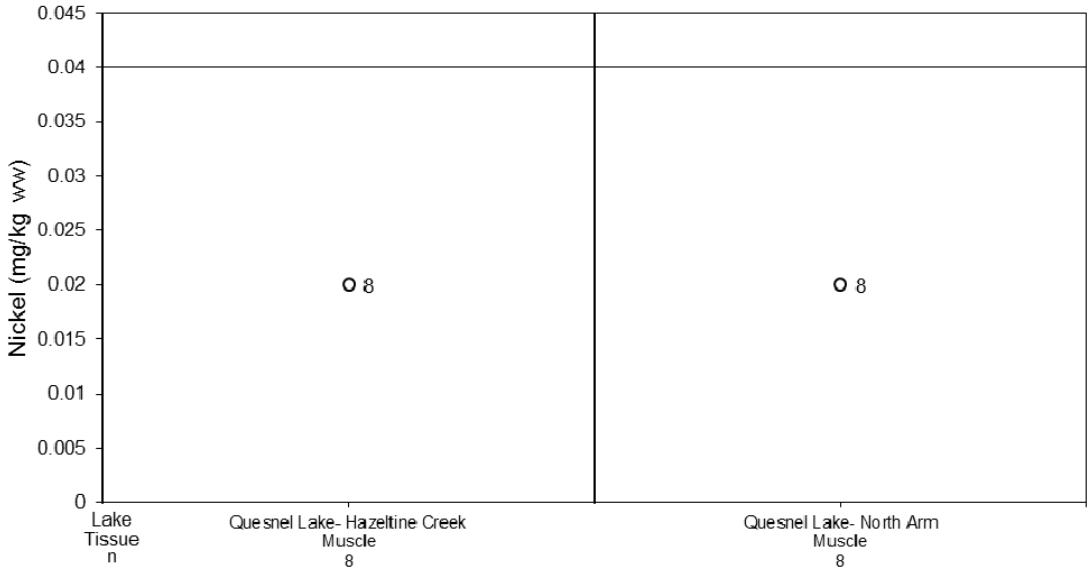


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

4.15 Nickel

Figure 148: Nickel Concentrations in Largescale Sucker Tissues Collected in 2015

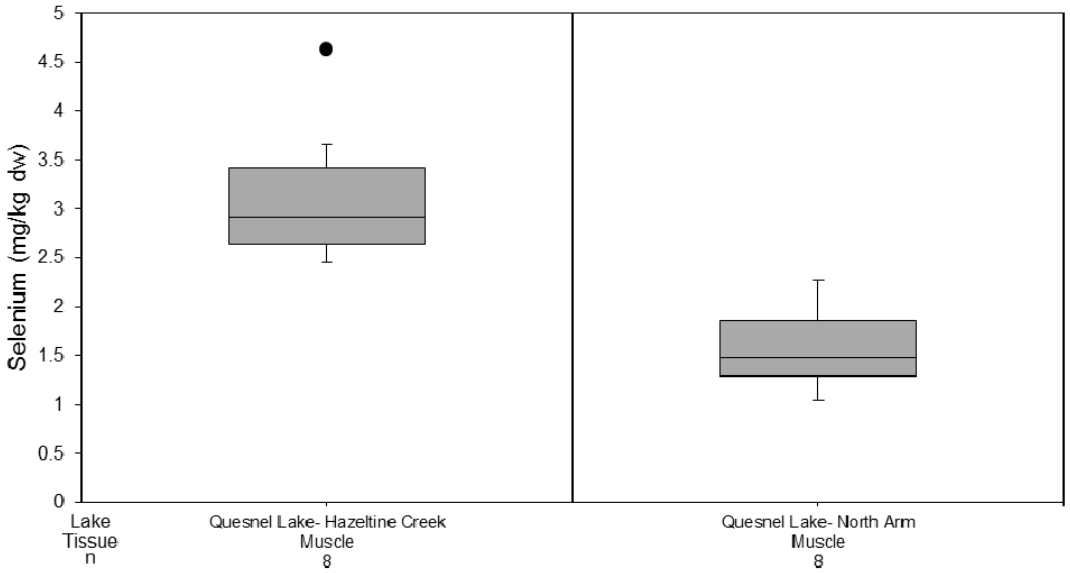


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

4.16 Selenium

Figure 149: Selenium Concentrations in Largescale Sucker Tissues Collected in 2015

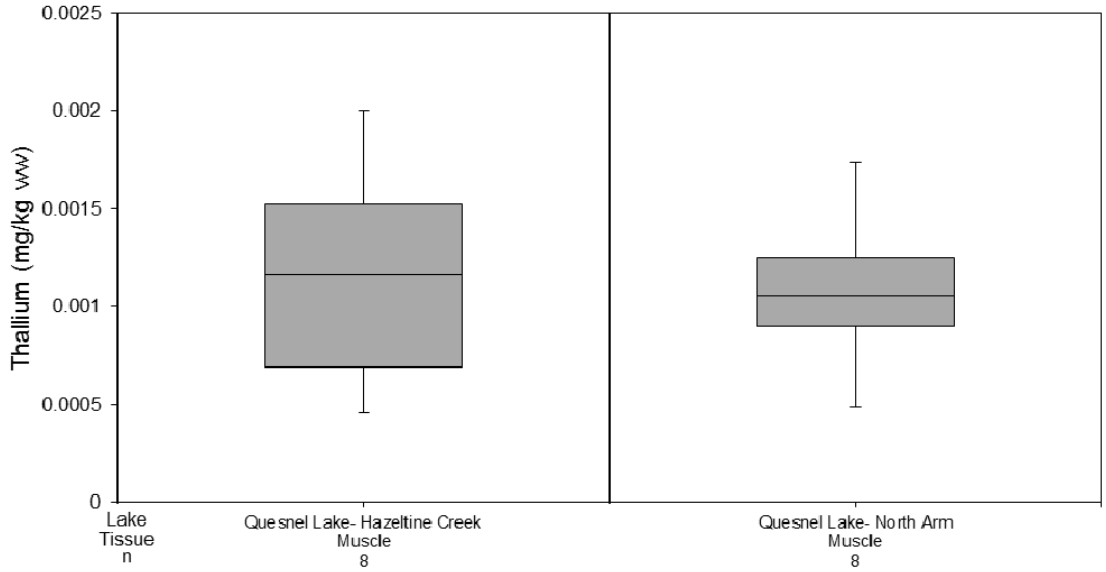


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg dw = milligrams per kilogram dry weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

4.17 Thallium

Figure 150: Thallium Concentrations in Largescale Sucker Tissues Collected in 2015

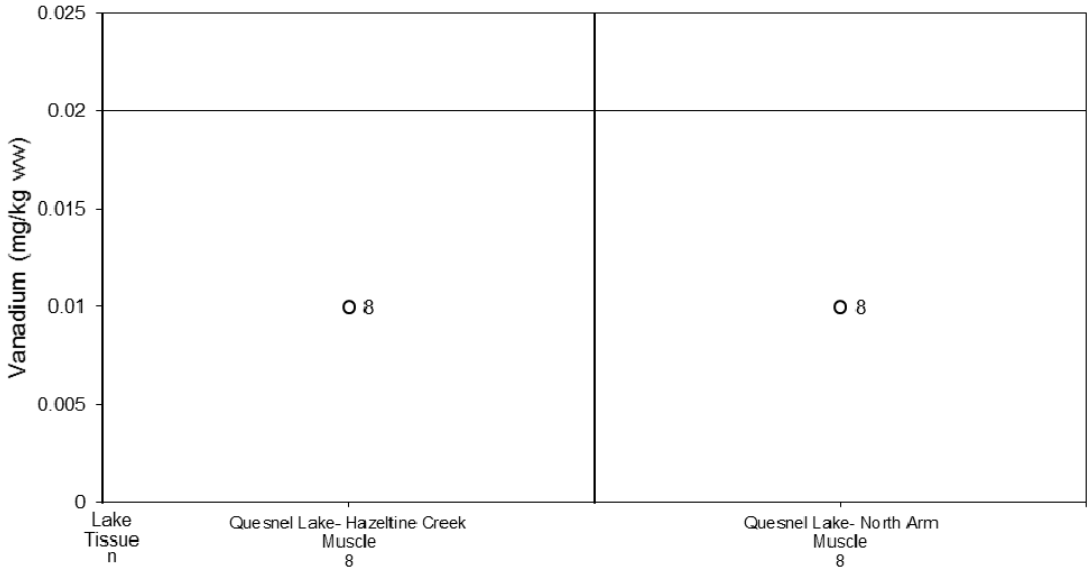


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

4.18 Vanadium

Figure 151: Vanadium Concentrations in Largescale Sucker Tissues Collected in 2015

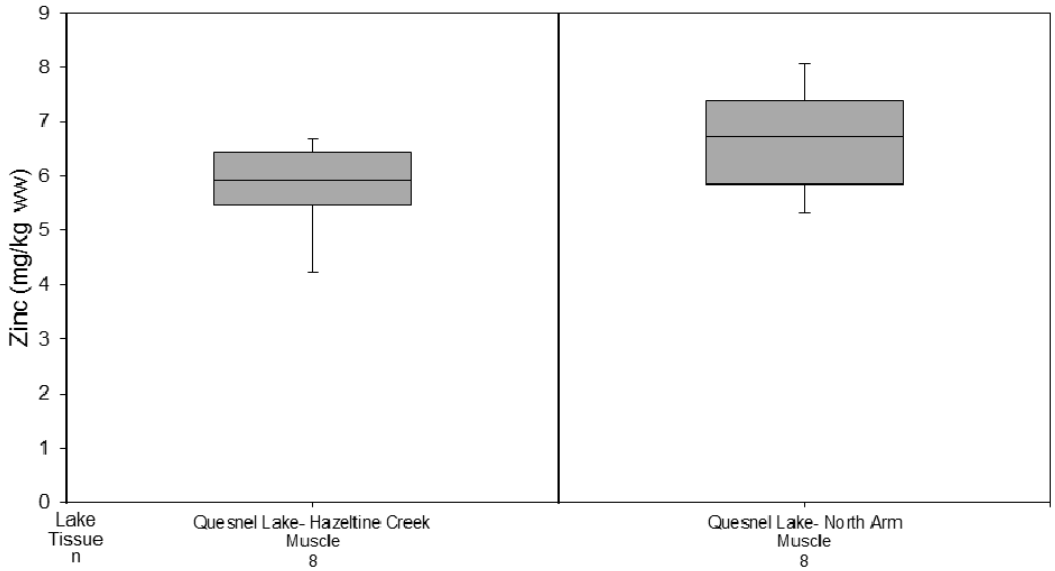


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

4.19 Zinc

Figure 152: Zinc Concentrations in Largescale Sucker Tissues Collected in 2015



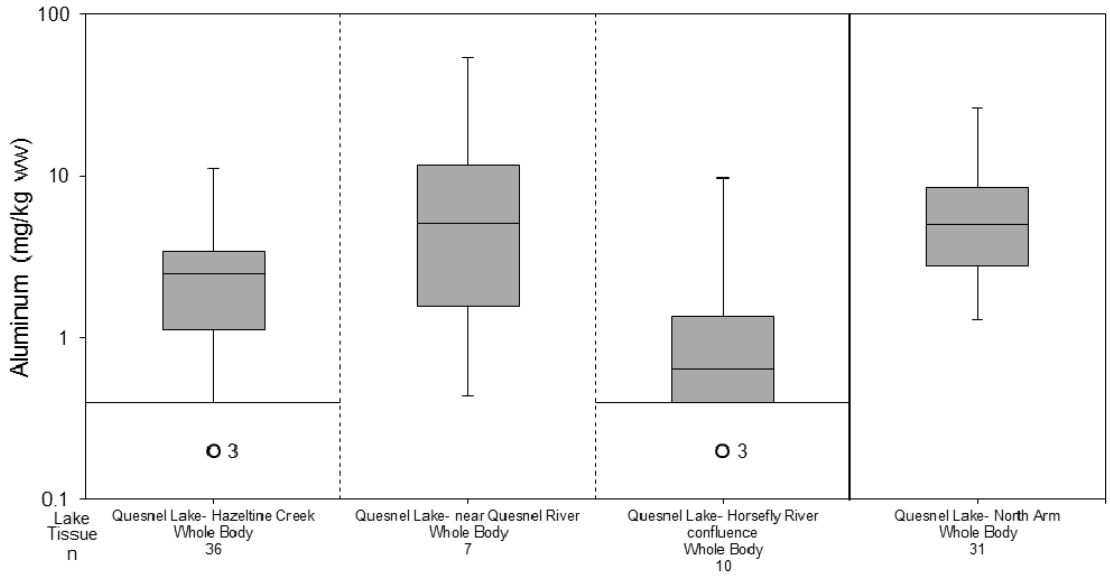
Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

5.0 NORTHERN PIKEMINNOW

5.1 Aluminum

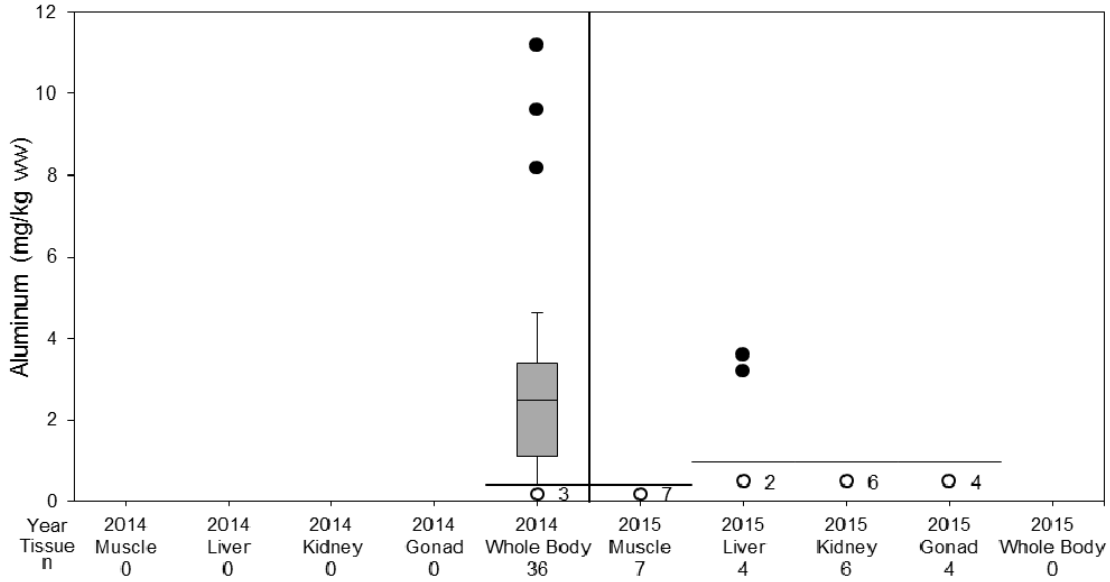
Figure 153: Aluminum Concentrations in Northern Pikeminnow Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 154: Aluminum Concentrations in Northern Pikeminnow Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

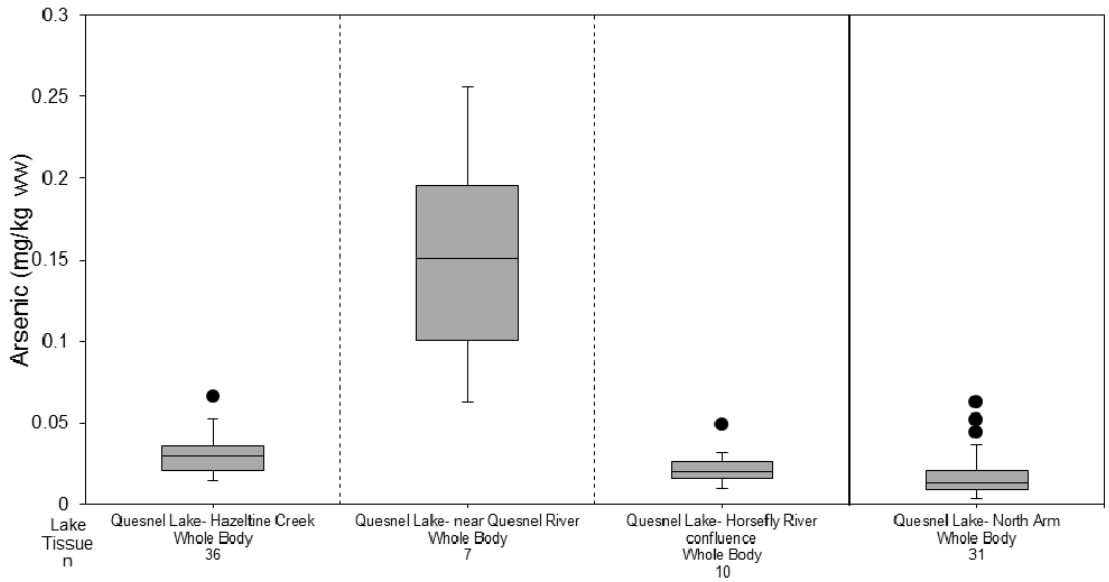


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

5.2 Arsenic

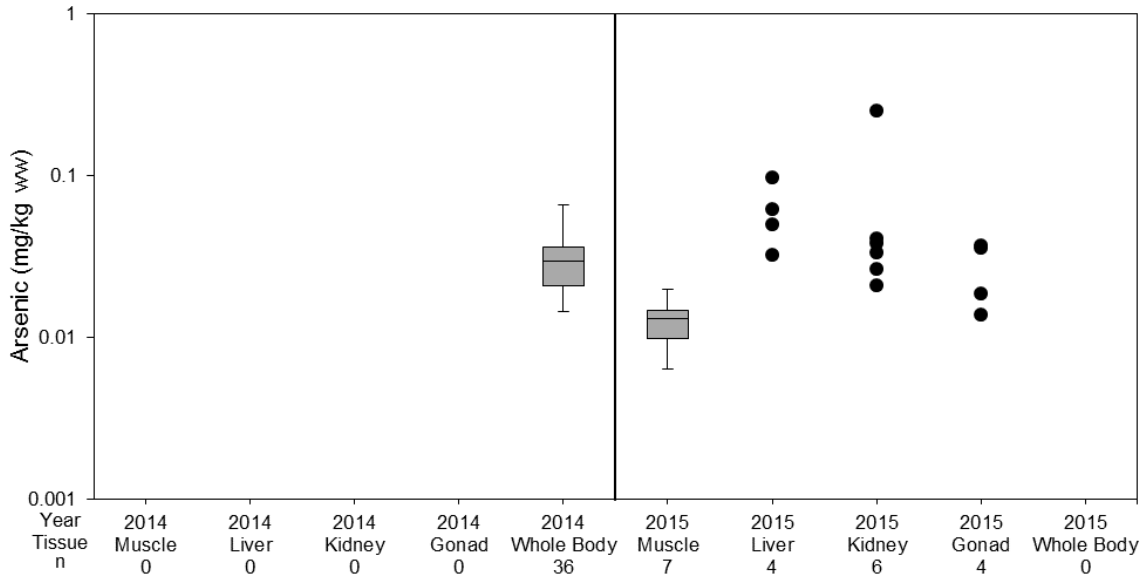
Figure 155: Arsenic Concentrations in Northern Pikeminnow Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 156: Arsenic Concentrations in Northern Pikeminnow Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

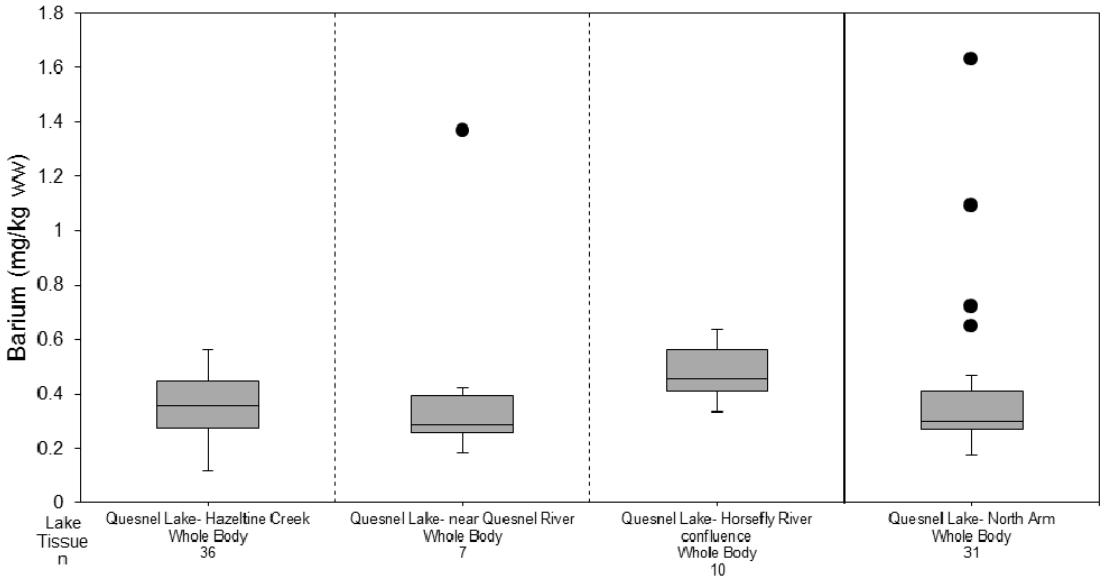


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

5.3 Barium

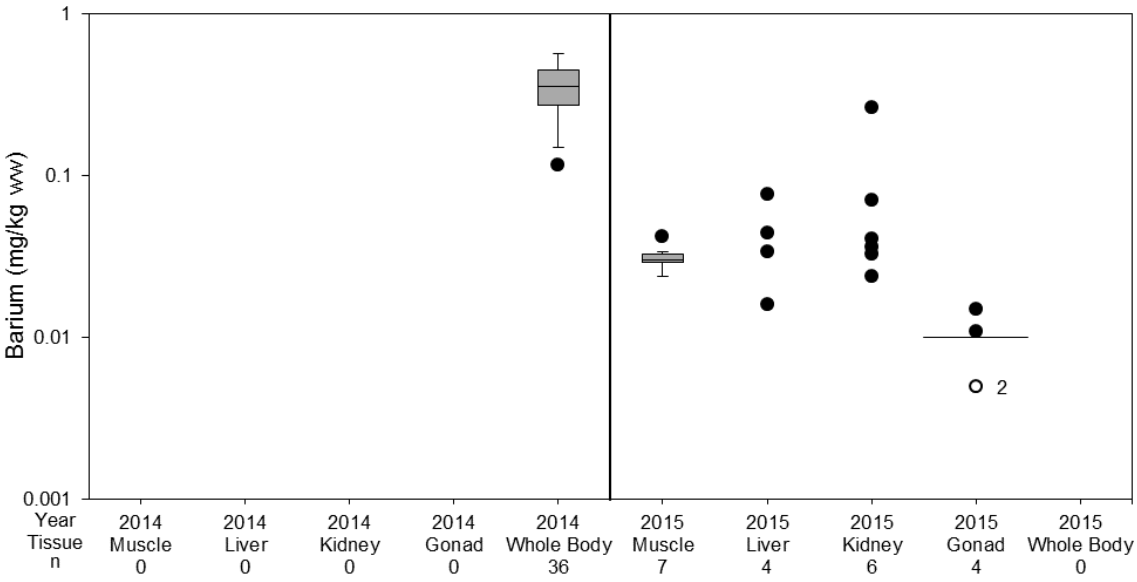
Figure 157: Barium Concentrations in Northern Pikeminnow Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 158: Barium Concentrations in Northern Pikeminnow Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

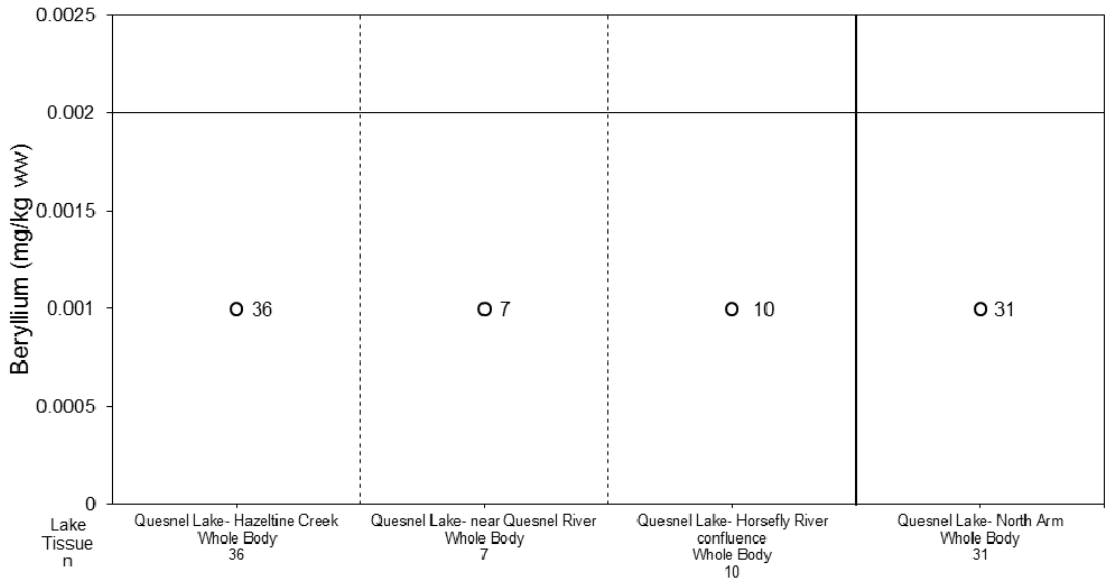


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

5.4 Beryllium

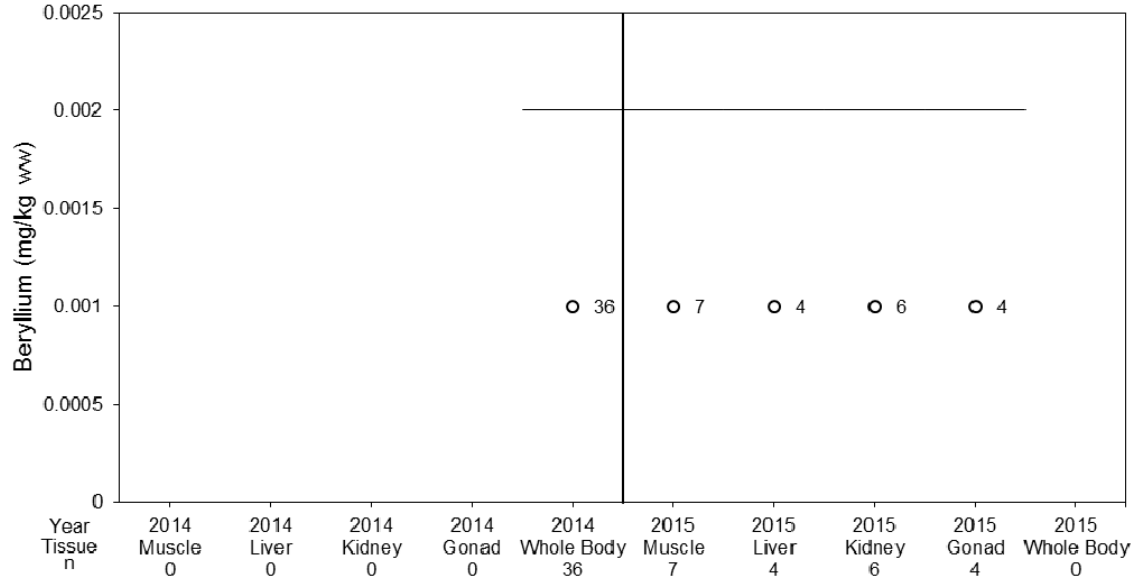
Figure 159: Beryllium Concentrations in Northern Pikeminnow Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 160: Beryllium Concentrations in Northern Pikeminnow Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

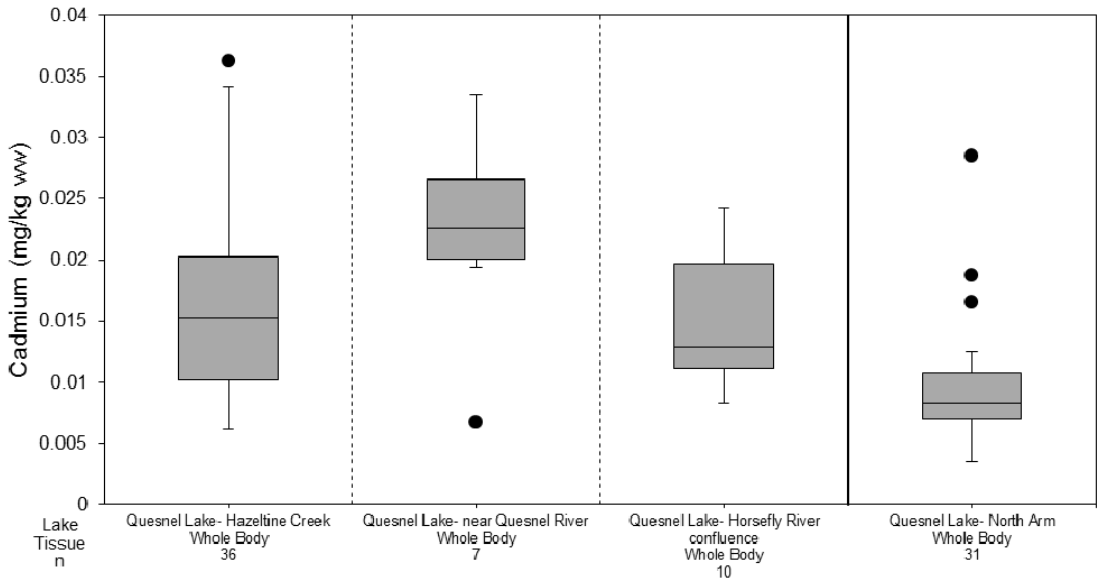


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

5.5 Cadmium

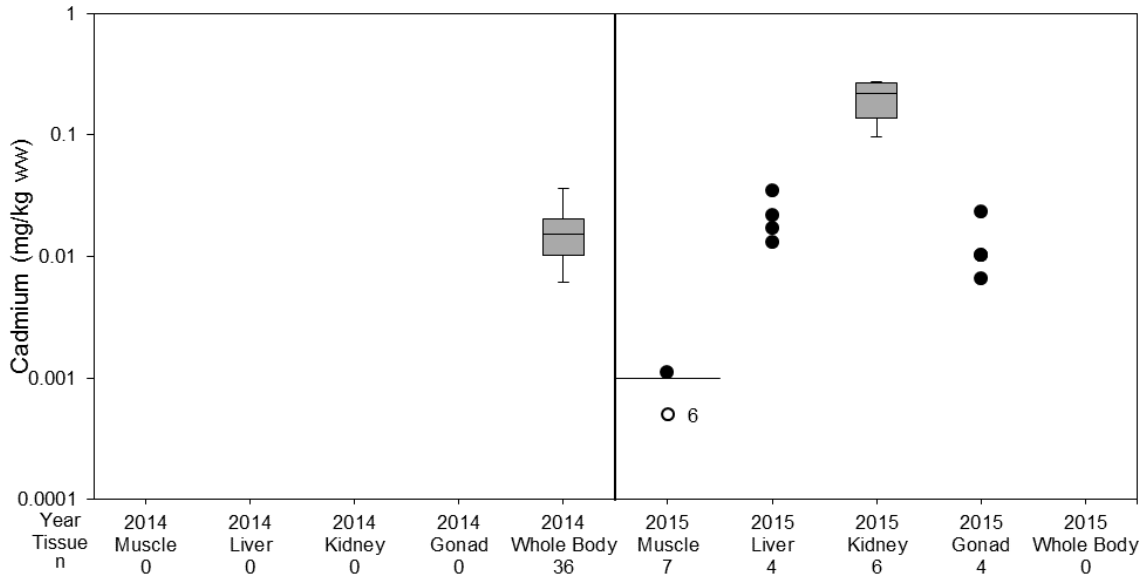
Figure 161: Cadmium Concentrations in Northern Pikeminnow Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 162: Cadmium Concentrations in Northern Pikeminnow Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

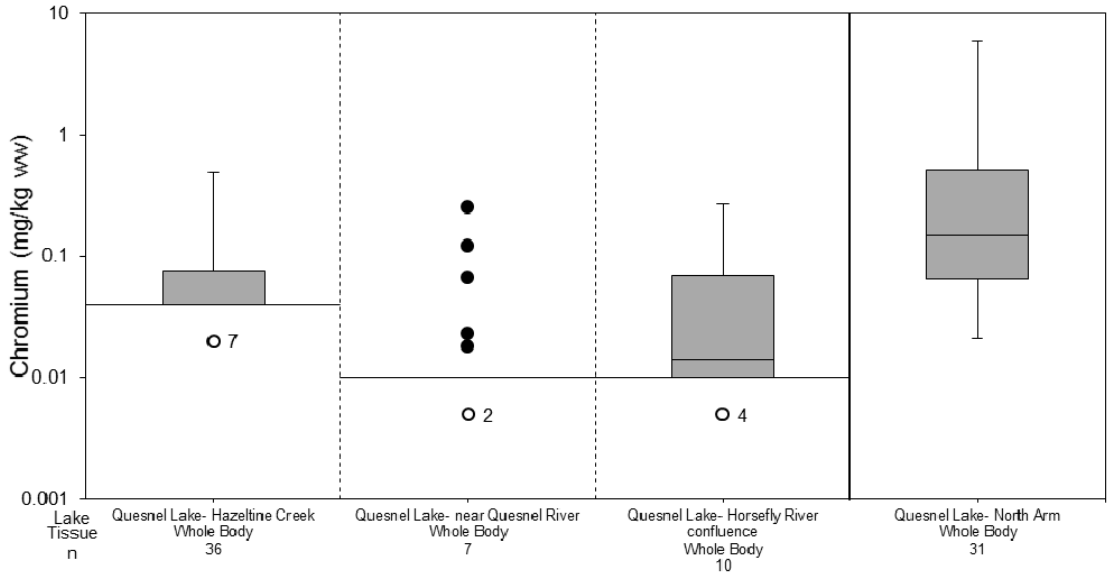


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

5.6 Chromium

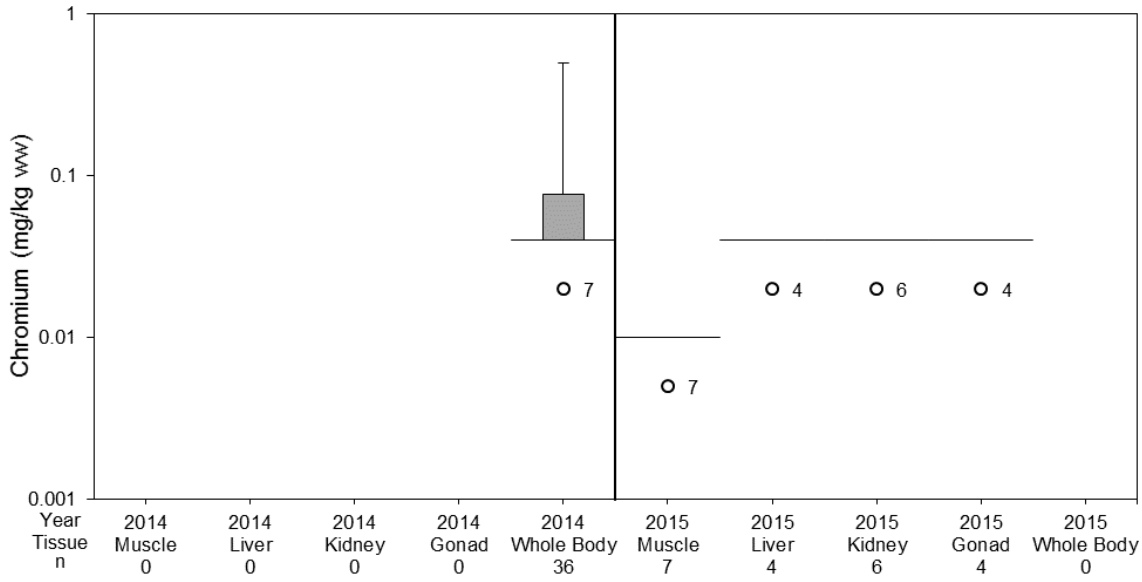
Figure 163: Chromium Concentrations in Northern Pikeminnow Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 164: Chromium Concentrations in Northern Pikeminnow Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

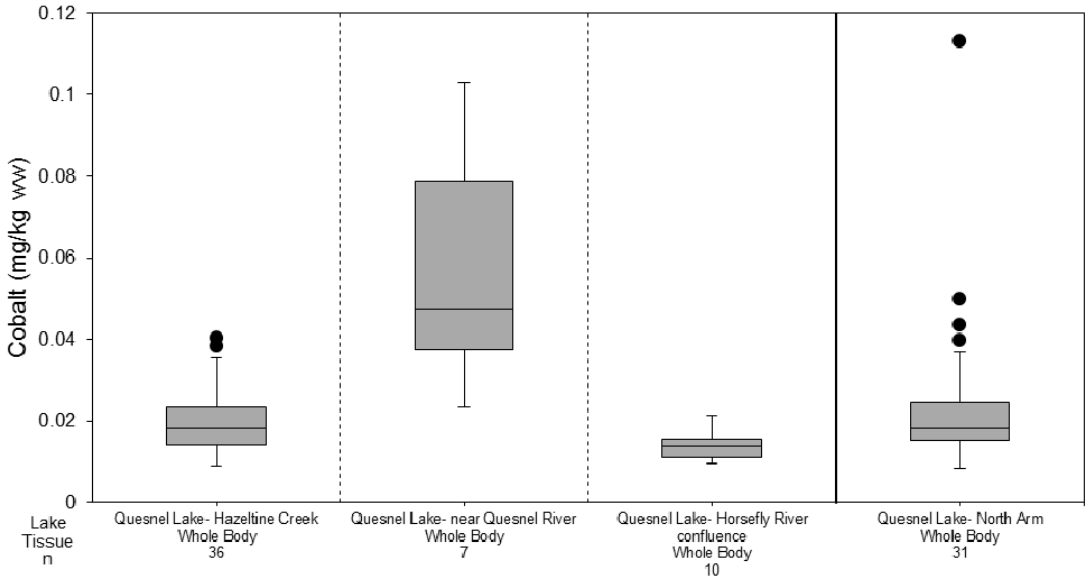


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

5.7 Cobalt

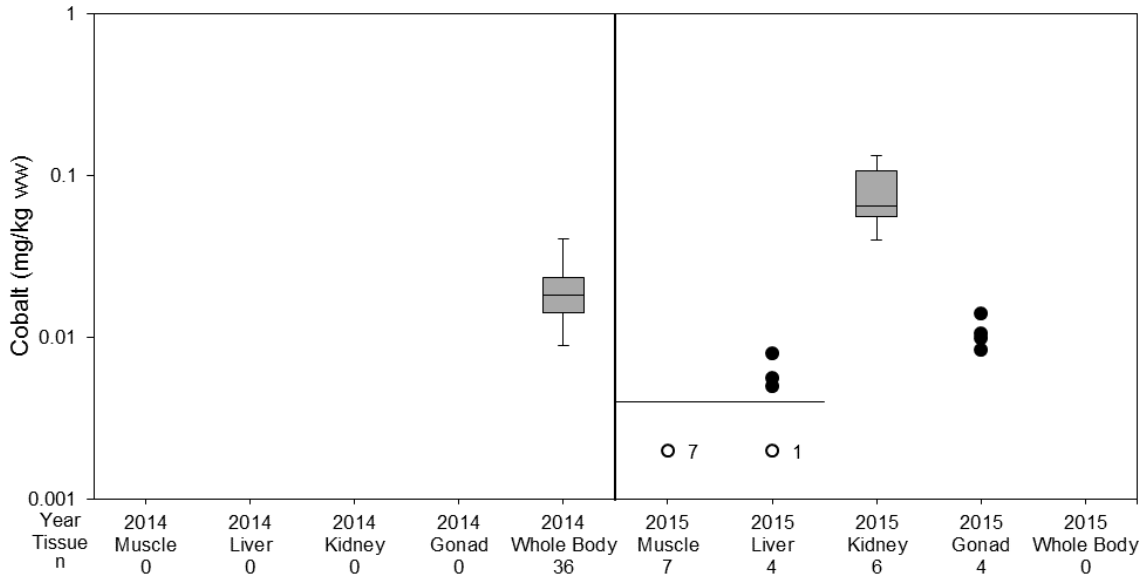
Figure 165: Cobalt Concentrations in Northern Pikeminnow Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 166: Cobalt Concentrations in Northern Pikeminnow Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

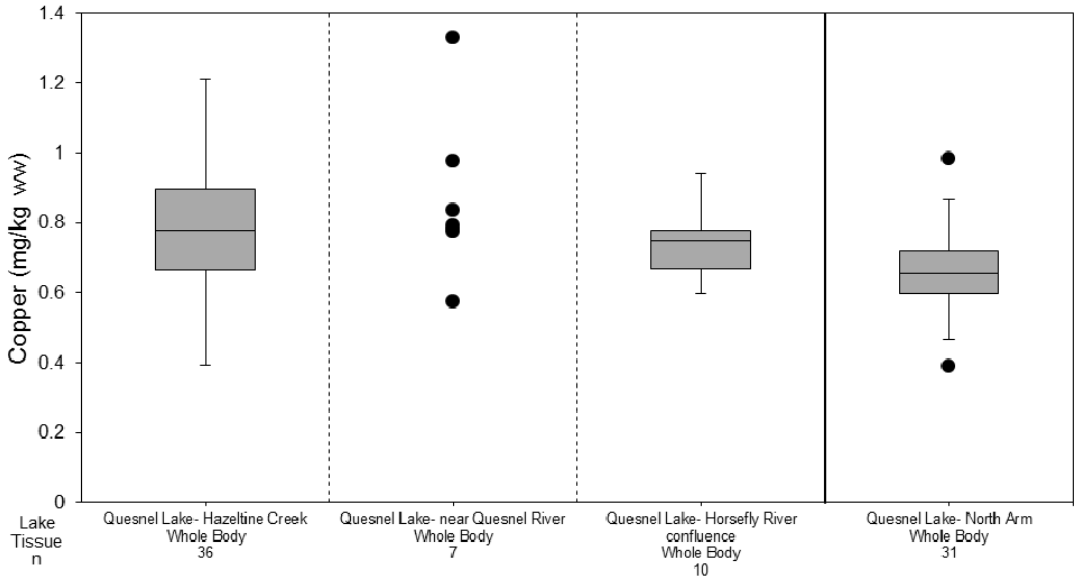


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

5.8 Copper

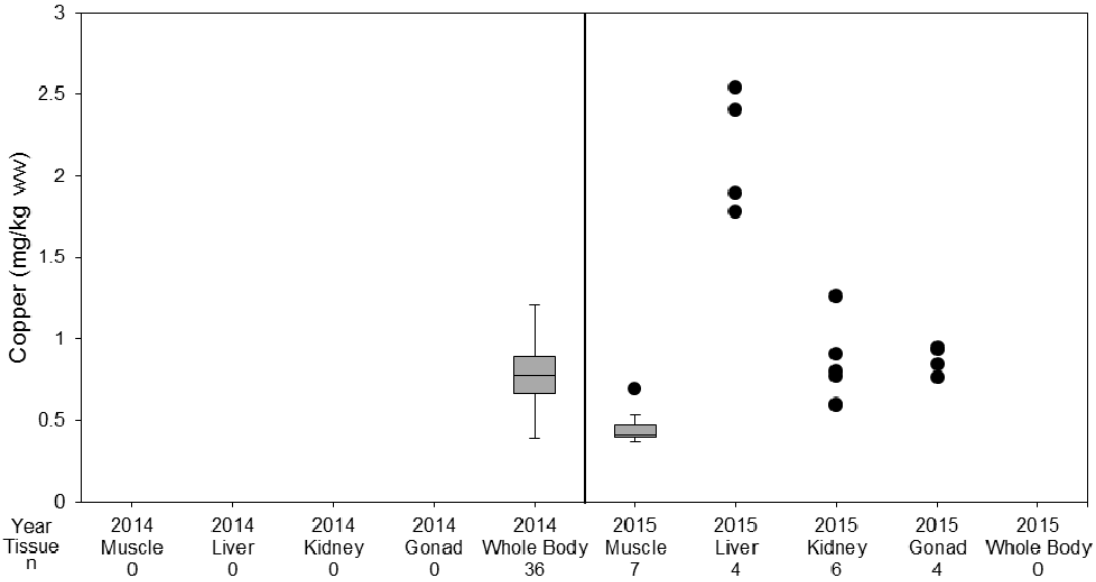
Figure 167: Copper Concentrations in Northern Pikeminnow Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 168: Copper Concentrations in Northern Pikeminnow Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

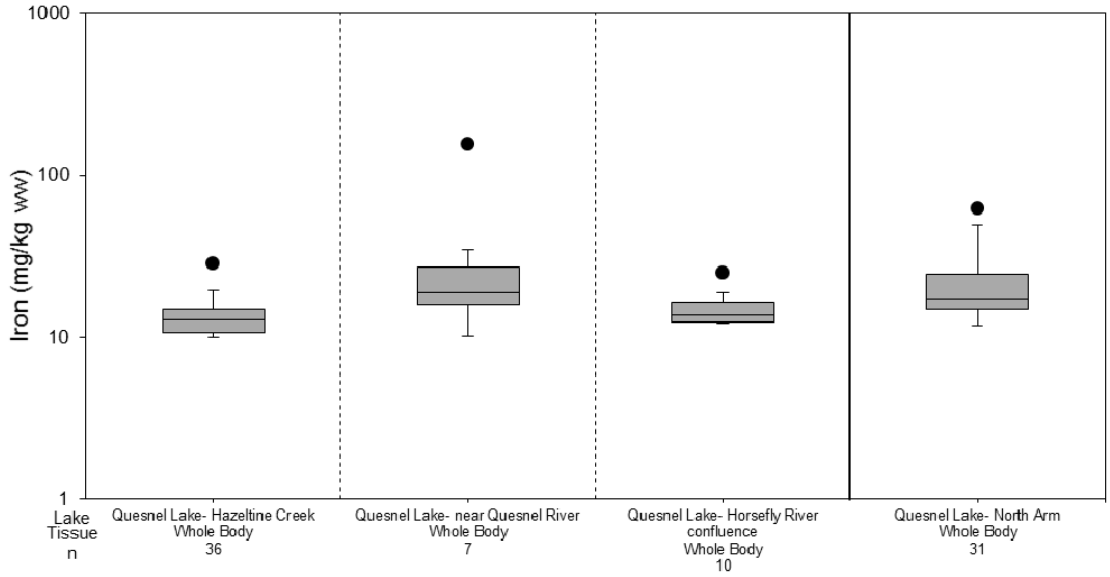


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

5.9 Iron

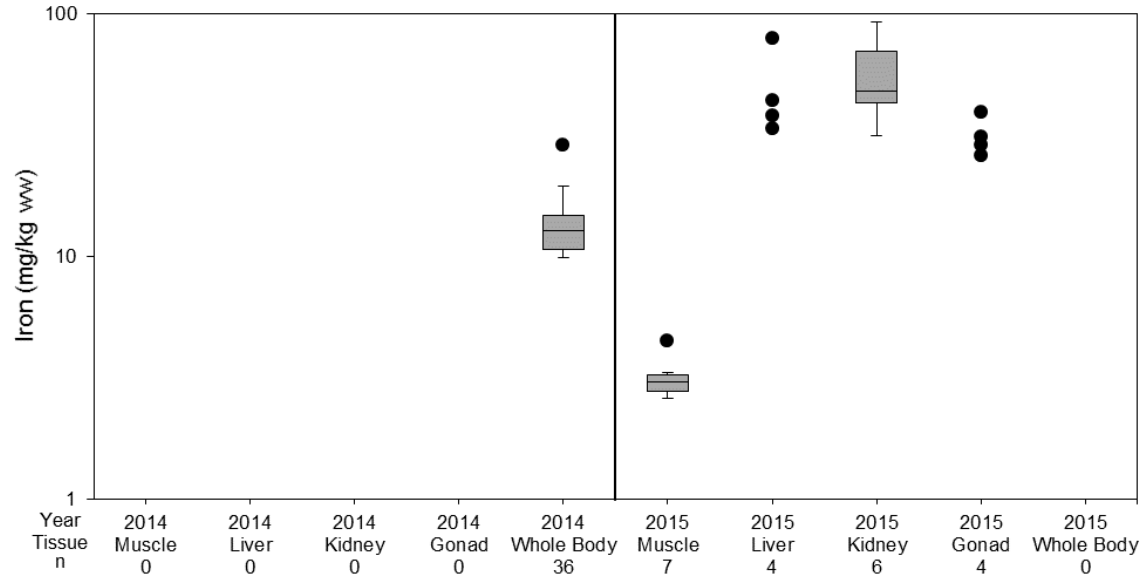
Figure 169: Iron Concentrations in Northern Pikeminnow Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 170: Iron Concentrations in Northern Pikeminnow Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

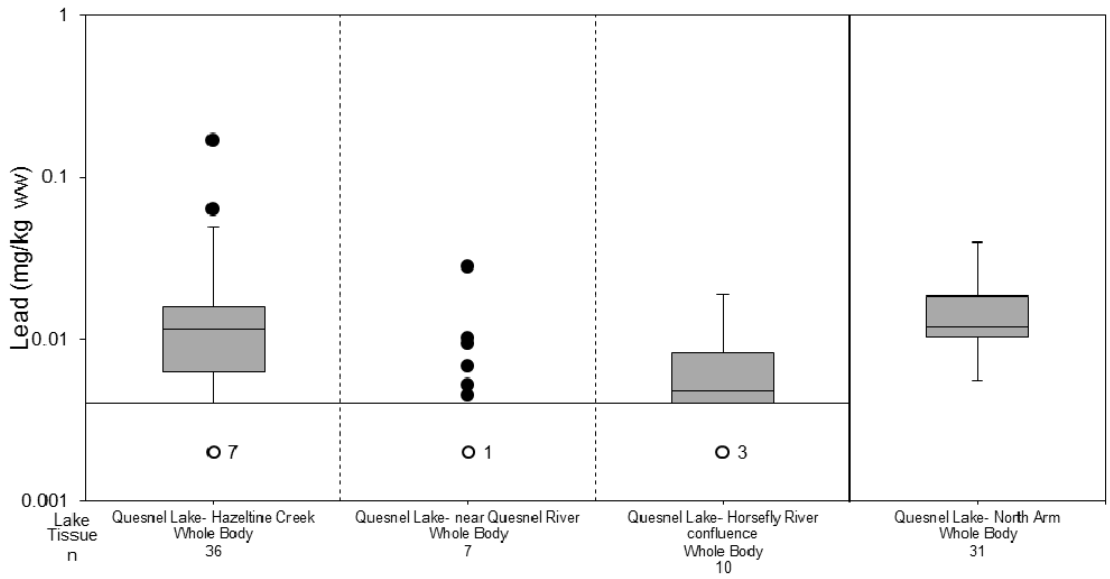


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

5.10 Lead

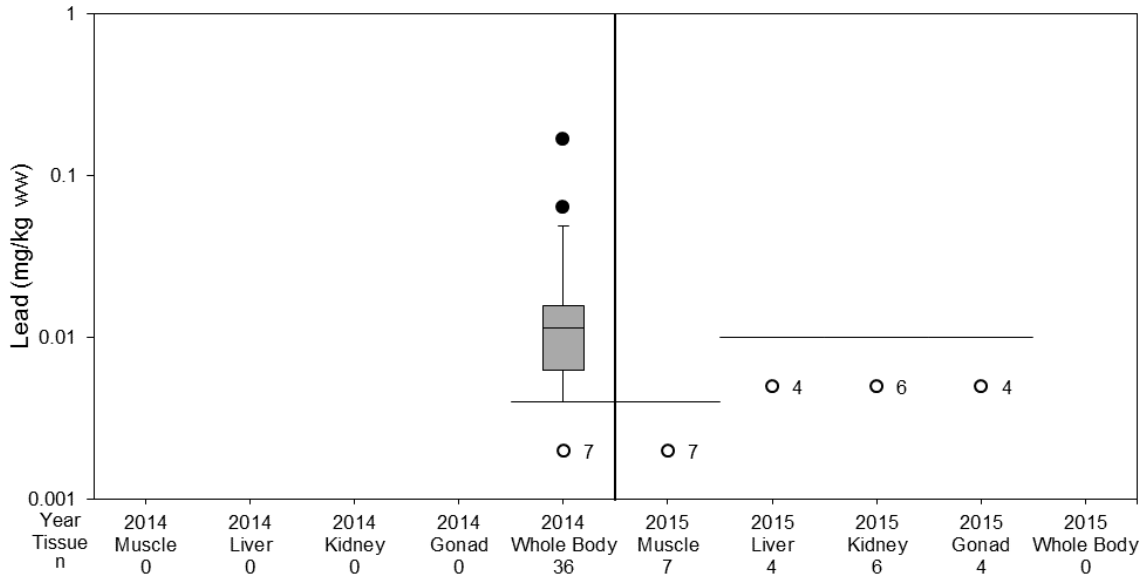
Figure 171: Lead Concentrations in Northern Pikeminnow Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 172: Lead Concentrations in Northern Pikeminnow Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

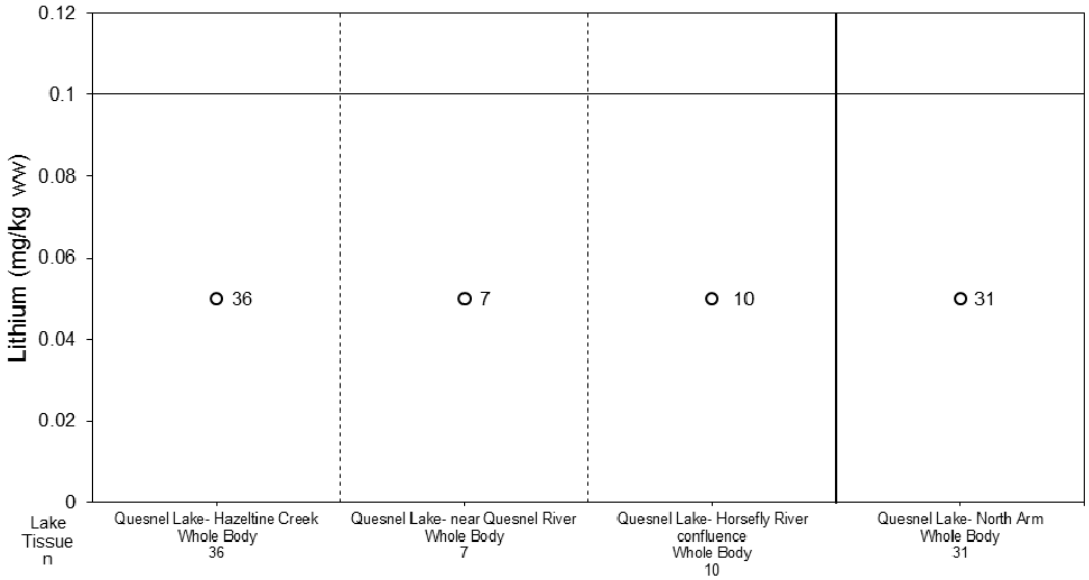


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

5.11 Lithium

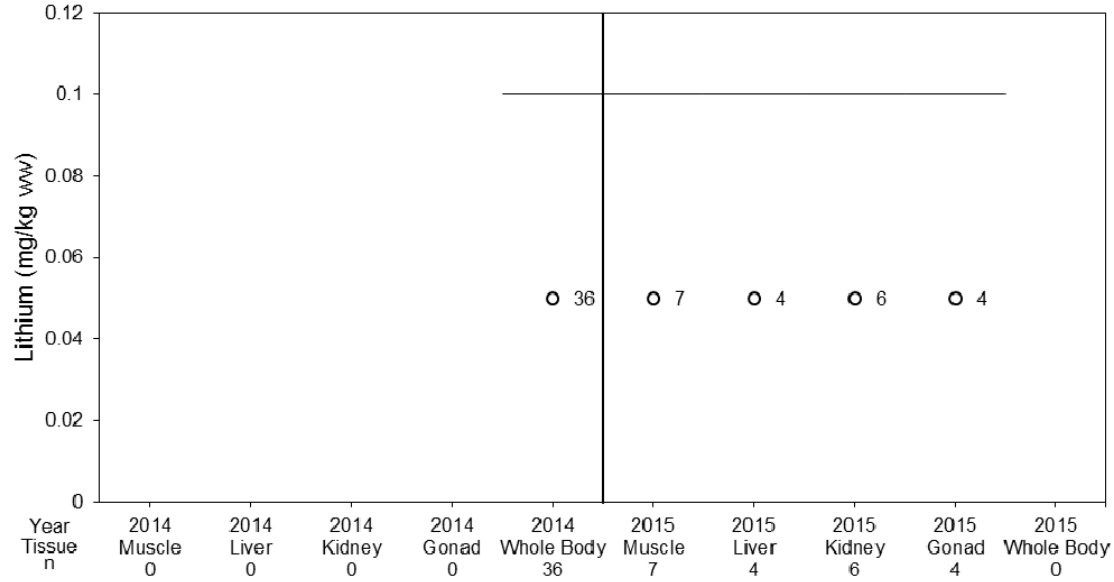
Figure 173: Lithium Concentrations in Northern Pikeminnow Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 174: Lithium Concentrations in Northern Pikeminnow Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

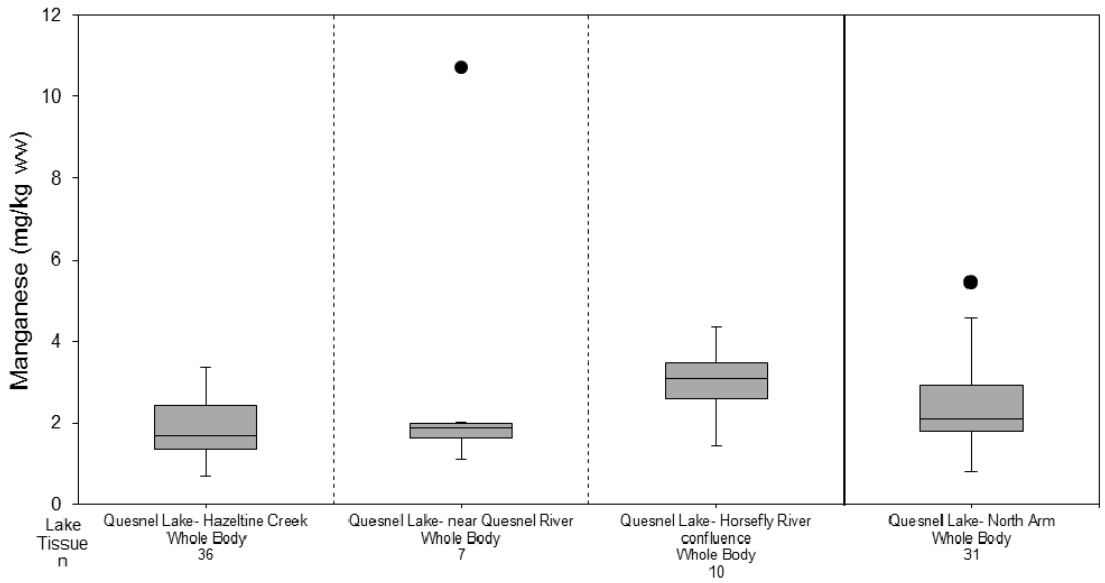


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

5.12 Manganese

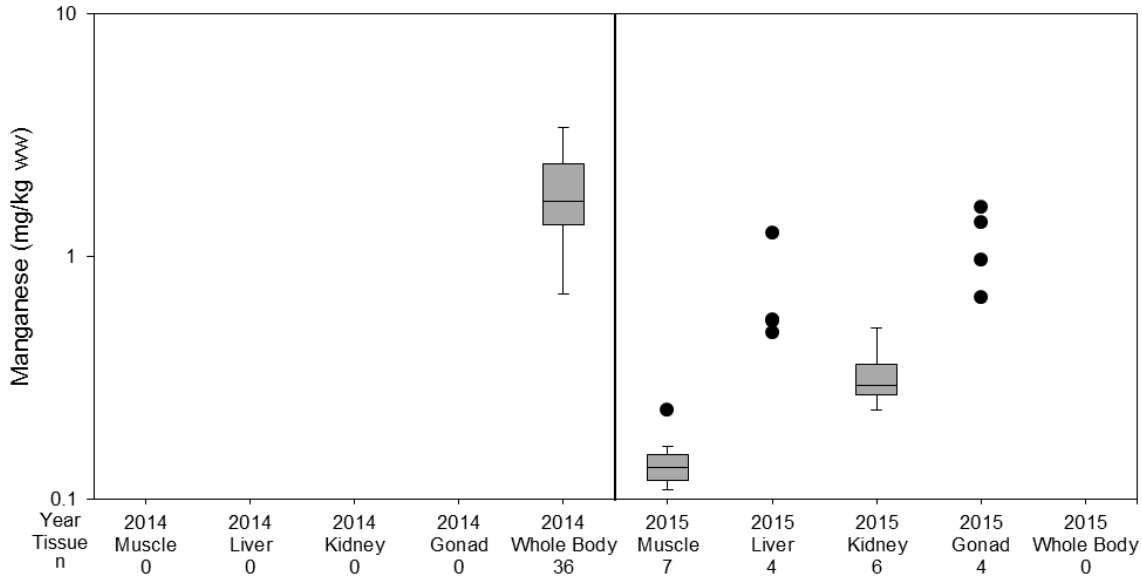
Figure 175: Manganese Concentrations in Northern Pikeminnow Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 176: Manganese Concentrations in Northern Pikeminnow Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

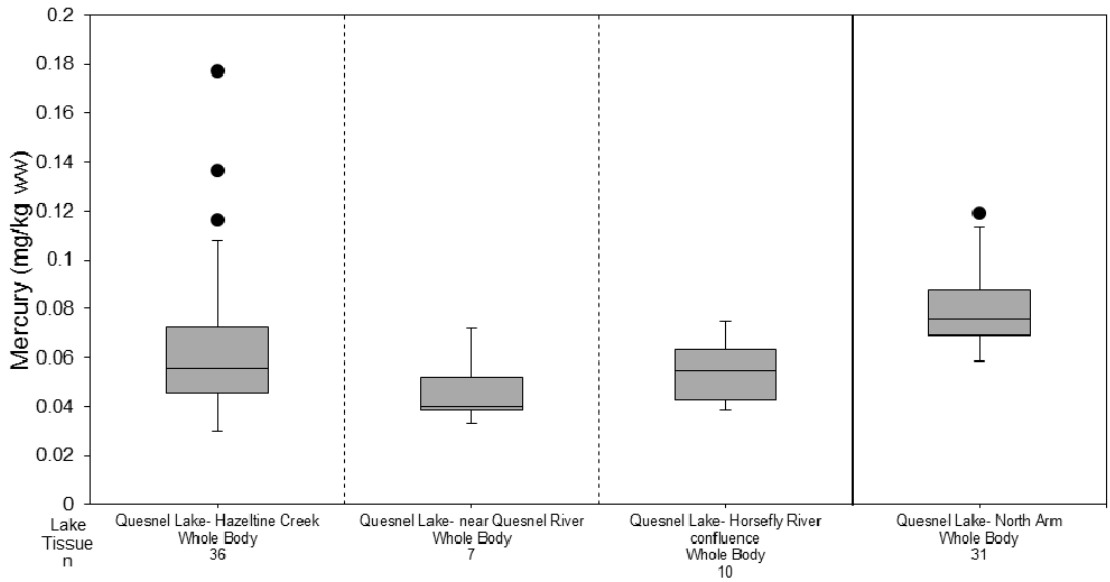


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

5.13 Mercury

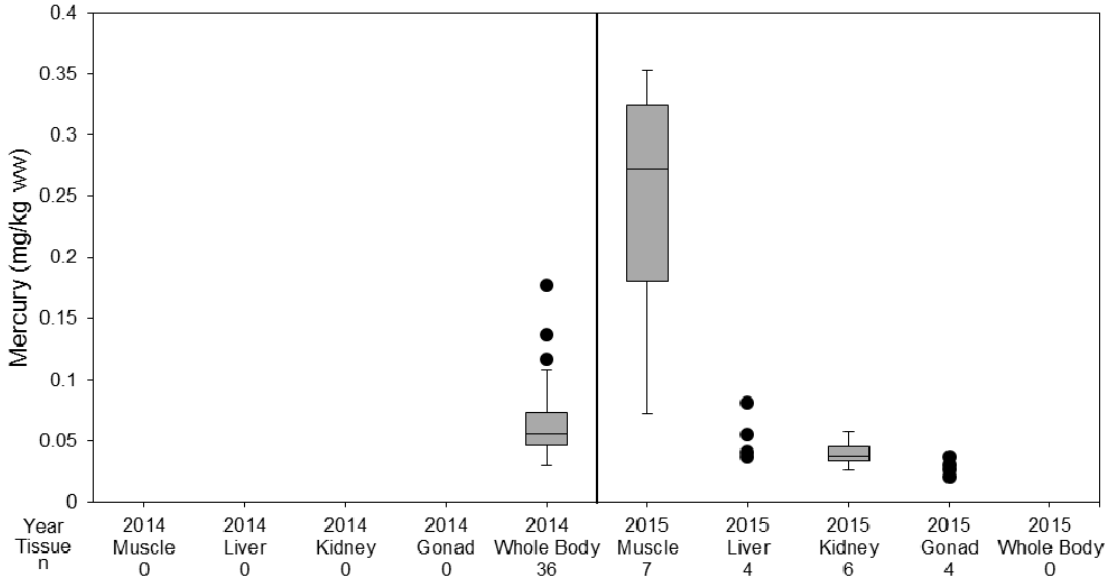
Figure 177: Mercury Concentrations in Northern Pikeminnow Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 178: Mercury Concentrations in Northern Pikeminnow Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

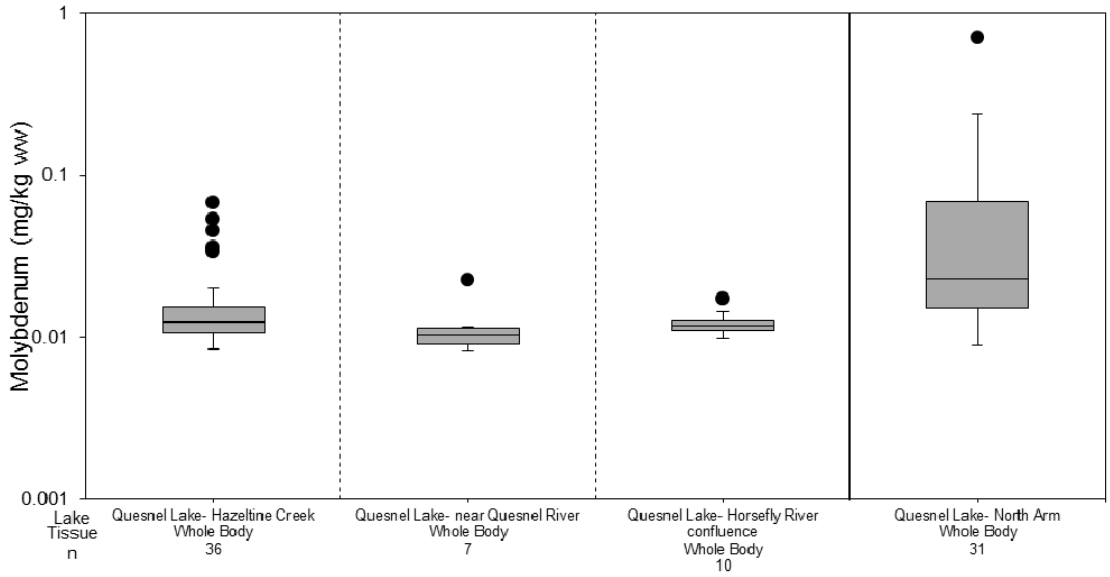


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

5.14 Molybdenum

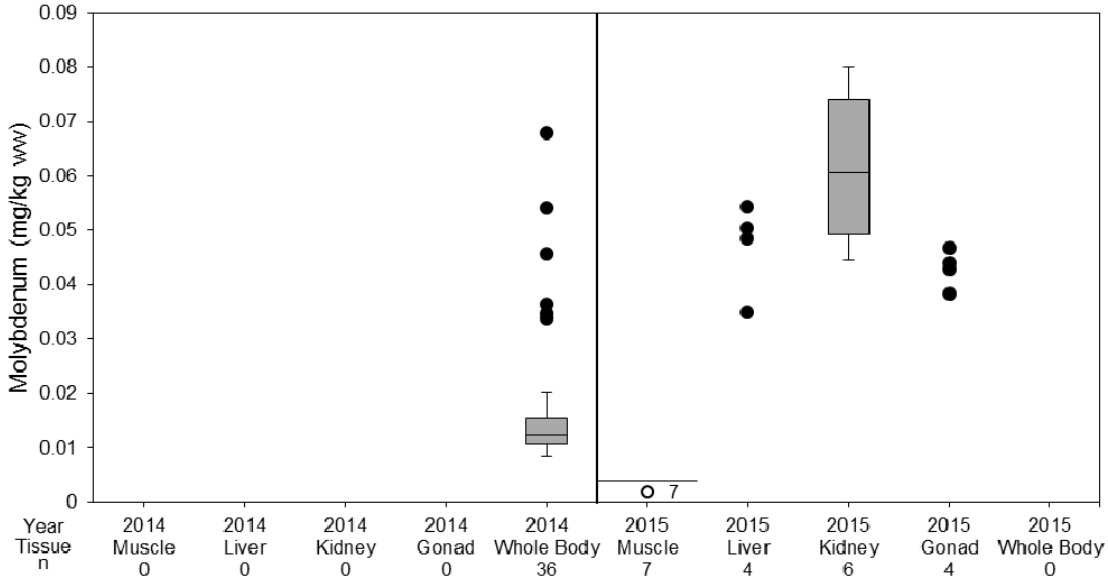
Figure 179: Molybdenum Concentrations in Northern Pikeminnow Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 180: Molybdenum Concentrations in Northern Pikeminnow Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

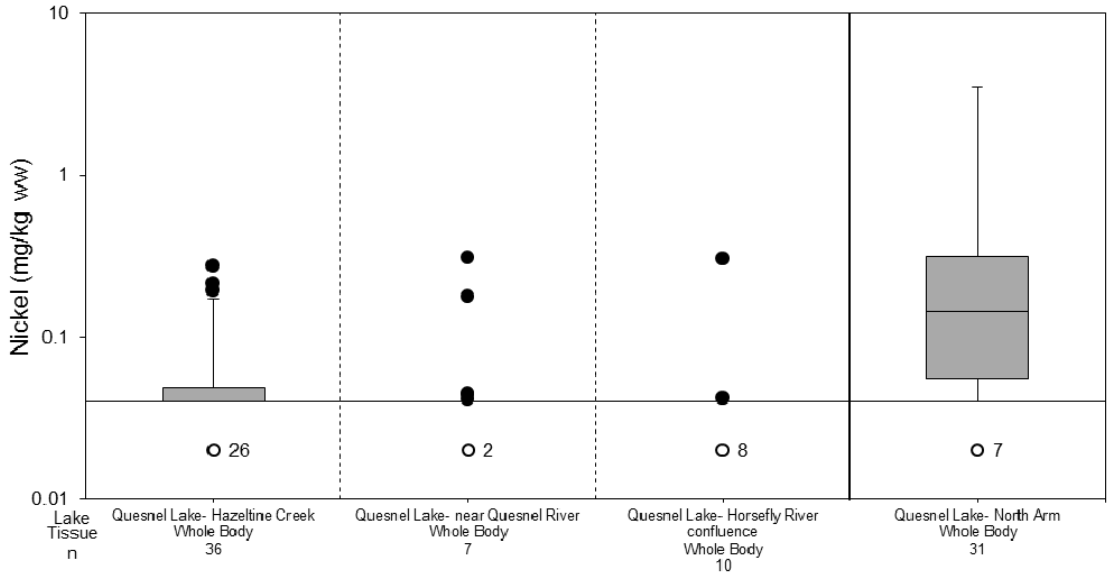


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

5.15 Nickel

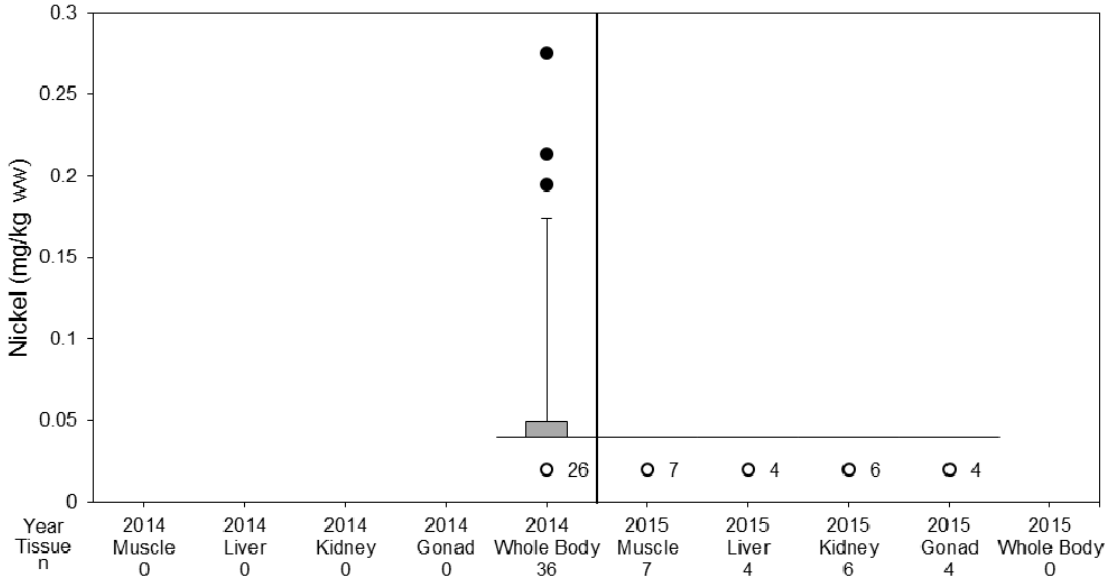
Figure 181: Nickel Concentrations in Northern Pikeminnow Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 182: Nickel Concentrations in Northern Pikeminnow Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

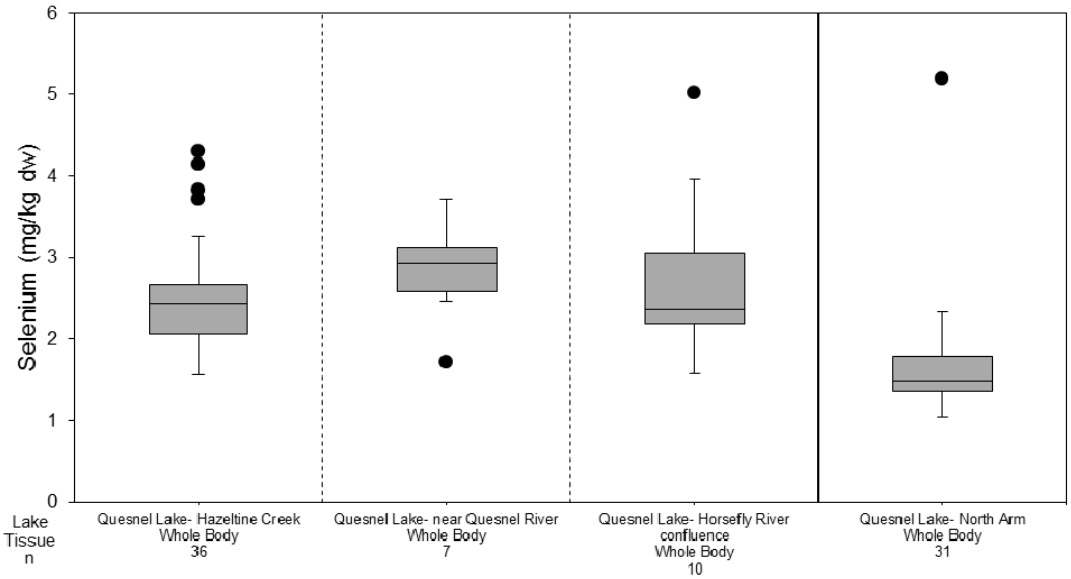


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

5.16 Selenium

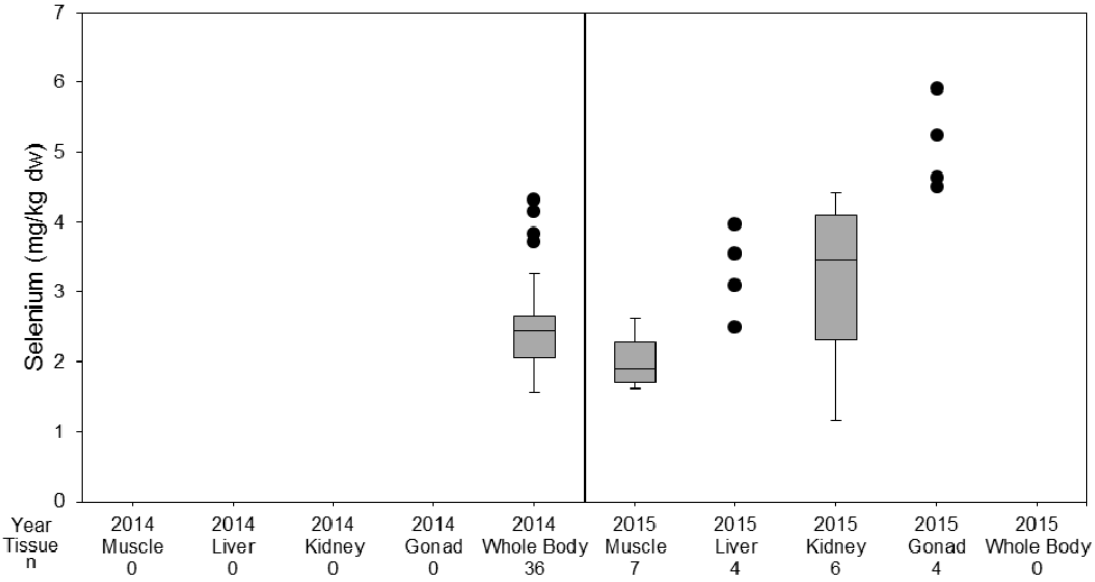
Figure 183: Selenium Concentrations in Northern Pikeminnow Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg dw = milligrams per kilogram dry weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 184: Selenium Concentrations in Northern Pikeminnow Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

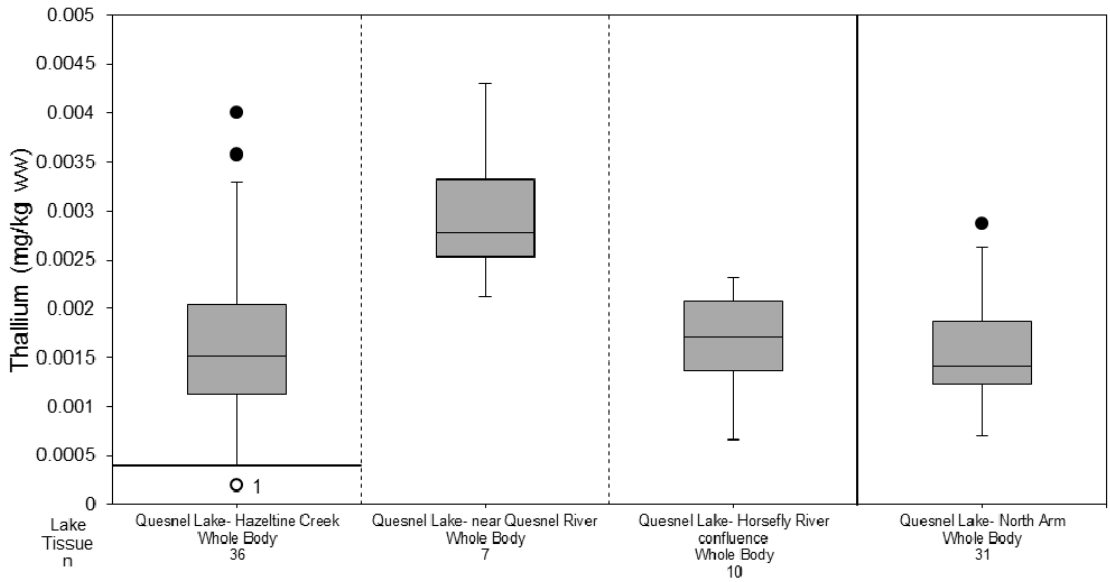


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg dw = milligrams per kilogram dry weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

5.17 Thallium

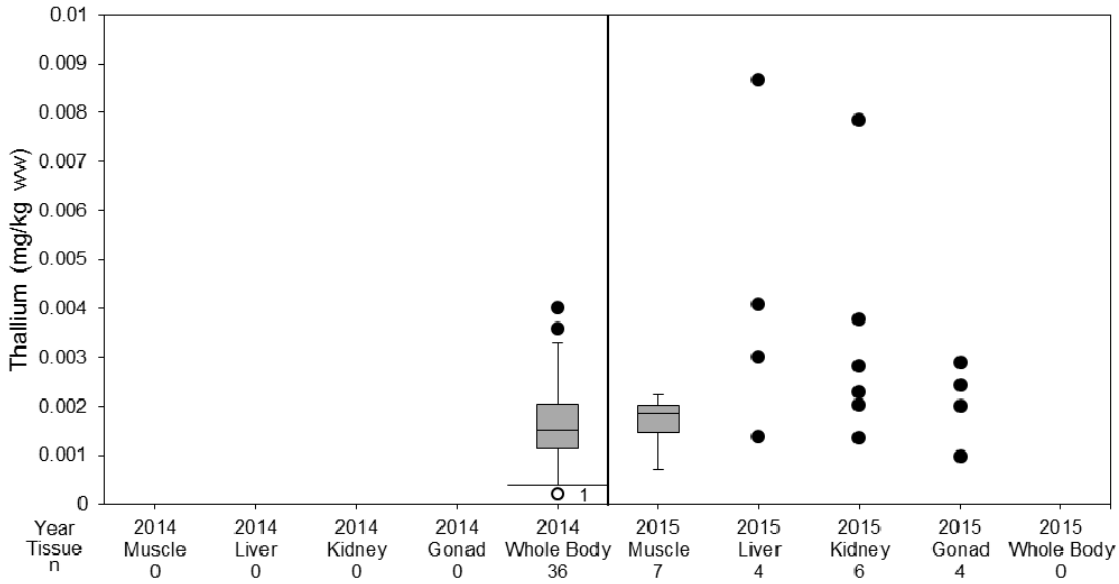
Figure 185: Thallium Concentrations in Northern Pikeminnow Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 186: Thallium Concentrations in Northern Pikeminnow Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

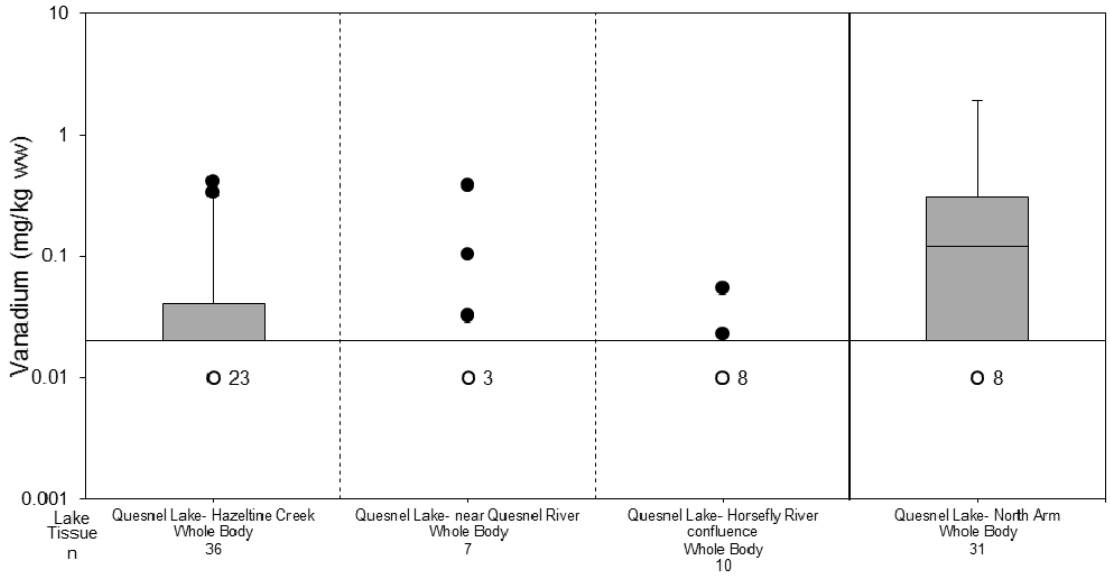


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

5.18 Vanadium

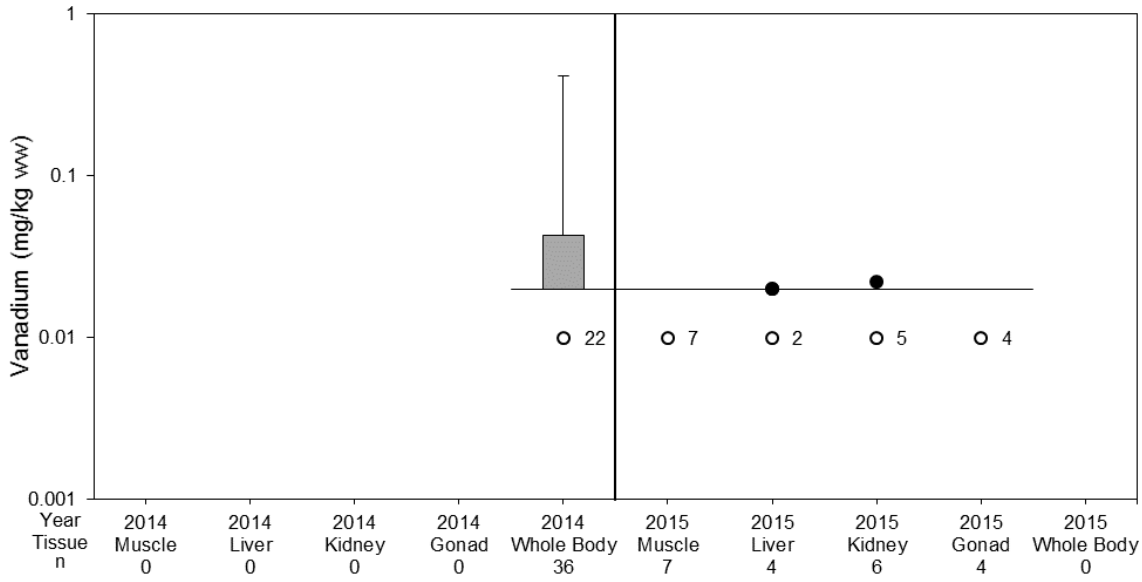
Figure 187: Vanadium Concentrations in Northern Pikeminnow Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 188: Vanadium Concentrations in Northern Pikeminnow Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

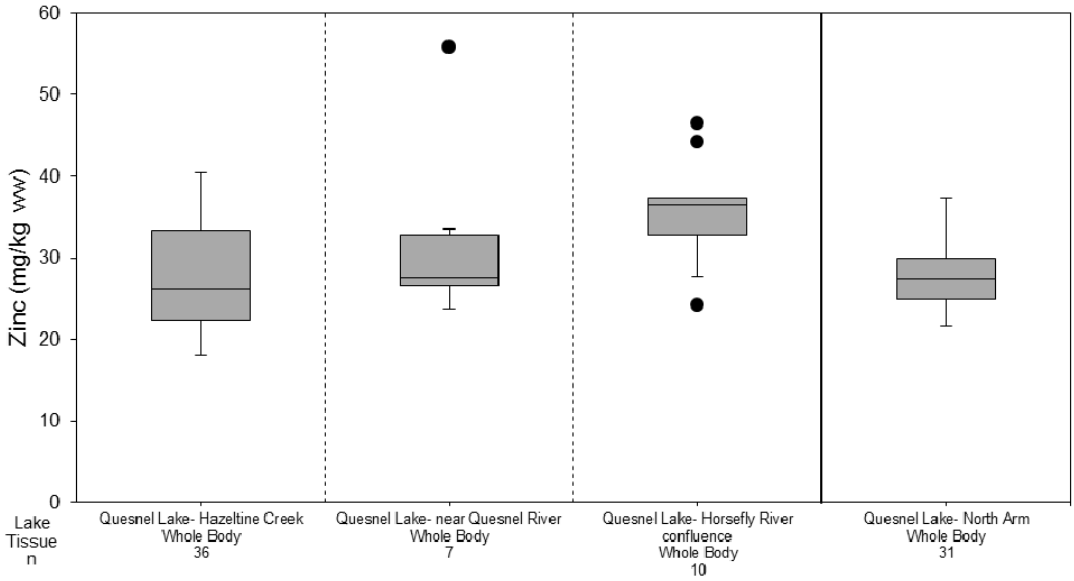


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

5.19 Zinc

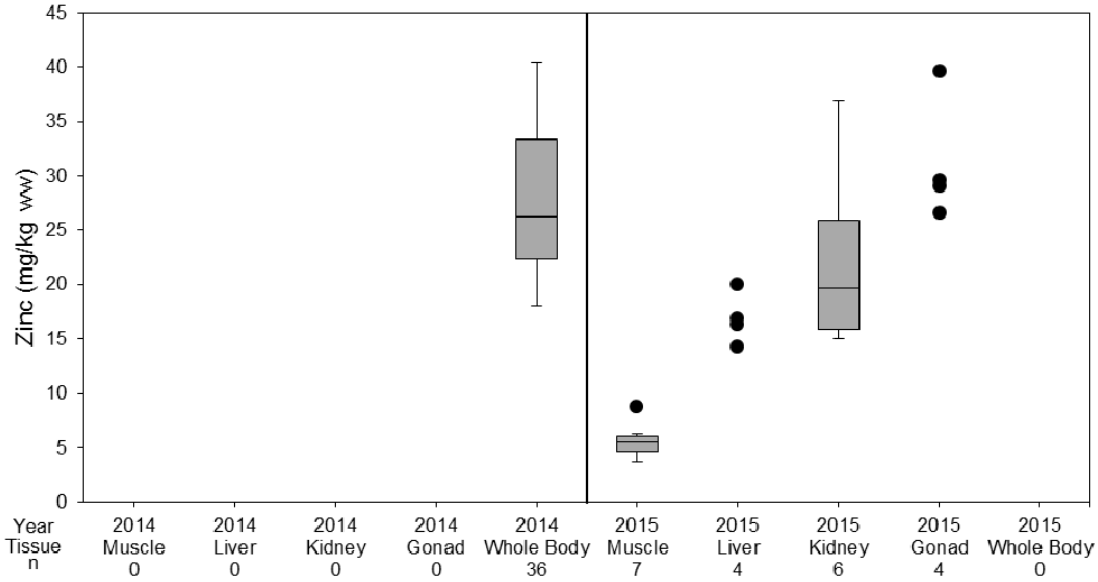
Figure 189: Zinc Concentrations in Northern Pikeminnow Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 190: Zinc Concentrations in Northern Pikeminnow Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015



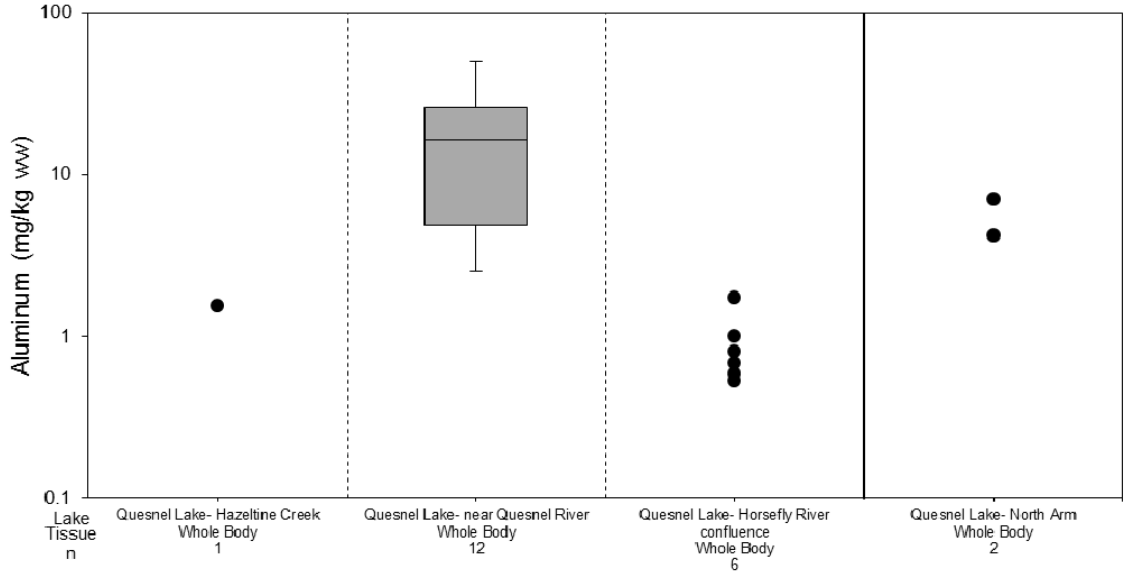
Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

6.0 PEAMOUTH CHUB

6.1 Aluminum

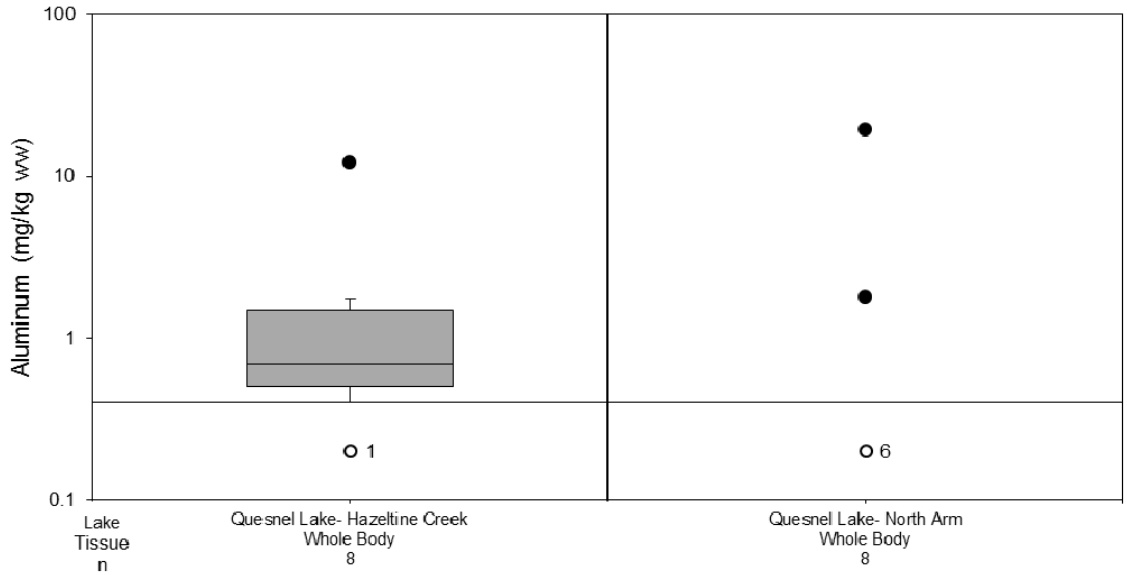
Figure 191: Aluminum Concentrations in Peamouth Chub Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

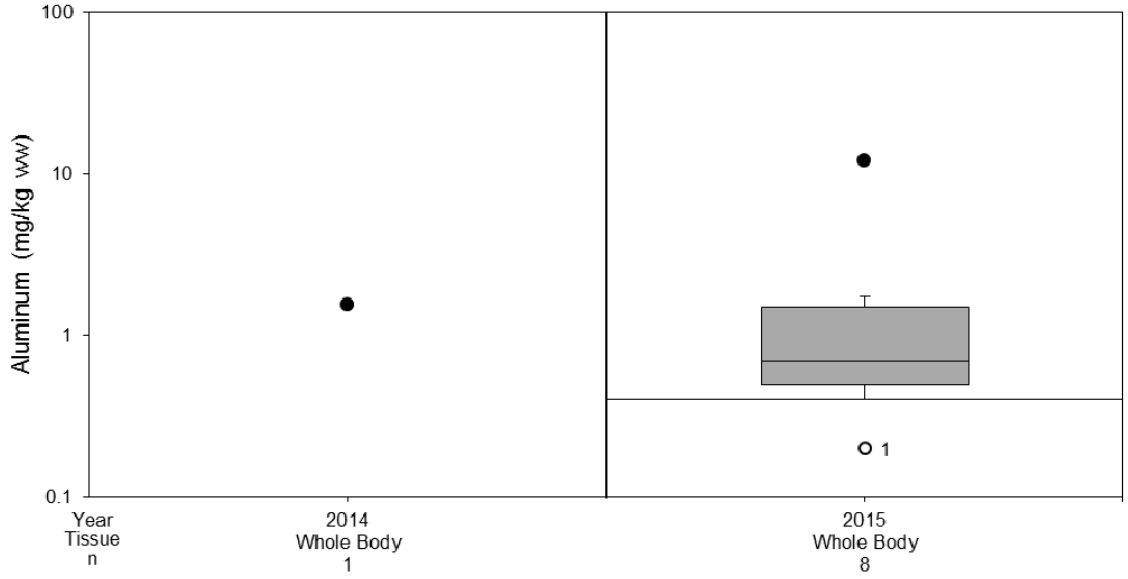
Figure 192: Aluminum Concentrations in Peamouth Chub Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 193: Aluminum Concentrations in Peamouth Chub Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

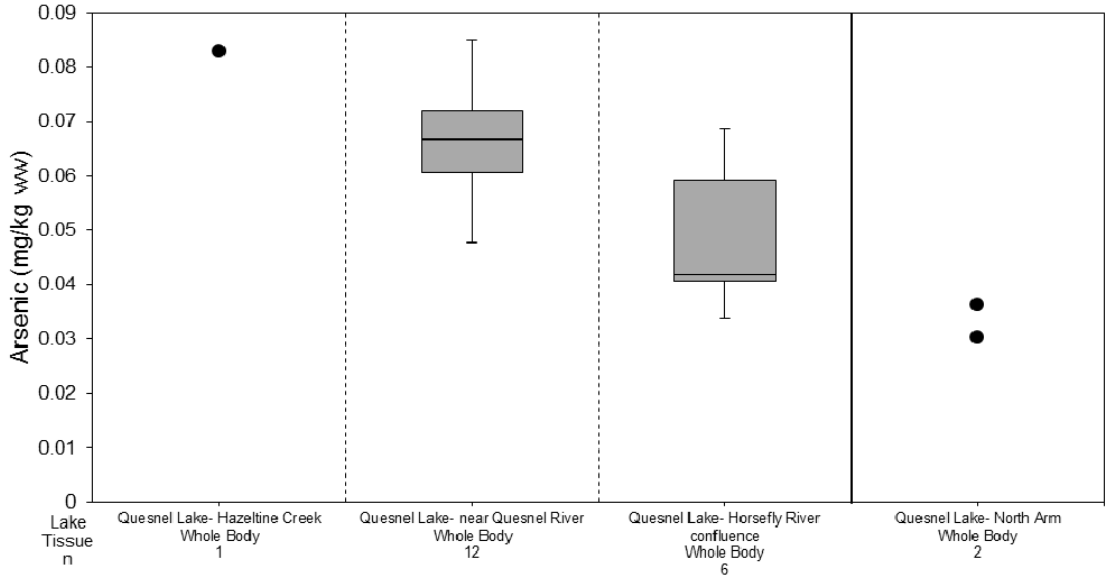


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

6.2 Arsenic

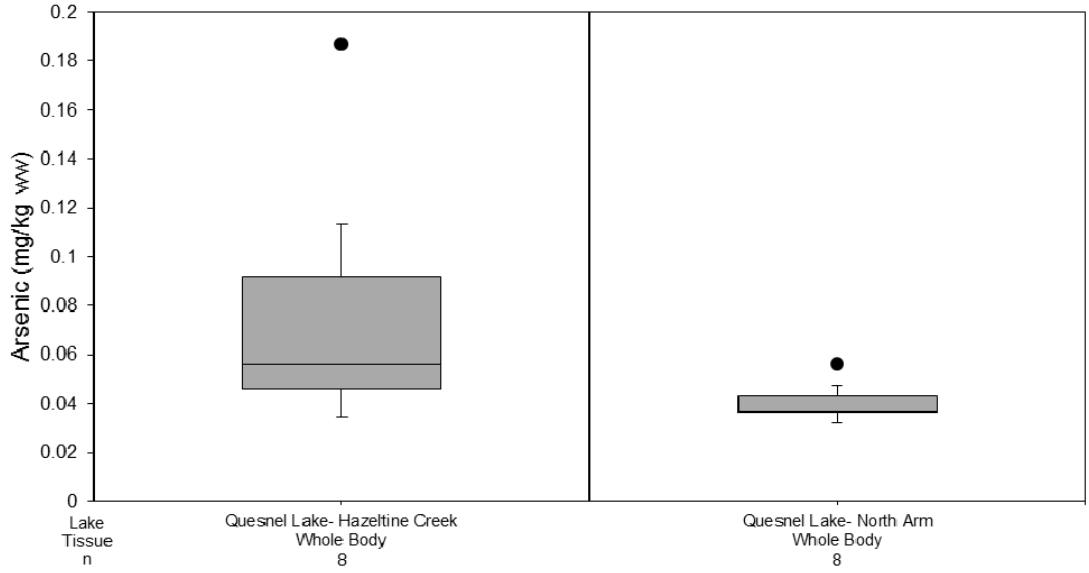
Figure 194: Arsenic Concentrations in Peamouth Chub Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

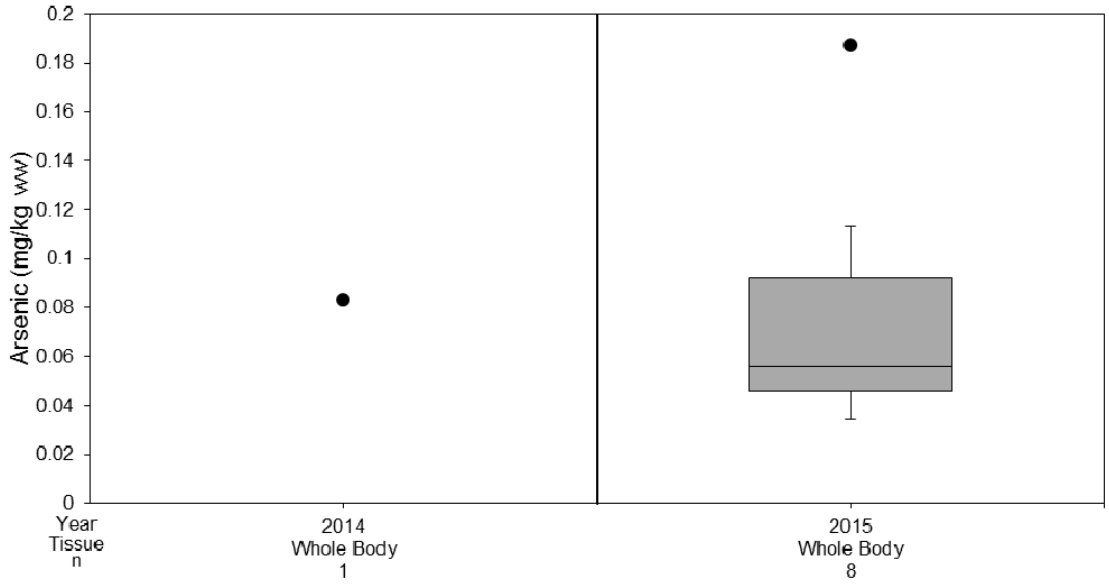
Figure 195: Arsenic Concentrations in Peamouth Chub Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 196: Arsenic Concentrations in Peamouth Chub Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

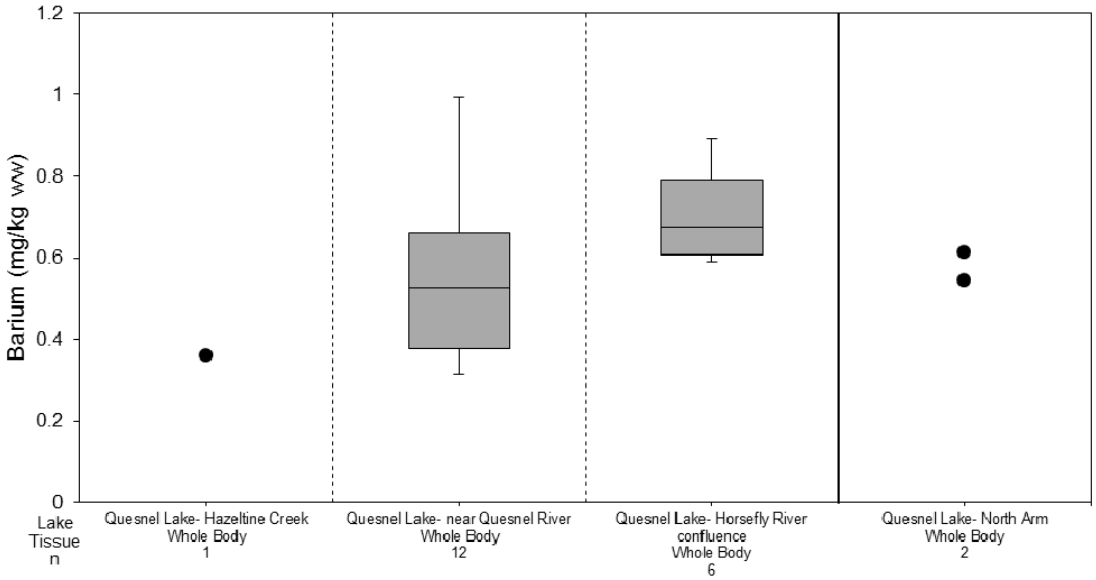


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

6.3 Barium

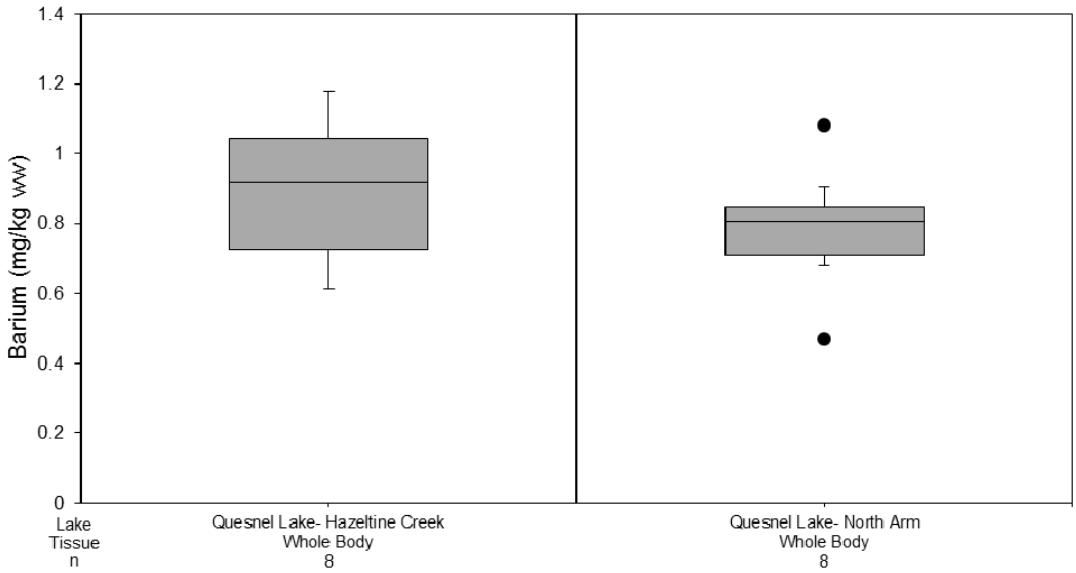
Figure 197: Barium Concentrations in Peamouth Chub Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

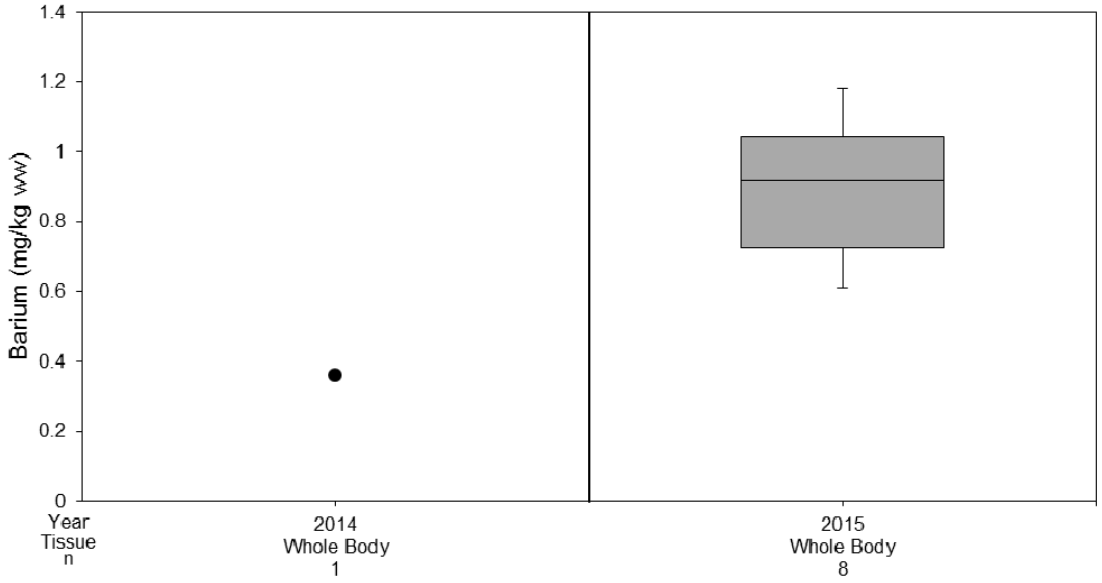
Figure 198: Barium Concentrations in Peamouth Chub Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 199: Barium Concentrations in Peamouth Chub Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

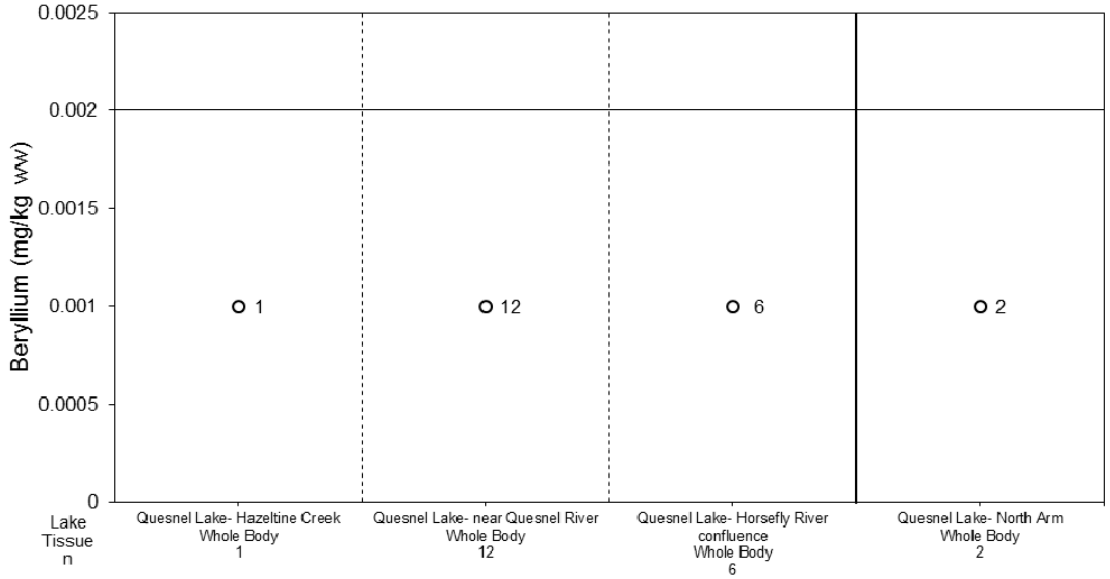


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

6.4 Beryllium

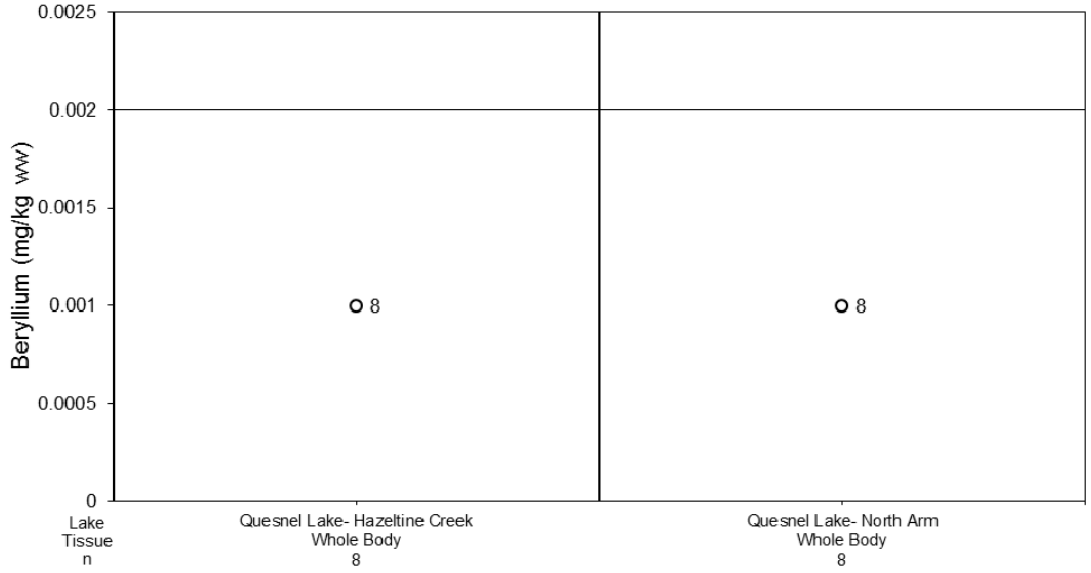
Figure 200: Beryllium Concentrations in Peamouth Chub Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

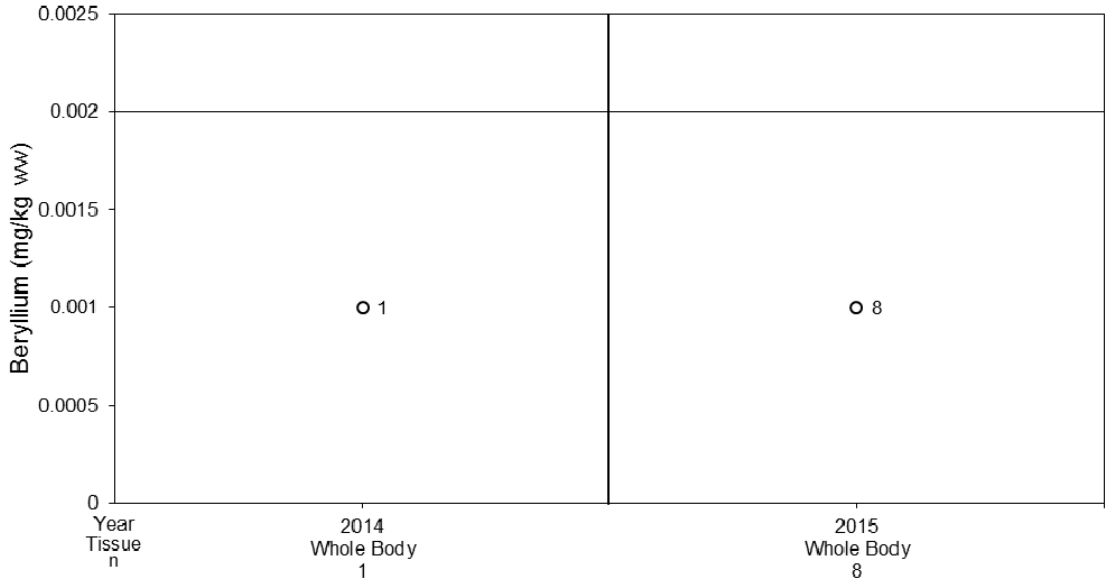
Figure 201: Beryllium Concentrations in Peamouth Chub Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 202: Beryllium Concentrations in Peamouth Chub Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

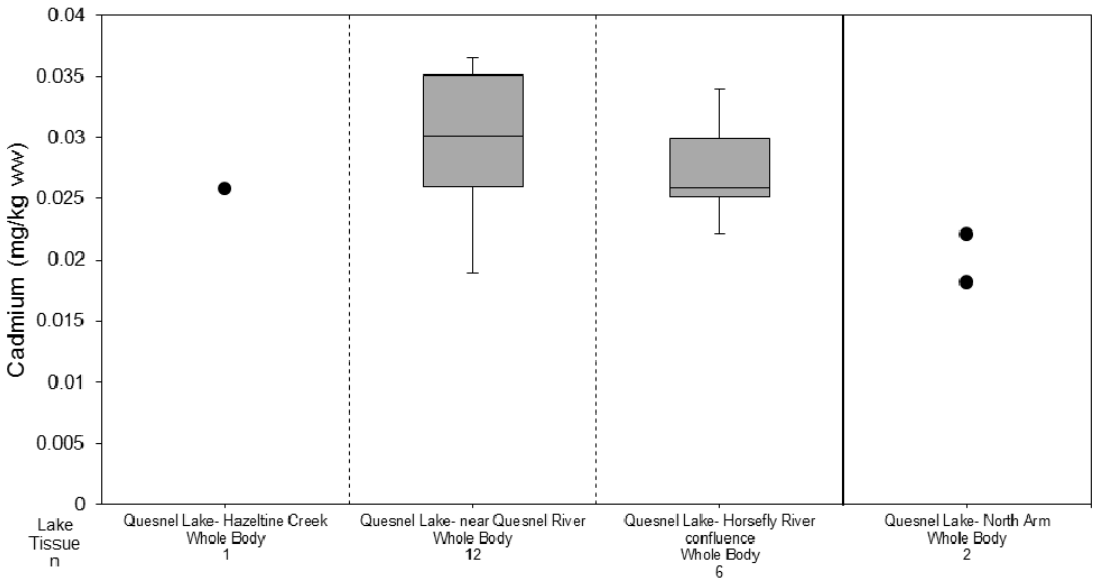


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

6.5 Cadmium

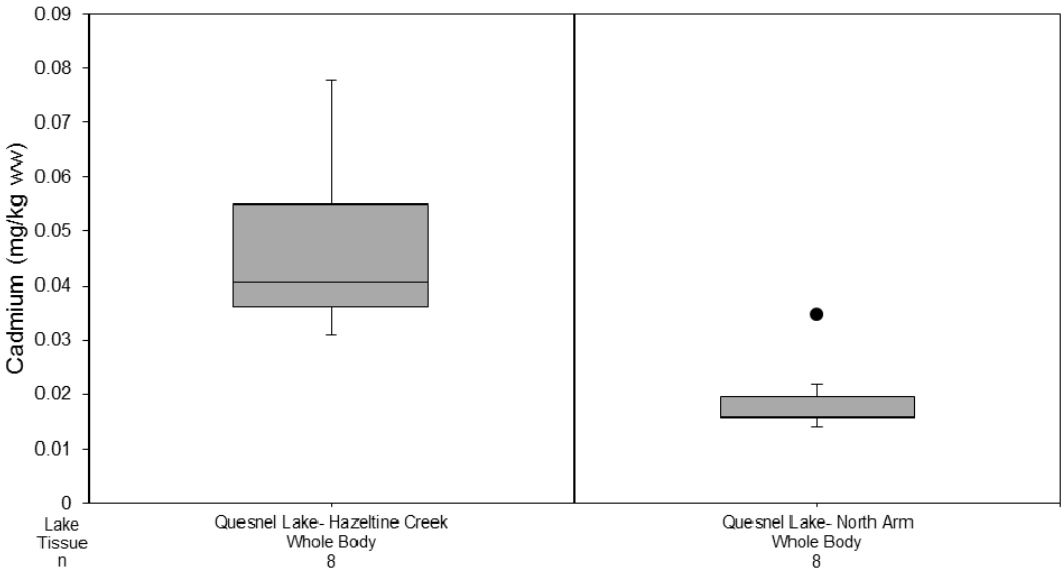
Figure 203: Cadmium Concentrations in Peamouth Chub Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 204: Cadmium Concentrations in Peamouth Chub Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

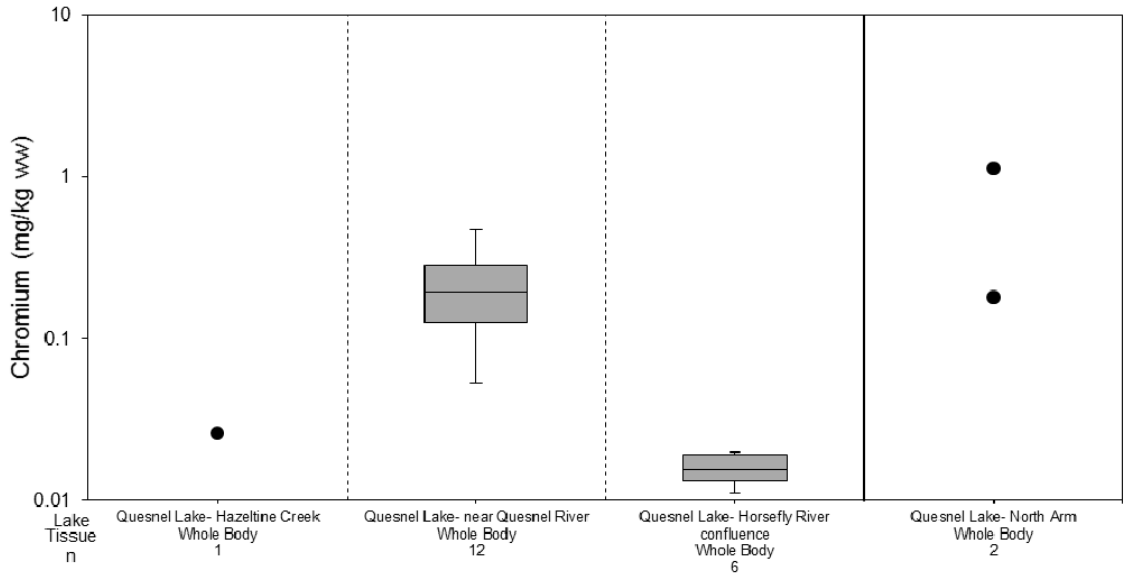
Figure 205: Cadmium Concentrations in Peamouth Chub Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

6.6 Chromium

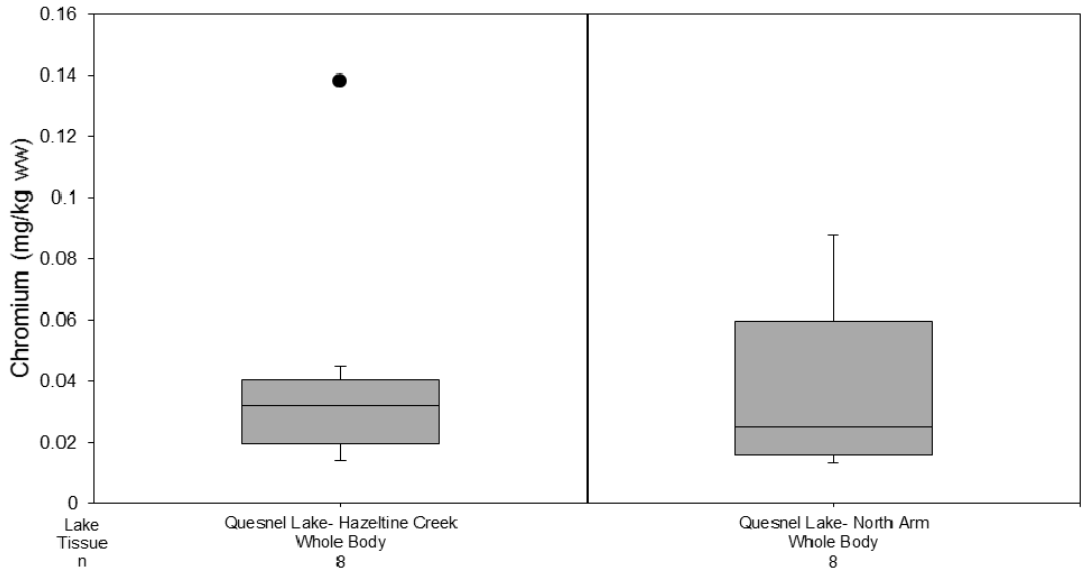
Figure 206: Chromium Concentrations in Peamouth Chub Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

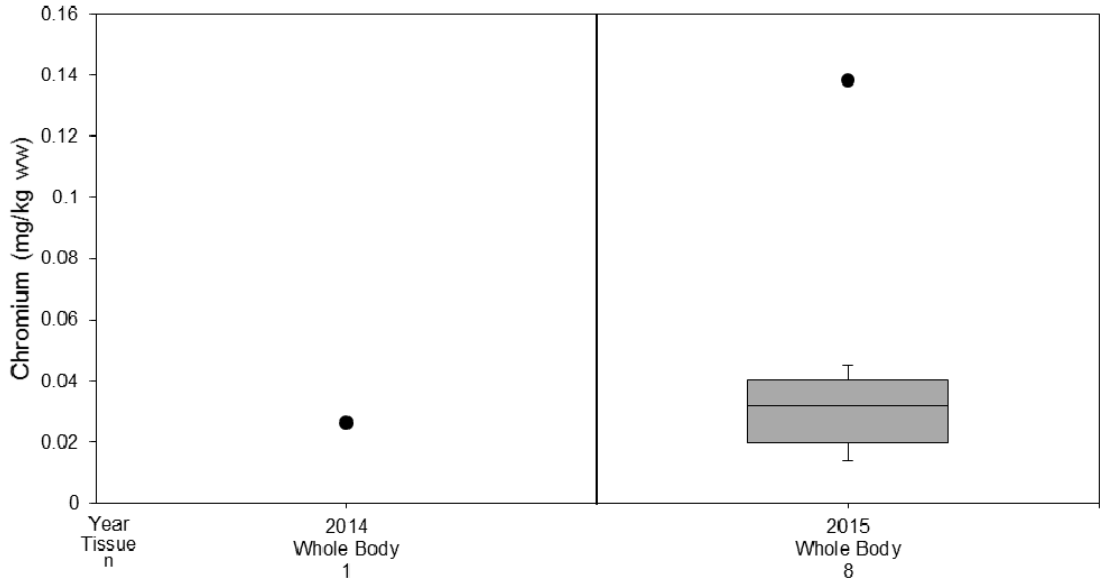
Figure 207: Chromium Concentrations in Peamouth Chub Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 208: Chromium Concentrations in Peamouth Chub Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

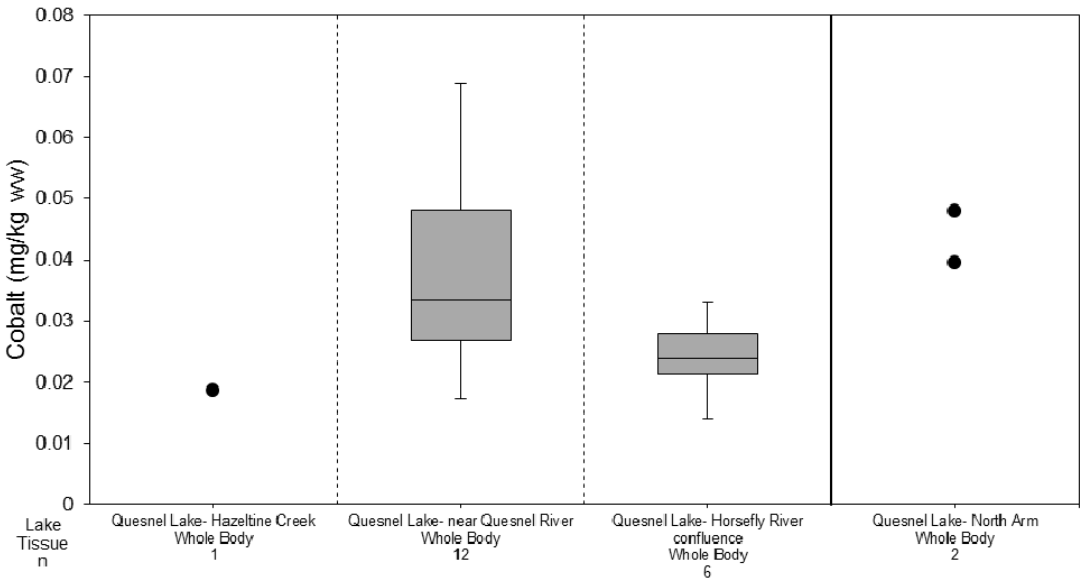


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

6.7 Cobalt

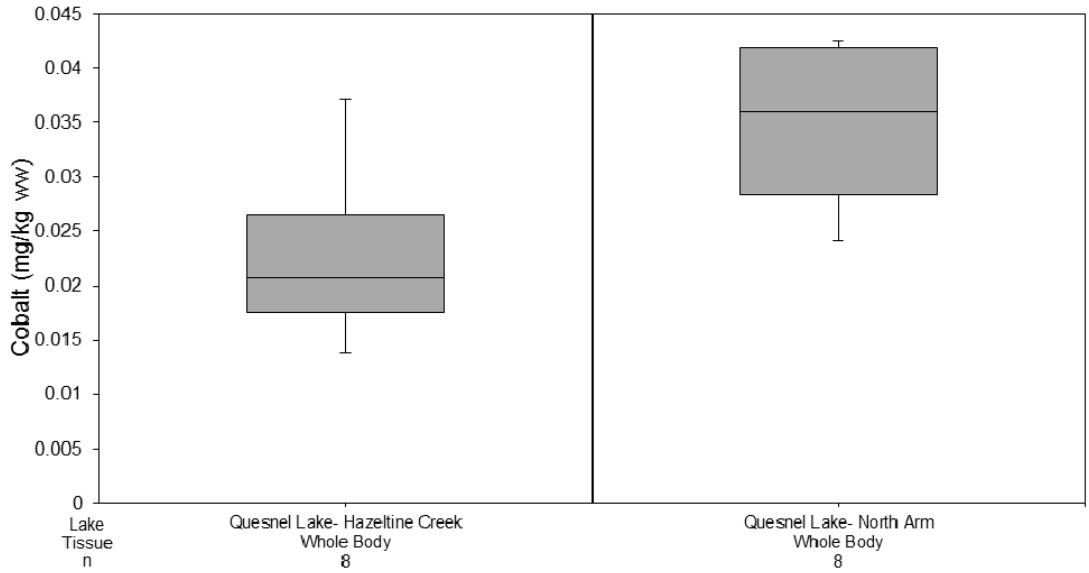
Figure 209: Cobalt Concentrations in Peamouth Chub Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

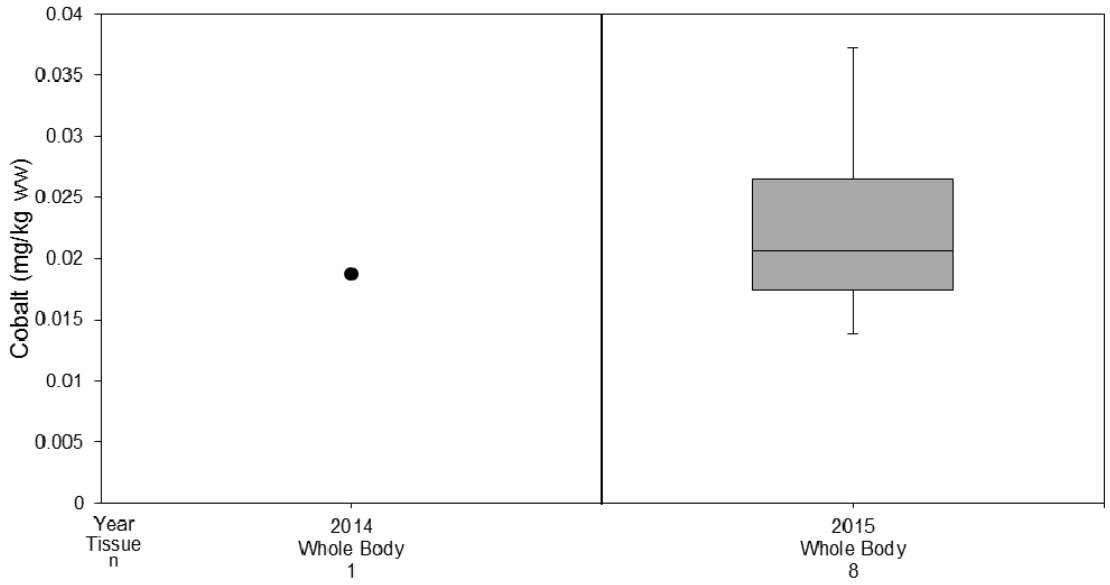
Figure 210: Cobalt Concentrations in Peamouth Chub Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 211: Cobalt Concentrations in Peamouth Chub Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

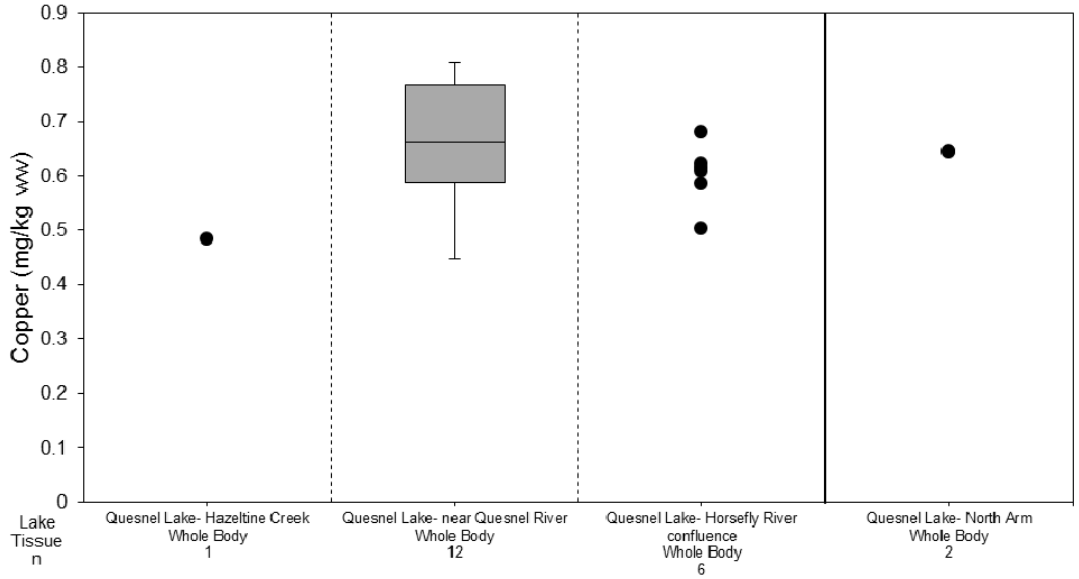


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

6.8 Copper

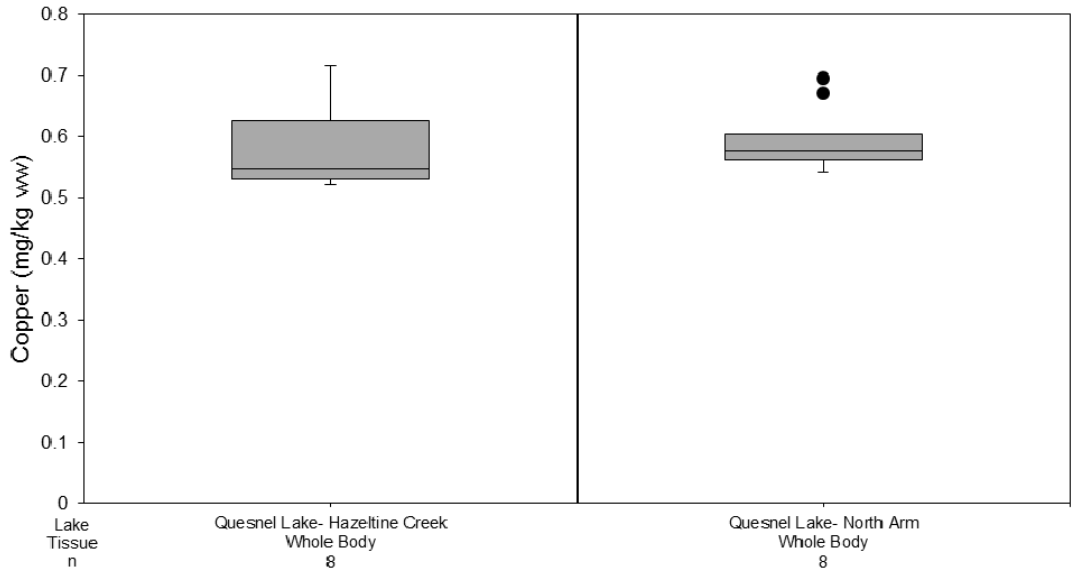
Figure 212: Copper Concentrations in Peamouth Chub Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

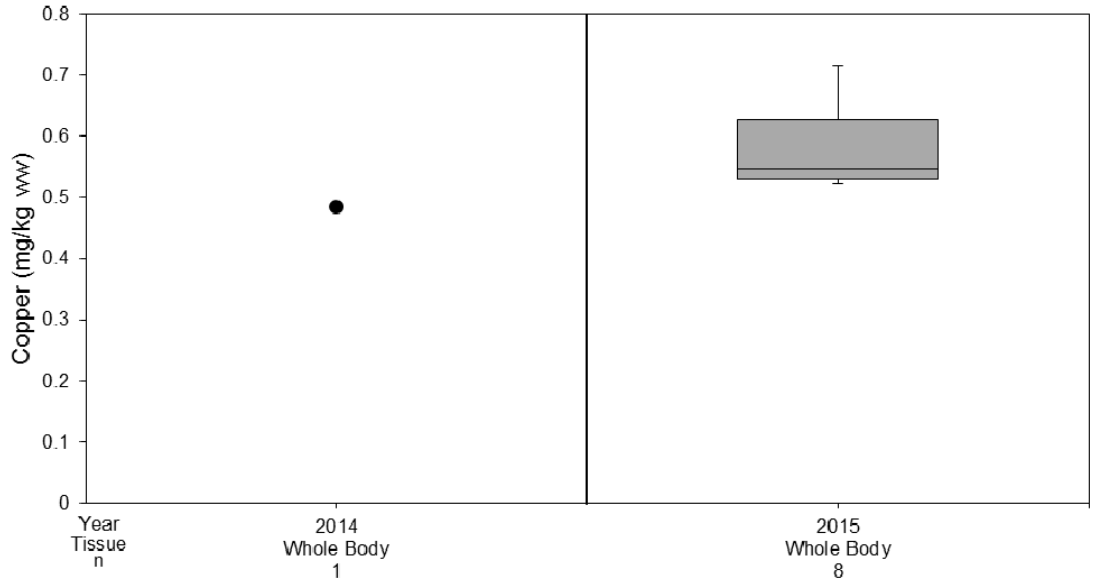
Figure 213: Copper Concentrations in Peamouth Chub Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 214: Copper Concentrations in Peamouth Chub Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

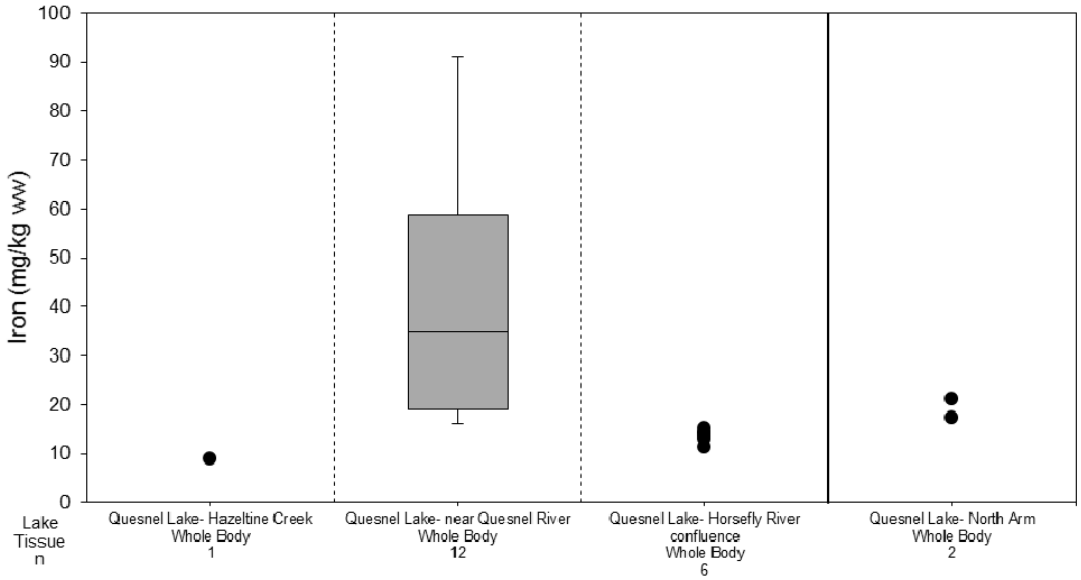


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

6.9 Iron

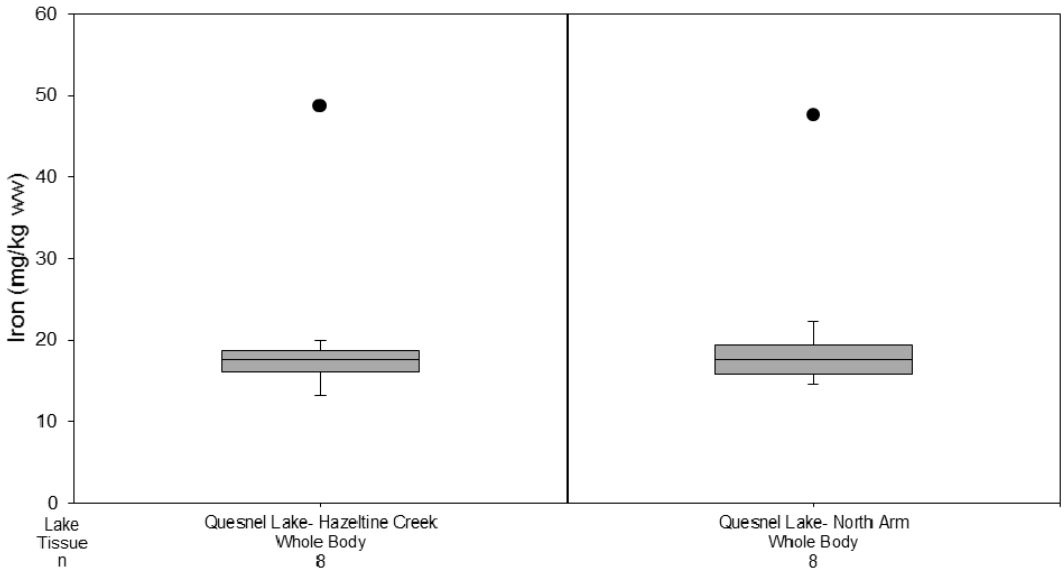
Figure 215: Iron Concentrations in Peamouth Chub Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

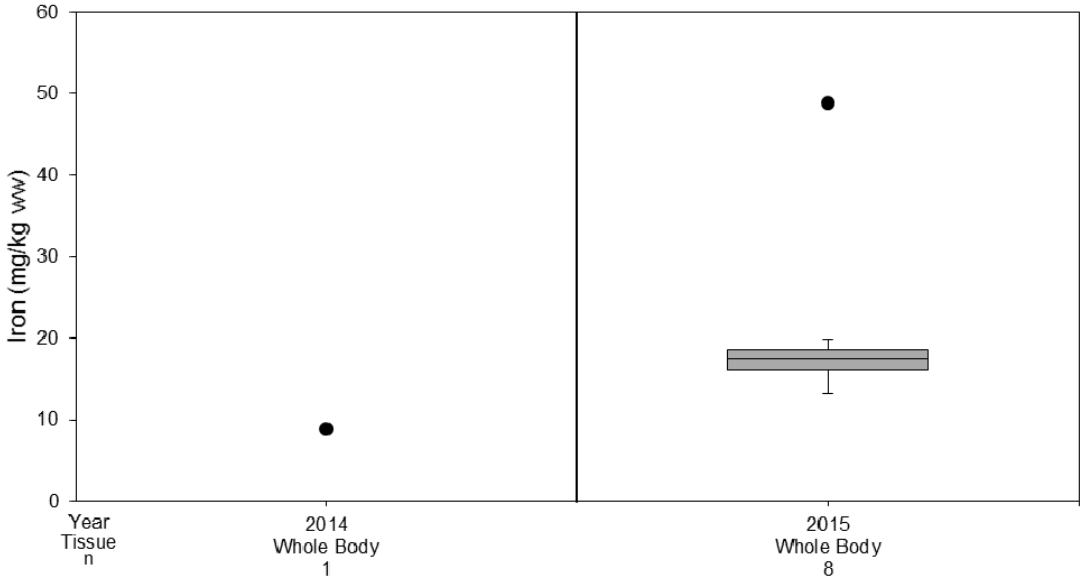
Figure 216: Iron Concentrations in Peamouth Chub Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 217: Iron Concentrations in Peamouth Chub Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

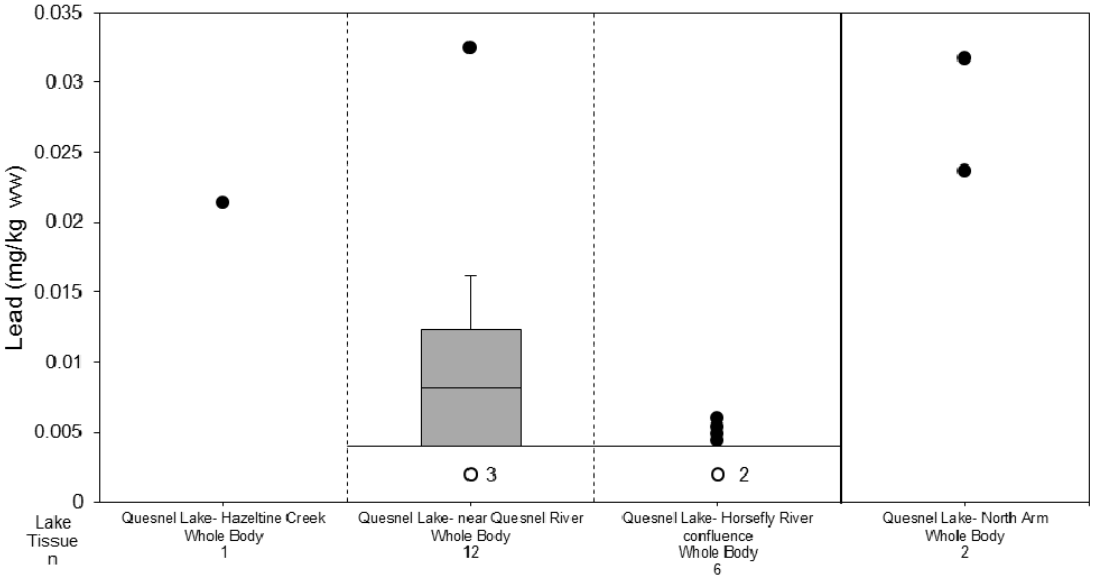


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

6.10 Lead

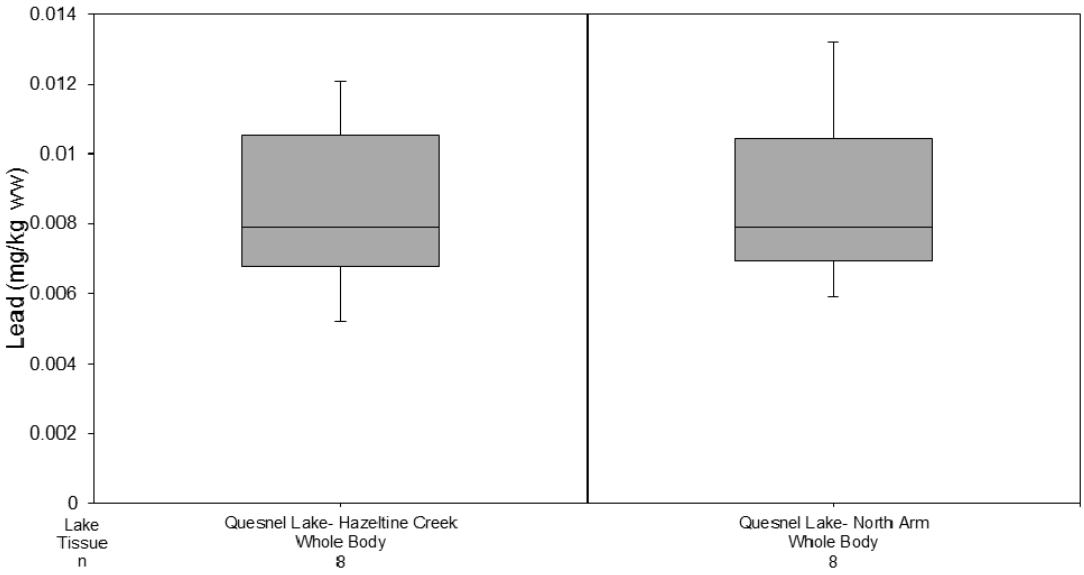
Figure 218: Lead Concentrations in Peamouth Chub Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 219: Lead Concentrations in Peamouth Chub Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

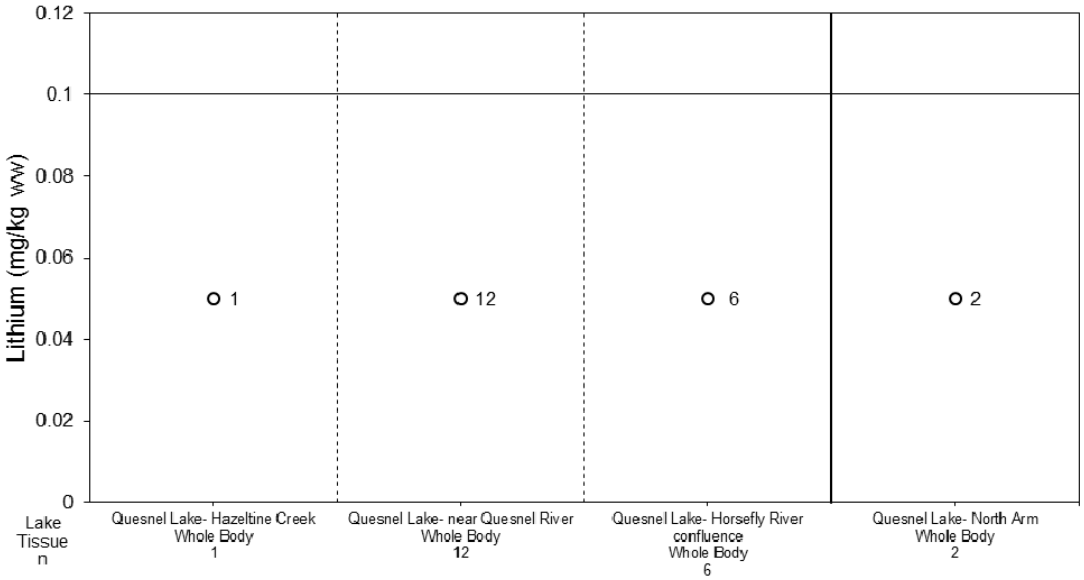
Figure 220: Lead Concentrations in Peamouth Chub Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

6.11 Lithium

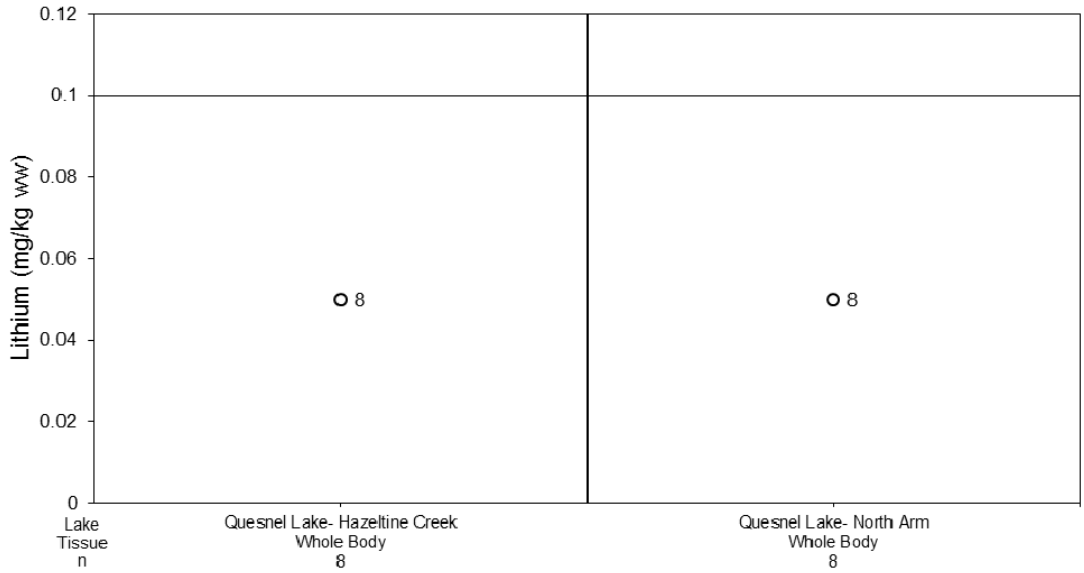
Figure 221: Lithium Concentrations in Peamouth Chub Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

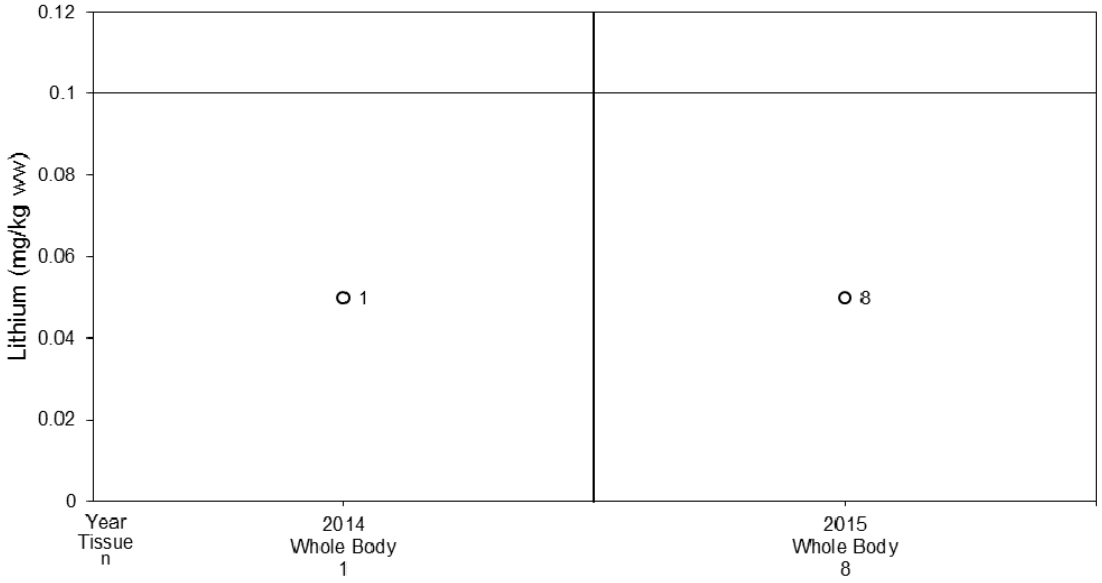
Figure 222: Lithium Concentrations in Peamouth Chub Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 223: Lithium Concentrations in Peamouth Chub Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

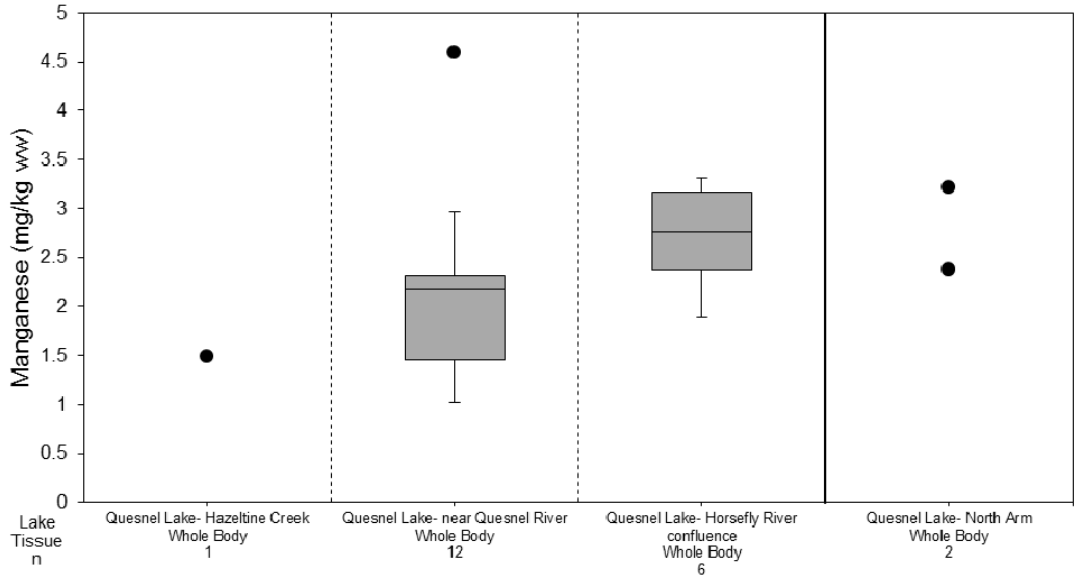


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

6.12 Manganese

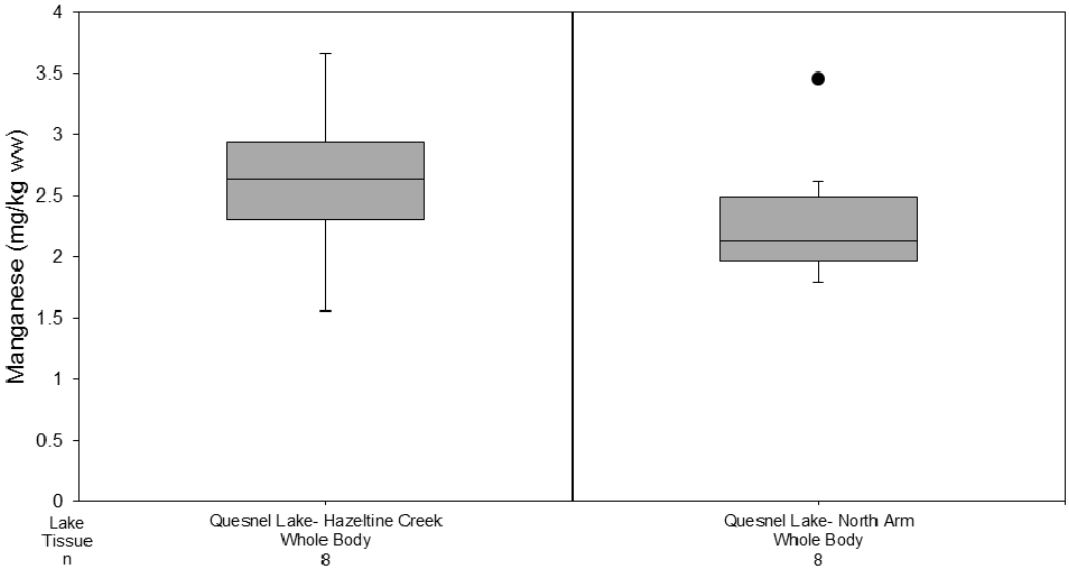
Figure 224: Manganese Concentrations in Peamouth Chub Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

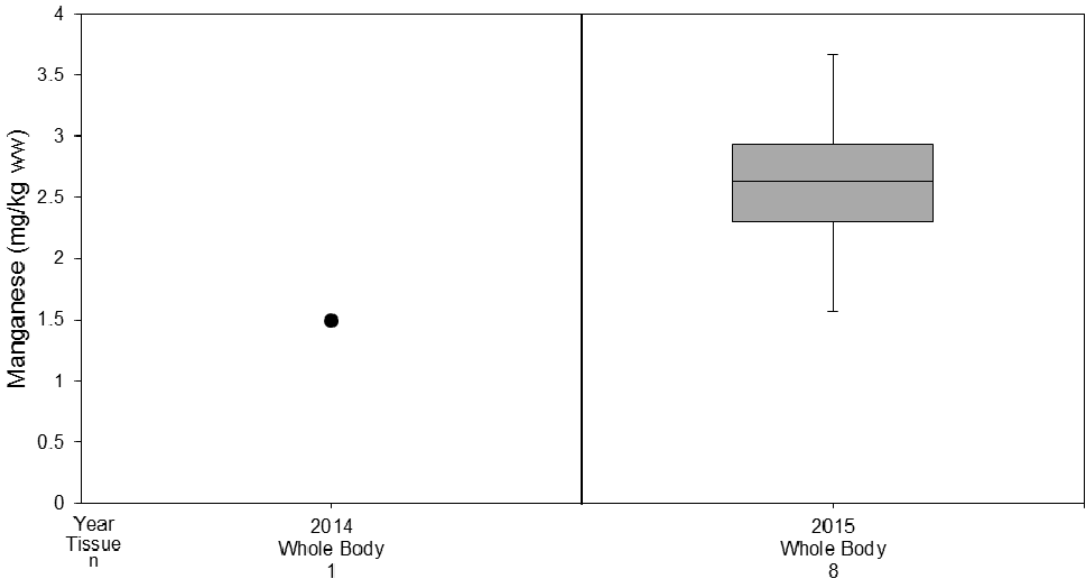
Figure 225: Manganese Concentrations in Peamouth Chub Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 226: Manganese Concentrations in Peamouth Chub Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

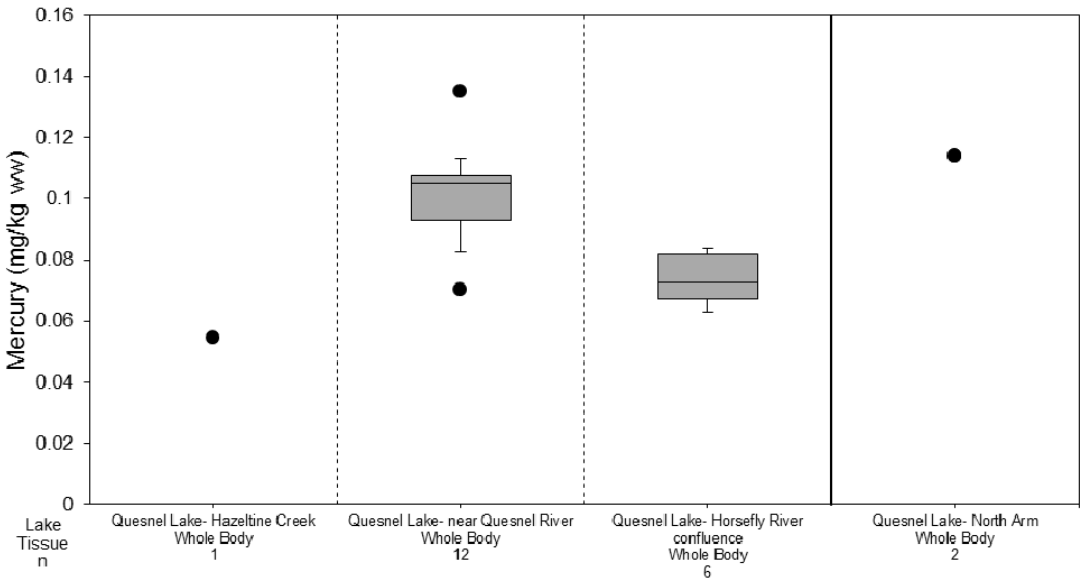


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

6.13 Mercury

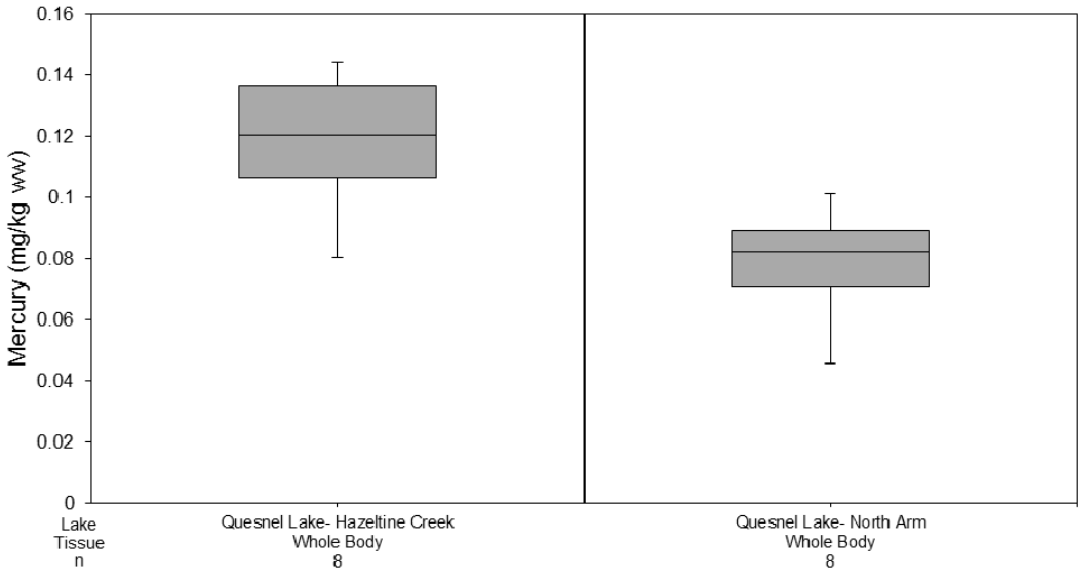
Figure 227: Mercury Concentrations in Peamouth Chub Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

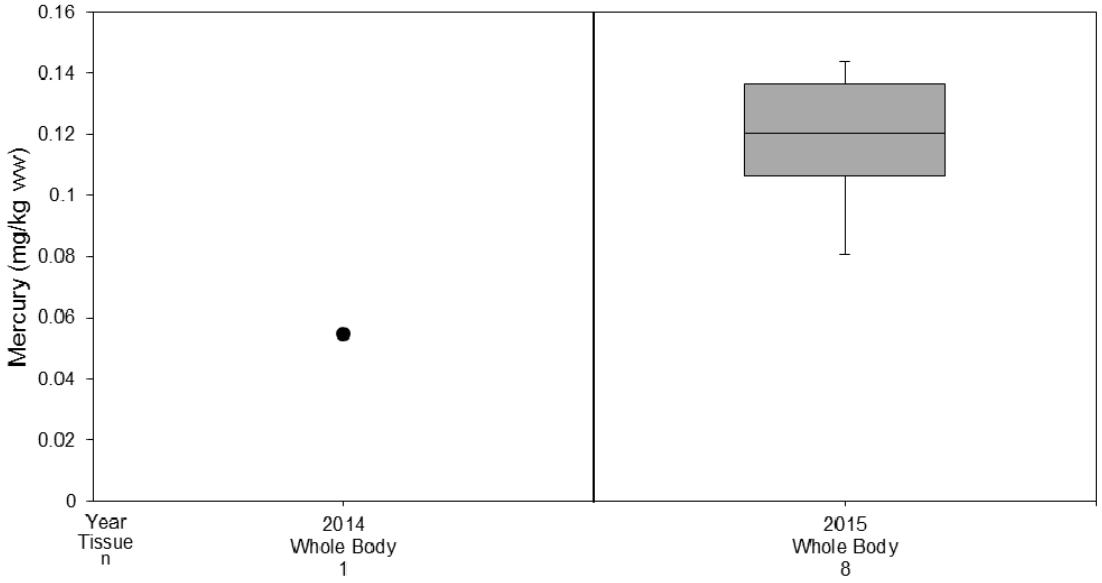
Figure 228: Mercury Concentrations in Peamouth Chub Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 229: Mercury Concentrations in Peamouth Chub Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

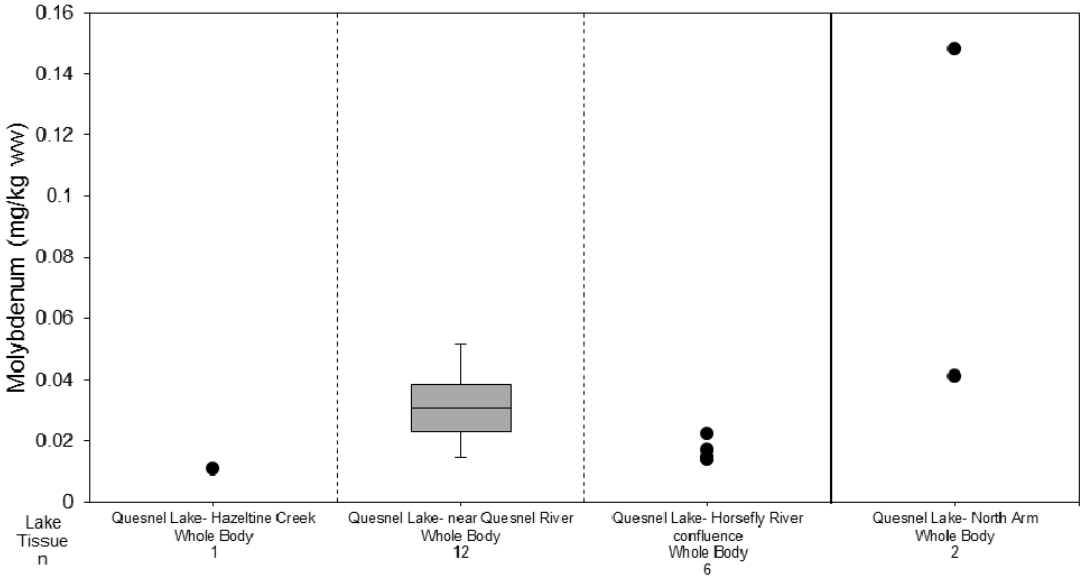


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

6.14 Molybdenum

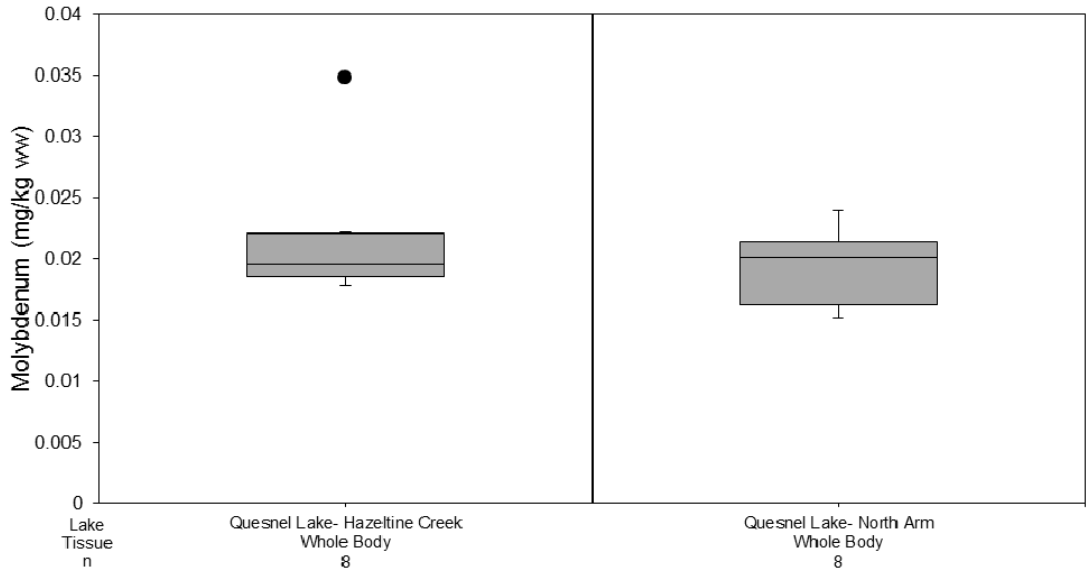
Figure 230: Molybdenum Concentrations in Peamouth Chub Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

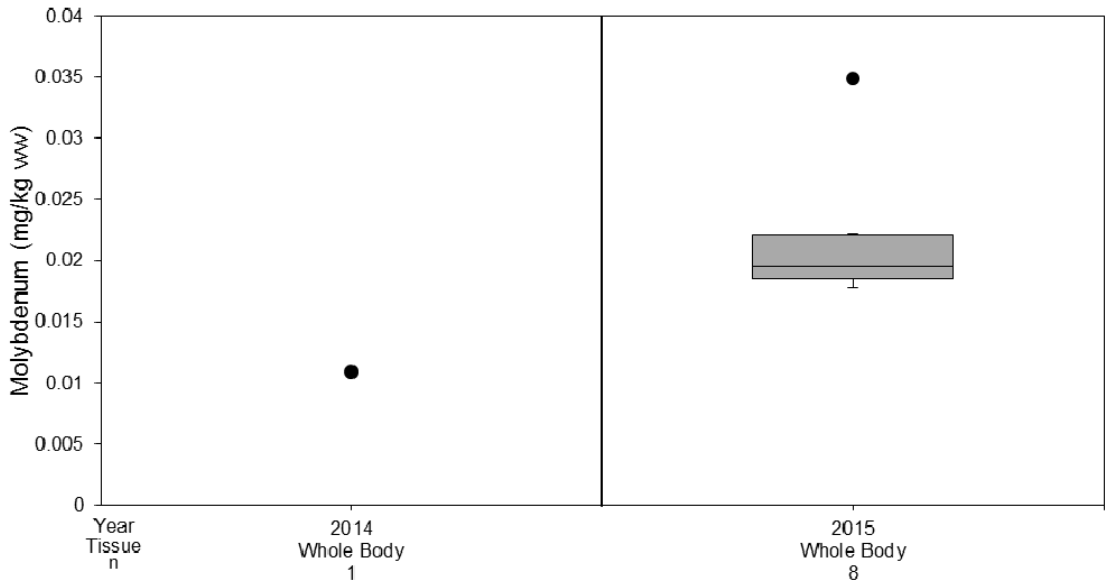
Figure 231: Molybdenum Concentrations in Peamouth Chub Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 232: Molybdenum Concentrations in Peamouth Chub Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

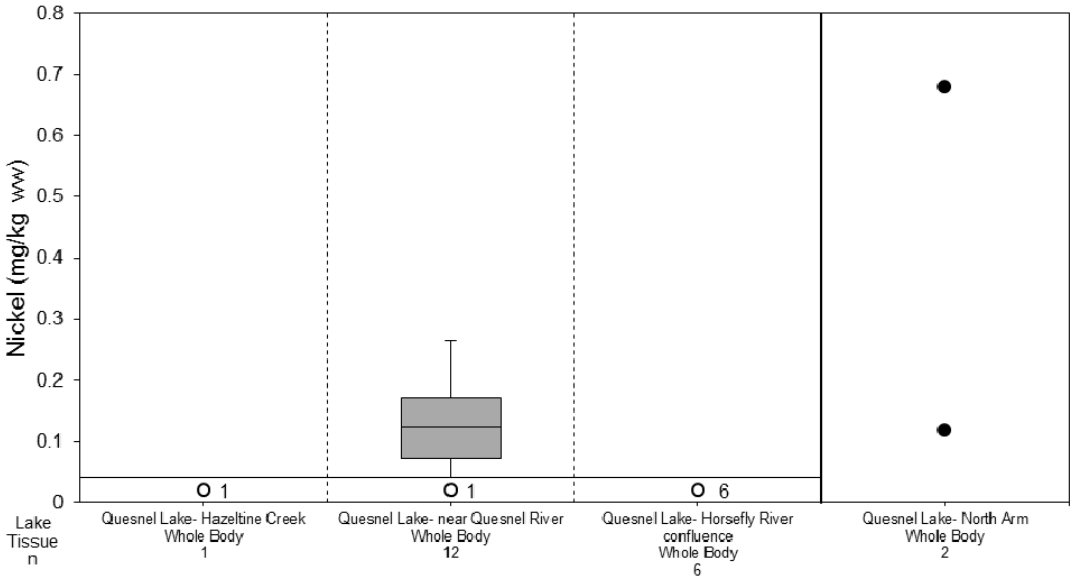


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

6.15 Nickel

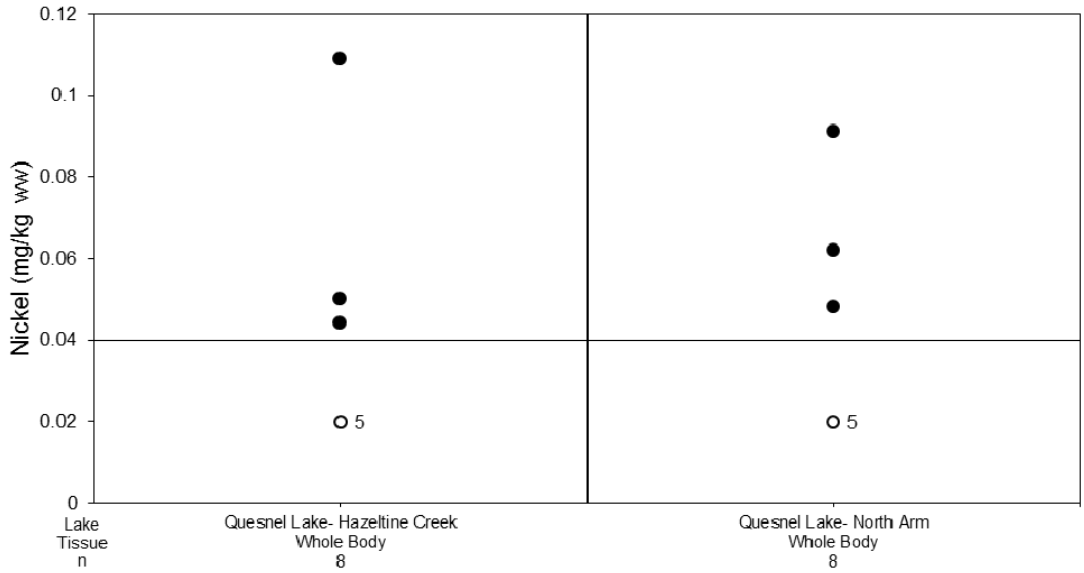
Figure 233: Nickel Concentrations in Peamouth Chub Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 234: Nickel Concentrations in Peamouth Chub Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

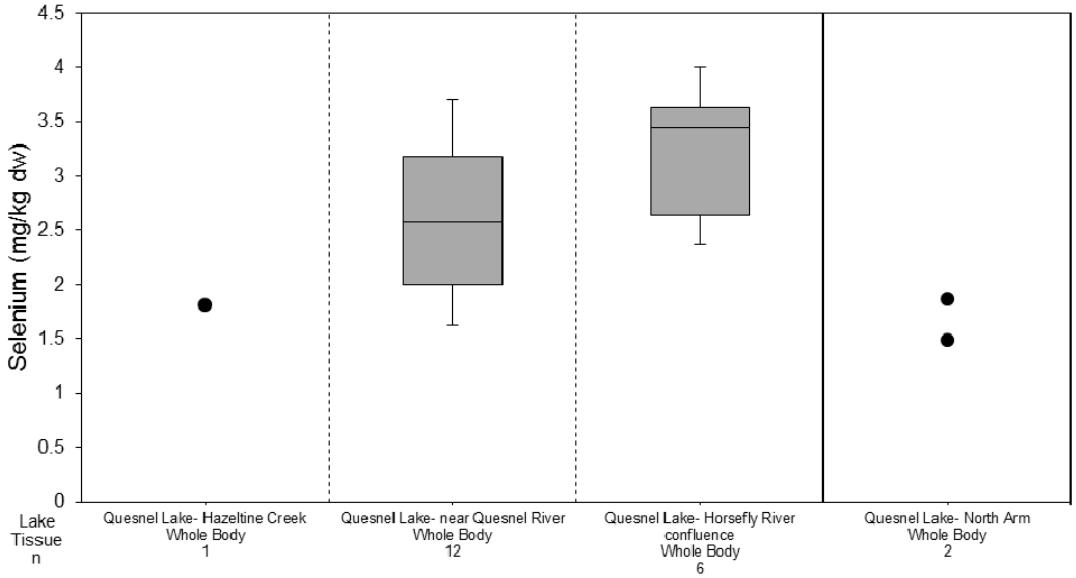
Figure 235: Nickel Concentrations in Peamouth Chub Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

6.16 Selenium

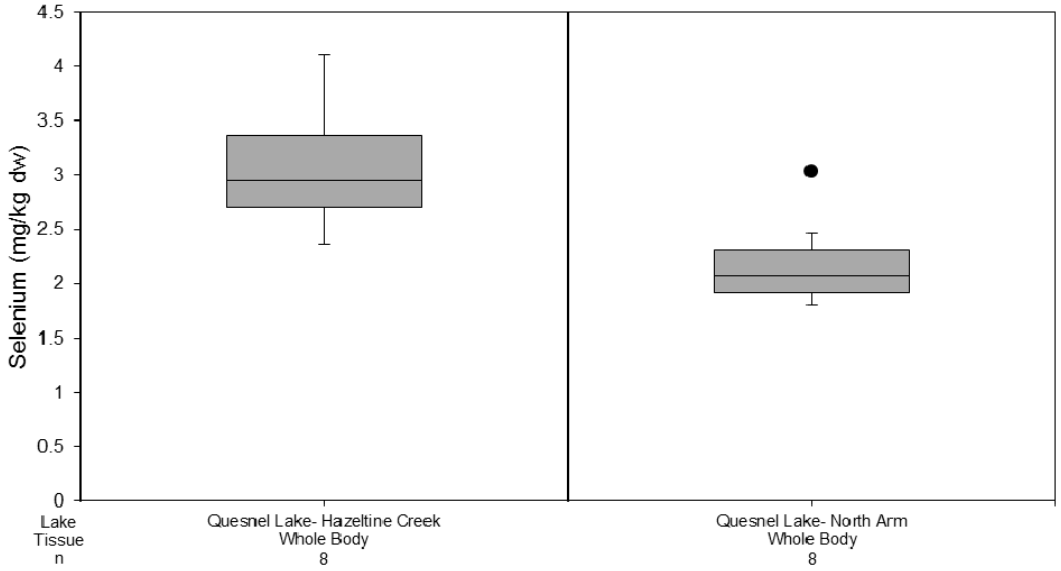
Figure 236: Selenium Concentrations in Peamouth Chub Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg dw = milligrams per kilogram dry weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 237: Selenium Concentrations in Peamouth Chub Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg dw = milligrams per kilogram dry weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

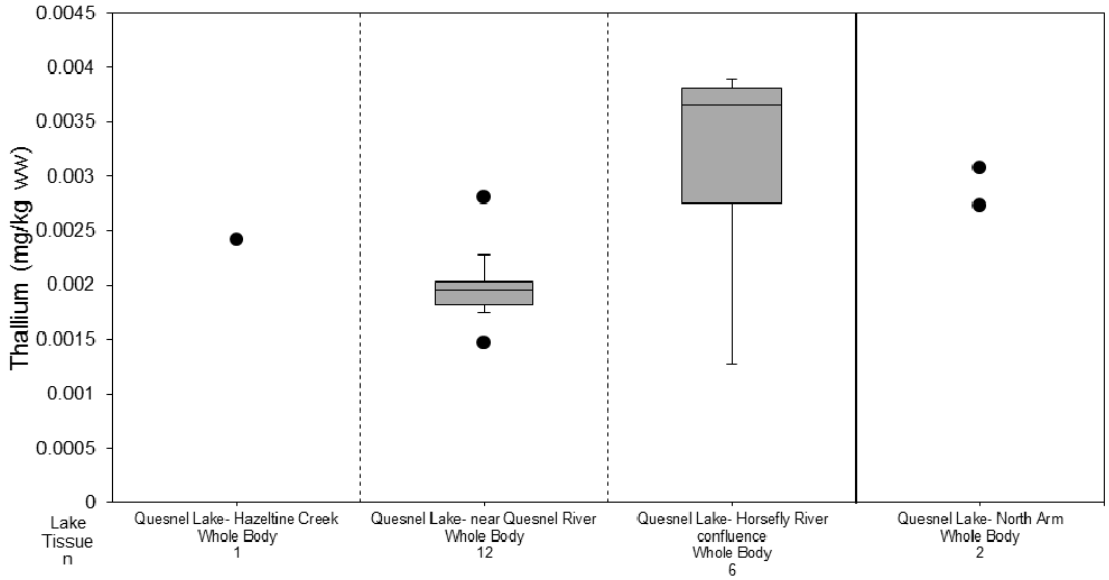
Figure 238: Selenium Concentrations in Peamouth Chub Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg dw = milligrams per kilogram dry weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

6.17 Thallium

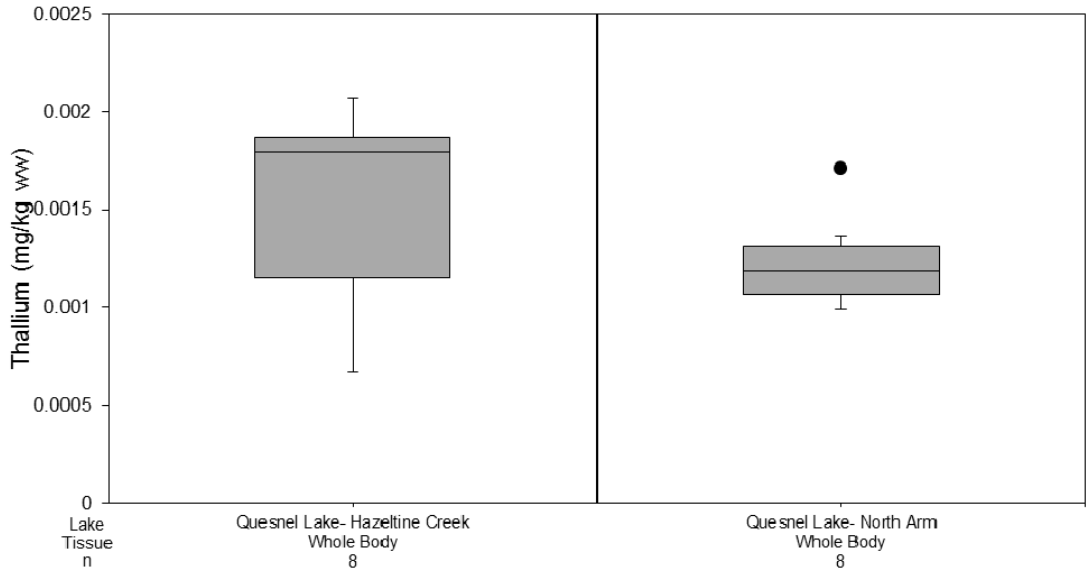
Figure 239: Thallium Concentrations in Peamouth Chub Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

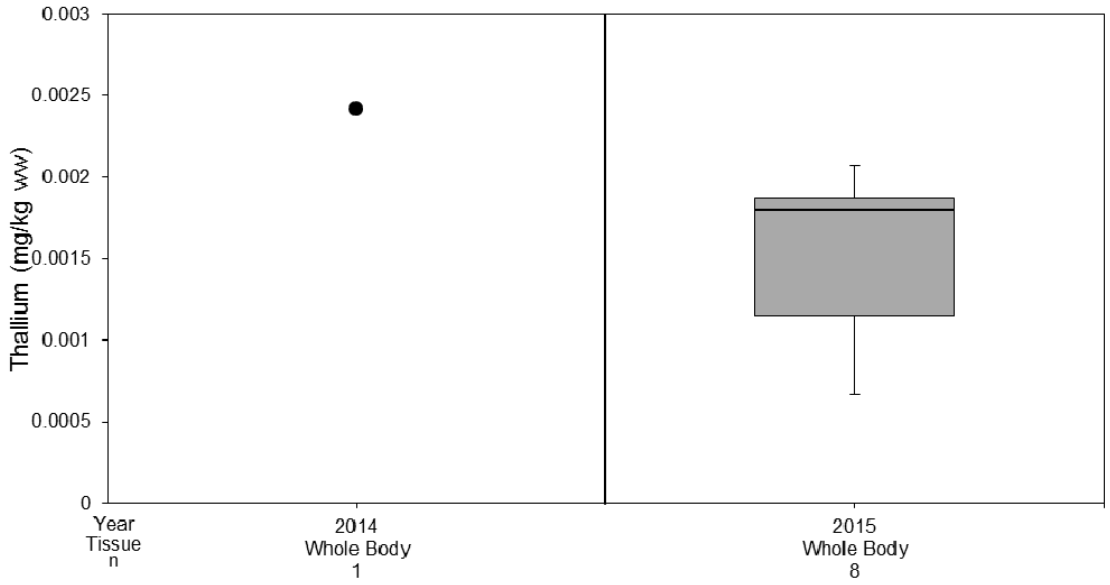
Figure 240: Thallium Concentrations in Peamouth Chub Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 241: Thallium Concentrations in Peamouth Chub Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

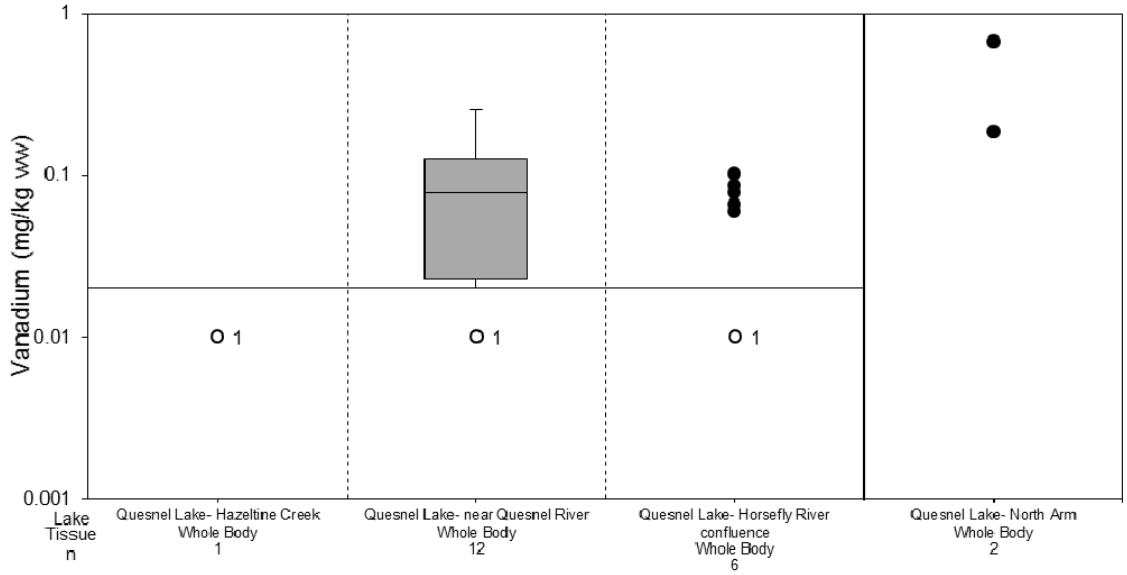


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

6.18 Vanadium

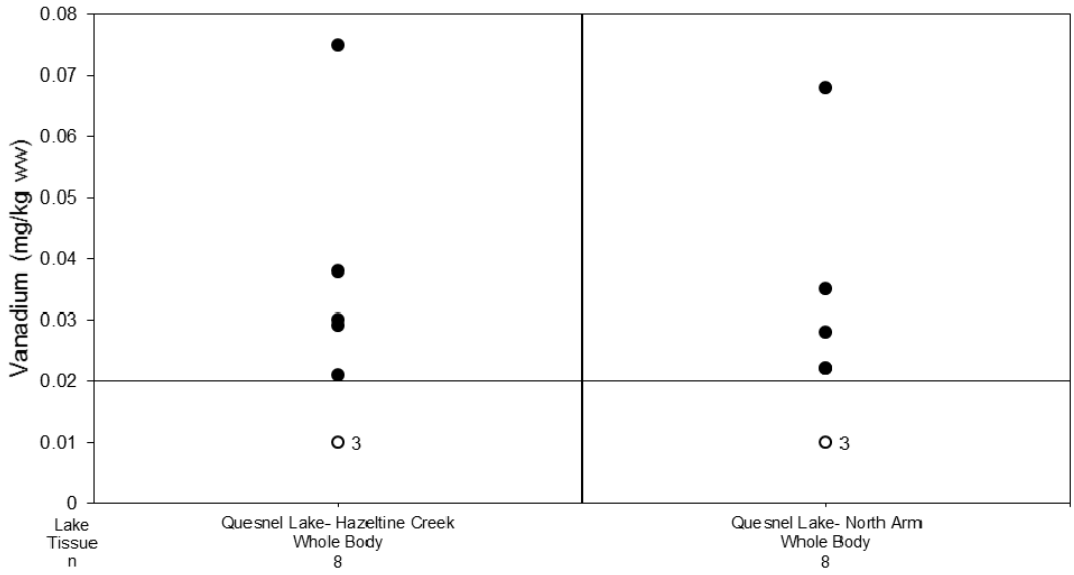
Figure 242: Vanadium Concentrations in Peamouth Chub Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

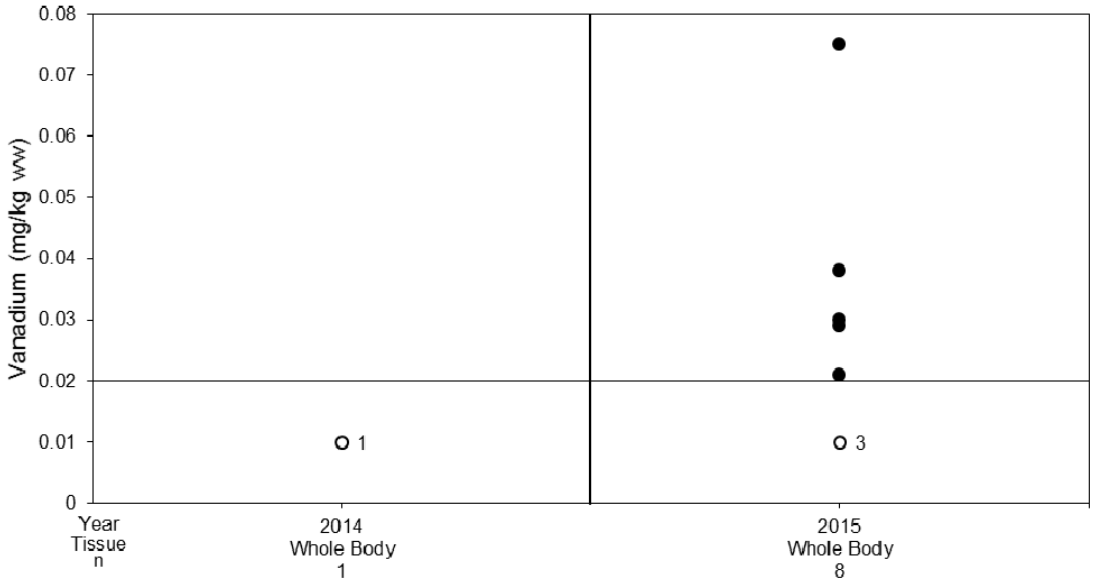
Figure 243: Vanadium Concentrations in Peamouth Chub Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 244: Vanadium Concentrations in Peamouth Chub Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015

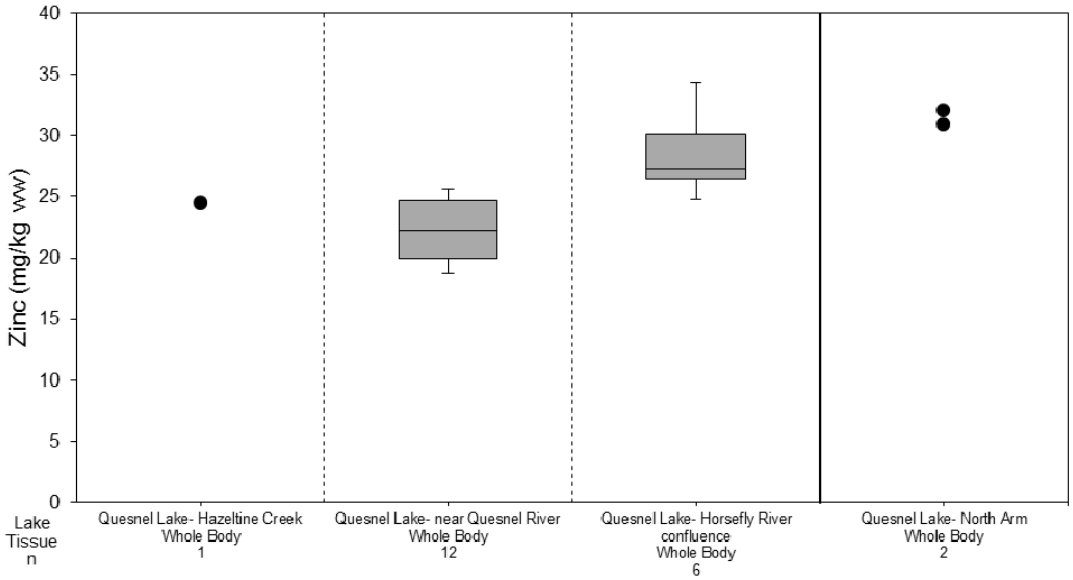


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

6.19 Zinc

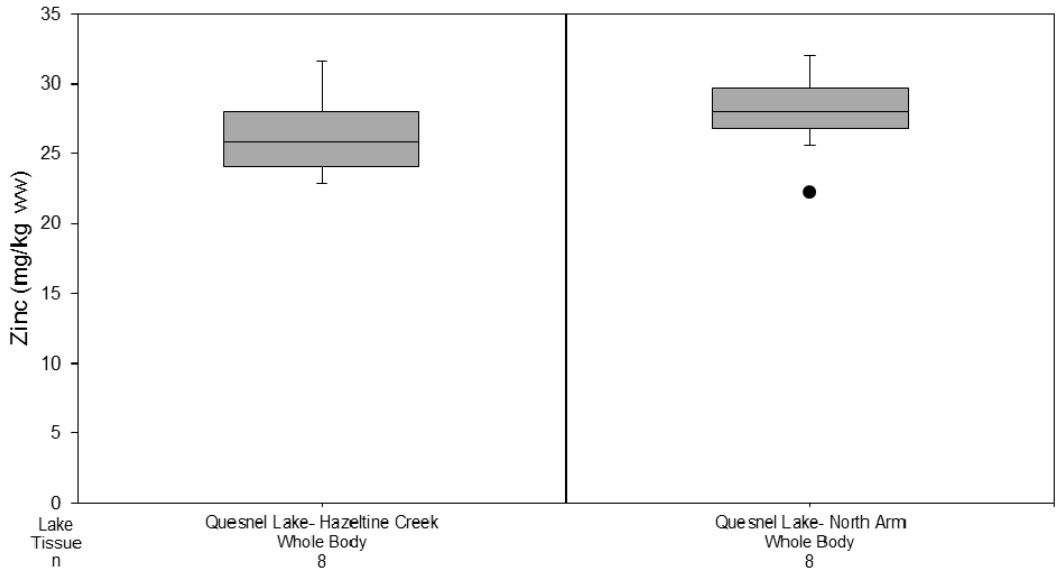
Figure 245: Zinc Concentrations in Peamouth Chub Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

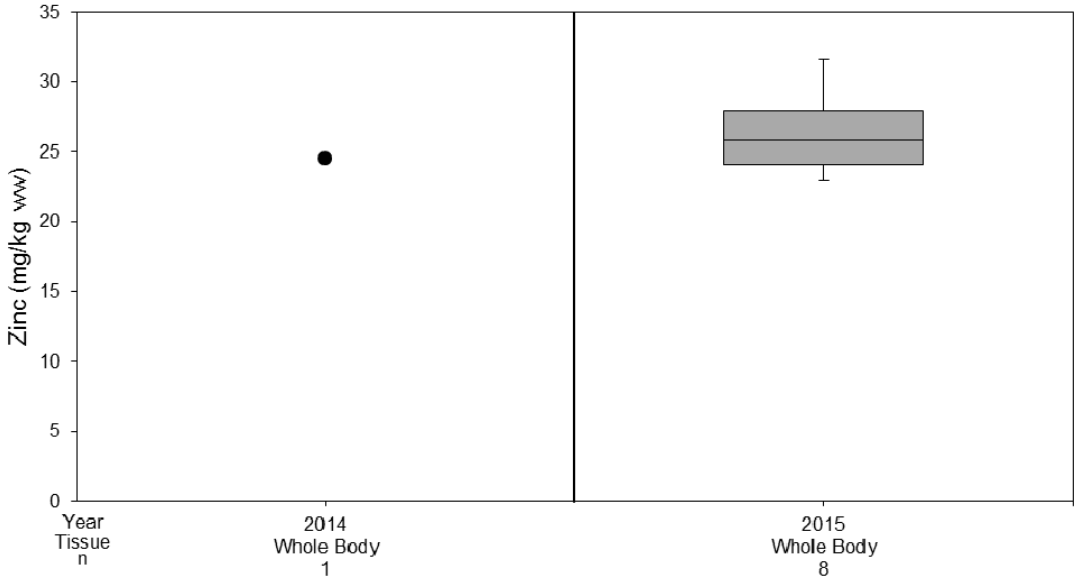
Figure 246: Zinc Concentrations in Peamouth Chub Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 247: Zinc Concentrations in Peamouth Chub Tissues Collected from the Quesnel Lake - Hazeltine Creek Confluence in 2014 and 2015



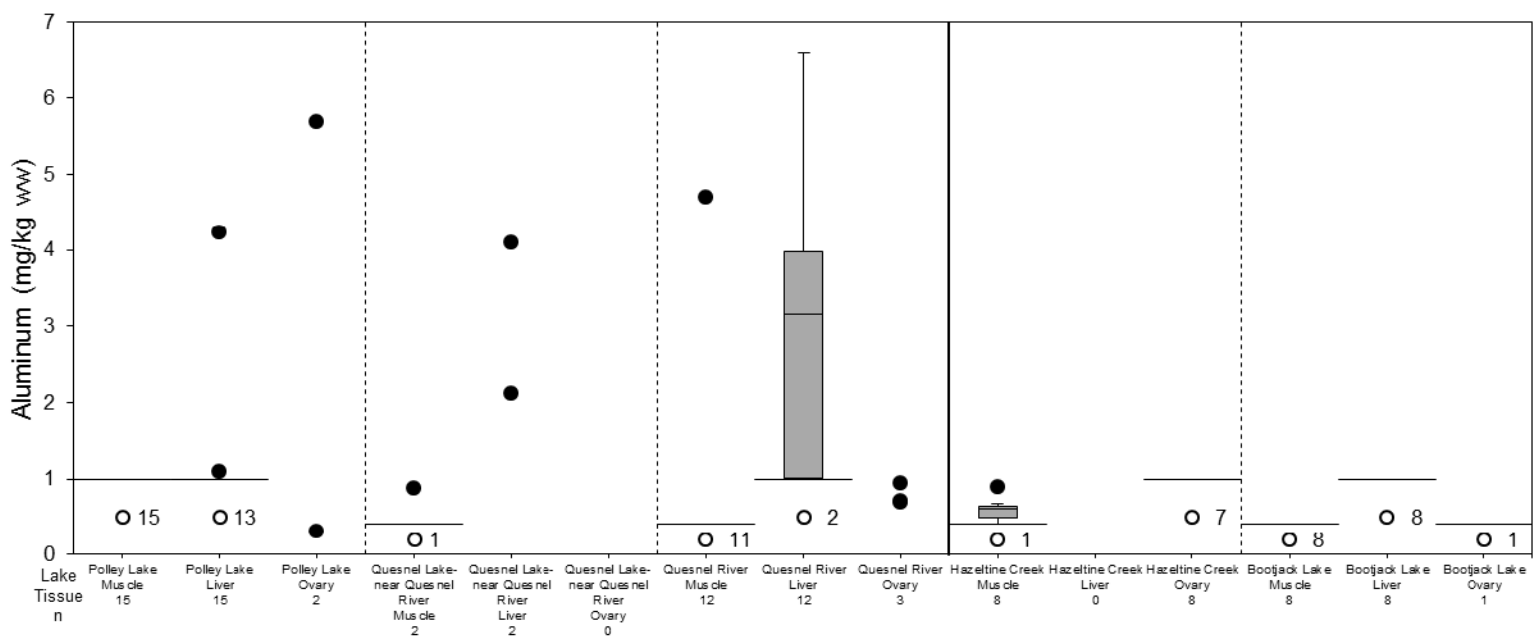
Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

7.0 RAINBOW TROUT

7.1 Aluminum

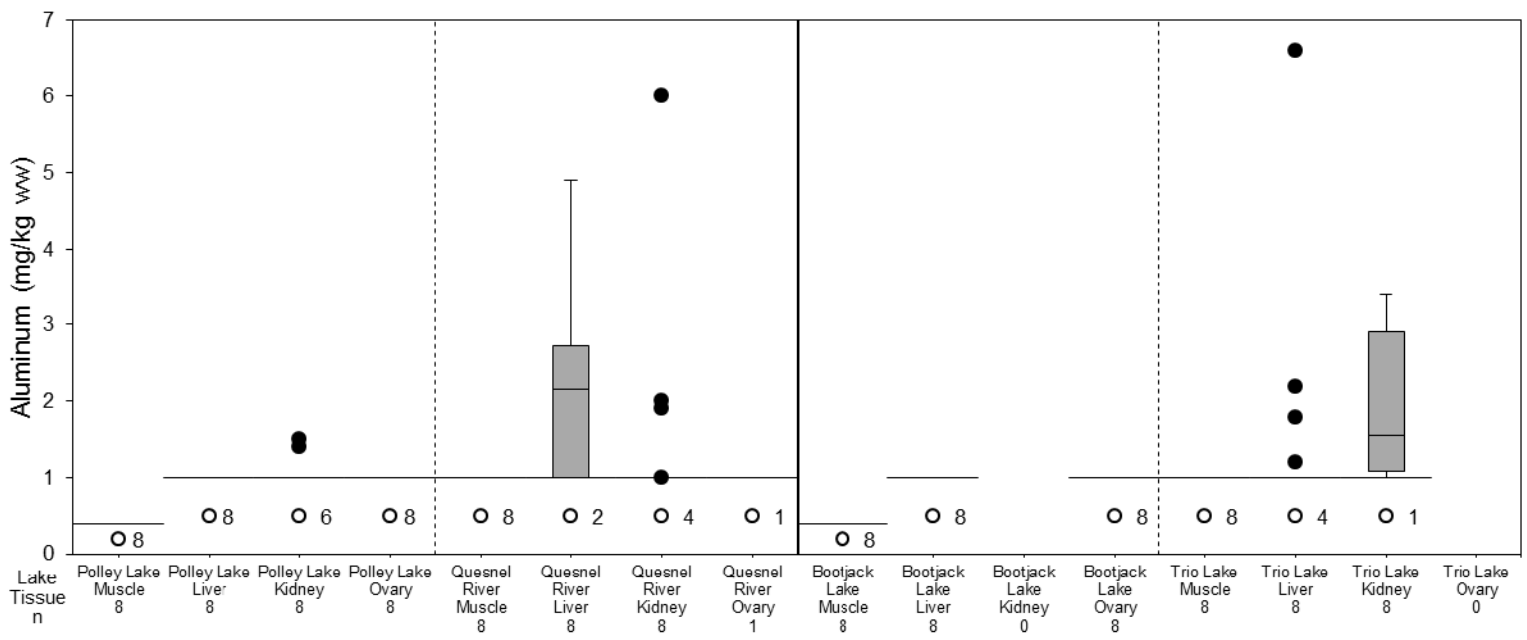
Figure 248: Aluminum Concentrations in Rainbow Trout Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

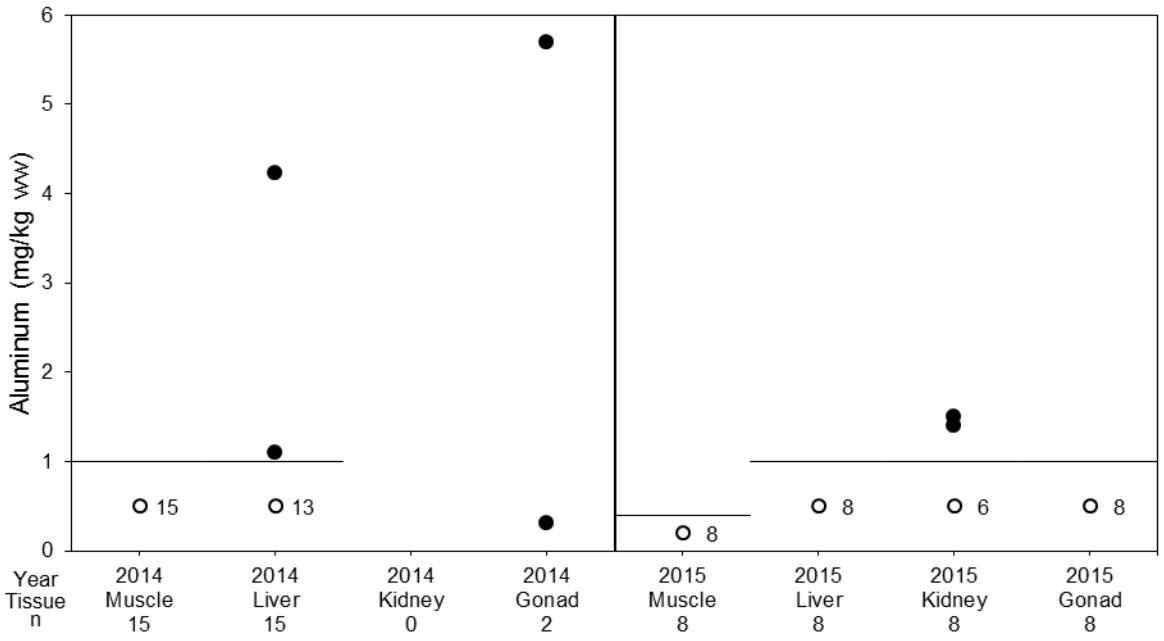
Figure 249: Aluminum Concentrations in Rainbow Trout Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

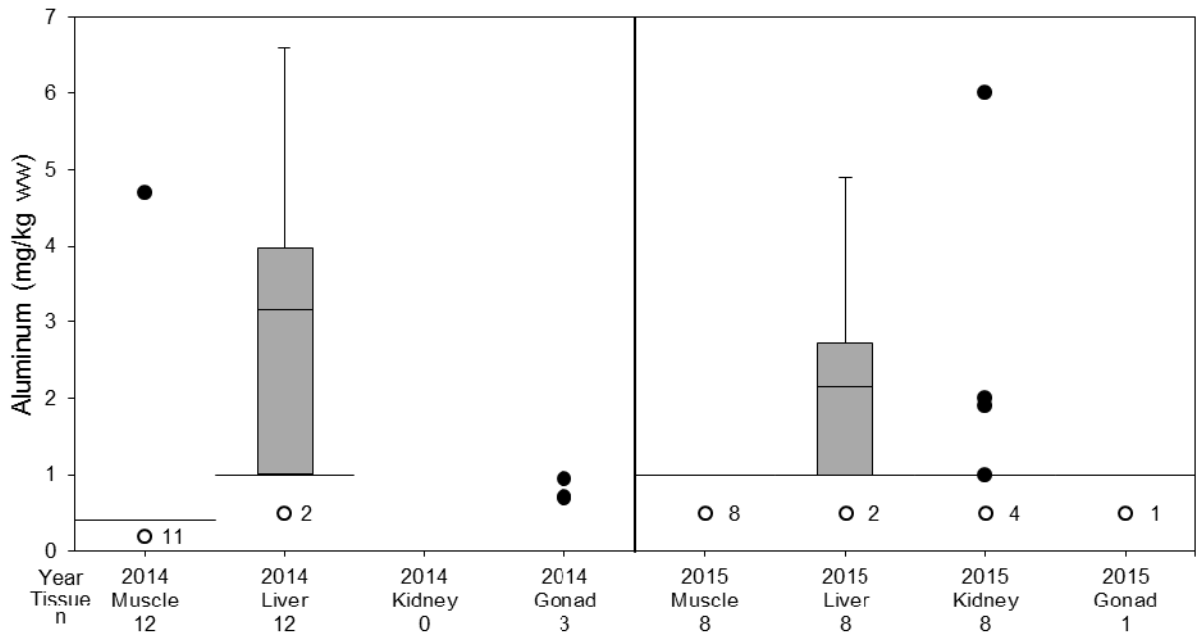
Figure 250: Aluminum Concentrations in Rainbow Trout Tissues Collected from Polley Lake in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 251: Aluminum Concentrations in Rainbow Trout Tissues Collected from Quesnel River in 2014 and 2015

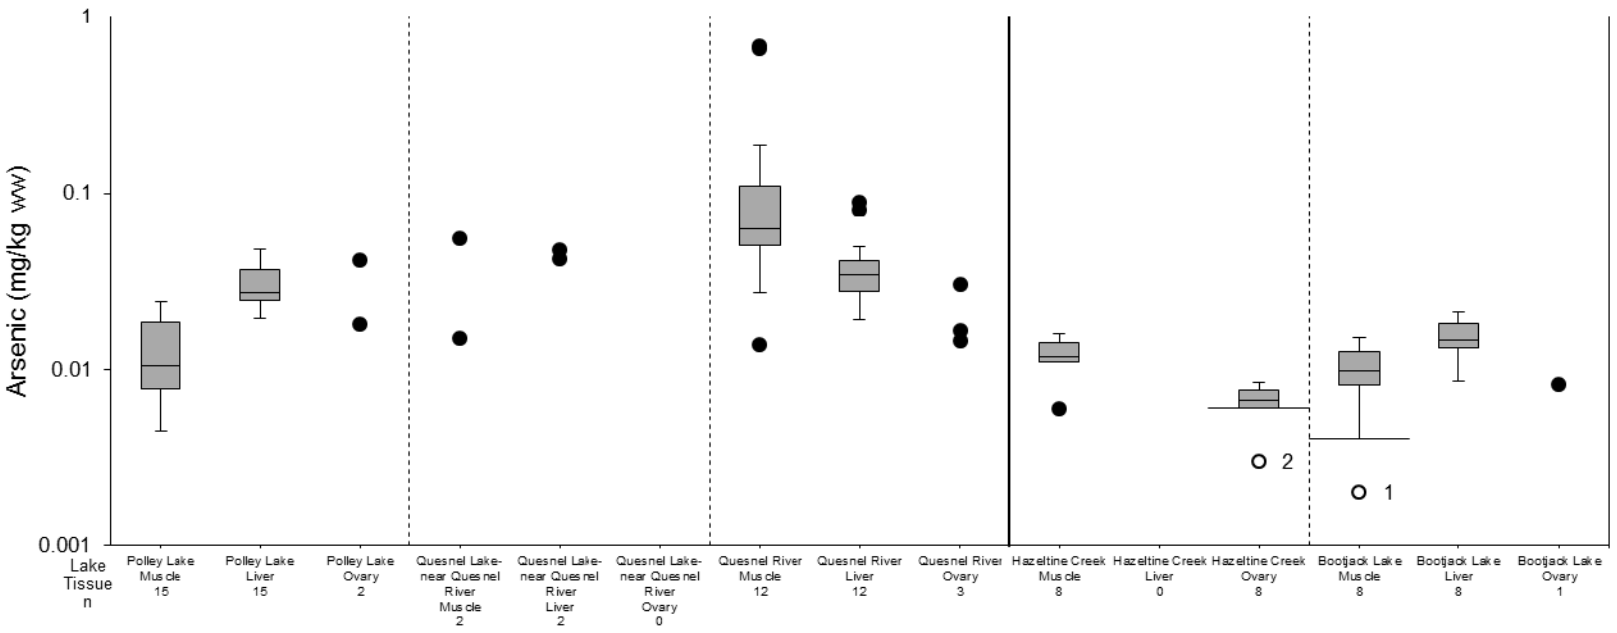


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

7.2 Arsenic

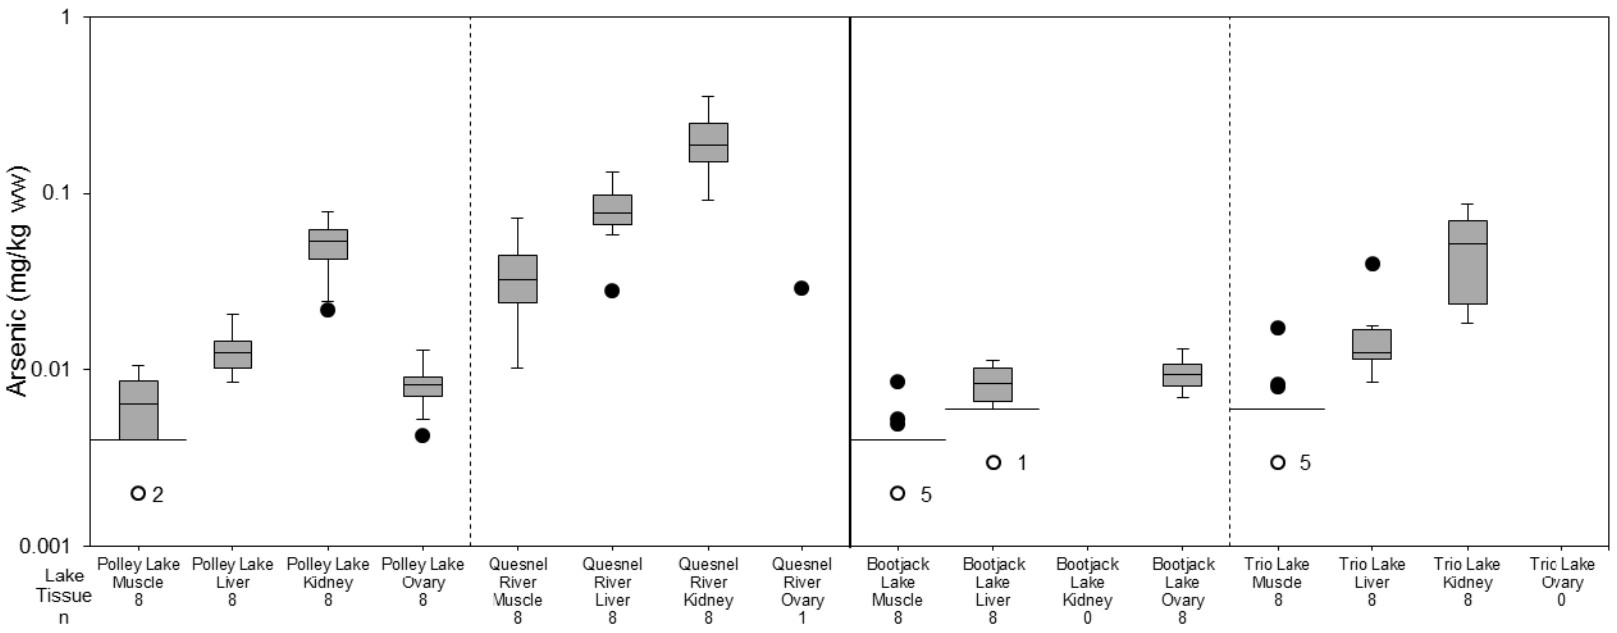
Figure 252: Arsenic Concentrations in Rainbow Trout Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

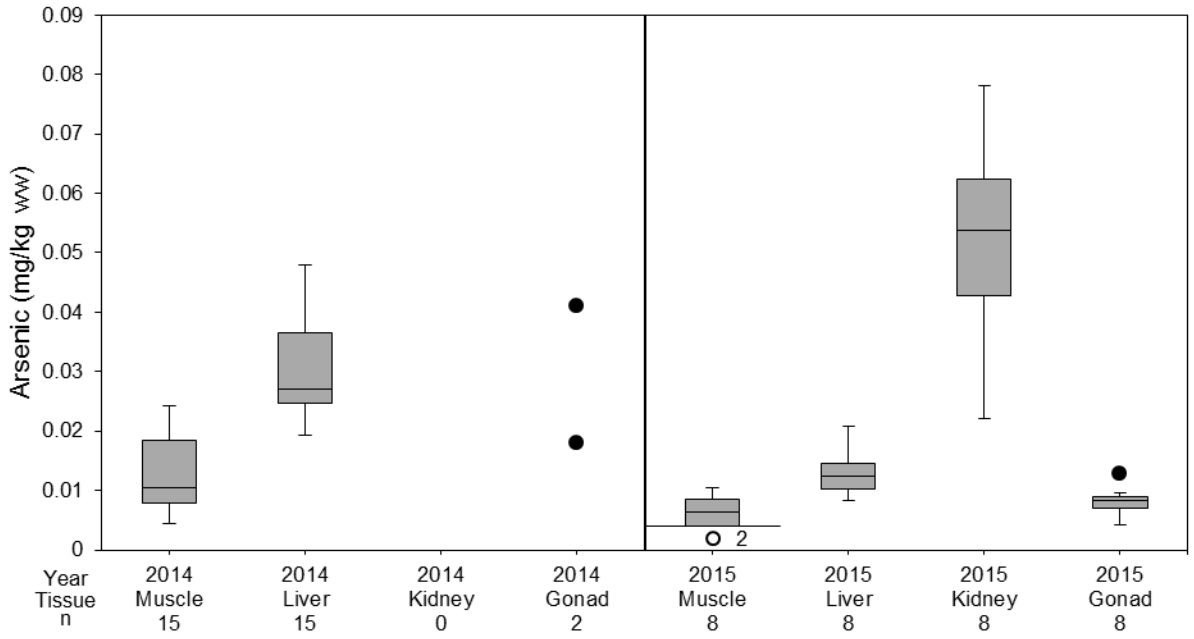
Figure 253: Arsenic Concentrations in Rainbow Trout Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

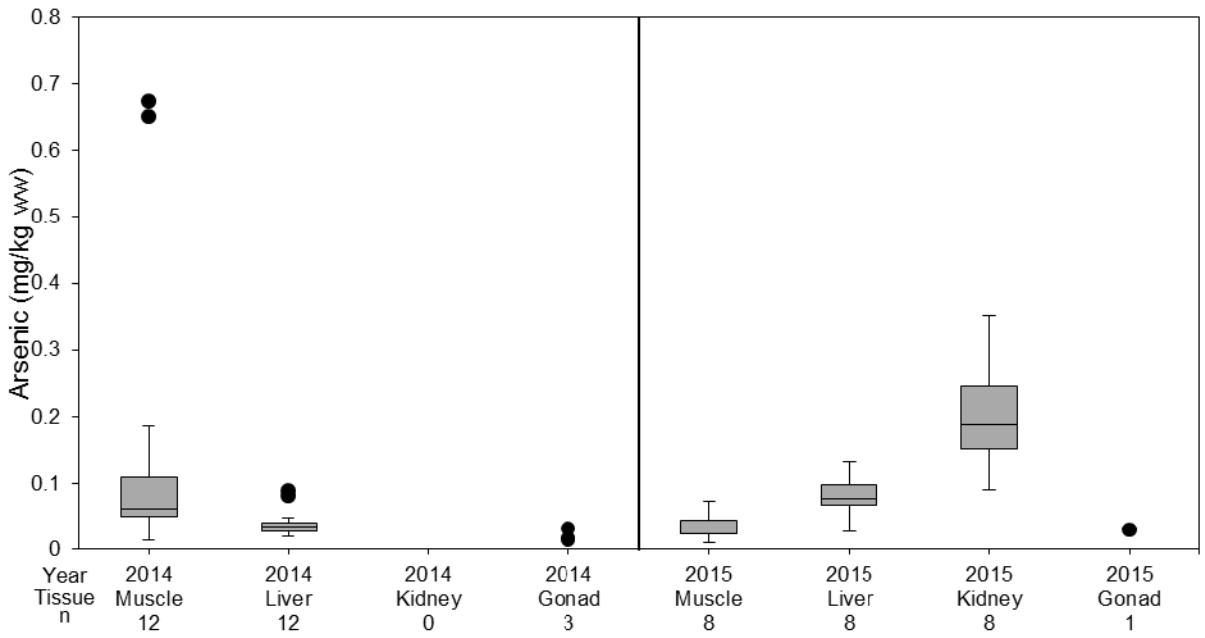
mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 254: Arsenic Concentrations in Rainbow Trout Tissues Collected from Polley Lake in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.
mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

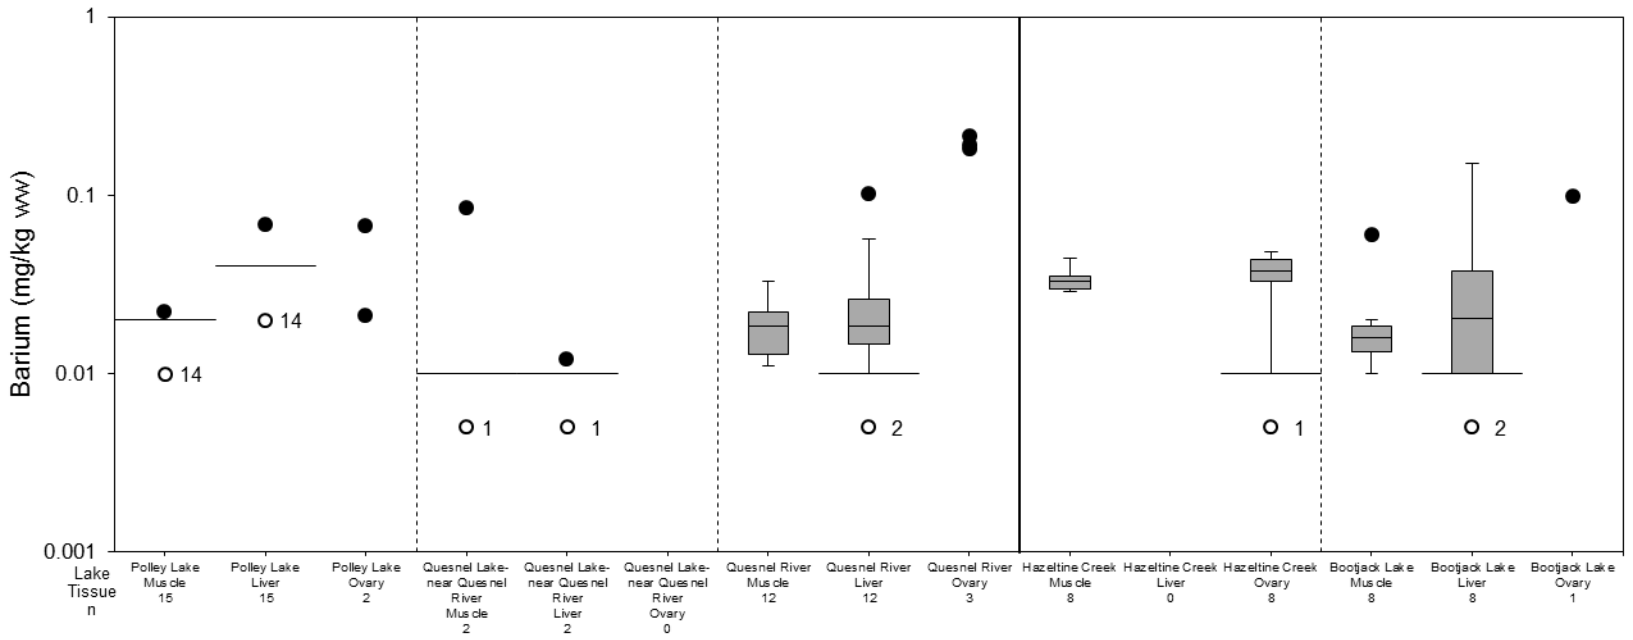
Figure 255: Arsenic Concentrations in Rainbow Trout Tissues Collected from Quesnel River in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.
mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

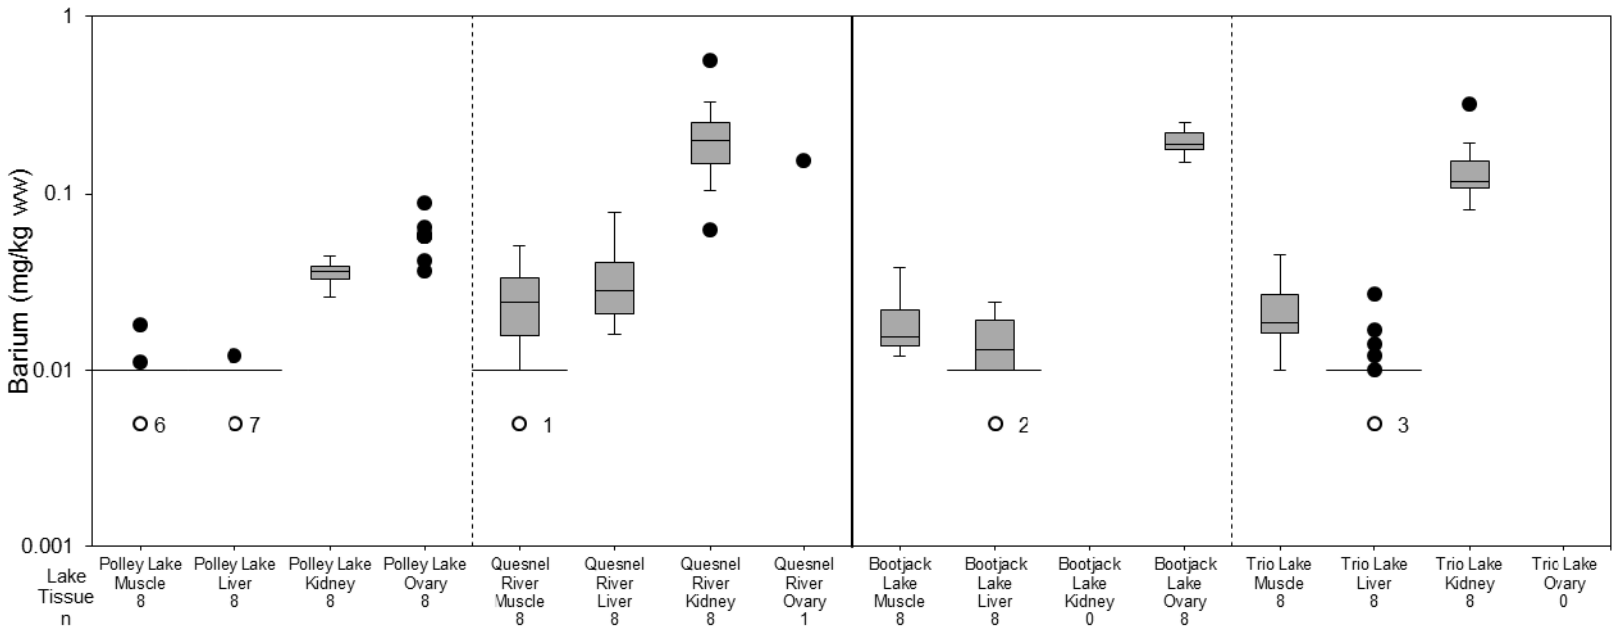
7.3 Barium

Figure 256: Barium Concentrations in Rainbow Trout Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.
mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

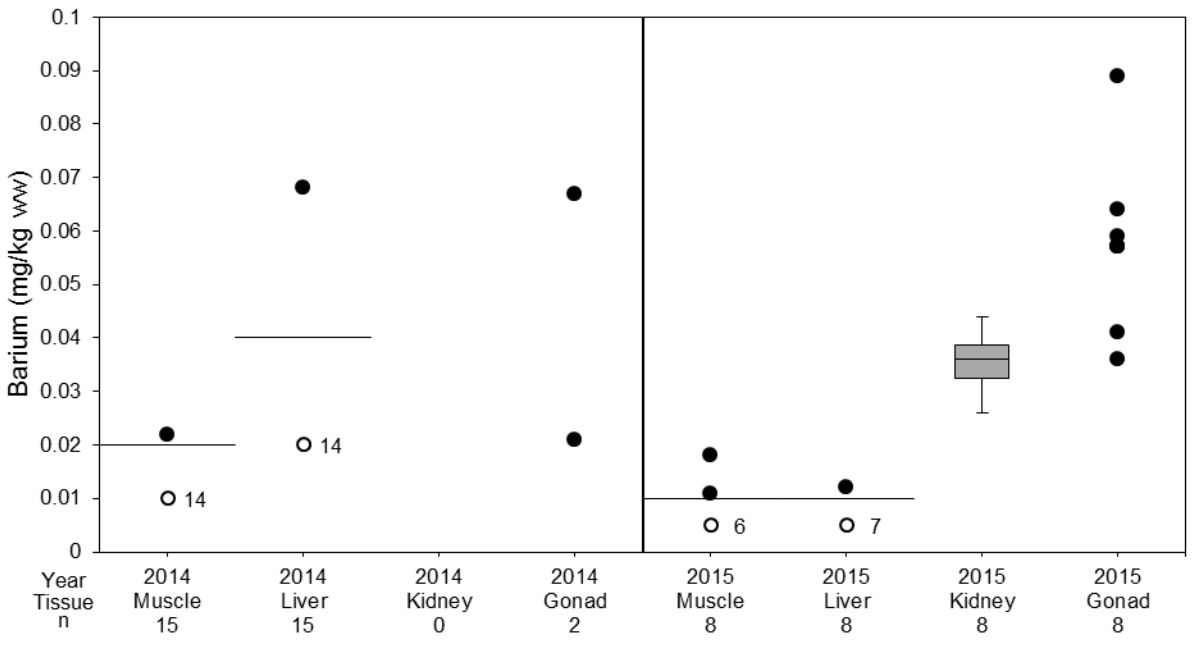
Figure 257: Barium Concentrations in Rainbow Trout Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

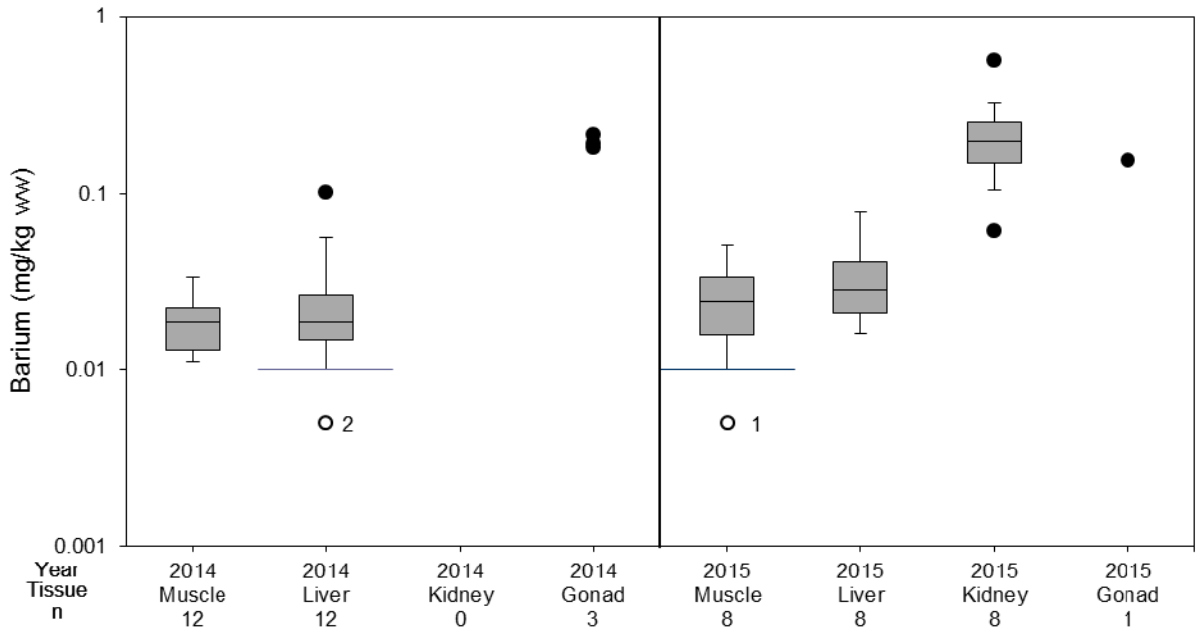
Figure 258: Barium Concentrations in Rainbow Trout Tissues Collected from Polley Lake in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 259: Barium Concentrations in Rainbow Trout Tissues Collected from Quesnel River in 2014 and 2015

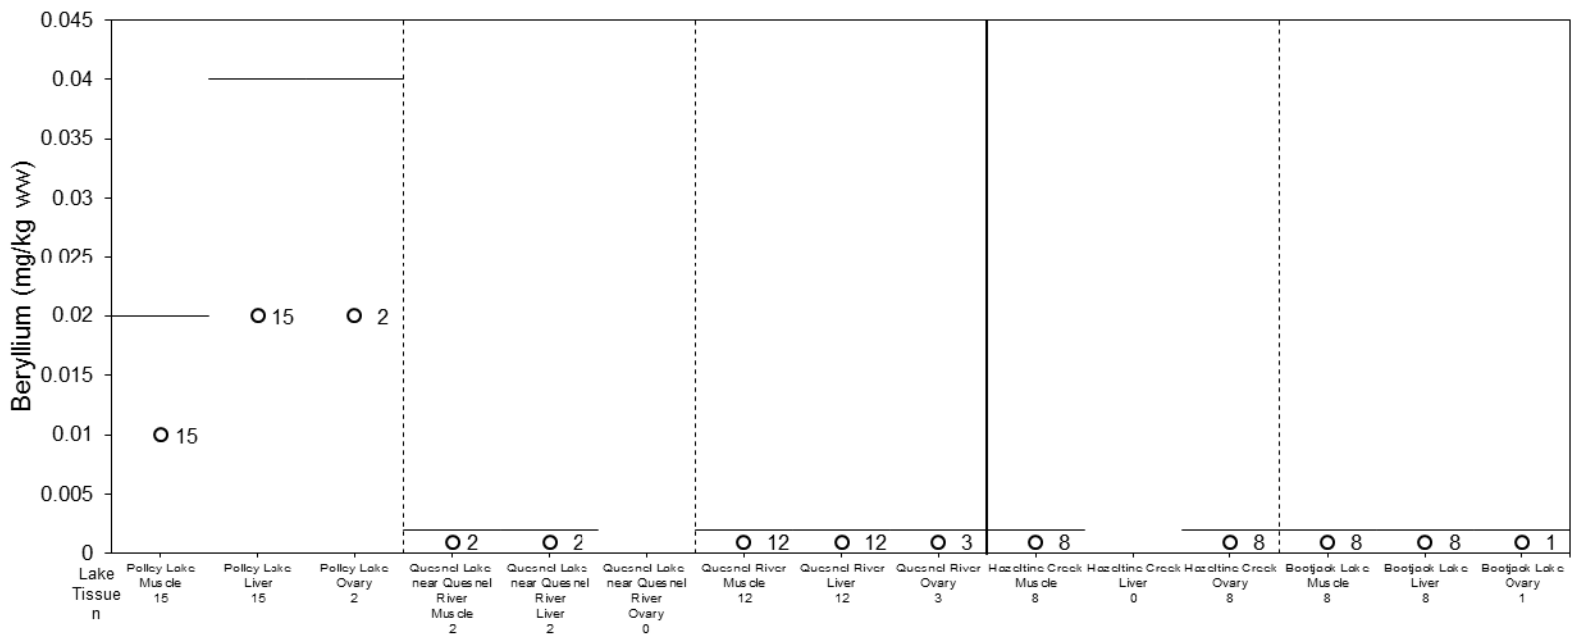


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

7.4 Beryllium

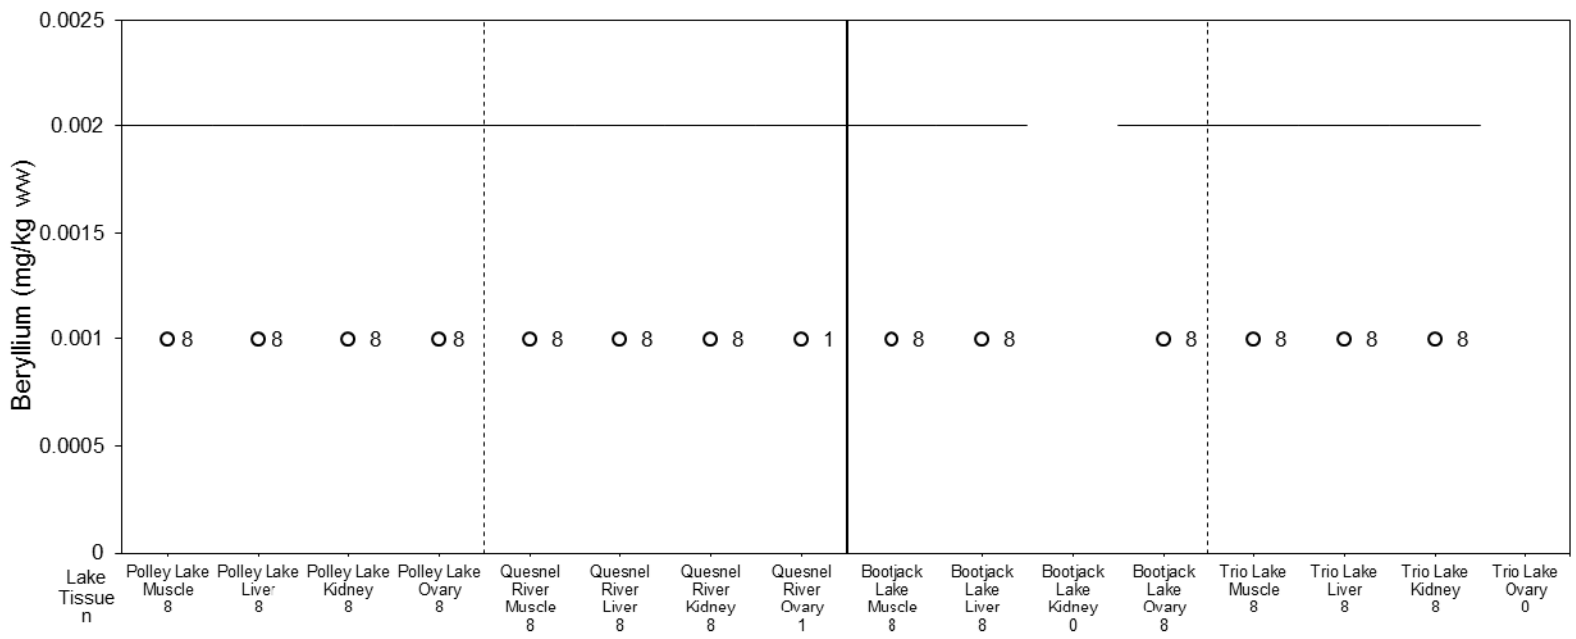
Figure 260: Beryllium Concentrations in Rainbow Trout Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

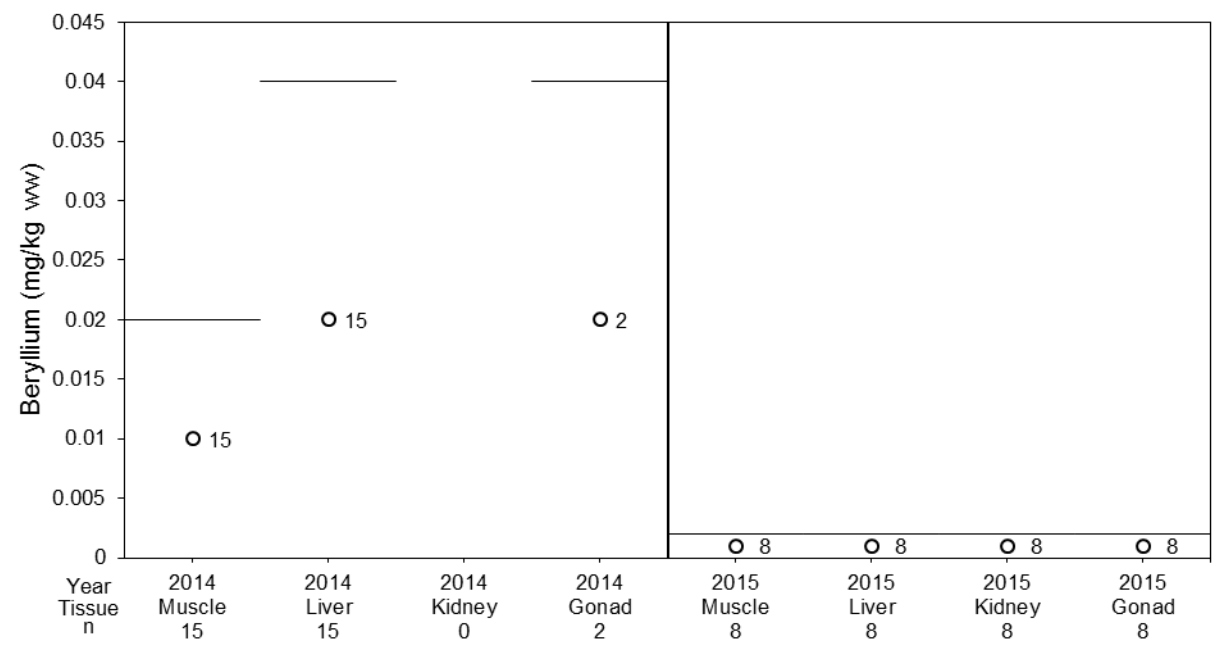
Figure 261: Beryllium Concentrations in Rainbow Trout Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 262: Beryllium Concentrations in Rainbow Trout Tissues Collected from Polley Lake in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

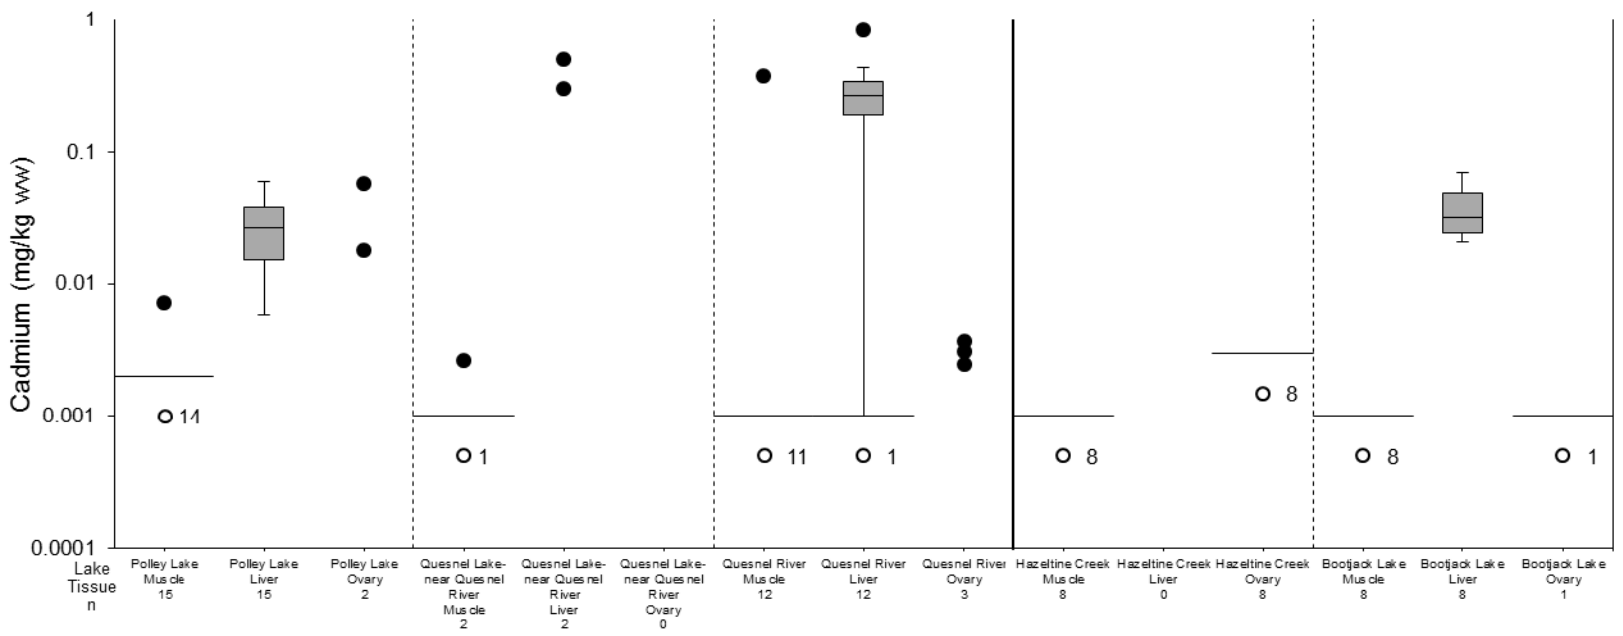
Figure 263: Beryllium Concentrations in Rainbow Trout Tissues Collected from Quesnel River in 2014 and 2015

Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

7.5 Cadmium

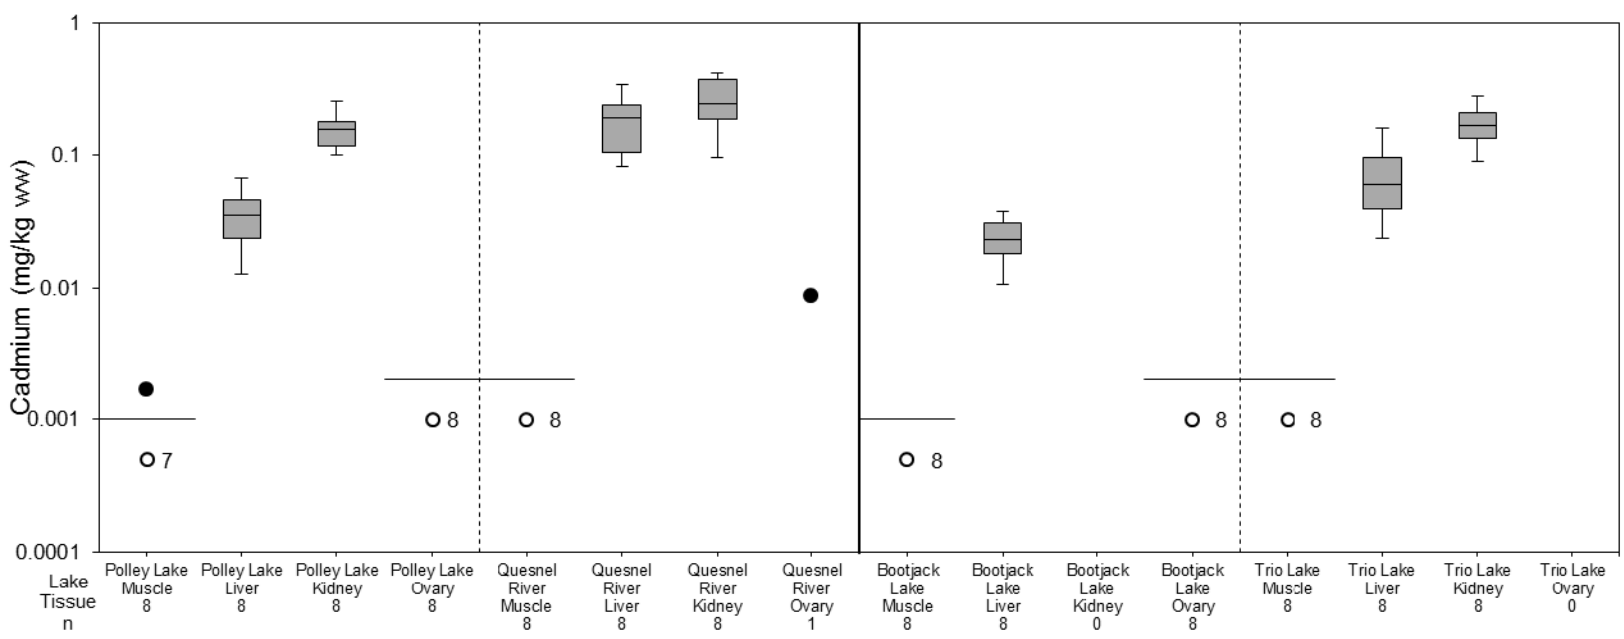
Figure 264: Cadmium Concentrations in Rainbow Trout Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

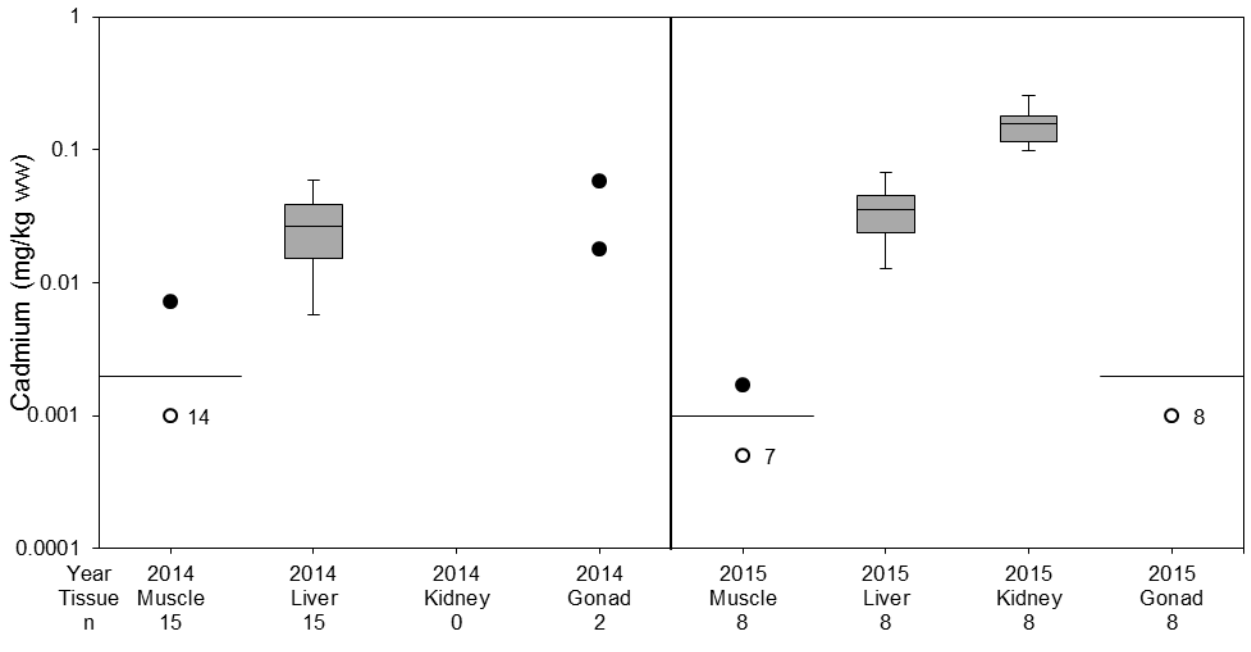
Figure 265: Cadmium Concentrations in Rainbow Trout Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

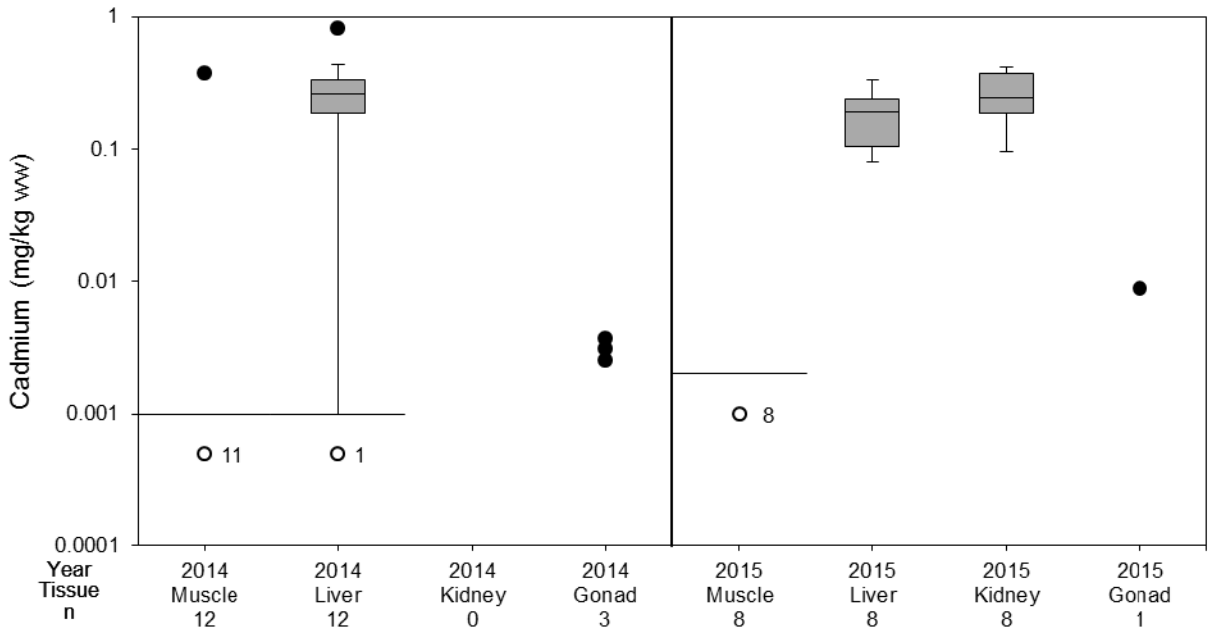
Figure 266: Cadmium Concentrations in Rainbow Trout Tissues Collected from Polley Lake in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 267: Cadmium Concentrations in Rainbow Trout Tissues Collected from Quesnel River in 2014 and 2015

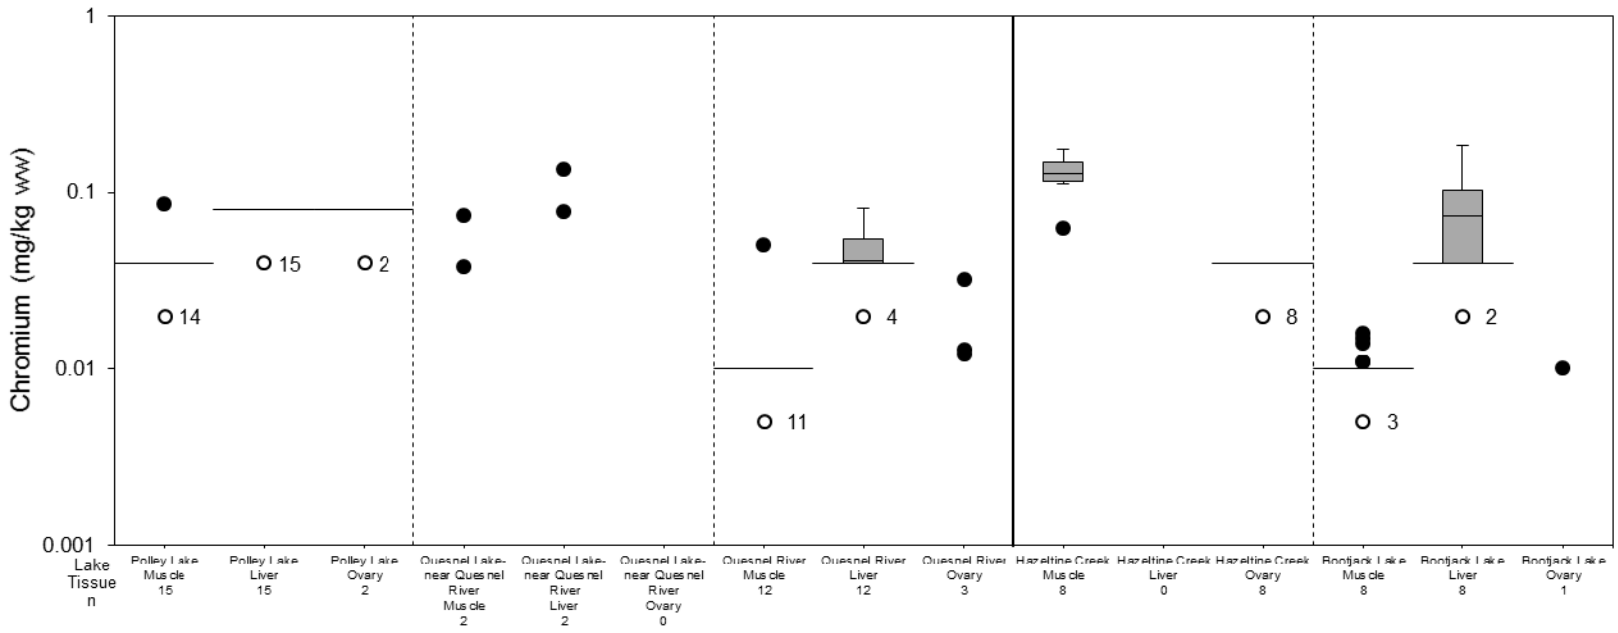


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

7.6 Chromium

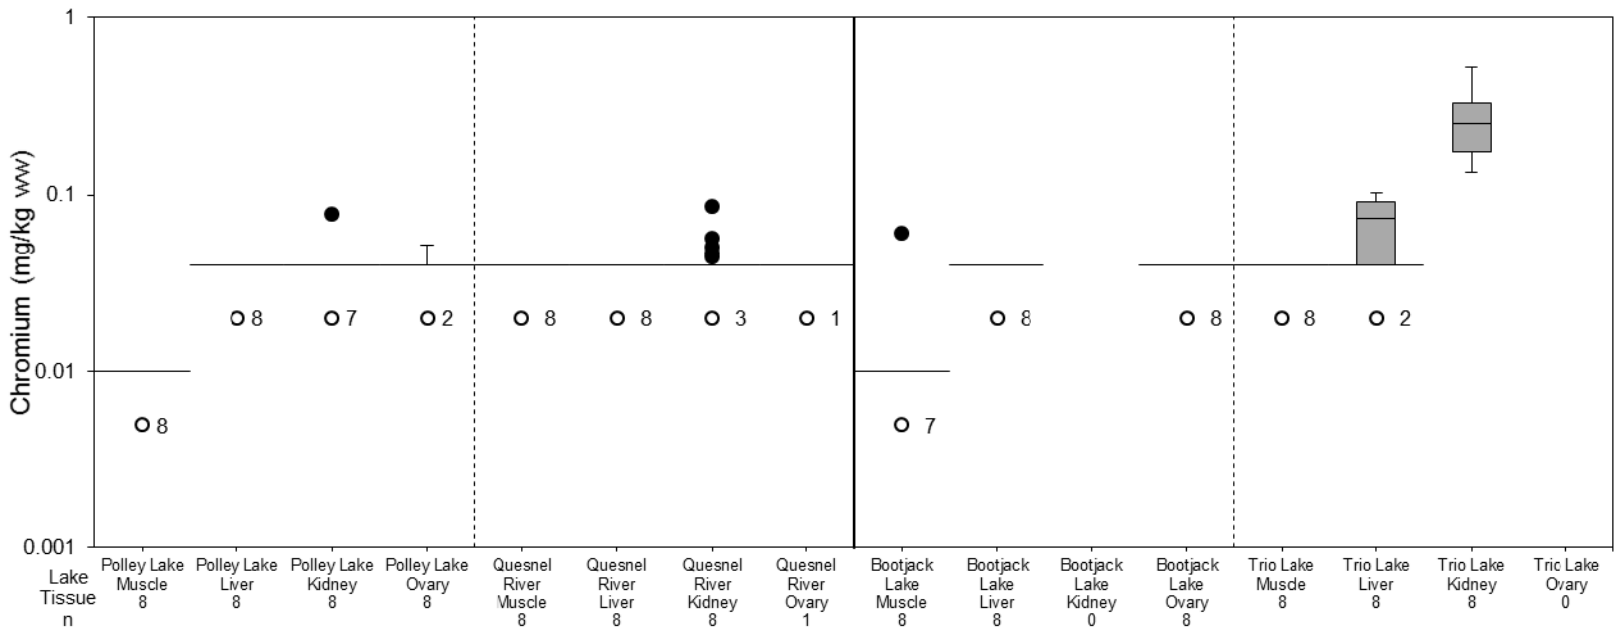
Figure 268: Chromium Concentrations in Rainbow Trout Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

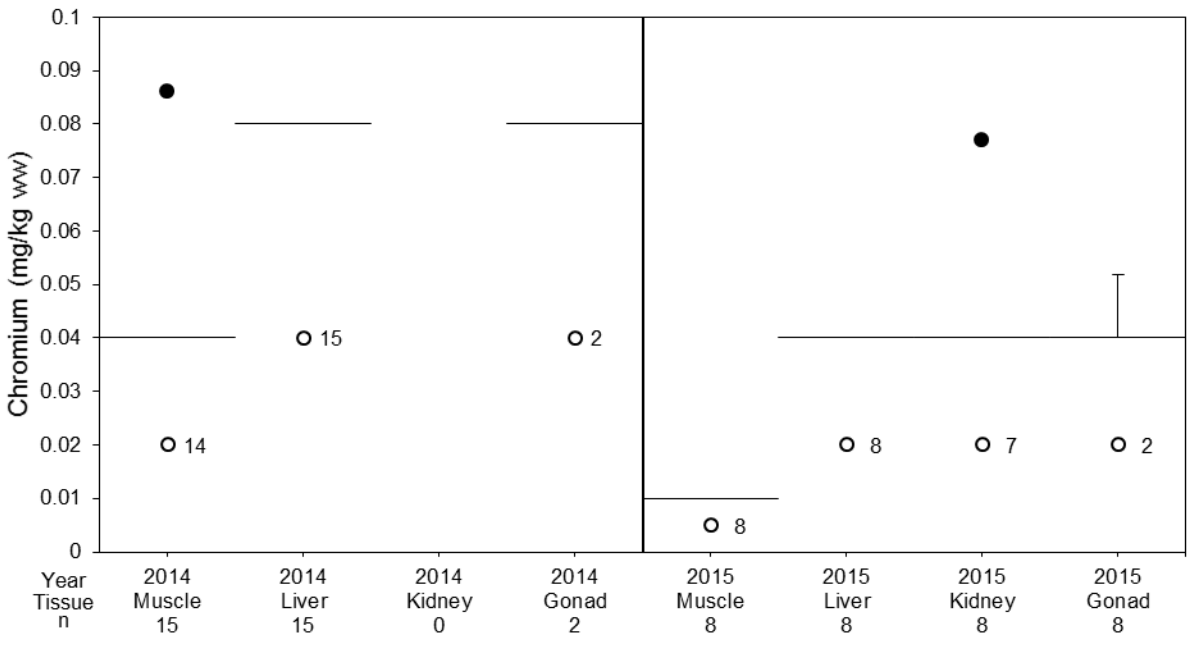
Figure 269: Chromium Concentrations in Rainbow Trout Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

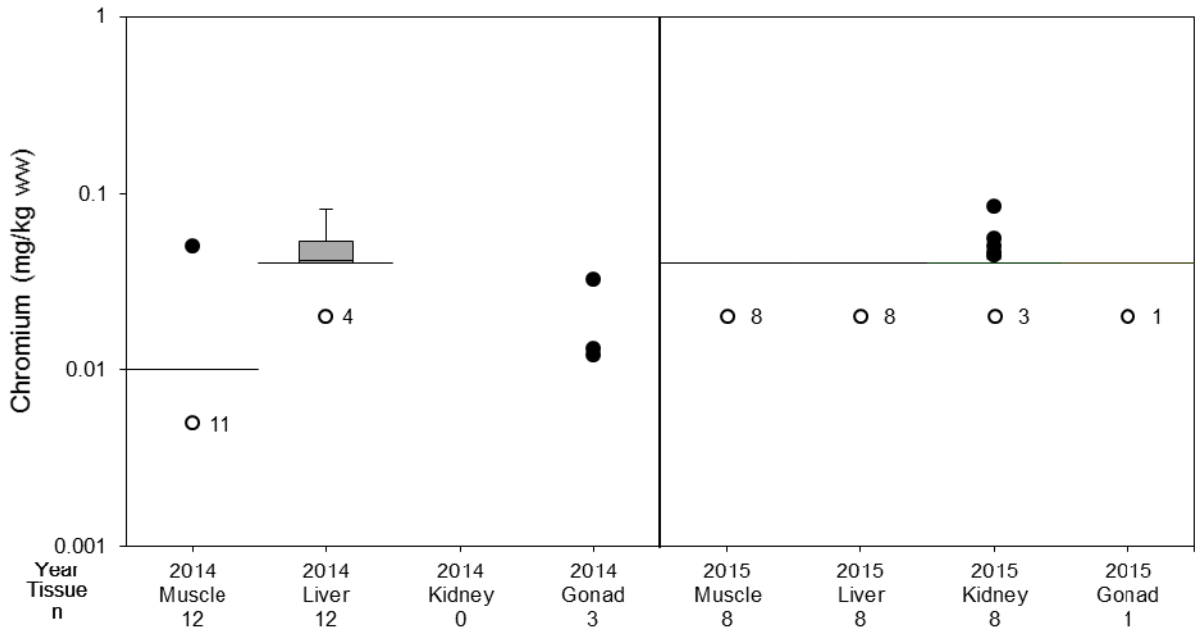
Figure 270: Chromium Concentrations in Rainbow Trout Tissues Collected from Polley Lake in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 271: Chromium Concentrations in Rainbow Trout Tissues Collected from Quesnel River in 2014 and 2015

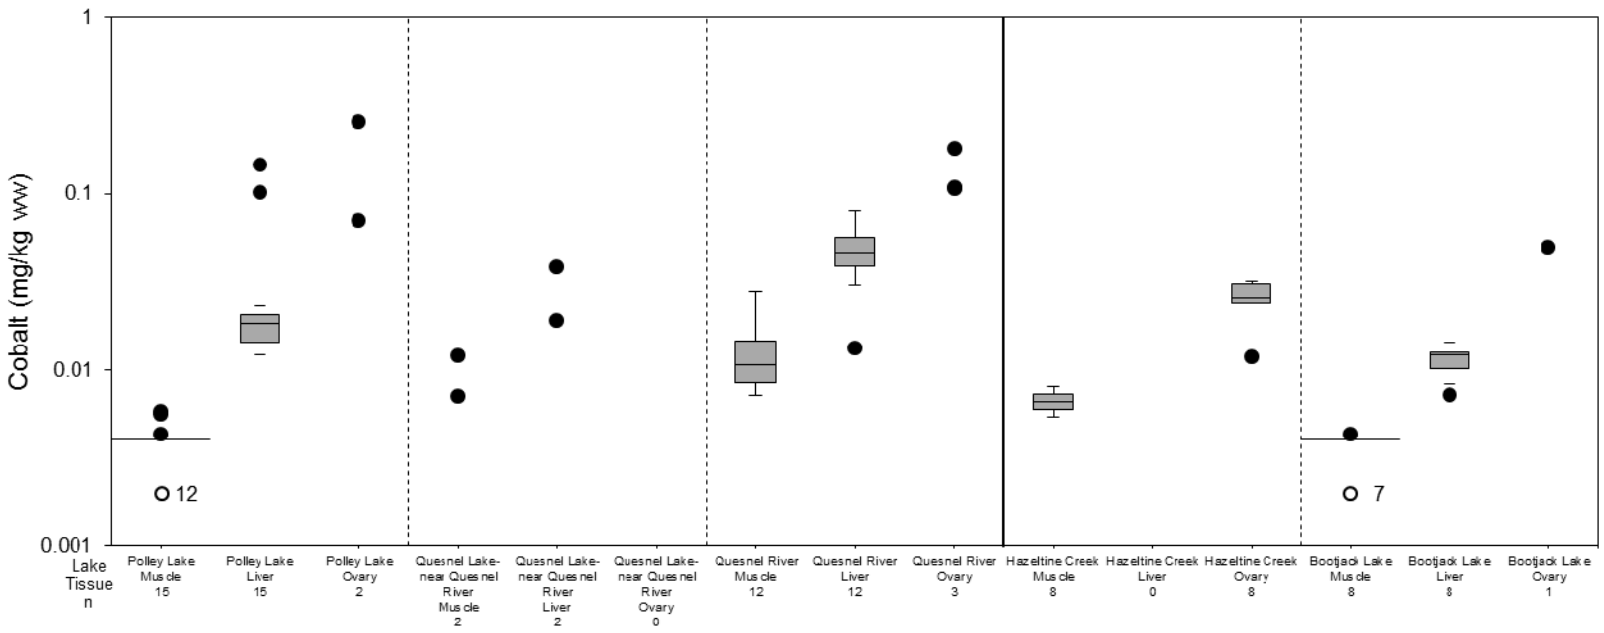


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale..

7.7 Cobalt

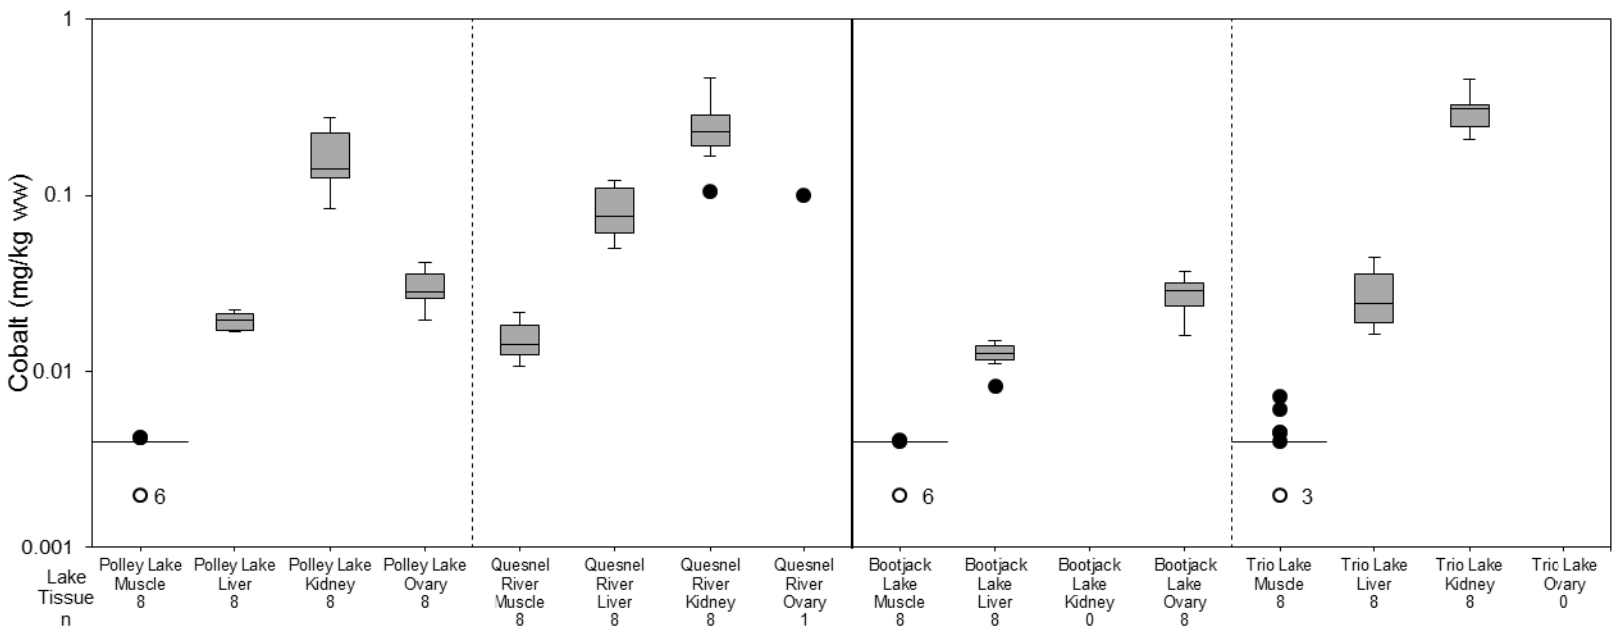
Figure 272: Cobalt Concentrations in Rainbow Trout Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

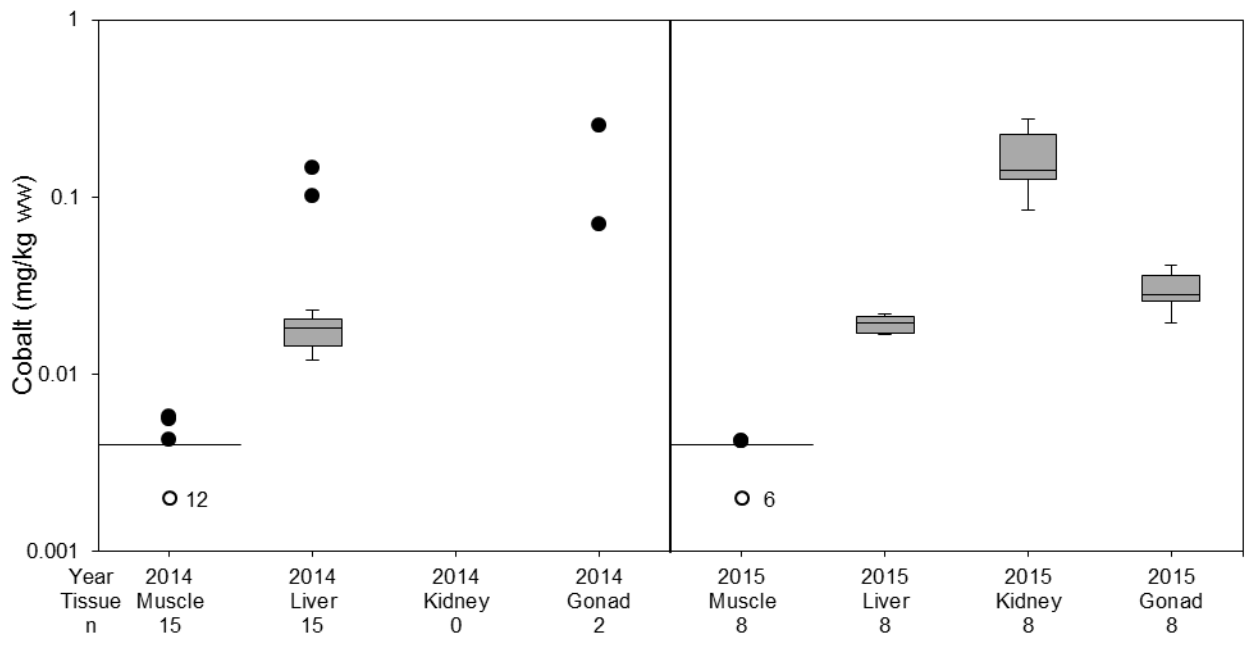
Figure 273: Cobalt Concentrations in Rainbow Trout Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

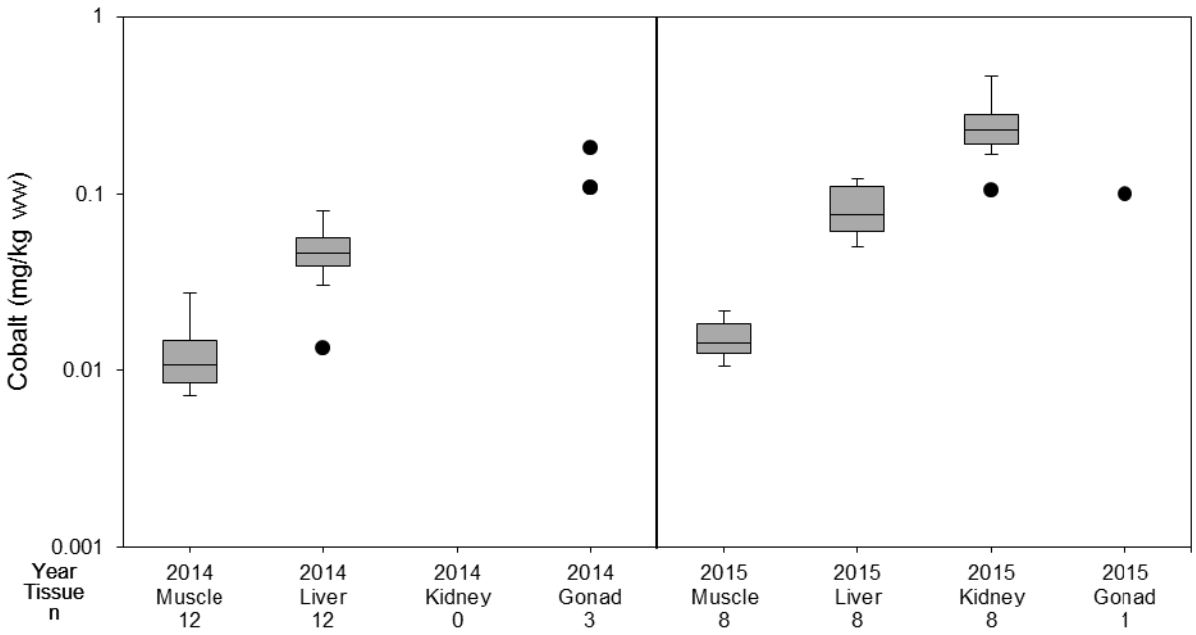
Figure 274: Cobalt Concentrations in Rainbow Trout Tissues Collected from Polley Lake in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 275: Cobalt Concentrations in Rainbow Trout Tissues Collected from Quesnel River in 2014 and 2015

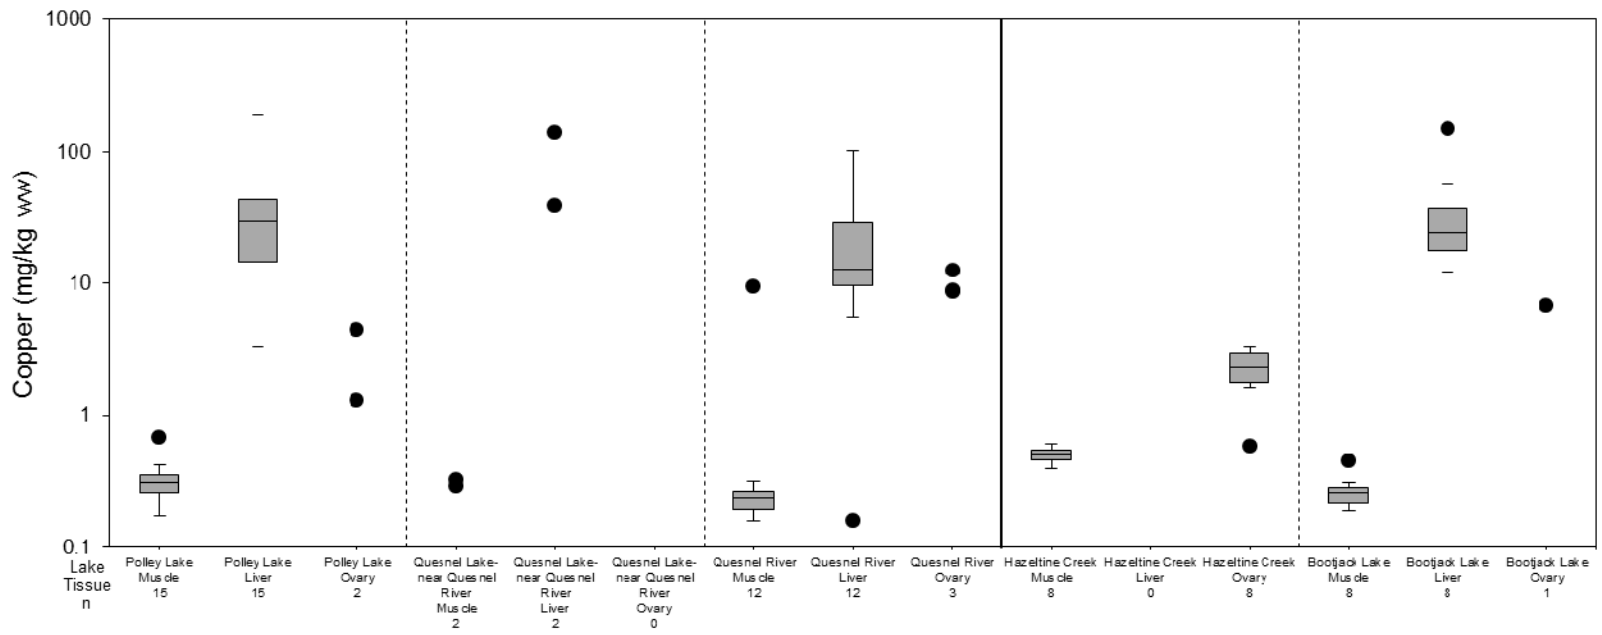


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

7.8 Copper

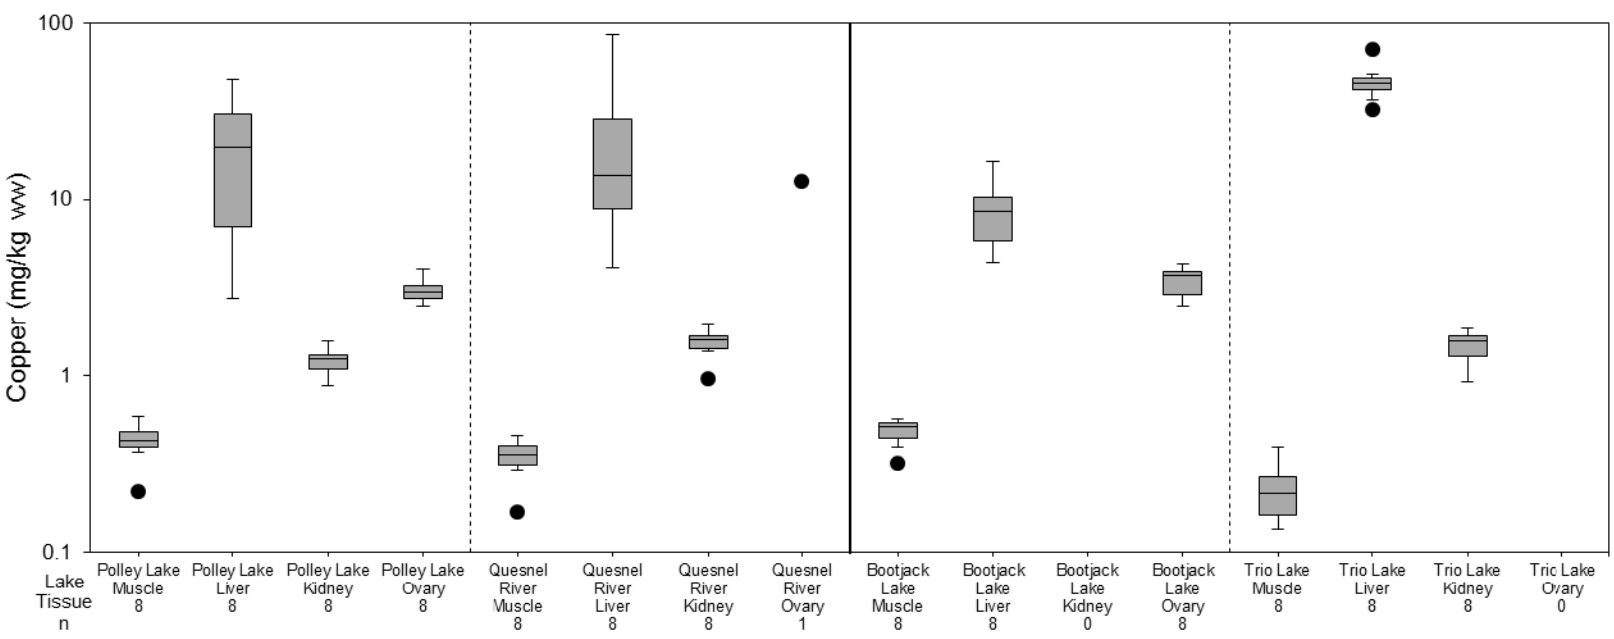
Figure 276: Copper Concentrations in Rainbow Trout Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

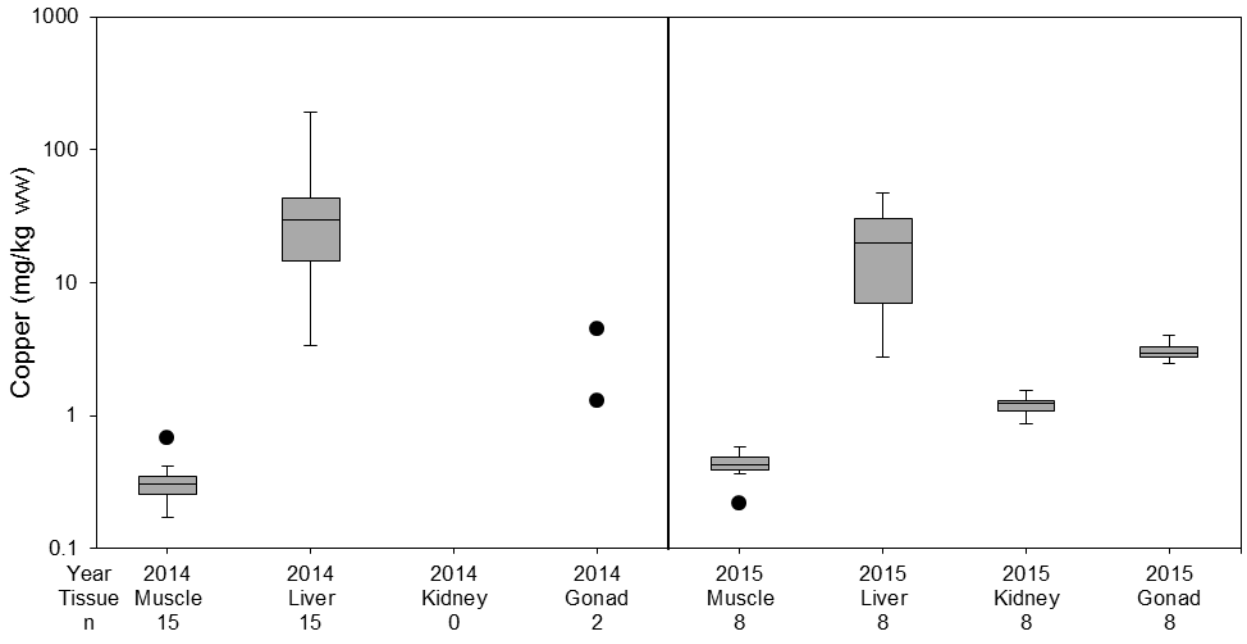
Figure 277: Copper Concentrations in Rainbow Trout Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

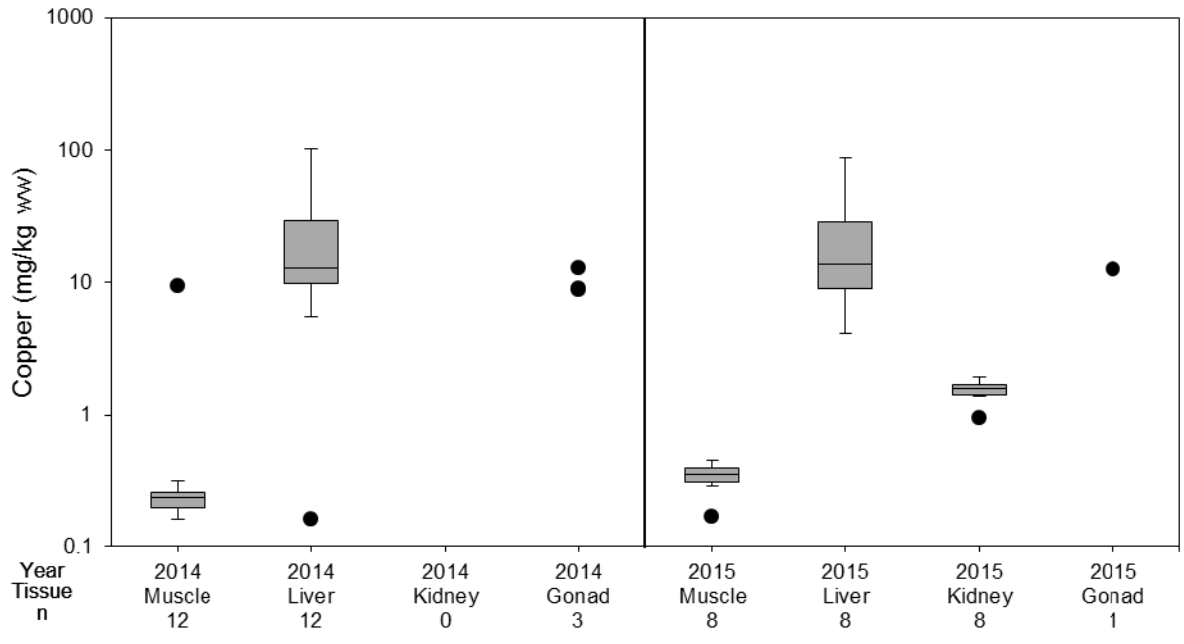
Figure 278: Copper Concentrations in Rainbow Trout Tissues Collected from Polley Lake in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 279: Copper Concentrations in Rainbow Trout Tissues Collected from Quesnel River in 2014 and 2015

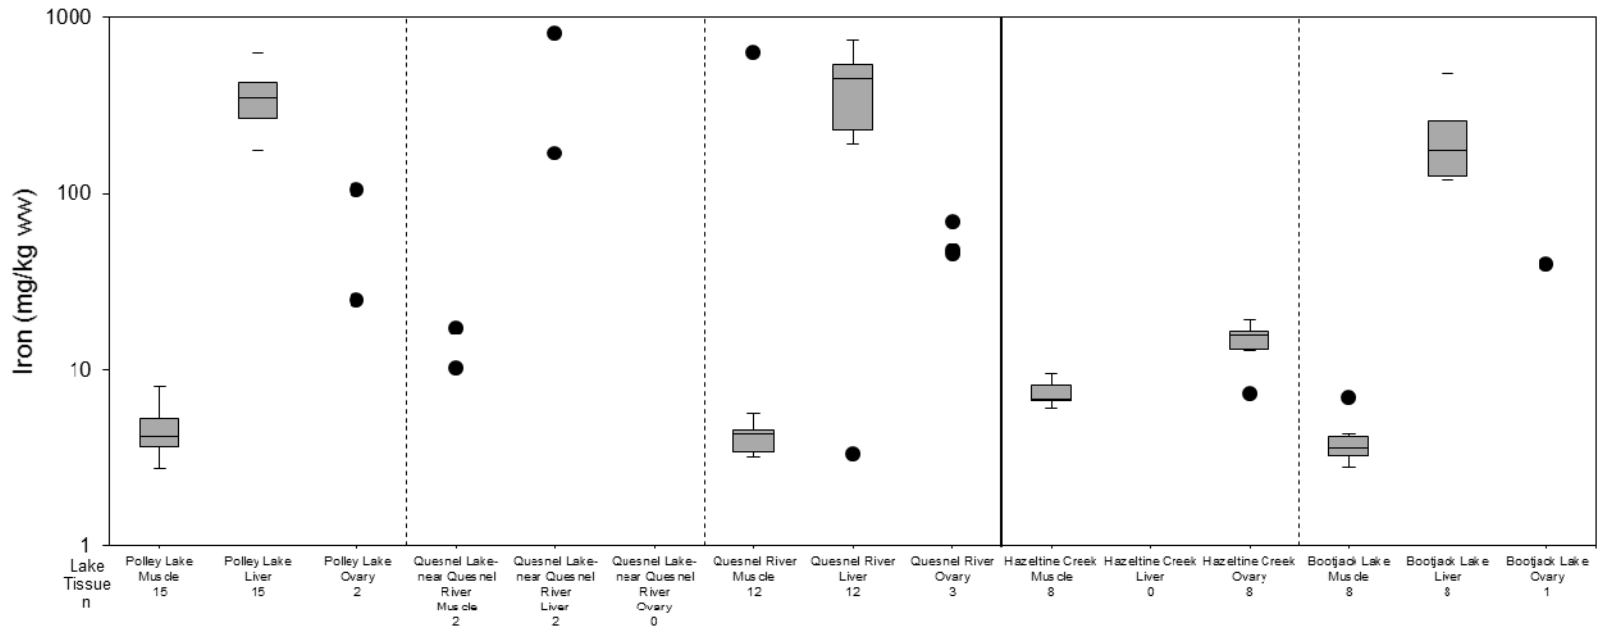


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

7.9 Iron

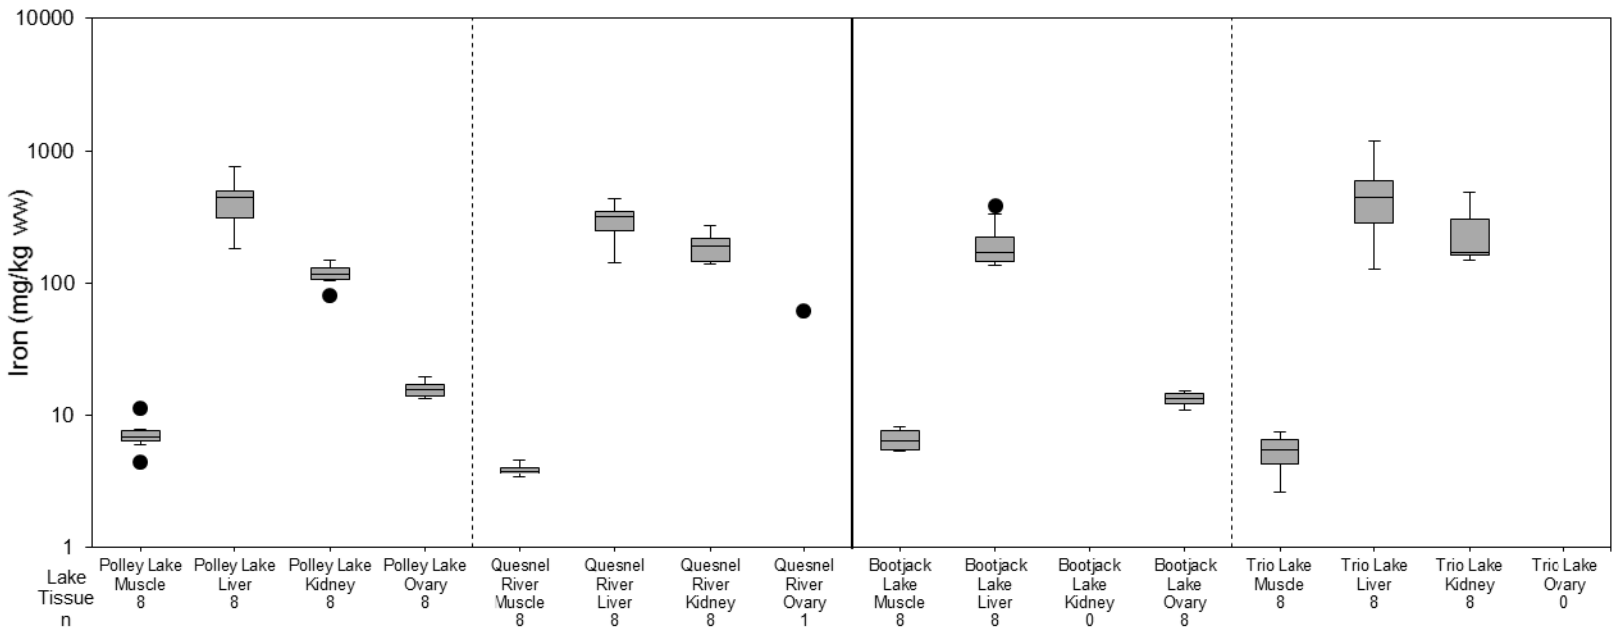
Figure 280: Iron Concentrations in Rainbow Trout Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

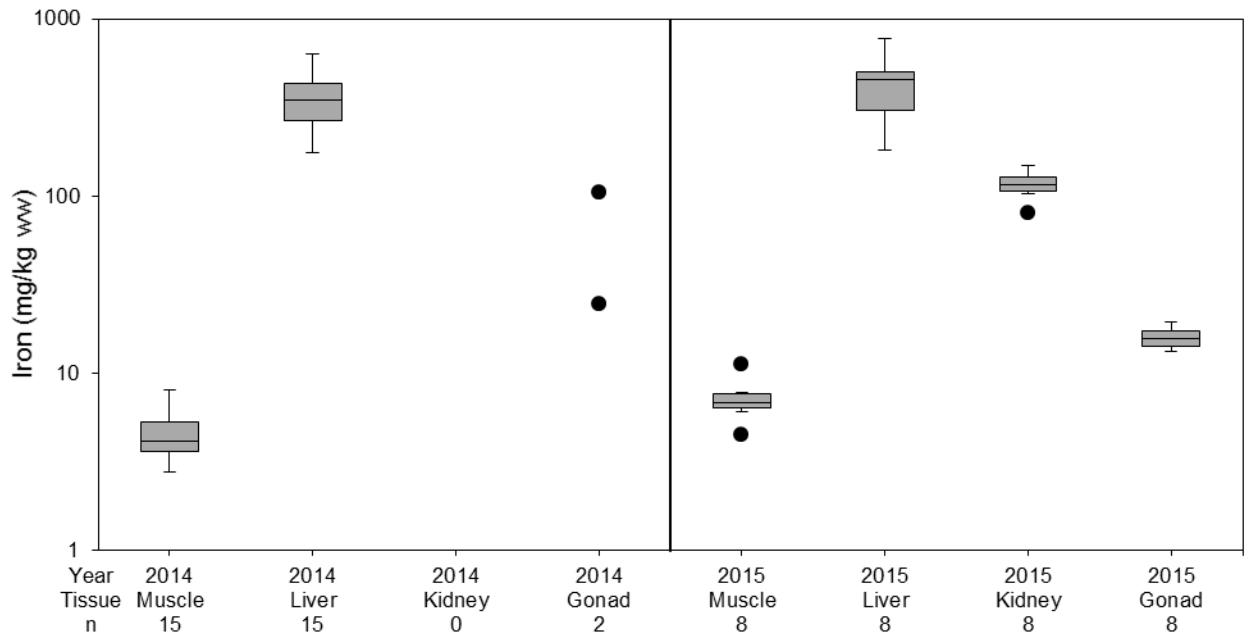
Figure 281: Iron Concentrations in Rainbow Trout Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

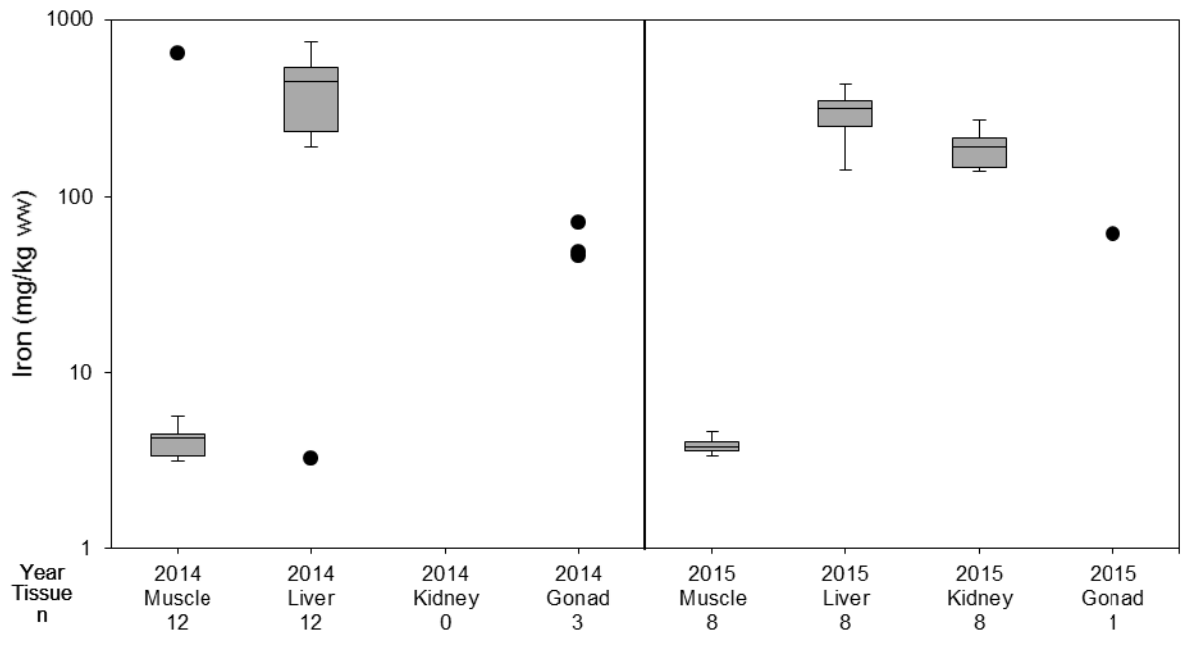
Figure 282: Iron Concentrations in Rainbow Trout Tissues Collected from Polley Lake in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 283: Iron Concentrations in Rainbow Trout Tissues Collected from Quesnel River in 2014 and 2015

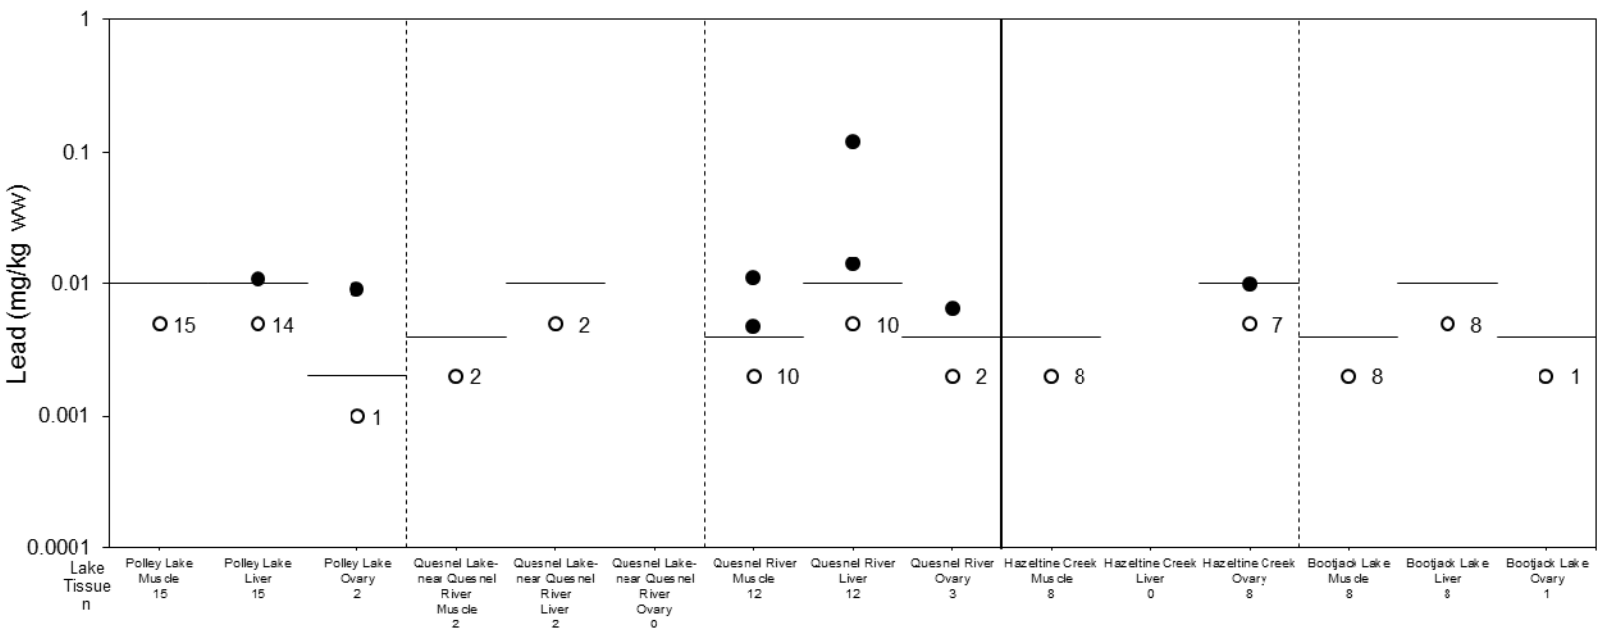


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

7.10 Lead

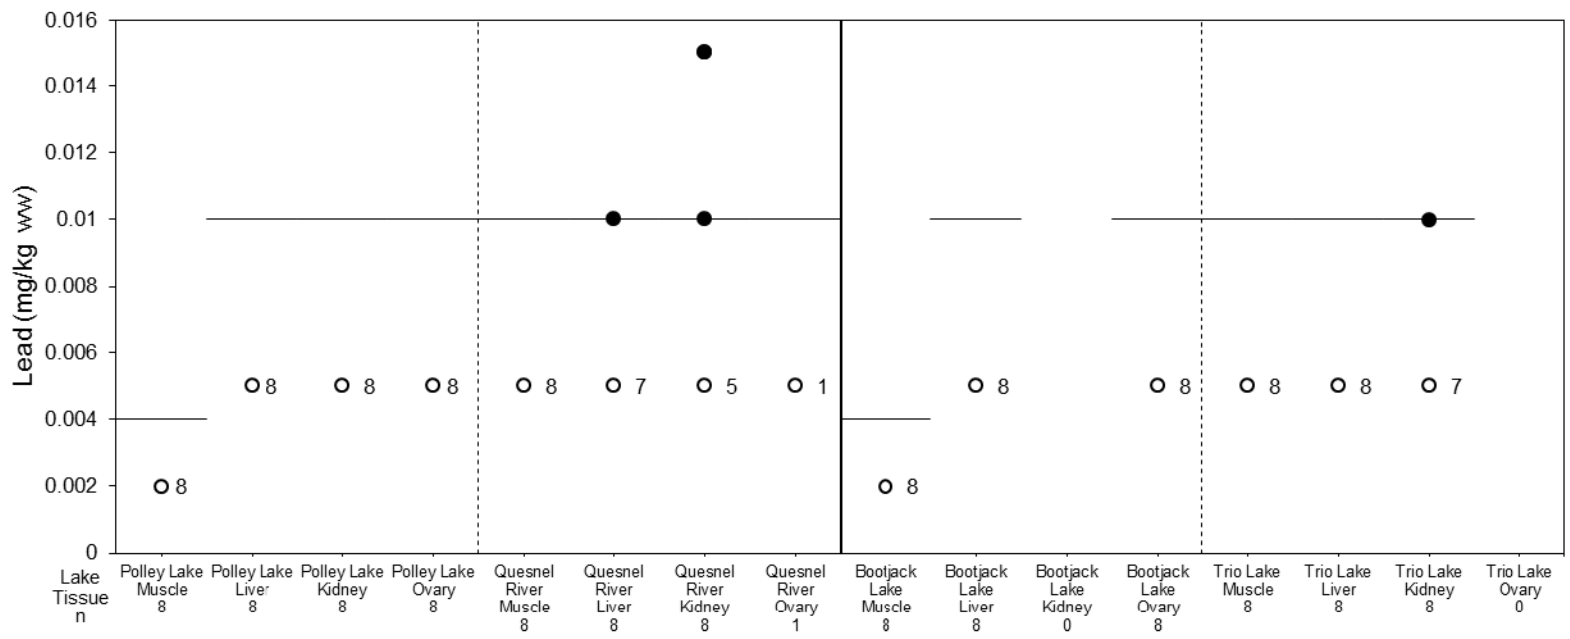
Figure 284: Lead Concentrations in Rainbow Trout Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

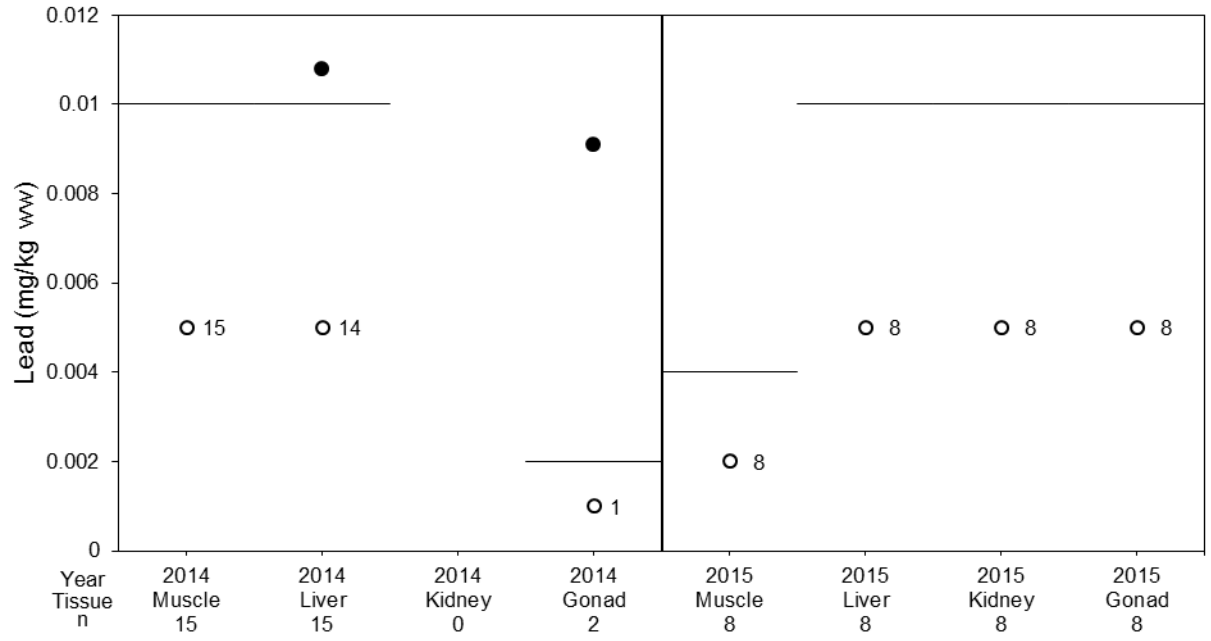
Figure 285: Lead Concentrations in Rainbow Trout Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

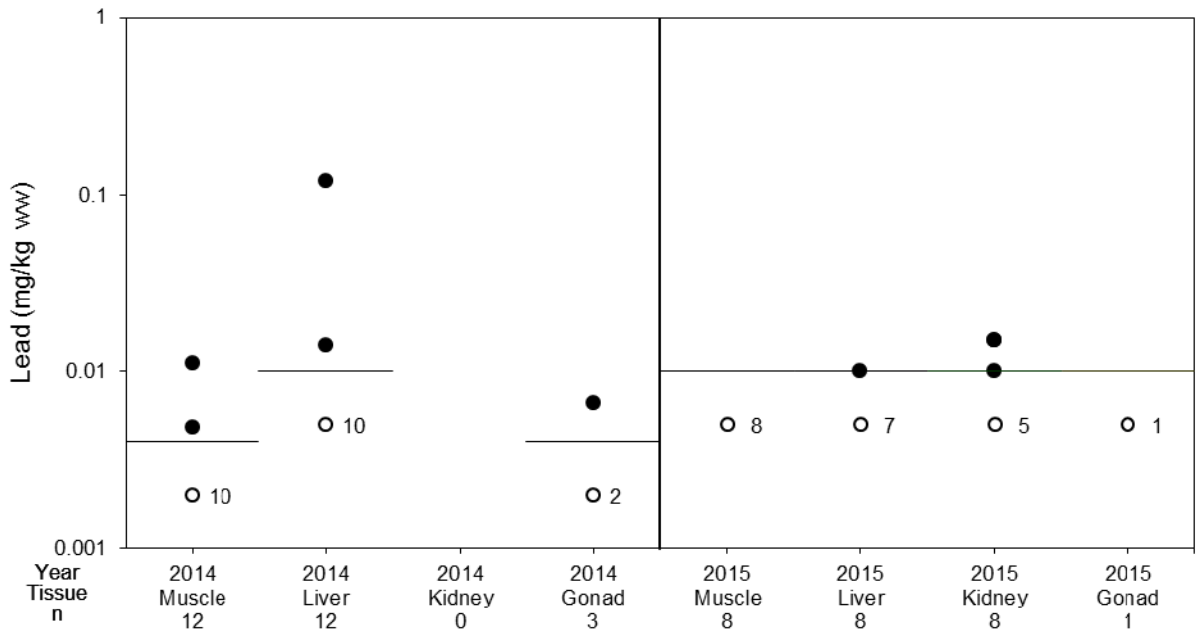
Figure 286: Lead Concentrations in Rainbow Trout Tissues Collected from Polley Lake in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 287: Lead Concentrations in Rainbow Trout Tissues Collected from Quesnel River in 2014 and 2015

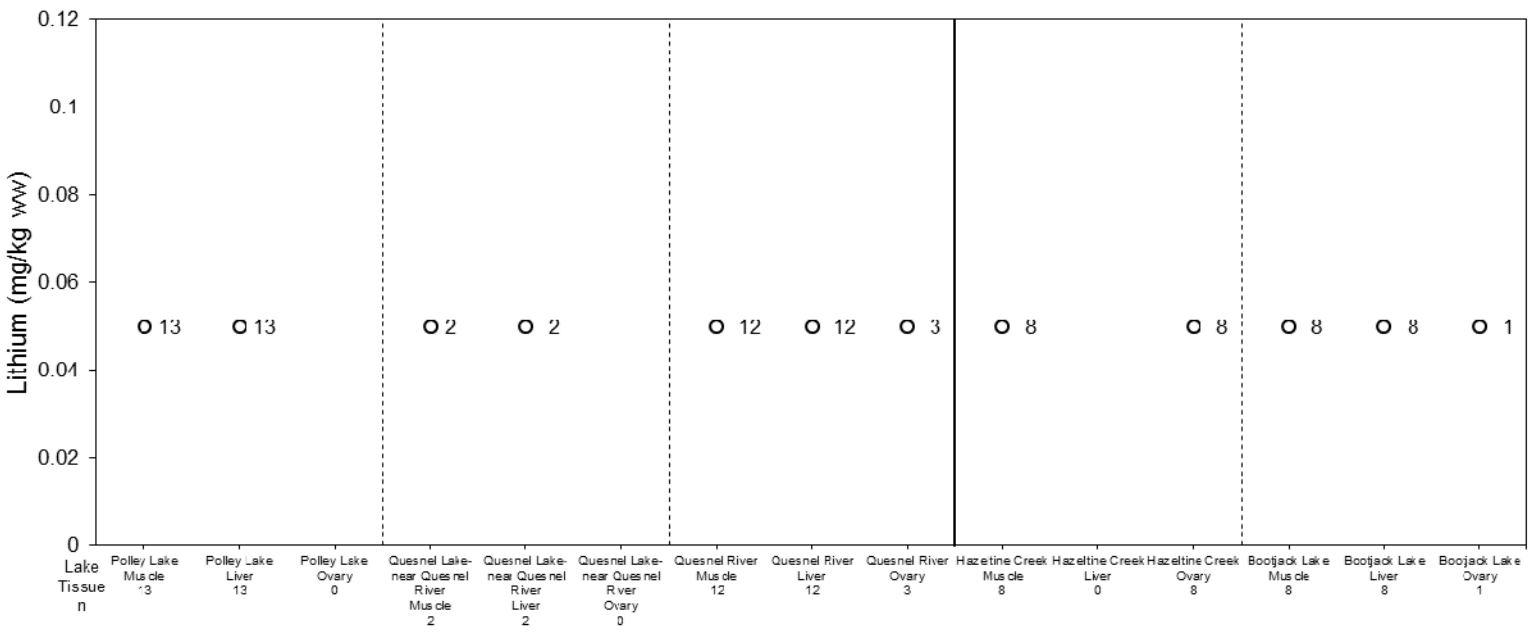


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

7.11 Lithium

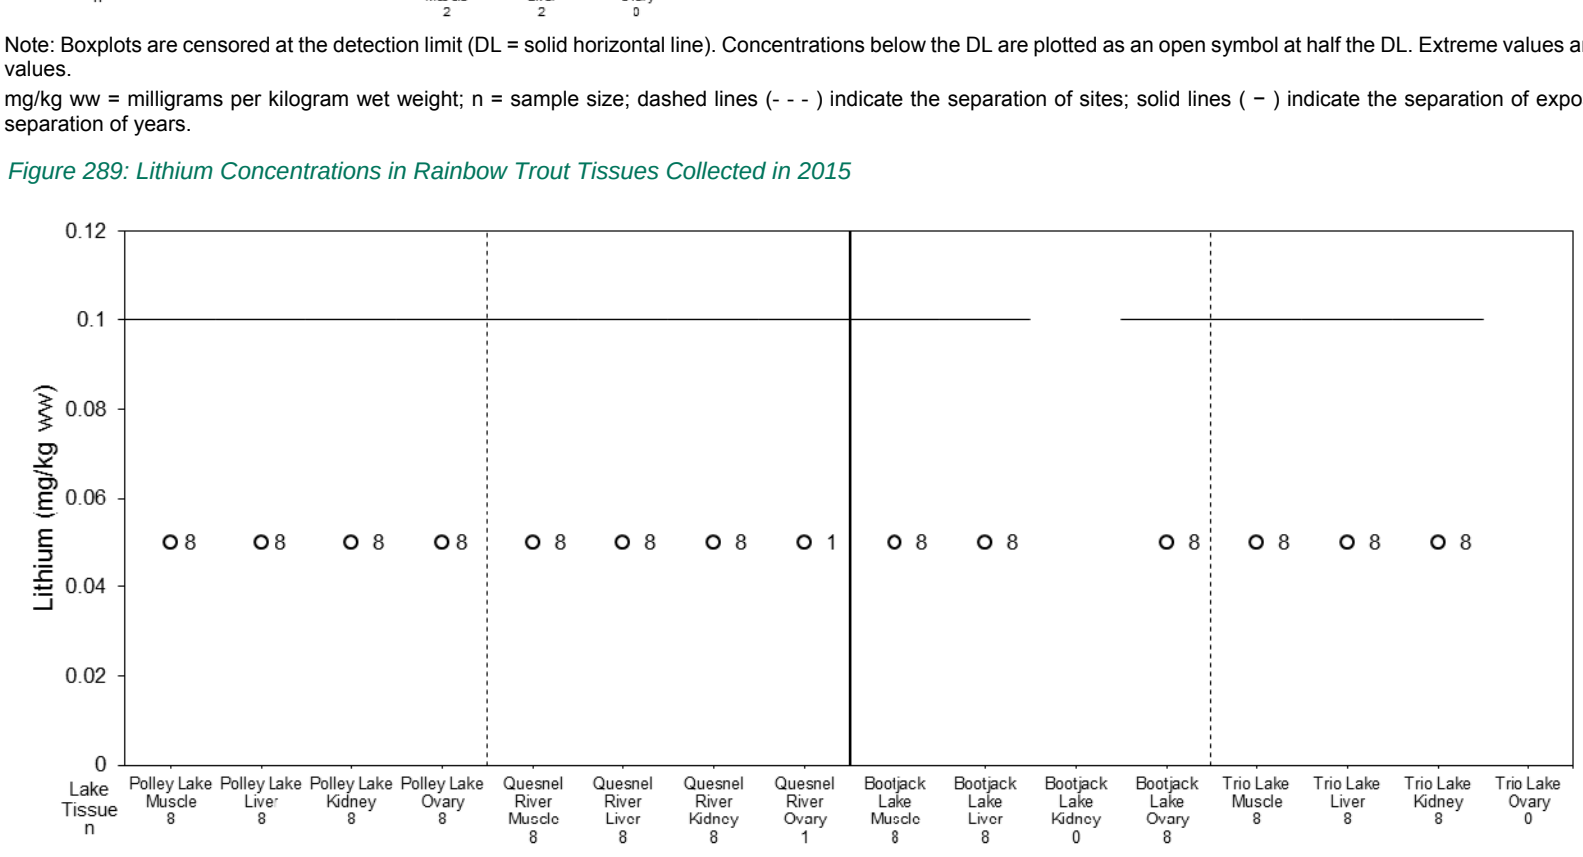
Figure 288: Lithium Concentrations in Rainbow Trout Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

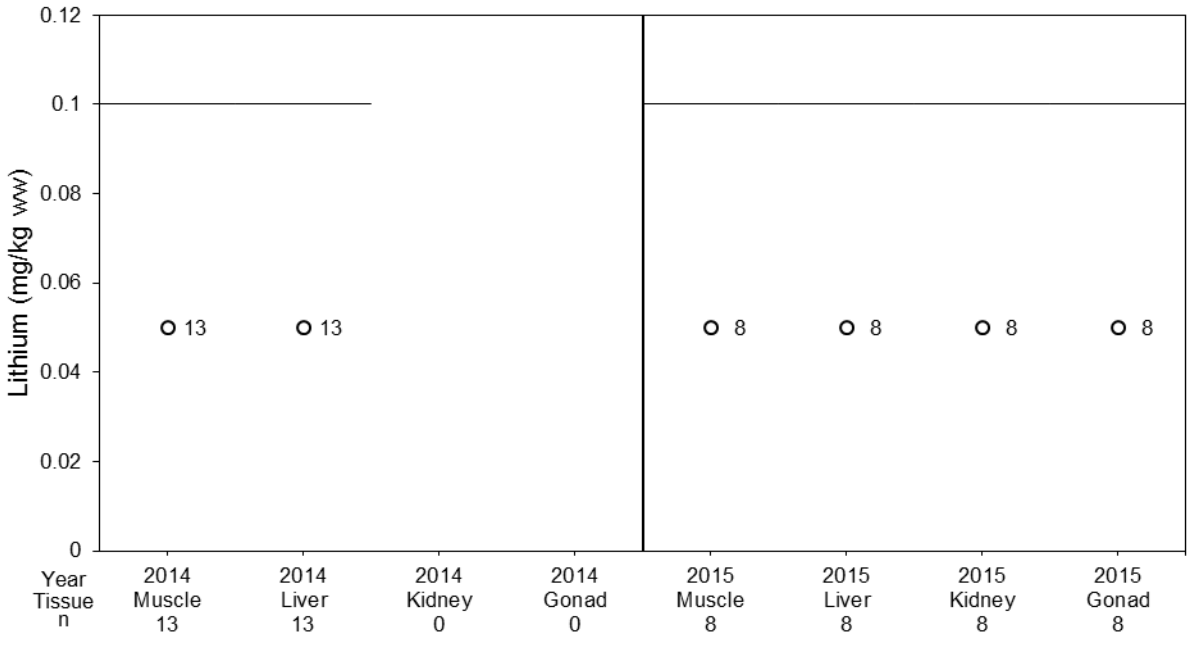
Figure 289: Lithium Concentrations in Rainbow Trout Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

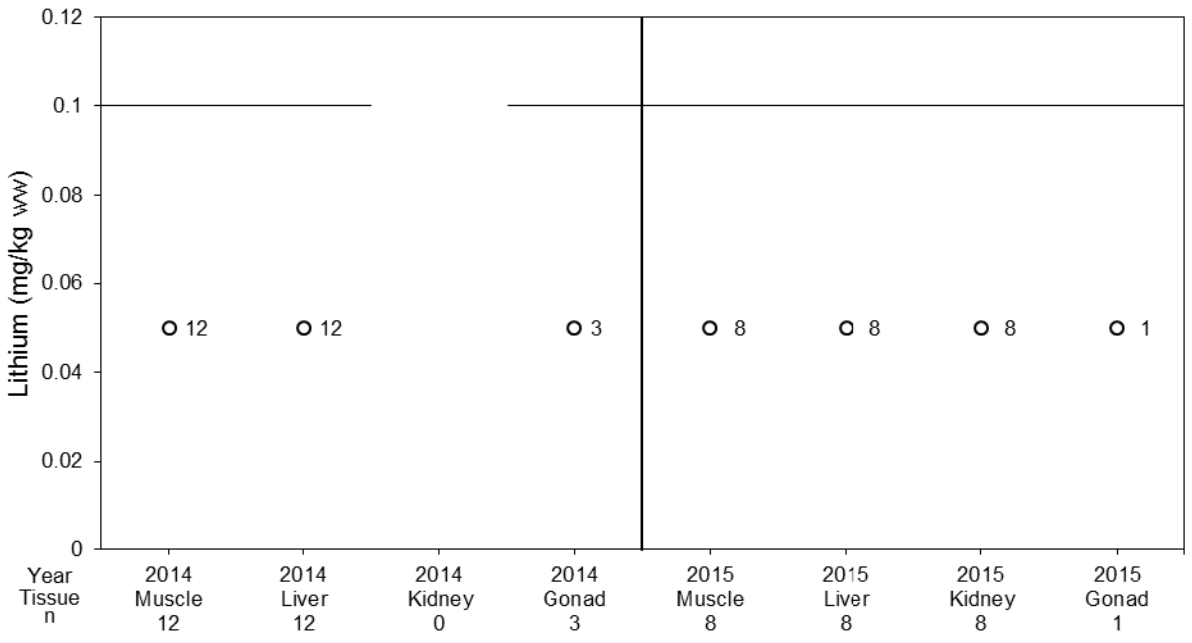
Figure 290: Lithium Concentrations in Rainbow Trout Tissues Collected from Polley Lake in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 291: Lithium Concentrations in Rainbow Trout Tissues Collected from Quesnel River in 2014 and 2015

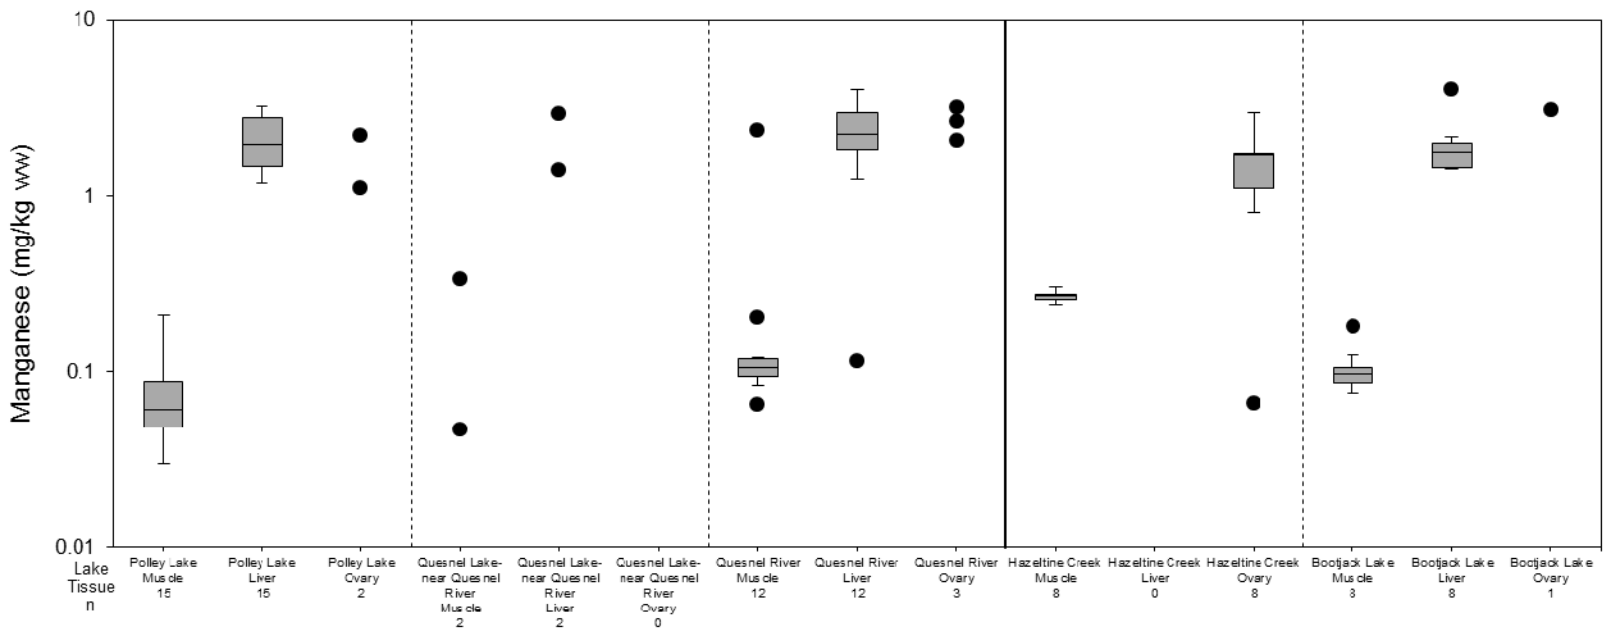


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

7.12 Manganese

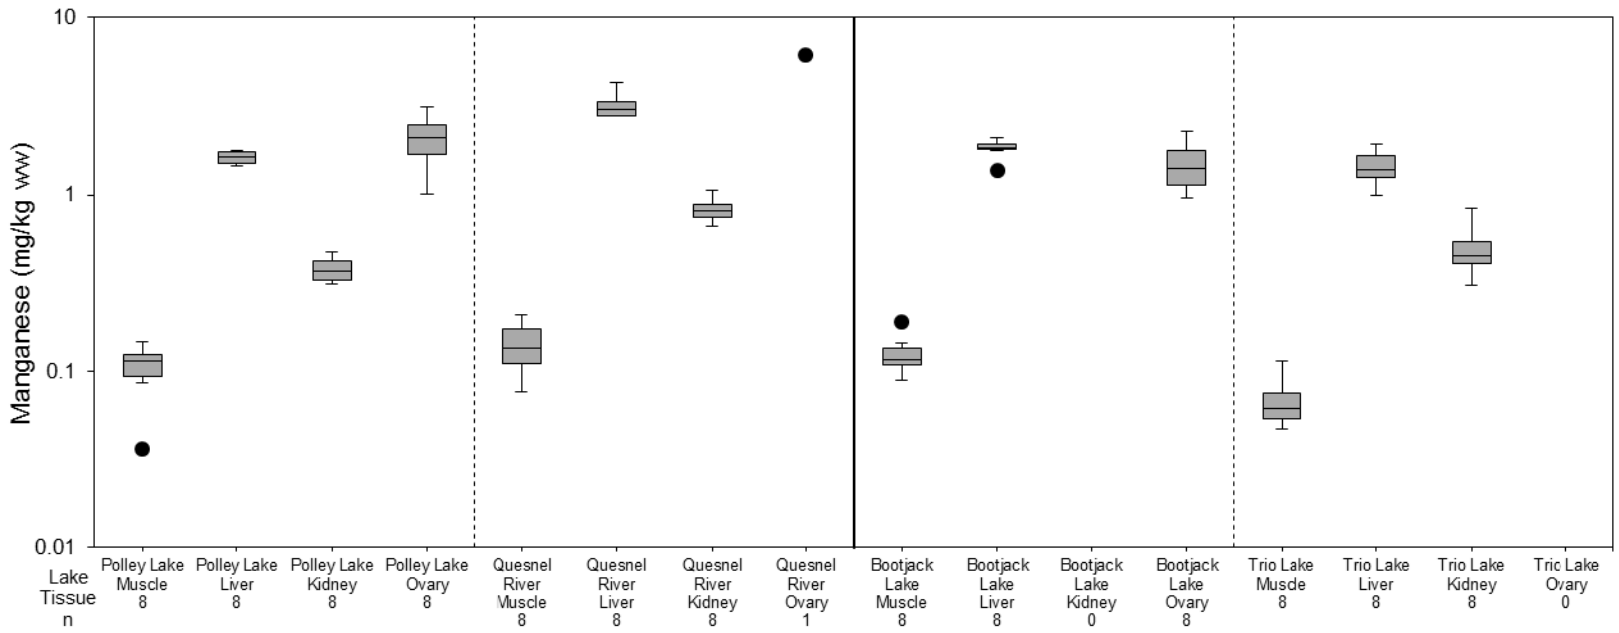
Figure 292: Manganese Concentrations in Rainbow Trout Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

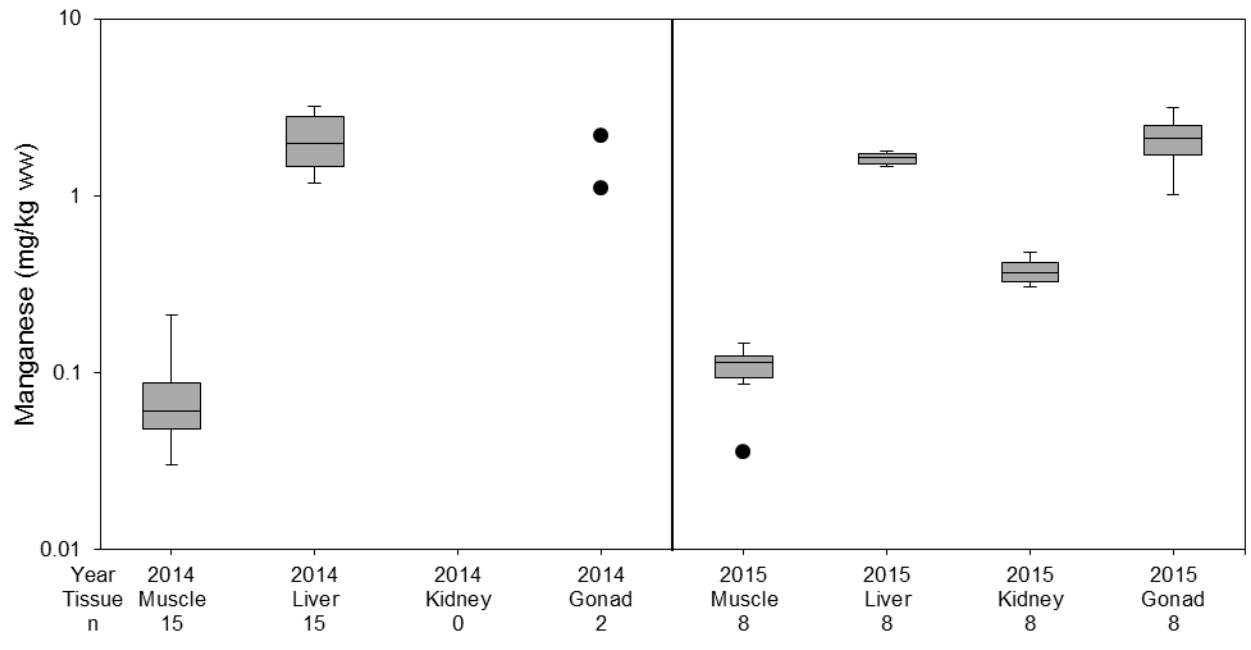
Figure 293: Manganese Concentrations in Rainbow Trout Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

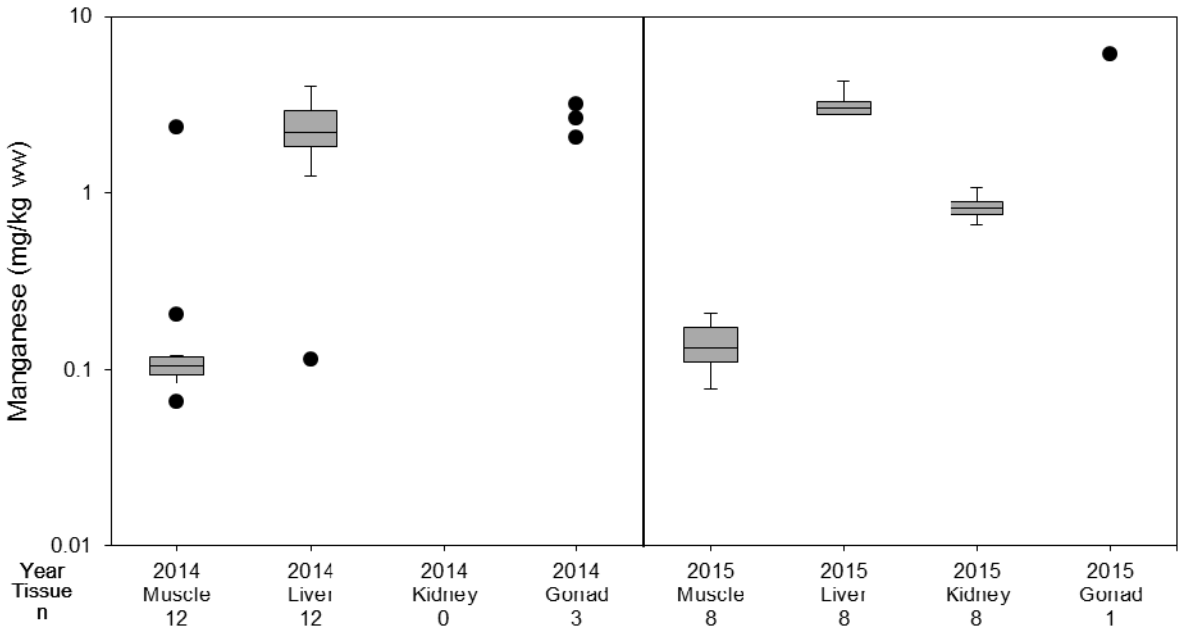
Figure 294: Manganese Concentrations in Rainbow Trout Tissues Collected from Polley Lake in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 295: Manganese Concentrations in Rainbow Trout Tissues Collected from Quesnel River in 2014 and 2015

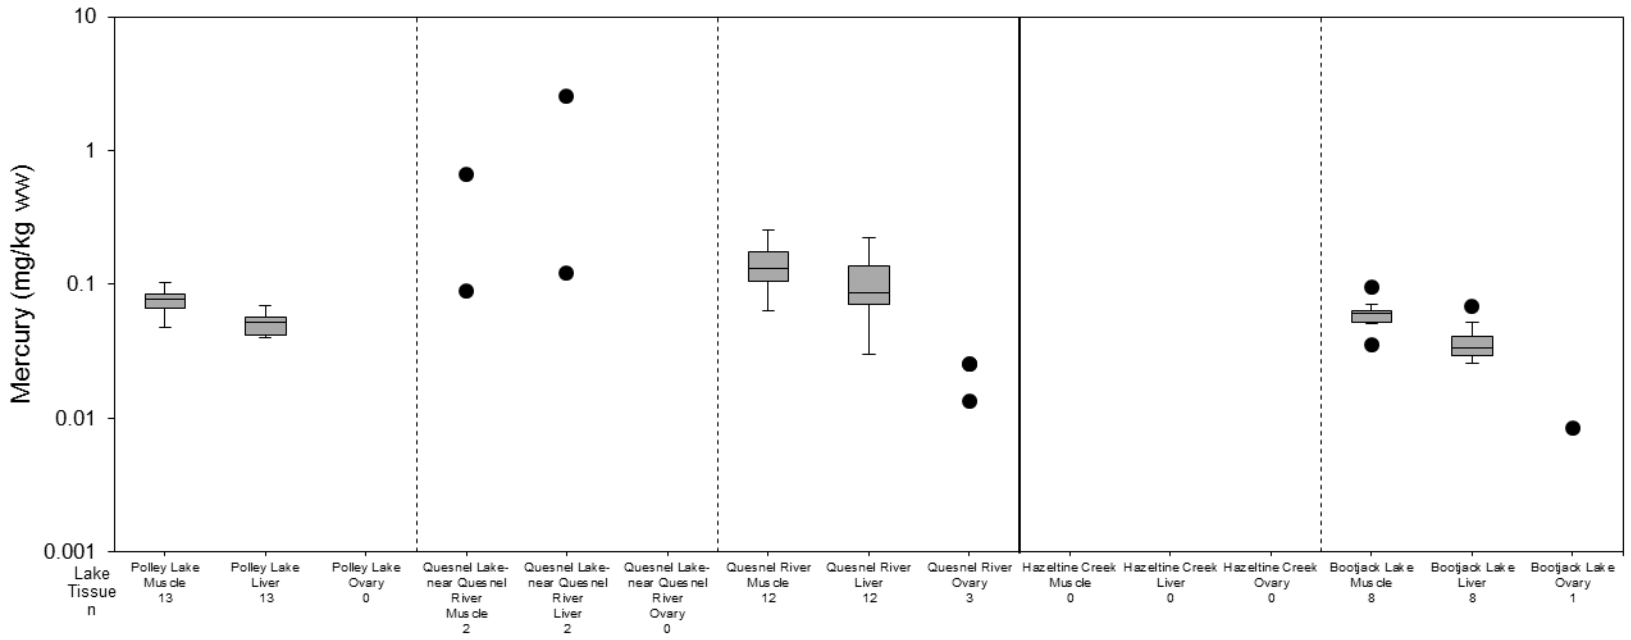


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

7.13 Mercury

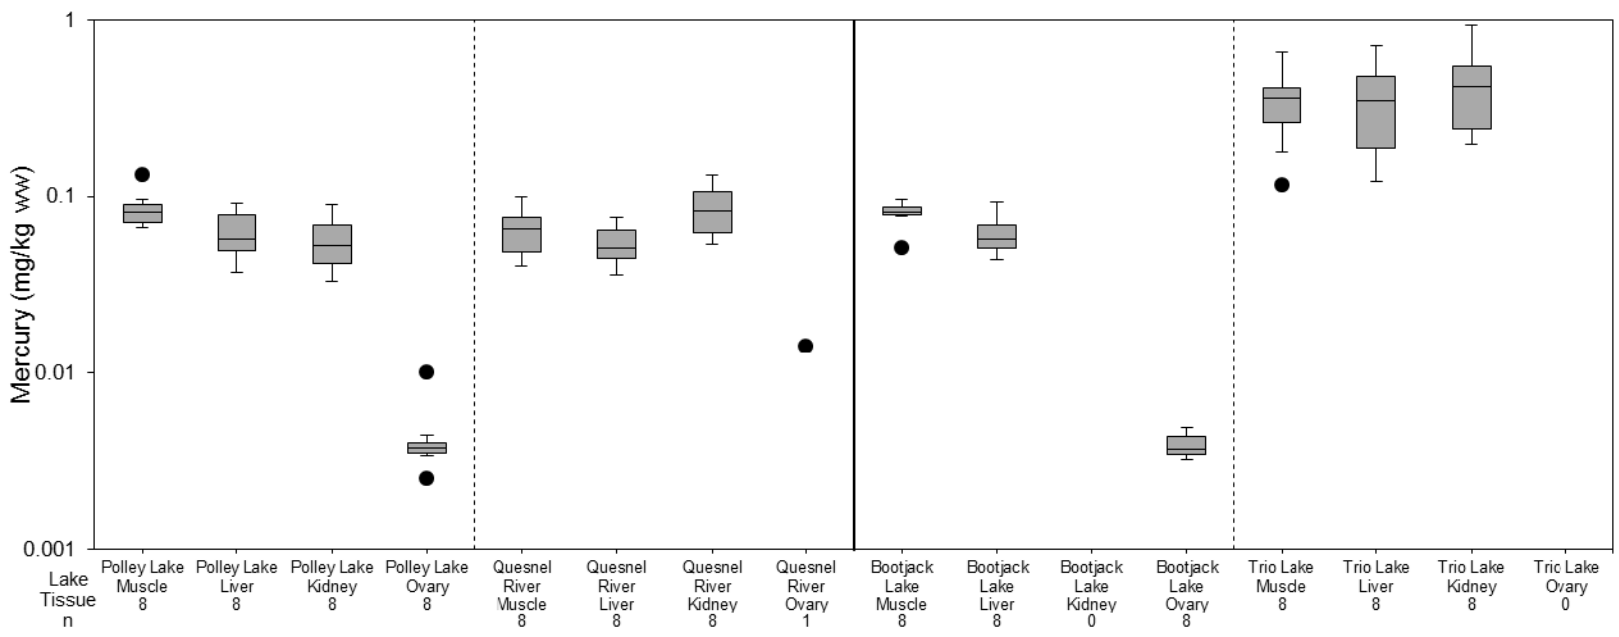
Figure 296: Mercury Concentrations in Rainbow Trout Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

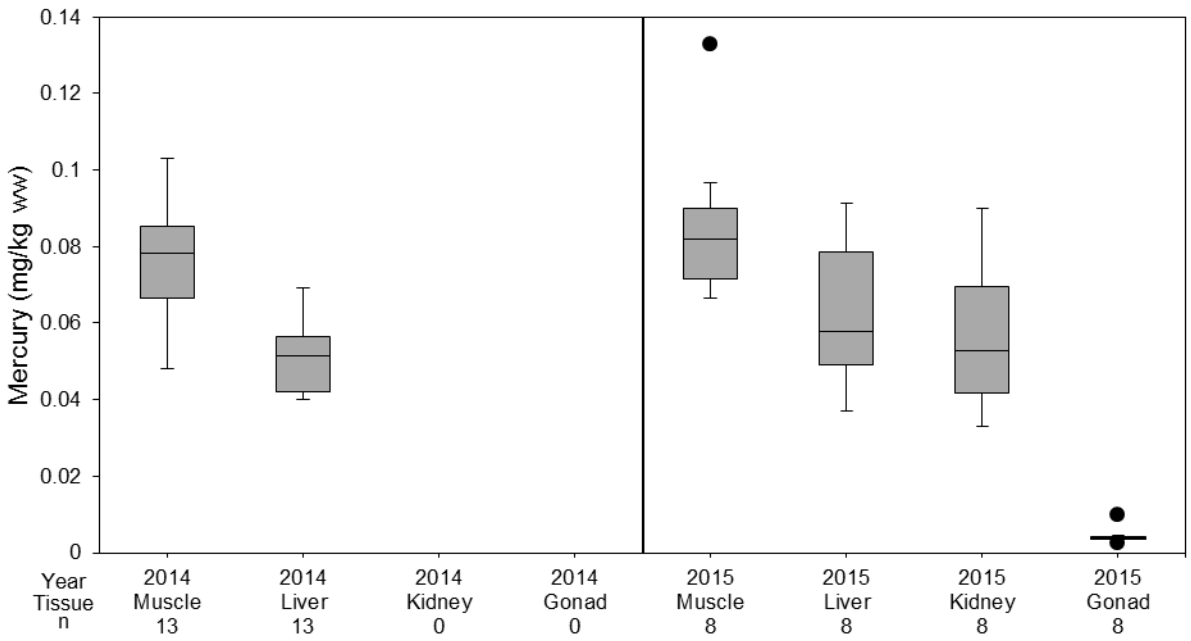
Figure 297: Mercury Concentrations in Rainbow Trout Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

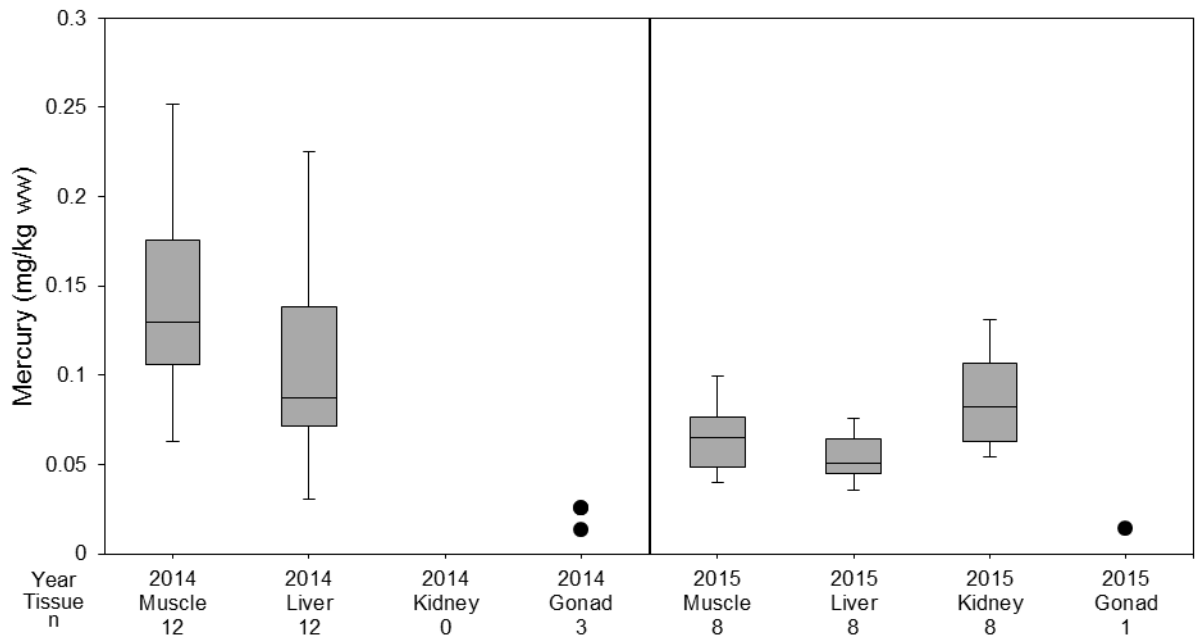
Figure 298: Mercury Concentrations in Rainbow Trout Tissues Collected from Polley Lake in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 299: Mercury Concentrations in Rainbow Trout Tissues Collected from Quesnel River in 2014 and 2015

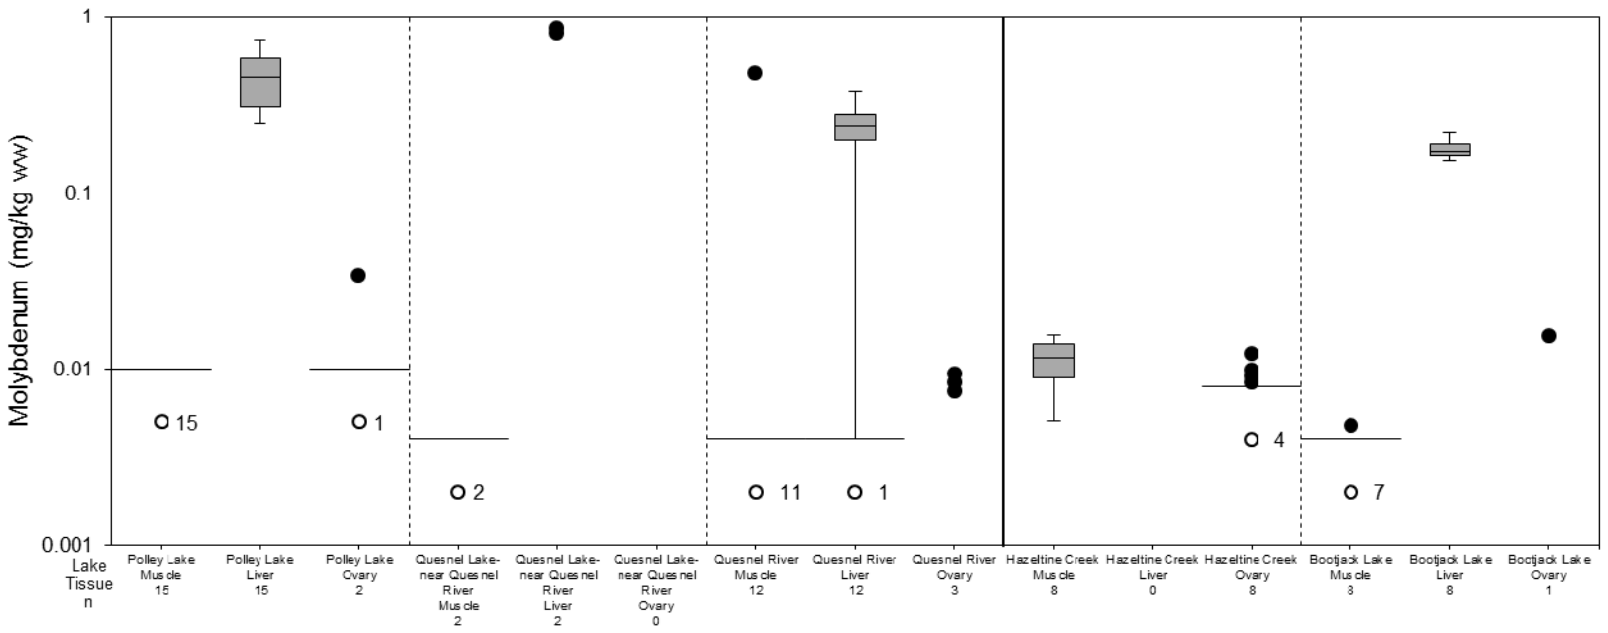


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

7.14 Molybdenum

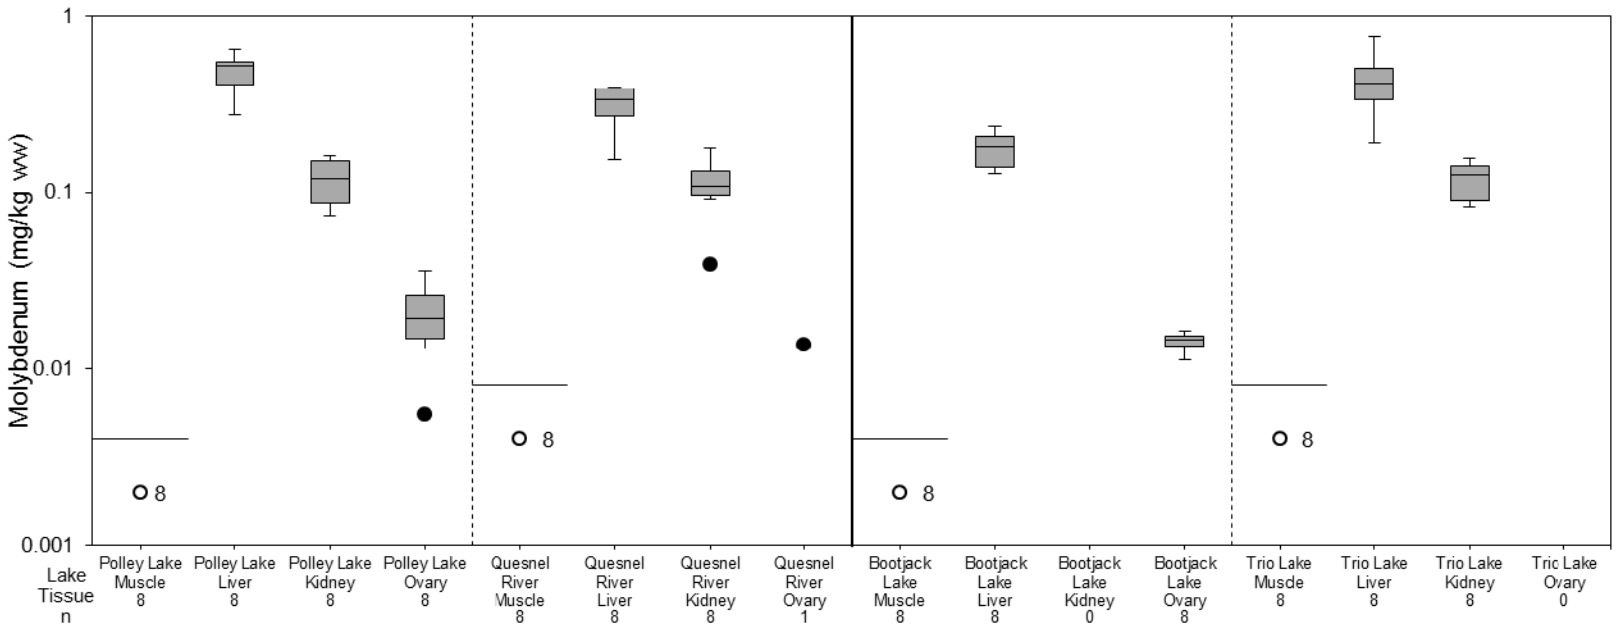
Figure 300: Molybdenum Concentrations in Rainbow Trout Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

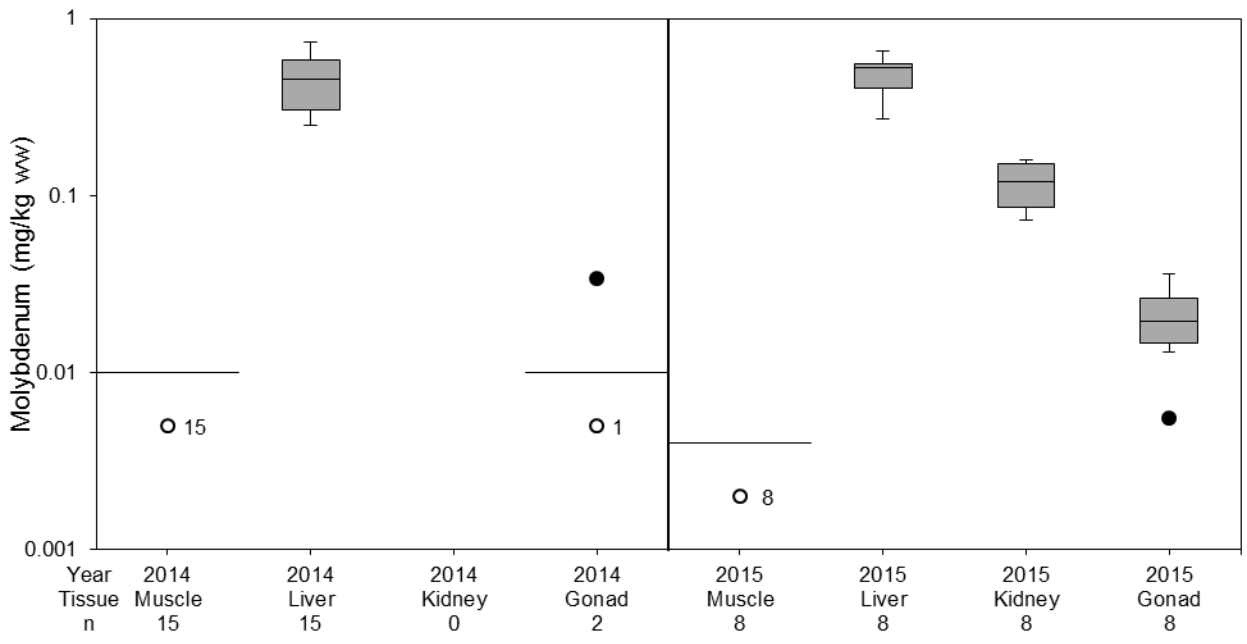
Figure 301: Molybdenum Concentrations in Rainbow Trout Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

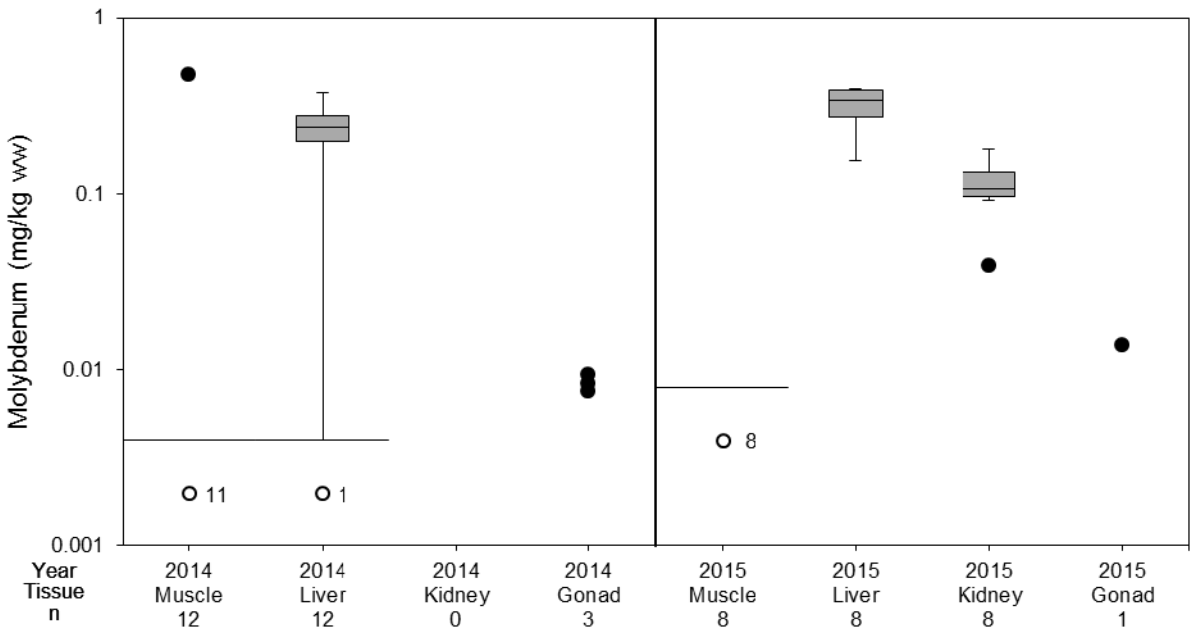
Figure 302: Molybdenum Concentrations in Rainbow Trout Tissues Collected from Polley Lake in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 303: Molybdenum Concentrations in Rainbow Trout Tissues Collected from Quesnel River in 2014 and 2015

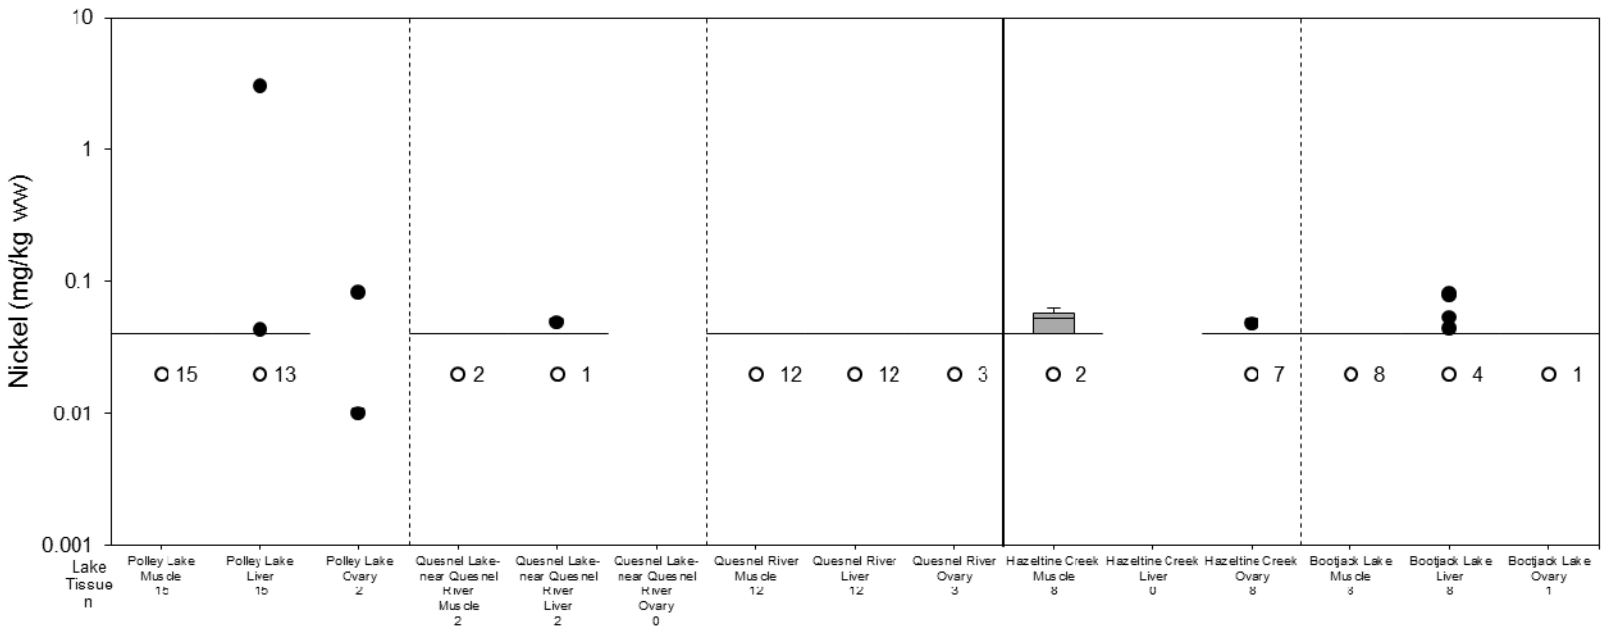


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

7.15 Nickel

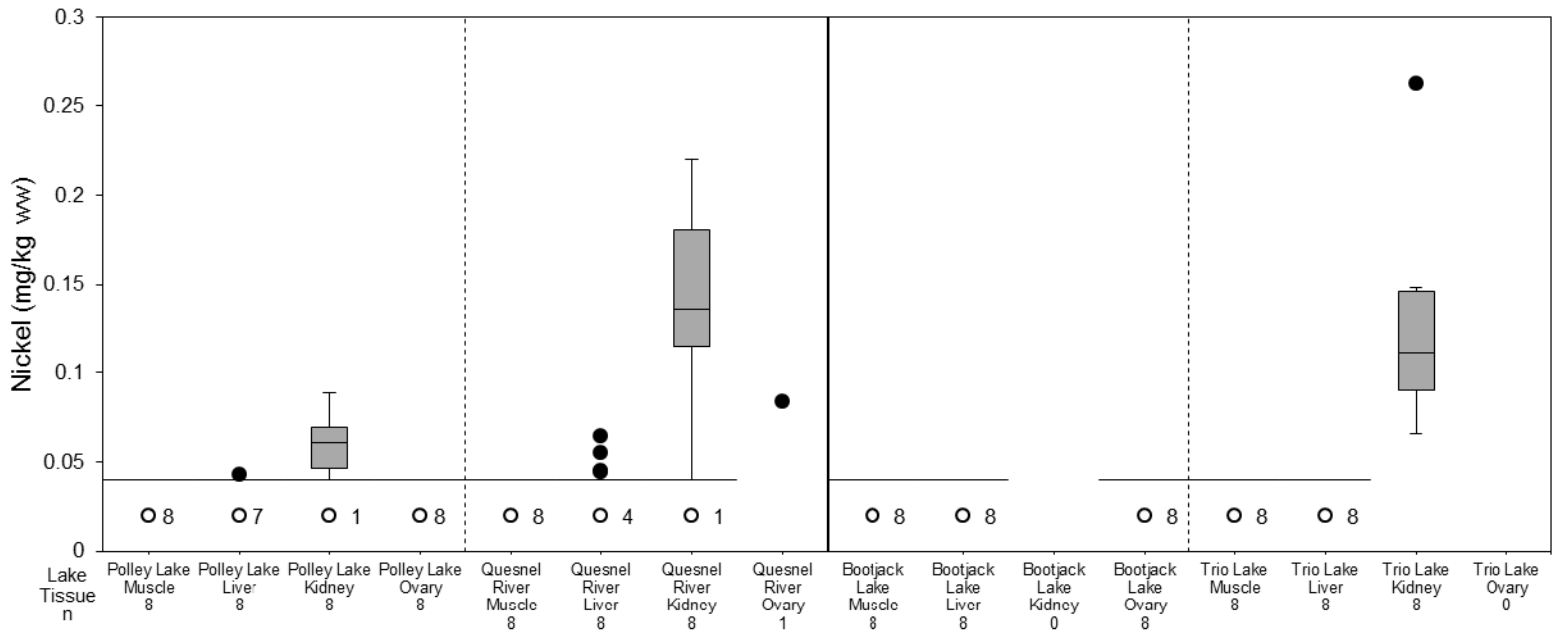
Figure 304: Nickel Concentrations in Rainbow Trout Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

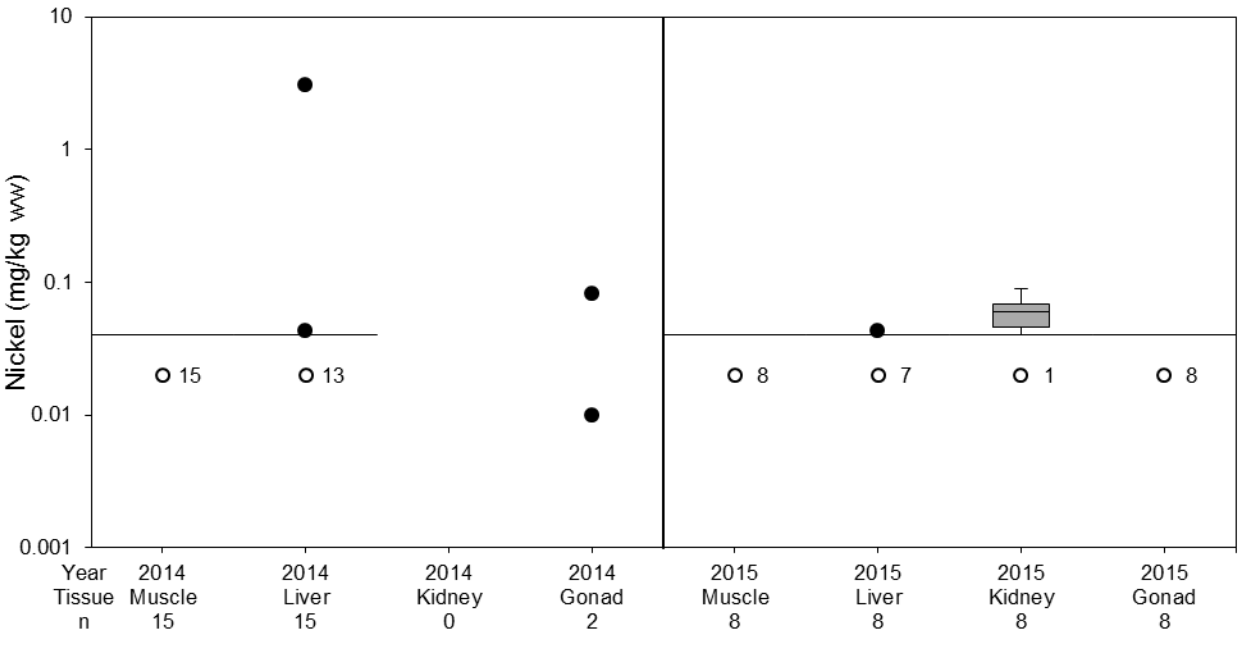
Figure 305: Nickel Concentrations in Rainbow Trout Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

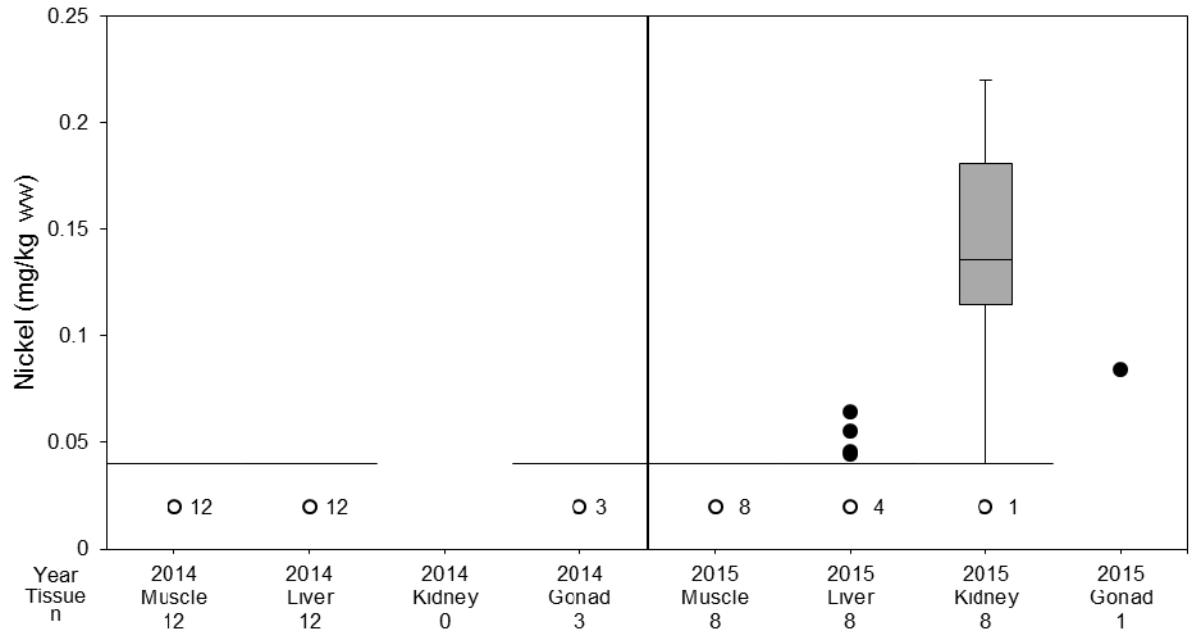
Figure 306: Nickel Concentrations in Rainbow Trout Tissues Collected from Polley Lake in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 307: Nickel Concentrations in Rainbow Trout Tissues Collected from Quesnel River in 2014 and 2015

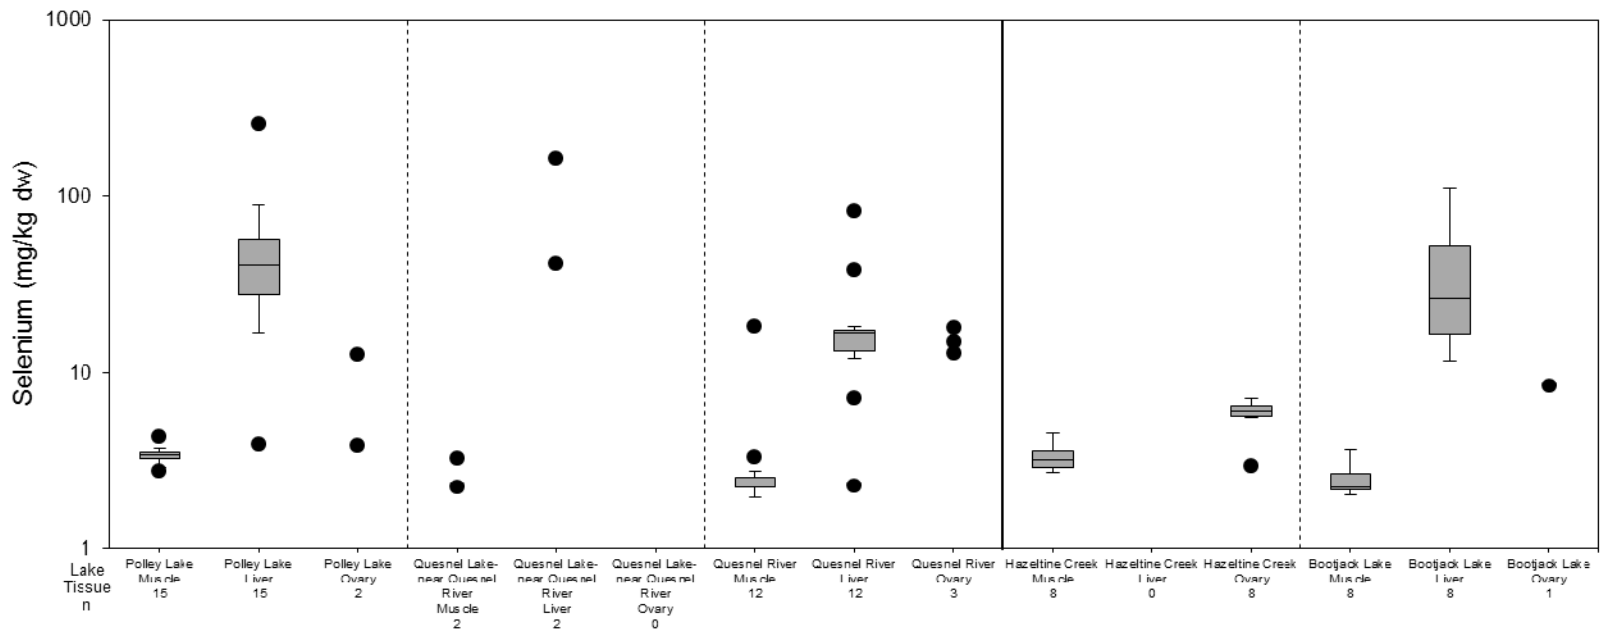


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

7.16 Selenium

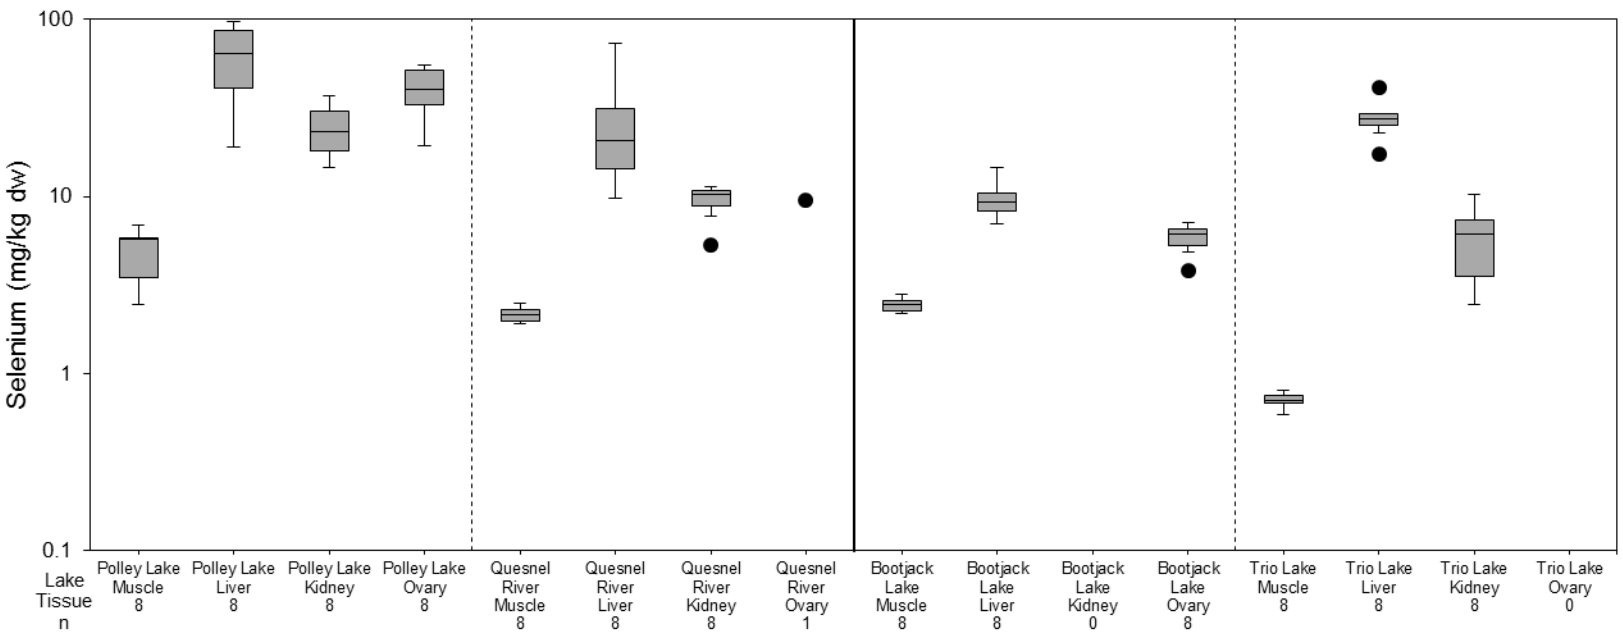
Figure 308: Selenium Concentrations in Rainbow Trout Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg dw = milligrams per kilogram dry weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

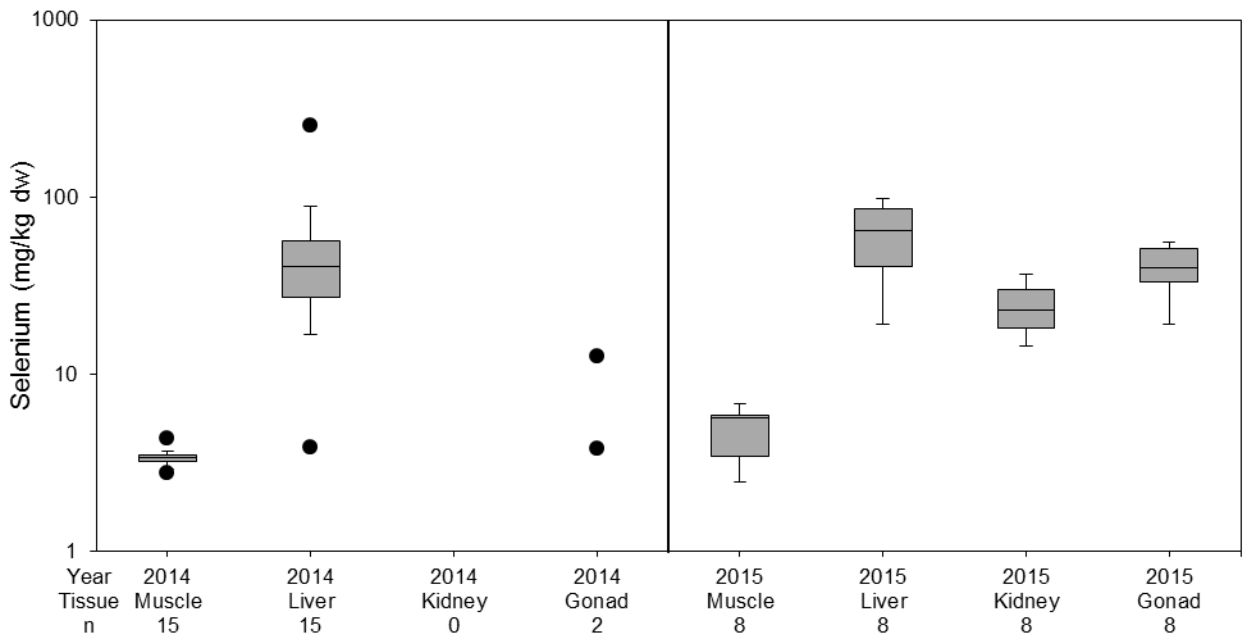
Figure 309: Selenium Concentrations in Rainbow Trout Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg dw = milligrams per kilogram dry weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

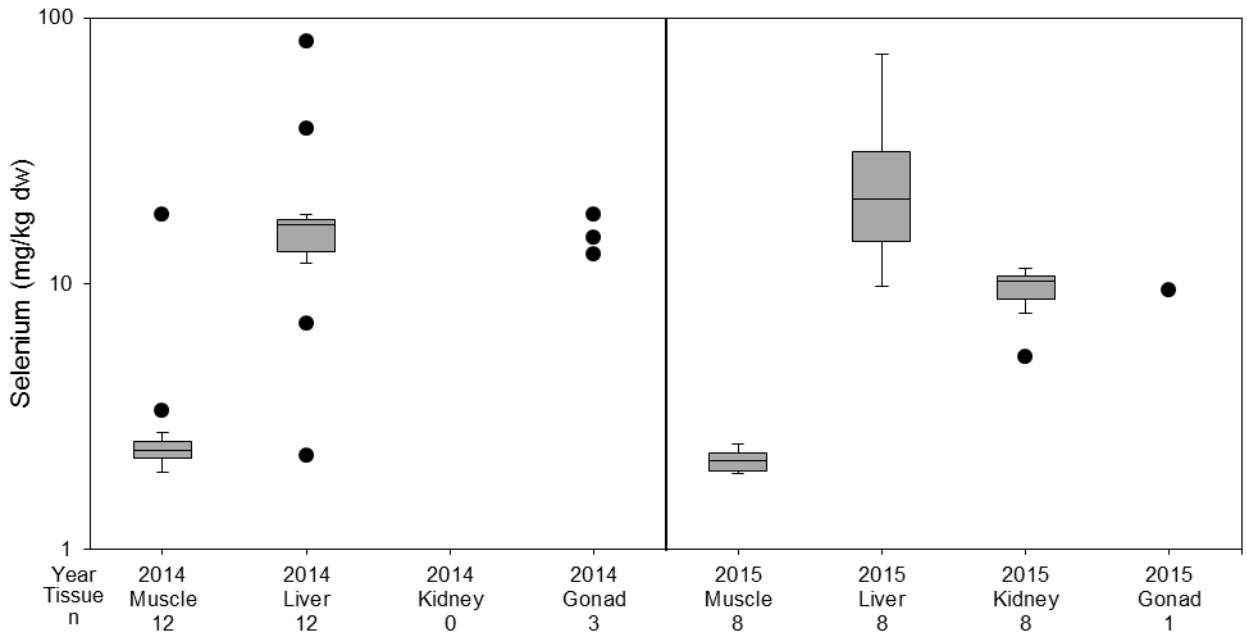
Figure 310: Selenium Concentrations in Rainbow Trout Tissues Collected from Polley Lake in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg dw = milligrams per kilogram dry weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 311: Selenium Concentrations in Rainbow Trout Tissues Collected from Quesnel River in 2014 and 2015

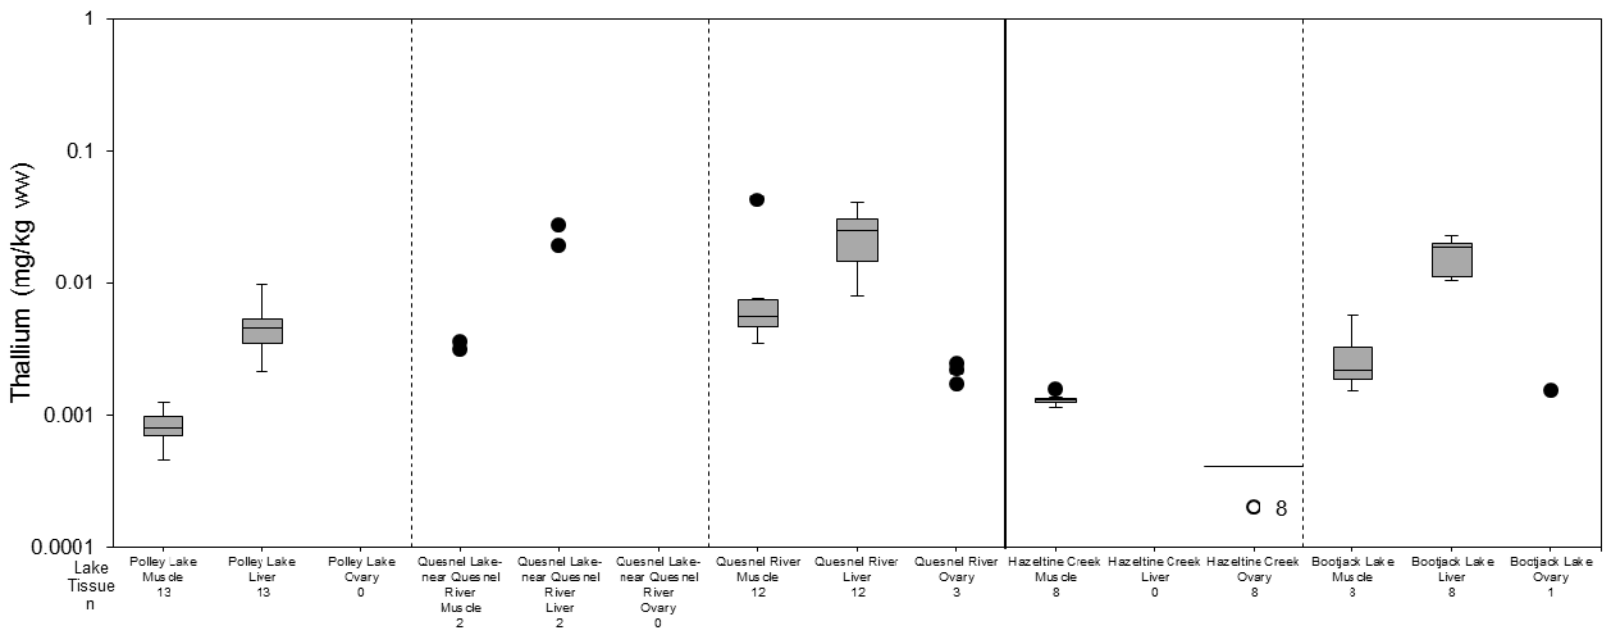


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg dw = milligrams per kilogram dry weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

7.17 Thallium

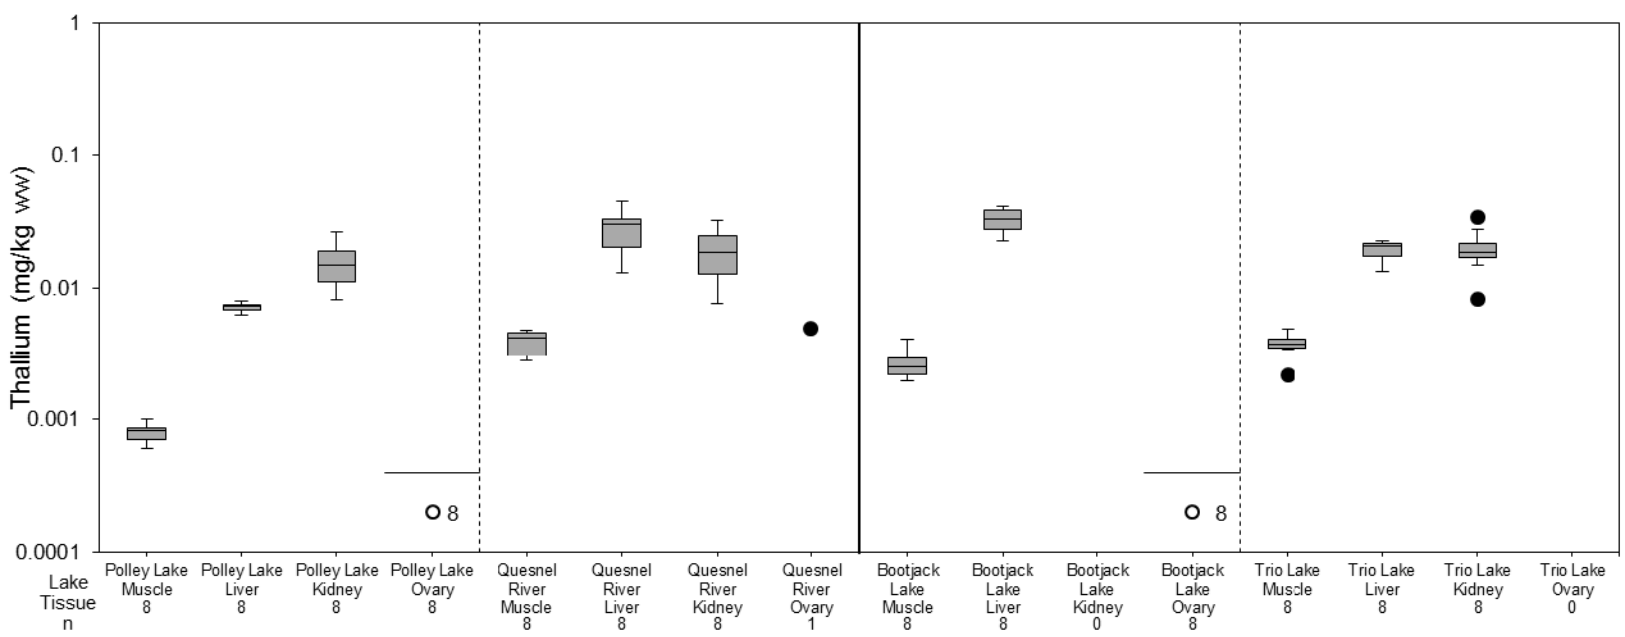
Figure 312: Thallium Concentrations in Rainbow Trout Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

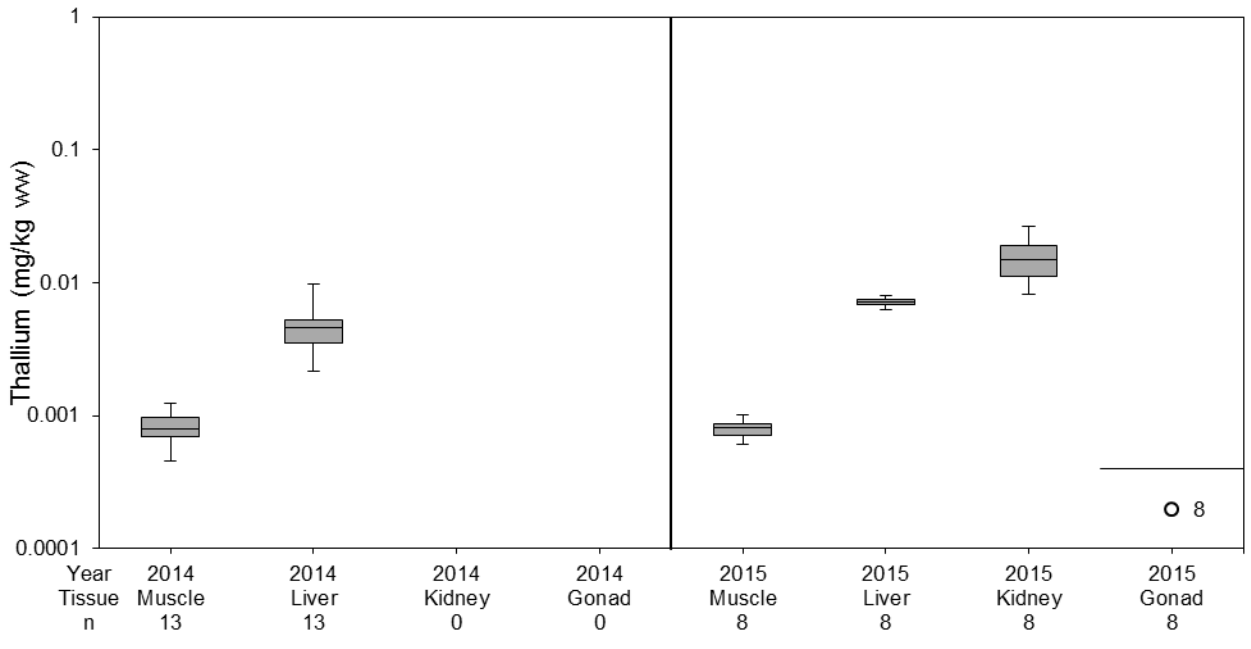
Figure 313: Thallium Concentrations in Rainbow Trout Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

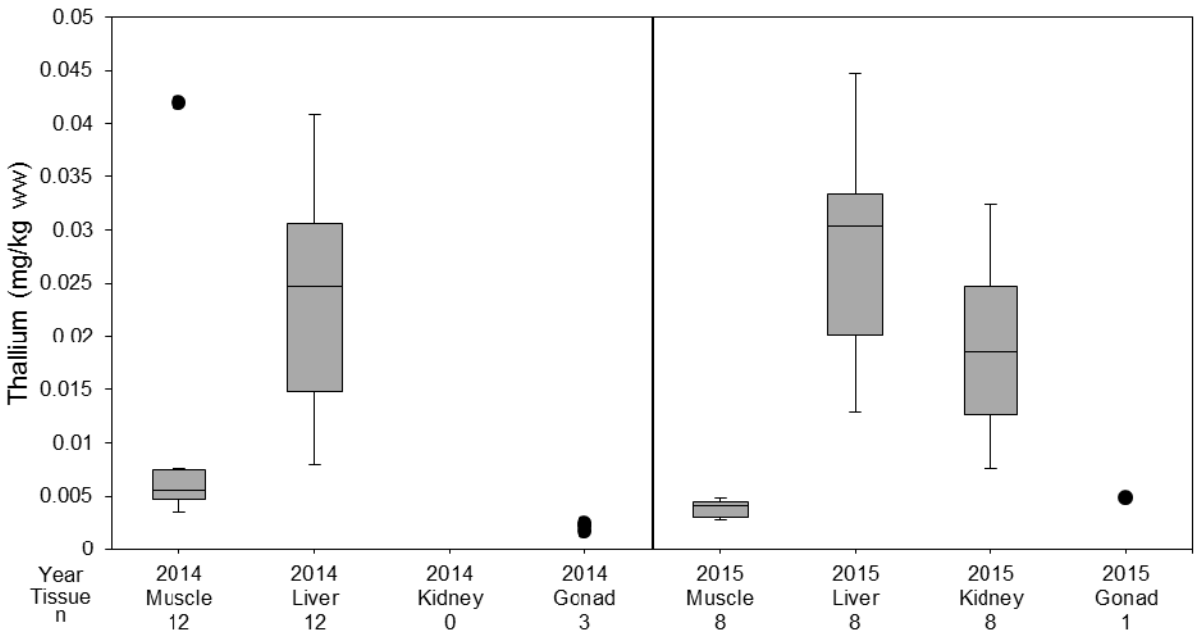
Figure 314: Thallium Concentrations in Rainbow Trout Tissues Collected from Polley Lake in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 315: Thallium Concentrations in Rainbow Trout Tissues Collected from Quesnel River in 2014 and 2015

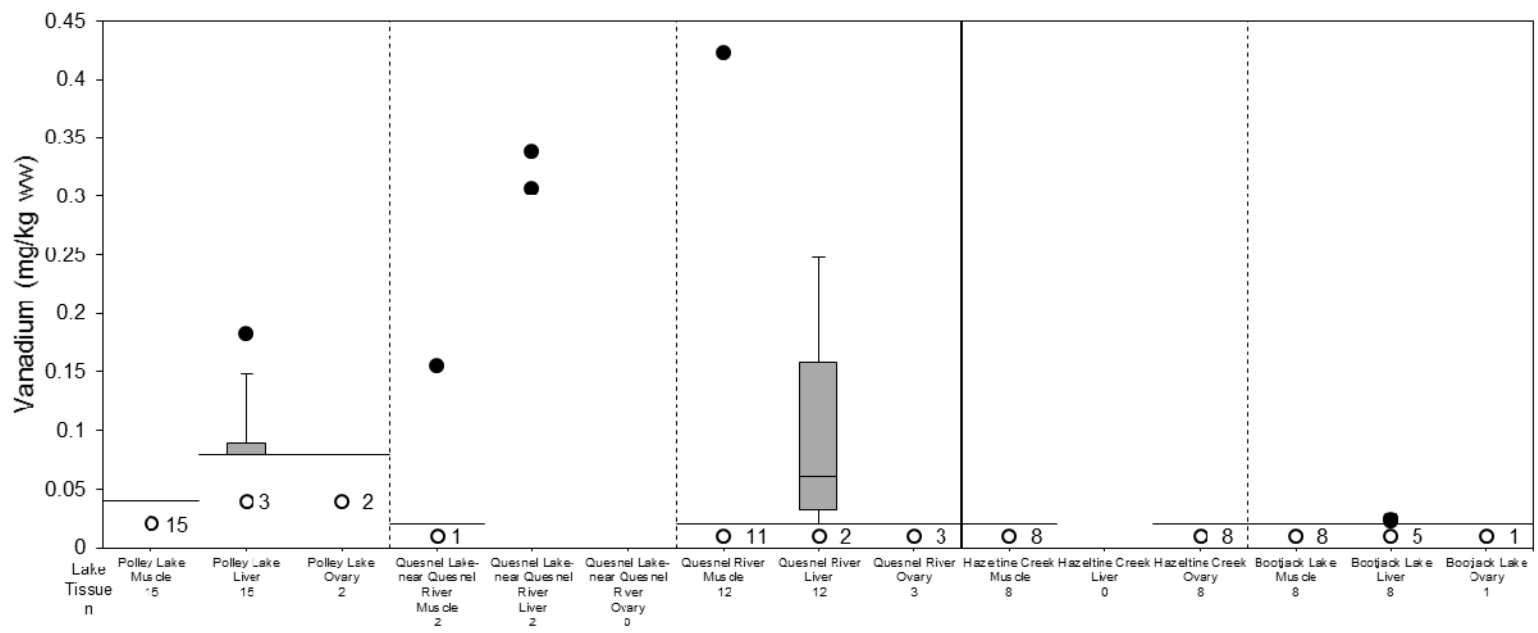


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

7.18 Vanadium

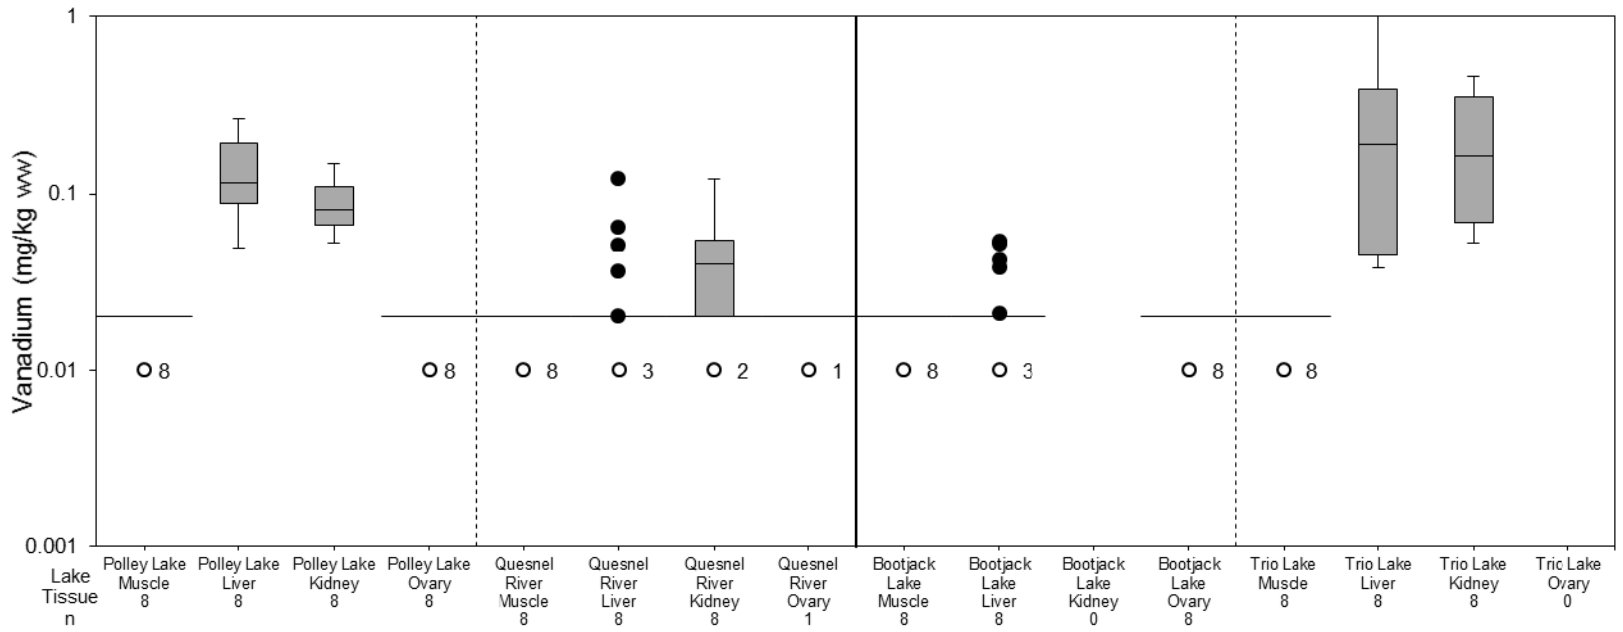
Figure 316: Vanadium Concentrations in Rainbow Trout Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

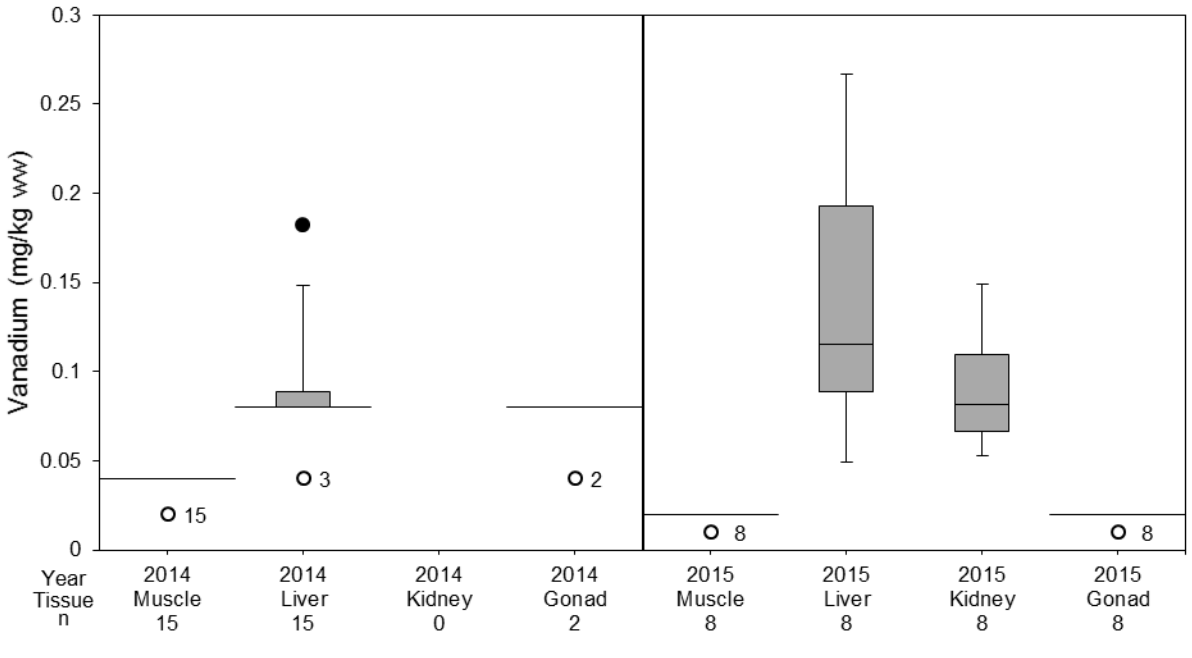
Figure 317: Vanadium Concentrations in Rainbow Trout Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

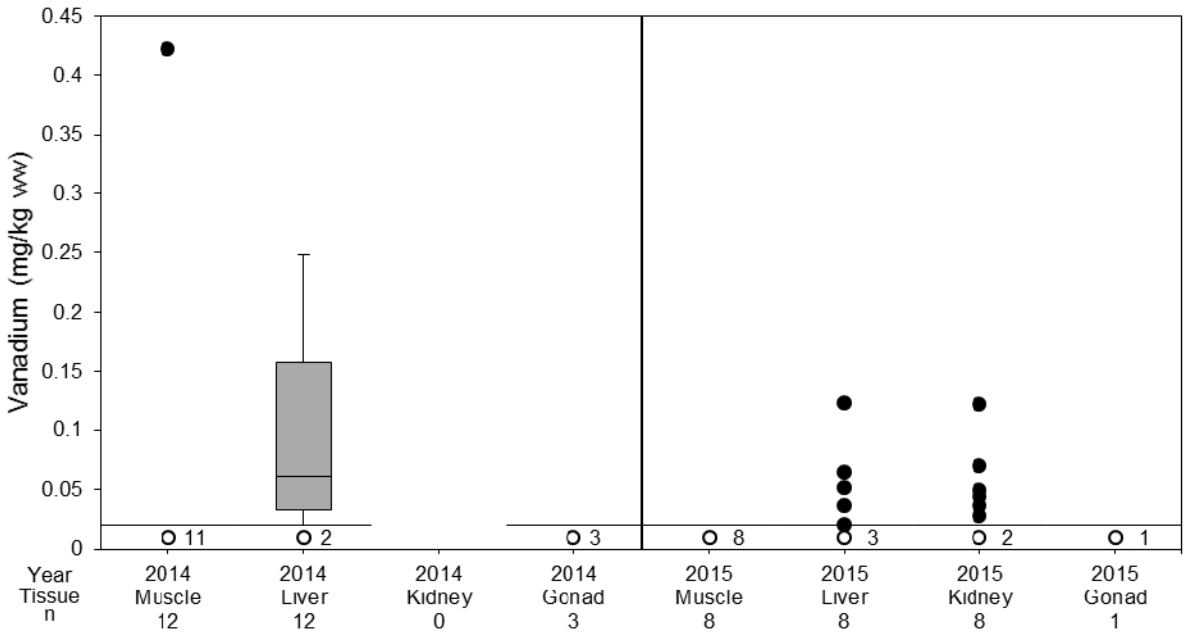
Figure 318: Vanadium Concentrations in Rainbow Trout Tissues Collected from Polley Lake in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 319: Vanadium Concentrations in Rainbow Trout Tissues Collected from Quesnel River in 2014 and 2015

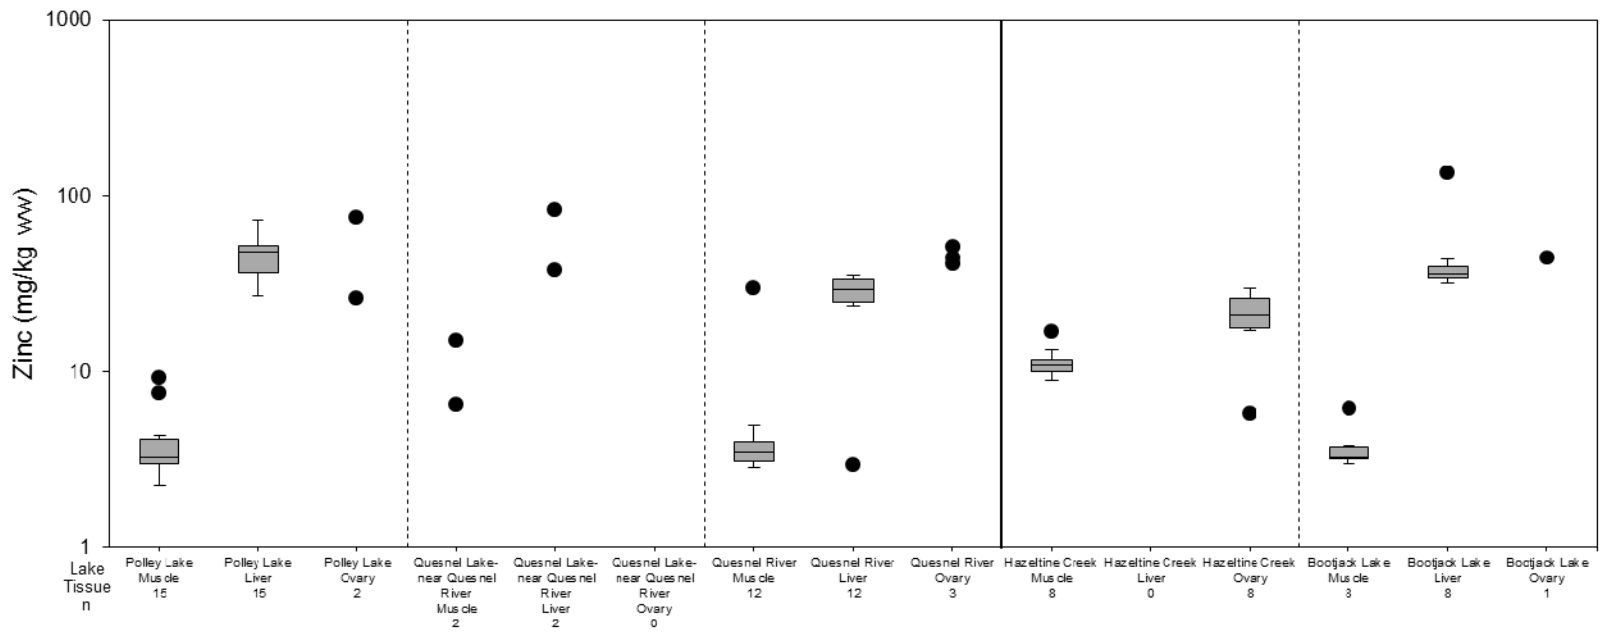


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

7.19 Zinc

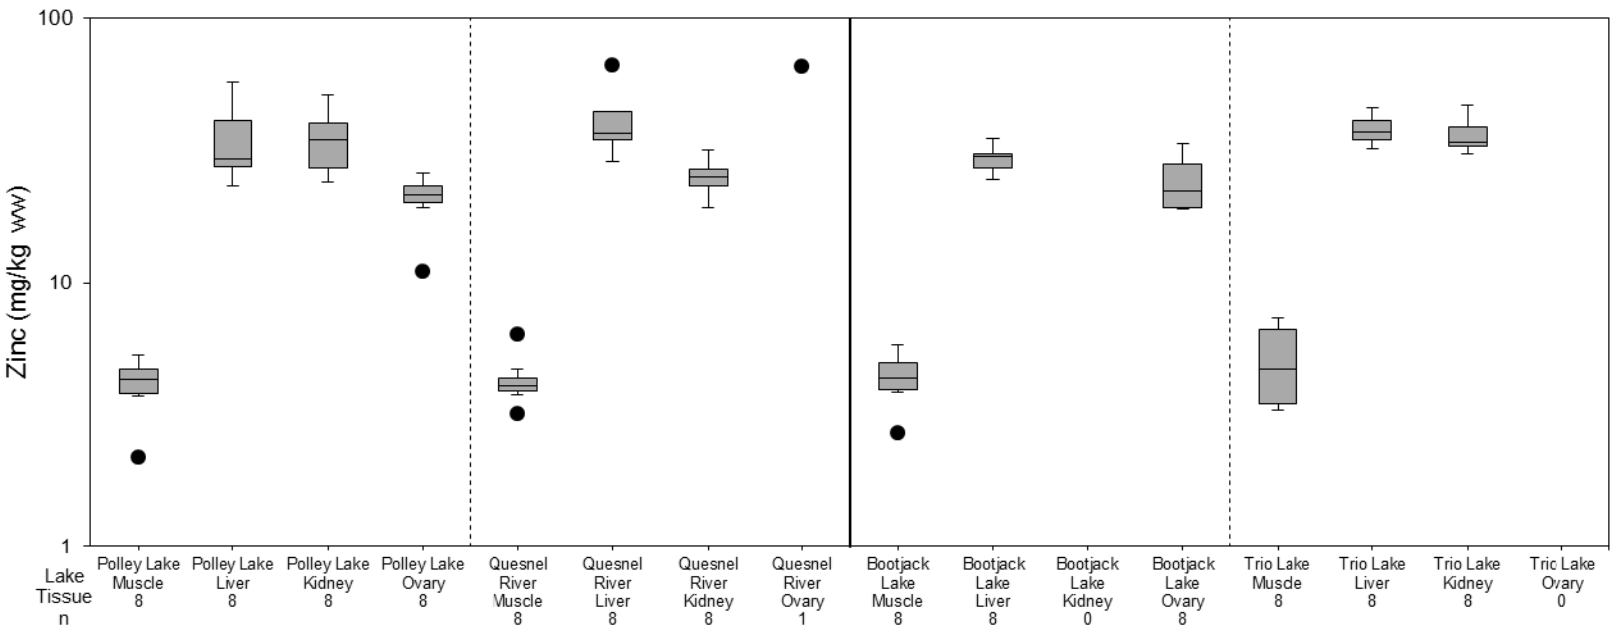
Figure 320: Zinc Concentrations in Rainbow Trout Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

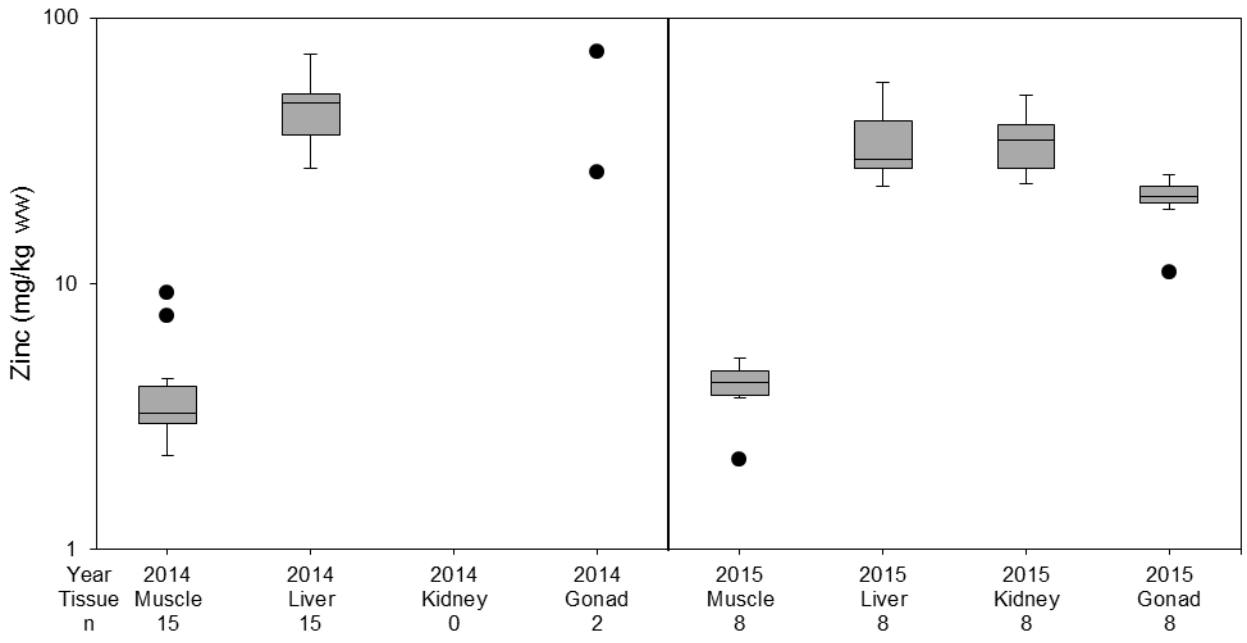
Figure 321: Zinc Concentrations in Rainbow Trout Tissues Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

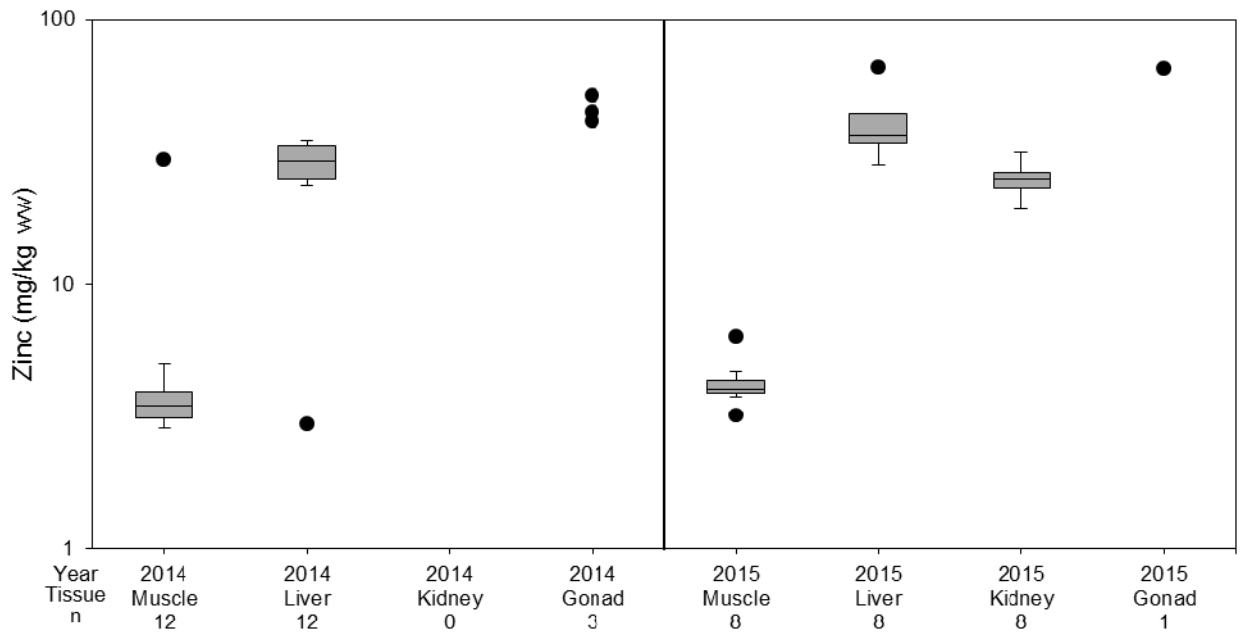
Figure 322: Zinc Concentrations in Rainbow Trout Tissues Collected from Polley Lake in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 323: Zinc Concentrations in Rainbow Trout Tissues Collected from Quesnel River in 2014 and 2015



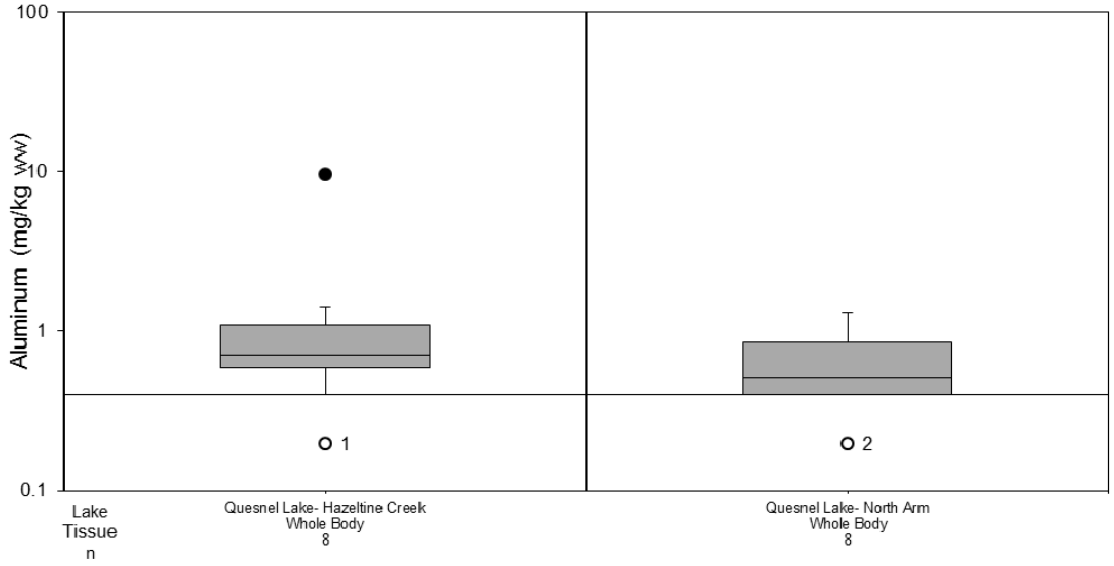
Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

8.0 REDSIDE SHINER

8.1 Aluminum

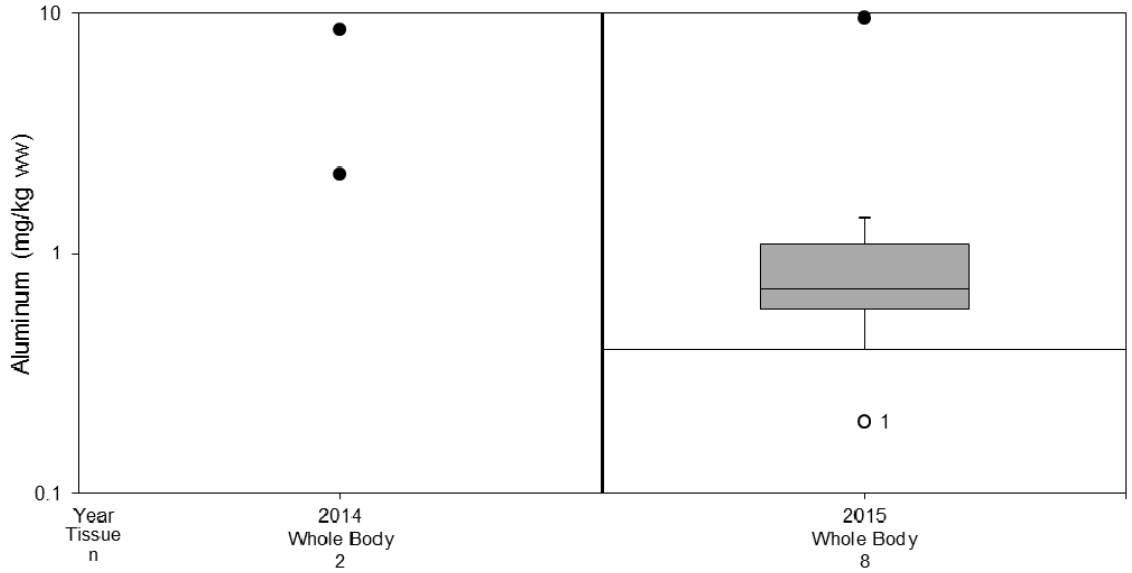
Figure 324: Aluminum Concentrations in Redside Shiner Tissue Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 325: Aluminum Concentrations in Redside Shiner Tissue Collected from the Quesnel Lake – Hazeltine Creek Confluence in 2014 and 2015

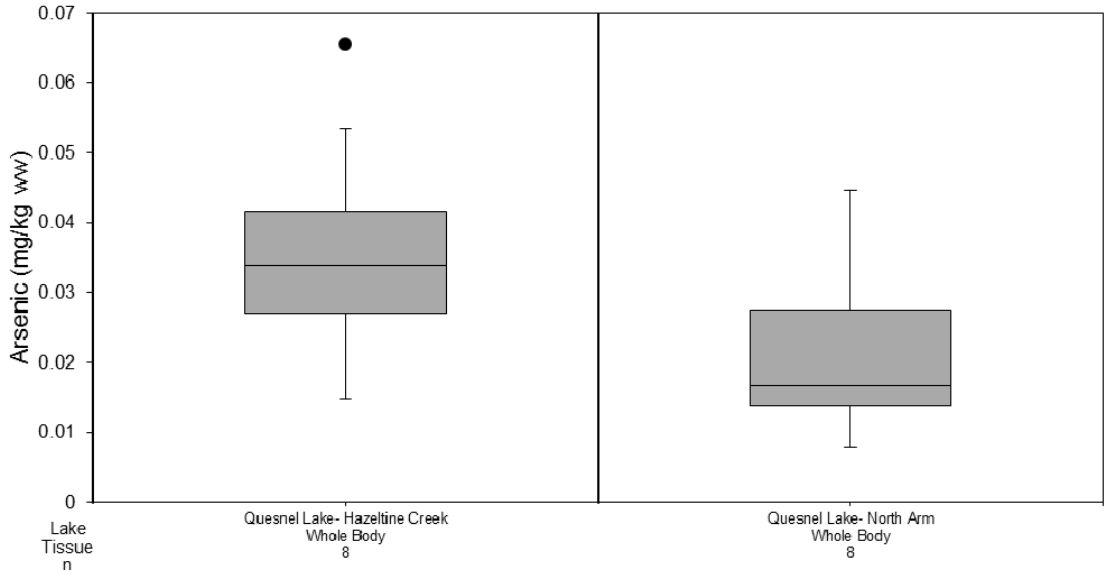


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

8.2 Arsenic

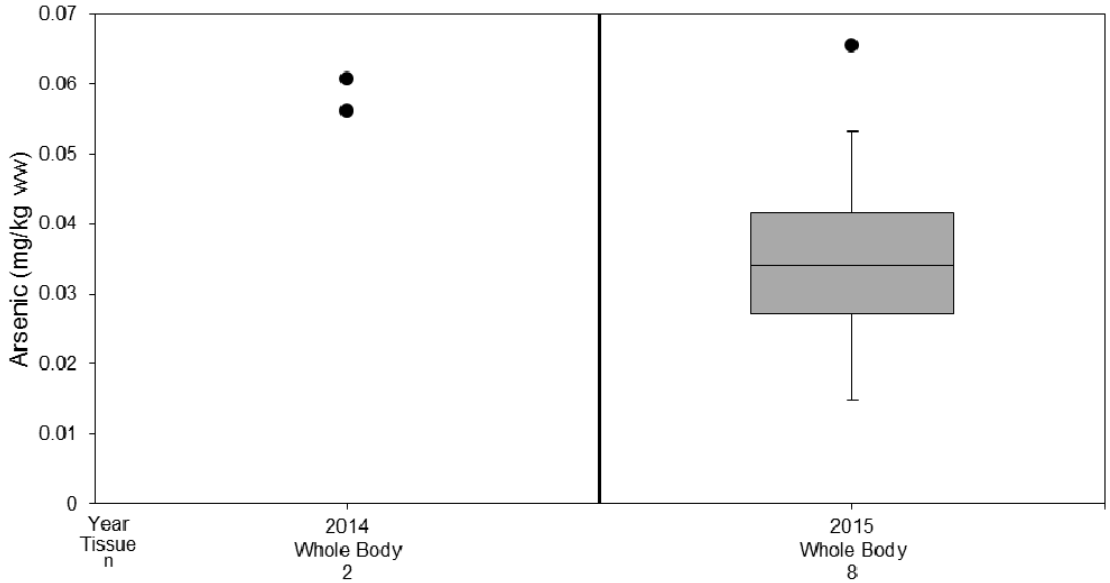
Figure 326: Arsenic Concentrations in Redside Shiner Tissue Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 327: Arsenic Concentrations in Redside Shiner Tissue Collected from the Quesnel Lake – Hazeltine Creek Confluence in 2014 and 2015

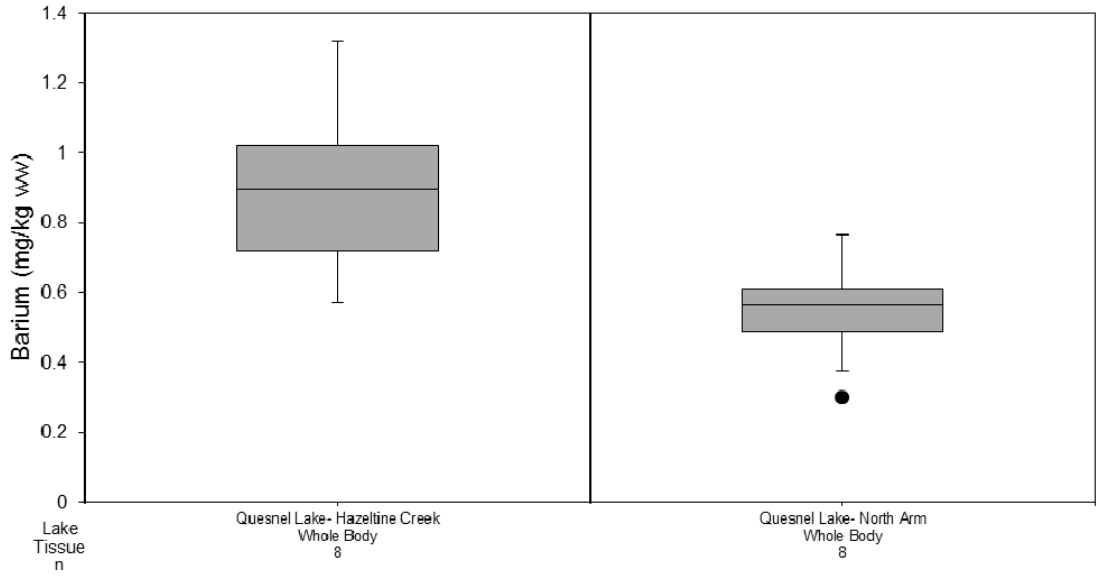


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

8.3 Barium

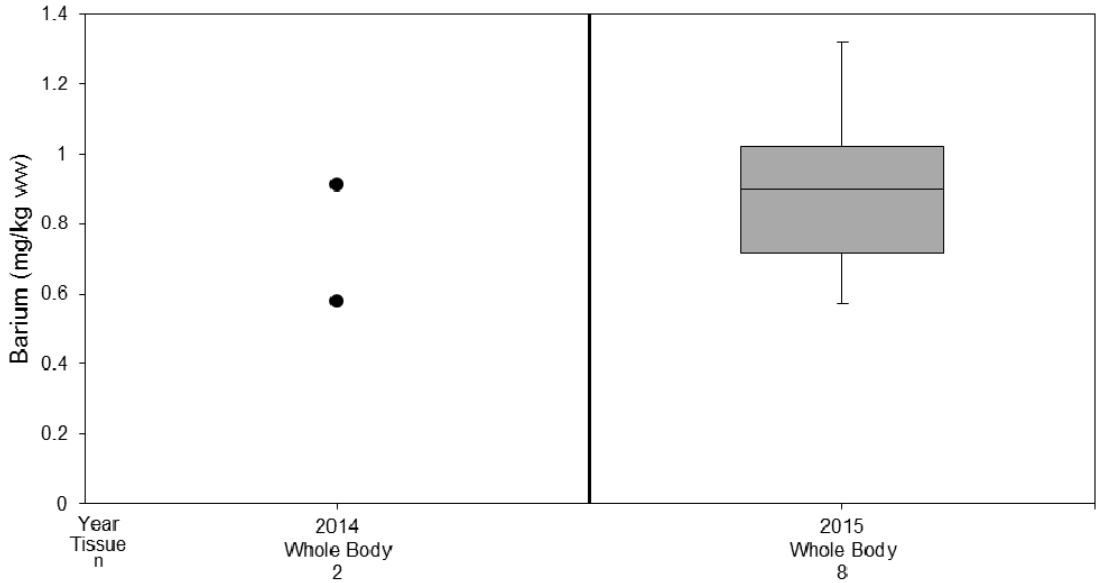
Figure 328: Barium Concentrations in Redside Shiner Tissue Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 329: Barium Concentrations in Redside Shiner Tissue Collected from the Quesnel Lake – Hazeltine Creek Confluence in 2014 and 2015

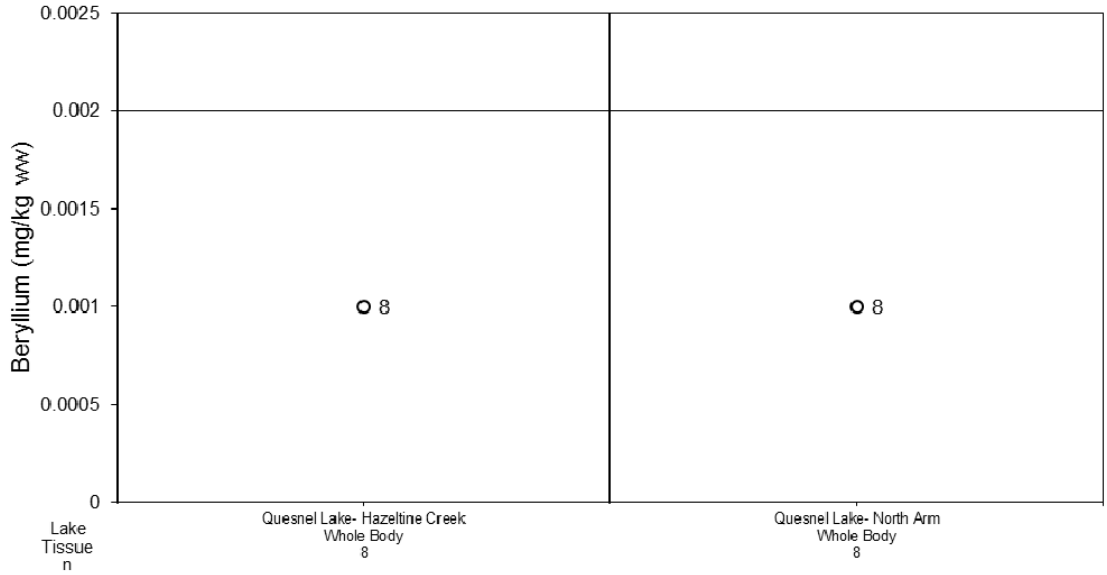


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

8.4 Beryllium

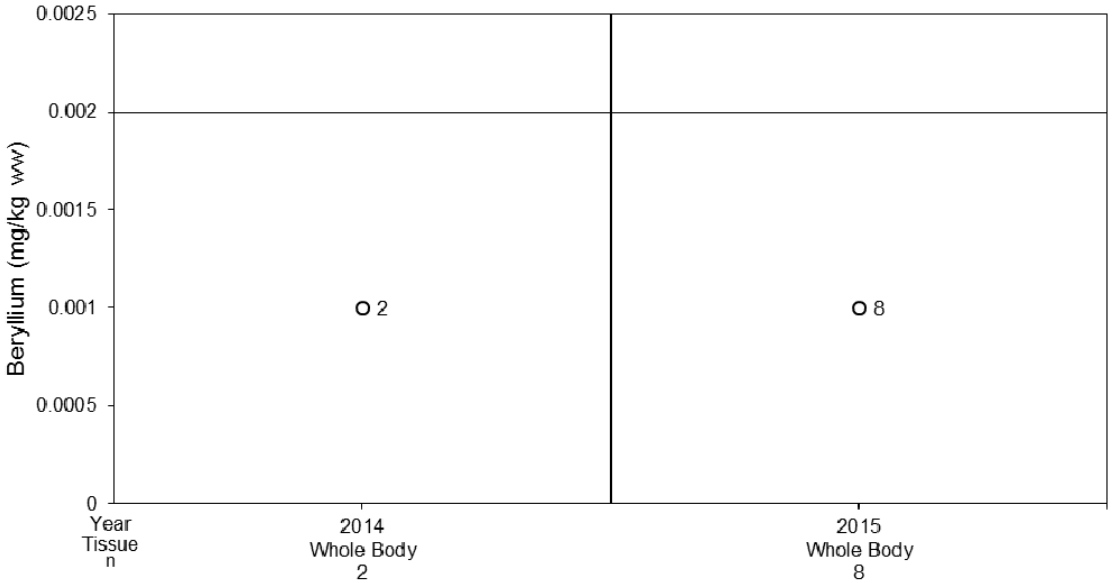
Figure 330: Beryllium Concentrations in Redside Shiner Tissue Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 331: Beryllium Concentrations in Redside Shiner Tissue Collected from the Quesnel Lake – Hazeltine Creek Confluence in 2014 and 2015

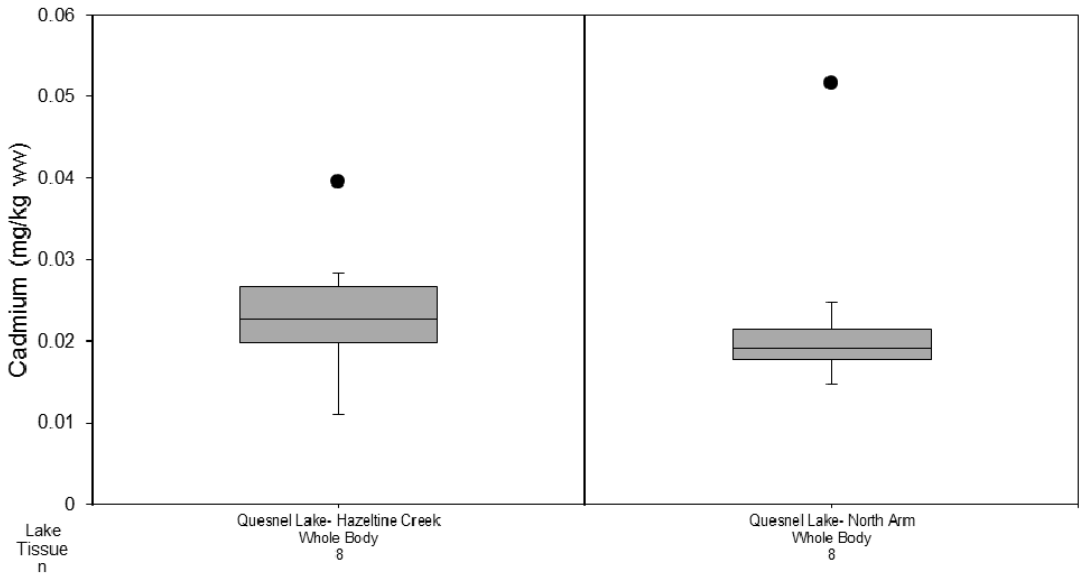


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

8.5 Cadmium

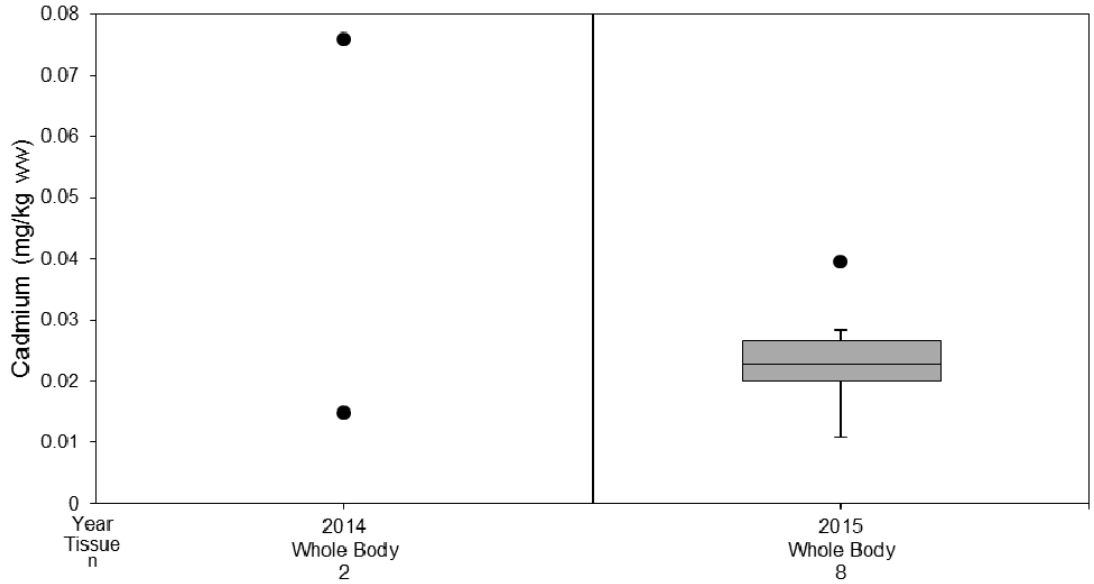
Figure 332: Cadmium Concentrations in Redside Shiner Tissue Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 333: Cadmium Concentrations in Redside Shiner Tissue Collected from the Quesnel Lake – Hazeltine Creek Confluence in 2014 and 2015

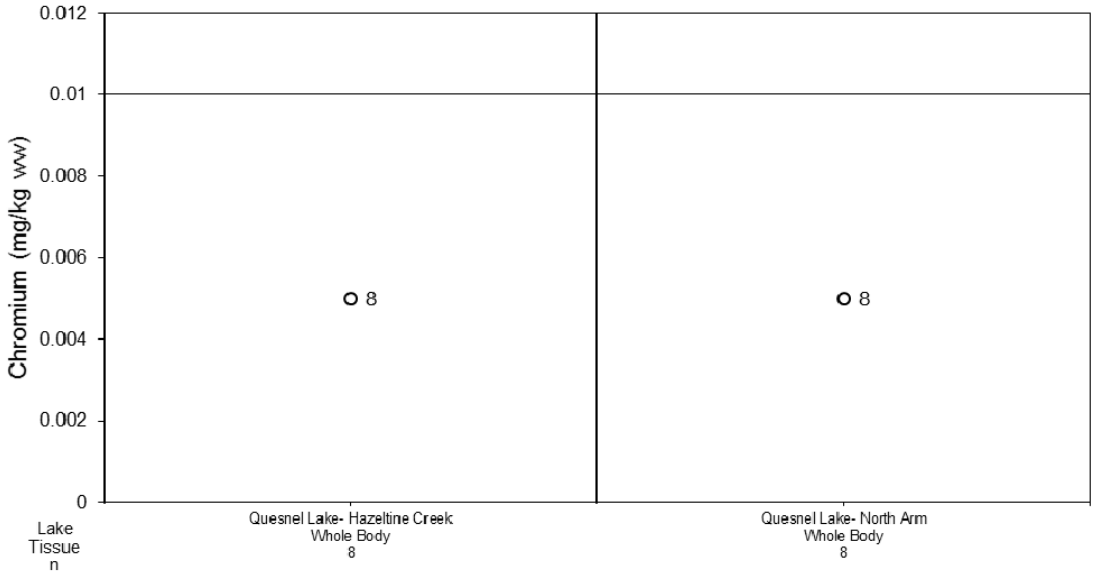


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

8.6 Chromium

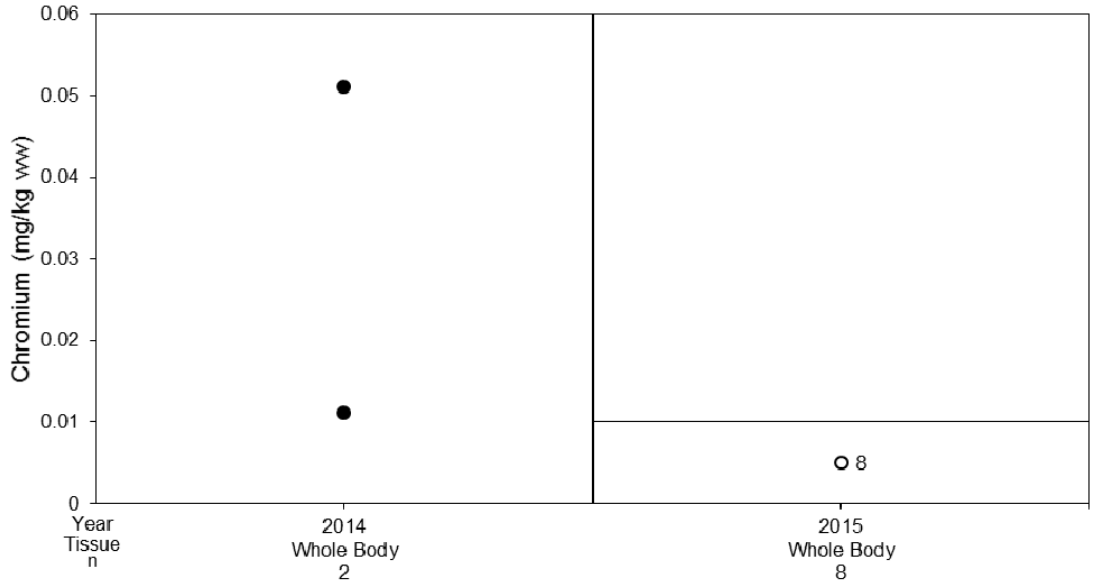
Figure 334: Chromium Concentrations in Redside Shiner Tissue Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 335: Chromium Concentrations in Redside Shiner Tissue Collected from the Quesnel Lake – Hazeltine Creek Confluence in 2014 and 2015

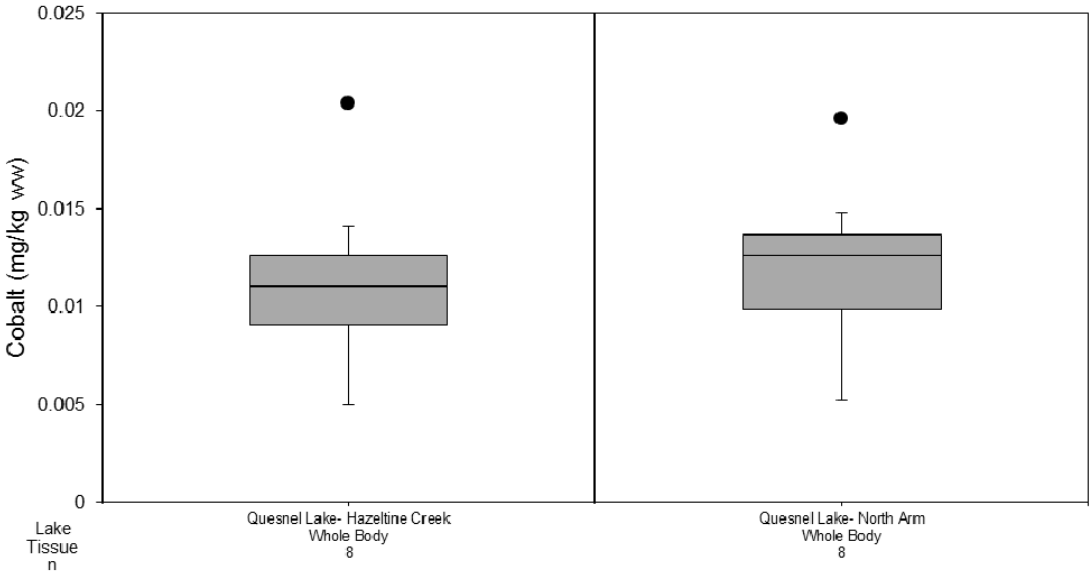


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

8.7 Cobalt

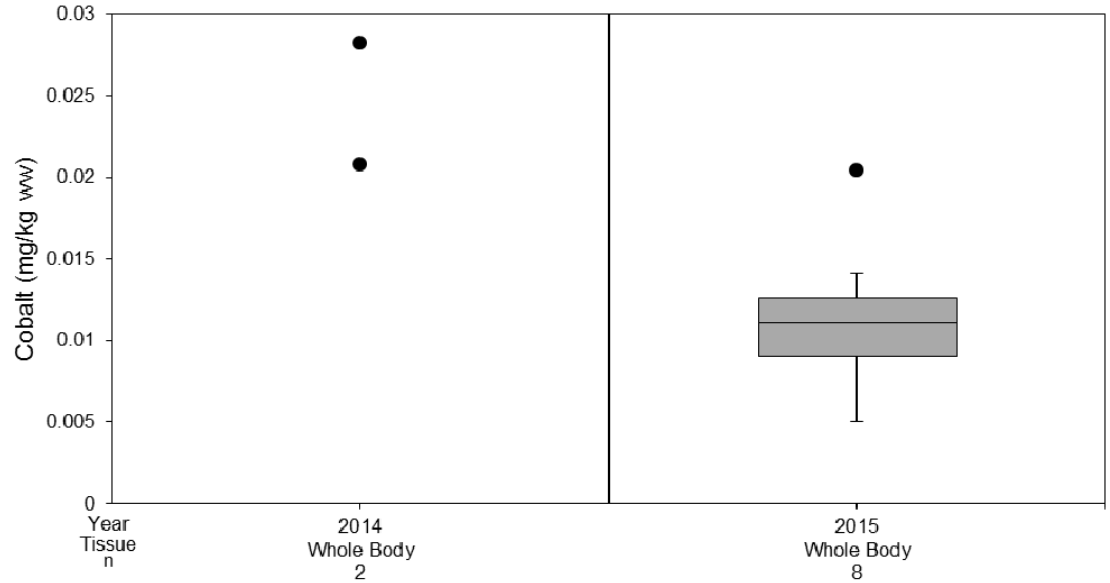
Figure 336: Cobalt Concentrations in Redside Shiner Tissue Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 337: Cobalt Concentrations in Redside Shiner Tissue Collected from the Quesnel Lake – Hazeltine Creek Confluence in 2014 and 2015

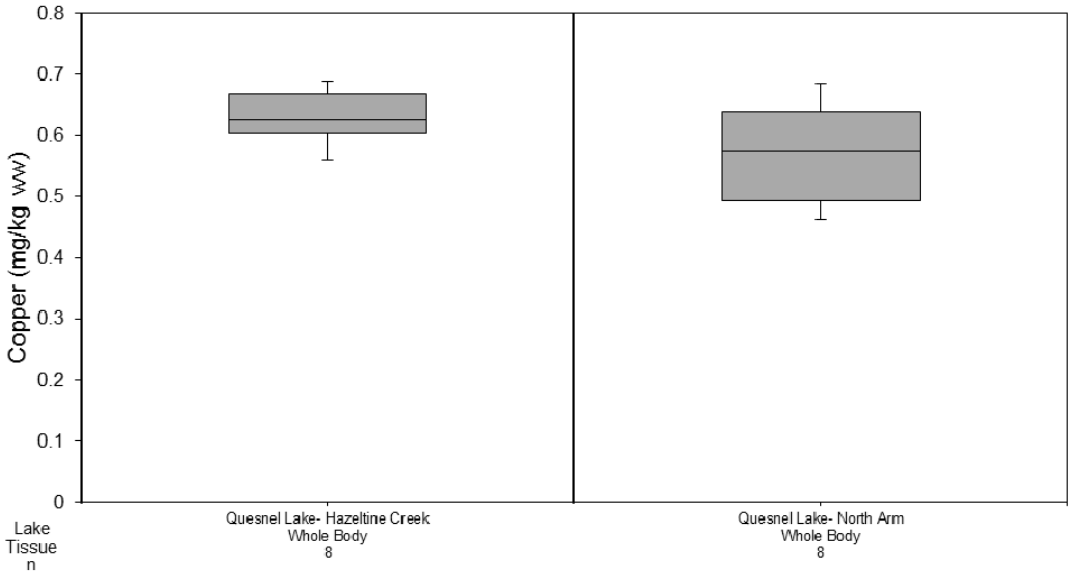


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

8.8 Copper

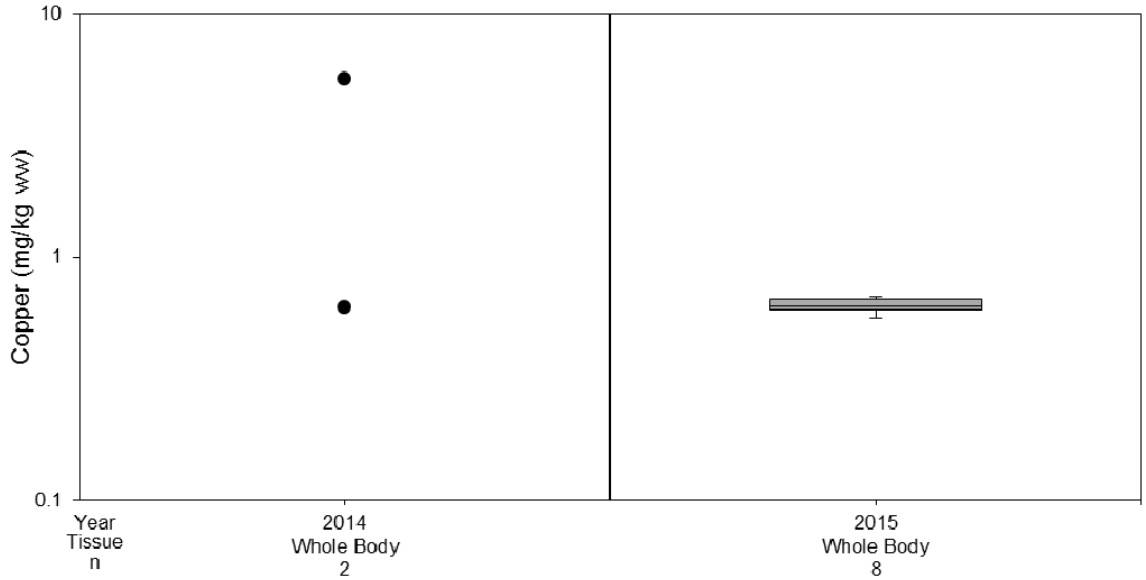
Figure 338: Copper Concentrations in Redside Shiner Tissue Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 339: Copper Concentrations in Redside Shiner Tissue Collected from the Quesnel Lake – Hazeltine Creek Confluence in 2014 and 2015

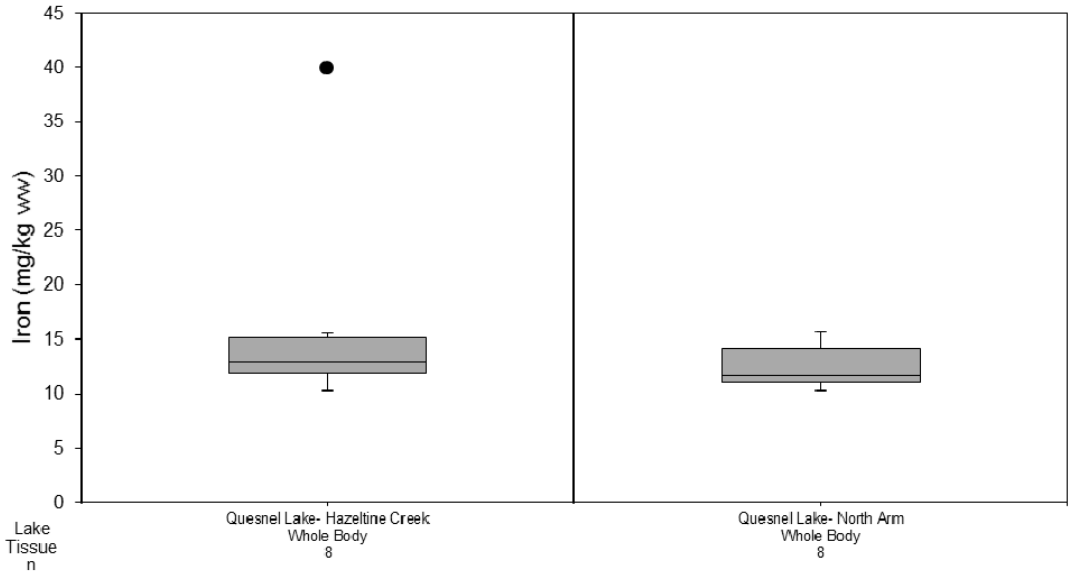


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

8.9 Iron

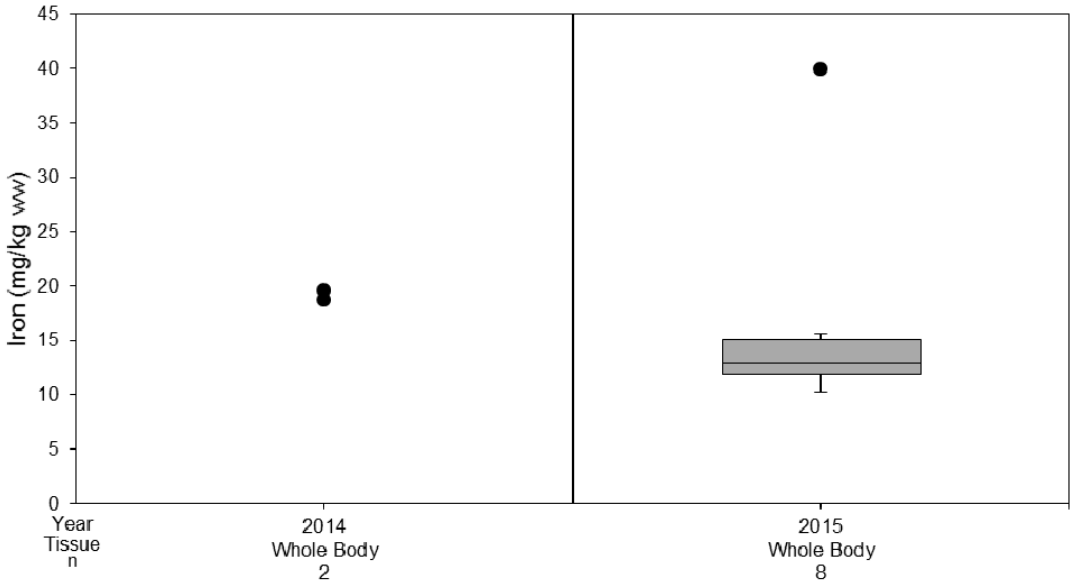
Figure 340: Iron Concentrations in Lake Redside Shiner Tissue Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 341: Iron Concentrations in Lake Redside Shiner Tissue Collected from the Quesnel Lake – Hazeltine Creek Confluence in 2014 and 2015

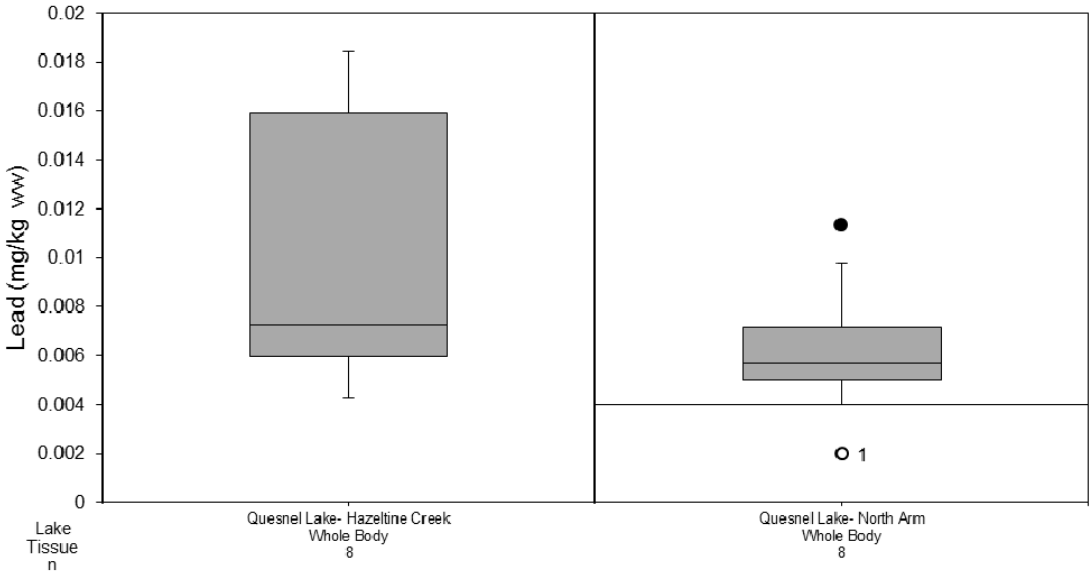


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

8.10 Lead

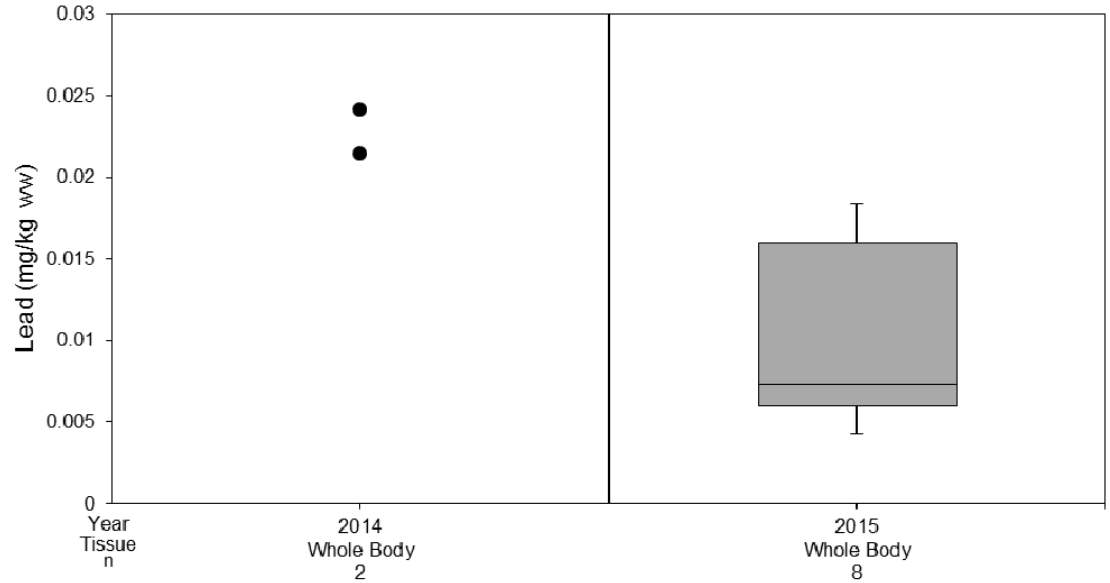
Figure 342: Lead Concentrations in Redside Shiner Tissue Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 343: Lead Concentrations in Redside Shiner Tissue Collected from the Quesnel Lake – Hazeltine Creek Confluence in 2014 and 2015

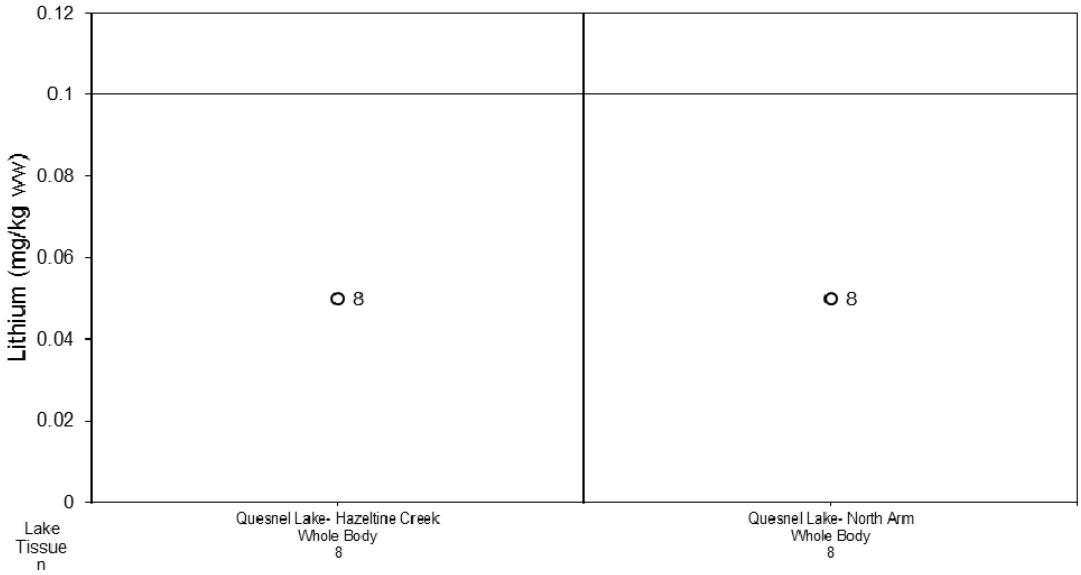


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

8.11 Lithium

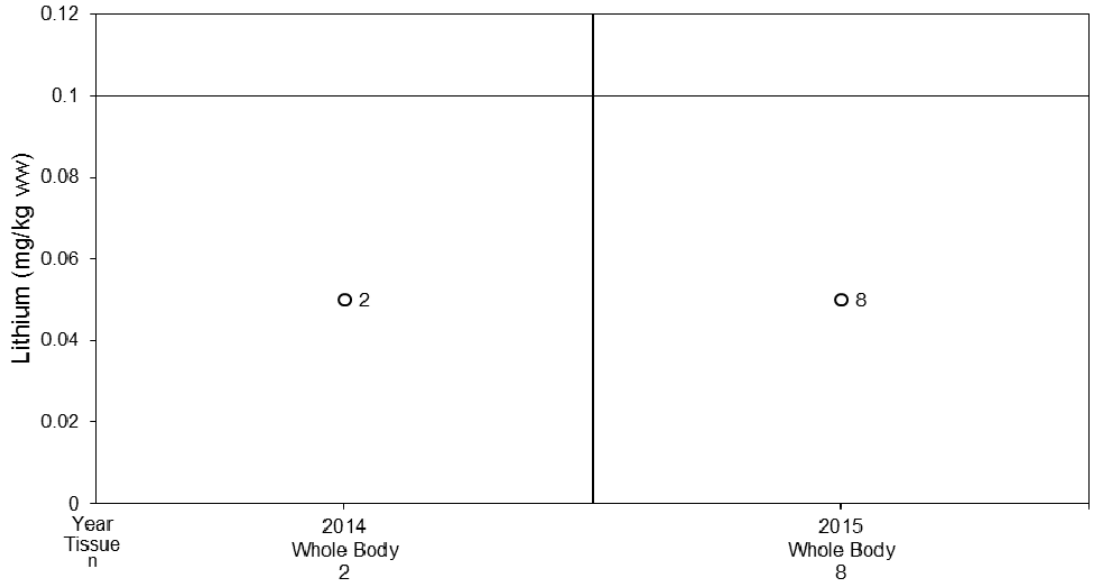
Figure 344: Lithium Concentrations in Redside Shiner Tissue Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 345: Lithium Concentrations in Redside Shiner Tissue Collected from the Quesnel Lake – Hazeltine Creek Confluence in 2014 and 2015

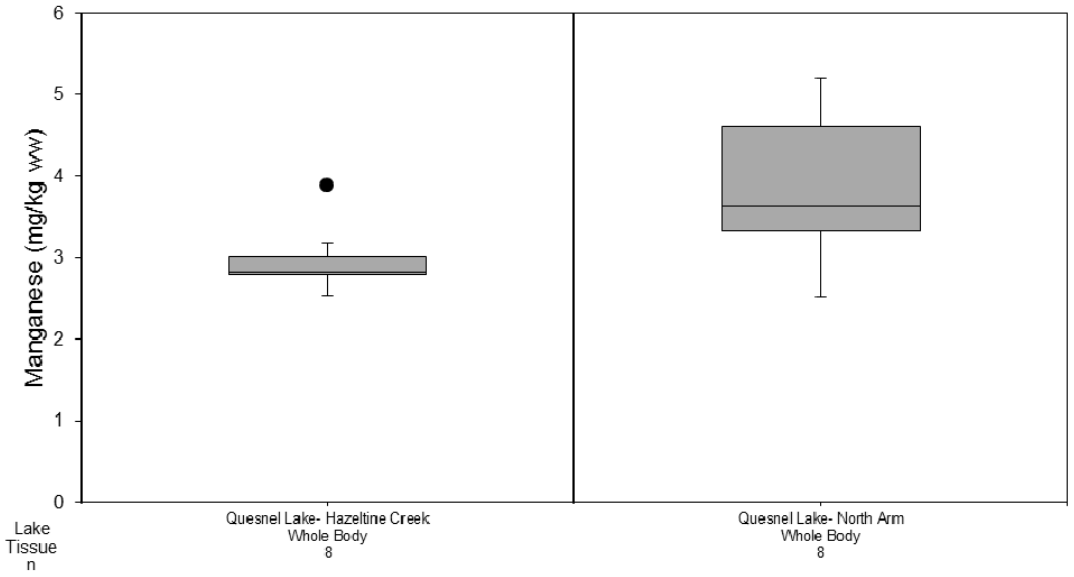


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

8.12 Manganese

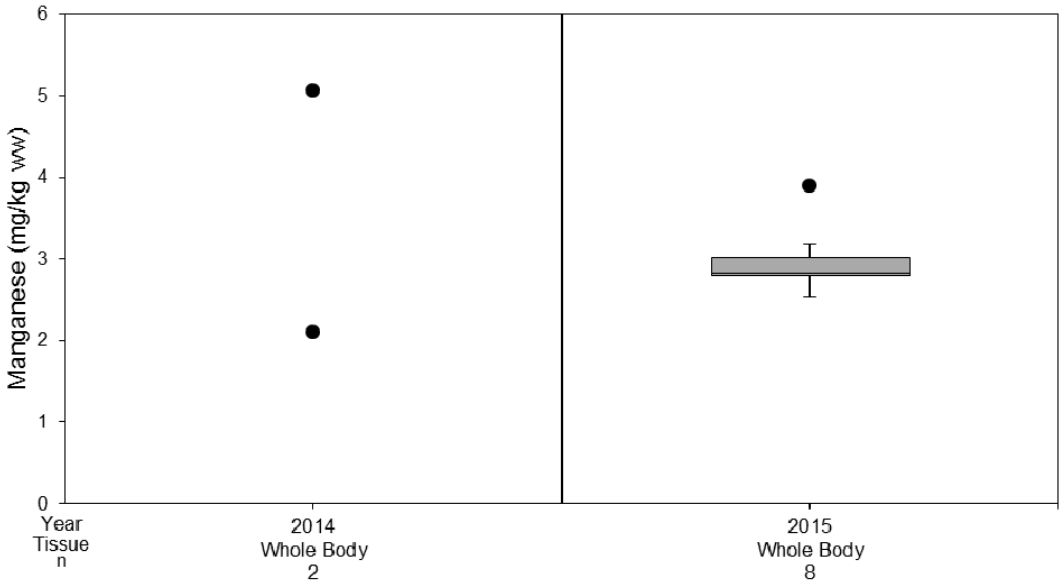
Figure 346: Manganese Concentrations in Redside Shiner Tissue Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 347: Manganese Concentrations in Redside Shiner Tissue Collected from the Quesnel Lake – Hazeltine Creek Confluence in 2014 and 2015

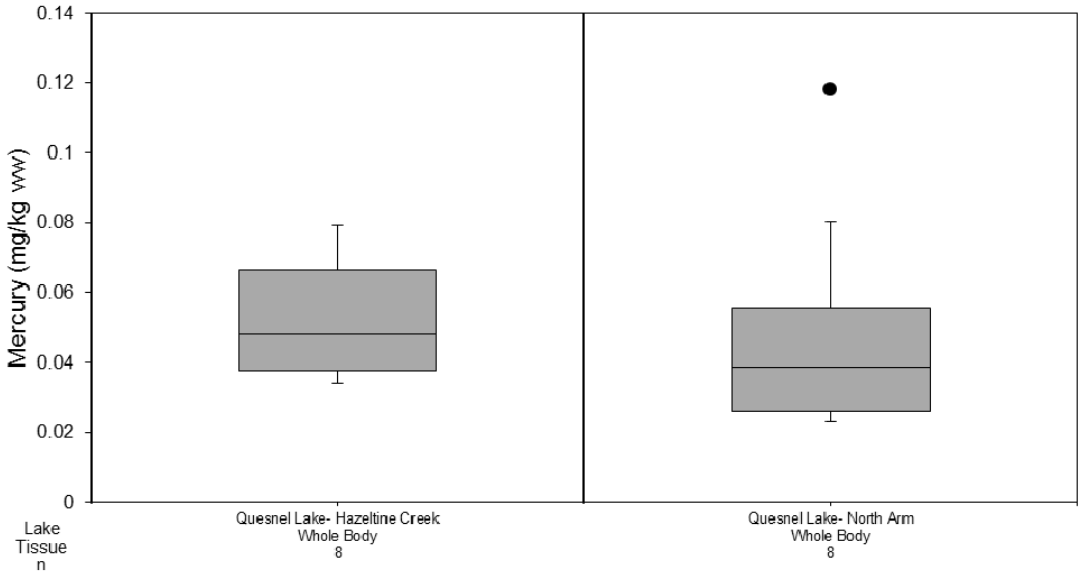


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

8.13 Mercury

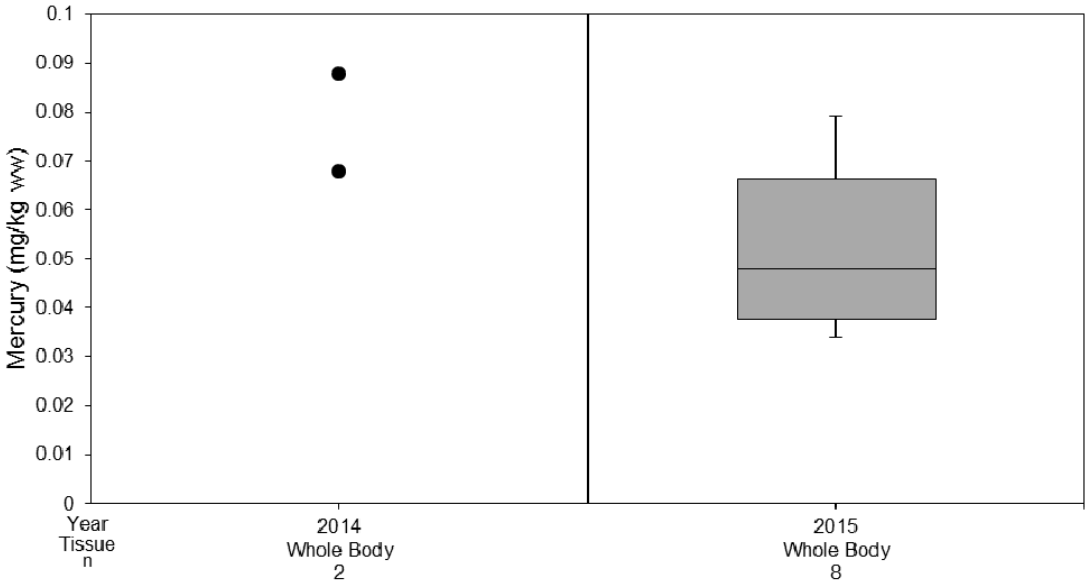
Figure 348: Mercury Concentrations in Redside Shiner Tissue Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 349: Mercury Concentrations in Redside Shiner Tissue Collected from the Quesnel Lake – Hazeltine Creek Confluence in 2014 and 2015

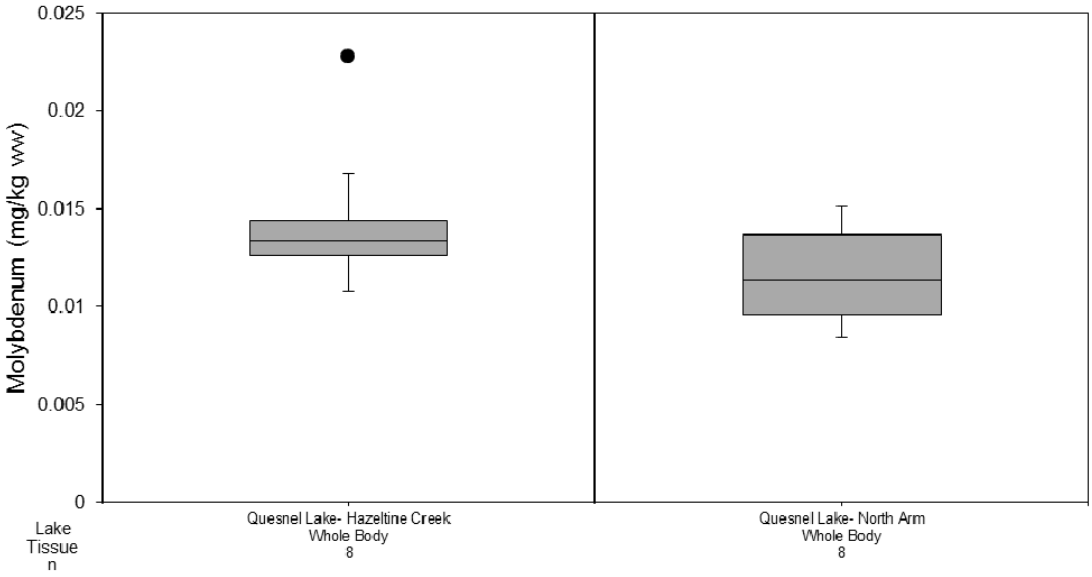


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

8.14 Molybdenum

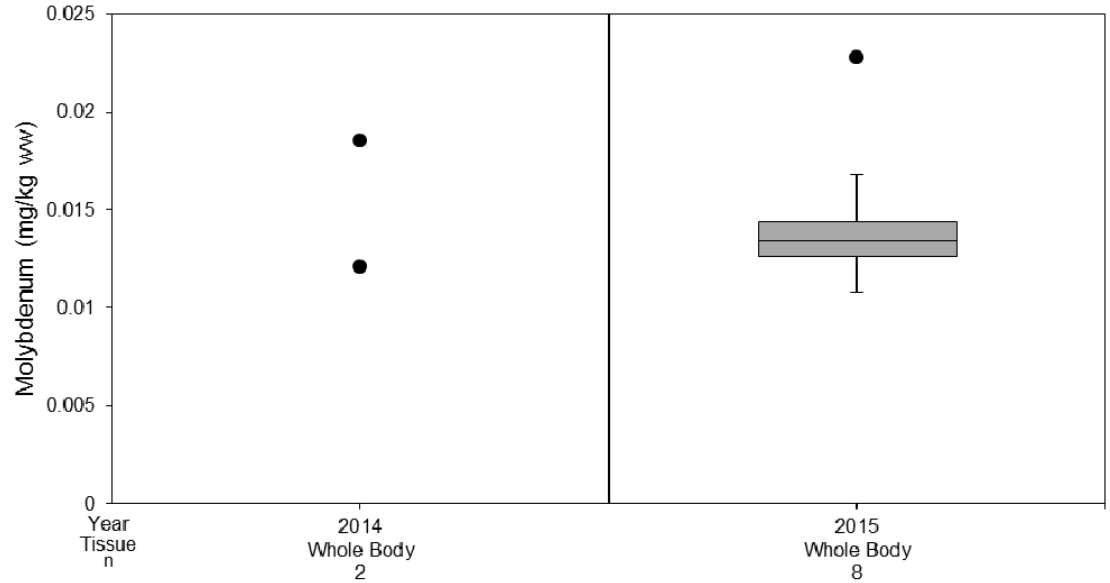
Figure 350: Molybdenum Concentrations in Redside Shiner Tissue Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 351: Molybdenum Concentrations in Redside Shiner Tissue Collected from the Quesnel Lake – Hazeltine Creek Confluence in 2014 and 2015

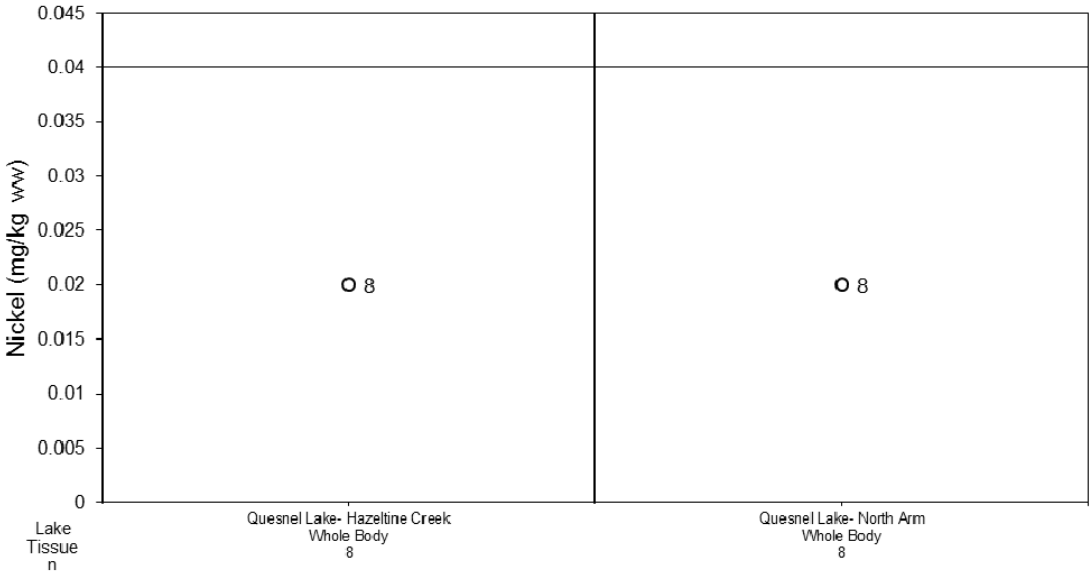


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

8.15 Nickel

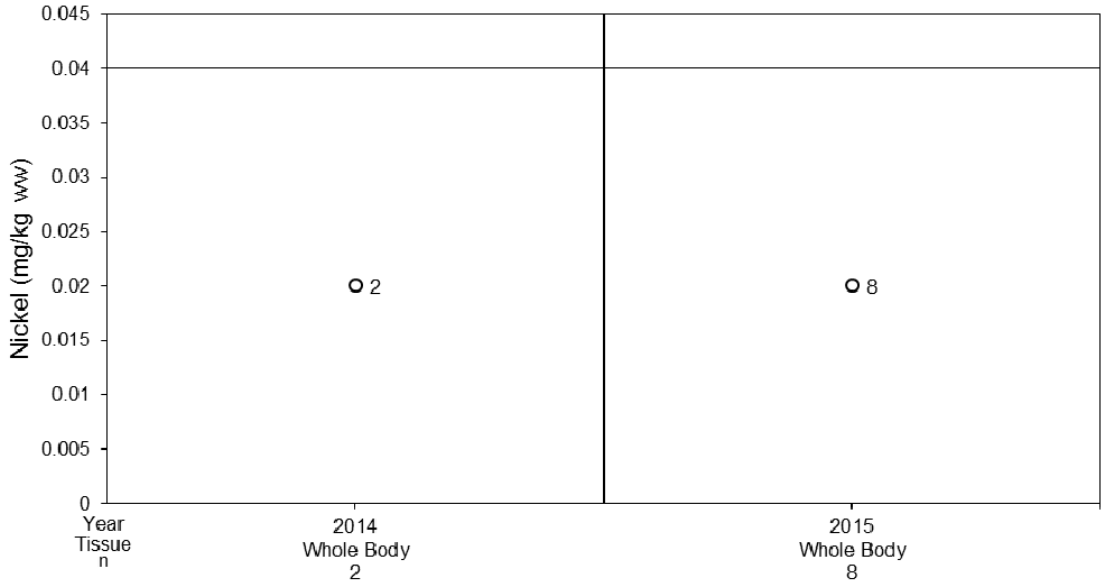
Figure 352: Nickel Concentrations in Lake Redside Shiner Tissue Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 353: Nickel Concentrations in Lake Redside Shiner Tissue Collected from the Quesnel Lake – Hazeltine Creek Confluence in 2014 and 2015

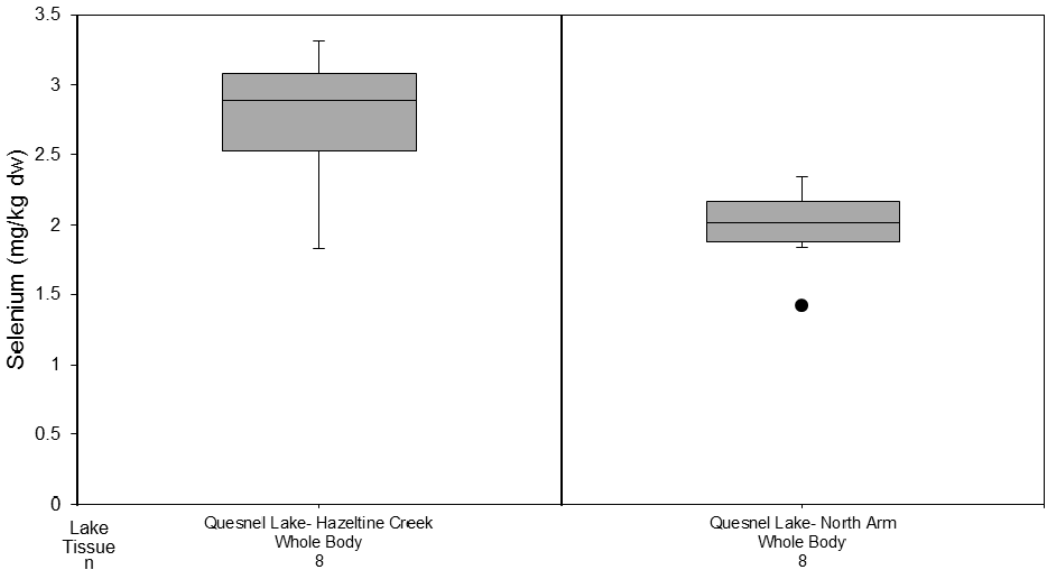


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

8.16 Selenium

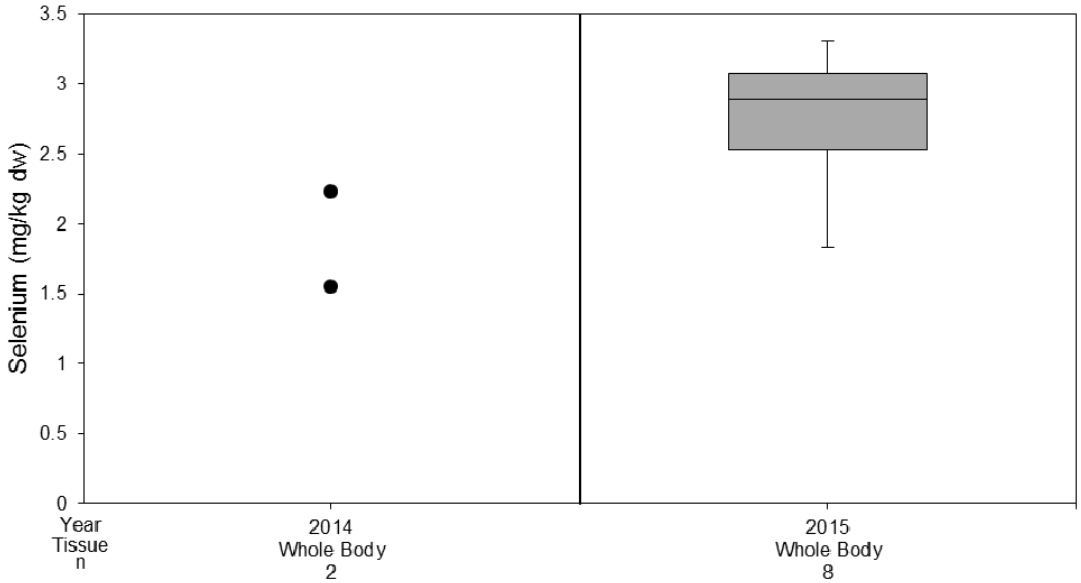
Figure 354: Selenium Concentrations in Redside Shiner Tissue Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg dw = milligrams per kilogram dry weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 355: Selenium Concentrations in Redside Shiner Tissue Collected from the Quesnel Lake – Hazeltine Creek Confluence in 2014 and 2015

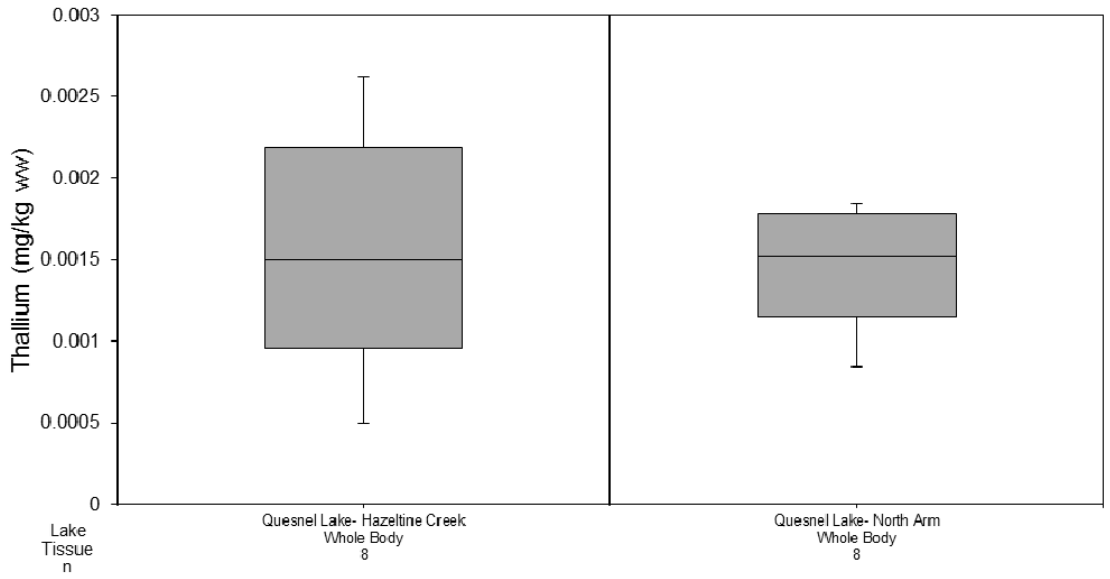


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg dw = milligrams per kilogram dry weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

8.17 Thallium

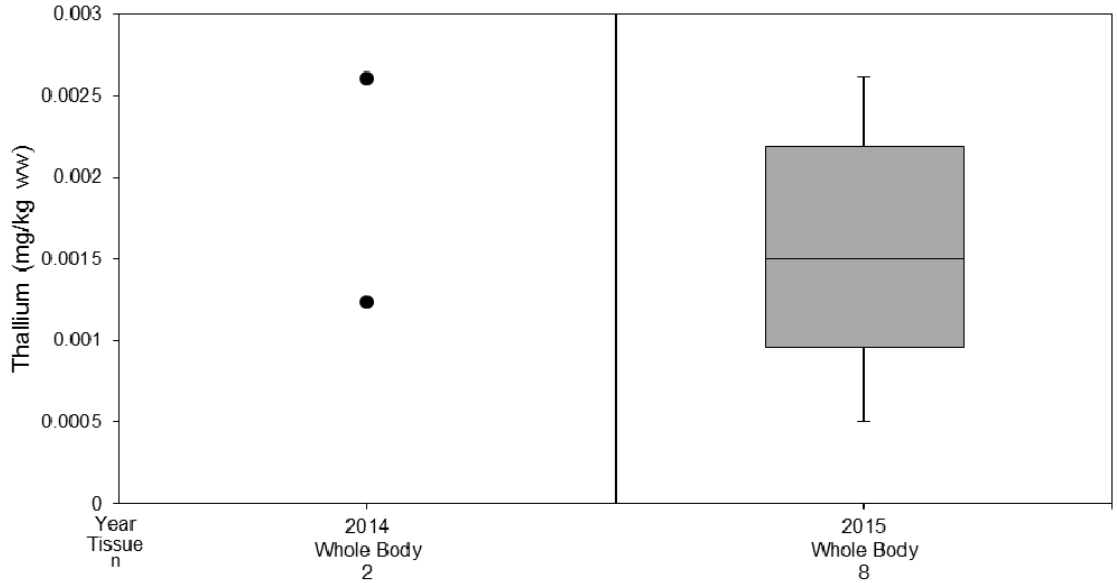
Figure 356: Thallium Concentrations in Redside Shiner Tissue Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 357: Thallium Concentrations in Redside Shiner Tissue Collected from the Quesnel Lake – Hazeltine Creek Confluence in 2014 and 2015

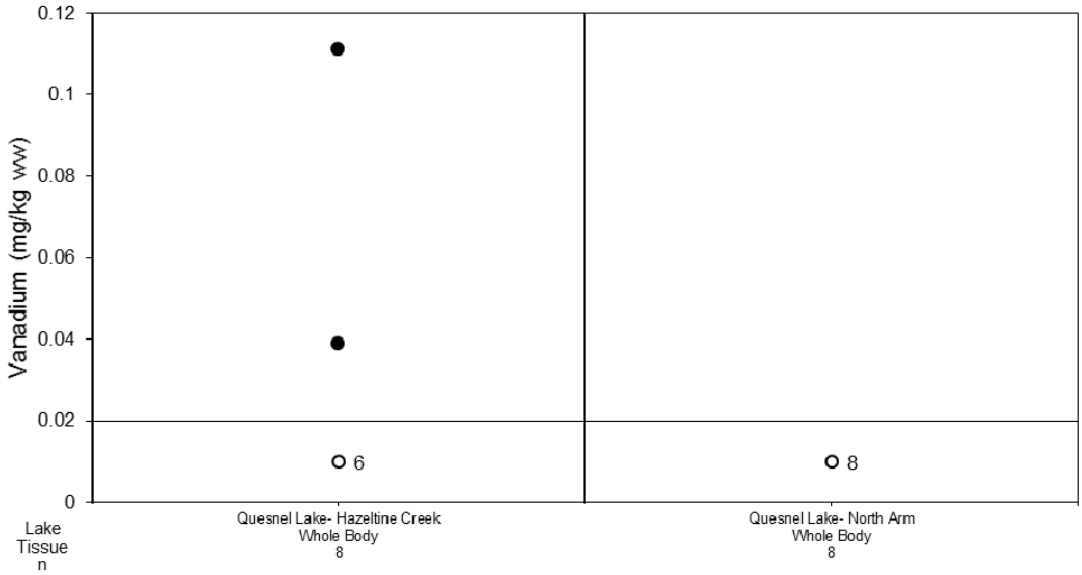


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

8.18 Vanadium

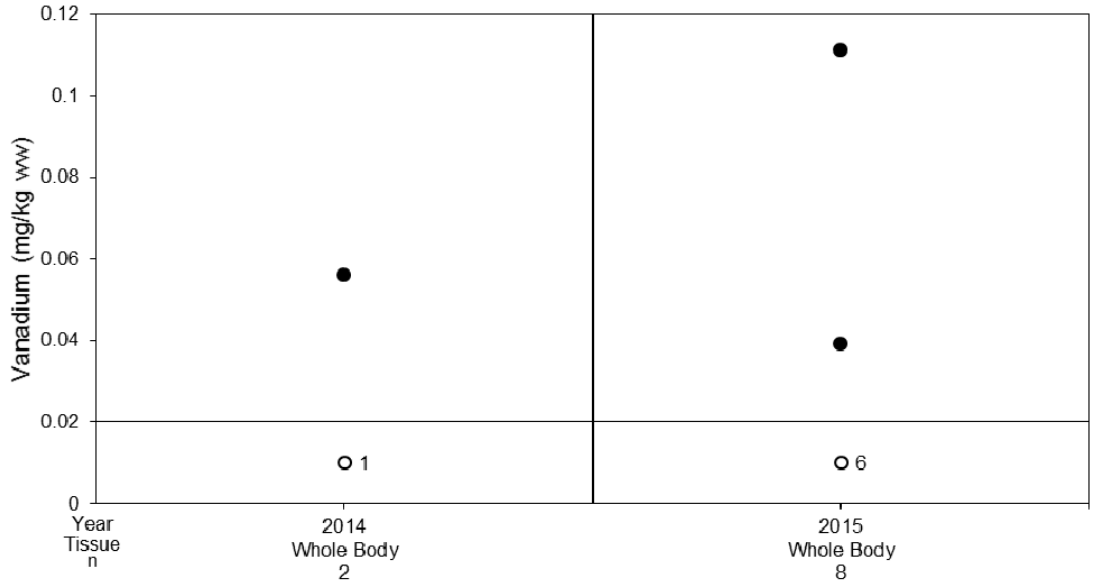
Figure 358: Vanadium Concentrations in Redside Shiner Tissue Collected in 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 359: Vanadium Concentrations in Redside Shiner Tissue Collected from the Quesnel Lake – Hazeltine Creek Confluence in 2014 and 2015

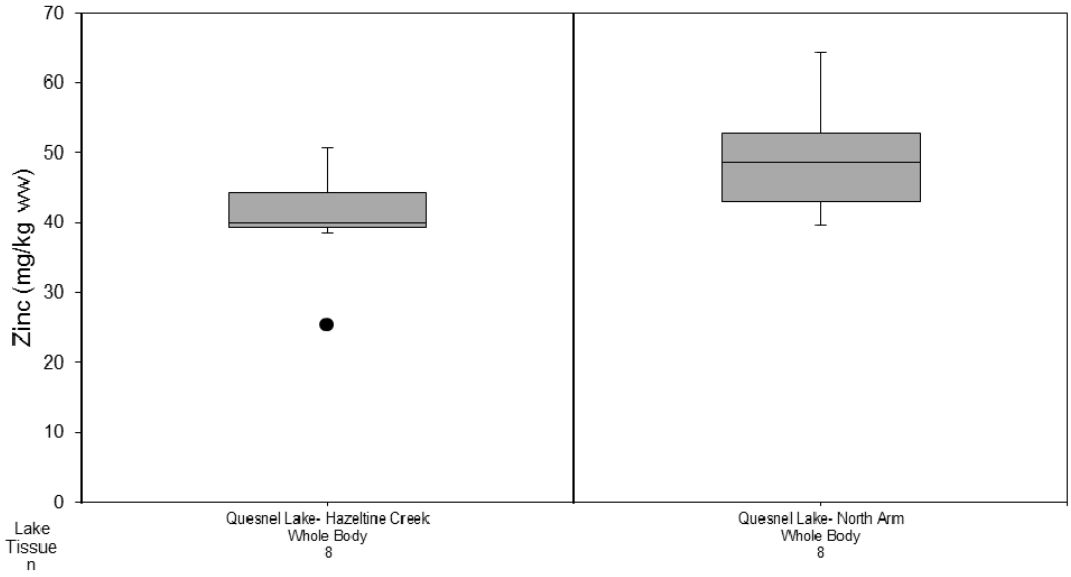


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

8.19 Zinc

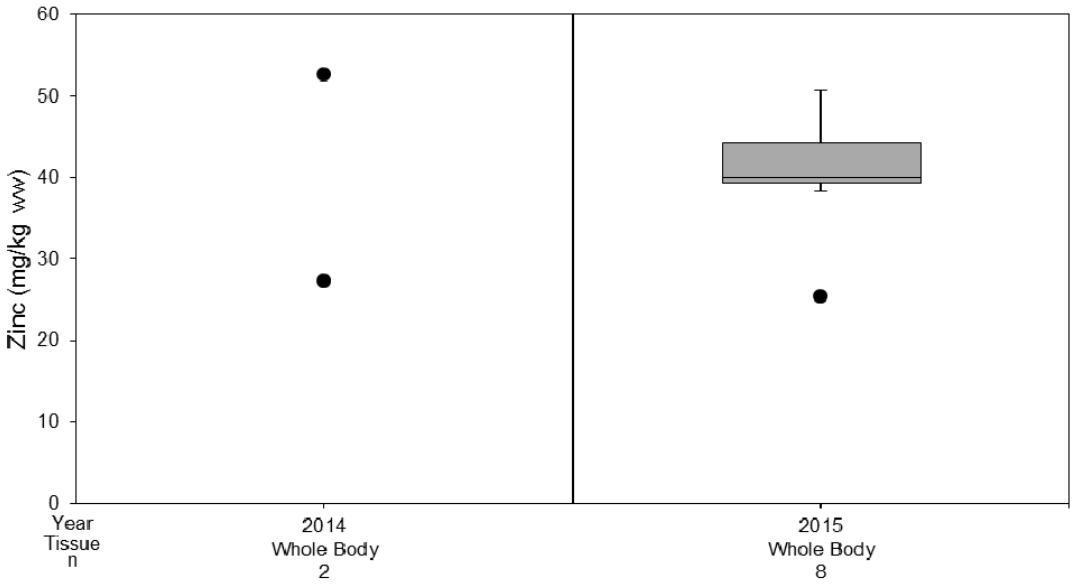
Figure 360: Zinc Concentrations in Redside Shiner Tissue Collected in 2015



\ Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 361: Zinc Concentrations in Redside Shiner Tissue Collected from the Quesnel Lake – Hazeltine Creek Confluence in 2014 and 2015



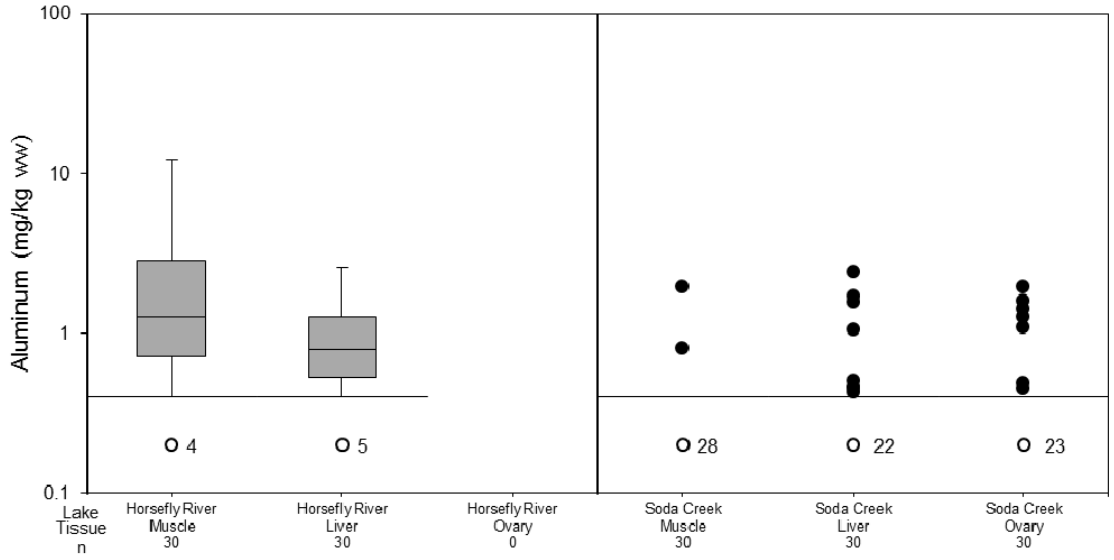
Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

9.0 SOCKEYE SALMON ADULTS

9.1 Aluminum

Figure 362: Aluminum Concentrations in Sockeye Salmon Adult Tissues Collected in 2014

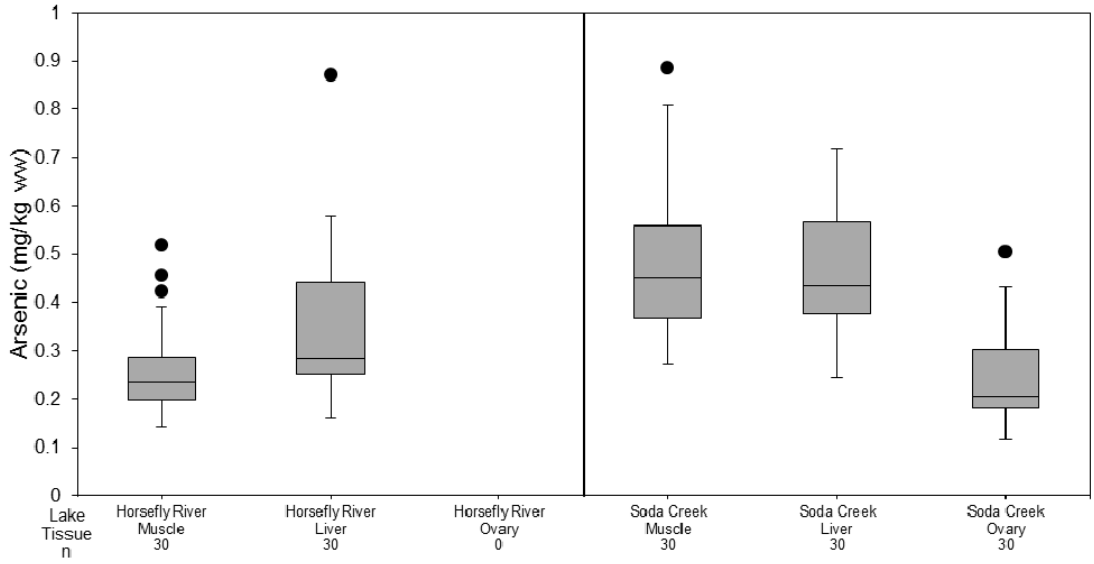


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

9.2 Arsenic

Figure 363: Arsenic Concentrations in Sockeye Salmon Adult Tissues Collected in 2014

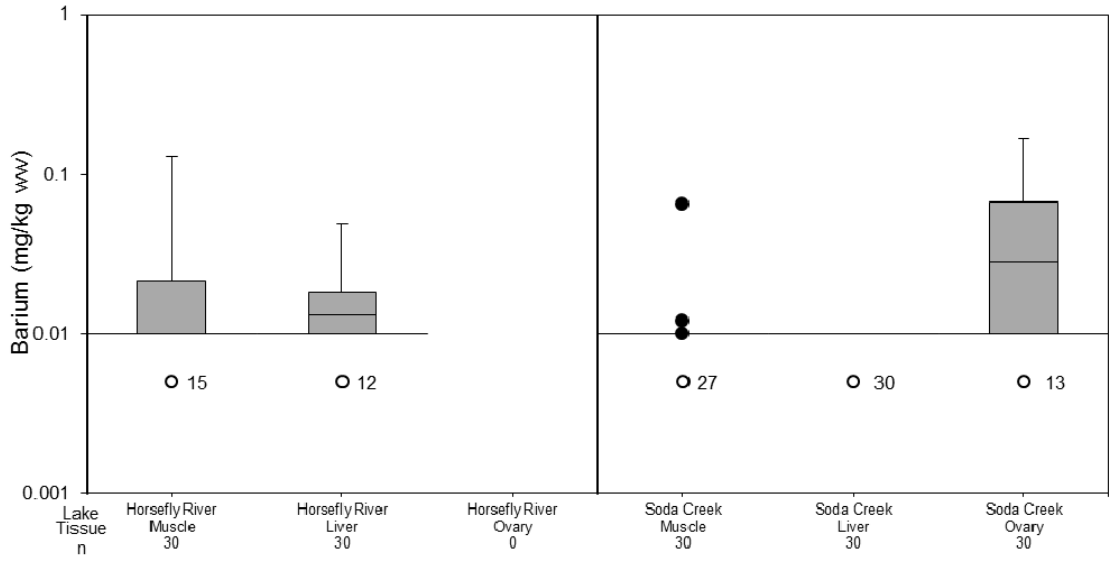


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

9.3 Barium

Figure 364: Barium Concentrations in Sockeye Salmon Adult Tissues Collected in 2014

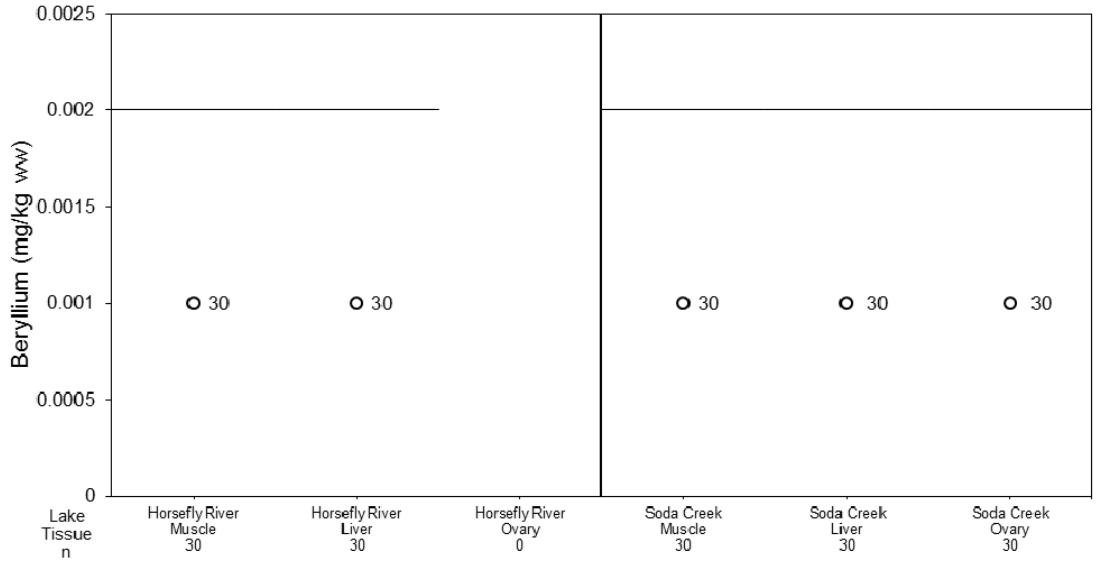


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

9.4 Beryllium

Figure 365: Beryllium Concentrations in Sockeye Salmon Adult Tissues Collected in 2014

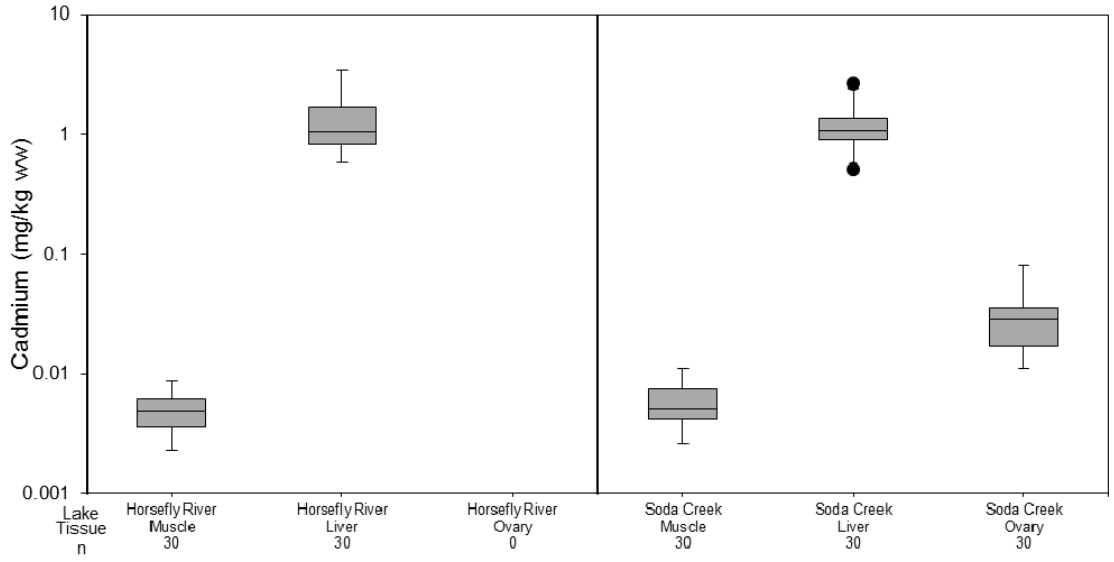


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

9.5 Cadmium

Figure 366: Cadmium Concentrations in Sockeye Salmon Adult Tissues Collected in 2014

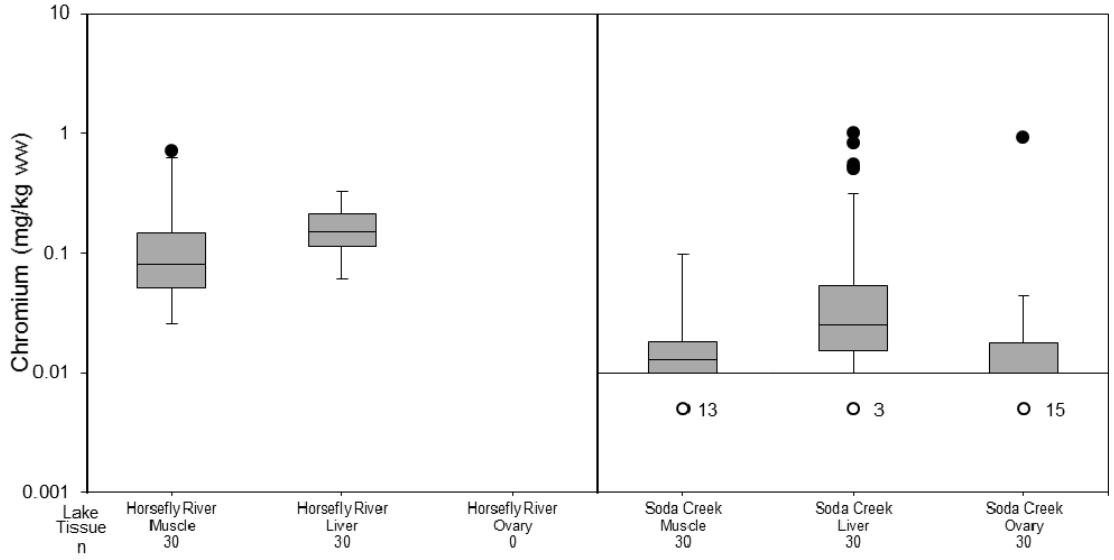


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

9.6 Chromium

Figure 367: Chromium Concentrations in Sockeye Salmon Adult Tissues Collected in 2014

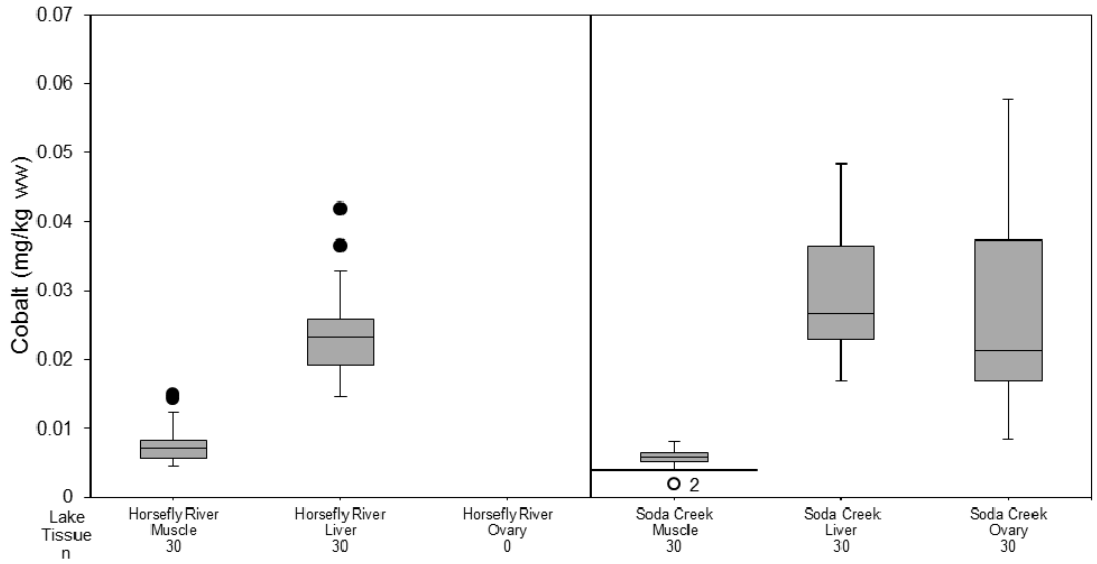


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

9.7 Cobalt

Figure 368: Cobalt Concentrations in Sockeye Salmon Adult Tissues Collected in 2014

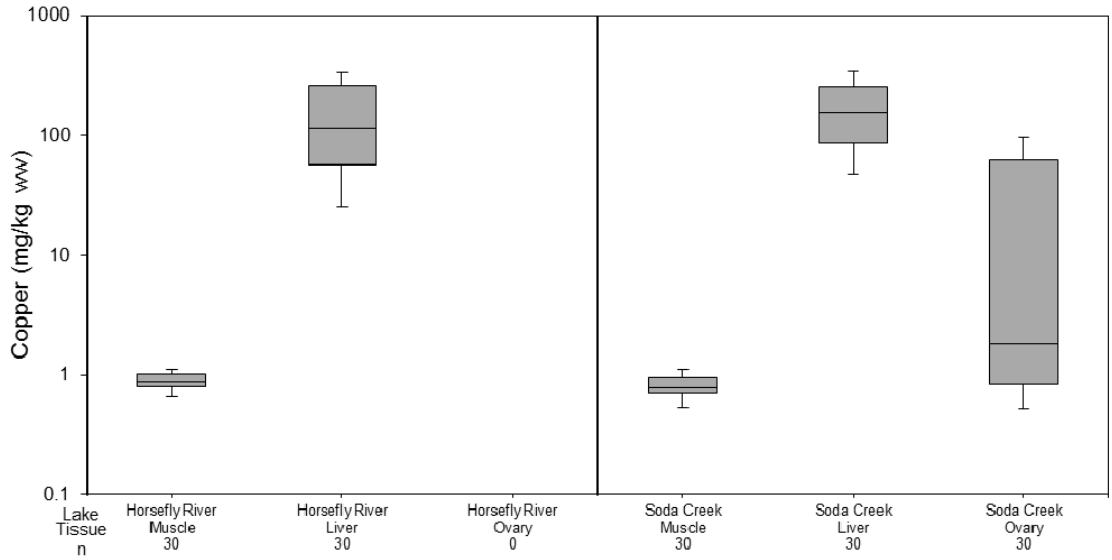


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

9.8 Copper

Figure 369: Copper Concentrations in Sockeye Salmon Adult Tissues Collected in 2014

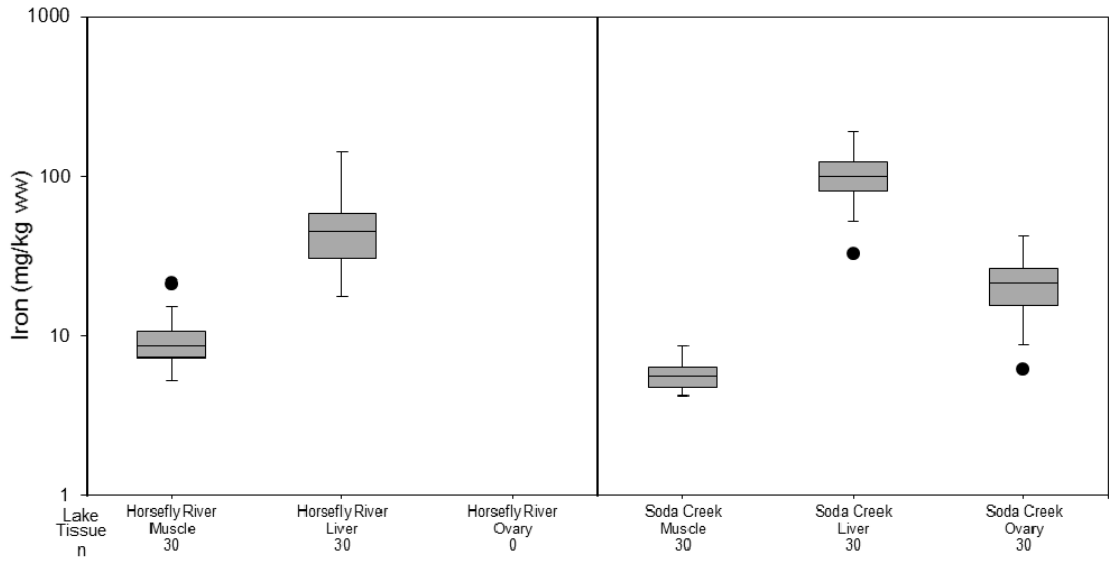


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

9.9 Iron

Figure 370: Iron Concentrations in Sockeye Salmon Adult Tissues Collected in 2014

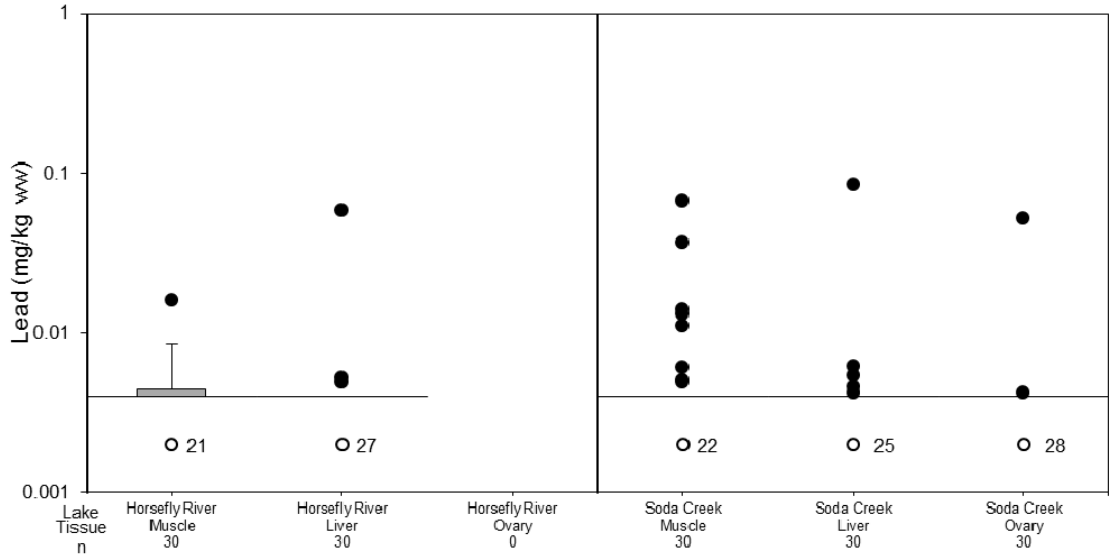


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

9.10 Lead

Figure 371: Lead Concentrations in Sockeye Salmon Adult Tissues Collected in 2014

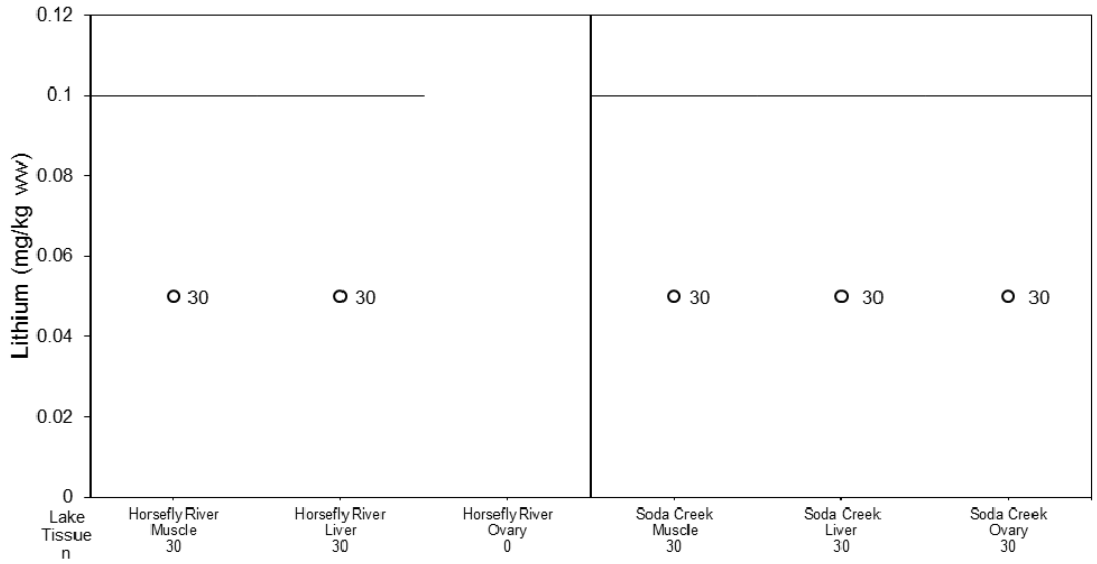


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

9.11 Lithium

Figure 372: Lithium Concentrations in Sockeye Salmon Adult Tissues Collected in 2014

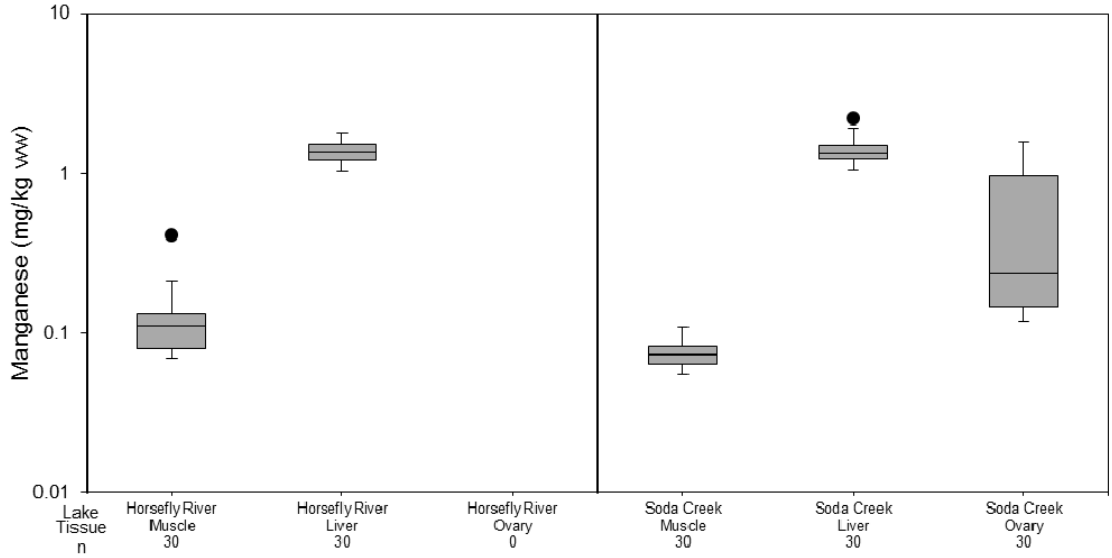


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

9.12 Manganese

Figure 373: Manganese Concentrations in Sockeye Salmon Adult Tissues Collected in 2014

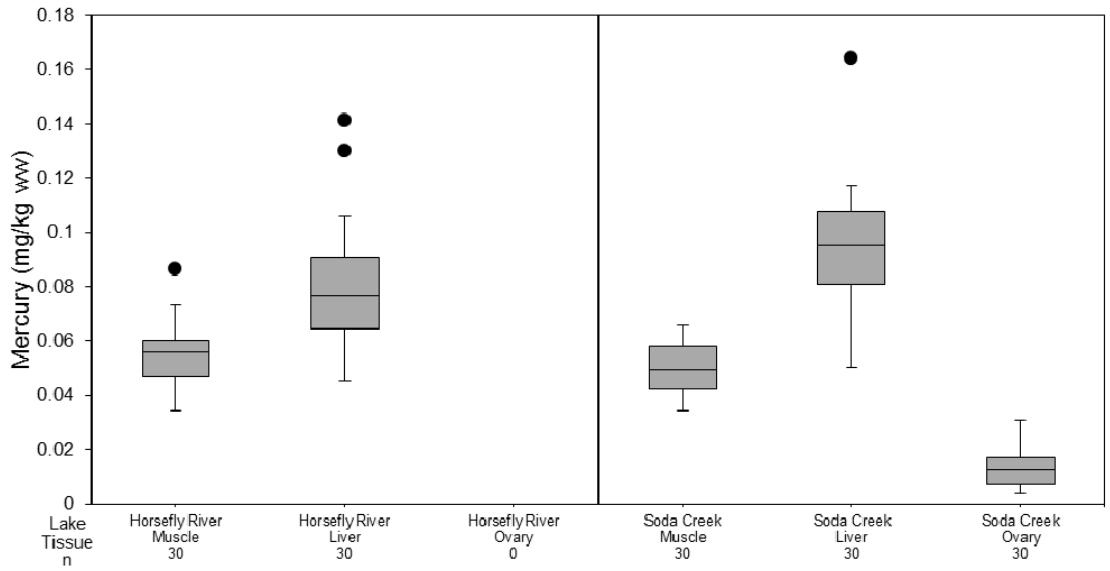


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

9.13 Mercury

Figure 374: Mercury Concentrations in Sockeye Salmon Adult Tissues Collected in 2014

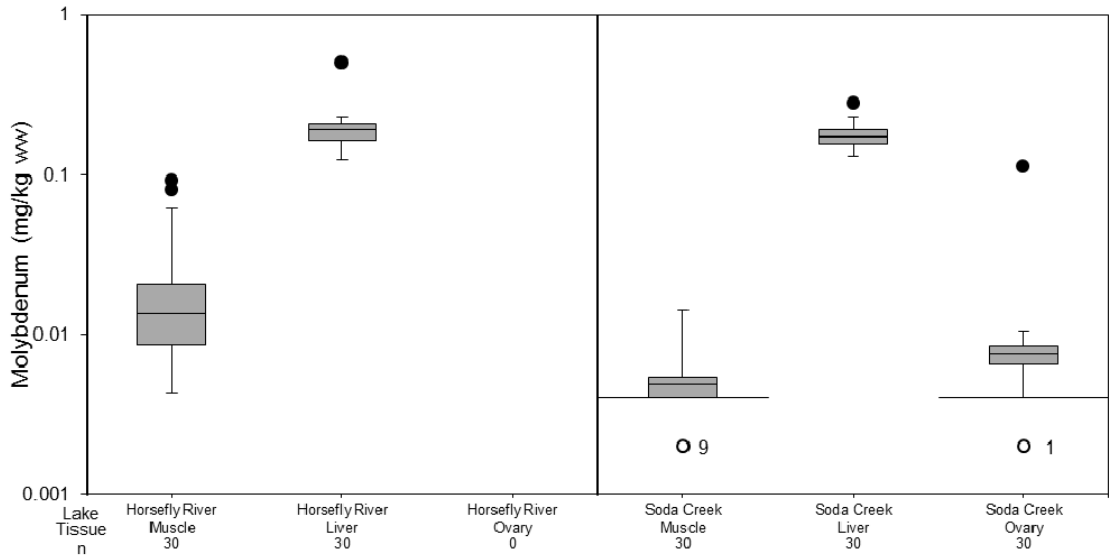


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

9.14 Molybdenum

Figure 375: Molybdenum Concentrations in Sockeye Salmon Adult Tissues Collected in 2014

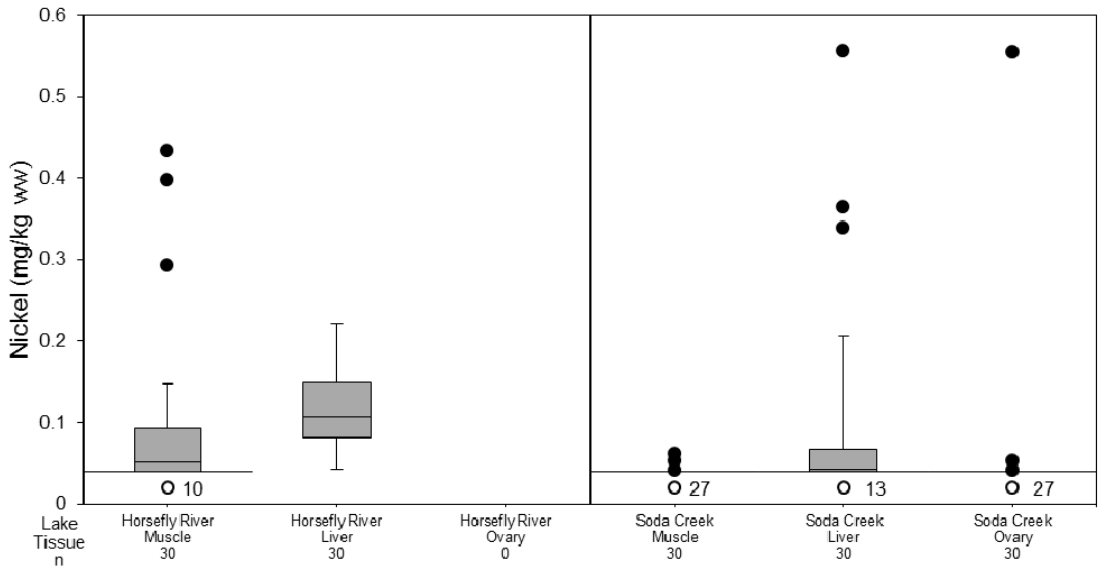


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

9.15 Nickel

Figure 376: Nickel Concentrations in Sockeye Salmon Adult Tissues Collected in 2014

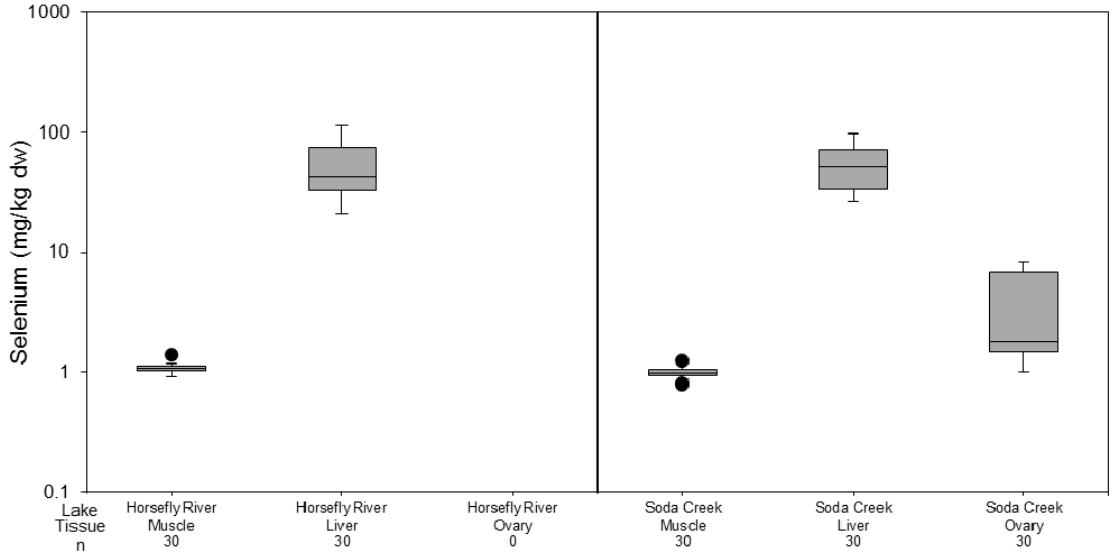


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

9.16 Selenium

Figure 377: Selenium Concentrations in Sockeye Salmon Adult Tissues Collected in 2014

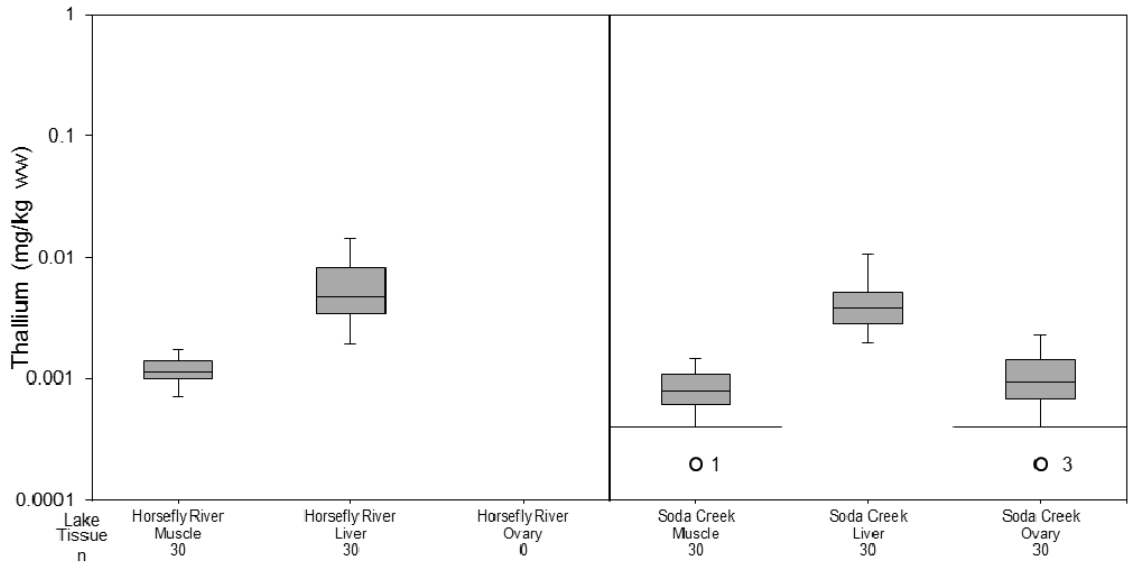


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg dw = milligrams per kilogram dry weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

9.17 Thallium

Figure 378: Thallium Concentrations in Sockeye Salmon Adult Tissues Collected in 2014



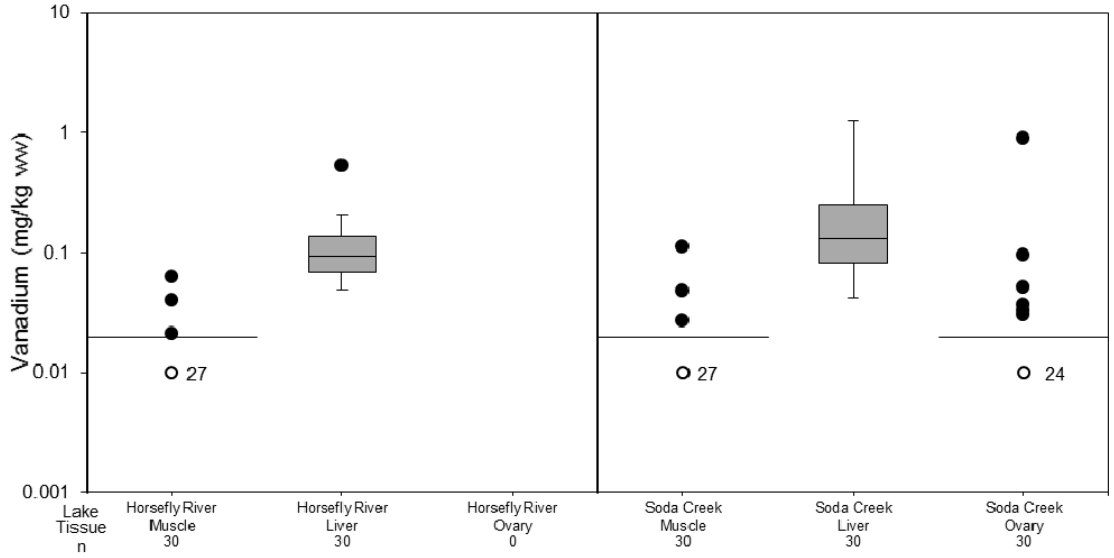
.

Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

9.18 Vanadium

Figure 379: Vanadium Concentrations in Sockeye Salmon Adult Tissues Collected in 2014

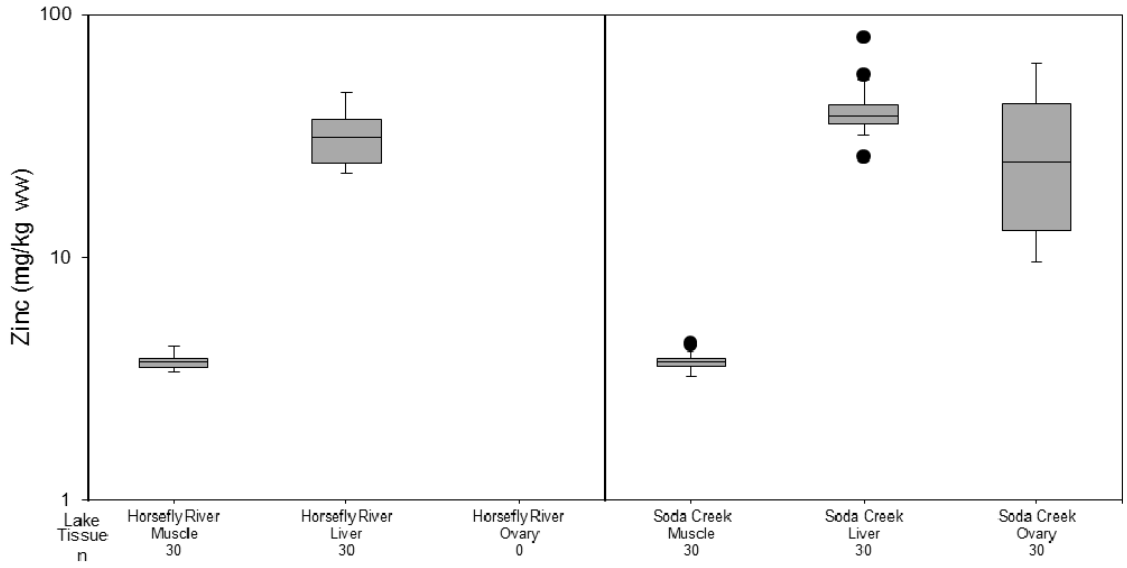


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

9.19 Zinc

Figure 380: Zinc Concentrations in Sockeye Salmon Adult Tissues Collected in 2014



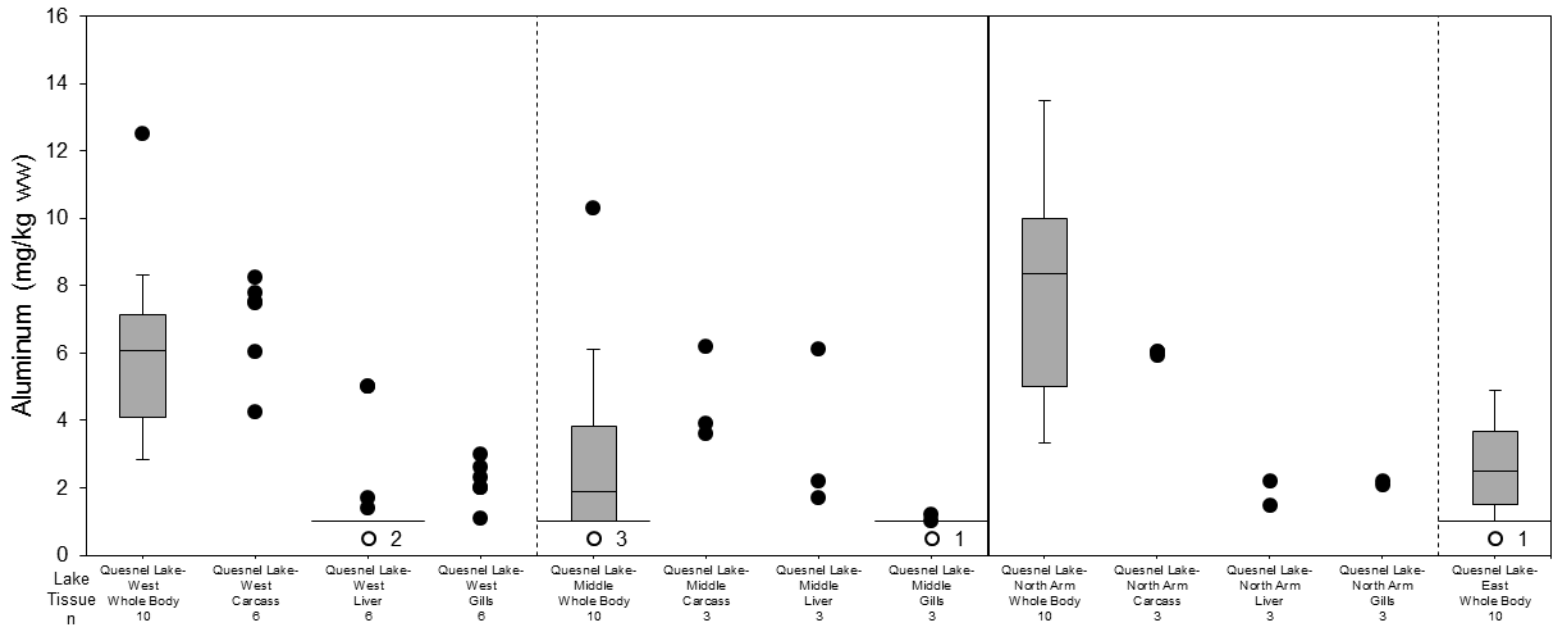
Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values.

mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

10.0 SOCKEYE SALMON JUVENILES

10.1 Aluminum

Figure 381: Aluminum Concentrations in Sockeye Salmon Juvenile Tissues Collected in 2014

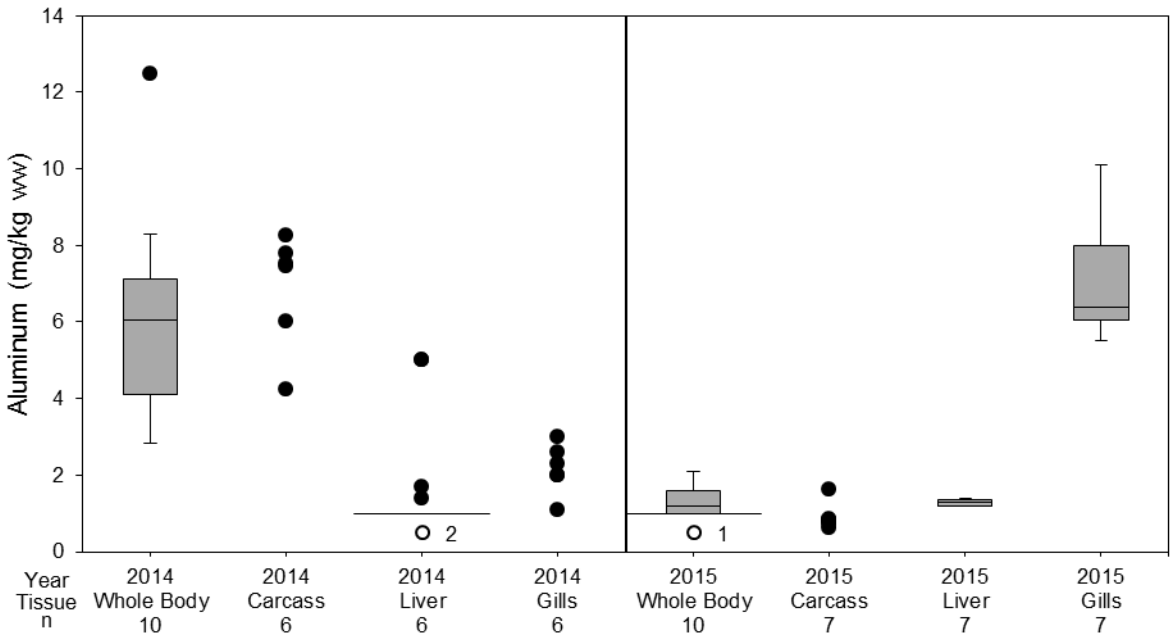


Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 382: Aluminum Concentrations in Sockeye Salmon Juvenile Tissues Collected in 2015

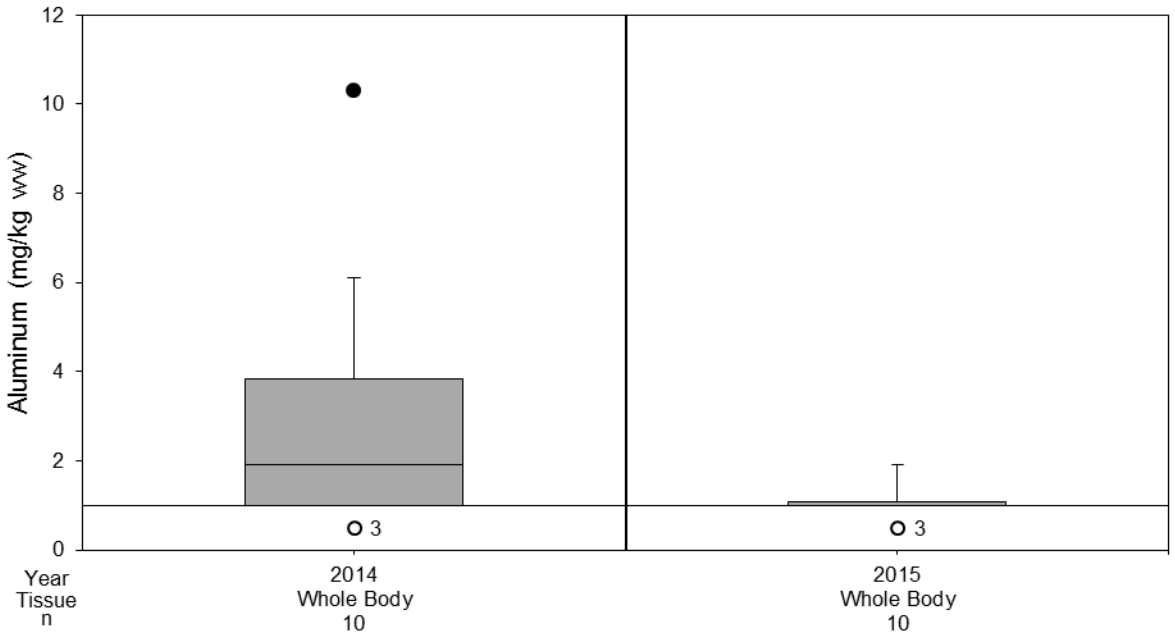
Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 383: Aluminum Concentrations in Sockeye Salmon Juvenile Tissues Collected from the Quesnel Lake – West in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

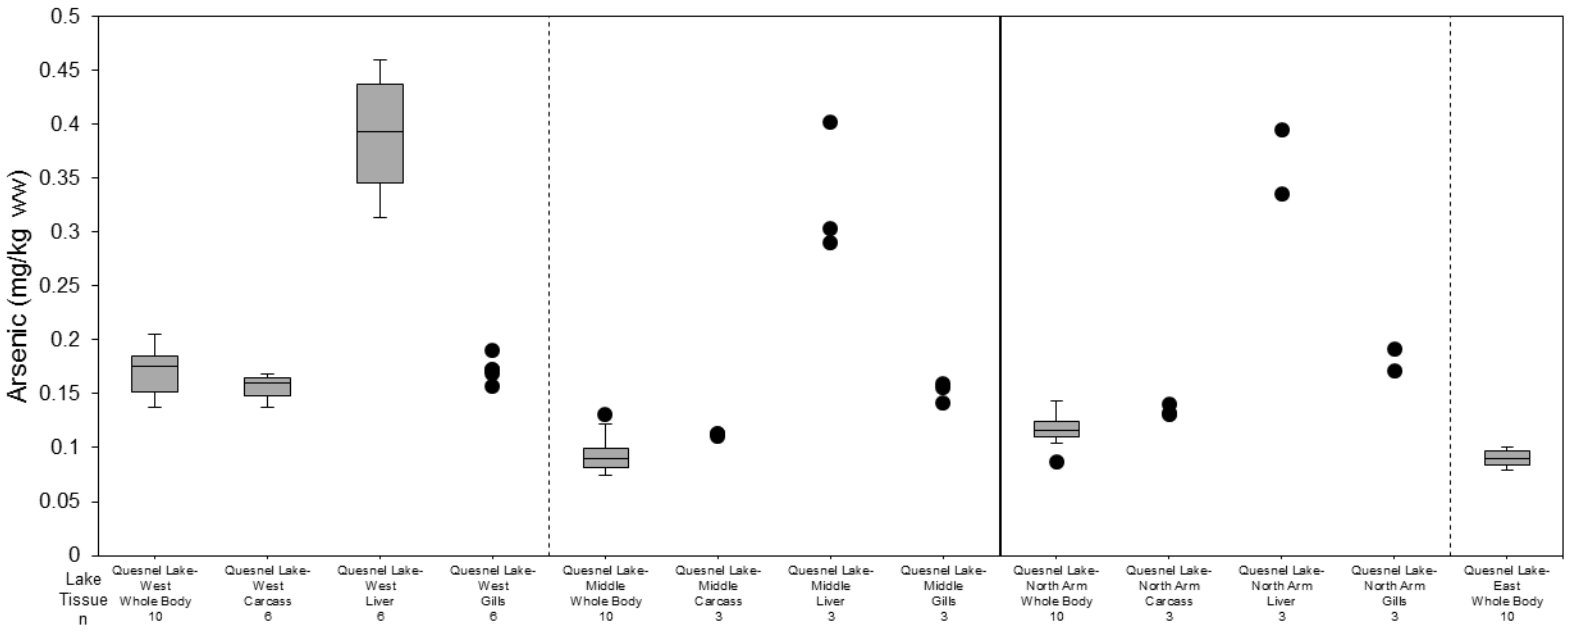
Figure 384: Aluminum Concentrations in Sockeye Salmon Juvenile Tissue Collected from the Quesnel Lake – Middle in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

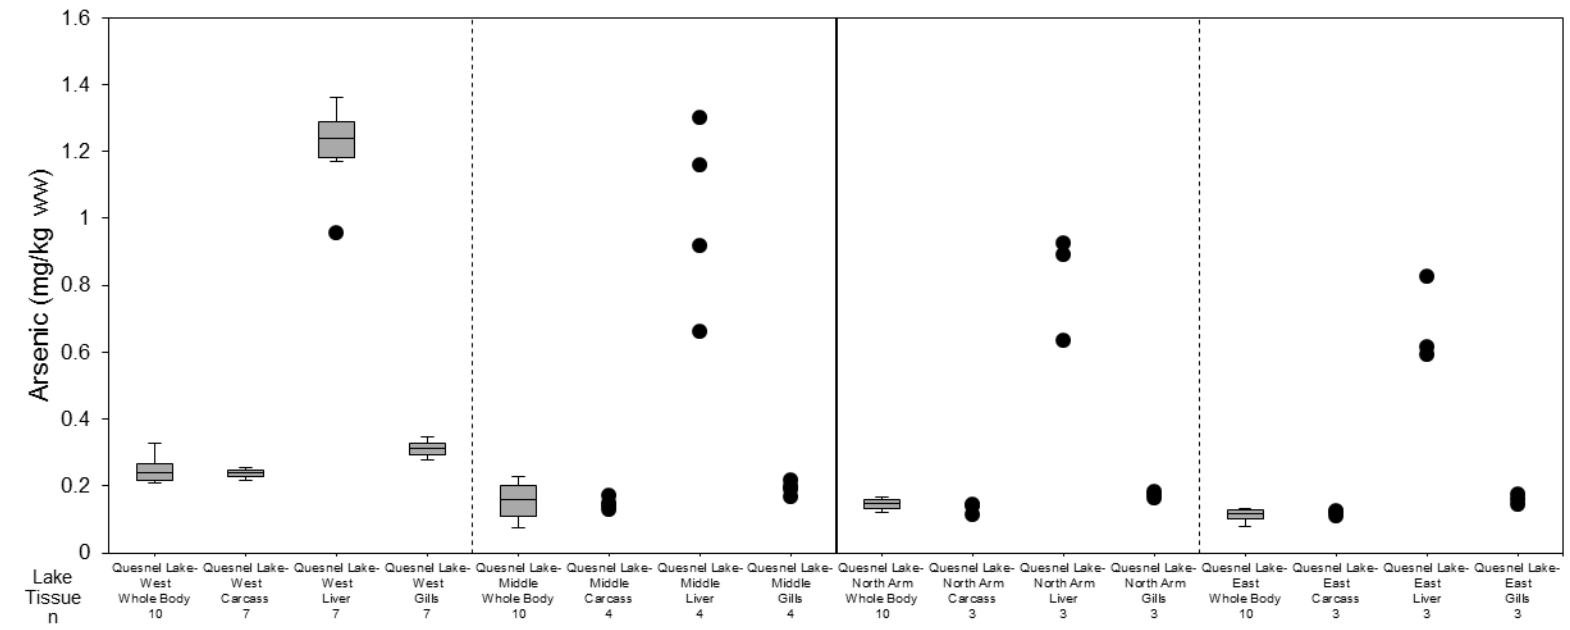
10.2 Arsenic

Figure 385: Arsenic Concentrations in Sockeye Salmon Juvenile Tissues Collected in 2014



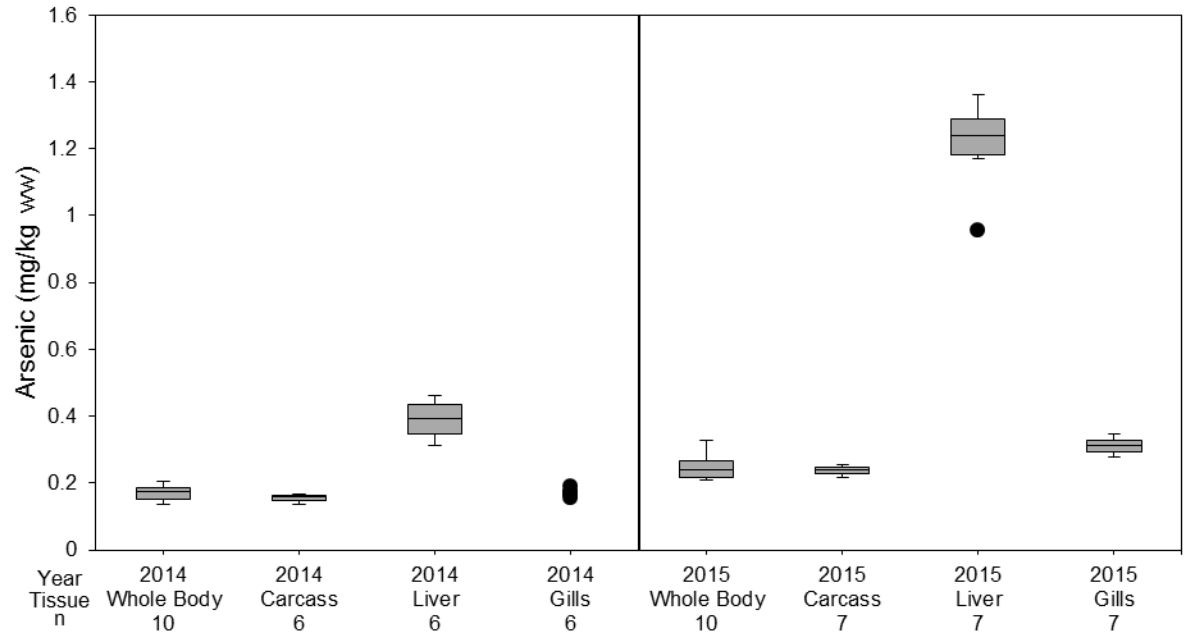
Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years

Figure 386: Arsenic Concentrations in Sockeye Salmon Juvenile Tissues Collected in 2015



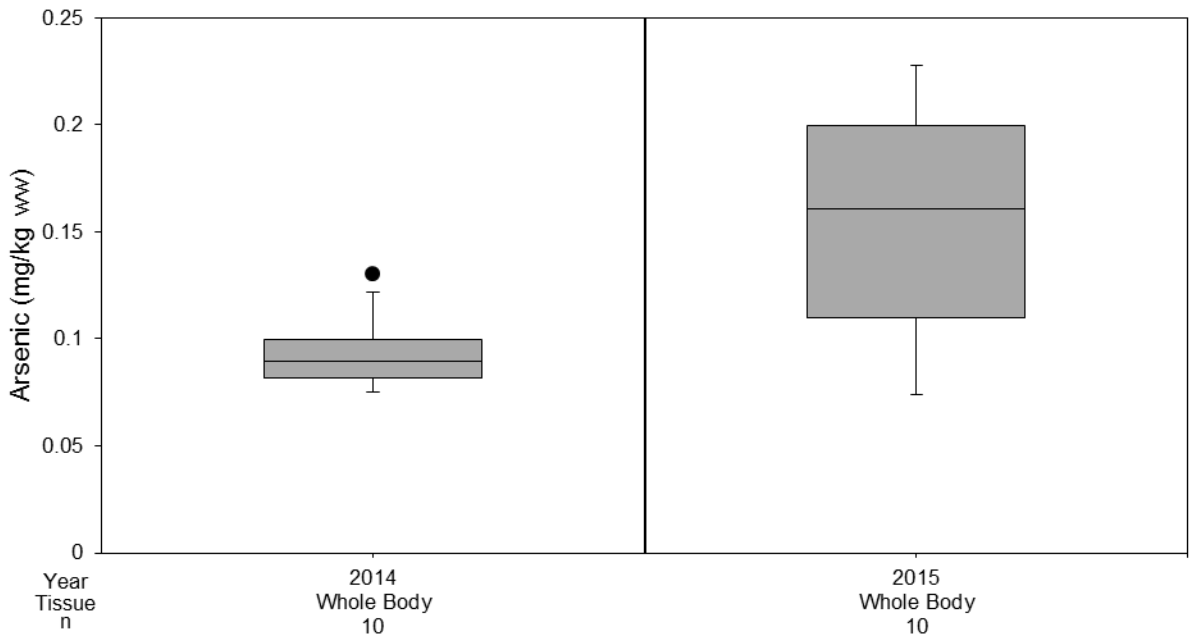
Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 387: Arsenic Concentrations in Sockeye Salmon Juvenile Tissues Collected from the Quesnel Lake – West in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

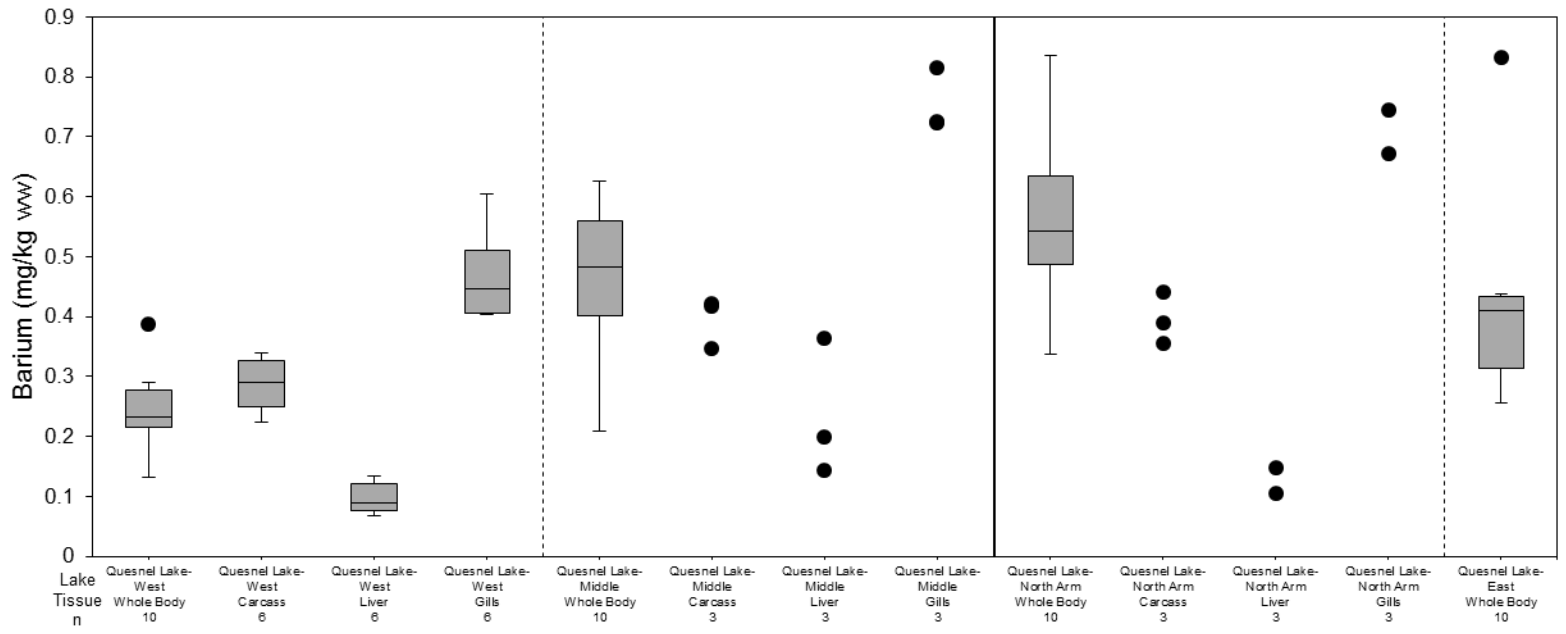
Figure 388: Arsenic Concentrations in Sockeye Salmon Juvenile Tissues Collected from the Quesnel Lake – Middle in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

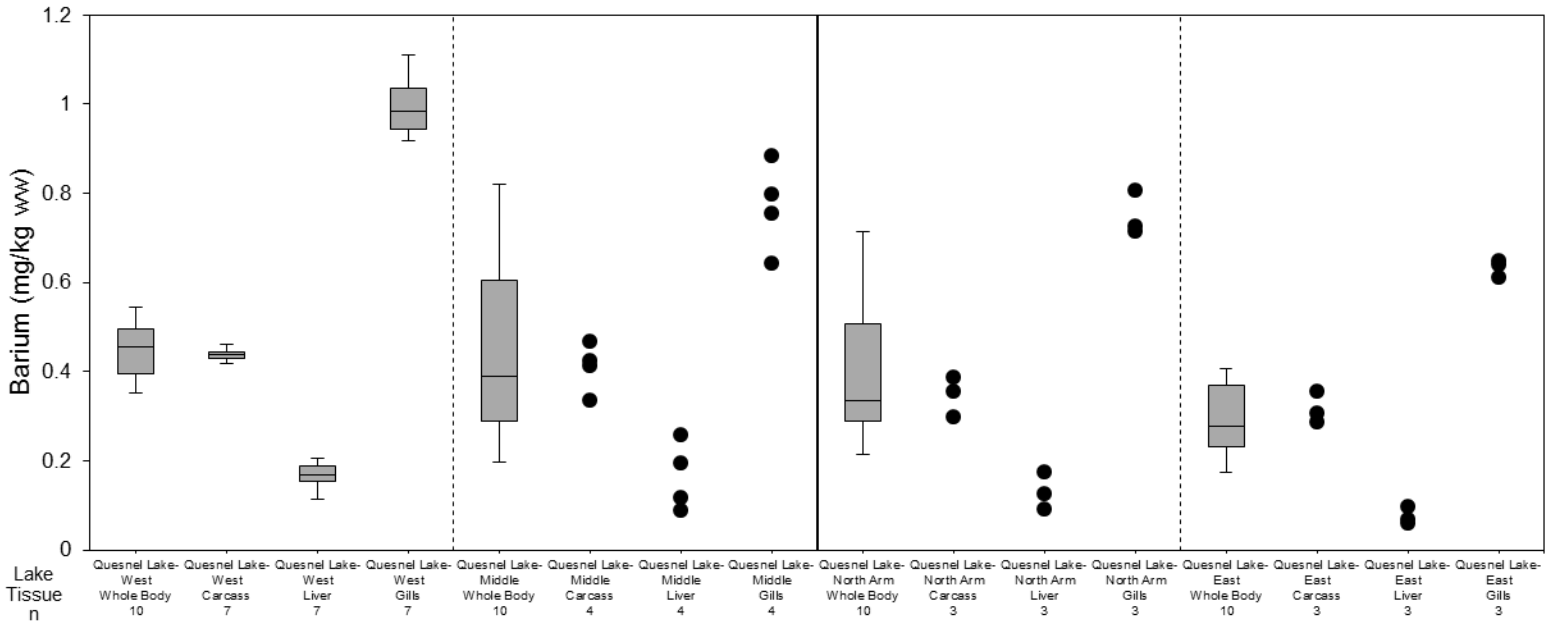
10.3 Barium

Figure 389: Barium Concentrations in Sockeye Salmon Juvenile Tissues Collected in 2014



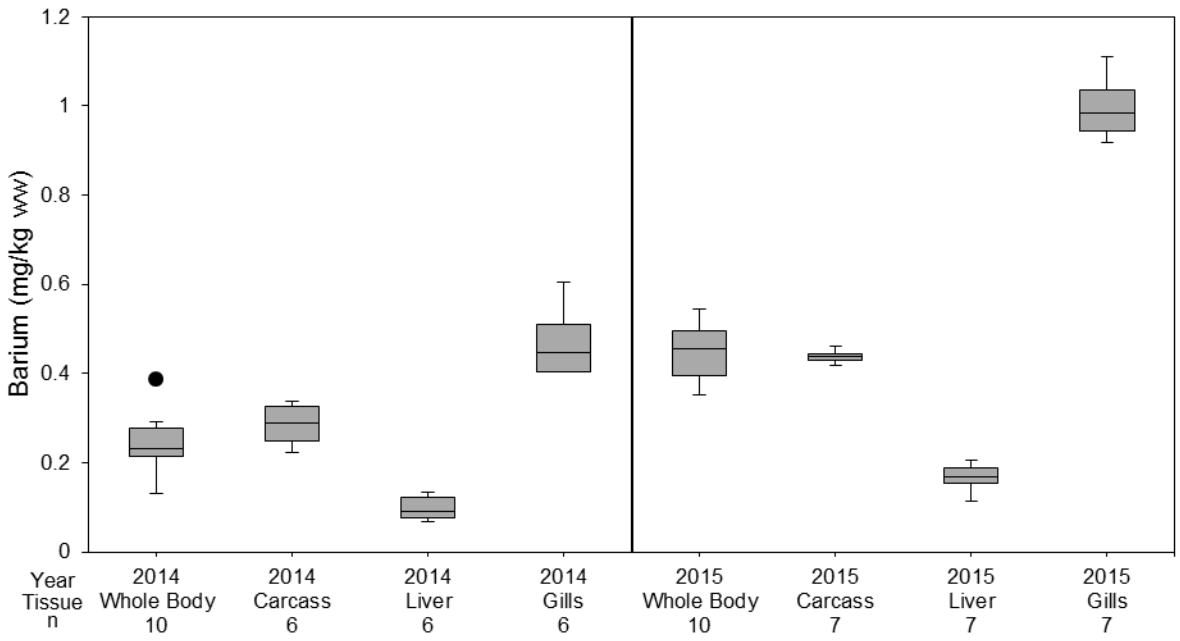
Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 390: Barium Concentrations in Sockeye Salmon Juvenile Tissues Collected in 2015



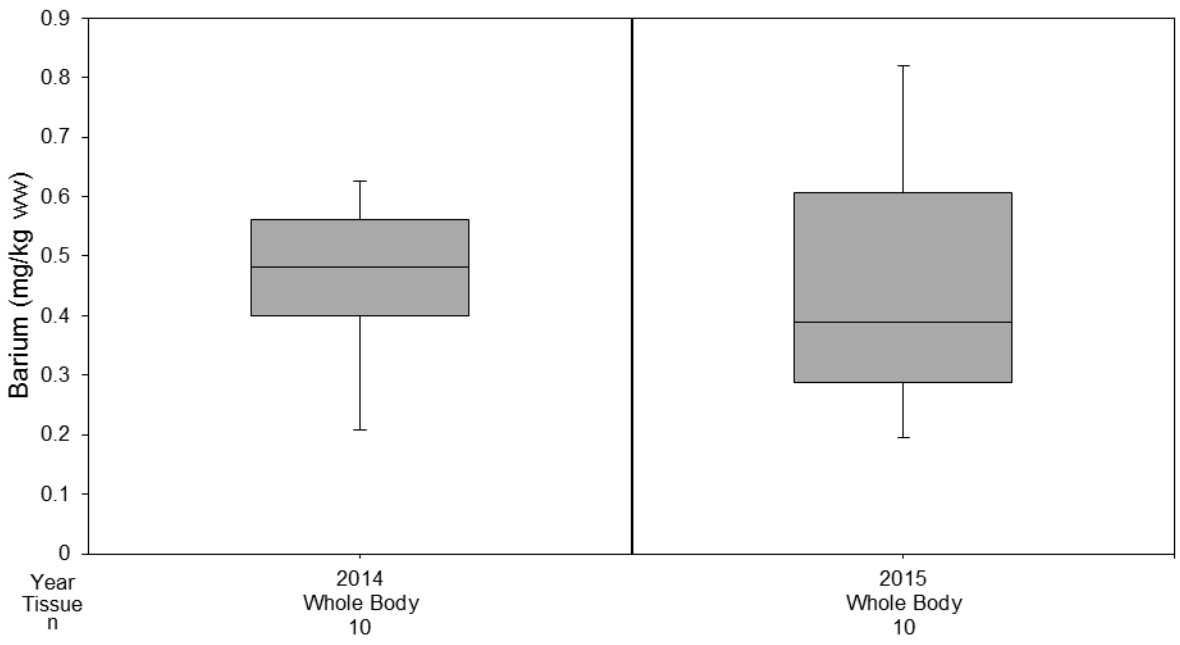
Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years

Figure 391: Barium Concentrations in Sockeye Salmon Juvenile Tissues Collected from the Quesnel Lake – West in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

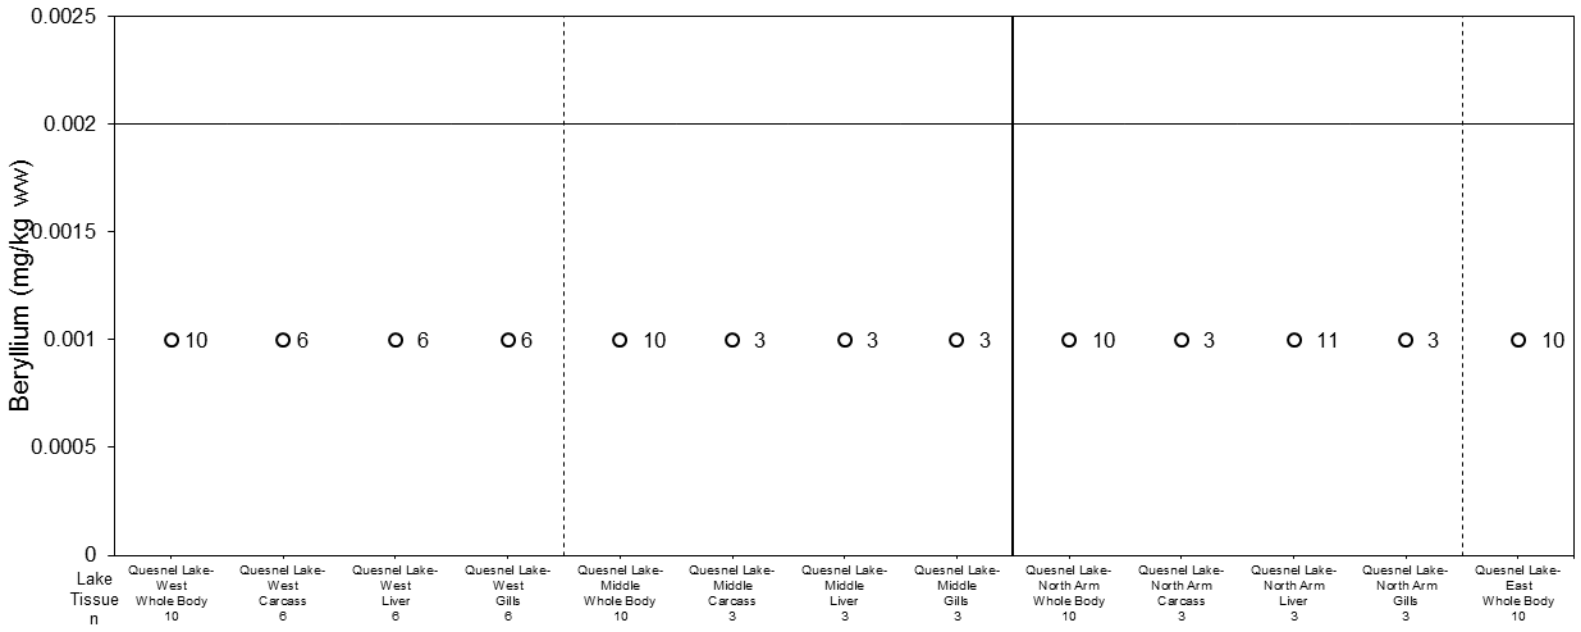
Figure 392: Barium Concentrations in Sockeye Salmon Juvenile Tissues Collected from the Quesnel Lake – Middle in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

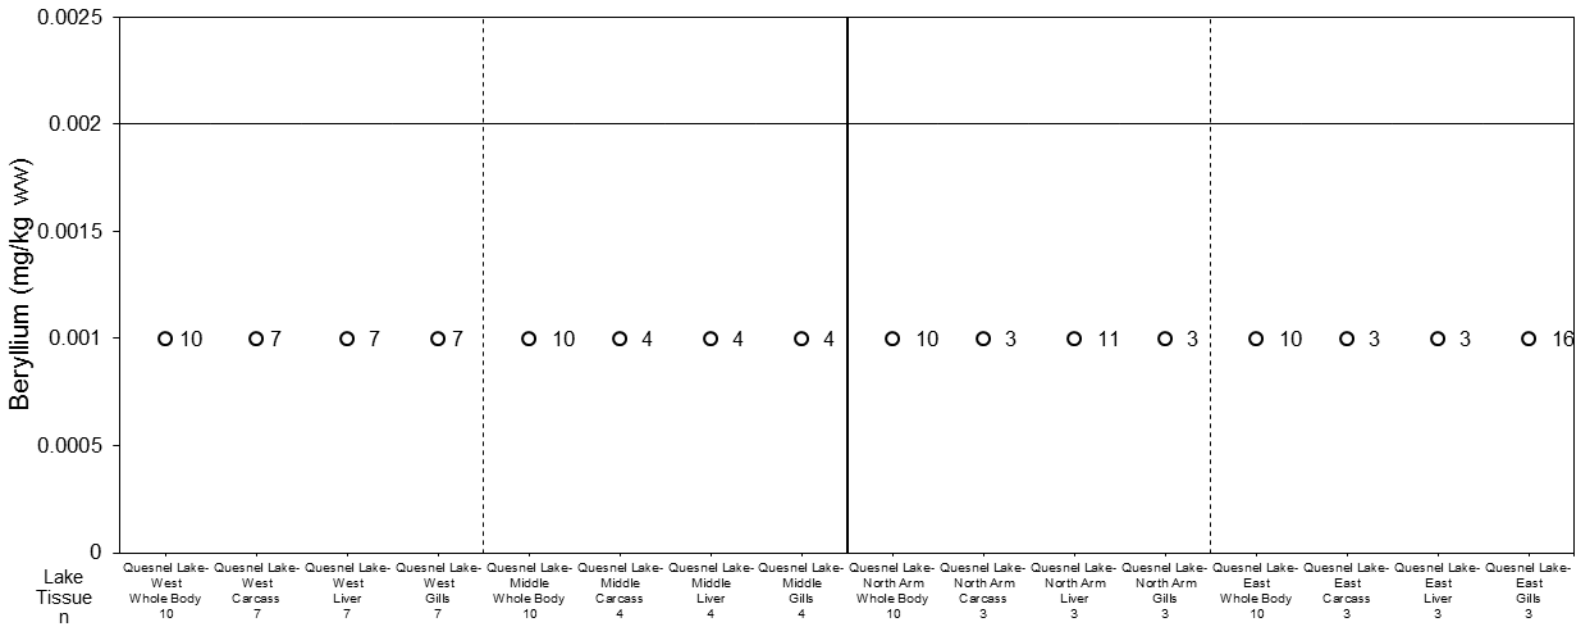
10.4 Beryllium

Figure 393: Beryllium Concentrations in Sockeye Salmon Juvenile Tissues Collected in 2014



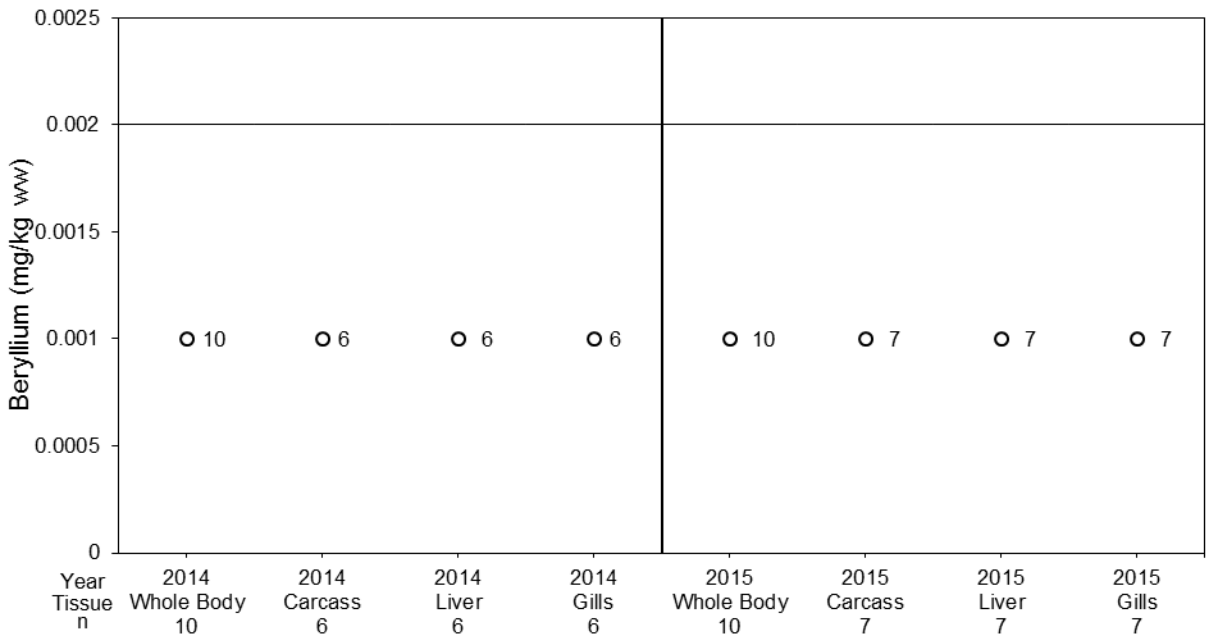
Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 394: Beryllium Concentrations in Sockeye Salmon Juvenile Tissues Collected in 2015



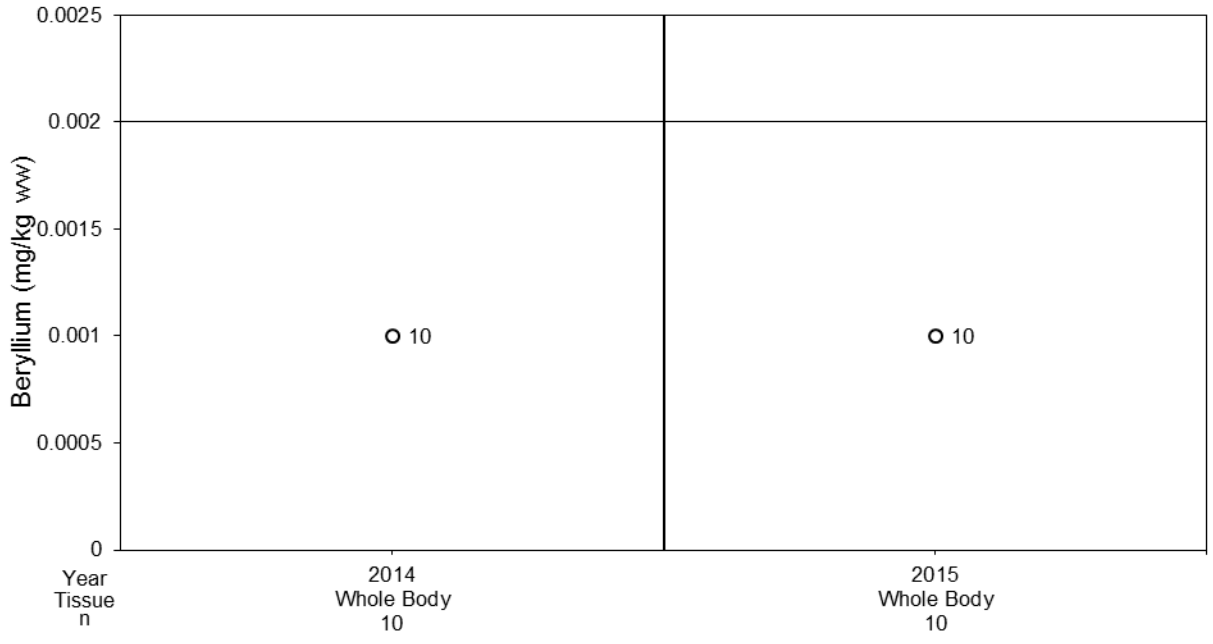
Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 395: Beryllium Concentrations in Sockeye Salmon Juvenile Tissues Collected from the Quesnel Lake – West in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

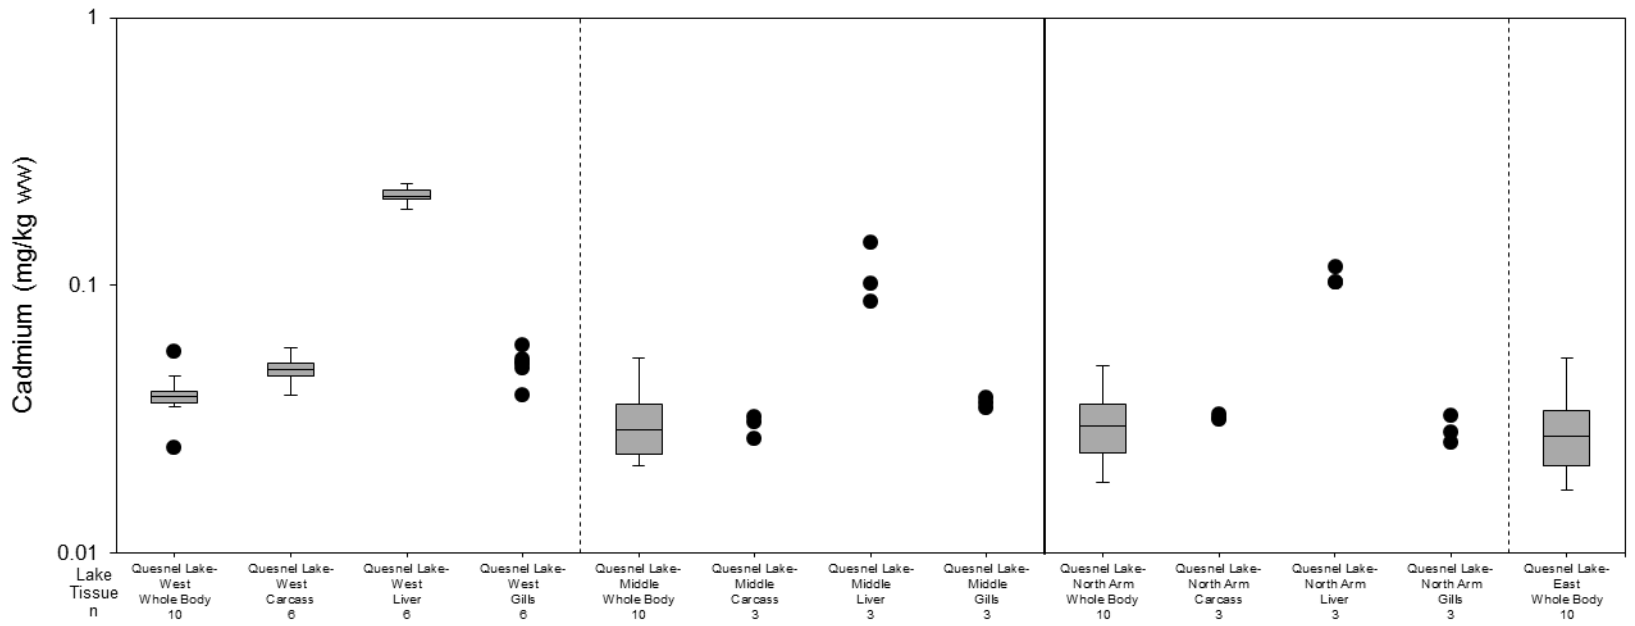
Figure 396: Beryllium Concentrations in Sockeye Salmon Juvenile Tissues Collected from the Quesnel Lake – Middle in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

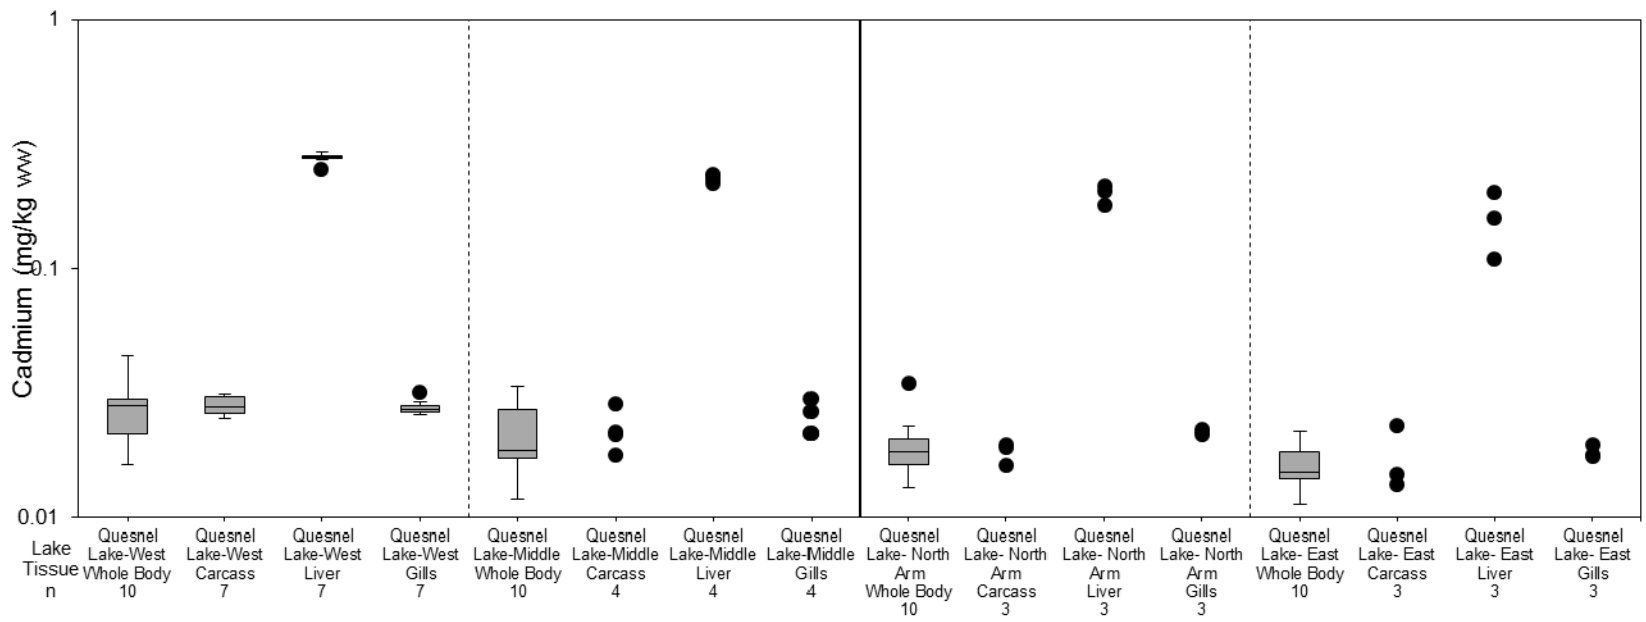
10.5 Cadmium

Figure 397: Cadmium Concentrations in Sockeye Salmon Juvenile Tissues Collected in 2014



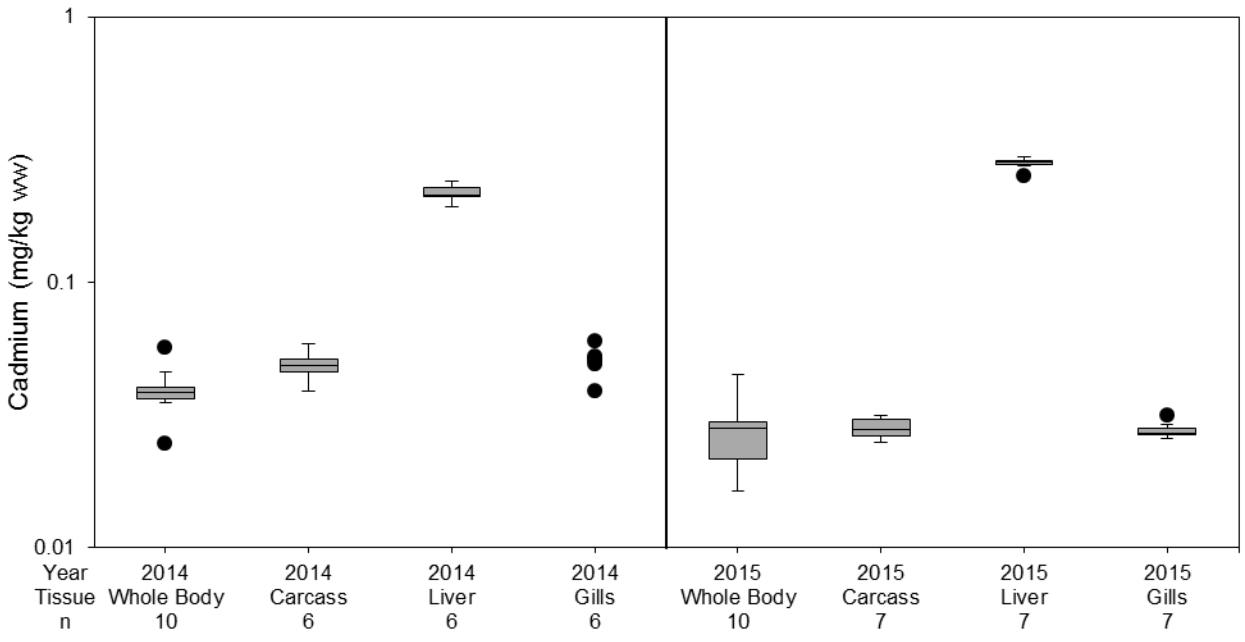
Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 398: Cadmium Concentrations in Sockeye Salmon Juvenile Tissues Collected in 2015



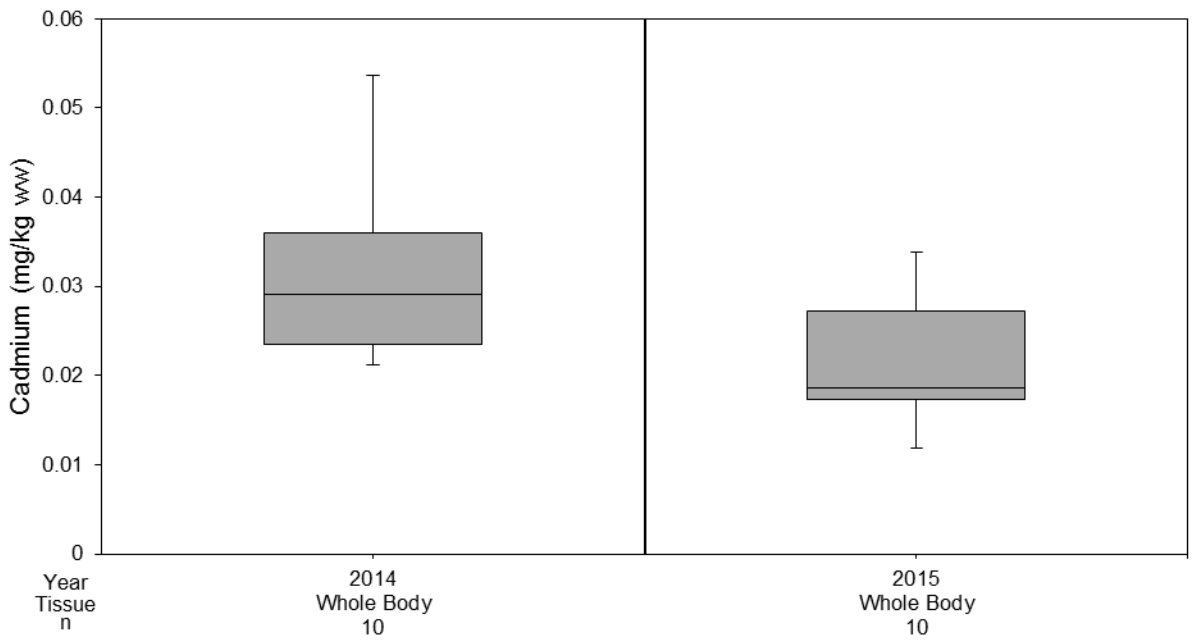
Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 399: Cadmium Concentrations in Sockeye Salmon Juvenile Tissues Collected from the Quesnel Lake – West in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

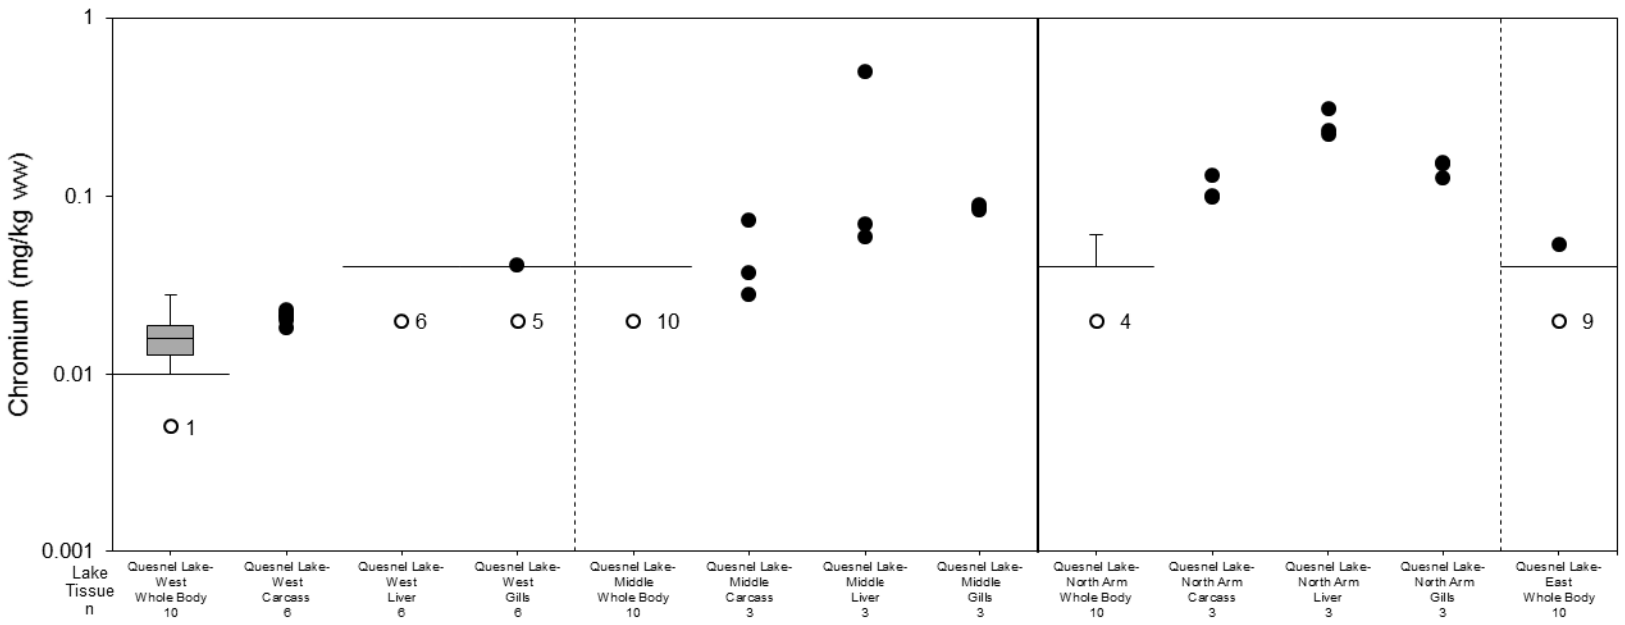
Figure 400: Cadmium Concentrations in Sockeye Salmon Juvenile Tissues Collected from the Quesnel Lake – Middle in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

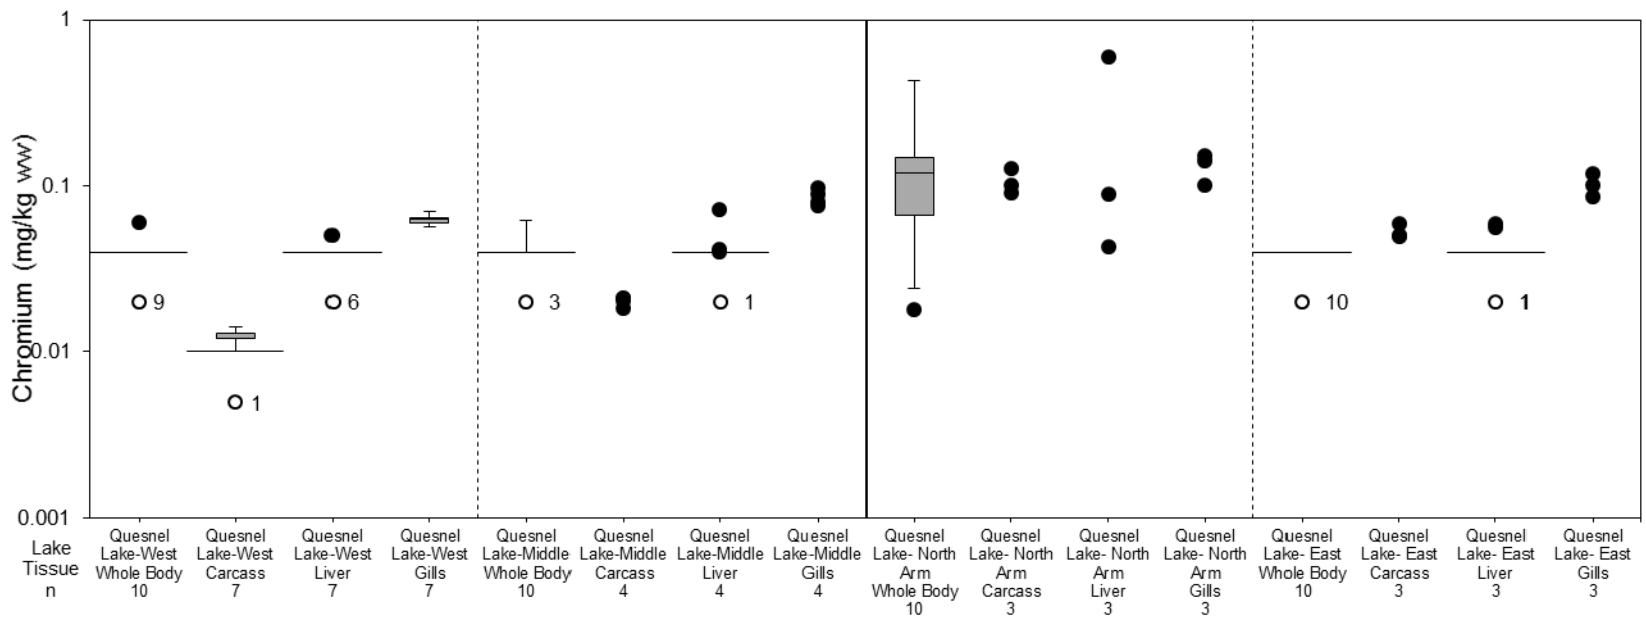
10.6 Chromium

Figure 401: Chromium Concentrations in Sockeye Salmon Juvenile Tissues Collected in 2014



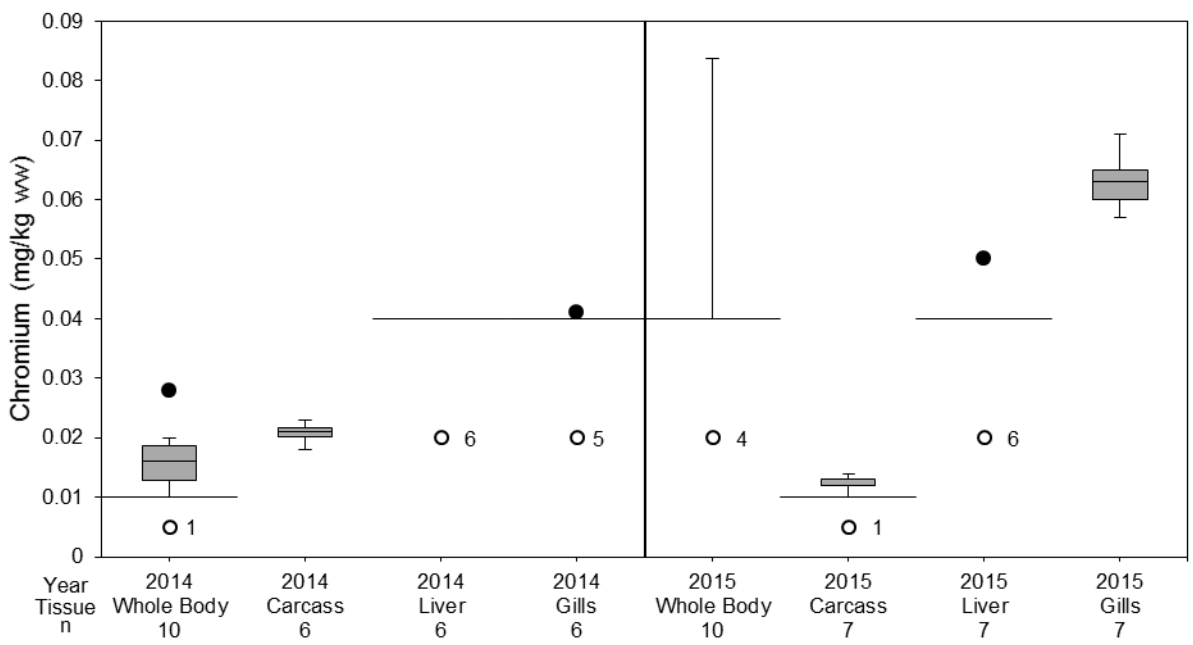
Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 402: Chromium Concentrations in Sockeye Salmon Juvenile Tissues Collected in 2014



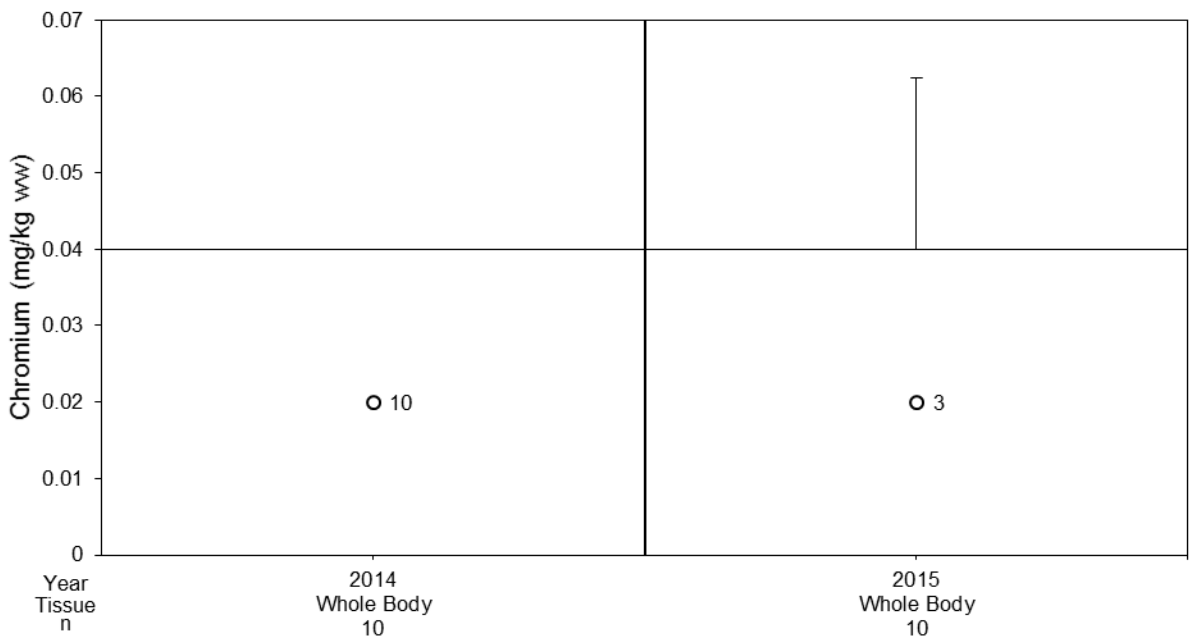
Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 403: Chromium Concentrations in Sockeye Salmon Juvenile Tissues Collected from the Quesnel Lake – West in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

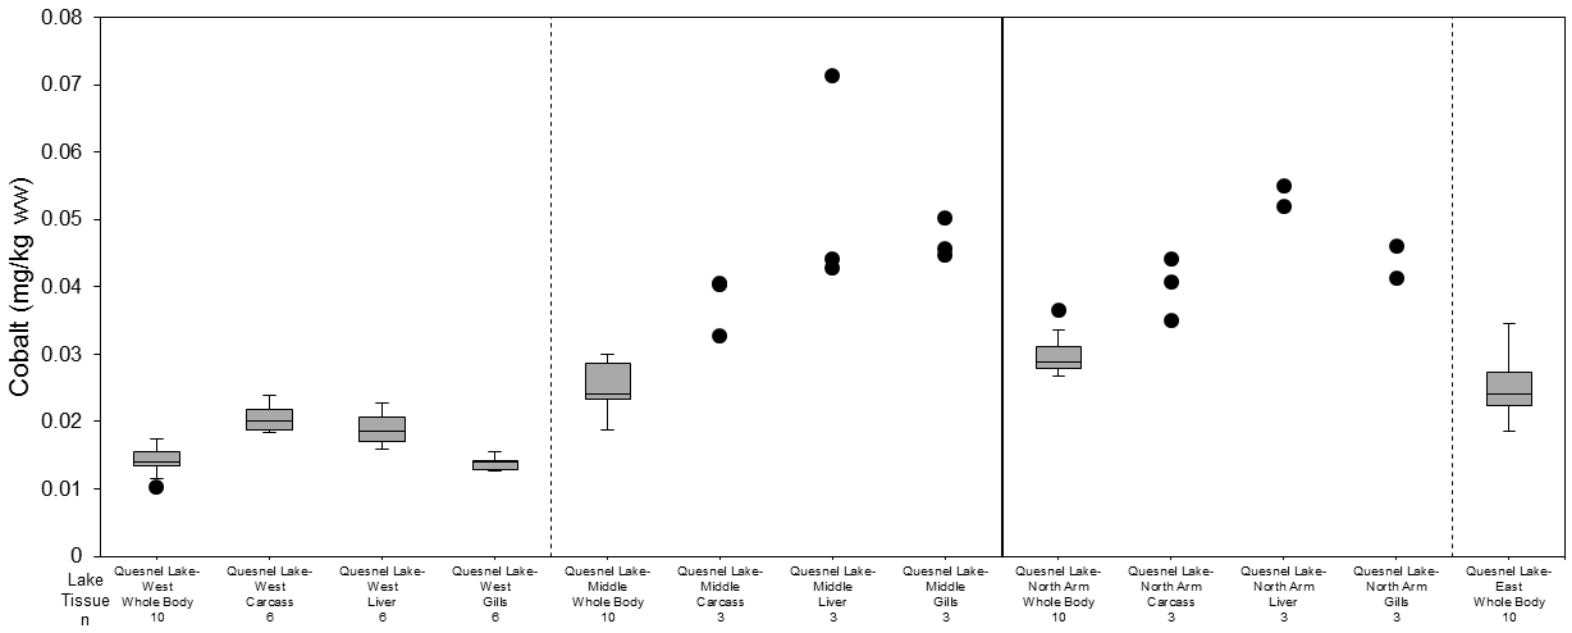
Figure 404: Chromium Concentrations in Sockeye Salmon Juvenile Tissues Collected from the Quesnel Lake – Middle in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

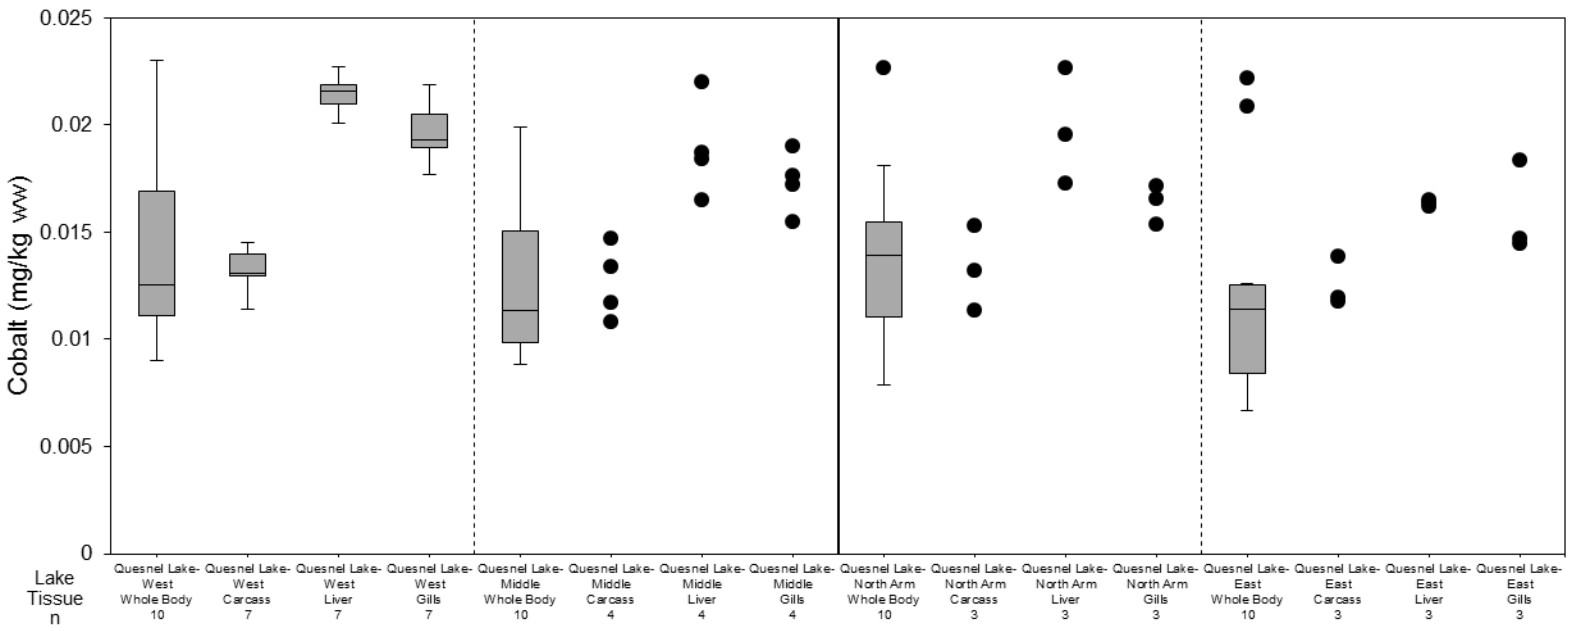
10.7 Cobalt

Figure 405: Cobalt Concentrations in Sockeye Salmon Juvenile Tissues Collected in 2014



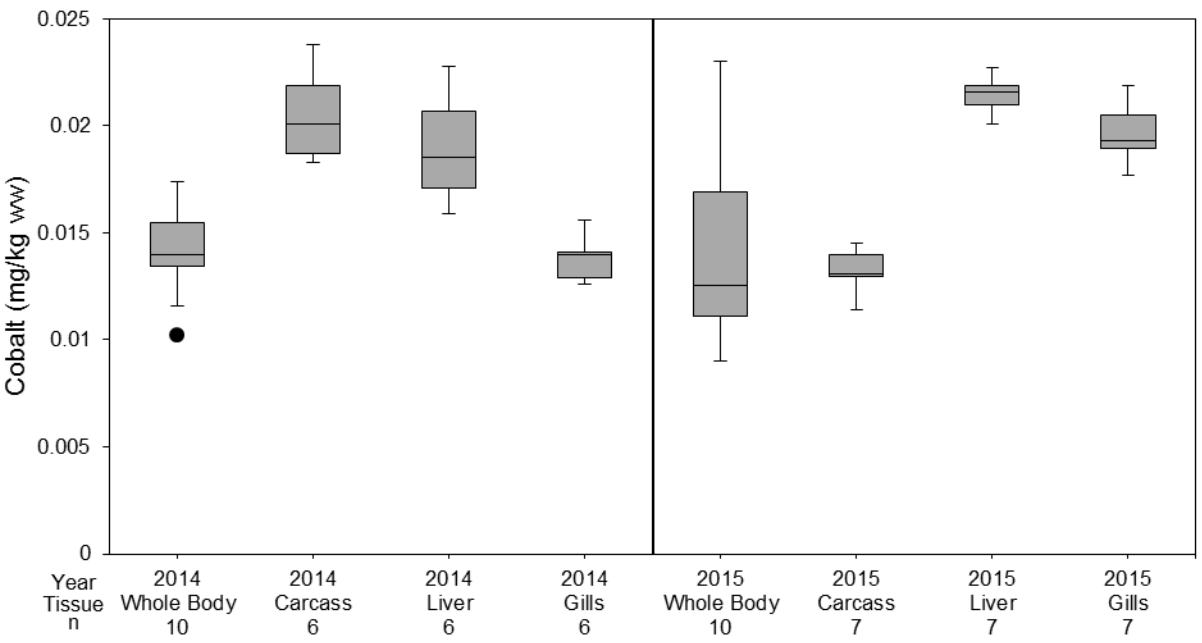
Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 406: Cobalt Concentrations in Sockeye Salmon Juvenile Tissues Collected in 2015



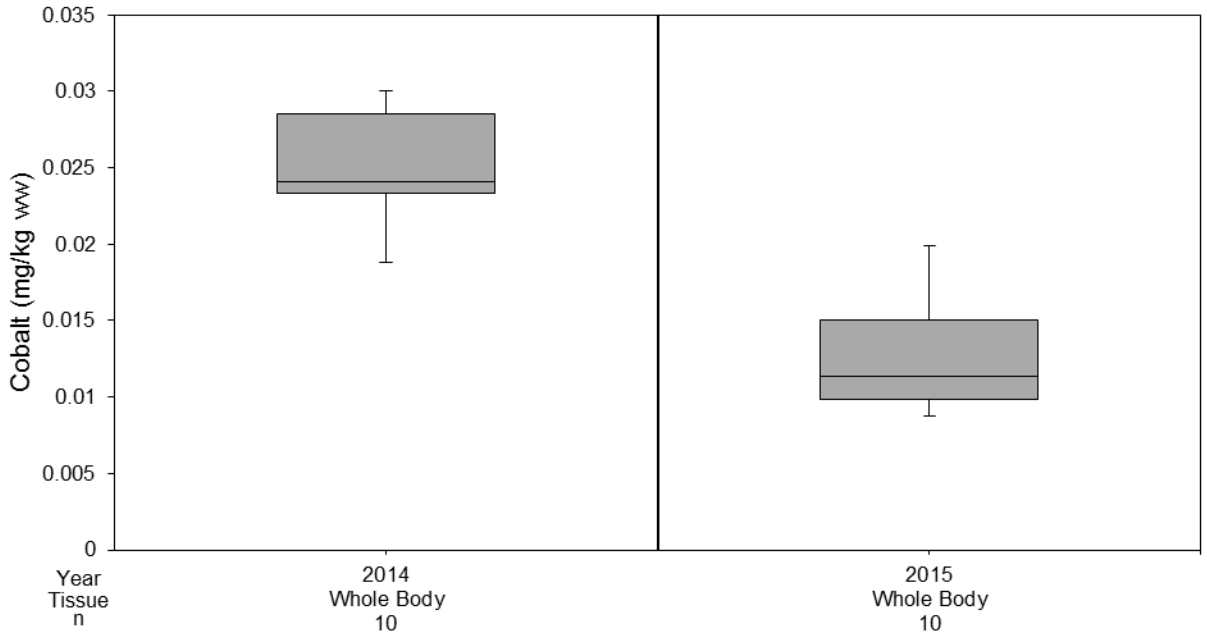
Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 407: Cobalt Concentrations in Sockeye Salmon Juvenile Tissues Collected from the Quesnel Lake – West in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

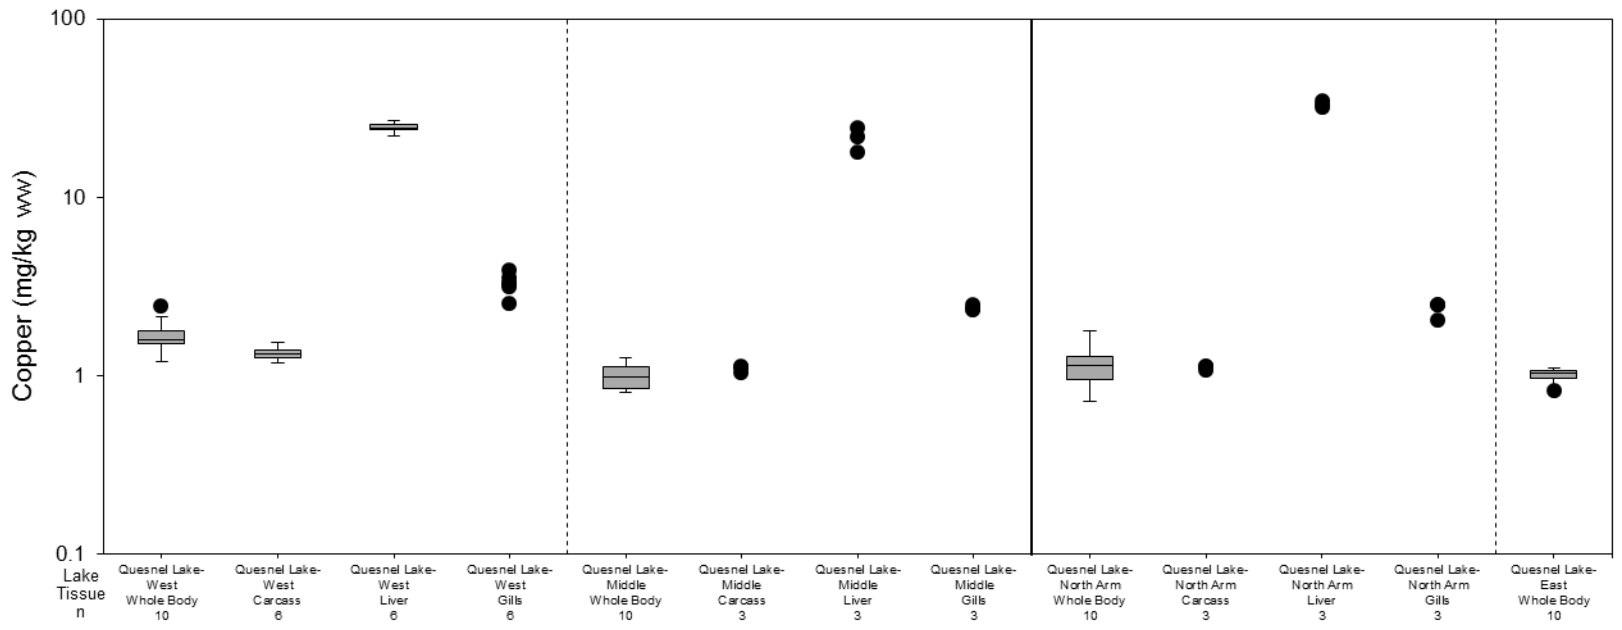
Figure 408: Cobalt Concentrations in Sockeye Salmon Juvenile Tissues Collected from the Quesnel Lake – Middle in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

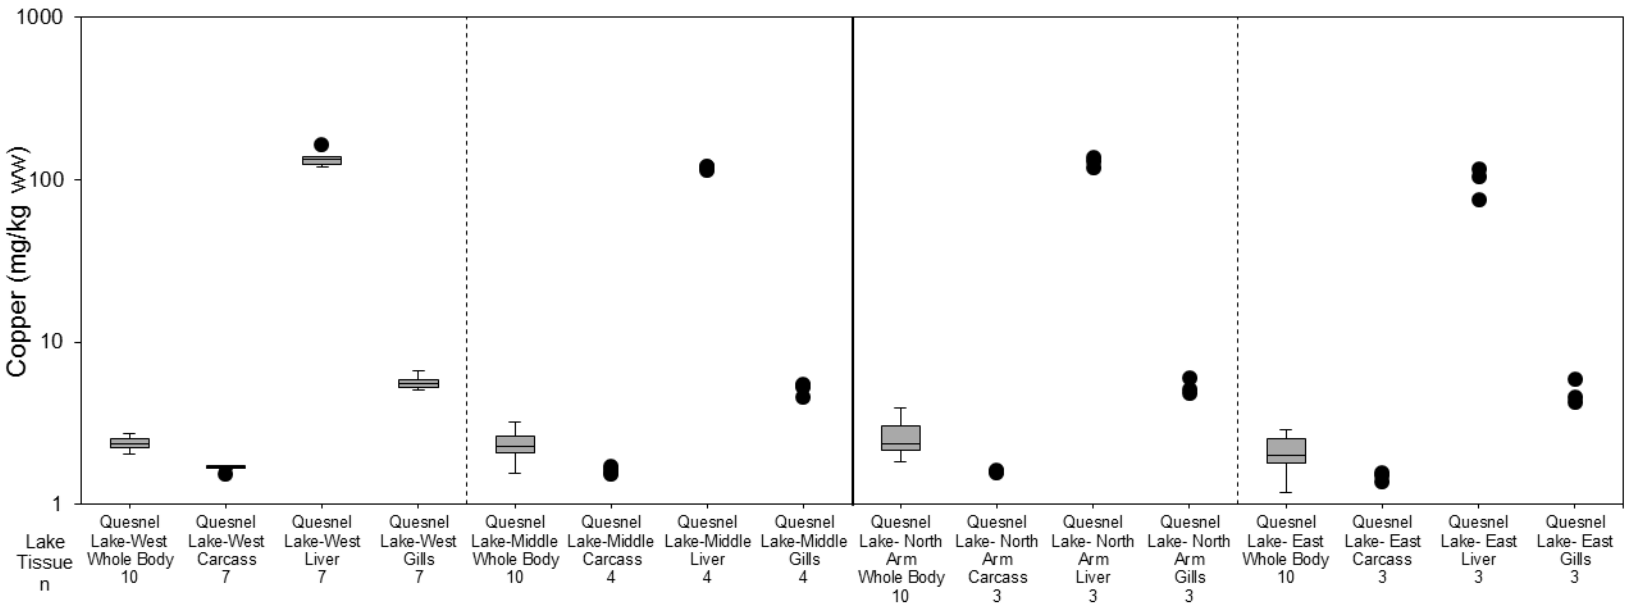
10.8 Copper

Figure 409: Copper Concentrations in Sockeye Salmon Juvenile Tissues Collected in 2014



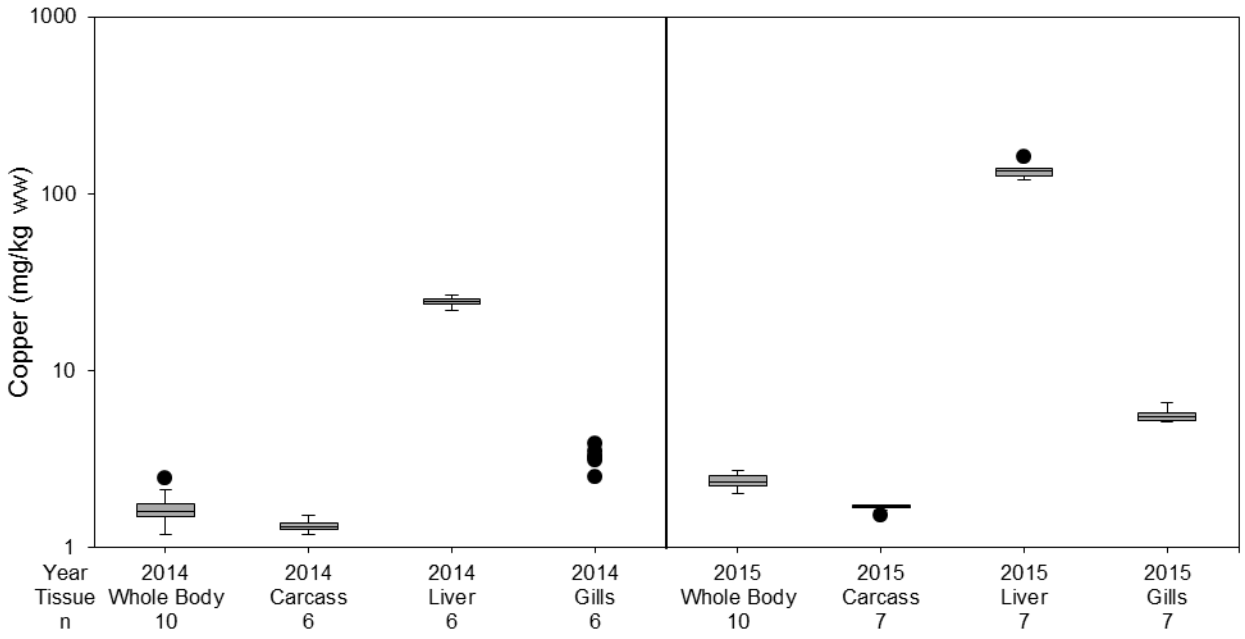
Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 410: Copper Concentrations in Sockeye Salmon Juvenile Tissues Collected in 2015



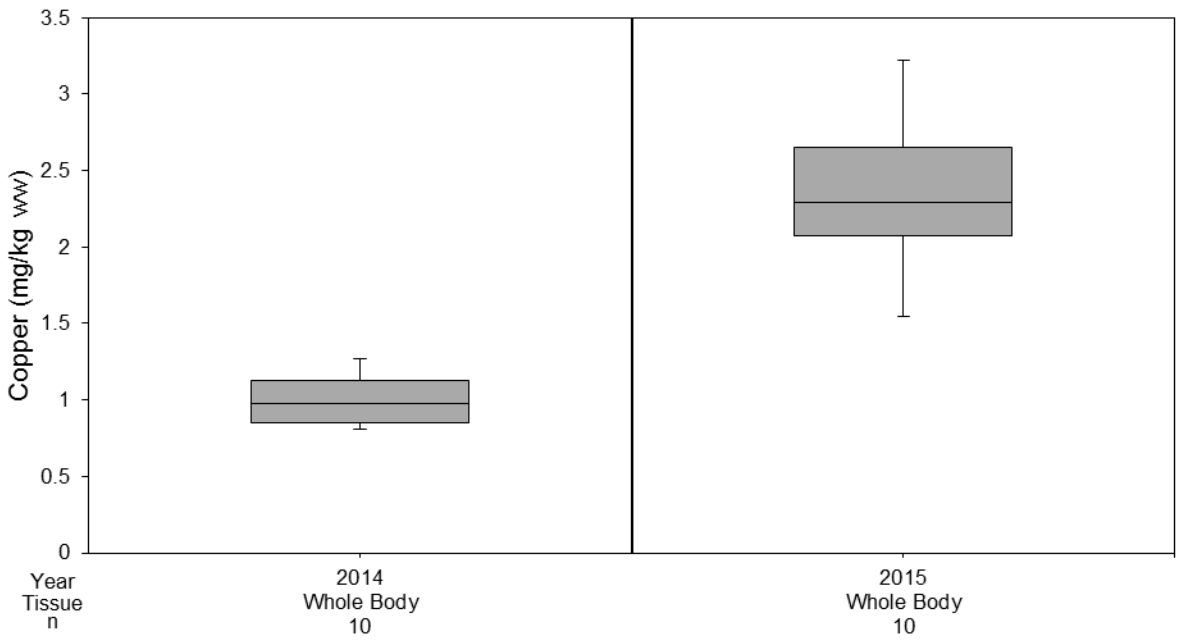
Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 411: Copper Concentrations in Sockeye Salmon Juvenile Tissues Collected from the Quesnel Lake – West in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

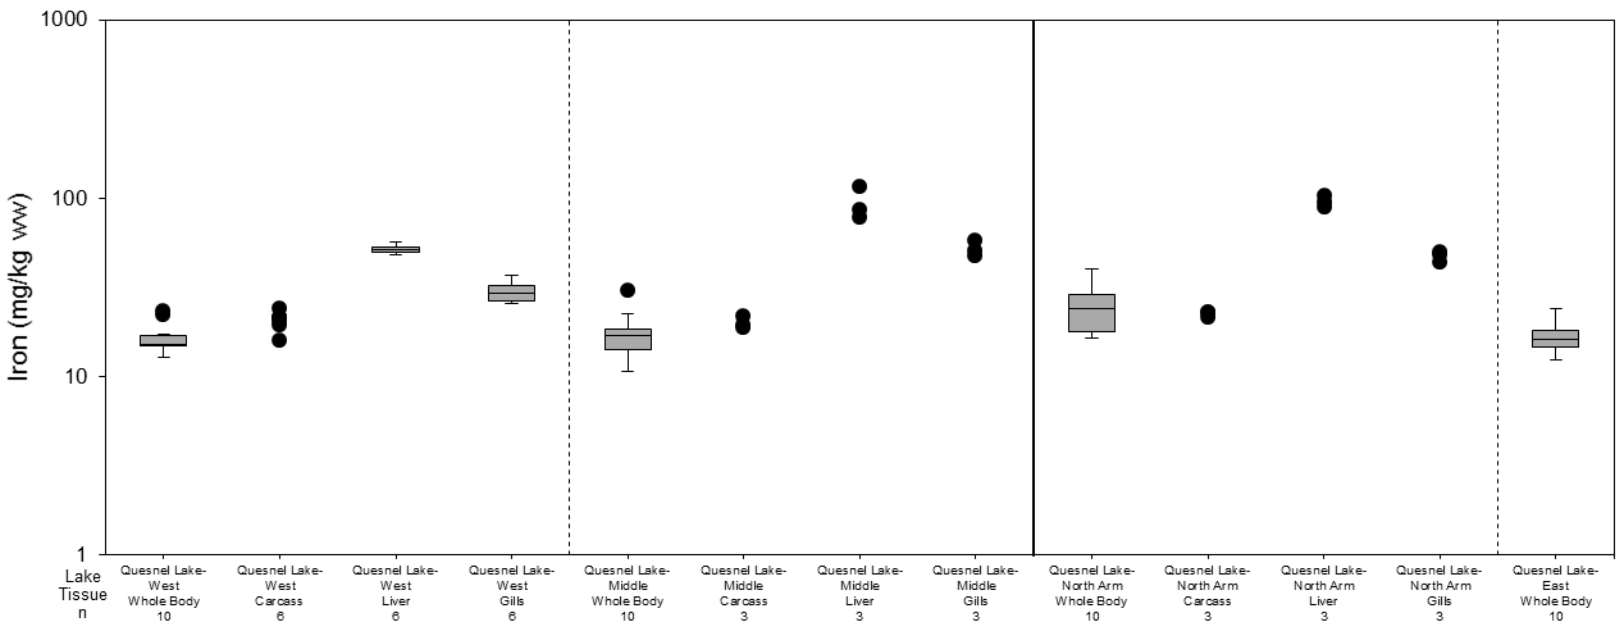
Figure 412: Copper Concentrations in Sockeye Salmon Juvenile Tissues Collected from the Quesnel Lake – Middle in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

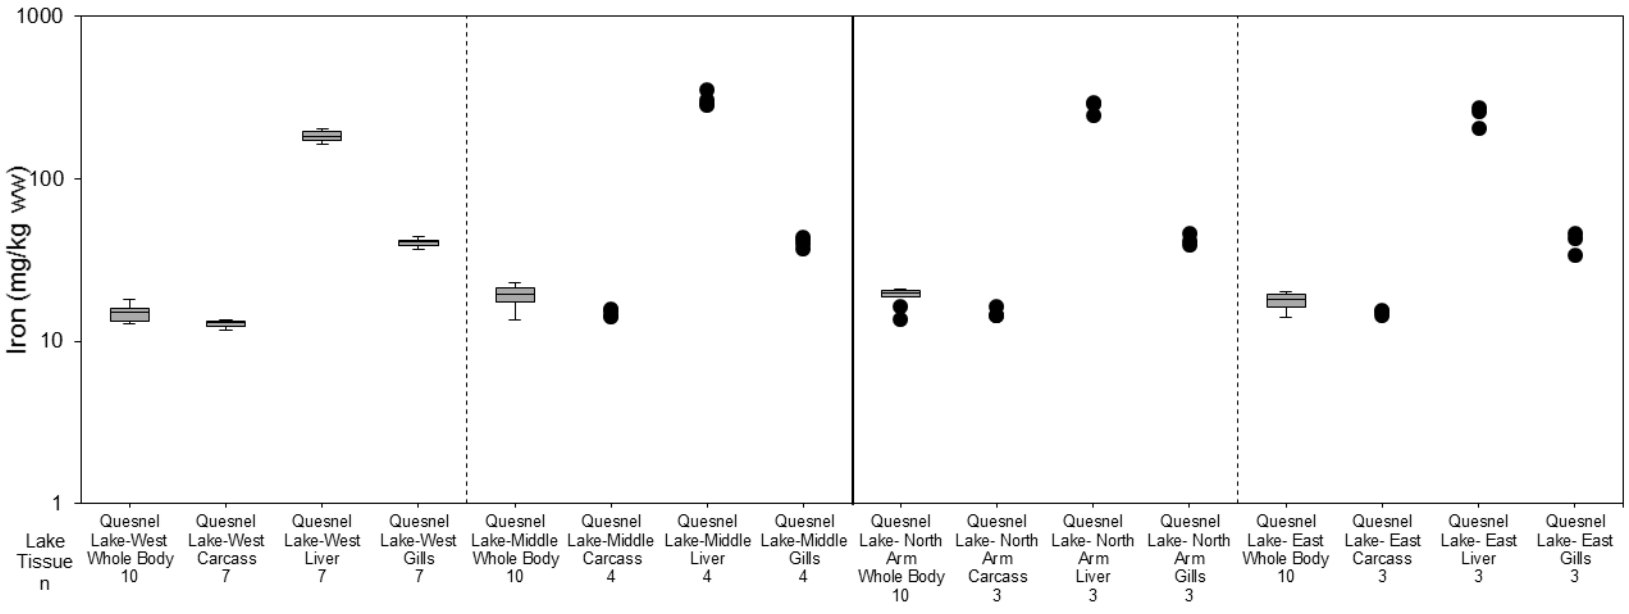
10.9 Iron

Figure 413: Iron Concentrations in Sockeye Salmon Juvenile Tissues Collected in 2014



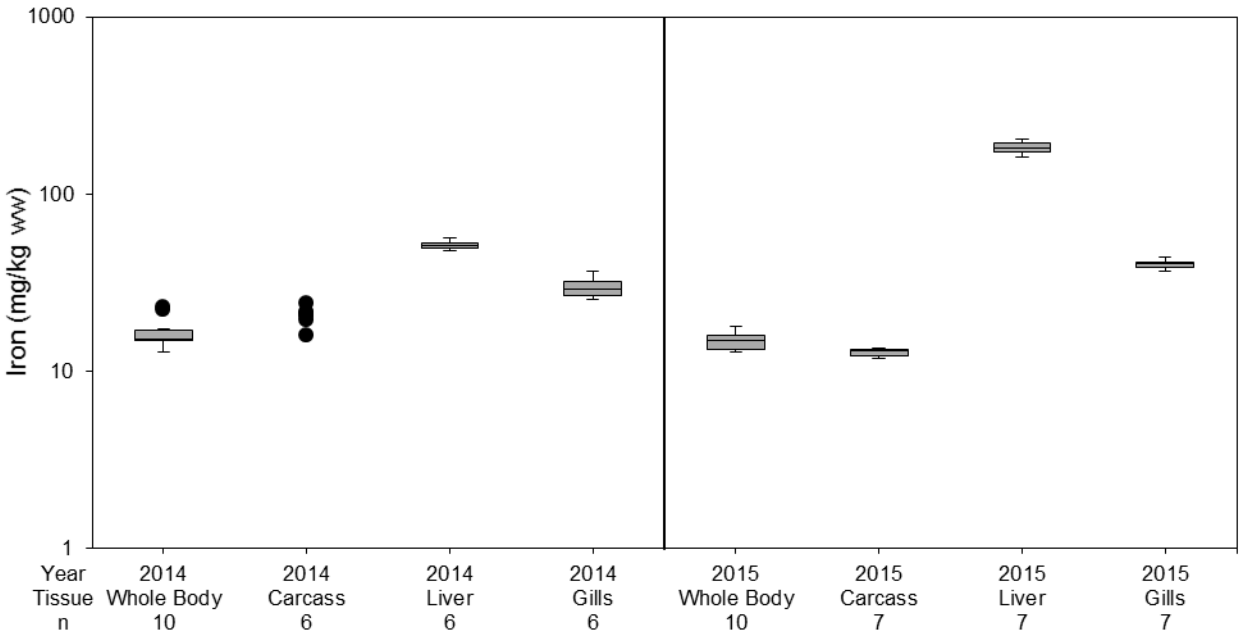
Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 414: Iron Concentrations in Sockeye Salmon Juvenile Tissues Collected in 2015



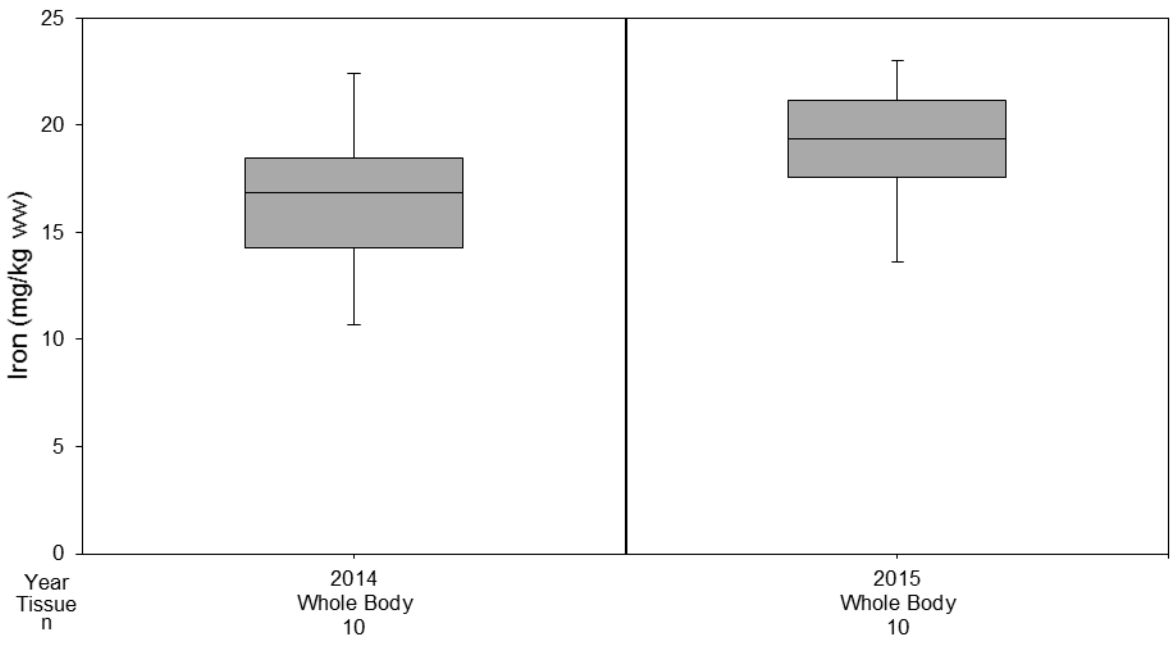
Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 415: Iron Concentrations in Sockeye Salmon Juvenile Tissues Collected from the Quesnel Lake – West in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

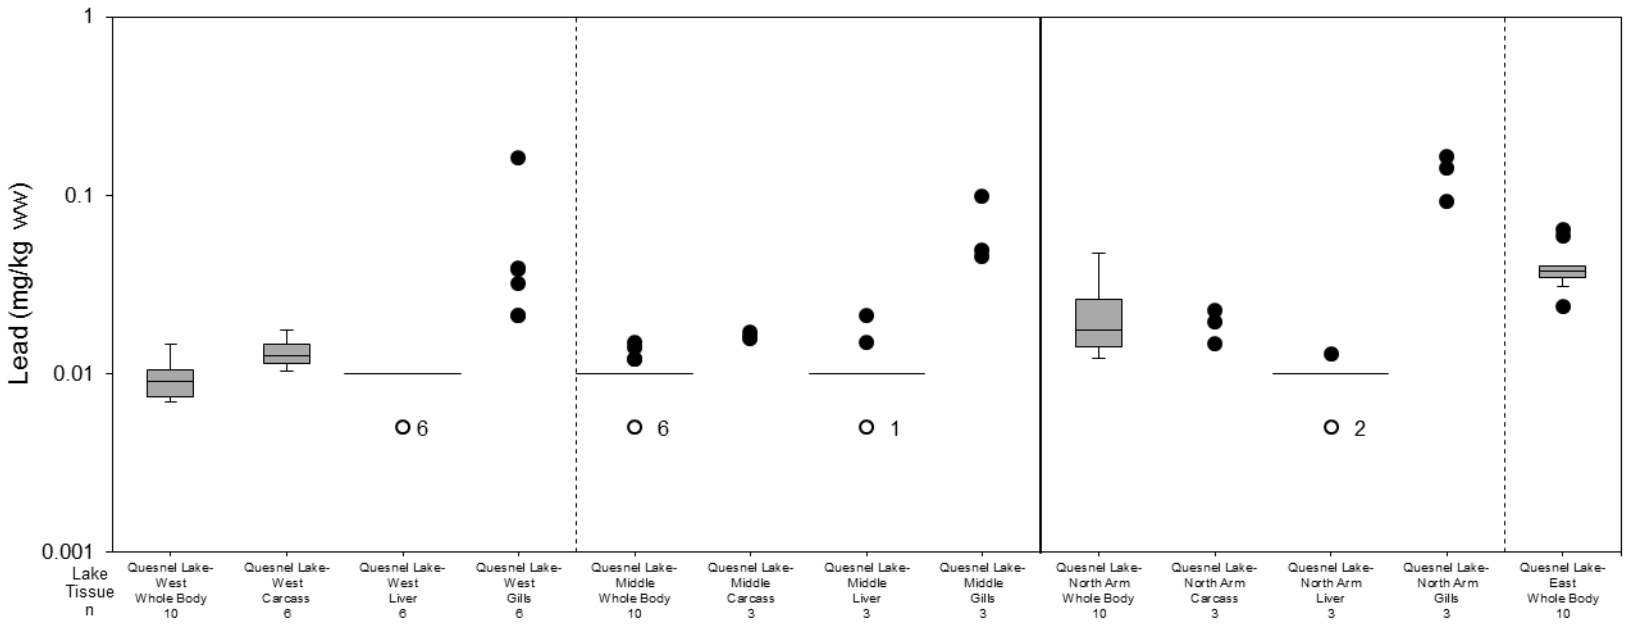
Figure 416: Iron Concentrations in Sockeye Salmon Juvenile Tissues Collected from the Quesnel Lake – Middle in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

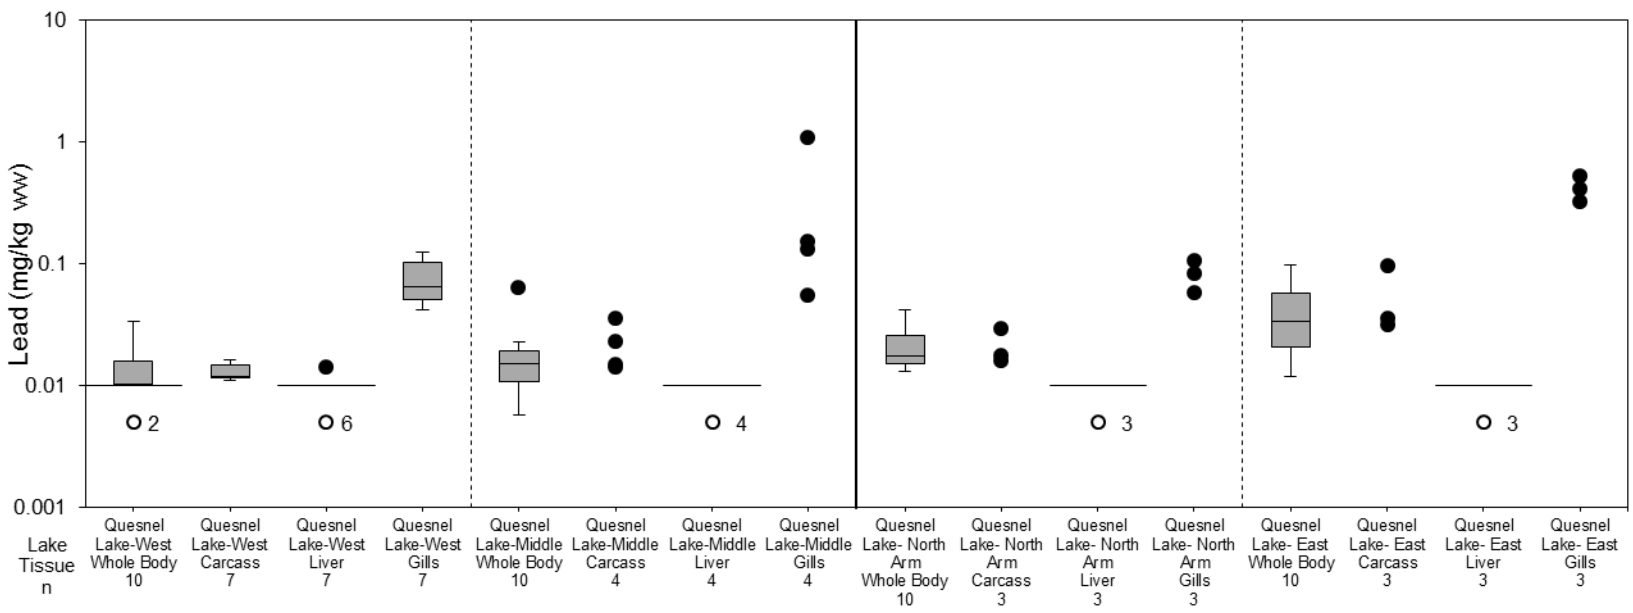
10.10 Lead

Figure 417: Lead Concentrations in Sockeye Salmon Juvenile Tissues Collected in 2014



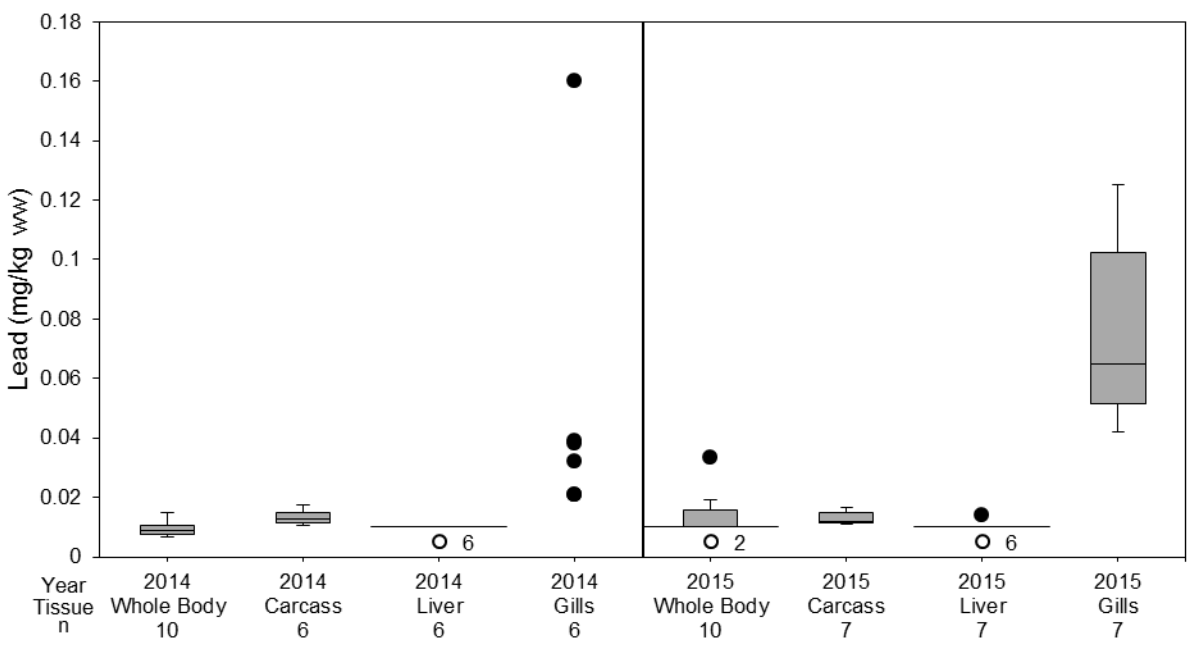
Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 418: Lead Concentrations in Sockeye Salmon Juvenile Tissues Collected in 2015



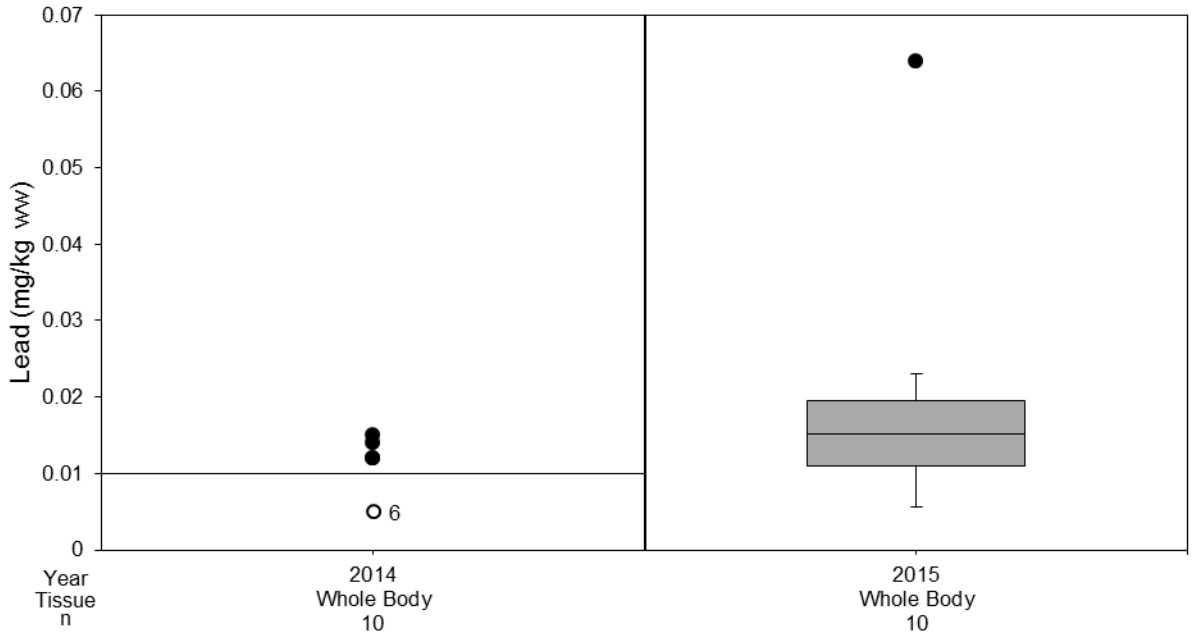
Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 419: Lead Concentrations in Sockeye Salmon Juvenile Tissues Collected from the Quesnel Lake – West in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

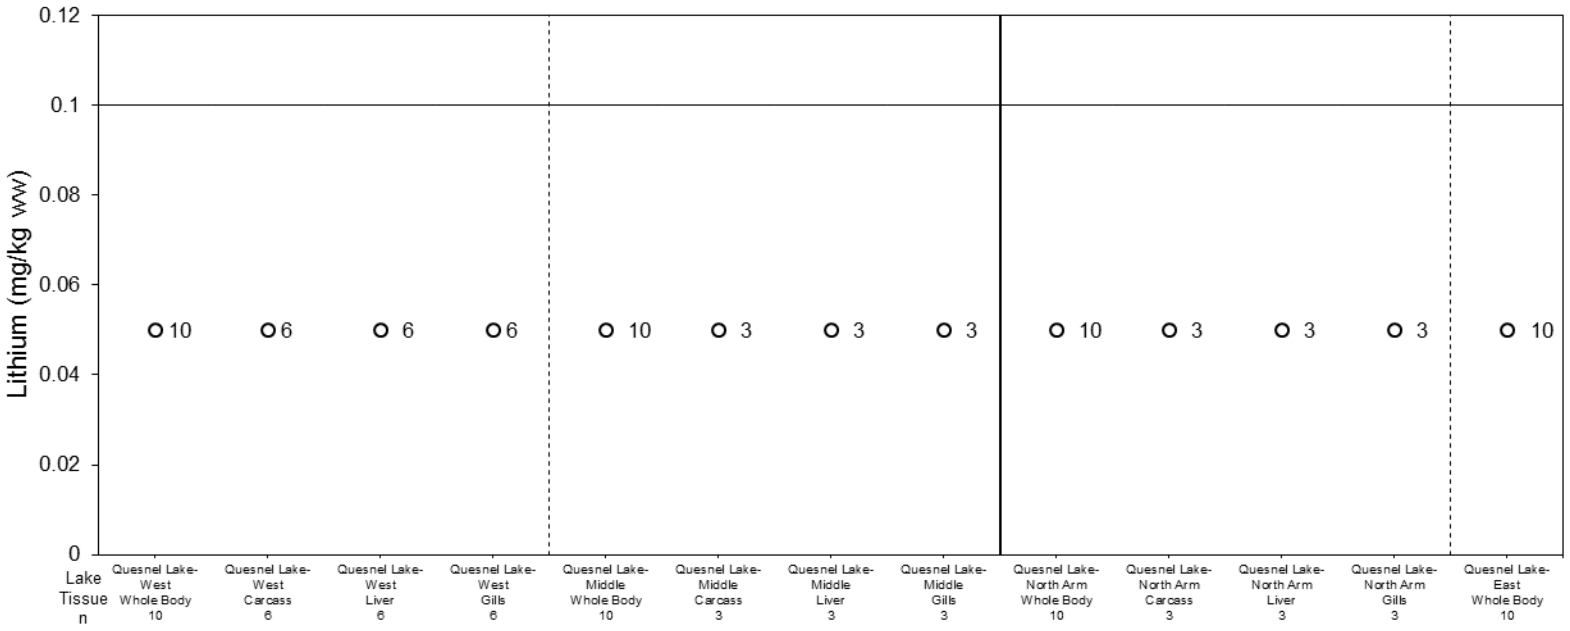
Figure 420: Lead Concentrations in Sockeye Salmon Juvenile Tissues Collected from the Quesnel Lake – Middle in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

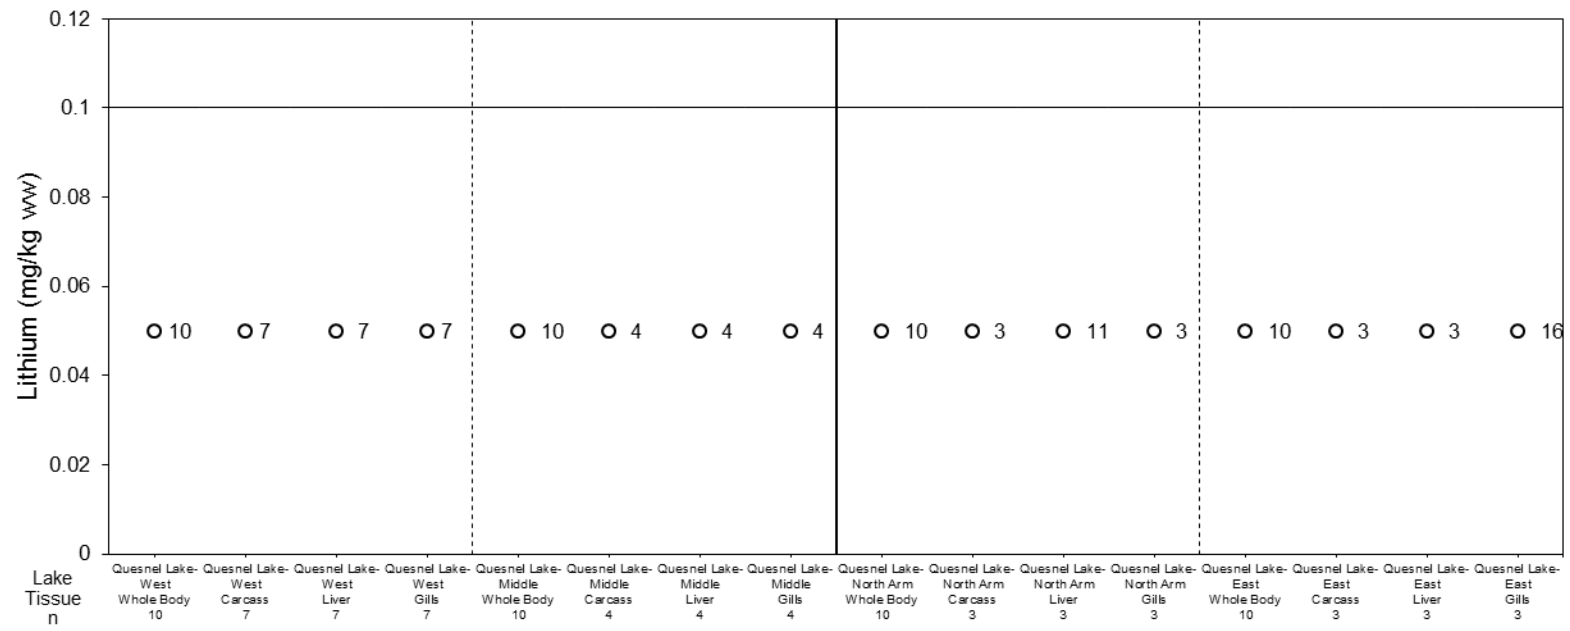
10.11 Lithium

Figure 421: Lithium Concentrations in Sockeye Salmon Juvenile Tissues Collected in 2014



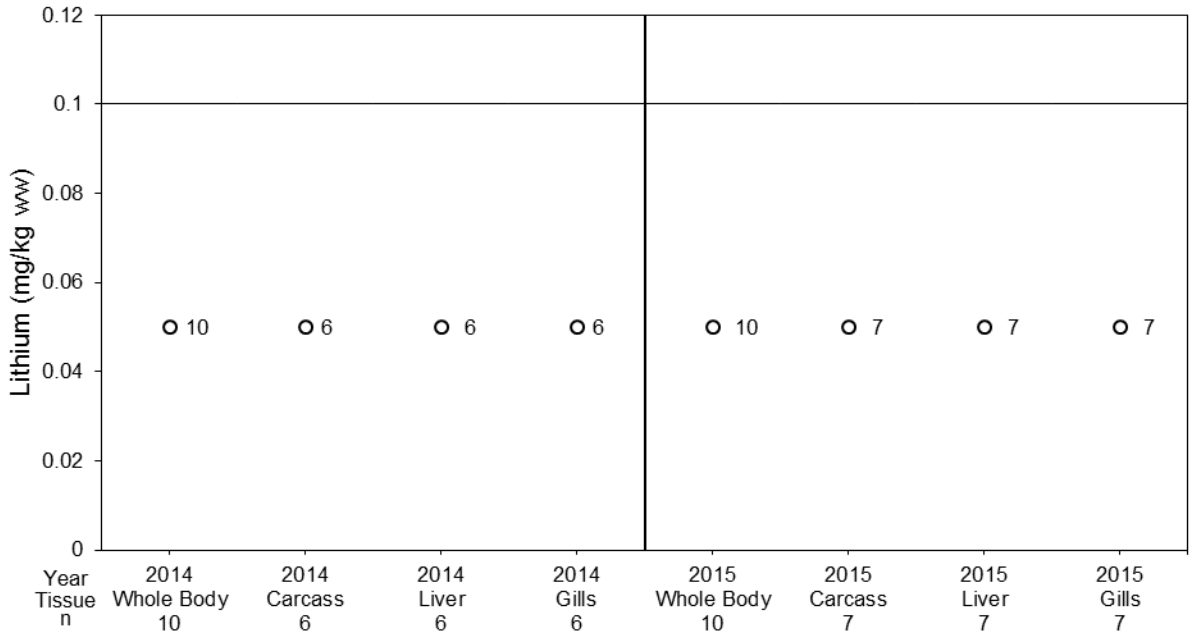
Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 422: Lithium Concentrations in Sockeye Salmon Juvenile Tissues Collected in 2015



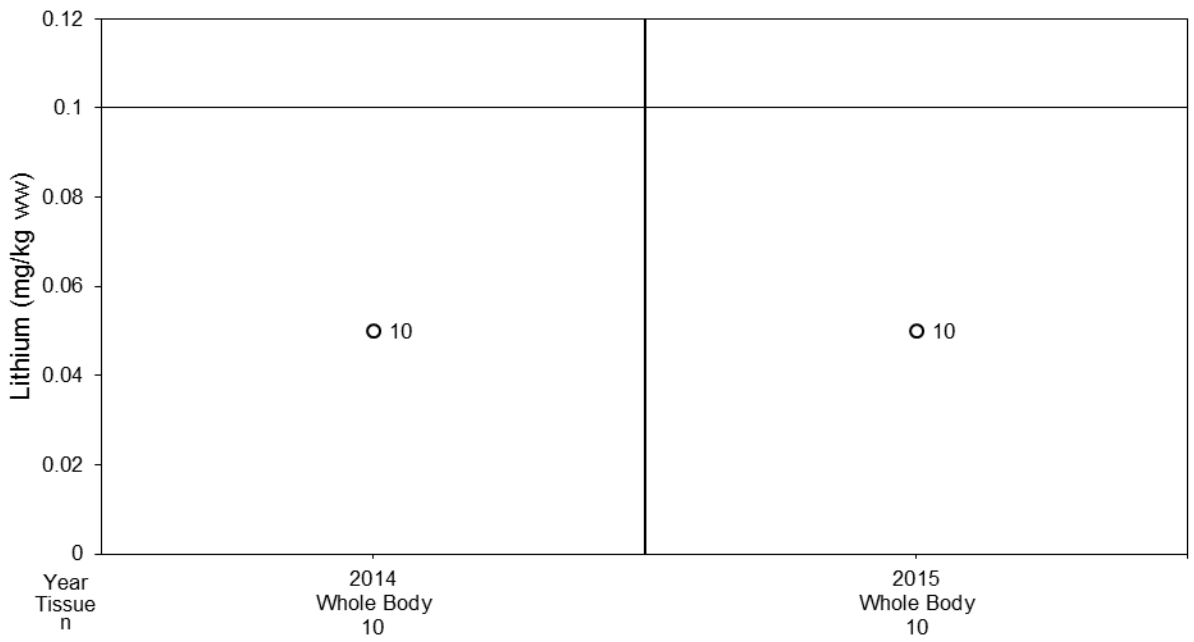
Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 423: Lithium Concentrations in Sockeye Salmon Juvenile Tissues Collected from the Quesnel Lake – West in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

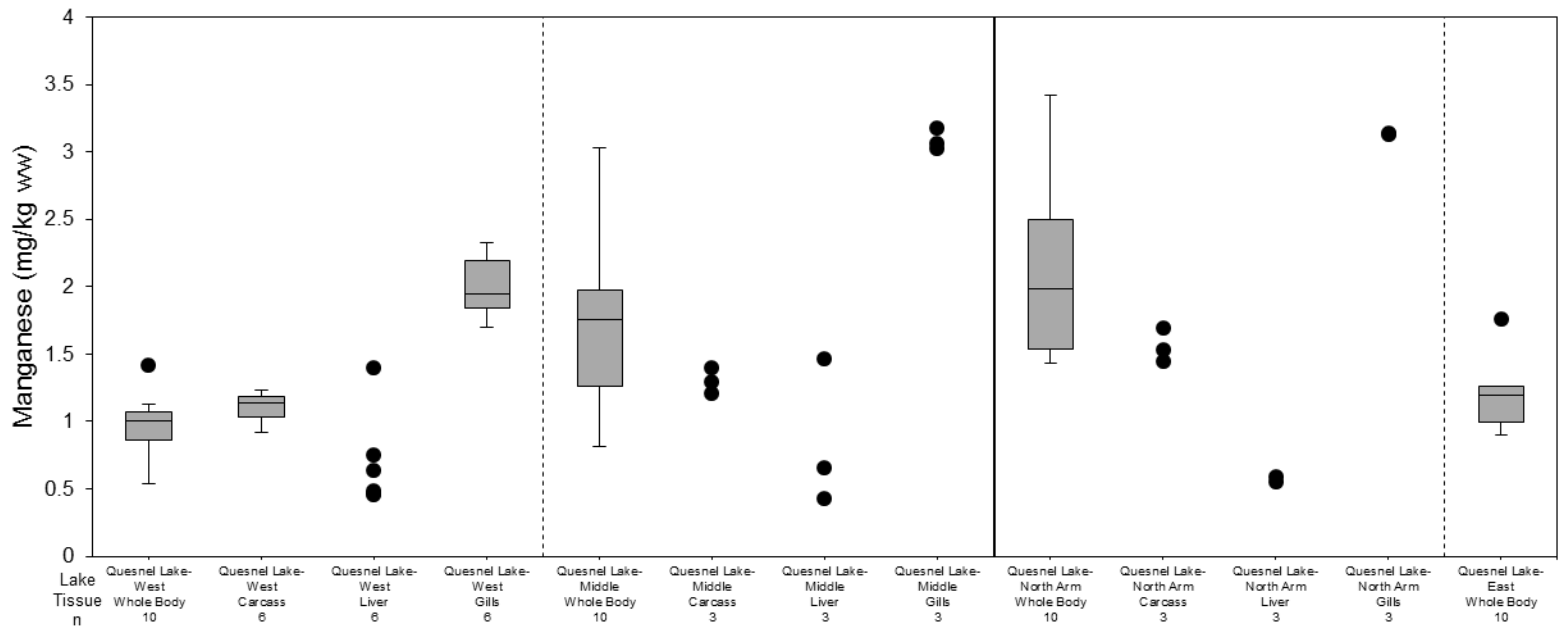
Figure 424: Lithium Concentrations in Sockeye Salmon Juvenile Tissues Collected from the Quesnel Lake – Middle in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

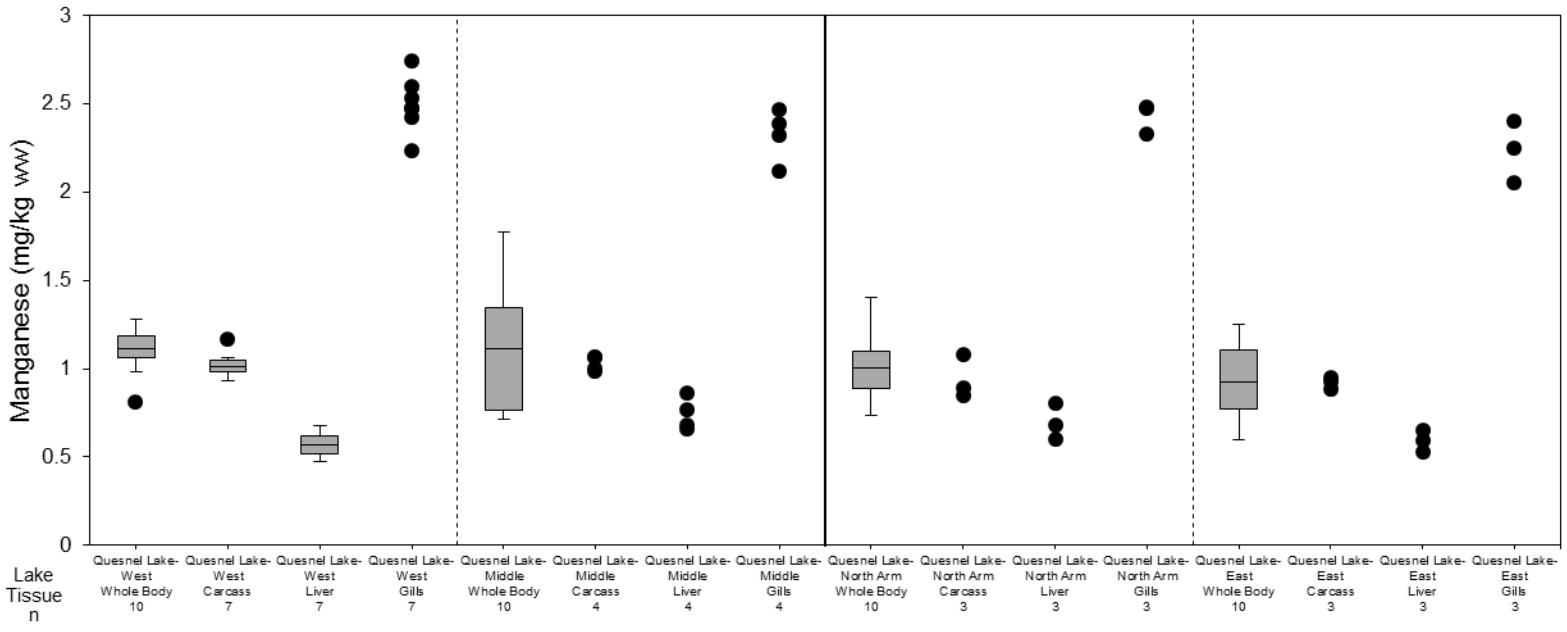
10.12 Manganese

Figure 425: Manganese Concentrations in Sockeye Salmon Juvenile Tissues Collected in 2014



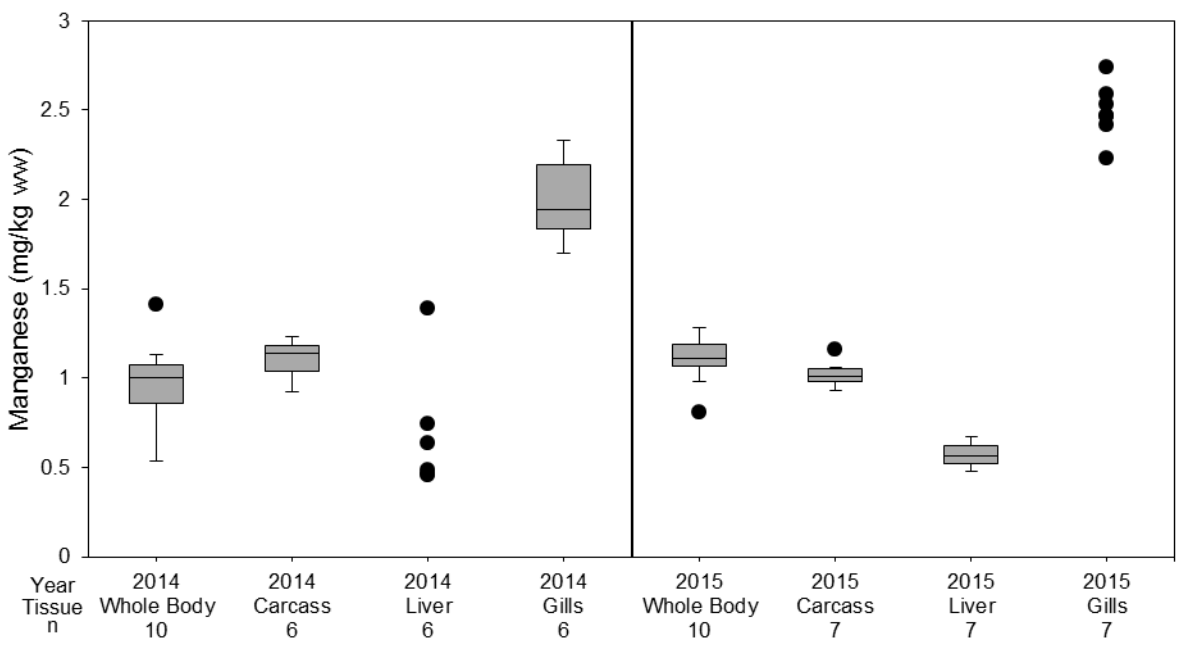
Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 426: Manganese Concentrations in Sockeye Salmon Juvenile Tissues Collected in 2015



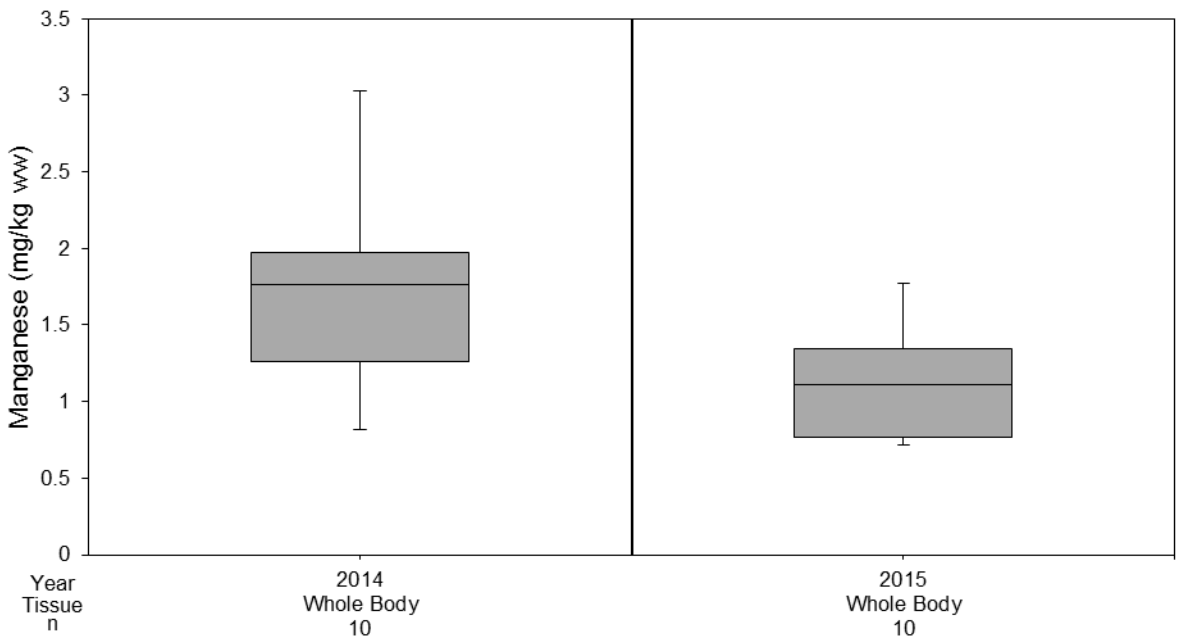
Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 427: Manganese Concentrations in Sockeye Salmon Juvenile Tissues Collected from the Quesnel Lake – West in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

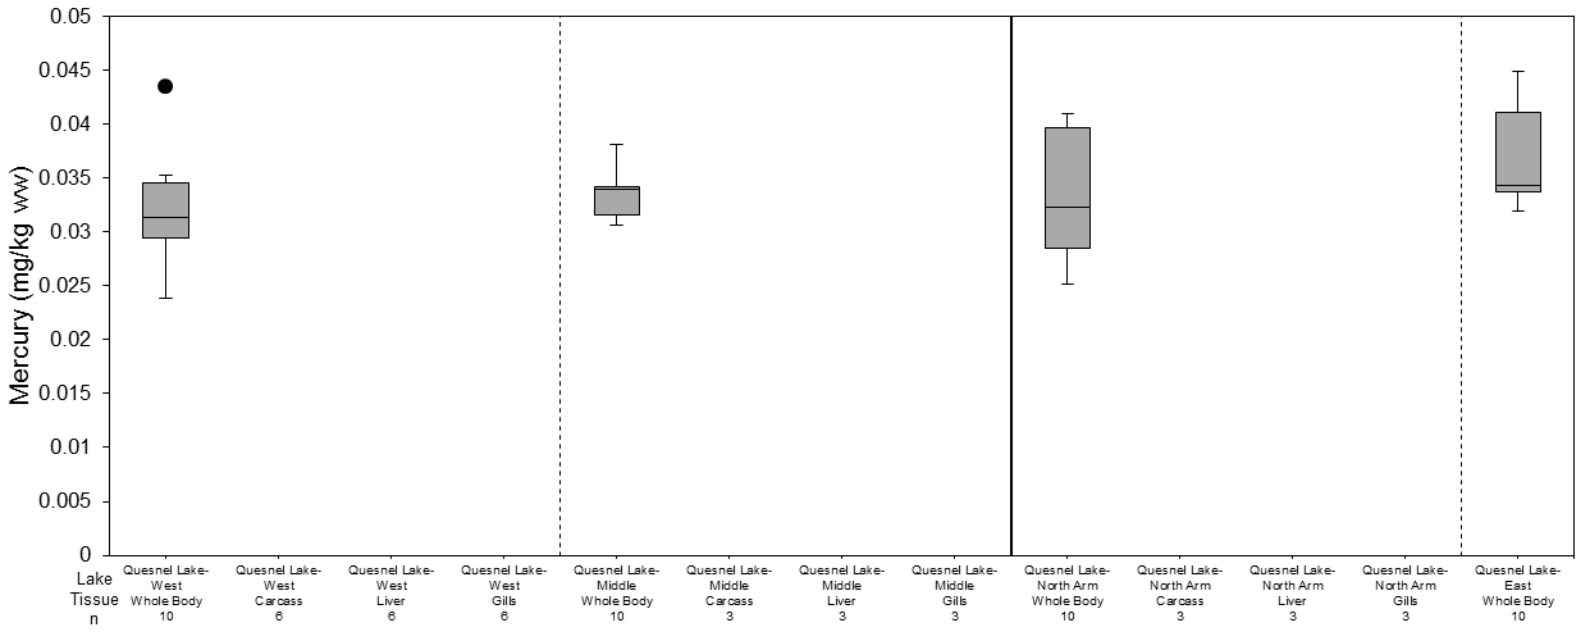
Figure 428: Manganese Concentrations in Sockeye Salmon Juvenile Tissues Collected from the Quesnel Lake – Middle in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

10.13 Mercury

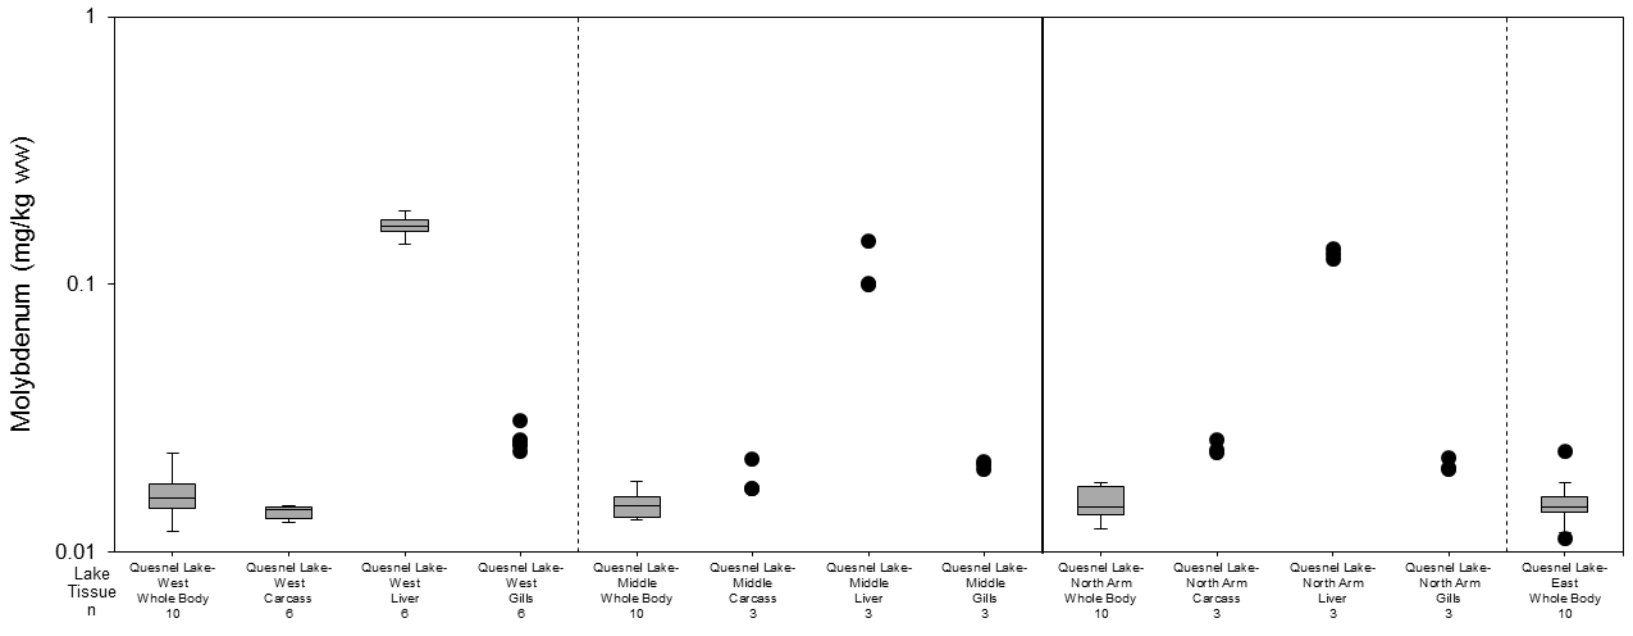
Figure 429: Mercury Concentrations in Sockeye Salmon Juvenile Tissues Collected in 2014



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years. Mercury data was not analyzed in 2015.

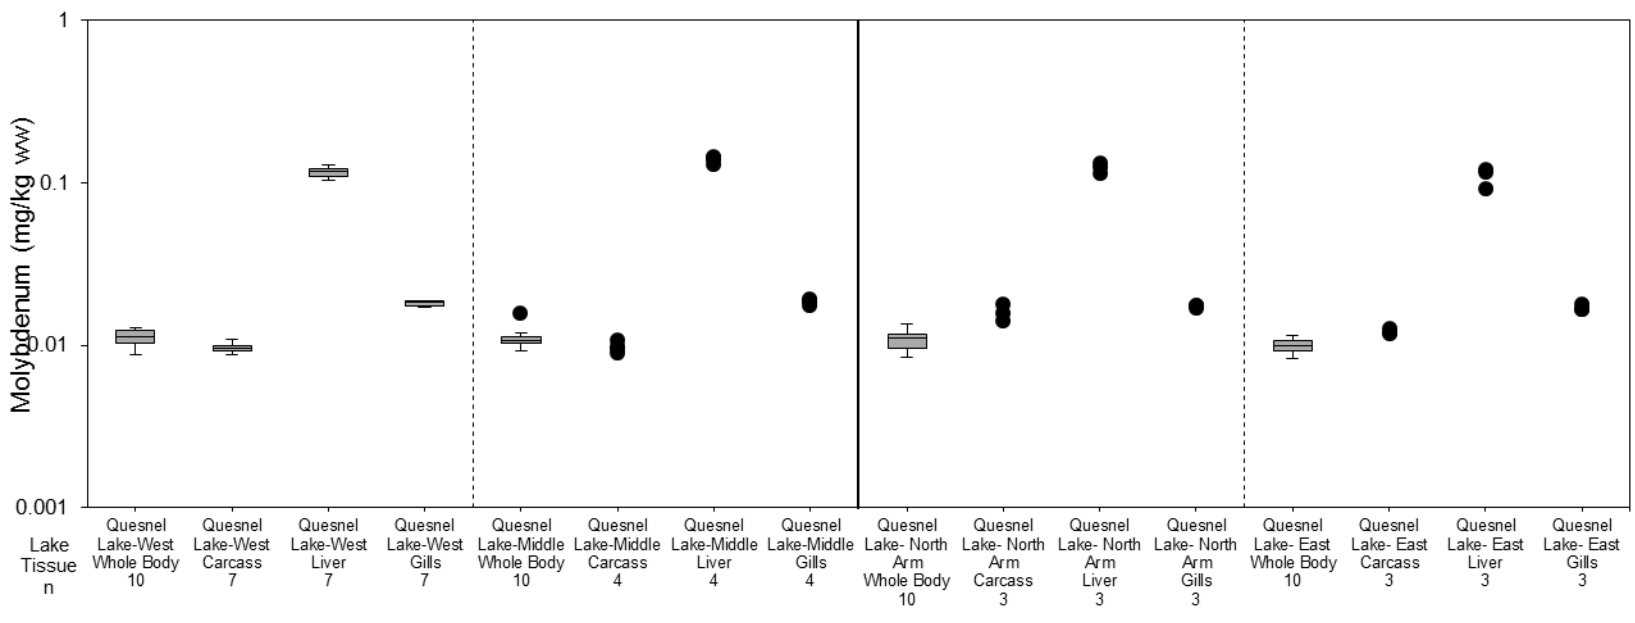
10.14 Molybdenum

Figure 430: Molybdenum Concentrations in Sockeye Salmon Juvenile Tissues Collected in 2014



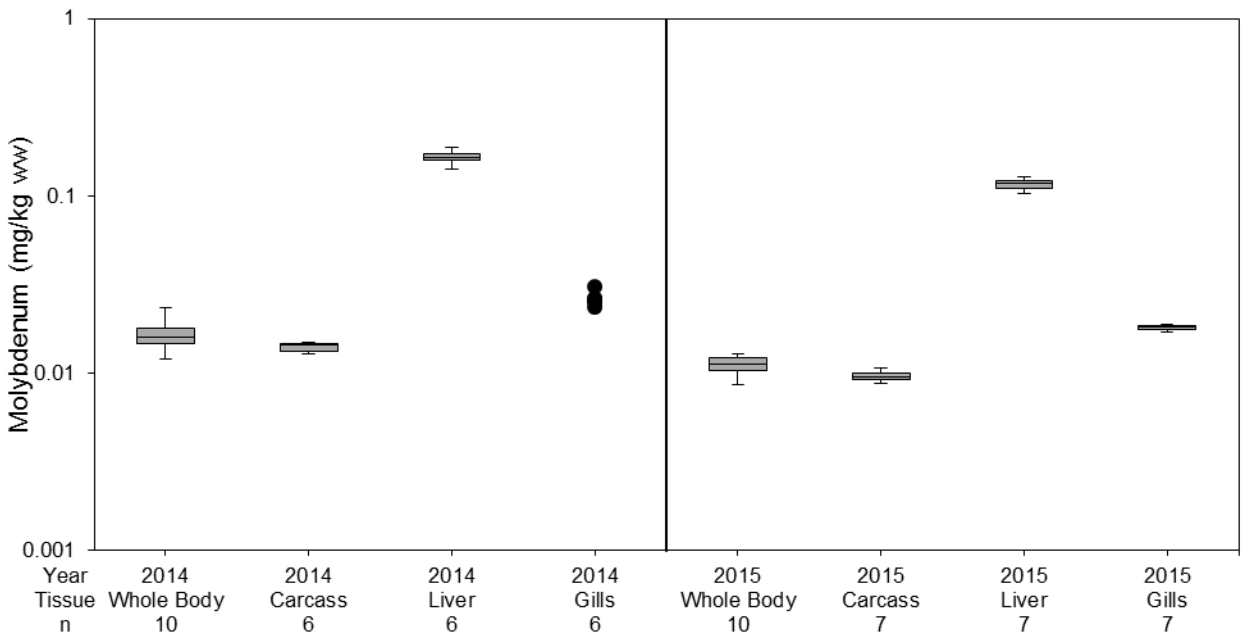
Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 431: Molybdenum Concentrations in Sockeye Salmon Juvenile Tissues Collected in 2015



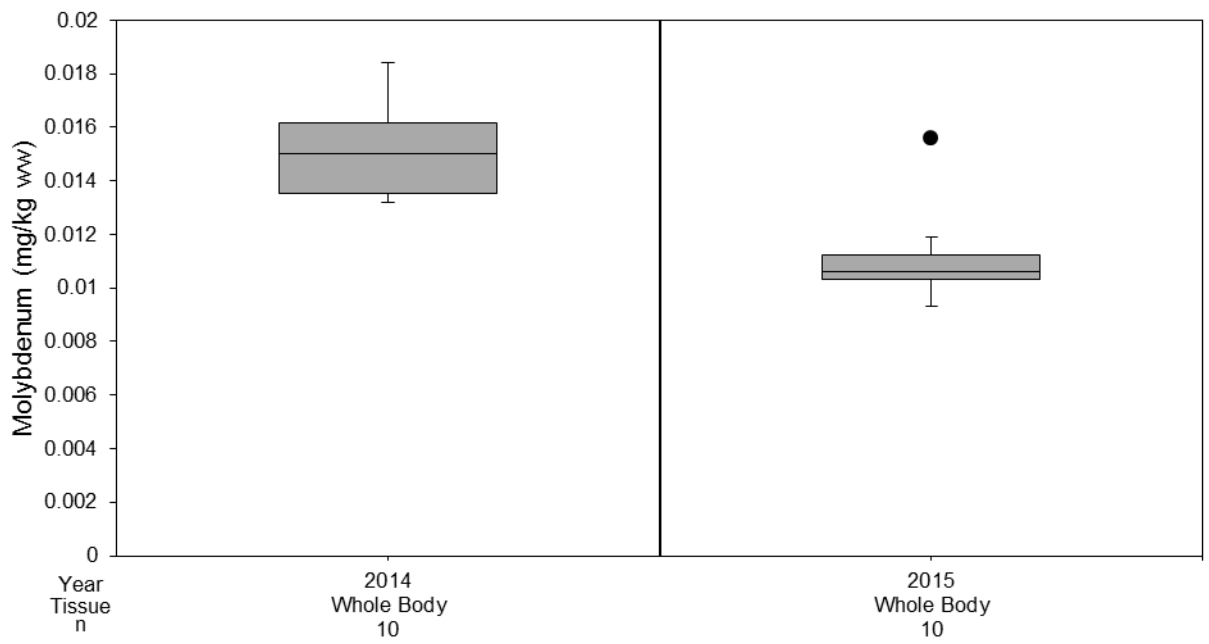
Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 432: Molybdenum Concentrations in Sockeye Salmon Juvenile Tissues Collected from the Quesnel Lake – West in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

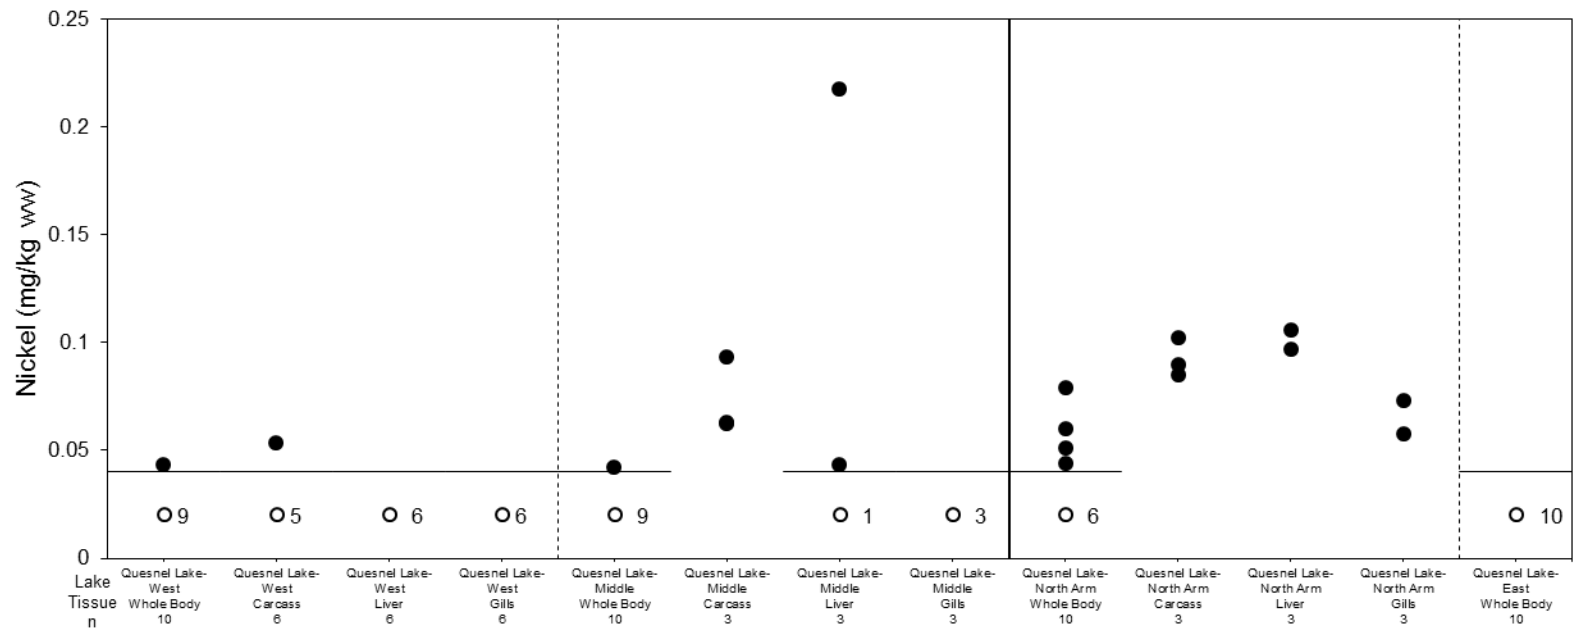
Figure 433: Molybdenum Concentrations in Sockeye Salmon Juvenile Tissues Collected from the Quesnel Lake – Middle in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

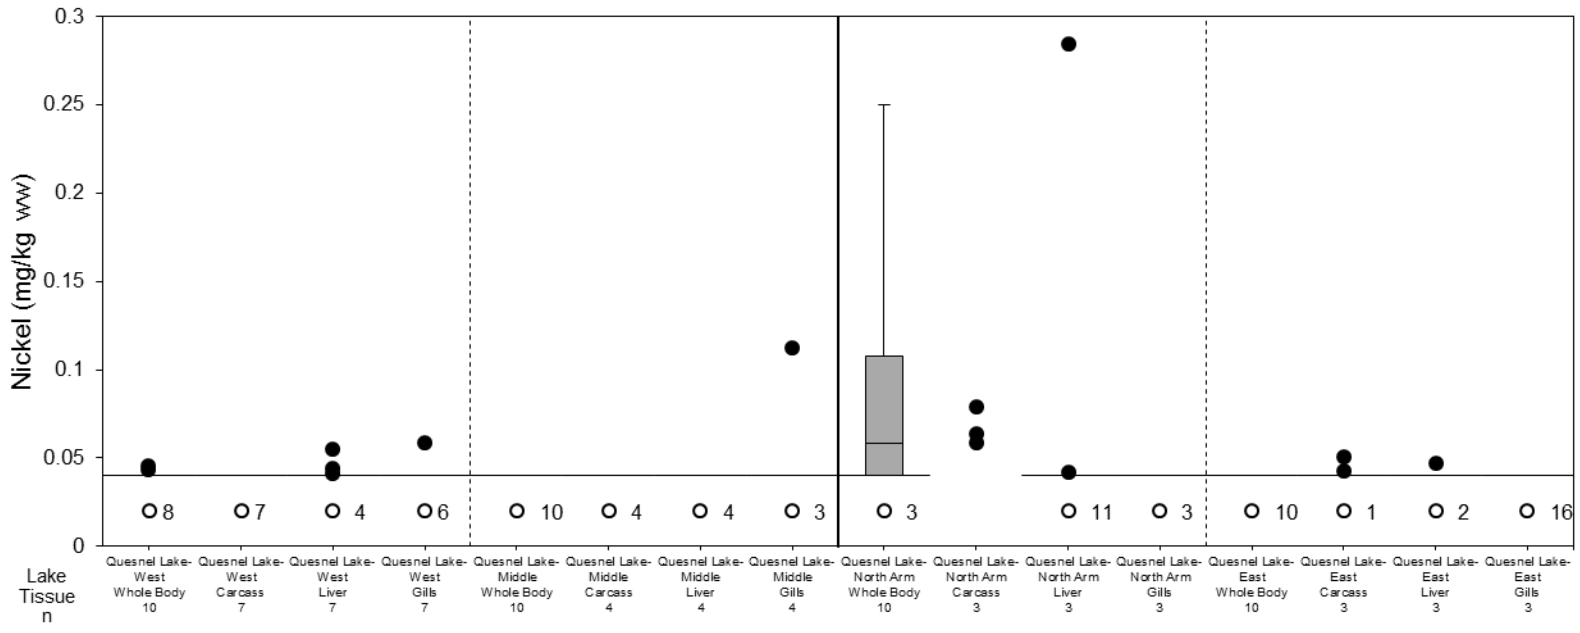
10.15 Nickel

Figure 434: Nickel Concentrations in Sockeye Salmon Juvenile Tissues Collected in 2014



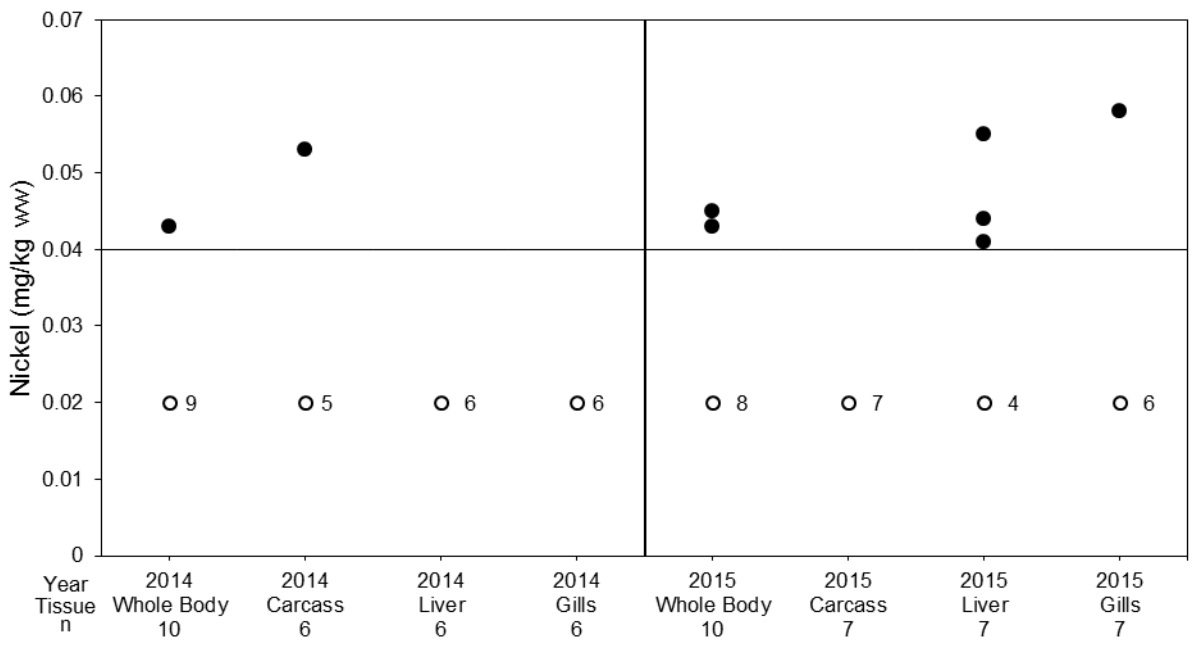
Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 435: Nickel Concentrations in Sockeye Salmon Juvenile Tissues Collected in 2015



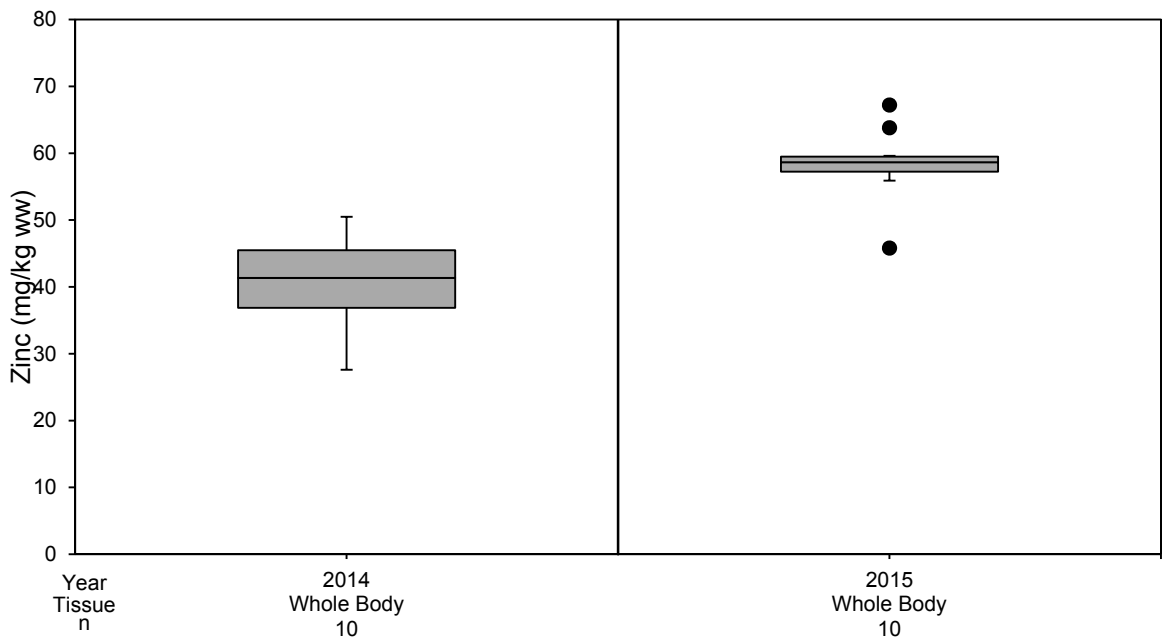
Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 436: Nickel Concentrations in Sockeye Salmon Juvenile Tissues Collected from the Quesnel Lake – West in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

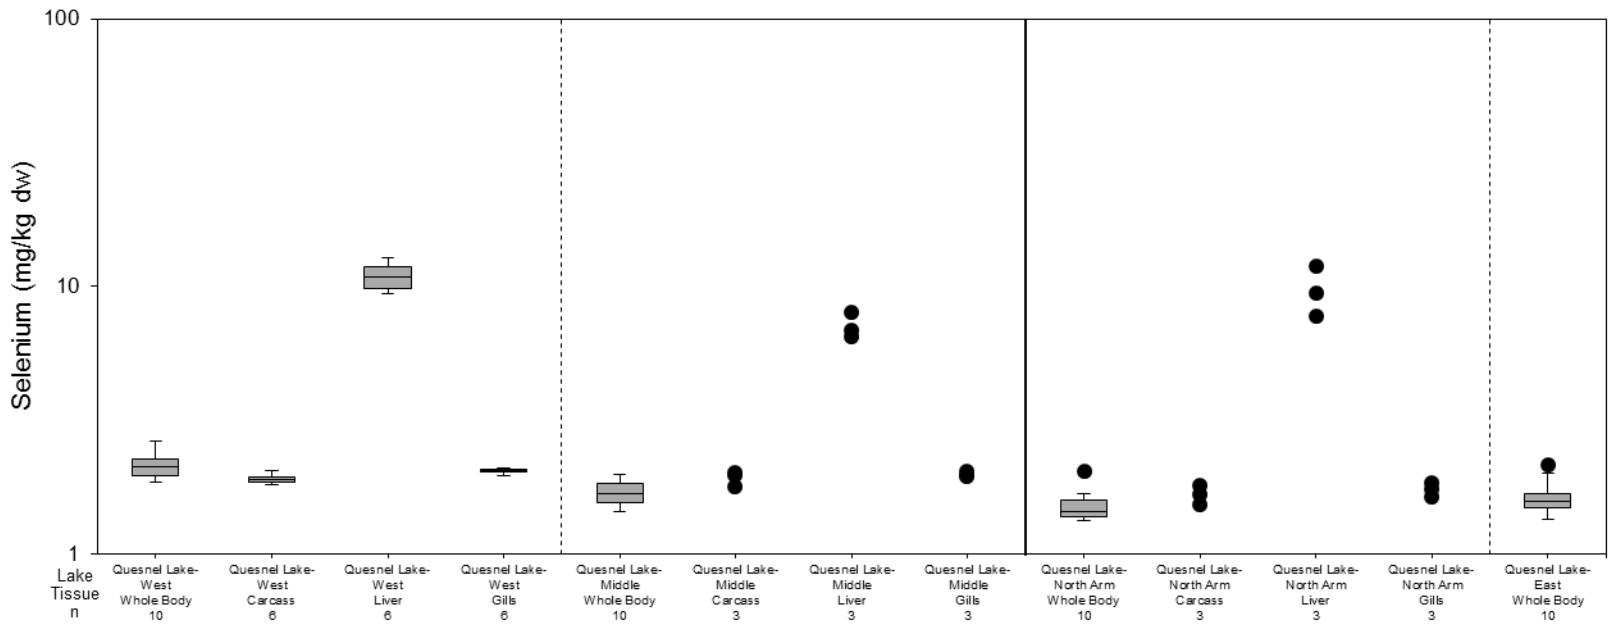
Figure 437: Nickel Concentrations in Sockeye Salmon Juvenile Tissues Collected from the Quesnel Lake – Middle in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

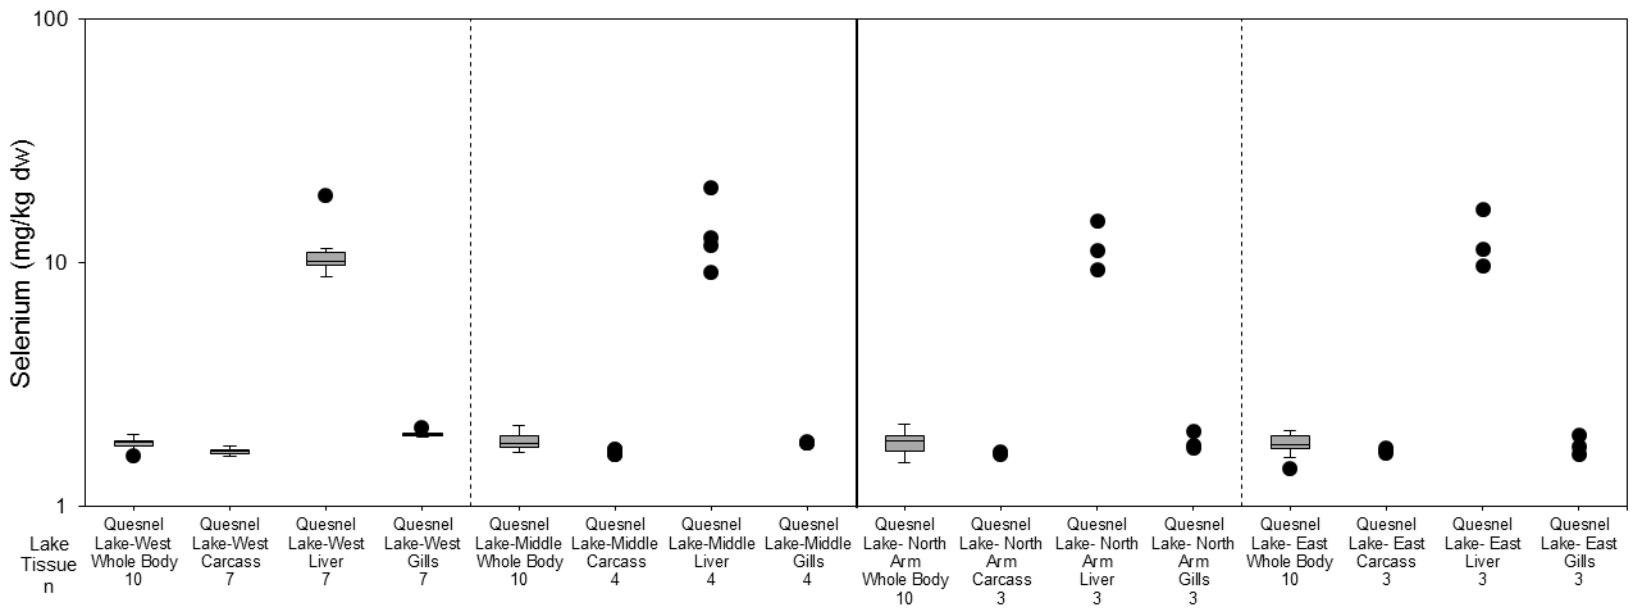
10.16 Selenium

Figure 438: Selenium Concentrations in Sockeye Salmon Juvenile Tissues Collected in 2014



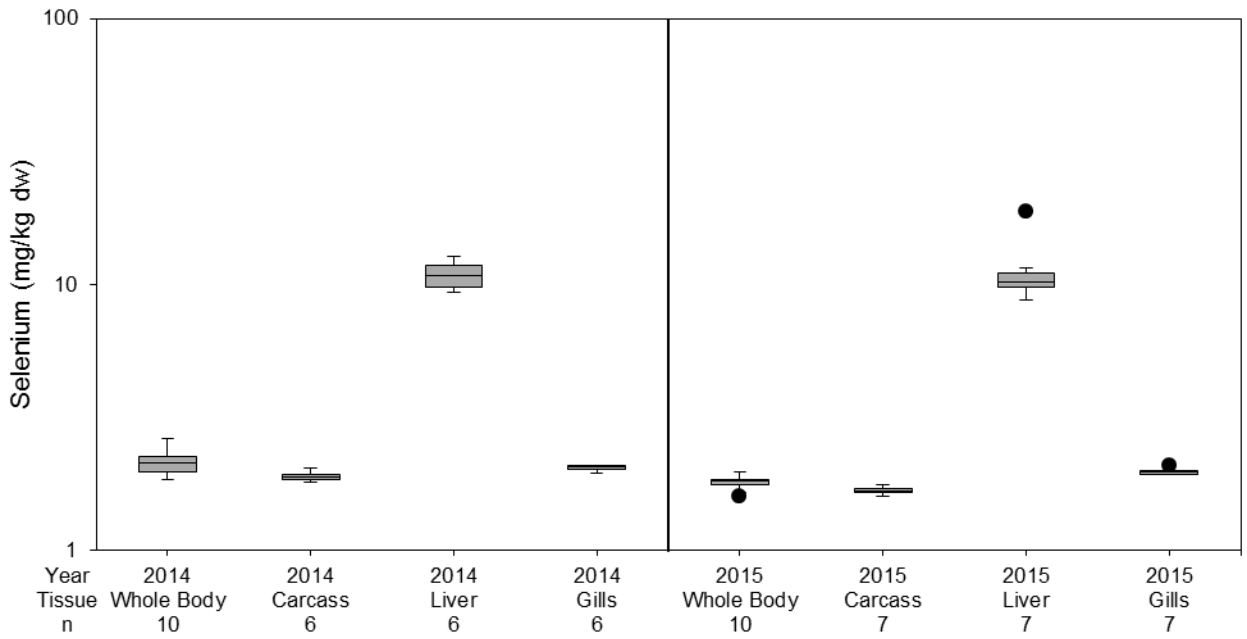
Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg dw = milligrams per kilogram dry weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 439: Selenium Concentrations in Sockeye Salmon Juvenile Tissues Collected in 2015



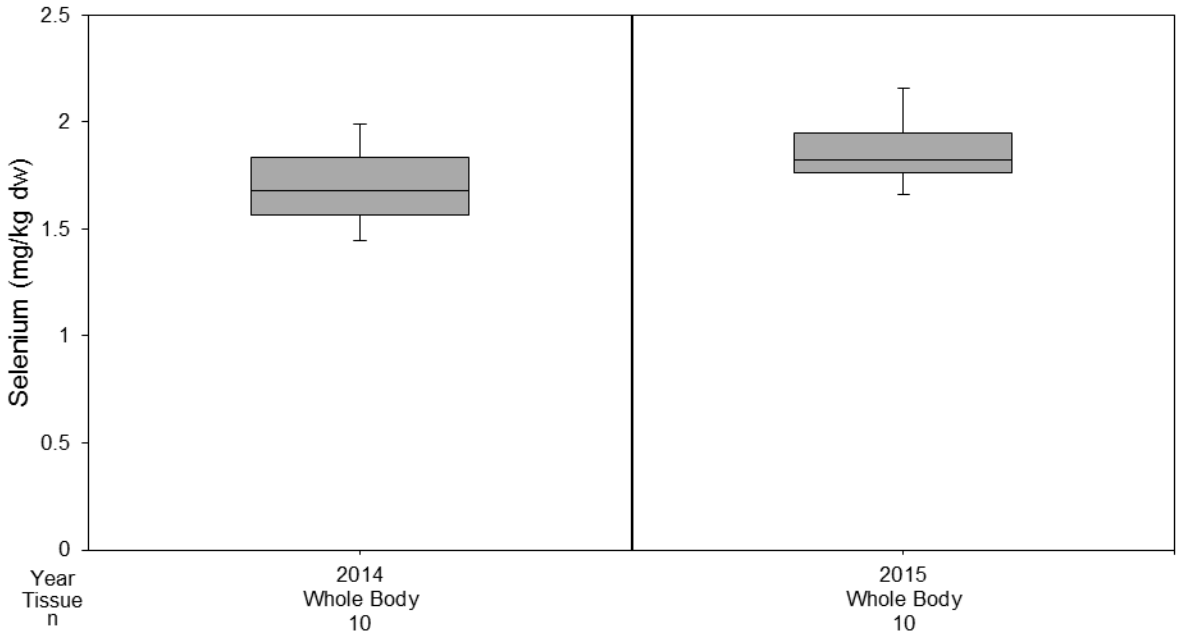
Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg dw = milligrams per kilogram dry weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

Figure 440: Selenium Concentrations in Sockeye Salmon Juvenile Tissues Collected from the Quesnel Lake – West in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg dw = milligrams per kilogram dry weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years; y-axis is a logarithmic scale.

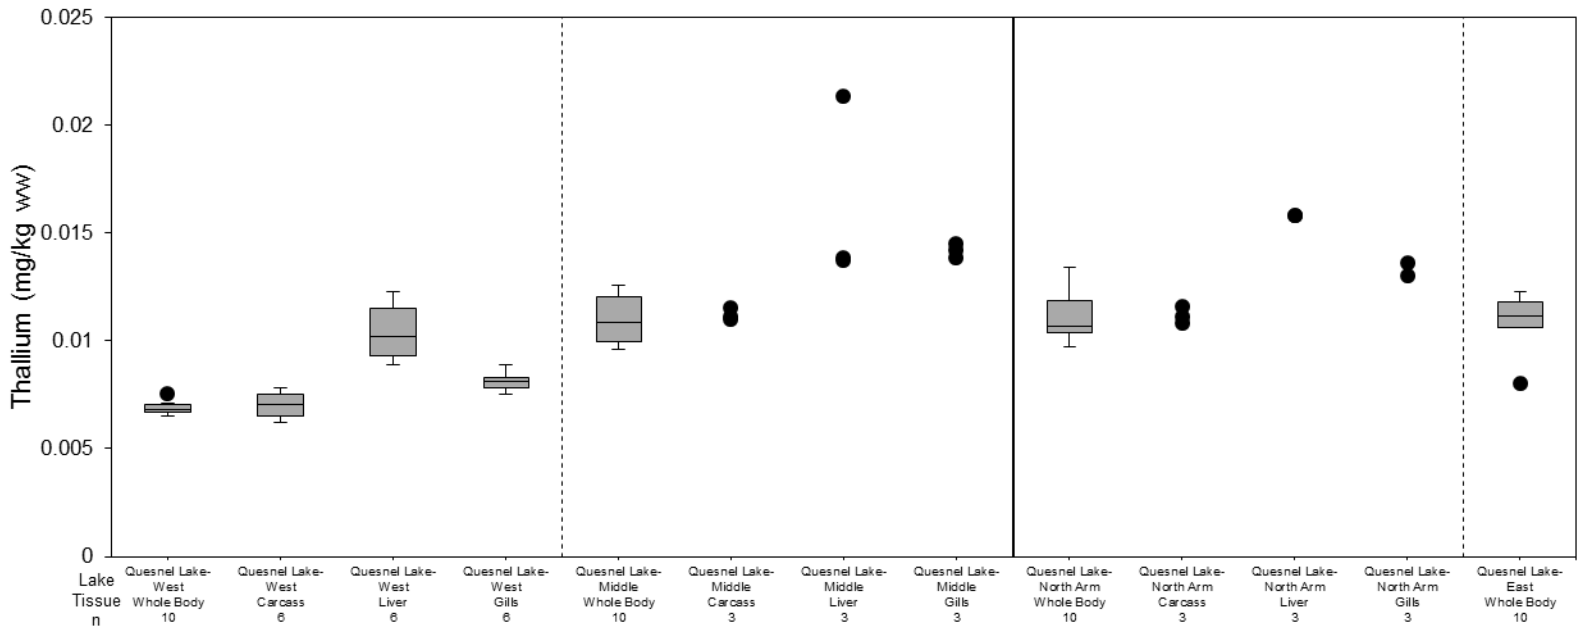
Figure 441: Selenium Concentrations in Sockeye Salmon Juvenile Tissues Collected from the Quesnel Lake – Middle in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg dw = milligrams per kilogram dry weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

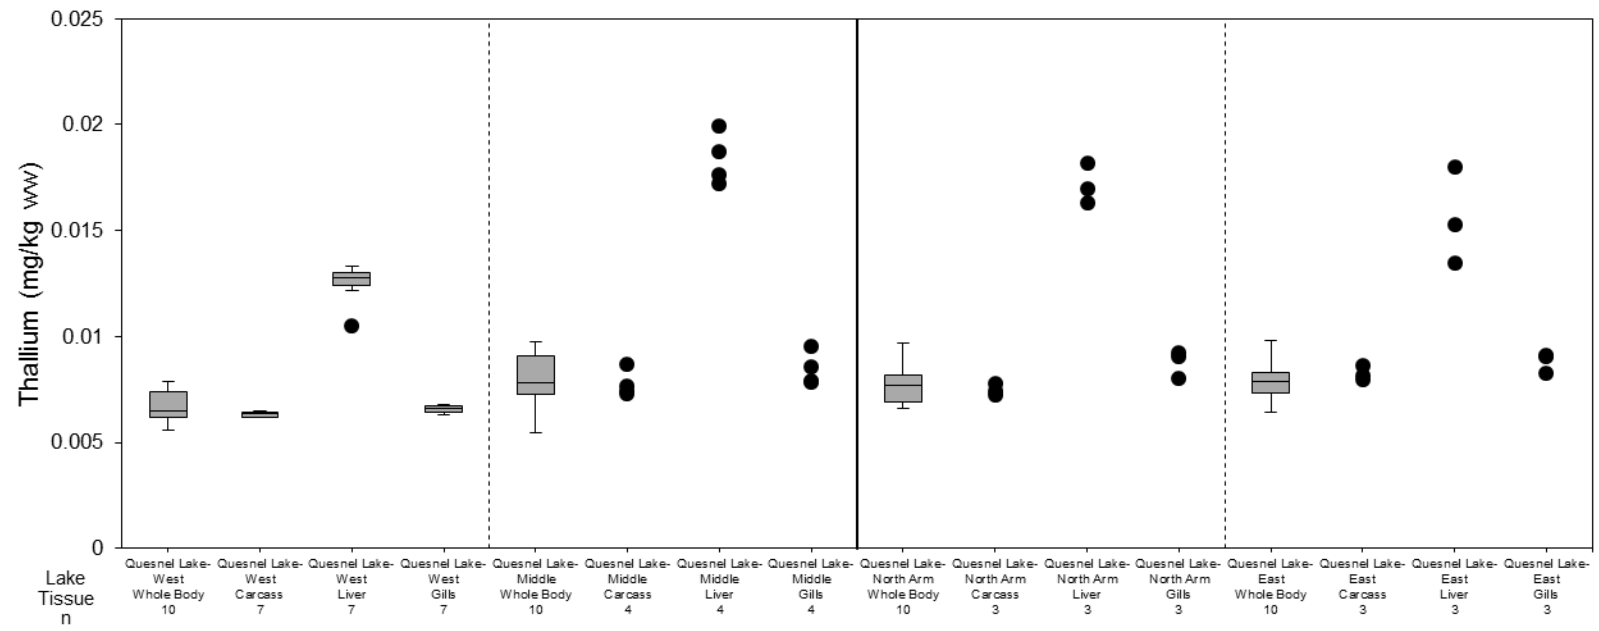
10.17 Thallium

Figure 442: Thallium Concentrations in Sockeye Salmon Juvenile Tissues Collected in 2014



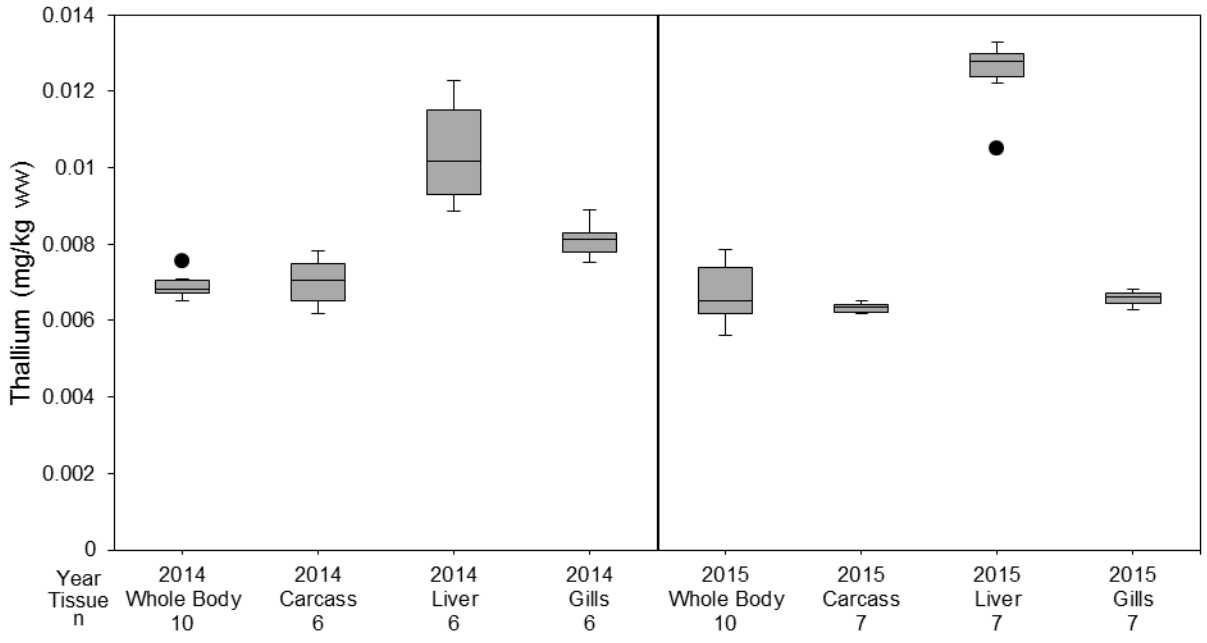
Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 443: Thallium Concentrations in Sockeye Salmon Juvenile Tissues Collected in 2015



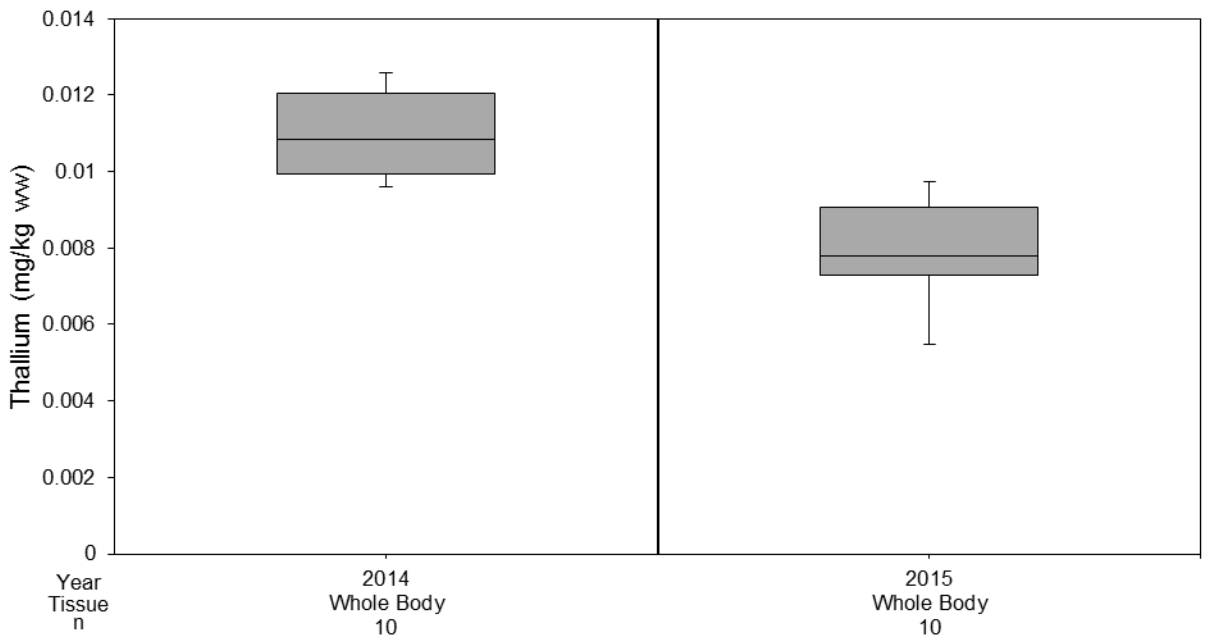
Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 444: Thallium Concentrations in Sockeye Salmon Juvenile Tissues Collected from the Quesnel Lake – West in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

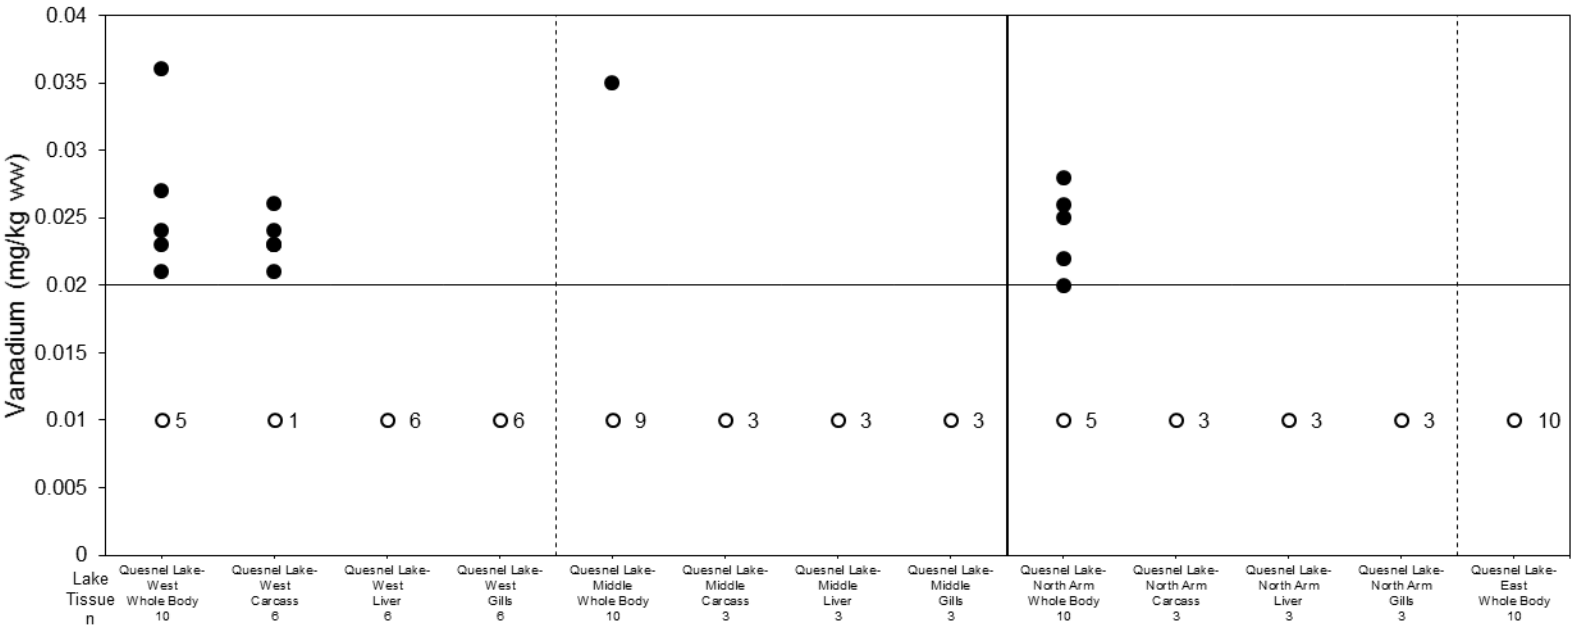
Figure 445: Thallium Concentrations in Sockeye Salmon Juvenile Tissues Collected from the Quesnel Lake – Middle in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

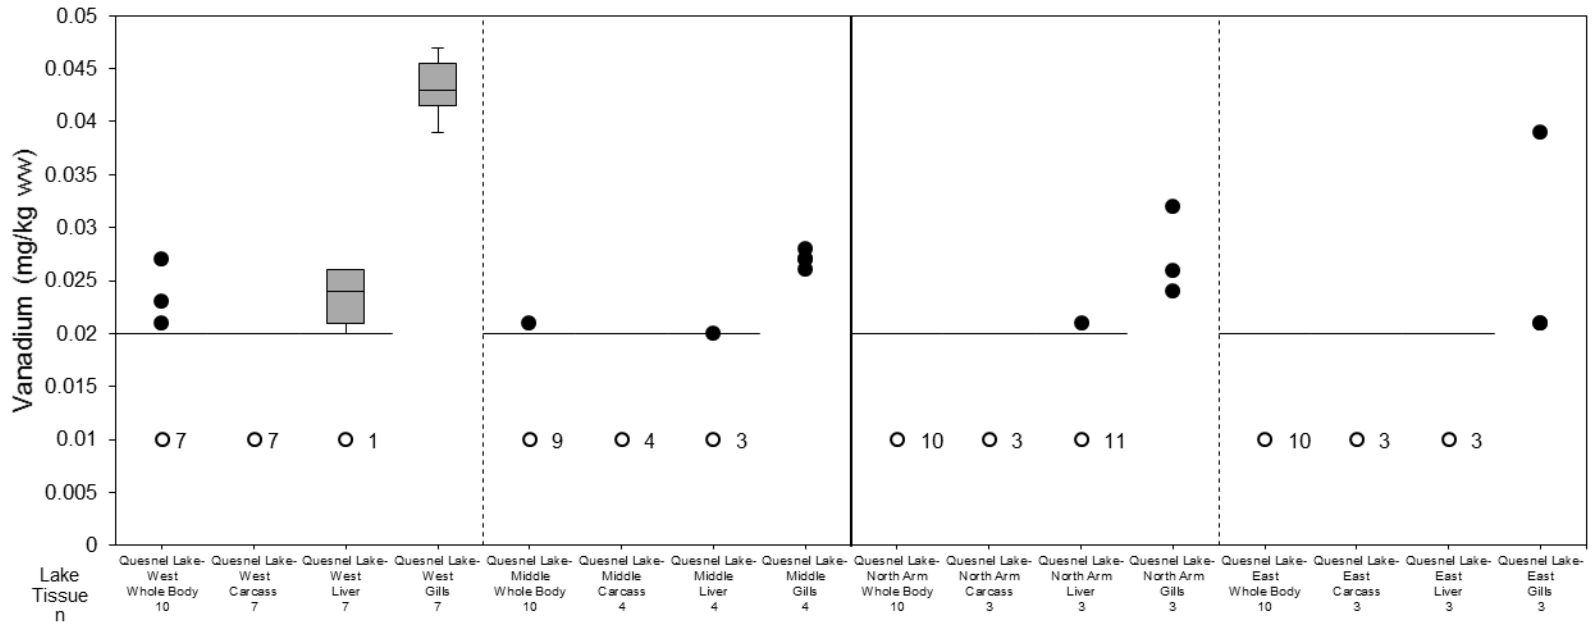
10.18 Vanadium

Figure 446: Vanadium Concentrations in Sockeye Salmon Juvenile Tissues Collected in 2014



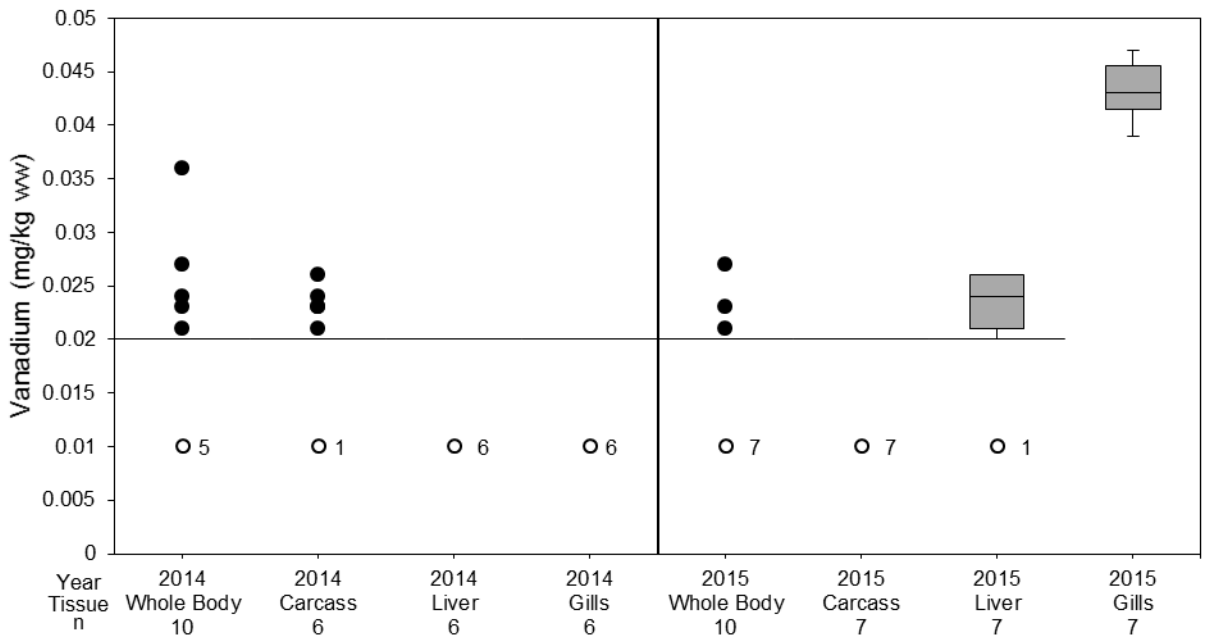
Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 447: Vanadium Concentrations in Sockeye Salmon Juvenile Tissues Collected in 2015



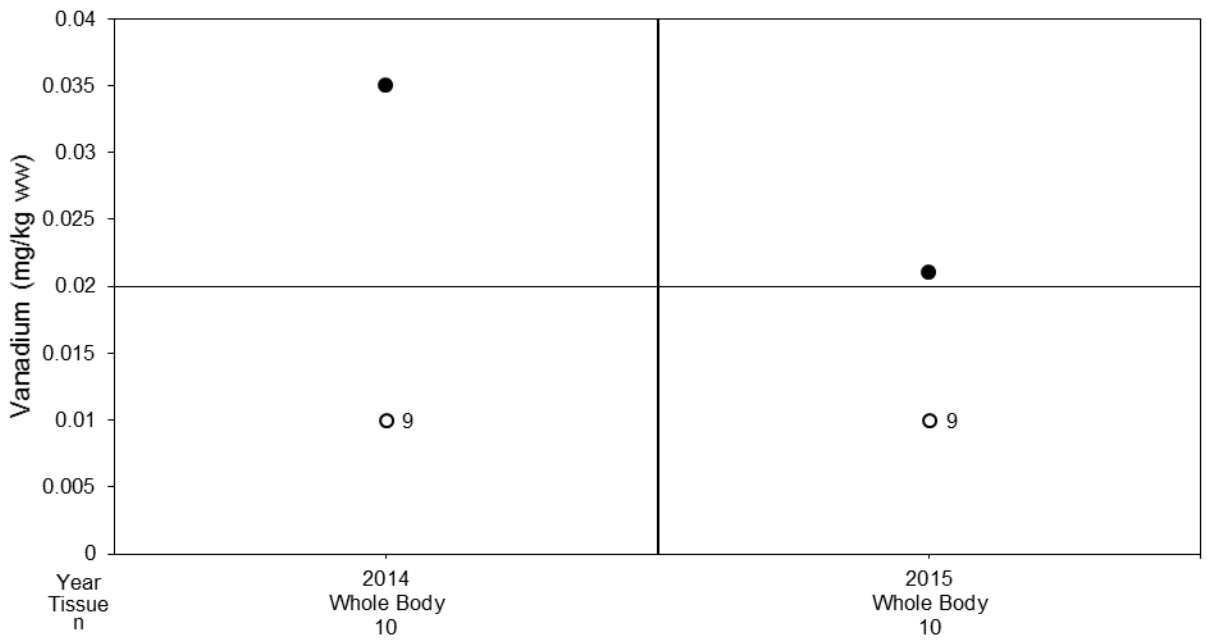
Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 448: Vanadium Concentrations in Sockeye Salmon Juvenile Tissues Collected from the Quesnel Lake – West in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

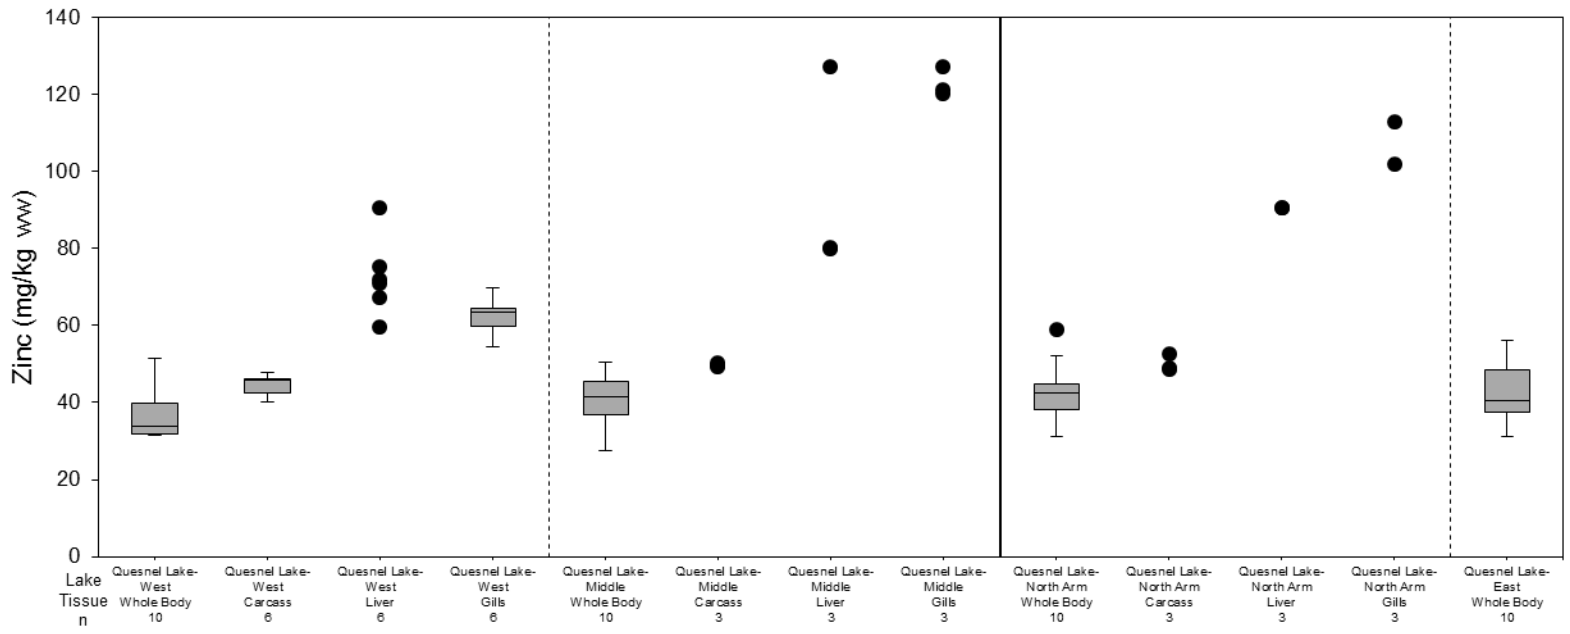
Figure 449: Vanadium Concentrations in Sockeye Salmon Juvenile Tissues Collected from the Quesnel Lake – Middle in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

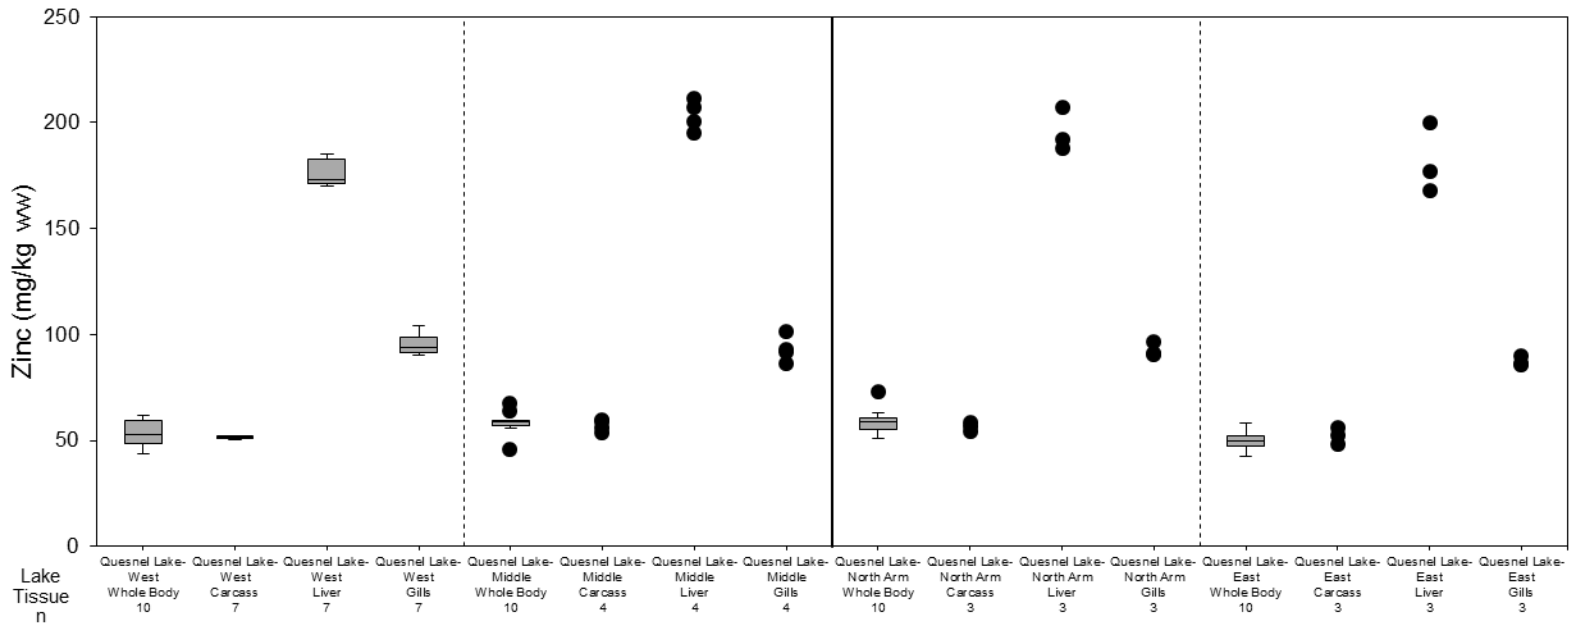
10.19 Zinc

Figure 450: Zinc Concentrations in Sockeye Salmon Juvenile Tissues Collected in 2014



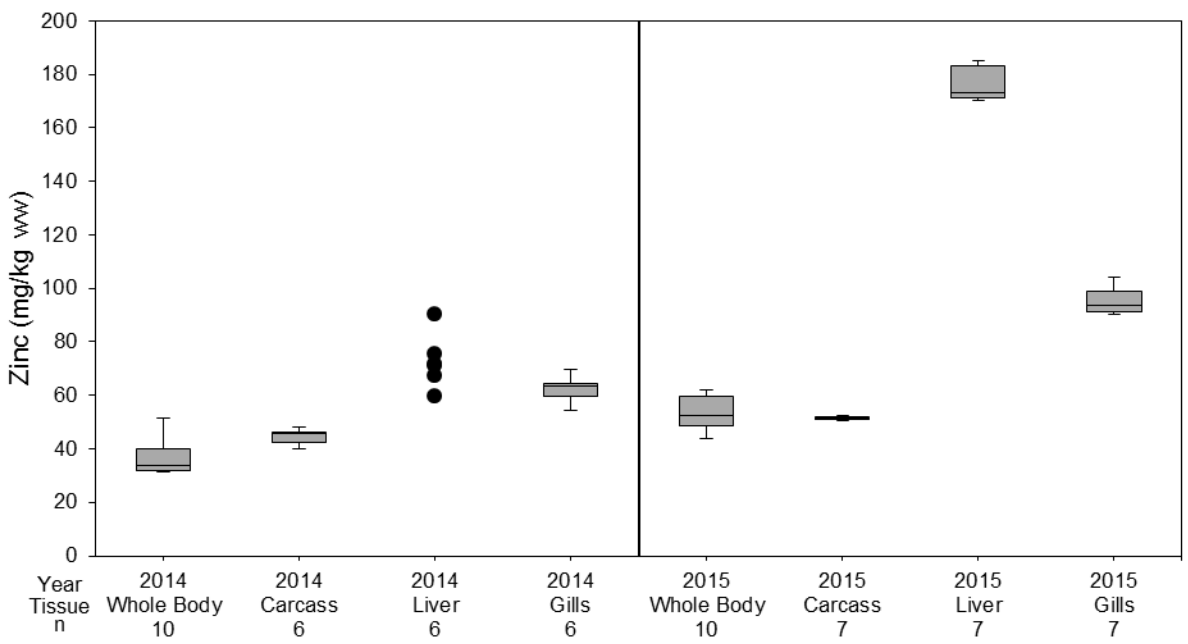
Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 451: Zinc Concentrations in Sockeye Salmon Juvenile Tissues Collected in 2015



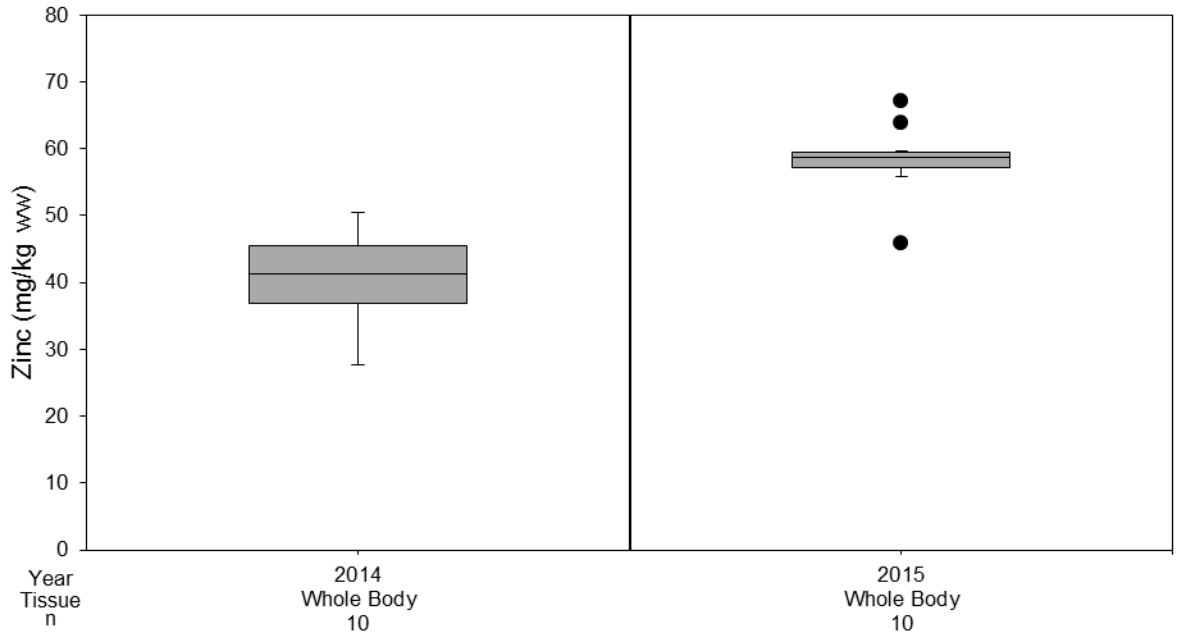
Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 452: Zinc Concentrations in Sockeye Salmon Juvenile Tissues Collected from the Quesnel Lake – West in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

Figure 453: Zinc Concentrations in Sockeye Salmon Juvenile Tissues Collected from the Quesnel Lake – Middle in 2014 and 2015



Note: Boxplots are censored at the detection limit (DL = solid horizontal line). Concentrations below the DL are plotted as an open symbol at half the DL. Extreme values are plotted as individual values. mg/kg ww = milligrams per kilogram wet weight; n = sample size; dashed lines (- - -) indicate the separation of sites; solid lines (−) indicate the separation of exposure and reference or separation of years.

ATTACHMENT 4

FISH TISSUE CHEMISTRY REGRESSION PLOTS

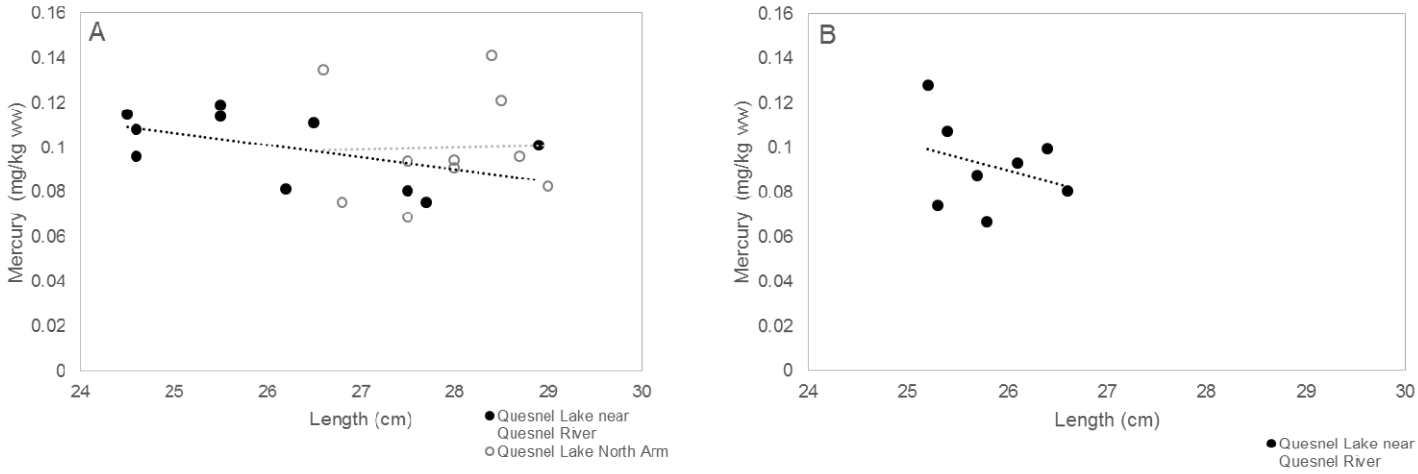
1.0 BURBOT

The type of samples collected from Burbot were not consistent among locations and years, therefore, no comparisons were made for Burbot tissue chemistry and regressions are not presented.

2.0 KOKANEE

2.1 Mercury

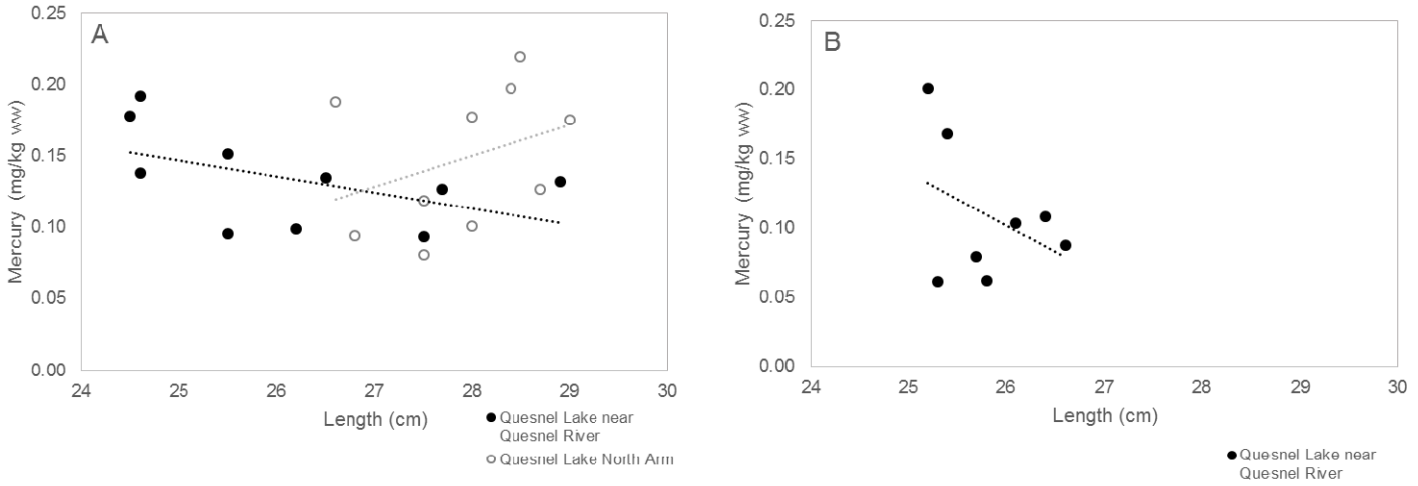
Figure 1: Mercury Concentration in Kokanee Muscle Tissue Collected in (A) 2014 and (B) 2015 Relative to Fish Length



Regression equations: **(A)** Quesnel Lake near Quesnel River (exposure) y = -0.0054x + 0.2425, R^2 = 0.2621; P = 0.130; **Quesnel Lake North Arm (reference) y = 0.0010x + 0.0728, R^2 = 0.0010; P = 0.931**; **(B)** Quesnel Lake near Quesnel River (exposure) y = -0.0119x + 0.4001, R^2 = 0.099; P = 0.448.

mg/kg ww = milligrams per kilogram wet weight; cm = centimetre; regression equations that are significant (P < 0.1) are bolded.

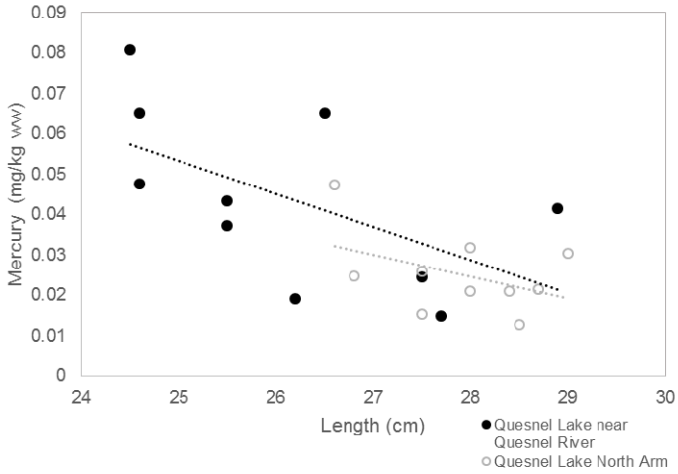
Figure 2: Mercury Concentration in Kokanee Liver Tissue Collected in (A) 2014 and (B) 2015 Relative to Fish Length



Regression equations: **(A)** Quesnel Lake near Quesnel River (exposure) y = -0.0112x + 0.4263, R^2 = 0.2534; P = 0.138; Quesnel Lake North Arm (reference) y = 0.0218x - 0.4597, R^2 = 0.1256; P = 0.315; **(B)** Quesnel Lake near Quesnel River (exposure) y = -0.0382x + 1.0954, R^2 = 0.1535; P = 0.337.

mg/kg ww = milligrams per kilogram wet weight; cm = centimetre; regression equations that are significant (P < 0.1) are bolded.

Figure 3: Mercury Concentration in Kokanee Ovary Tissue Collected in 2014 Relative to Fish Length



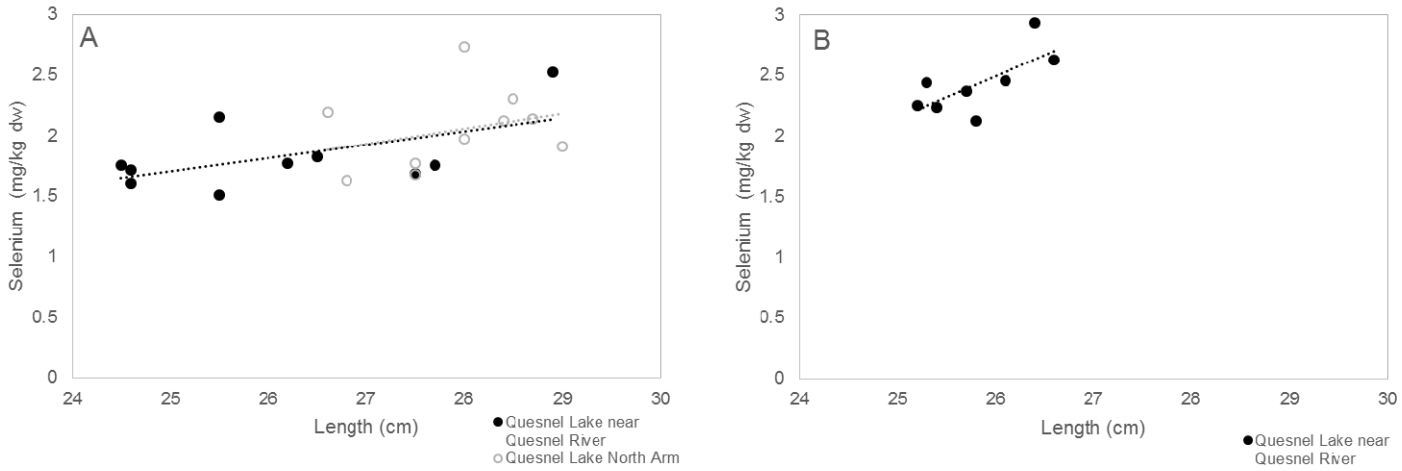
Sample size < 5 for Kokanee ovary collected in 2015.

Regression equations: **Quesnel Lake near Quesnel River (exposure) y = -0.0082x + 0.2585, R^2 = 0.3291; P = 0.083**; Quesnel Lake North Arm (reference) y = -0.0055x + 0.1773, R^2 = 0.1962; P = 0.200.

mg/kg ww = milligrams per kilogram wet weight; cm = centimetre; regression equations that are significant (P < 0.1) are bolded.

2.2 Selenium

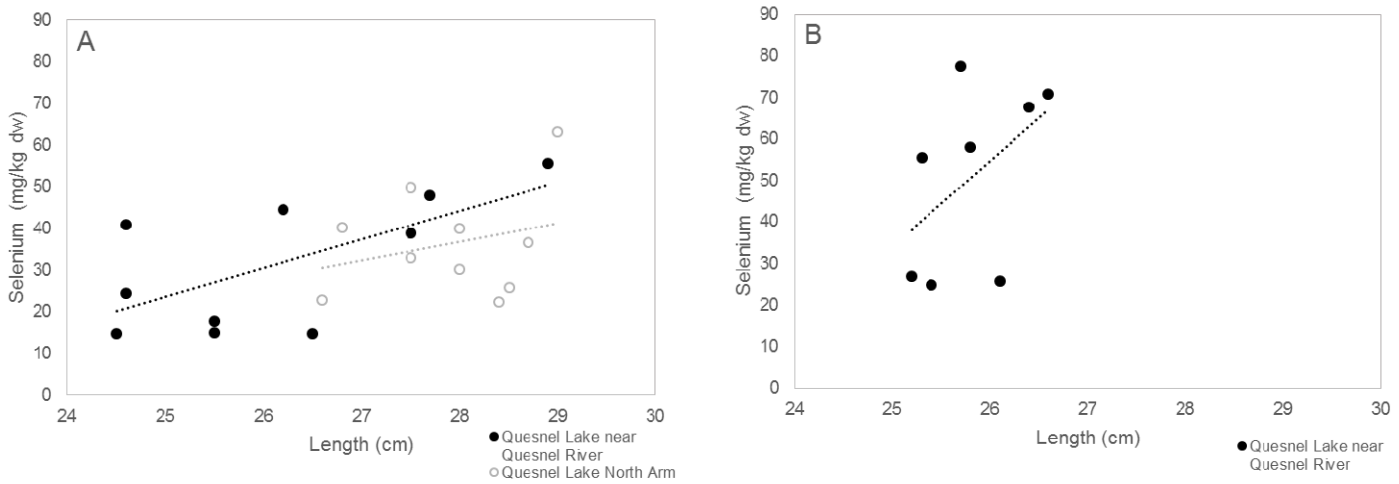
Figure 4: Selenium Concentrations in Kokanee Muscle Tissue Collected in (A) 2014 and (B) 2015 Relative to Fish Length



Regression equations: **(A) Quesnel Lake near Quesnel River (exposure) y = 0.1096x - 1.0365, R^2 = 0.3123; P = 0.093**; Quesnel Lake North Arm (reference) y = 0.1245x – 1.4291, R^2 = 0.0892; P = 0.402; **(B) Quesnel Lake near Quesnel River (exposure) y = 0.3509x – 6.6276, R^2 = 0.0501; P = 0.049**.

mg/kg dw = milligrams per kilogram dry weight; cm = centimetre; regression equations that are significant (P < 0.1) are bolded.

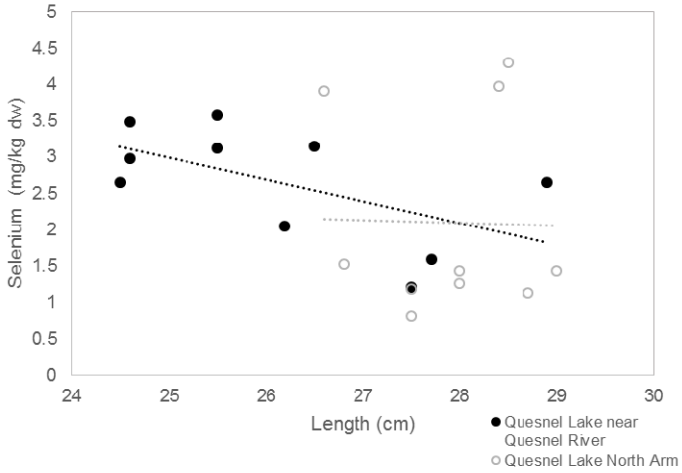
Figure 5: Selenium Concentrations in Kokanee Liver Tissue Collected in (A) 2014 and (B) 2015 Relative to Fish Length



Regression equations: **(A) Quesnel Lake near Quesnel River (exposure) y = 6.9058x – 149.0965, R^2 = 0.4326; P = 0.039**; Quesnel Lake North Arm (reference) y = 4.4129x – 86.7912, R^2 = 0.0758; P = 0.441; **(B)** Quesnel Lake near Quesnel River (exposure) y = 20.5727x – 480.1874, R^2 = 0.2348; P = 0.224.

mg/kg dw = milligrams per kilogram dry weight; cm = centimetre; regression equations that are significant (P < 0.1) are bolded.

Figure 6: Selenium Concentrations in Kokanee Ovary Tissue Collected in 2014 Relative to Fish Length



Sample size < 5 for Kokanee ovary collected in 2015.

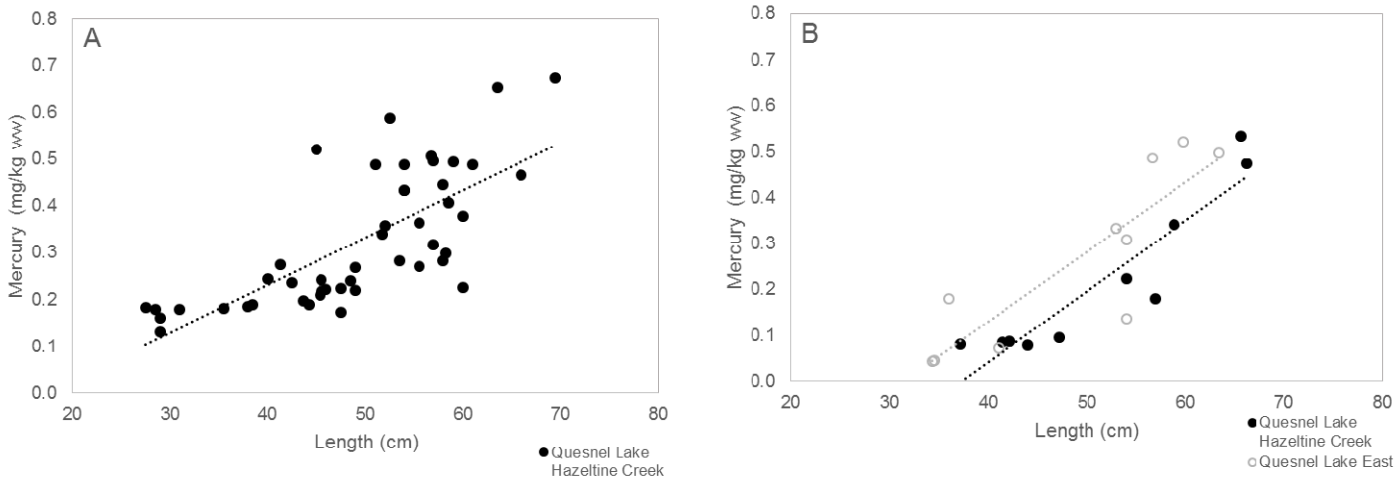
Regression equations: **Quesnel Lake near Quesnel River (exposure) y = -0.3031x – 10.5742, R^2 = 0.3294; P = 0.082**; Quesnel Lake North Arm (reference) y = -0.0408x – 3.2400, R^2 = 0.0006; P = 0.948.

mg/kg dw = milligrams per kilogram dry weight; cm = centimetre; regression equations that are significant (P < 0.1) are bolded.

3.0 LAKE TROUT

3.1 Mercury

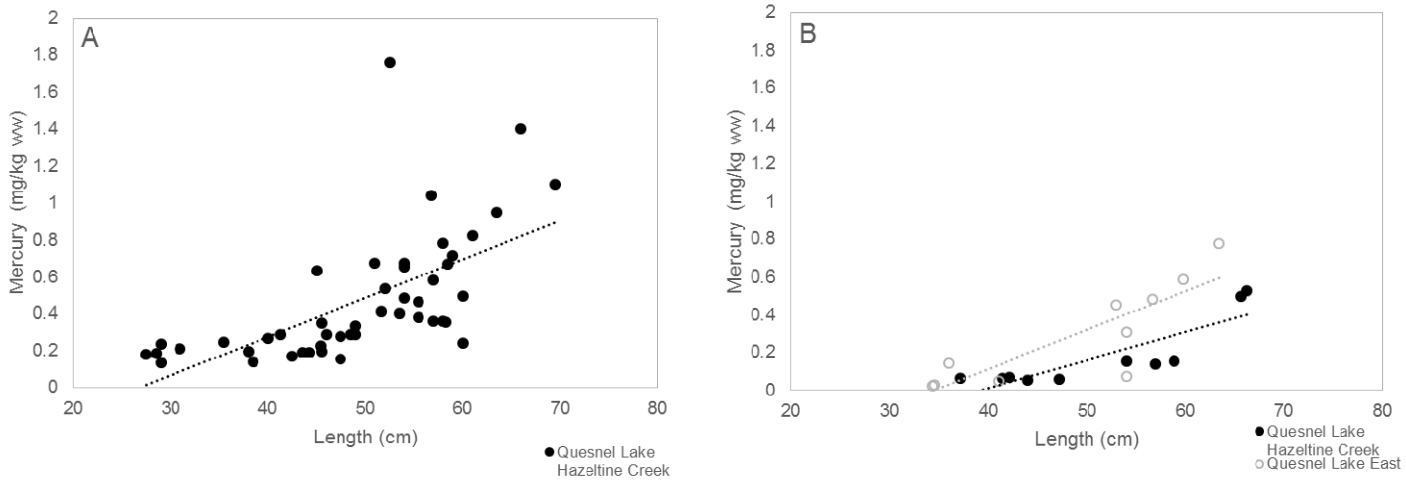
Figure 7: Mercury Concentrations in Lake Trout Muscle Tissue Collected in (A) 2014 and (B) 2015 Relative to Fish Length



Regression equations: **(A) Quesnel Lake Hazeltine Creek (exposure) y = 0.0101x – 0.1750, R^2 = 0.5363; P = <0.001**; **(B) Quesnel Lake Hazeltine Creek (exposure) y = 0.0154x – 0.5748, R^2 = 0.8602; P = <0.001**; **Quesnel Lake East (reference) y = 0.0152x – 0.4773, R^2 = 0.7599; P = 0.001**.

mg/kg ww = milligrams per kilogram wet weight; cm = centimetre; regression equations that are significant (P < 0.1) are bolded.

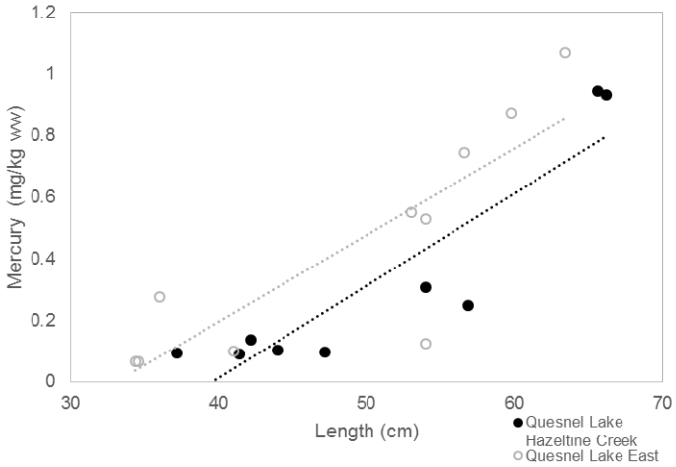
Figure 8: Mercury Concentrations in Lake Trout Liver Tissue Collected in (A) 2014 and (B) 2015 Relative to Fish Length



Regression equations: **(A) Quesnel Lake Hazeltine Creek (exposure) y = 0.0210x – 0.5642, R^2 = 0.3943; P = <0.001**; **(B) Quesnel Lake Hazeltine Creek (exposure) y = 0.0148x – 0.5788, R^2 = 0.7267; P = 0.002**; **Quesnel Lake East (reference) y = 0.0207x – 0.7123, R^2 = 0.7231; P = 0.002**.
mg/kg ww = milligrams per kilogram wet weight; cm = centimetre; regression equations that are significant (P < 0.1) are bolded.

Figure 9: Mercury Concentrations in Lake Trout Kidney Tissue Collected in 2015 Relative to Fish Length

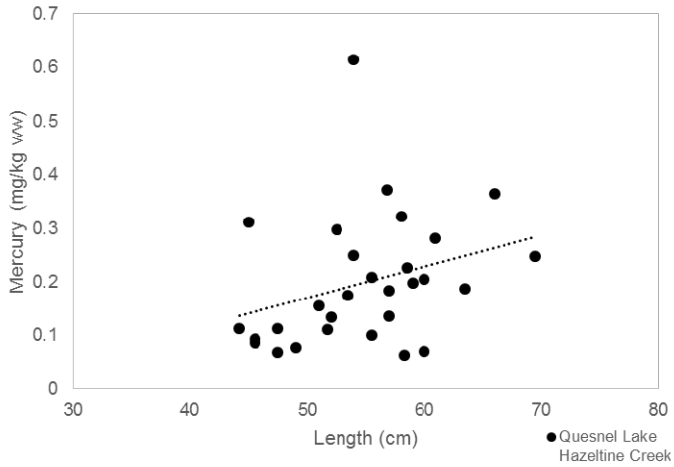
Lake Trout kidney was not collected in 2014.



Regression equations: **Quesnel Lake Hazeltine Creek (exposure) y = 0.0300x – 1.1904, R^2 = 0.8167; P = <0.001**; **Quesnel Lake East (reference) y = 0.0283x – 0.9358, R^2 = 0.7202; P = 0.002**.

mg/kg ww = milligrams per kilogram wet weight; cm = centimetre; regression equations that are significant (P < 0.1) are bolded.

Figure 10: Mercury Concentrations in Lake Trout Ovary Tissue Collected in 2014 Relative to Fish Length

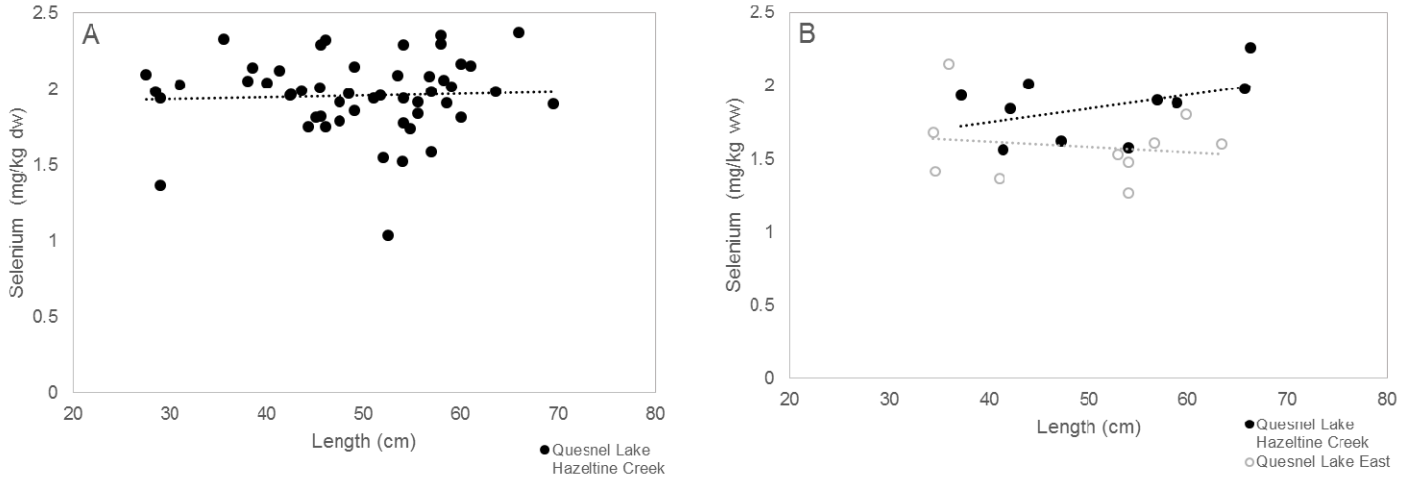


Sample size < 5 for Lake Trout ovary collected in 2015.

Regression equation: Quesnel Lake Hazeltine Creek (exposure) y = 0.0058x – 0.1195, R^2 = 0.0933; P = 0.107.
mg/kg ww = milligrams per kilogram wet weight; cm = centimetre; regression equations that are significant (P < 0.1) are bolded.

3.2 Selenium

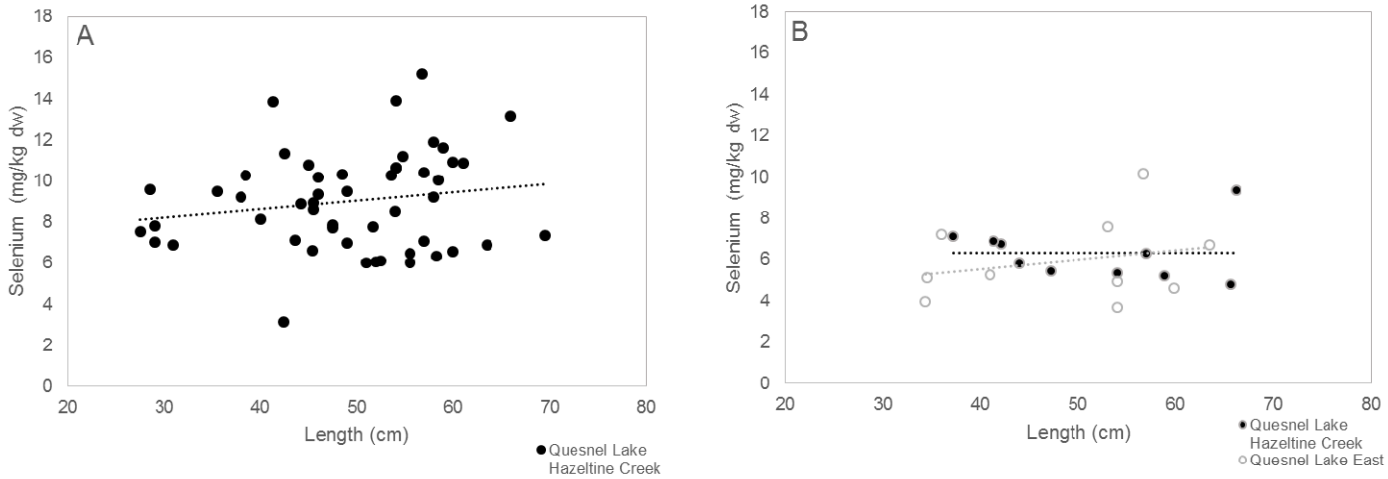
Figure 11: Selenium Concentrations in Lake Trout Muscle Tissue Collected in (A) 2014 and (B) 2015 Relative to Fish Length



Regression equations: **(A)** Quesnel Lake Hazeltine Creek (exposure) y = 0.0011x + 1.9040, R^2 = 0.0018; P = 0.766; **(B)** Quesnel Lake Hazeltine Creek (exposure) y = 0.0095x + 1.3692, R^2 = 0.2038; P = 0.190; Quesnel Lake East (reference) y = -0.0036x + 1.7682, R^2 = 0.0254; P = 0.660.

mg/kg dw = milligrams per kilogram dry weight; cm = centimetre; regression equations that are significant (P < 0.1) are bolded.

Figure 12: Selenium Concentrations in Lake Trout Liver Tissue Collected in (A) 2014 and (B) 2015 Relative to Fish Length

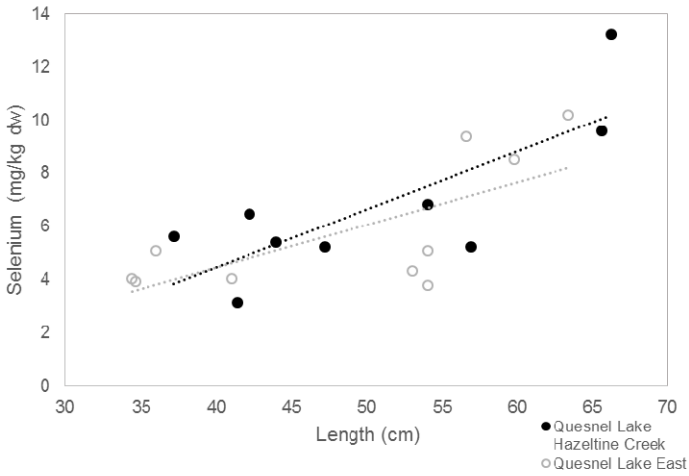


Regression equations: **(A)** Quesnel Lake Hazeltine Creek (exposure) y = 0.0407x + 6.9842, R^2 = 0.0290; P = 0.233; **(B)** Quesnel Lake Hazeltine Creek (exposure) y = -0.0008x + 6.3557, R^2 = <0.0001; P = 0.986; Quesnel Lake East (reference) y = 0.0445x + 3.7542, R^2 = 0.0614; P = 0.490.

mg/kg dw = milligrams per kilogram dry weight; cm = centimetre; regression equations that are significant (P < 0.1) are bolded.

Figure 13: Selenium Concentrations in Lake Trout Kidney Tissue Collected in 2015 Relative to Fish Length

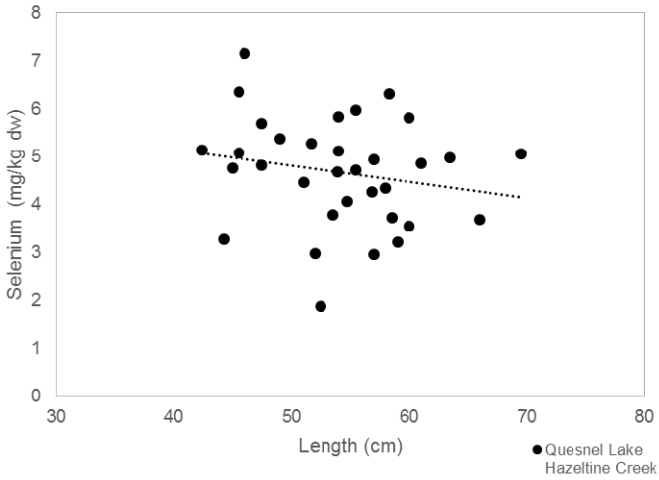
Lake Trout kidney was not collected in 2014.



Regression equations: **Quesnel Lake Hazeltine Creek (exposure) y = 0.2193x – 4.3360, R^2 = 0.6158**; **P = 0.012; Quesnel Lake East (reference) y = 0.1606x – 1.9804, R^2 = 0.5007, P = 0.022**.

mg/kg dw = milligrams per kilogram dry weight; cm = centimetre; regression equations that are significant (P < 0.1) are bolded.

Figure 14: Selenium Concentrations in Lake Trout Ovary Tissue Collected in 2014 Relative to Fish Length



Sample size < 5 for Lake Trout ovary collected in 2015.

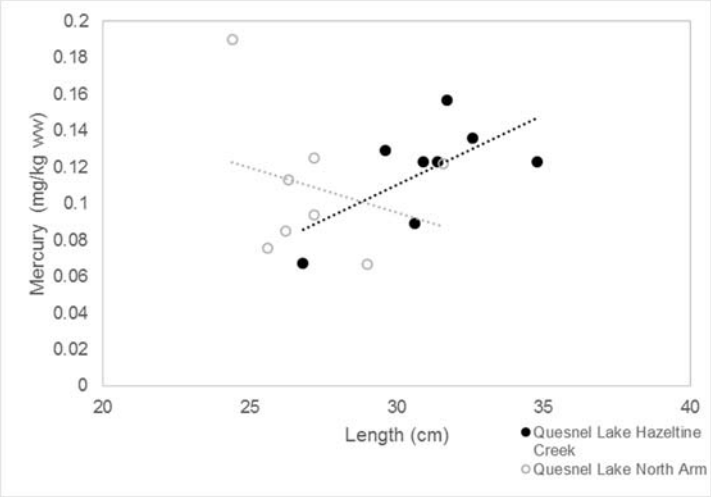
Regression equation: Quesnel Lake Hazeltine Creek (exposure) y = -0.0332x + 6.4665, R^2 = 0.0362; P = 0.289.
mg/kg dw = milligrams per kilogram dry weight; cm = centimetre; regression equations that are significant (P < 0.1) are bolded.

4.0 LARGESCALE SUCKER

4.1 Mercury

Figure 15: Mercury Concentrations in Largescale Sucker Muscle Tissue Collected in 2015 Relative to Fish Length

Largescale Sucker muscle was not collected in 2014.



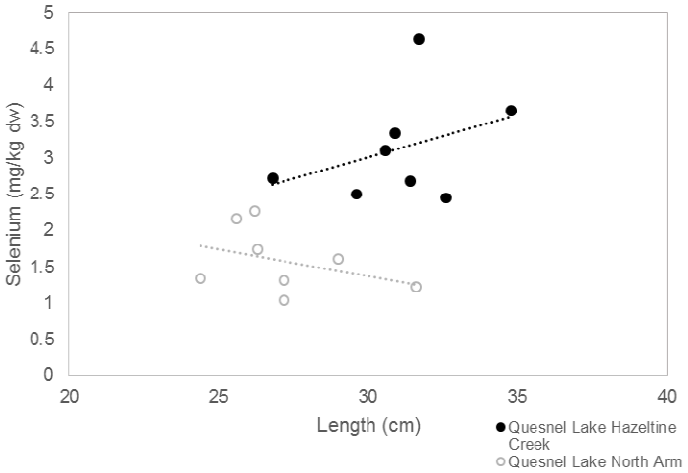
Regression equation: **Quesnel Lake Hazeltine Creek (exposure) y = 0.0076x – 0.1186, R^2 = 0.4003; P = 0.092**; Quesnel Lake North Arm (reference) y = -0.0049x + 0.2431, R^2 = 0.0792, P = 0.499.

mg/kg ww = milligrams per kilogram wet weight; cm = centimetre; regression equations that are significant (P < 0.1) are bolded.

4.2 Selenium

Figure 16: Selenium Concentrations in Largescale Sucker Muscle Tissue Collected in 2015 Relative to Fish Length

Largescale Sucker muscle was not collected in 2014.



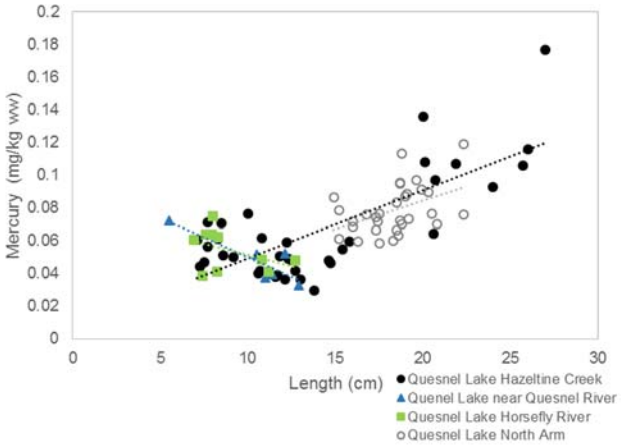
Regression equation: Quesnel Lake Hazeltine Creek (exposure) y = 0.1172x – 0.5040, R^2 = 0.1353; P = 0.370; Quesnel Lake North Arm (reference) y = -0.0752x + 3.6305, R^2 = 0.1407, P = 0.360.

mg/kg dw = milligrams per kilogram dry weight; cm = centimetre; regression equations that are significant (P < 0.1) are bolded.

5.0 NORTHERN PIKEMINNOW

5.1 Mercury

Figure 17: Mercury Concentrations in Northern Pikeminnow Whole Body Tissue Collected in 2014 Relative to Fish Length



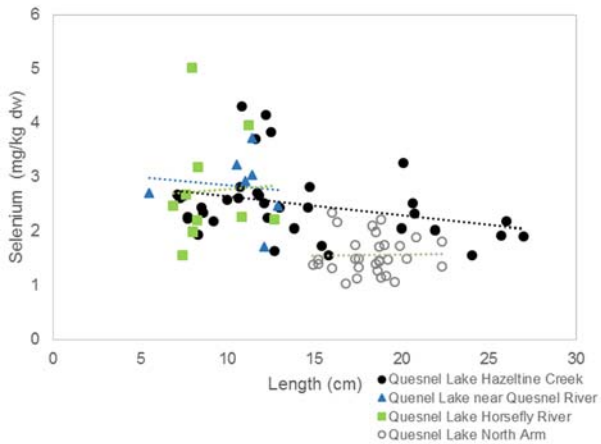
Northern Pikeminnow whole body was not collected in 2015.

Regression equations: **Quesnel Lake Hazeltine Creek (exposure) y = 0.0041x + 0.0082, R^2 = 0.5595; P = <0.001**; **Quesnel Lake near Quesnel River (exposure) y = -0.0048x + 0.0978, R^2 = 0.7500, P = 0.012**; Quesnel Lake Horsefly River (exposure) y = -0.0027x + 0.0782, R^2 = 0.1769, P = 0.226; **Quesnel Lake North Arm (reference) y = 0.0035x + 0.0154, R^2 = 0.1913, P = 0.014**.

mg/kg ww = milligrams per kilogram wet weight; cm = centimetre; regression equations that are significant (P < 0.1) are bolded.

5.2 Selenium

Figure 18: Selenium Concentrations in Northern Pikeminnow Whole Body Tissue Collected in 2014 Relative to Fish Length



Northern Pikeminnow whole body was not collected in 2015.

Regression equations: **Quesnel Lake Hazeltine Creek (exposure) y = -0.0350x + 2.9851, R^2 = 0.0947; P = 0.068**; Quesnel Lake near Quesnel River (exposure) y = -0.0290x + 3.1352, R^2 = 0.0123, P = 0.813; Quesnel Lake Horsefly River (exposure) y = 0.0251x + 2.5260, R^2 = 0.0022, P = 0.898; Quesnel Lake North Arm (reference) y = 0.0050x + 1.4732, R^2 = 0.0007, P = 0.888.

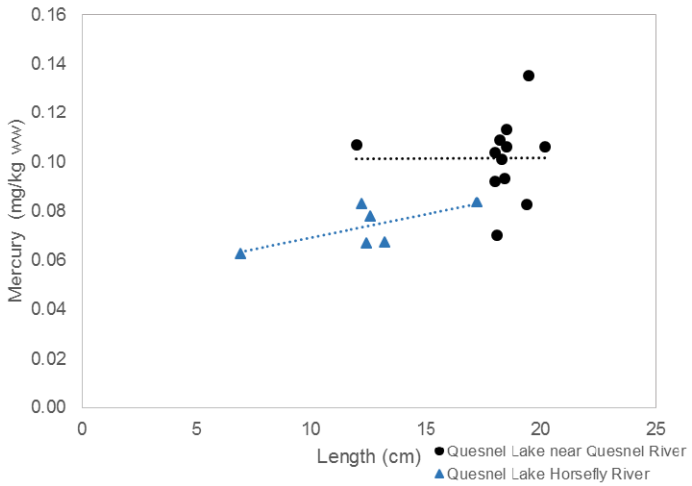
mg/kg dw = milligrams per kilogram dry weight; cm = centimetre.

Note: One statistical outlier from Quesnel Lake North Arm was removed (i.e. standardized residual > 3); regression equations that are significant (P < 0.1) are bolded.

6.0 PEAMOUTH CHUB

6.1 Mercury

Figure 19: Mercury Concentrations in Peamouth Chub Whole Body Tissue Collected in 2014 Relative to Fish Length



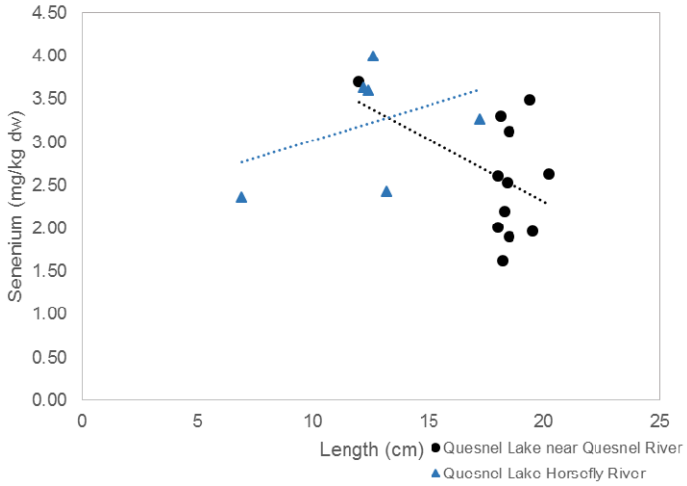
Insufficient data for 2015 Peamouth Chub (i.e., no lengths).

Regression equations: Quesnel Lake near Quesnel River (exposure) y = 7E-05x + 0.1003, R^2 = <0.0001, P = 0.978; Quesnel Lake Horsefly River (exposure) y = 0.0019x + 0.0504, R^2 = 0.4739, P = 0.131.

mg/kg ww = milligrams per kilogram wet weight; cm = centimetre; regression equations that are significant (P < 0.1) are bolded.

6.2 Selenium

Figure 20: Selenium Concentrations in Peamouth Chub Collected from Quesnel Lake near Quesnel River in 2014 and 2015



Insufficient data for 2015 Peamouth Chub (i.e., no lengths).

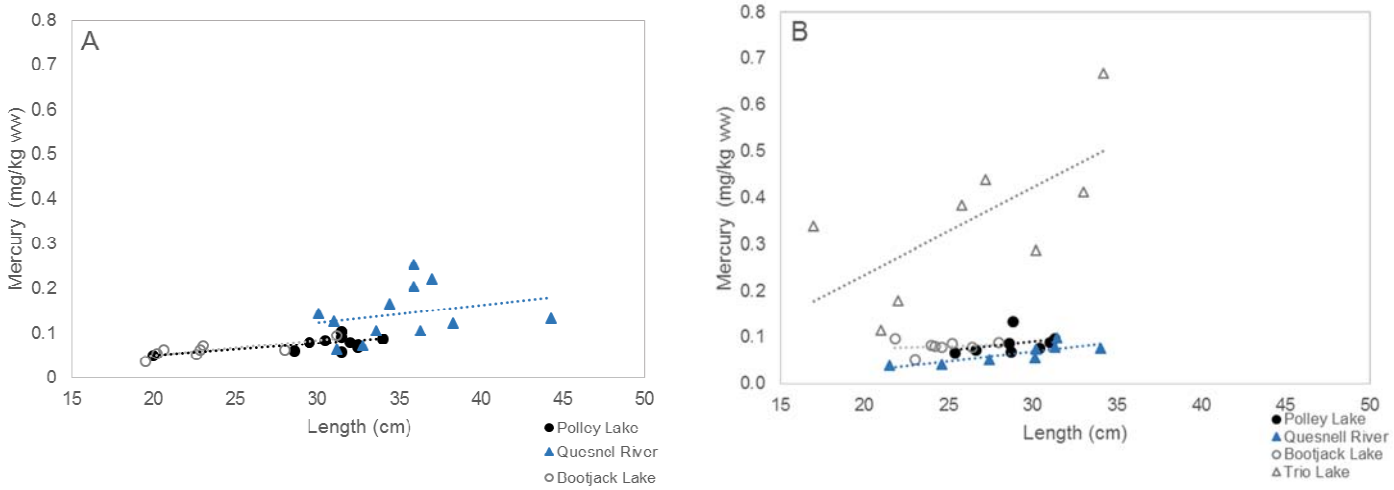
Regression equations: Quesnel Lake near Quesnel River (exposure) y = 0.0812x + 2.2082, R^2 = 0.1550, P = 0.440; Quesnel Lake Horsefly River (exposure) y = -0.1439x + 5.1930, R^2 = 0.1842, P = 0.164.

mg/kg dw = milligrams per kilogram dry weight; cm = centimetre; regression equations that are significant (P < 0.1) are bolded.

7.0 RAINBOW TROUT

7.1 Mercury

Figure 21: Mercury Concentrations in Rainbow Trout Muscle Tissue Collected in (A) 2014 and (B) 2015 Relative to Fish Length

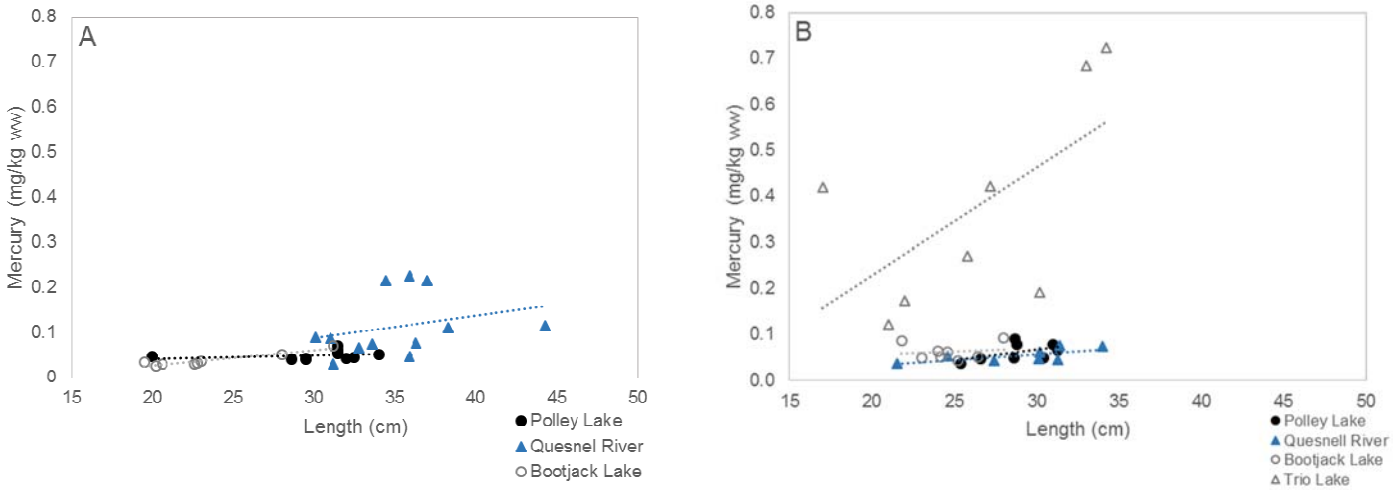


Regression equations: **(A) Polley Lake (exposure) y = 0.0027x - 0.0054, R^2 = 0.3131, P = 0.047**; Quesnel River (exposure) y = 0.0040x + 0.0034, R^2 = 0.0708, P = 0.403; **Bootjack Lake (reference) y = 0.0035x – 0.0202, R^2 = 0.6563, P = 0.015**; **(B)** Polley Lake (exposure) y = 0.0038x – 0.0235, R^2 = 0.1326, P = 0.375; **Quesnel River (exposure) y = 0.0042x – 0.0552, R^2 = 0.6627, P = 0.014**; Bootjack Lake (reference) y = 0.0013x + 0.0492, R^2 = 0.0346, P = 0.659; Trio Lake (reference) y = 0.0234x – 0.2385, R^2 = 0.3790, P = 0.104.

mg/kg ww = milligrams per kilogram wet weight; cm = centimetre; regression equations that are significant (P < 0.1) are bolded.

Note: One statistical outlier from (A) Quesnel River was removed (i.e. standardized residual > 3).

Figure 22: Mercury Concentrations in Rainbow Trout Liver Tissue Collected in (A) 2014 and (B) 2015 Relative to Fish Length



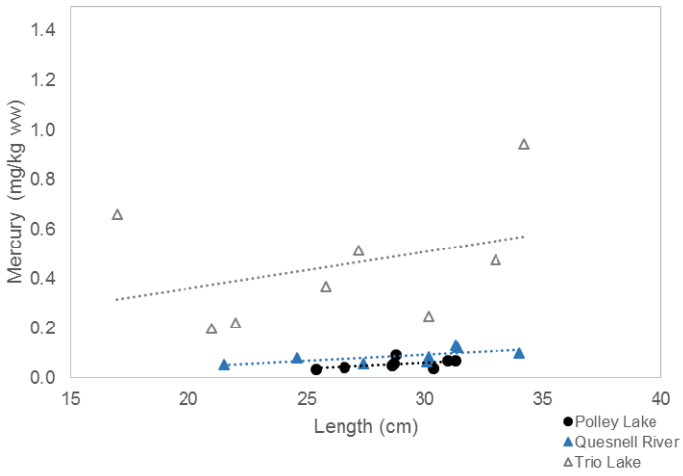
Regression equations: **(A)** Polley Lake (exposure) y = 0.0008x + 0.0265, R^2 = 0.0879, P = 0.325; Quesnel River (exposure) y = 0.0050x – 0.0631, R^2 = 0.0811, P = 0.370; **Bootjack Lake (reference) y = 0.0034x – 0.0419, R^2 = 0.8936, P = <0.001**; **(B)** Polley Lake (exposure) y = 0.0048x – 0.0750, R^2 = 0.2655, P = 0.191; **Quesnel River (exposure) y = 0.0025x – 0.0166, R^2 = 0.4741, P = 0.059**; Bootjack Lake (reference) y = 0.0012x + 0.0320, R^2 = 0.0182, P = 0.750; Trio Lake (reference) y = 0.0027x + 0.0178, R^2 = 0.0264, P = 0.701.

mg/kg ww = milligrams per kilogram wet weight; cm = centimetre.

Note: One statistical outlier from (A) Polley Lake was removed (i.e. standardized residual > 3); regression equations that are significant (P < 0.1) are bolded.

Figure 23: Mercury Concentrations in Rainbow Trout Kidney Tissue Collected in 2015 Relative to Fish Length

Rainbow Trout kidney was not collected in 2014.

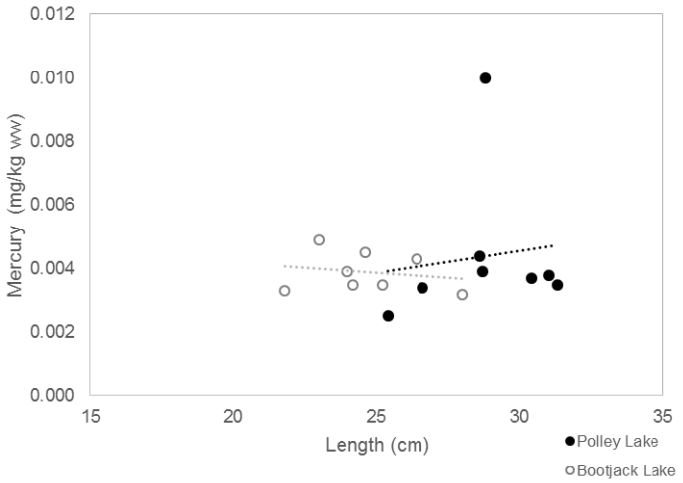


Regression equations: Polley Lake (exposure) y = 0.0049x – 0.0837, R^2 = 0.2738, P = 0.183; **Quesnel River (exposure) y = 0.0048x – 0.0521, R^2 = 0.4540, P = 0.067**; Trio Lake (reference) y = 0.0146x + 0.0696, R^2 = 0.1200, P = 0.401.

mg/kg ww = milligrams per kilogram wet weight; cm = centimetre; regression equations that are significant (P < 0.1) are bolded.

Figure 24: Mercury Concentrations in Rainbow Trout Ovary Tissue Collected in 2015 Relative to Fish Length

Sample size < 5 for Rainbow Trout ovary collected in 2014.

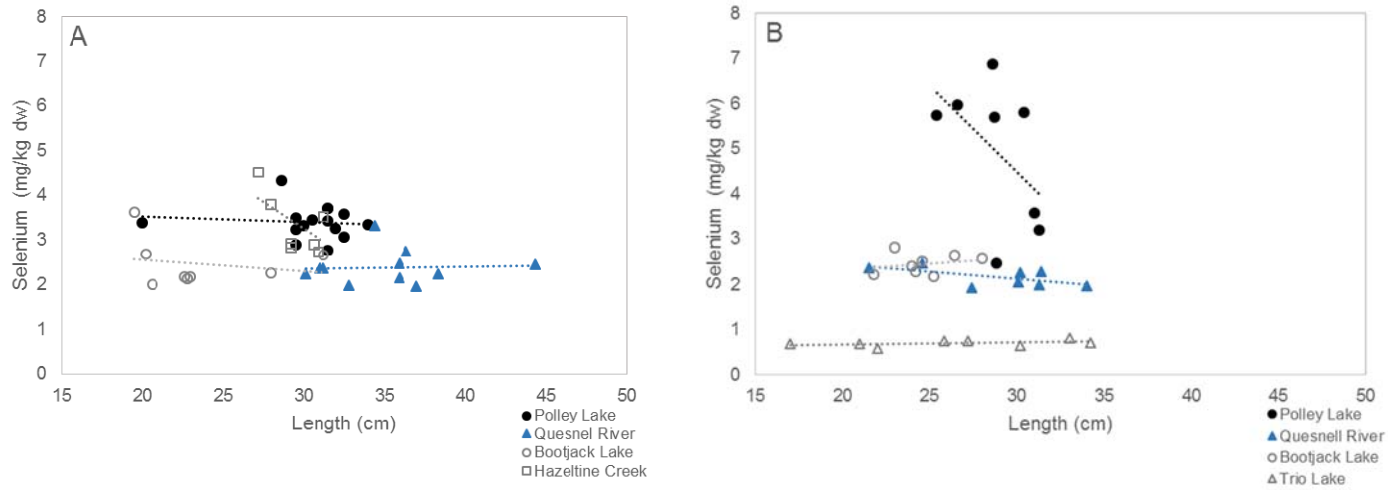


Regression equations: Polley Lake (exposure) y = 0.0001x + 0.0005, R^2 = 0.0142, P = 0.779; Bootjack Lake (reference) y = -6E-05x + 0.0055, R^2 = 0.0391, P = 0.639.

mg/kg ww = milligrams per kilogram wet weight; cm = centimetre; regression equations that are significant (P < 0.1) are bolded.

7.2 Selenium

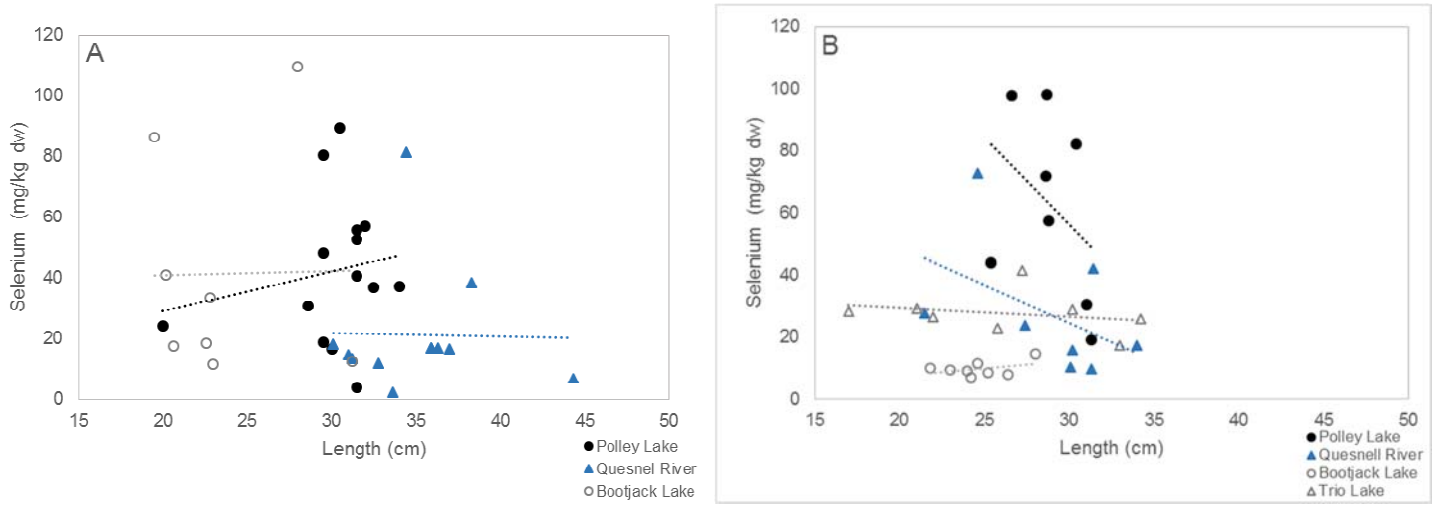
Figure 25: Selenium Concentrations in Rainbow Trout Muscle Tissue Collected in (A) 2014 and (B) 2015 Relative to Fish Length



Regression equations: **(A)** Polley Lake (exposure) y = -0.0119x + 3.7628, R^2 = 0.0107, P = 0.714; Quesnel River (exposure) y = 0.0045x + 2.2334, R^2 = 0.0022, P = 0.890; Bootjack Lake (reference) y = -0.0241x + 3.0359, R^2 = 0.0344, P = 0.660; **(B)** Polley Lake (exposure) y = -0.3815x + 15.9216, R^2 = 0.2455, P = 0.212; Quesnel River (exposure) y = -0.0310x + 3.0620, R^2 = 0.3657, P = 0.112; Bootjack Lake (reference) y = 0.0282x + 1.7665, R^2 = 0.0616, P = 0.553; Trio Lake (reference) y = 0.0050x + 0.5735, R^2 = 0.2063, P = 0.258.

mg/kg dw = milligrams per kilogram dry weight; cm = centimetre; regression equations that are significant (P < 0.1) are bolded.

Figure 26: Selenium Concentrations in Rainbow Trout Liver Tissue Collected in (A) 2014 and (B) 2015 Relative to Fish Length

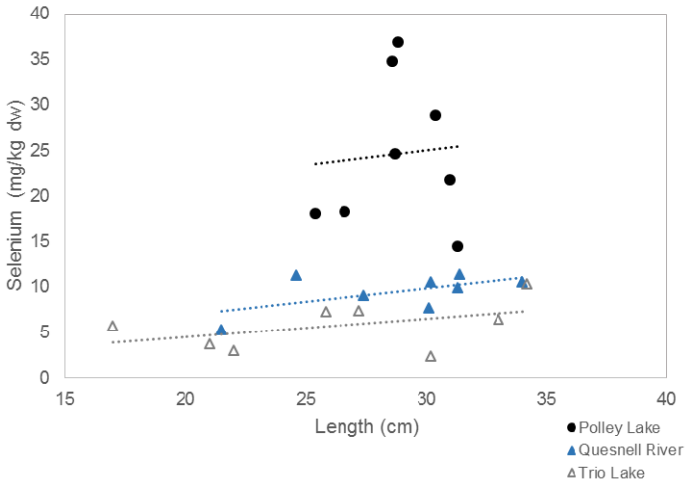


Regression equations: **(A)** Polley Lake (exposure) y = 1.3235x – 2.4468, R^2 = 0.0326, P = 0.537; Quesnel River (exposure) y = -0.1013x + 24.8301, R^2 = 0.0004, P = 0.953; Bootjack Lake (reference) y = 0.1300x + 38.3498, R^2 = 0.0002, P = 0.973; **(B)** Polley Lake (exposure) y = -5.5811x + 223.6408, R^2 = 0.1498, P = 0.343; Quesnel River (exposure) y = -2.4281x + 97.4570, R^2 = 0.2201, P = 0.241; Bootjack Lake (reference) y = 0.5084x – 2.7753, R^2 = 0.1673, P = 0.314; Trio Lake (reference) y = -0.2888x + 35.2176, R^2 = 0.0649, P = 0.543.

mg/kg dw = milligrams per kilogram dry weight; cm = centimetre; regression equations that are significant (P < 0.1) are bolded.

Figure 27: Selenium Concentrations in Rainbow Trout Kidney Tissue Collected in 2015 Relative to Fish Length

Rainbow Trout kidney was not collected in 2014.

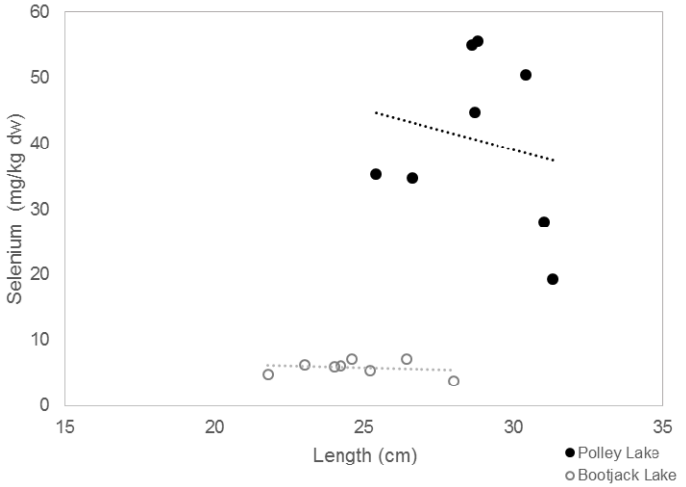


Regression equations: Polley Lake (exposure) y = 0.3150x + 15.4823, R^2 = 0.0066, P = 0.848; Quesnel River (exposure) y = 0.2917x + 1.0800, R^2 = 0.3316, P = 0.135; Trio Lake (reference) y = 0.2000x + 0.5509, R^2 = 0.2090, P = 0.255.

mg/kg dw = milligrams per kilogram dry weight; cm = centimetre; regression equations that are significant (P < 0.1) are bolded.

Figure 28: Selenium Concentrations in Rainbow Trout Ovary Tissue Collected in 2015 Relative to Fish Length

Sample size < 5 for Rainbow Trout ovary collected in 2014.



Regression equations: Polley Lake (exposure) y = -1.2396x + 76.1761, R^2 = 0.0378, P = 0.645; Bootjack Lake (reference) y = -0.1191x + 8.8001, R^2 = 0.0402, P = 0.634.

mg/kg dw = milligrams per kilogram dry weight; cm = centimetre; regression equations that are significant (P < 0.1) are bolded.

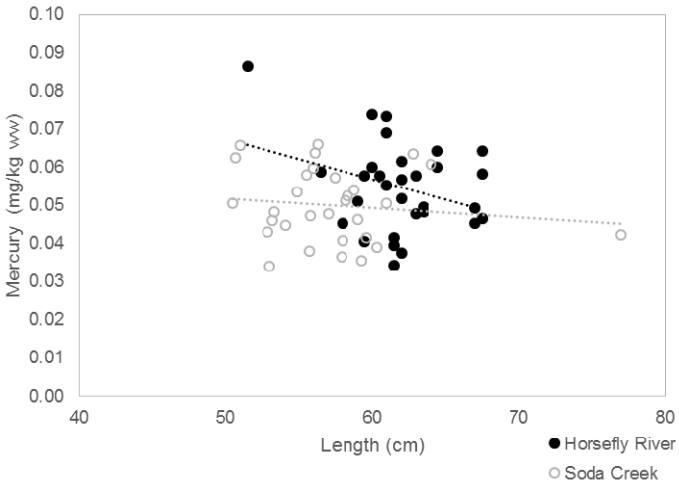
8.0 REDSIDE SHINER

Redside Shiner samples collected in 2014 had sample sizes < 5. Samples collected in 2015 did have a robust sample size, however length data was not available. Therefore, regressions could not be completed.

9.0 SOCKEYE SALMON ADULTS

9.1 Mercury

Figure 29: Mercury Concentrations in Sockeye Salmon Muscle Tissue Collected in 2014 Relative to Fish Length

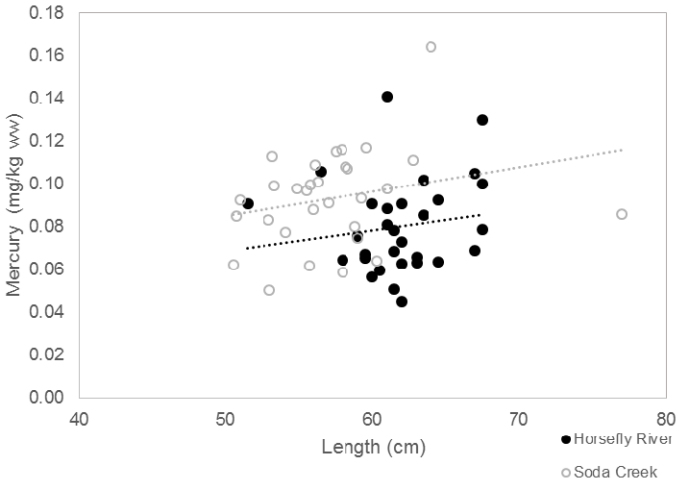


Sockeye Salmon were not collected in 2015.

Regression equations: **Horsefly River (exposure) y = -0.0011x + 0.1200, R^2 = 0.0983 P = 0.092**; Soda Creek (reference) y = -0.0002x + 0.0643, R^2 = 0.0173, P = 0.489.

mg/kg ww = milligrams per kilogram wet weight; cm = centimetre; regression equations that are significant (P < 0.1) are bolded.

Figure 30: Mercury Concentrations in Sockeye Salmon Liver Tissue Collected in 2014 Relative to Fish Length



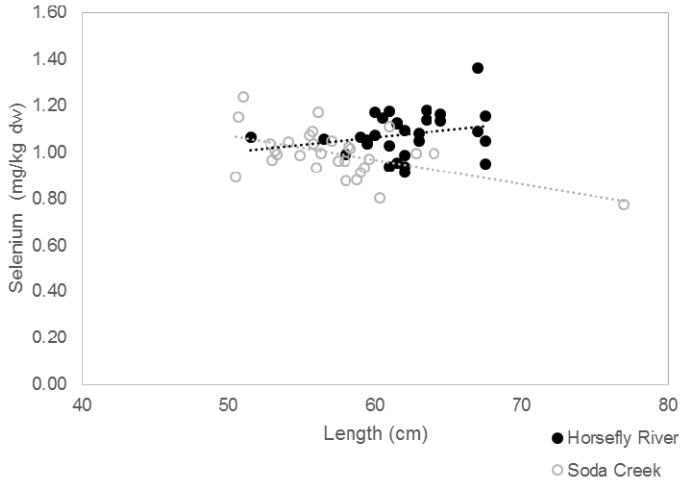
Sockeye Salmon were not collected in 2015.

Regression equations: Horsefly River (exposure) y = 0.0010x + 0.0194, R^2 = 0.0242 P = 0.412; Soda Creek (reference) y = 0.0011x + 0.0284, R^2= 0.0628, P = 0.182.

mg/kg ww = milligrams per kilogram wet weight; cm = centimetre; regression equations that are significant (P < 0.1) are bolded.

9.2 Selenium

Figure 31: Selenium Concentrations in Sockeye Salmon Muscle Tissue Collected in 2014 Relative to Fish Length

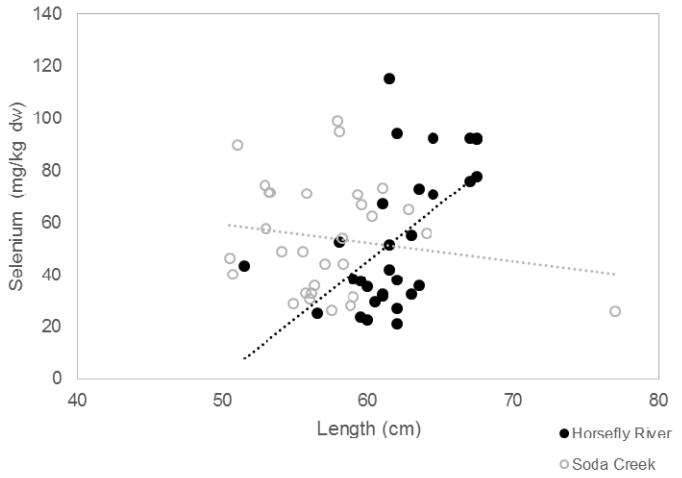


Sockeye Salmon were not collected in 2015.

Regression equations: Horsefly River (exposure) y = 0.0064x + 0.6787, R^2 = 0.0561 P = 0.208; **Soda Creek (reference) y = -0.0105x + 1.5991, R^2 = 0.2747, P = 0.003**.

mg/kg dw = milligrams per kilogram dry weight; cm = centimetre; regression equations that are significant (P < 0.1) are bolded.

Figure 32: Selenium Concentrations in Sockeye Salmon Liver Tissue Collected in 2014 Relative to Fish Length



Sockeye Salmon were not collected in 2015.

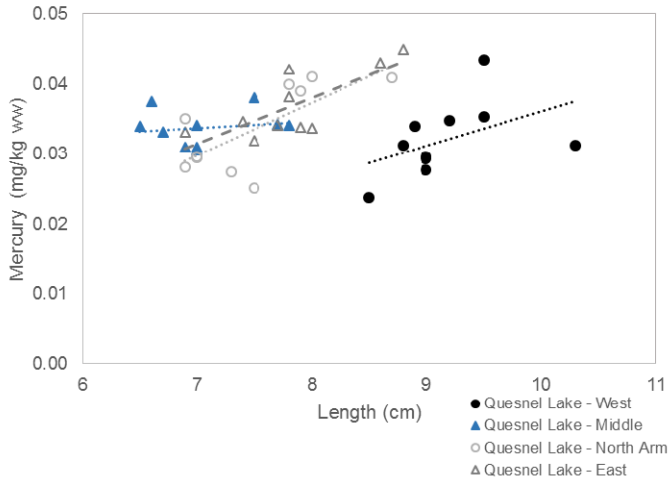
Regression equations: **Horsefly River (exposure) y = 4.4067x + 219.0123, R^2 = 0.3215 P = 0.001**; Soda Creek (reference) y = -0.6943x + 93.8863, R^2 = 0.0273, P = 0.383.

mg/kg dw = milligrams per kilogram dry weight; cm = centimetre; regression equations that are significant (P < 0.1) are bolded.

10.0 SOCKEYE SALMON JUVENILE

10.1 Mercury

Figure 33: Mercury Concentrations in Sockeye Salmon Whole Body Tissue Collected in 2014 Relative to Fish Length



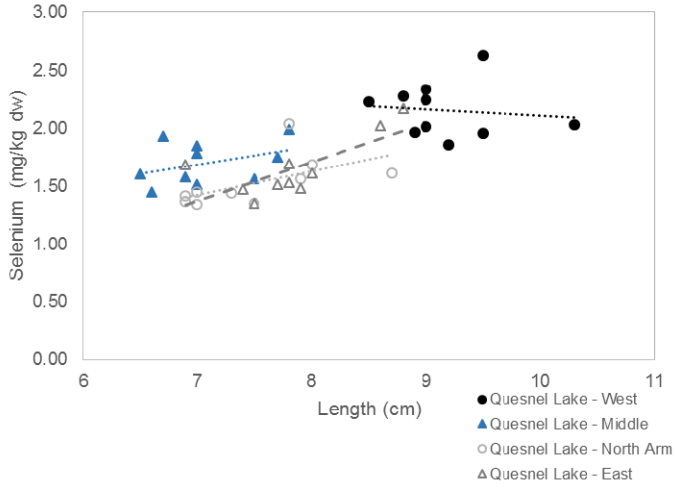
Sockeye Salmon were not collected in 2015.

Regression equations: Quesnel Lake - West (exposure) y = 0.0049x – 0.0130, R^2 = 0.2129, P = 0.180; Quesnel Lake – Middle (exposure) y = 0.0009x + 0.0273, R^2 = 0.0256, P = 0.659; **Quesnel Lake – North Arm (reference) y = 0.0076x – 0.0233, R^2 = 0.5216, P = 0.018**; **Quesnel Lake – East (reference) y = 0.0065x – 0.0143, R^2 = 0.5818, P = 0.010**.

mg/kg ww = milligrams per kilogram wet weight; cm = centimetre; regression equations that are significant (P < 0.1) are bolded.

10.2 Selenium

Figure 34: Selenium Concentrations in Sockeye Salmon Whole Body Tissue Collected in 2014 Relative to Fish Length



Sockeye Salmon were not collected in 2015.

Regression equations: Quesnel Lake - West (exposure) y = -0.0532x + 2.6404, R^2 = 0.0131, P = 0.753; Quesnel Lake – Middle (exposure) y = 0.1589x + 0.5772, R^2 = 0.1494, P = 0.270; **Quesnel Lake – North Arm (reference) y = 0.2054x – 0.0145, R^2 = 0.3285, P = 0.083**; **Quesnel Lake – East (reference) y = 0.3377x – 0.9939, R^2 = 0.5316, P = 0.017**.

mg/kg dw = milligrams per kilogram dry weight; cm = centimetre; regression equations that are significant (P < 0.1) are bolded.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Duplicate	Cadmium (Cd)-Total	DLB	L1468984-2, -3, -4, -6, -8

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLB	Detection Limit was raised due to detection of analyte at comparable level in Method Blank.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
MET-DRY-CCMS-VA	Tissue	Metals in Tissue by CRC ICPMS (DRY)	EPA 200.3/6020A

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-DRY-MICR-HRMS-VA	Tissue	Metals in Tissue by HR-ICPMS Micro (DRY)	EPA 200.3/200.8

Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on dry weight basis.

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-WET-CCMS-VA	Tissue	Metals in Tissue by CRC ICPMS (WET)	EPA 200.3/6020A

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-WET-MICR-HRMS-VA	Tissue	Metals in Tissue by HR-ICPMS Micro (WET)	EPA 200.3/200.8

Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on wet weight basis.

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MOISTURE-TISS-VA	Tissue	% Moisture in Tissues	ASTM D2974-00 Method A

This analysis is carried out gravimetrically by drying the sample at 105 C for a minimum of six hours.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

1 2

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Duplicate	Aluminum (Al)-Total	DUP-H	L1506160-14, -15, -16, -17, -18, -19, -20, -21, -23, -24, -26, -27, -28, -29, -31, -32, -33, -34, -35

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DUP-H	Duplicate results outside ALS DQO, due to sample heterogeneity.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
HG-WET-CVAFS-VA	Tissue	Mercury in Tissue by CVAFS (WET)	EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7. This digestion procedure was implemented on October 5, 2009.

MET-WET-CCMS-VA	Tissue	Metals in Tissue by CRC ICPMS (WET)	EPA 200.3/6020A

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MOISTURE-TISS-VA	Tissue	% Moisture in Tissues	ASTM D2974-00 Method A

This analysis is carried out gravimetrically by drying the sample at 105 C for a minimum of six hours.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

1 2

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Quality Control Report

Legend:

Limit	ALS Control Limit (Data Quality Objectives)
DUP	Duplicate
RPD	Relative Percent Difference
N/A	Not Available
LCS	Laboratory Control Sample
SRM	Standard Reference Material
MS	Matrix Spike
MSD	Matrix Spike Duplicate
ADE	Average Desorption Efficiency
MB	Method Blank
IRM	Internal Reference Material
CRM	Certified Reference Material
CCV	Continuing Calibration Verification
CVS	Calibration Verification Standard
LCSD	Laboratory Control Sample Duplicate

Sample Parameter Qualifier Definitions:

Qualifier	Description
DUP-H	Duplicate results outside ALS DQO, due to sample heterogeneity.
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

ALS Group strives to deliver on-time results to our clients at all times. However, there are times when due to capacity issues or other unforeseen circumstances we are unable to meet our expected turnaround times. The information above is related to a recent workorder you have submitted to our laboratory. In the event that you have an inquiry, please refer to the Lab Work Order # L1506160 when calling your Account Manager.

ALS Group appreciates your business. Thank you for the opportunity to work with you.

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
HG-WET-CVAFS-VA	Tissue	Mercury in Tissue by CVAFS (WET)	EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7. This digestion procedure was implemented on October 5, 2009.

MET-WET-CCMS-VA	Tissue	Metals in Tissue by CRC ICPMS (WET)	EPA 200.3/6020A

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MOISTURE-TISS-VA	Tissue	% Moisture in Tissues	ASTM D2974-00 Method A

This analysis is carried out gravimetrically by drying the sample at 105 C for a minimum of six hours.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

1

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

CVS	Calibration Verification Standard
LCSD	Laboratory Control Sample Duplicate

Sample Parameter Qualifier Definitions:

Qualifier	Description
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
HG-WET-CVAFS-VA	Tissue	Mercury in Tissue by CVAFS (WET)	EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7. This digestion procedure was implemented on October 5, 2009.

MET-WET-CCMS-VA	Tissue	Metals in Tissue by CRC ICPMS (WET)	EPA 200.3/6020A

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MOISTURE-TISS-VA	Tissue	% Moisture in Tissues	ASTM D2974-00 Method A

This analysis is carried out gravimetrically by drying the sample at 105 C for a minimum of six hours.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

1

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Sample Parameter Qualifier Definitions:

Qualifier	Description
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Sample Receipt Confirmation

ALS Group strives to deliver on-time results to our clients at all times. However, there are times when due to capacity issues or other unforeseen circumstances we are unable to meet our expected turnaround times. The information above is related to a recent workorder you have submitted to our laboratory. In the event that you have an inquiry, please refer to the Lab Work Order # L1506204 when calling your Account Manager.

ALS Group appreciates your business. Thank you for the opportunity to work with you.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Method Blank	Phosphorus (P)-Total	MB-LOR	L1514793-1, -10, -12, -13, -14, -15, -16, -19, -2, -20, -24, -27, -30, -34, -38, -39, -4, -5, -54, -55, -59, -6, -7, -9

Qualifiers for Individual Parameters Listed:

Qualifier	Description
MB-LOR	Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
HG-WET-CVAFS-VA	Tissue	Mercury in Tissue by CVAFS (WET)	EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1991). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7. This digestion procedure was implemented on October 5, 2009.

This analysis is not compliant with the requirements of the B.C. Lab Manual for digestion of tissue samples from British Columbia for metals analysis after January 1, 2015.

MET-WET-CCMS-VA	Tissue	Metals in Tissue by CRC ICPMS (WET)	EPA 200.3/6020A

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1991). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

This analysis is not compliant with the requirements of the B.C. Lab Manual for digestion of tissue samples from British Columbia for metals analysis after January 1, 2015.

MOISTURE-TISS-VA	Tissue	% Moisture in Tissues	ASTM D2974-00 Method A

This analysis is carried out gravimetrically by drying the sample at 105 C for a minimum of six hours.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location

Chain of Custody Numbers:

Horsefly River

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Quality Control Report

Legend:

Limit	ALS Control Limit (Data Quality Objectives)
DUP	Duplicate
RPD	Relative Percent Difference
N/A	Not Available
LCS	Laboratory Control Sample
SRM	Standard Reference Material
MS	Matrix Spike
MSD	Matrix Spike Duplicate
ADE	Average Desorption Efficiency
MB	Method Blank
IRM	Internal Reference Material
CRM	Certified Reference Material
CCV	Continuing Calibration Verification
CVS	Calibration Verification Standard
LCSD	Laboratory Control Sample Duplicate

Sample Parameter Qualifier Definitions:

Qualifier	Description
J	Duplicate results and limits are expressed in terms of absolute difference.
MB-LOR	Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level.
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Sample Disposal Information:

Where possible, ALS will store samples for 30 days from the date a final report is issued, or 30 days from the date samples are placed on hold without analytical requests, after which samples may be discarded. Air samples collected on re-usable media are an exception, and are stored for 7 days from the date a final report is issued. Longer storage times are available upon request.

For information about ALS accreditations and certifications please contact your Account Manager or visit our webpage at www.alsglobal.com (see Canada downloads).

ALS Group strives to deliver on-time results to our clients at all times. However, there are times when due to capacity issues or other unforeseen circumstances we are unable to meet our expected turnaround times. The information above is related to a recent workorder you have submitted to our laboratory. In the event that you have an inquiry, please refer to the Lab Work Order # L1514793 when calling your Account Manager.

ALS Group appreciates your business. Thank you for the opportunity to work with you.

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Duplicate	Chromium (Cr)-Total	DUP-H	L1514806-10
Duplicate	Chromium (Cr)-Total	DUP-H	L1514806-10

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DUP-H	Duplicate results outside ALS DQO, due to sample heterogeneity.
RRU	Reported Result is Uncertain due to proximity to the estimated Method Detection Limit.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
HG-WET-CVAFS-VA	Tissue	Mercury in Tissue by CVAFS (WET)	EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1991). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7. This digestion procedure was implemented on October 5, 2009.

This analysis is not compliant with the requirements of the B.C. Lab Manual for digestion of tissue samples from British Columbia for metals analysis after January 1, 2015.

MET-WET-CCMS-VA	Tissue	Metals in Tissue by CRC ICPMS (WET)	EPA 200.3/6020A

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1991). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

This analysis is not compliant with the requirements of the B.C. Lab Manual for digestion of tissue samples from British Columbia for metals analysis after January 1, 2015.

MOISTURE-TISS-VA	Tissue	% Moisture in Tissues	ASTM D2974-00 Method A

This analysis is carried out gravimetrically by drying the sample at 105 C for a minimum of six hours.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location

Chain of Custody Numbers:

QL UNIMPACTED

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Quality Control Report

Legend:

Limit	ALS Control Limit (Data Quality Objectives)
DUP	Duplicate
RPD	Relative Percent Difference
N/A	Not Available
LCS	Laboratory Control Sample
SRM	Standard Reference Material
MS	Matrix Spike
MSD	Matrix Spike Duplicate
ADE	Average Desorption Efficiency
MB	Method Blank
IRM	Internal Reference Material
CRM	Certified Reference Material
CCV	Continuing Calibration Verification
CVS	Calibration Verification Standard
LCSD	Laboratory Control Sample Duplicate

Sample Parameter Qualifier Definitions:

Qualifier	Description
DUP-H	Duplicate results outside ALS DQO, due to sample heterogeneity.
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Sample Disposal Information:

Where possible, ALS will store samples for 30 days from the date a final report is issued, or 30 days from the date samples are placed on hold without analytical requests, after which samples may be discarded. Air samples collected on re-usable media are an exception, and are stored for 7 days from the date a final report is issued. Longer storage times are available upon request.

For information about ALS accreditations and certifications please contact your Account Manager or visit our webpage at www.alsglobal.com (see Canada downloads).

ALS Group strives to deliver on-time results to our clients at all times. However, there are times when due to capacity issues or other unforeseen circumstances we are unable to meet our expected turnaround times. The information above is related to a recent workorder you have submitted to our laboratory. In the event that you have an inquiry, please refer to the Lab Work Order # L1514806 when calling your Account Manager.

ALS Group appreciates your business. Thank you for the opportunity to work with you.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Duplicate	Chromium (Cr)-Total	DUP-H	L1514817-1, -10, -11, -12, -14, -17, -18, -2, -3, -4, -5, -6, -7, -8, -9

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DUP-H	Duplicate results outside ALS DQO, due to sample heterogeneity.
RRU	Reported Result is Uncertain due to proximity to the estimated Method Detection Limit.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
HG-WET-CVAFS-VA	Tissue	Mercury in Tissue by CVAFS (WET)	EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1991). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7. This digestion procedure was implemented on October 5, 2009.

This analysis is not compliant with the requirements of the B.C. Lab Manual for digestion of tissue samples from British Columbia for metals analysis after January 1, 2015.

HG-WET-MICR-CVAF-VA	Tissue	Mercury in Tissue by CVAFS Micro (WET)	EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

MET-WET-CCMS-VA	Tissue	Metals in Tissue by CRC ICPMS (WET)	EPA 200.3/6020A

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1991). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

This analysis is not compliant with the requirements of the B.C. Lab Manual for digestion of tissue samples from British Columbia for metals analysis after January 1, 2015.

MET-WET-MICR-HRMS-VA	Tissue	Metals in Tissue by HR-ICPMS Micro (WET)	EPA 200.3/200.8

Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on wet weight basis.

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MOISTURE-TISS-VA	Tissue	% Moisture in Tissues	ASTM D2974-00 Method A

This analysis is carried out gravimetrically by drying the sample at 105 C for a minimum of six hours.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Quality Control Report

Legend:

Limit	ALS Control Limit (Data Quality Objectives)
DUP	Duplicate
RPD	Relative Percent Difference
N/A	Not Available
LCS	Laboratory Control Sample
SRM	Standard Reference Material
MS	Matrix Spike
MSD	Matrix Spike Duplicate
ADE	Average Desorption Efficiency
MB	Method Blank
IRM	Internal Reference Material
CRM	Certified Reference Material
CCV	Continuing Calibration Verification
CVS	Calibration Verification Standard
LCSD	Laboratory Control Sample Duplicate

Sample Parameter Qualifier Definitions:

Qualifier	Description
DUP-H	Duplicate results outside ALS DQO, due to sample heterogeneity.
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Sample Receipt Confirmation

Sample Disposal Information:

Where possible, ALS will store samples for 30 days from the date a final report is issued, or 30 days from the date samples are placed on hold without analytical requests, after which samples may be discarded. Air samples collected on re-usable media are an exception, and are stored for 7 days from the date a final report is issued. Longer storage times are available upon request.

For information about ALS accreditations and certifications please contact your Account Manager or visit our webpage at www.alsglobal.com (see Canada downloads).

ALS Group strives to deliver on-time results to our clients at all times. However, there are times when due to capacity issues or other unforeseen circumstances we are unable to meet our expected turnaround times. The information above is related to a recent workorder you have submitted to our laboratory. In the event that you have an inquiry, please refer to the Lab Work Order # L1514817 when calling your Account Manager.

ALS Group appreciates your business. Thank you for the opportunity to work with you.

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DUP-H	Duplicate results outside ALS DQO, due to sample heterogeneity.
RM-H	Reference Material recovery was above ALS DQO. Non-detected sample results are considered reliable. Other results, if reported, have been qualified.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
HG-DRY-CVAFS-VA	Tissue	Mercury in Tissue by CVAFS (DRY)	EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7. This digestion procedure was implemented on October 5, 2009.

HG-DRY-MICR-CVAF-VA	Tissue	Mercury in Tissue by CVAFS Micro (DRY)	EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

HG-WET-CVAFS-VA	Tissue	Mercury in Tissue by CVAFS (WET)	EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7. This digestion procedure was implemented on October 5, 2009.

HG-WET-MICR-CVAF-VA	Tissue	Mercury in Tissue by CVAFS Micro (WET)	EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

MET-DRY-CCMS-VA	Tissue	Metals in Tissue by CRC ICPMS (DRY)	EPA 200.3/6020A

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Reference Information

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-DRY-MICR-HRMS-VA Tissue Metals in Tissue by HR-ICPMS Micro (DRY) EPA 200.3/200.8

Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on dry weight basis.

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-WET-CCMS-VA Tissue Metals in Tissue by CRC ICPMS (WET) EPA 200.3/6020A

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-WET-MICR-HRMS-VA Tissue Metals in Tissue by HR-ICPMS Micro (WET) EPA 200.3/200.8

Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on wet weight basis.

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MOISTURE-TISS-VA Tissue % Moisture in Tissues ASTM D2974-00 Method A

This analysis is carried out gravimetrically by drying the sample at 105 C for a minimum of six hours.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

P0027

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
HG-DRY-CVAFS-VA	Tissue	Mercury in Tissue by CVAFS (DRY)	EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7. This digestion procedure was implemented on October 5, 2009.

HG-DRY-MICR-CVAF-VA	Tissue	Mercury in Tissue by CVAFS Micro (DRY)	EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

HG-WET-CVAFS-VA	Tissue	Mercury in Tissue by CVAFS (WET)	EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7. This digestion procedure was implemented on October 5, 2009.

HG-WET-MICR-CVAF-VA	Tissue	Mercury in Tissue by CVAFS Micro (WET)	EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

MET-DRY-CCMS-VA	Tissue	Metals in Tissue by CRC ICPMS (DRY)	EPA 200.3/6020A

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-DRY-MICR-HRMS-VA	Tissue	Metals in Tissue by HR-ICPMS Micro (DRY)	EPA 200.3/200.8

Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on dry weight basis.

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-WET-CCMS-VA	Tissue	Metals in Tissue by CRC ICPMS (WET)	EPA 200.3/6020A

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-WET-MICR-HRMS-VA	Tissue	Metals in Tissue by HR-ICPMS Micro (WET)	EPA 200.3/200.8

Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on wet weight basis.

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MOISTURE-TISS-VA	Tissue	% Moisture in Tissues	ASTM D2974-00 Method A

This analysis is carried out gravimetrically by drying the sample at 105 C for a minimum of six hours.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Certificate of Analysis

Lab Work Order #: L1527061

Project P.O. #: NOT SUBMITTED
Job Reference:
C of C Numbers:
Legal Site Desc:

Comments: Please note we received an extra sample "RB-1 QUESNEL LAKE (IMPACTED) TISSUE R" not listed on the COC. We analyzed the extra sample as per other samples in the work order.

Please note we did not receive samples "BB-1 (HFSL-2) Right side liver tissue" and "RSC-11 (Polley Lake, Sinking net, P4)." Hence, requested analyses could not be completed.

14-SEP-2015 Revision 2: The sample collection date for the sample ASL identify as L1527061-12 was modified.

Can Dang
Senior Account Manager

Reference Information

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLHM	Detection Limit Adjusted: Sample has High Moisture Content

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
HG-DRY-CVAFS-VA	Tissue	Mercury in Tissue by CVAFS (DRY)	EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1991). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7. This digestion procedure was implemented on October 5, 2009.

This analysis is not compliant with the requirements of the B.C. Lab Manual for digestion of tissue samples from British Columbia for metals analysis after January 1, 2015.

HG-WET-CVAFS-VA	Tissue	Mercury in Tissue by CVAFS (WET)	EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1991). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7. This digestion procedure was implemented on October 5, 2009.

This analysis is not compliant with the requirements of the B.C. Lab Manual for digestion of tissue samples from British Columbia for metals analysis after January 1, 2015.

MET-DRY-CCMS-VA	Tissue	Metals in Tissue by CRC ICPMS (DRY)	EPA 200.3/6020A

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1991). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

This analysis is not compliant with the requirements of the B.C. Lab Manual for digestion of tissue samples from British Columbia for metals analysis after January 1, 2015.

MET-WET-CCMS-VA	Tissue	Metals in Tissue by CRC ICPMS (WET)	EPA 200.3/6020A

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1991). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

This analysis is not compliant with the requirements of the B.C. Lab Manual for digestion of tissue samples from British Columbia for metals analysis after January 1, 2015.

MOISTURE-TISS-VA	Tissue	% Moisture in Tissues	ASTM D2974-00 Method A

This analysis is carried out gravimetrically by drying the sample at 105 C for a minimum of six hours.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location

Chain of Custody Numbers:

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Sample Receipt Confirmation

Sample Disposal Information:

Where possible, ALS will store samples for 30 days from the date a final report is issued, or 30 days from the date samples are placed on hold without analytical requests, after which samples may be discarded. Air samples collected on re-usable media are an exception, and are stored for 7 days from the date a final report is issued. Longer storage times are available upon request.

For information about ALS accreditations and certifications please contact your Account Manager or visit our webpage at www.alsglobal.com (see Canada downloads).

ALS Group strives to deliver on-time results to our clients at all times. However, there are times when due to capacity issues or other unforeseen circumstances we are unable to meet our expected turnaround times. The information above is related to a recent workorder you have submitted to our laboratory. In the event that you have an inquiry, please refer to the Lab Work Order # L1527061 when calling your Account Manager.

ALS Group appreciates your business. Thank you for the opportunity to work with you.

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
HG-DRY-CVAFS-VA	Tissue	Mercury in Tissue by CVAFS (DRY)	EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7. This digestion procedure was implemented on October 5, 2009.

HG-WET-CVAFS-VA	Tissue	Mercury in Tissue by CVAFS (WET)	EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7. This digestion procedure was implemented on October 5, 2009.

MET-DRY-CCMS-VA	Tissue	Metals in Tissue by CRC ICPMS (DRY)	EPA 200.3/6020A

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-WET-CCMS-VA	Tissue	Metals in Tissue by CRC ICPMS (WET)	EPA 200.3/6020A

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MOISTURE-TISS-VA	Tissue	% Moisture in Tissues	ASTM D2974-00 Method A

This analysis is carried out gravimetrically by drying the sample at 105 C for a minimum of six hours.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

Q LK CPGN-1 PCC-1-12

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Sample Integrity Observations: No observations were identified for this work order submission.

ALS Group strives to deliver on-time results to our clients at all times. However, there are times when due to capacity issues or other unforeseen circumstances we are unable to meet our expected turnaround times. The information above is related to a recent workorder you have submitted to our laboratory. In the event that you have an inquiry, please refer to the Lab Work Order # when calling your Account Manager.

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
HG-DRY-CVAFS-VA	Tissue	Mercury in Tissue by CVAFS (DRY)	EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7. This digestion procedure was implemented on October 5, 2009.

HG-DRY-MICR-CVAF-VA	Tissue	Mercury in Tissue by CVAFS Micro (DRY)	EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

HG-WET-CVAFS-VA	Tissue	Mercury in Tissue by CVAFS (WET)	EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7. This digestion procedure was implemented on October 5, 2009.

HG-WET-MICR-CVAF-VA	Tissue	Mercury in Tissue by CVAFS Micro (WET)	EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

MET-DRY-CCMS-VA	Tissue	Metals in Tissue by CRC ICPMS (DRY)	EPA 200.3/6020A

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-DRY-MICR-HRMS-VA	Tissue	Metals in Tissue by HR-ICPMS Micro (DRY)	EPA 200.3/200.8

Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on dry weight basis.

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-WET-CCMS-VA	Tissue	Metals in Tissue by CRC ICPMS (WET)	EPA 200.3/6020A

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-WET-MICR-HRMS-VA	Tissue	Metals in Tissue by HR-ICPMS Micro (WET)	EPA 200.3/200.8

Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on wet weight basis.

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MOISTURE-TISS-VA	Tissue	% Moisture in Tissues	ASTM D2974-00 Method A

This analysis is carried out gravimetrically by drying the sample at 105 C for a minimum of six hours.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Sample Integrity Observations: No observations were identified for this work order submission.

ALS Group strives to deliver on-time results to our clients at all times. However, there are times when due to capacity issues or other unforeseen circumstances we are unable to meet our expected turnaround times. The information above is related to a recent workorder you have submitted to our laboratory. In the event that you have an inquiry, please refer to the Lab Work Order # when calling your Account Manager.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Duplicate	Copper (Cu)-Total	DUP-H	L1527095-1, -10, -11, -12, -13, -14, -15, -16, -2, -3, -4, -5, -6, -7, -8, -9
Duplicate	Copper (Cu)-Total	DUP-H	L1527095-1, -10, -11, -12, -13, -14, -15, -16, -2, -3, -4, -5, -6, -7, -8, -9

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DUP-H	Duplicate results outside ALS DQO, due to sample heterogeneity.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
HG-DRY-MICR-CVAF-VA	Tissue	Mercury in Tissue by CVAFS Micro (DRY)	EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

HG-WET-MICR-CVAF-VA	Tissue	Mercury in Tissue by CVAFS Micro (WET)	EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

MET-DRY-MICR-HRMS-VA	Tissue	Metals in Tissue by HR-ICPMS Micro (DRY)	EPA 200.3/200.8

Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on dry weight basis.

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-WET-MICR-HRMS-VA	Tissue	Metals in Tissue by HR-ICPMS Micro (WET)	EPA 200.3/200.8

Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on wet weight basis.

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MOISTURE-TISS-VA	Tissue	% Moisture in Tissues	ASTM D2974-00 Method A

This analysis is carried out gravimetrically by drying the sample at 105 C for a minimum of six hours.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

LNS-1-8 POL LK GN LNS-9-16 POL LK GN

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Sample Integrity Observations: No observations were identified for this work order submission.

ALS Group strives to deliver on-time results to our clients at all times. However, there are times when due to capacity issues or other unforeseen circumstances we are unable to meet our expected turnaround times. The information above is related to a recent workorder you have submitted to our laboratory. In the event that you have an inquiry, please refer to the Lab Work Order # when calling your Account Manager.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Duplicate	Aluminum (Al)-Total	DUP-H	L1538008-10, -11, -12, -13, -14, -15, -17, -18, -19, -2, -3, -31, -33, -37, -38, -39, -40, -6, -8, -9
Duplicate	Iron (Fe)-Total	DUP-H	L1538008-10, -11, -12, -13, -14, -15, -17, -18, -19, -2, -3, -31, -33, -37, -38, -39, -40, -6, -8, -9
Duplicate	Manganese (Mn)-Total	DUP-H	L1538008-10, -11, -12, -13, -14, -15, -17, -18, -19, -2, -3, -31, -33, -37, -38, -39, -40, -6, -8, -9
Duplicate	Zinc (Zn)-Total	DUP-H	L1538008-10, -11, -12, -13, -14, -15, -17, -18, -19, -2, -3, -31, -33, -37, -38, -39, -40, -6, -8, -9
Duplicate	Aluminum (Al)-Total	DUP-H	L1538008-14, -20, -32, -36
Duplicate	Barium (Ba)-Total	DUP-H	L1538008-14, -20, -32, -36
Duplicate	Magnesium (Mg)-Total	DUP-H	L1538008-14, -20, -32, -36
Duplicate	Manganese (Mn)-Total	DUP-H	L1538008-14, -20, -32, -36
Duplicate	Uranium (U)-Total	DUP-H	L1538008-14, -20, -32, -36
Duplicate	Antimony (Sb)-Total	RRU	L1538008-27

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DUP-H	Duplicate results outside ALS DQO, due to sample heterogeneity.
RRU	Reported Result is Uncertain due to proximity to the estimated Method Detection Limit.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
HG-WET-CVAFS-VA	Tissue	Mercury in Tissue by CVAFS (WET)	EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1991). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7. This digestion procedure was implemented on October 5, 2009.

This analysis is not compliant with the requirements of the B.C. Lab Manual for digestion of tissue samples from British Columbia for metals analysis after January 1, 2015.

HG-WET-MICR-CVAF-VA	Tissue	Mercury in Tissue by CVAFS Micro (WET)	EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

MET-WET-CCMS-VA	Tissue	Metals in Tissue by CRC ICPMS (WET)	EPA 200.3/6020A

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1991). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

This analysis is not compliant with the requirements of the B.C. Lab Manual for digestion of tissue samples from British Columbia for metals analysis after January 1, 2015.

MET-WET-MICR-HRMS-VA	Tissue	Metals in Tissue by HR-ICPMS Micro (WET)	EPA 200.3/200.8

Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on wet weight basis.

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MOISTURE-TISS-VA	Tissue	% Moisture in Tissues	ASTM D2974-00 Method A

This analysis is carried out gravimetrically by drying the sample at 105 C for a minimum of six hours.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

ALS Group strives to deliver on-time results to our clients at all times. However, there are times when due to capacity issues or other unforeseen circumstances we are unable to meet our expected turnaround times. The information above is related to a recent workorder you have submitted to our laboratory. In the event that you have an inquiry, please refer to the Lab Work Order # L1538008 when calling your Account Manager.

ALS Group appreciates your business. Thank you for the opportunity to work with you.

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
HG-DRY-CVAFS-N-VA	Tissue	Mercury in Tissue by CVAFS (DRY)	EPA 200.3, EPA 245.7

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

HG-DRY-MICR-CVAF-VA	Tissue	Mercury in Tissue by CVAFS Micro (DRY)	EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

HG-WET-CVAFS-N-VA	Tissue	Mercury in Tissue by CVAFS (WET)	EPA 200.3, EPA 245.7

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

HG-WET-MICR-CVAF-VA	Tissue	Mercury in Tissue by CVAFS Micro (WET)	EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

MET-DRY-CCMS-N-VA	Tissue	Metals in Tissue by CRC ICPMS (DRY)	EPA 200.3/6020A

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-DRY-MICR-HRMS-VA	Tissue	Metals in Tissue by HR-ICPMS Micro (DRY)	EPA 200.3/200.8

Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on dry weight basis.

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-WET-CCMS-N-VA	Tissue	Metals in Tissue by CRC ICPMS (WET)	EPA 200.3/6020A

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-WET-MICR-HRMS-VA	Tissue	Metals in Tissue by HR-ICPMS Micro (WET)	EPA 200.3/200.8

Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on wet weight basis.

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MOISTURE-TISS-VA	Tissue	% Moisture in Tissues	ASTM D2974-00 Method A

This analysis is carried out gravimetrically by drying the sample at 105 C for a minimum of six hours.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DUP-H	Duplicate results outside ALS DQO, due to sample heterogeneity.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
HG-DRY-CVAFS-N-VA	Tissue	Mercury in Tissue by CVAFS (DRY)	EPA 200.3, EPA 245.7

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

HG-DRY-MICR-CVAF-VA Tissue Mercury in Tissue by CVAFS Micro (DRY) EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

HG-WET-CVAFS-N-VA Tissue Mercury in Tissue by CVAFS (WET) EPA 200.3, EPA 245.7

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

HG-WET-MICR-CVAF-VA Tissue Mercury in Tissue by CVAFS Micro (WET) EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

MET-DRY-CCMS-N-VA Tissue Metals in Tissue by CRC ICPMS (DRY) EPA 200.3/6020A

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-DRY-MICR-HRMS-VA Tissue Metals in Tissue by HR-ICPMS Micro (DRY) EPA 200.3/200.8

Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on dry weight basis.

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-WET-CCMS-N-VA Tissue Metals in Tissue by CRC ICPMS (WET) EPA 200.3/6020A

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only

Reference Information

partially recovered.

MET-WET-MICR-HRMS-VA Tissue Metals in Tissue by HR-ICPMS Micro (WET) EPA 200.3/200.8

Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on wet weight basis.

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MOISTURE-TISS-VA Tissue % Moisture in Tissues ASTM D2974-00 Method A

This analysis is carried out gravimetrically by drying the sample at 105 C for a minimum of six hours.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location

Chain of Custody Numbers:

FT-2

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Duplicate	Aluminum (Al)-Total	DUP-H	L1667546-45, -48
Duplicate	Iron (Fe)-Total	DUP-H	L1667546-45, -48
Duplicate	Phosphorus (P)-Total	DUP-H	L1667546-45, -48
Duplicate	Potassium (K)-Total	DUP-H	L1667546-45, -48
Duplicate	Aluminum (Al)-Total	DUP-H	L1667546-45, -48
Duplicate	Iron (Fe)-Total	DUP-H	L1667546-45, -48
Duplicate	Phosphorus (P)-Total	DUP-H	L1667546-45, -48
Duplicate	Potassium (K)-Total	DUP-H	L1667546-45, -48

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DUP-H	Duplicate results outside ALS DQO, due to sample heterogeneity.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
MET-DRY-CCMS-N-VA	Tissue	Metals in Tissue by CRC ICPMS (DRY)	EPA 200.3/6020A

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-DRY-MICR-HRMS-VA	Tissue	Metals in Tissue by HR-ICPMS Micro (DRY)	EPA 200.3/200.8

Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on dry weight basis.

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-WET-CCMS-N-VA	Tissue	Metals in Tissue by CRC ICPMS (WET)	EPA 200.3/6020A

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-WET-MICR-HRMS-VA	Tissue	Metals in Tissue by HR-ICPMS Micro (WET)	EPA 200.3/200.8

Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on wet weight basis.

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MOISTURE-TISS-VA	Tissue	% Moisture in Tissues	ASTM D2974-00 Method A

This analysis is carried out gravimetrically by drying the sample at 105 C for a minimum of six hours.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location

Chain of Custody Numbers:

2 3 4 B0023

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Comments: ADDITIONAL 25-FEB-16 15:09

26-FEB-2016 Revision 2: As results from re-analysis of specific samples this revision includes the following modifications:
- The Aluminum data for the sample, L1686208-24, was modified;
- The Nickel data for the sample, L1686208-32, was modified;
- The data obtained from re-analysis of the sample, "QUL NEAR HAZELTINE CR LT #3 KIDNEY"(L1686208-12), is included under the additional sample "QUL NEAR HAZELTINE CR LT #3 KIDNEY (RECHECK)"(L1686208-36).

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DUP-H	Duplicate results outside ALS DQO, due to sample heterogeneity.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
HG-DRY-CVAFS-N-VA	Tissue	Mercury in Tissue by CVAFS (DRY)	EPA 200.3, EPA 245.7

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

HG-DRY-MICR-CVAF-VA Tissue Mercury in Tissue by CVAFS Micro (DRY) EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

HG-WET-CVAFS-N-VA Tissue Mercury in Tissue by CVAFS (WET) EPA 200.3, EPA 245.7

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

HG-WET-MICR-CVAF-VA Tissue Mercury in Tissue by CVAFS Micro (WET) EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

MET-DRY-CCMS-N-VA Tissue Metals in Tissue by CRC ICPMS (DRY) EPA 200.3/6020A

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-DRY-MICR-HRMS-VA Tissue Metals in Tissue by HR-ICPMS Micro (DRY) EPA 200.3/200.8

Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on dry weight basis.

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-WET-CCMS-N-VA Tissue Metals in Tissue by CRC ICPMS (WET) EPA 200.3/6020A

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-WET-MICR-HRMS-VA Tissue Metals in Tissue by HR-ICPMS Micro (WET) EPA 200.3/200.8

Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on wet weight basis.

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

Reference Information

MOISTURE-TISS-VA	Tissue	% Moisture in Tissues	ASTM D2974-00 Method A

This analysis is carried out gravimetrically by drying the sample at 105 C for a minimum of six hours.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Method Blank	Copper (Cu)-Total	MB-LOR	L1687334-1, -2, -3, -4, -5, -6, -7, -8, -9
Method Blank	Manganese (Mn)-Total	MB-LOR	L1687334-1, -2, -3, -4, -5, -6, -7, -8, -9
Method Blank	Copper (Cu)-Total	MB-LOR	L1687334-1, -2, -3, -4, -5, -6, -7, -8, -9
Method Blank	Manganese (Mn)-Total	MB-LOR	L1687334-1, -2, -3, -4, -5, -6, -7, -8, -9

Qualifiers for Individual Parameters Listed:

Qualifier	Description
MB-LOR	Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
HG-DRY-CVAFS-N-VA	Tissue	Mercury in Tissue by CVAFS (DRY)	EPA 200.3, EPA 245.7

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

HG-WET-CVAFS-N-VA	Tissue	Mercury in Tissue by CVAFS (WET)	EPA 200.3, EPA 245.7

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

MET-DRY-CCMS-N-VA	Tissue	Metals in Tissue by CRC ICPMS (DRY)	EPA 200.3/6020A

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-WET-CCMS-N-VA	Tissue	Metals in Tissue by CRC ICPMS (WET)	EPA 200.3/6020A

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MOISTURE-TISS-VA	Tissue	% Moisture in Tissues	ASTM D2974-00 Method A

This analysis is carried out gravimetrically by drying the sample at 105 C for a minimum of six hours.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location

Chain of Custody Numbers:

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Method Blank	Strontium (Sr)-Total	MB-LOR	L1687336-1, -14, -15, -18, -21, -24, -4, -7
Method Blank	Copper (Cu)-Total	MB-LOR	L1687336-1, -14, -15, -18, -21, -24, -4, -7
Method Blank	Strontium (Sr)-Total	MB-LOR	L1687336-1, -14, -15, -18, -21, -24, -4, -7

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DUP-H	Duplicate results outside ALS DQO, due to sample heterogeneity.
MB-LOR	Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
HG-DRY-CVAFS-N-VA	Tissue	Mercury in Tissue by CVAFS (DRY)	EPA 200.3, EPA 245.7

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

HG-DRY-MICR-CVAF-VA	Tissue	Mercury in Tissue by CVAFS Micro (DRY)	EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

HG-WET-CVAFS-N-VA	Tissue	Mercury in Tissue by CVAFS (WET)	EPA 200.3, EPA 245.7

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

HG-WET-MICR-CVAF-VA	Tissue	Mercury in Tissue by CVAFS Micro (WET)	EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

MET-DRY-CCMS-N-VA	Tissue	Metals in Tissue by CRC ICPMS (DRY)	EPA 200.3/6020A

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-DRY-MICR-HRMS-VA	Tissue	Metals in Tissue by HR-ICPMS Micro (DRY)	EPA 200.3/200.8

Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on dry weight basis.

Reference Information

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-WET-CCMS-N-VA Tissue Metals in Tissue by CRC ICPMS (WET) EPA 200.3/6020A

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-WET-MICR-HRMS-VA Tissue Metals in Tissue by HR-ICPMS Micro (WET) EPA 200.3/200.8

Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on wet weight basis.

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MOISTURE-TISS-VA Tissue % Moisture in Tissues ASTM D2974-00 Method A

This analysis is carried out gravimetrically by drying the sample at 105 C for a minimum of six hours.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Method Blank	Copper (Cu)-Total	MB-LOR	L1687337-1, -2, -3, -4, -5, -6, -7, -8, -9
Method Blank	Manganese (Mn)-Total	MB-LOR	L1687337-1, -2, -3, -4, -5, -6, -7, -8, -9
Method Blank	Copper (Cu)-Total	MB-LOR	L1687337-1, -2, -3, -4, -5, -6, -7, -8, -9
Method Blank	Manganese (Mn)-Total	MB-LOR	L1687337-1, -2, -3, -4, -5, -6, -7, -8, -9

Qualifiers for Individual Parameters Listed:

Qualifier	Description
MB-LOR	Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
HG-DRY-CVAFS-N-VA	Tissue	Mercury in Tissue by CVAFS (DRY)	EPA 200.3, EPA 245.7

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

HG-WET-CVAFS-N-VA	Tissue	Mercury in Tissue by CVAFS (WET)	EPA 200.3, EPA 245.7

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

MET-DRY-CCMS-N-VA	Tissue	Metals in Tissue by CRC ICPMS (DRY)	EPA 200.3/6020A

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-WET-CCMS-N-VA	Tissue	Metals in Tissue by CRC ICPMS (WET)	EPA 200.3/6020A

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MOISTURE-TISS-VA	Tissue	% Moisture in Tissues	ASTM D2974-00 Method A

This analysis is carried out gravimetrically by drying the sample at 105 C for a minimum of six hours.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location

Chain of Custody Numbers:

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
HG-DRY-CVAFS-N-VA	Tissue	Mercury in Tissue by CVAFS (DRY)	EPA 200.3, EPA 245.7

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

HG-DRY-MICR-CVAF-VA	Tissue	Mercury in Tissue by CVAFS Micro (DRY)	EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

HG-WET-CVAFS-N-VA	Tissue	Mercury in Tissue by CVAFS (WET)	EPA 200.3, EPA 245.7

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

HG-WET-MICR-CVAF-VA	Tissue	Mercury in Tissue by CVAFS Micro (WET)	EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

MET-DRY-CCMS-N-VA	Tissue	Metals in Tissue by CRC ICPMS (DRY)	EPA 200.3/6020A

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-DRY-MICR-HRMS-VA	Tissue	Metals in Tissue by HR-ICPMS Micro (DRY)	EPA 200.3/200.8

Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on dry weight basis.

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-WET-CCMS-N-VA	Tissue	Metals in Tissue by CRC ICPMS (WET)	EPA 200.3/6020A

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-WET-MICR-HRMS-VA	Tissue	Metals in Tissue by HR-ICPMS Micro (WET)	EPA 200.3/200.8

Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on wet weight basis.

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MOISTURE-TISS-VA	Tissue	% Moisture in Tissues	ASTM D2974-00 Method A

This analysis is carried out gravimetrically by drying the sample at 105 C for a minimum of six hours.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Duplicate	Molybdenum (Mo)-Total	DUP-H	L1688082-1
Duplicate	Molybdenum (Mo)-Total	DUP-H	L1688082-1
Method Blank	Uranium (U)-Total	MB-LOR	L1688082-1
Method Blank	Uranium (U)-Total	MB-LOR	L1688082-1

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DUP-H	Duplicate results outside ALS DQO, due to sample heterogeneity.
MB-LOR	Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
HG-DRY-CVAFS-N-VA	Tissue	Mercury in Tissue by CVAFS (DRY)	EPA 200.3, EPA 245.7

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

HG-DRY-MICR-CVAF-VA	Tissue	Mercury in Tissue by CVAFS Micro (DRY)	EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

HG-WET-CVAFS-N-VA	Tissue	Mercury in Tissue by CVAFS (WET)	EPA 200.3, EPA 245.7

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

HG-WET-MICR-CVAF-VA	Tissue	Mercury in Tissue by CVAFS Micro (WET)	EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

MET-DRY-CCMS-N-VA	Tissue	Metals in Tissue by CRC ICPMS (DRY)	EPA 200.3/6020A

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-DRY-MICR-HRMS-VA	Tissue	Metals in Tissue by HR-ICPMS Micro (DRY)	EPA 200.3/200.8

Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on dry weight basis.

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-WET-CCMS-N-VA	Tissue	Metals in Tissue by CRC ICPMS (WET)	EPA 200.3/6020A

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-WET-MICR-HRMS-VA	Tissue	Metals in Tissue by HR-ICPMS Micro (WET)	EPA 200.3/200.8

Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on wet weight basis.

Reference Information

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MOISTURE-TISS-VA Tissue % Moisture in Tissues ASTM D2974-00 Method A

This analysis is carried out gravimetrically by drying the sample at 105 C for a minimum of six hours.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
HG-DRY-CVAFS-N-VA	Tissue	Mercury in Tissue by CVAFS (DRY)	EPA 200.3, EPA 245.7

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

HG-DRY-MICR-CVAF-VA	Tissue	Mercury in Tissue by CVAFS Micro (DRY)	EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

HG-WET-CVAFS-N-VA	Tissue	Mercury in Tissue by CVAFS (WET)	EPA 200.3, EPA 245.7

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

HG-WET-MICR-CVAF-VA	Tissue	Mercury in Tissue by CVAFS Micro (WET)	EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

MET-DRY-CCMS-N-VA	Tissue	Metals in Tissue by CRC ICPMS (DRY)	EPA 200.3/6020A

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-DRY-MICR-HRMS-VA	Tissue	Metals in Tissue by HR-ICPMS Micro (DRY)	EPA 200.3/200.8

Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on dry weight basis.

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-WET-CCMS-N-VA	Tissue	Metals in Tissue by CRC ICPMS (WET)	EPA 200.3/6020A

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-WET-MICR-HRMS-VA	Tissue	Metals in Tissue by HR-ICPMS Micro (WET)	EPA 200.3/200.8

Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on wet weight basis.

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MOISTURE-TISS-VA	Tissue	% Moisture in Tissues	ASTM D2974-00 Method A

This analysis is carried out gravimetrically by drying the sample at 105 C for a minimum of six hours.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
HG-DRY-CVAFS-N-VA	Tissue	Mercury in Tissue by CVAFS (DRY)	EPA 200.3, EPA 245.7

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

HG-DRY-MICR-CVAF-VA	Tissue	Mercury in Tissue by CVAFS Micro (DRY)	EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

HG-WET-CVAFS-N-VA	Tissue	Mercury in Tissue by CVAFS (WET)	EPA 200.3, EPA 245.7

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

HG-WET-MICR-CVAF-VA	Tissue	Mercury in Tissue by CVAFS Micro (WET)	EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

MET-DRY-CCMS-N-VA	Tissue	Metals in Tissue by CRC ICPMS (DRY)	EPA 200.3/6020A

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-DRY-MICR-HRMS-VA	Tissue	Metals in Tissue by HR-ICPMS Micro (DRY)	EPA 200.3/200.8

Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on dry weight basis.

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-WET-CCMS-N-VA	Tissue	Metals in Tissue by CRC ICPMS (WET)	EPA 200.3/6020A

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-WET-MICR-HRMS-VA	Tissue	Metals in Tissue by HR-ICPMS Micro (WET)	EPA 200.3/200.8

Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on wet weight basis.

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MOISTURE-TISS-VA	Tissue	% Moisture in Tissues	ASTM D2974-00 Method A

This analysis is carried out gravimetrically by drying the sample at 105 C for a minimum of six hours.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location

Chain of Custody Numbers:

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

* Please refer to the Reference Information section for an explanation of any qualifiers detected.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Duplicate	Aluminum (Al)-Total	DUP-H	L1691825-2, -5, -7, -9
Method Blank	Copper (Cu)-Total	MB-LOR	L1691825-2, -5, -7, -9
Method Blank	Copper (Cu)-Total	MB-LOR	L1691825-2, -5, -7, -9

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DUP-H	Duplicate results outside ALS DQO, due to sample heterogeneity.
MB-LOR	Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
HG-DRY-CVAFS-N-VA	Tissue	Mercury in Tissue by CVAFS (DRY)	EPA 200.3, EPA 245.7

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

HG-WET-CVAFS-N-VA	Tissue	Mercury in Tissue by CVAFS (WET)	EPA 200.3, EPA 245.7

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

MET-DRY-CCMS-N-VA	Tissue	Metals in Tissue by CRC ICPMS (DRY)	EPA 200.3/6020A

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-WET-CCMS-N-VA	Tissue	Metals in Tissue by CRC ICPMS (WET)	EPA 200.3/6020A

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MOISTURE-TISS-VA	Tissue	% Moisture in Tissues	ASTM D2974-00 Method A

This analysis is carried out gravimetrically by drying the sample at 105 C for a minimum of six hours.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.
