QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Duplicate	Mercury (Hg)-Total	DUP-H	L1691836-1, -10, -11, -12, -13, -14, -15, -16, -17, -18, -19, -2, -20, -21, -22, -23, -24, -25, -3, -4, -5, -6, -7, -8, -9
Duplicate	Iron (Fe)-Total	DUP-H	L1691836-1, -10, -11, -12, -13, -14, -15, -16, -17, -18, -19, -2, -20, -21, -22, -23, -24, -25, -3, -4, -5, -6, -7, -8, -9
Duplicate	Mercury (Hg)-Total	LCS-L	L1691836-1, -10, -11, -12, -13, -14, -15, -16, -17, -18, -19, -2, -20, -21, -22, -23, -24, -25, -3, -4, -5, -6, -7, -8, -9

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DUP-H	Duplicate results outside ALS DQO, due to sample heterogeneity.
LCS-L	Lab Control Sample recovery was below ALS DQO. Reference Material and/or Matrix Spike results were acceptable. Non-detected sample results are considered reliable. Other results, if reported, have been qualified.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
HG-DRY-MICR-CVAF-VA	Tissue	Mercury in Tissue by CVAFS Micro (DRY)	EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

HG-WET-MICR-CVAF-VA	Tissue	Mercury in Tissue by CVAFS Micro (WET)	EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

MET-DRY-MICR-HRMS-VA	Tissue	Metals in Tissue by HR-ICPMS Micro (DRY)	EPA 200.3/200.8

Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on dry weight basis.

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-WET-MICR-HRMS-VA	Tissue	Metals in Tissue by HR-ICPMS Micro (WET)	EPA 200.3/200.8

Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on wet weight basis.

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MOISTURE-TISS-VA	Tissue	% Moisture in Tissues	ASTM D2974-00 Method A

This analysis is carried out gravimetrically by drying the sample at 105 C for a minimum of six hours.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
HG-DRY-CVAFS-N-VA	Tissue	Mercury in Tissue by CVAFS (DRY)	EPA 200.3, EPA 245.7

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

HG-WET-CVAFS-N-VA	Tissue	Mercury in Tissue by CVAFS (WET)	EPA 200.3, EPA 245.7

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

LIPIDS-GRAV-VA	Tissue	Lipids in Tissue by Gravimetric	EPA 3570, 8290

A portion of homogenized sample is extracted with dichloromethane. The extract is evaporated to dryness and the lipid content determined gravimetrically.

MET-DRY-CCMS-N-VA	Tissue	Metals in Tissue by CRC ICPMS (DRY)	EPA 200.3/6020A

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-WET-CCMS-N-VA	Tissue	Metals in Tissue by CRC ICPMS (WET)	EPA 200.3/6020A

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MOISTURE-TISS-VA	Tissue	% Moisture in Tissues	ASTM D2974-00 Method A

This analysis is carried out gravimetrically by drying the sample at 105 C for a minimum of six hours.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Sample Integrity Observations:

No observations were identified for this work order submission.

Sample Disposal Information:

Where possible, ALS will store samples for 30 days from the date a final report is issued, or 30 days from the date samples are placed on hold without analytical requests, after which samples may be discarded. Air samples collected on re-usable media are an exception, and are stored for 7 days from the date a final report is issued. Longer storage times are available upon request.

For information about ALS accreditations and certifications please contact your Account Manager or visit our webpage at www.alsglobal.com (see Canada downloads).

ALS Group strives to deliver on-time results to our clients at all times. However, there are times when due to capacity issues or other unforeseen circumstances we are unable to meet our expected turnaround times. The information above is related to a recent workorder you have submitted to our laboratory. In the event that you have an inquiry, please refer to the Lab Work Order # when calling your Account Manager.

ALS Group appreciates your business. Thank you for the opportunity to work with you.

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
HG-DRY-CVAFS-N-VA	Tissue	Mercury in Tissue by CVAFS (DRY)	EPA 200.3, EPA 245.7

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

HG-WET-CVAFS-N-VA	Tissue	Mercury in Tissue by CVAFS (WET)	EPA 200.3, EPA 245.7

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

LIPIDS-GRAV-VA	Tissue	Lipids in Tissue by Gravimetric	EPA 3570, 8290

A portion of homogenized sample is extracted with dichloromethane. The extract is evaporated to dryness and the lipid content determined gravimetrically.

MET-DRY-CCMS-N-VA	Tissue	Metals in Tissue by CRC ICPMS (DRY)	EPA 200.3/6020A

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-WET-CCMS-N-VA	Tissue	Metals in Tissue by CRC ICPMS (WET)	EPA 200.3/6020A

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MOISTURE-TISS-VA	Tissue	% Moisture in Tissues	ASTM D2974-00 Method A

This analysis is carried out gravimetrically by drying the sample at 105 C for a minimum of six hours.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Sample Integrity Observations:

No observations were identified for this work order submission.

Sample Disposal Information:

Where possible, ALS will store samples for 30 days from the date a final report is issued, or 30 days from the date samples are placed on hold without analytical requests, after which samples may be discarded. Air samples collected on re-usable media are an exception, and are stored for 7 days from the date a final report is issued. Longer storage times are available upon request.

For information about ALS accreditations and certifications please contact your Account Manager or visit our webpage at www.alsglobal.com (see Canada downloads).

ALS Group strives to deliver on-time results to our clients at all times. However, there are times when due to capacity issues or other unforeseen circumstances we are unable to meet our expected turnaround times. The information above is related to a recent workorder you have submitted to our laboratory. In the event that you have an inquiry, please refer to the Lab Work Order # when calling your Account Manager.

ALS Group appreciates your business. Thank you for the opportunity to work with you.

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
HG-DRY-CVAFS-N-VA	Tissue	Mercury in Tissue by CVAFS (DRY)	EPA 200.3, EPA 245.7

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

HG-WET-CVAFS-N-VA	Tissue	Mercury in Tissue by CVAFS (WET)	EPA 200.3, EPA 245.7

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

LIPIDS-GRAV-VA	Tissue	Lipids in Tissue by Gravimetric	EPA 3570, 8290

A portion of homogenized sample is extracted with dichloromethane. The extract is evaporated to dryness and the lipid content determined gravimetrically.

MET-DRY-CCMS-N-VA	Tissue	Metals in Tissue by CRC ICPMS (DRY)	EPA 200.3/6020A

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-WET-CCMS-N-VA	Tissue	Metals in Tissue by CRC ICPMS (WET)	EPA 200.3/6020A

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MOISTURE-TISS-VA	Tissue	% Moisture in Tissues	ASTM D2974-00 Method A

This analysis is carried out gravimetrically by drying the sample at 105 C for a minimum of six hours.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Sample Integrity Observations:

No observations were identified for this work order submission.

Sample Disposal Information:

Where possible, ALS will store samples for 30 days from the date a final report is issued, or 30 days from the date samples are placed on hold without analytical requests, after which samples may be discarded. Air samples collected on re-usable media are an exception, and are stored for 7 days from the date a final report is issued. Longer storage times are available upon request.

For information about ALS accreditations and certifications please contact your Account Manager or visit our webpage at www.alsglobal.com (see Canada downloads).

ALS Group strives to deliver on-time results to our clients at all times. However, there are times when due to capacity issues or other unforeseen circumstances we are unable to meet our expected turnaround times. The information above is related to a recent workorder you have submitted to our laboratory. In the event that you have an inquiry, please refer to the Lab Work Order # when calling your Account Manager.

ALS Group appreciates your business. Thank you for the opportunity to work with you.

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
HG-DRY-CVAFS-N-VA	Tissue	Mercury in Tissue by CVAFS (DRY)	EPA 200.3, EPA 245.7

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

HG-WET-CVAFS-N-VA	Tissue	Mercury in Tissue by CVAFS (WET)	EPA 200.3, EPA 245.7

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

LIPIDS-GRAV-VA	Tissue	Lipids in Tissue by Gravimetric	EPA 3570, 8290

A portion of homogenized sample is extracted with dichloromethane. The extract is evaporated to dryness and the lipid content determined gravimetrically.

MET-DRY-CCMS-N-VA	Tissue	Metals in Tissue by CRC ICPMS (DRY)	EPA 200.3/6020A

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-WET-CCMS-N-VA	Tissue	Metals in Tissue by CRC ICPMS (WET)	EPA 200.3/6020A

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MOISTURE-TISS-VA	Tissue	% Moisture in Tissues	ASTM D2974-00 Method A

This analysis is carried out gravimetrically by drying the sample at 105 C for a minimum of six hours.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Sample Integrity Observations:

No observations were identified for this work order submission.

Sample Disposal Information:

Where possible, ALS will store samples for 30 days from the date a final report is issued, or 30 days from the date samples are placed on hold without analytical requests, after which samples may be discarded. Air samples collected on re-usable media are an exception, and are stored for 7 days from the date a final report is issued. Longer storage times are available upon request.

For information about ALS accreditations and certifications please contact your Account Manager or visit our webpage at www.alsglobal.com (see Canada downloads).

ALS Group strives to deliver on-time results to our clients at all times. However, there are times when due to capacity issues or other unforeseen circumstances we are unable to meet our expected turnaround times. The information above is related to a recent workorder you have submitted to our laboratory. In the event that you have an inquiry, please refer to the Lab Work Order # when calling your Account Manager.

ALS Group appreciates your business. Thank you for the opportunity to work with you.

2016 TISSUE DATA REPORT FOR PLANTS COLLECTED ALONG HAZELTINE CHANNEL – MOUNT POLLEY MINE

Golder Associates Ltd. (Golder) is pleased to provide Mount Polley Mining Corporation (MPMC) with the following technical memorandum that summarizes the tissue chemistry results of plant samples collected from the Hazeltine Channel floodplain and halo in 2015 and 2016. This memorandum updates and presents statistical analyses of the tissue data presented in "Appendix J – *Terrestrial Vegetation Data Report* (dated 25 May 2016)" included in the Post-Event Environmental Impact Assessment Report (PEEIAR) update report dated 3 June 2016 (Golder 2016a). This memorandum presents the data collected in 2015 and 2016 and provides some context for the tissue concentrations measured. This memorandum will be appended to the up-coming human health risk assessment (HHRA). The data within will be used in both the human health and ecological risk assessments for evaluation of potential risks associated with metal concentrations in plant tissue.

1.0 BACKGROUND

Samples of plants considered edible for human and/or ecological receptors (berries, spruce, willow, and rye/barley grass) were collected in summer 2015 and summer 2016 from the terrestrial area impacted by the Tailings Storage Facility (TSF) embankment breach (i.e., Hazeltine Channel floodplain and halo) to evaluate whether concentrations of copper, selenium, and vanadium in plant tissue have changed as a result of tailings deposition along the Hazeltine Channel. This data will also be used to evaluate potential risks to human and ecological receptors in the up-coming risk assessments. Copper and vanadium were identified previously (Golder 2016b) to be contaminants of potential concern (COPC) because concentrations of these metals in tailings exceeded the applicable BC Contaminated Sites Regulation (CSR) soil standards (BC MoE 2014). Selenium in tailings and plants was included in the present analysis on request from project reviewers, although tailings concentrations were below the CSR standard and less than some of the natural sediments along the Hazeltine Channel. The 'floodplain' area is where the forest and portions of native soils were removed by the flood of debris from the TSF embankment breach. The area along the Hazeltine Channel where tailings had deposited on top of the native organic soil is referred to as the 'halo' area (Figures A-1 through A-14 in Attachment A). This memorandum refers to 'tailings deposited' along the Hazeltine Channel. In reality, the deposited material is a heterogeneous mix of tailings, scoured native till and construction material.

The limited amount of plant tissue collected in 2015 were insufficient for statistical comparison. However, a preliminary assessment indicated that concentrations of copper, selenium, and vanadium in plants from the floodplain and halo were similar to local background and/or baseline concentrations. In 2016, additional samples were collected to provide sufficient data for statistical analysis and provide a more definitive evaluation of the potential impact of tailings on plant tissue chemistry.

Copper is an essential element for plant growth and reproduction (Hochmuth et al. 2015, Landis and Steenis 2000, Majid 1984). It is a constituent of proteins and enzymes, playing a role in forming chlorophyll, and required for chloroplast development and photosynthesis (Hochmuth et al. 2015, Fageria 2007). Essential copper concentrations vary for different plant species, and tissue concentrations can vary within different parts of the plant (e.g., shoots, leaves, roots), and is dependent on plant age (Hochmuth et al. 2015). Plants are well adapted to prevent copper toxicity through specific immobilization mechanisms in their roots, stems, and mycorrhizal fungal associations (Emamverdian et al. 2015). Vanadium also occurs in all living organisms at trace levels, but its role in plant or animal metabolism is poorly understood (Imtiaz et al. 2015). In general, selenium is not known to be an essential element for plant growth, however, elemental selenium is chemically similar to sulphur and as a result, plants incidentally take up and metabolize selenium via sulphur transporters and pathways (Pilon-Smits and Quinn 2010). In a few plant species, selenium can increase growth, increase antioxidant potential, and protect against predators such as herbivores and disease (Pilon-Smits and Quinn 2010, Boyd and Martens 1993).

2.0 METHODS

2.1 Sample Collection

Consistent with the methods used in the 2015 program, samples of edible plants were collected between 3 August and 5 September 2016 by Golder and MPMC field staff. Plant samples were hand-picked by field staff using nitrile gloves and collected in clean, laboratory-supplied 2 ounce or 3.38 ounce Whirl-Pak® bags. Each plant sample was collected along with a soil sample at the same time and location (i.e., at the base of the plant). Plant and soil samples were also collected from non-impacted areas to represent local background. The locations of tissue and co-located soil samples can be found in Figures A-1 through A-14 in Attachment A.

- Berry—Berry samples were collected from plants growing in the halo area. The type of berries collected were those that are likely to be consumed by humans and wildlife (e.g., thimbleberry [*Rubus parviflorus*], blueberry [*Vaccinium* sp.], Devil's club [*Oplopanax horridus*], and highbush cranberry [*Viburnum trilobum]*). The plants selected were those producing berries and growing through or rooted within tailings or tailings mixture. Berry samples were primarily found where the tailings layer was less than 30 cm in depth.

- Conifer—Spruce (*Picea* sp.) needle samples were collected from trees growing in the halo area. The new growth at the tips of branches was collected; it is in this new shoot growth where metals would accumulate (Burkhead et al., 2009) and new shoots are preferred by wildlife. The trees growing in the halo area were growing through tailings and rooted in native soil.

- Shrub—Willow (*Salix* sp.) leaf samples were collected from shrubs planted in the floodplain by MPMC and from native shrubs in the halo area. Only willow planted in the floodplain before spring 2016 were sampled because established plants would have developed roots into the substrate for nutrient acquisition (as opposed to the recent cuttings, which primarily would have developed from nutrients stored within the cutting). Plants sampled included willow planted in lower Hazeltine Channel in early 2015, above the canyon in late 2015, and in upper Hazeltine Channel late 2015 (near Gavin Lake Bridge, was collected using a hand shovel).

- Grass—Rye and barley grass *(Lolium* sp., *Secale* sp., and *Hordeum* sp.) samples were collected from the floodplain, and if present, from the halo area. Where rye and barley grass were not present, a variety of other grass species including *Festuca* (Fescue), *Poa* (meadow grass), *Cinna* (woodreed), *Deschampsia* (tufted hairgrass) and *Achnatherum* (needle grass) were collected. The above ground portion of grass was collected. Grasses were generally shallowly rooted in deposited tailings, a tailings till mixture or in reclaimed substrates.
- Soil samples were collected at each plant sample location. Surface soil, generally within the top 0.2 m from the base of the plant was collected using a hand shovel. Soil collected targeted the rooting layer. In the floodplain this was generally the surficial tailings or till layer. In the halo plants were rooted in the native soil under tailings. The forest floor (LFH layers) was removed before collecting samples in background areas. Soil was homogenized in a stainless steel bowl prior to transfer to clean, laboratory-supplied 125-mL, glass sample jars with Teflon™ lined lids.

Tissue samples were submitted for analysis of metals and moisture content, and were rinsed with DI water by the laboratory staff prior to analysis. Soil samples were submitted for analysis of metals, nutrients, total organic carbon (TOC), and pH. For quality assurance and quality control (QA/QC), field duplicate samples of plants and soil were collected from 10% of locations.

2.2 Statistical Analyses

The statistical analysis was designed to evaluate temporal and spatial differences in metals concentrations in plants. Specifically, the analyses were used to address the following questions:

- Are metal concentrations in plants collected from exposed areas statistically higher than concentrations measured in plants from background areas and the pre-mine baseline study?
- If statistically different concentrations were measured in exposed areas, do these concentrations exceed documented thresholds for plant toxicity?

A baseline study of plant tissue sampling at the Mount Polley property was conducted by Hallam Knight Piésold to document pre-mine concentrations of metals in plants on or near the mine. Sampling was conducted in 1989, 1995, and 1996 in areas including the Central and West Pits (now the Cariboo and Springer Pits), the Mill Site, and the TSF (Golder 2016a). Vanadium was not measured in the historic plant samples and berry samples were not collected in the baseline study. Soil samples were not collected with baseline plant samples. Further detail of the available baseline data are provided in Appendix J of the PEEIAR update (Golder 2016a).

Tissue data were first separated into different populations based on tissue type by plant functional group (i.e., berries from berry-producing shrubs, other shrubs, conifers, grasses), sample area (i.e., background, baseline, halo, or floodplain), and collection year (baseline data were not separated by year). Background and baseline data were not pooled as the samples were collected at least 19 years apart from different parts of the mine area. Floodplain and halo data were kept as separate populations as there are differences between these two areas, namely; i) growth medium – plants growing in the halo are generally rooted in native soils underlying tailings while floodplain plants have been planted directly into the deposited tailings till mixture, and ii) age of plants – plants growing in the halo are generally well established and have been growing for several years while all plants in the floodplain have been planted post TSF embankment breach as part of restoration efforts.

Copper, selenium, and vanadium concentrations in plants collected from the floodplain and halo areas in 2015 and 2016 were compared to samples from background areas and the available baseline data. Table 1 provides a summary of the samples available for each parameter.

Table 1: Number of Each Type of Plant Tissue Sample Collected Along Hazeltine Channel

Tissue	Year	Halo (Cu, Se, V)	Floodplain (Cu, Se, V)	Background (Cu, Se, V)	Baseline (Cu)	Baseline (Se)
Berry	2015	11	-	6	-	-
	2016	21		10		
Shrub	2015	1	20	10	85	79
	2016	6	19	11		
Conifer	2015	7	-	3	11	9
	2016	19		12		
Grass	2015	-	11	-	10	5
	2016	2	19	11		

Different tissue types were considered separate data populations for the purposes of statistical analysis. The following outlines the rationale for the further breakdown of data populations:

- A non-parametric Wilcoxon signed-rank test was first used to test for differences in tissue concentrations between 2015 and 2016 data populations. There were no statistical differences between 2015 and 2016 data, with the exception of selenium concentrations in floodplain grasses (Section 3.0). The difference observed for selenium is believed to be associated with uncertainty due to variable data sets. Over 50% of the grass samples had concentrations of selenium less than five times that method detection limit, where uncertainty in results is greater. Also, the variation in selenium concentrations in natural sediments along the Hazeltine Creek channel may also contribute to variability, particularly when concentrations range above and below 5x MDL. No difference was found for copper and vanadium concentrations for the same data population.
- As the data for the two sampling events appears to be similar, and there is no evidence of a difference in environmental or geochemical conditions between the 2015 and 2016 seasons, the two data sets were pooled for each area and tissue type.

Available data populations are summarized in Table 2. Halo berry, halo conifer, floodplain shrub, and floodplain grass data were compared to background and baseline data for each tissue type where available. As previously mentioned, the pre-mine baseline survey did not include berries, nor did it include analyses for vanadium.

Table 2: Data Populations Available for Statistical Analysis

Tissue	Halo	Floodplain	Background	Baseline
Berry	Yes	No	Yes	No
Shrub	No	Yes	Yes	Yes
Conifer	Yes	No	Yes	Yes
Grass	No	Yes	Yes	Yes

With guidance from Dr. Dennis Helsel[1] of Practical Statistics, the following statistical analysis was performed to evaluate whether metal concentrations in plant tissues were elevated in areas impacted by tailings deposition. The following statistical analyses were conducted using R version 3.3.2:

Non-parametric Wilcoxon signed-rank tests were used to compare tissue concentrations between two data populations (e.g., floodplain shrubs to background shrubs). A one-tailed test of difference was used since it is reasonable to assume that the concentrations in the floodplain or halo would be equal to or greater than background or baseline concentrations. A threshold for statistical significance of $\alpha = 0.05$ was applied to identify statistically significant differences among data populations.

Summary statistics (minimum, maximum, mean, median, number of samples, and number of detected samples) were reported for each tissue type separated by area. Mean values were calculated using the full detection limit for samples with non-detects.

Non-parametric tests were considered to be the most appropriate method for evaluating whether there is a statistically significant difference between plant tissue concentrations from impacted areas and background areas. This is because the objective of non-parametric tests is to determine whether one group tends to produce generally higher observations than the other (Helsel 2002). Additionally, non-parametric tests are better suited than parametric tests to deal with non-detects, outliers, and non-normally distributed data, which are common with chemical concentrations in the field (Helsel 2002). Non-parametric tests do not require the data to conform to an unrealistic, specific shape such as a normal distribution, and have greater power to identify differences for skewed distributions common to environmental data (Helsel 1987). Non-parametric comparisons are more robust than a test of difference between means of the different data populations (Helsel 1987).

Individual plant samples collected from the floodplain and halo areas in 2015 and 2016 were plotted for comparison to background and baseline samples. Boxplots were created for each tissue type to compare concentrations across areas (i.e., halo, floodplain, background, or baseline). Boxplots indicate minimum values, 25th, 50th, and 75th percentiles, maximum values, and outliers. Data greater than three times the interquartile range (IQR; interquartile range = difference between the 25th and 75th percentile) above the 75th percentile are typically flagged for further evaluation as potential outliers. However, as we had no reason to question the sample results, all the data were included in the statistical analyses. The upper whisker of a boxplot shows the maximum detected value within three times the interquartile range.

Metal concentrations in plant tissue were also compared to the co-located soil samples to determine tissue: soil ratios (i.e., bioaccumulation factors [BAFs]). Individual plant tissue concentrations were plotted against co-located soil concentrations to visualize the relationship. Bioaccumulation factors were plotted against soil concentration to examine if there was a concentration-dependence of metal accumulation in plants.

[1] Dr. Dennis Helsel (PhD, Environmental Science and Engineering, Virginia Tech) has 37 years of experience applying statistics to practical issues in environmental sciences. He is the owner and lead scientist of Practical Stats, an environmental statistics training and consulting firm. He is the lead or sole author of two textbooks, *Statistical Methods in Water Resources* (USGS, 2002), and *Statistics for Censored Environmental Data using Minitab and R*, 2nd ed. (Wiley 2012), as well chapters in two handbooks and over 50 journal articles. *Full list of publications (pdf)*

Dr. Helsel was a 2003 recipient of the Distinguished Achievement Award from the American Statistical Association's section on Statistics and the Environment, and of the Dept. of Interior's Distinguished Service Award in 2007. He has been invited to conduct training classes on environmental statistics to the Chinese Ministry of Water Resources, the Umweltbundesamt (German Environment Agency), the Helsinki University of Technology, Finland; and the American Statistical Association.

2.3 Quality Assurance/Quality Control

2.3.1 Field Quality Assurance/Quality Control

Plant samples were hand-picked by field staff wearing nitrile gloves and placed in labelled collection bags. Re-usable equipment (e.g., bowls and trowels) was decontaminated between samples. Care was taken to minimize the introduction of foreign material into the samples or loss of plant material of interest during sample collection. Field notes were maintained to document the field sampling program. Each sample was labelled with a unique identifier and the date sampled. Soil samples were refrigerated and plant samples were frozen after collection for storage before submission for chemical analysis. Chain-of-custody forms were updated as samples were collected, and were checked to verify the information recorded before samples were submitted for chemical analysis.

For QA/QC purposes, nine duplicate plant samples and seven duplicate soil samples were collected and analyzed. Plant tissue duplicates were comprised of three conifer duplicates, three shrub duplicates and three grass duplicates collected from both impacted and non-impacted local background areas. Due to low sample volume, no berry duplicates were collected in 2016. Sample duplicates are collected to provide an indication of sample variation and the reproducibility of the laboratory test methods. Duplicate samples were collected using the same methods as described above, but repeated twice at the desired location. Each duplicate sample was submitted to the laboratory for chemical analysis under a unique sample number to prevent reporting bias.

The results of the duplicate samples are often expressed as Relative Percent Difference (RPD). The RPD is an indicator of laboratory precision and sample heterogeneity. Lower RPD numbers indicate better precision in laboratory analysis and sample homogeneity. The formula for computing the RPD is given below:

$$RPD = \frac{abs(sample - duplicate)}{mean} \times 100$$

Where:

- RPD is the relative percent difference
- abs (sample-duplicate) is the absolute value of the original sample minus the duplicate sample
- mean is the average between the two samples

In accordance with British Columbia Field Sampling Manual (2013), a data quality objective (DQO) of an RPD value of 50% was used to identify notable differences between original and duplicate tissue samples, when values were greater than or equal to five times the method detection limit (MDL). The RPD value used for tissue is relatively high because a higher degree of natural variability is expected for this biological matrix. An RPD value of >35% was used for soil samples as some heterogeneity is still expected. For values less than five times the MDL, a difference factor (DF) was calculated. A DF is the absolute difference between the two sample values divided by the method detection limit. In general, samples should have a difference factor of less than 2.0.

2.3.2 Laboratory Quality Assurance/Quality Control

ALS Laboratory (ALS, Burnaby BC) is an accredited laboratory (locally, Canadian Association for Laboratory Accreditation Inc. and Standard Council of Canada) and methods are based on International Organization for Standards/International Electrotechnical Commission (ISO/IEC) 17025:2005. ALS analytical methods are based on well established, internationally-recognized procedures such as those published by the United States Environmental Protection Agency and the American Public Health Association, as well as local country standards. All approved methods included quality control and performance criteria that must be achieved prior to releasing the data.

Laboratory quality control for chemistry samples included analysis of method blanks, laboratory duplicates, spiked samples, and control samples using certified reference materials to assess precision and accuracy of chemical analyses. Laboratory data quality control reports were reviewed upon receipt to confirm that the laboratory data quality objectives (DQOs) had been met and that the appropriate quality control information had been reported.

3.0 RESULTS

Statistical comparisons between 2015 and 2016 data populations were conducted as a first step to evaluate whether data could be pooled. No statistically significant differences were found between 2015 and 2016 data populations with the exception of selenium concentrations in floodplain grasses (Attachment B; Table B-1). Differences in selenium concentration in floodplain grasses were likely due to the high natural variability of tissue concentrations and small sizes of the data populations, as changes were not observed in geochemical or environmental conditions. Therefore, tissue data from 2015 and 2016 were pooled for subsequent statistical comparisons between areas. Raw tissue and soil chemistry data are presented in Attachment C.

3.1 Copper

Statistical comparisons of copper concentrations in plant tissues are presented in Table 3. Summary statistics of copper concentrations in plant tissue collected from the different areas are presented in Attachment B. Box-plots for the various tissue types are presented below (Figure 2 and 3). In soil, copper concentrations ranged from 11 to 1030 mg/kg (Table C-2, Attachment C). Copper concentrations in plant tissue samples collected in 2015 and 2016 ranged from 0.8 to 79 milligrams per kilogram dry weight (mg/kg dw) with a median concentration of 5.6 mg/kg dw (Table B-2; Figure 1). There are no standards for concentrations of copper in plant tissue. Adequate copper concentrations in plants is variable for different species, within different parts of the plant (e.g., shoots, leaves, roots), and is dependent on plant age. The adequate range of copper concentration in plants is between 4 and 20 mg/kg dw (Hochmuth et al. 2015). These results are provided to give some perspective on measured concentrations of copper in plant tissues collected from the Site. Copper results are discussed below for the floodplain and halo.

Table 3: Results of Non-Parametric, Two-Sample Wilcoxon Test for Difference in Copper Concentrations in Plant Tissue

Area	Tissue	P-value (vs Background)	P-value (vs Pre-mine Baseline)
Floodplain	Grass	**0.0177**	**0.0315**
	Shrub	**<0.001**	**<0.001**
Halo	Conifer	**0.0328**	0.0975
	Berry	0.289	N/A

Note: The values shown are the p-value from one-tailed, two-sample Wilcoxon tests assuming that background or baseline < halo or floodplain tissue concentrations.

Bold = Statistical difference; significance level set at 0.05.

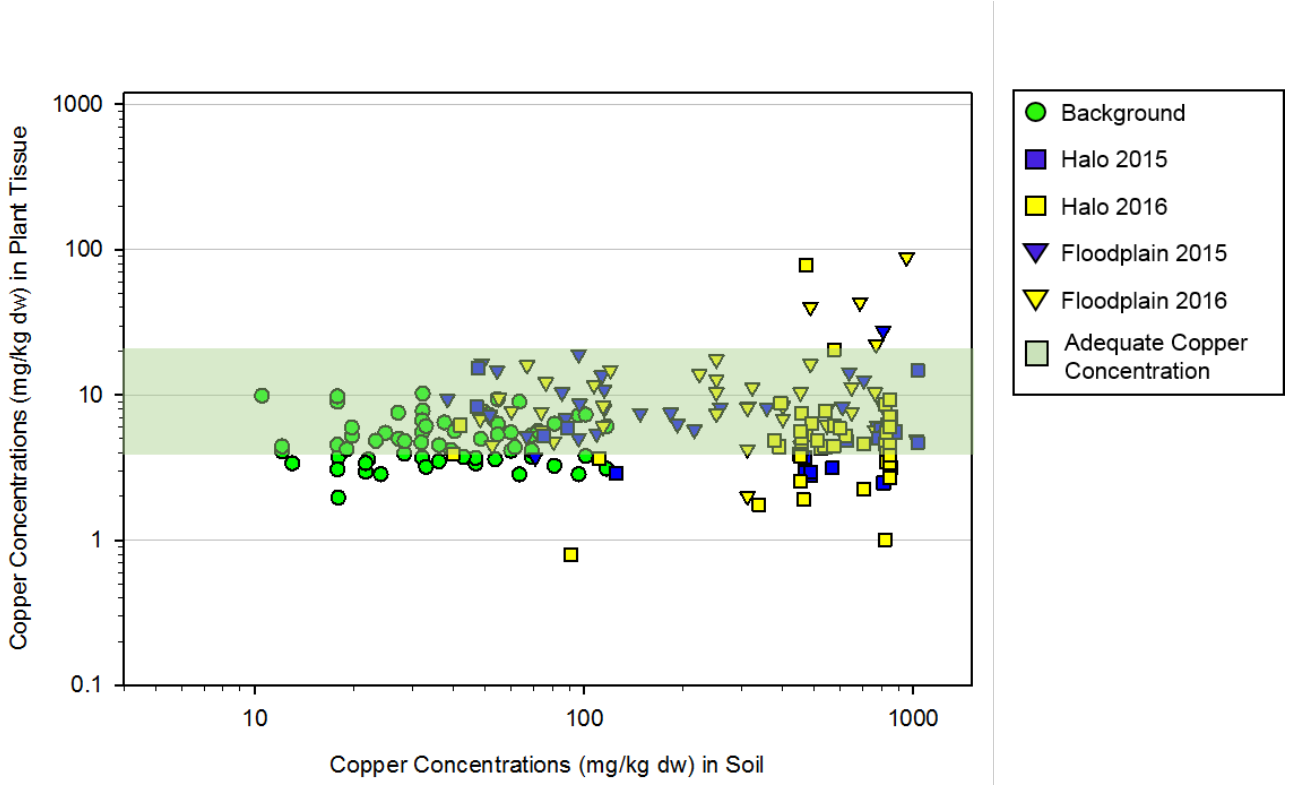

Figure 1: Copper Concentrations in Plant Tissue versus Soil

Note: The Green Shaded Band Represents Copper Concentrations in Plant Tissues Described as Adequate for Normal Growth and Development by Hochmuth et al. 2015.

Floodplain

Grass and shrub samples were collected from the floodplain; berries and spruce were not present in the floodplain.

- Grass: Copper concentrations in floodplain grass ranged from 2.0 to 89 mg/kg dw with a median value of 7.6 mg/kg dw (Table B-2; Figure 2a). Copper concentrations in grass from the floodplain were statistically higher than concentrations in background and baseline samples (Table 3).
- Shrubs: Copper concentrations in floodplain shrubs ranged from 3.7 to 22 mg/kg dw with a median value of 8.4 mg/kg dw (Table B-2, Figure 2b). Copper concentrations in shrubs from the floodplain were statistically higher than concentrations in background and baseline samples (Table 3, Figure 2b). However, the floodplain results (n=39) fall within the range of the baseline data (n=85).

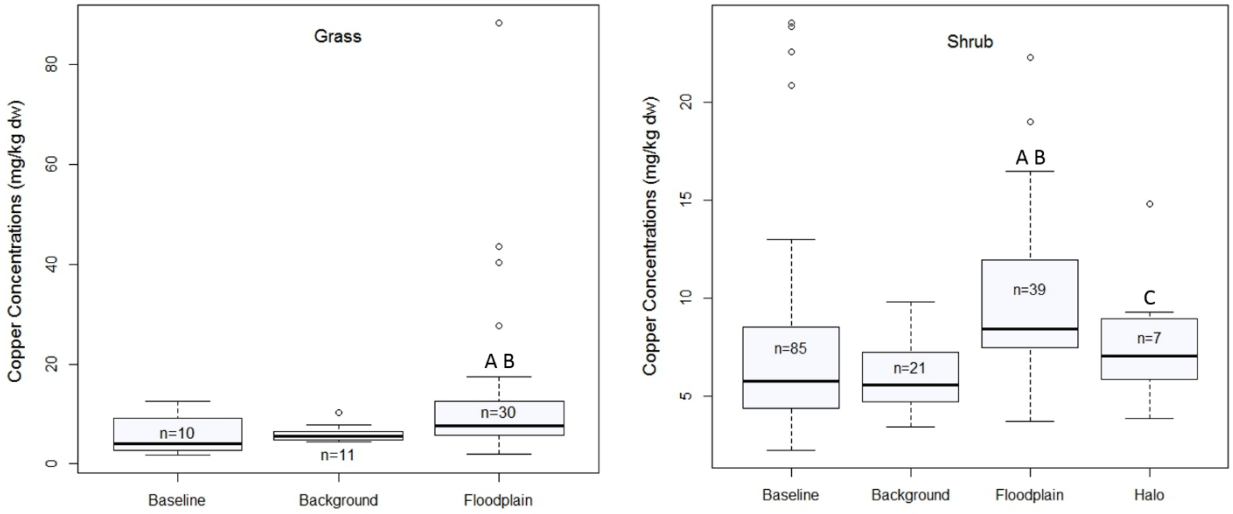

Figure 2: Copper Concentrations in a) Grass and b) Shrub Samples Collected in 2015 and 2016 (Floodplain, Halo, and Background) and Prior to Mine Development (Baseline)

A) Statistically Higher than Baseline.

B) Statistically Higher than Background.

C) Insufficient Data for Statistical Comparison to Background or Baseline.

Halo

Conifer, berry and shrub samples were collected from the halo area.

- Conifer: Copper concentrations in halo conifers ranged from 2.3 to 7.7 mg/kg dw with a median concentration of 4.0 mg/kg dw (Table B-2; Figure 3a). Copper concentrations in conifers from the halo were statistically higher than concentrations in background samples, but were not statistically higher than in baseline samples (Table 1). In spite of these differences, the measured concentrations in halo conifers are below copper toxicity levels previously observed in lodgepole pine, which occur at concentrations from 10.2 to 28.9 mg/kg according to Majid (1984).
- Berries: Copper concentrations in halo berries ranged from 0.80 to 79 mg/kg dw with a median concentration of 4.9 mg/kg dw (Table B-2, Figure 3b). Copper concentrations in berries from the halo were not statistically higher than in background samples (Table 1). No baseline data were available for berries. With the exception of the three potential outliers, halo berry samples fall within the range of background samples (Figure 3b).
- Shrubs: Copper concentrations in halo shrubs ranged from 3.8 to 15 mg/kg dw with a median concentration of 7.0 mg/kg dw (Table B-2, Figure 2b). With the exception of one potential outlier, the range of copper concentrations in halo shrubs was within the range measured in background shrubs. Copper concentrations in halo shrubs were within the range of baseline shrubs (Figure 2b). No statistical comparison of halo shrubs (n=7) to background or baseline was conducted as the sample size was considered too small to identify differences with sufficient power.

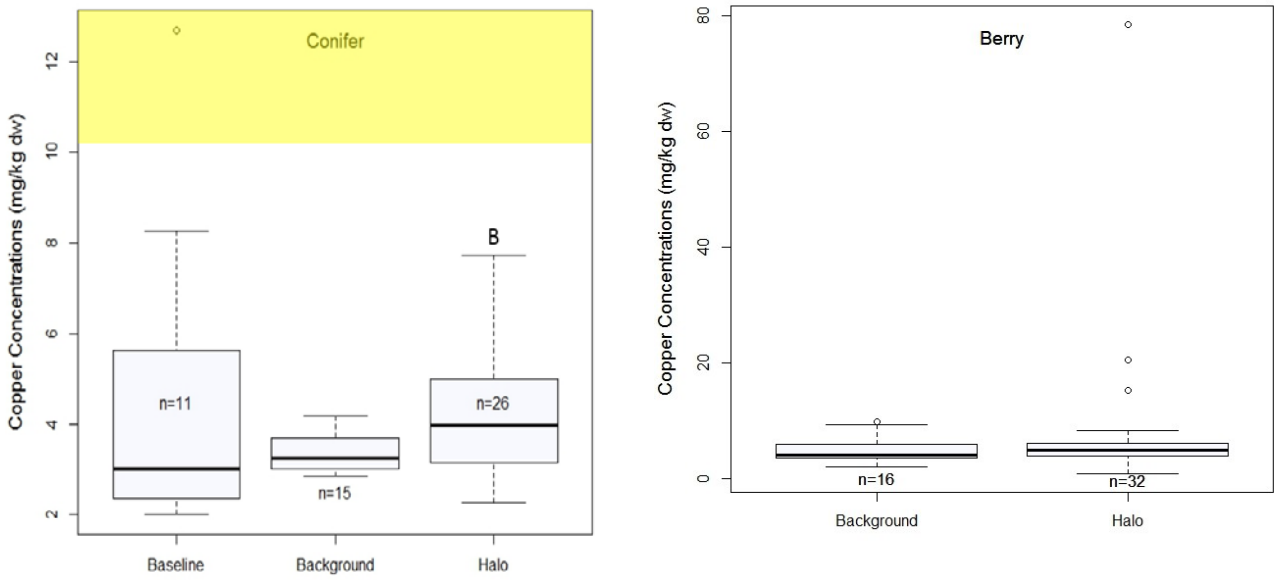

Figure 3: Copper Concentrations in a) Conifer and b) Berry Samples Collected in 2015 and 2016 (Halo and Background) and Prior to Mine Development (Baseline)

A) Statistically Higher than Baseline.

B) Statistically Higher than Background.

The Yellow Shaded Band Represents the Range of Copper Toxicity Found for Lodgepole Pine Based on Reduction in Shoot Growth by Majid 1984.

Copper bioaccumulation factors for all plant samples were below one and decreased with increasing soil concentration (Figure 4). These data indicate that there is a nonlinear relationship between copper concentrations in soil and plants, supported by the understanding that plants are able to regulate copper uptake (Emamverdian et al. 2015). The majority of tissue samples have copper concentrations between 2 and 20 mg/kg dw (Figure 1), which is within the general range for different plant species considered adequate for plant health (4 to 20 mg/kg dw; Hochmuth et al. 2015).

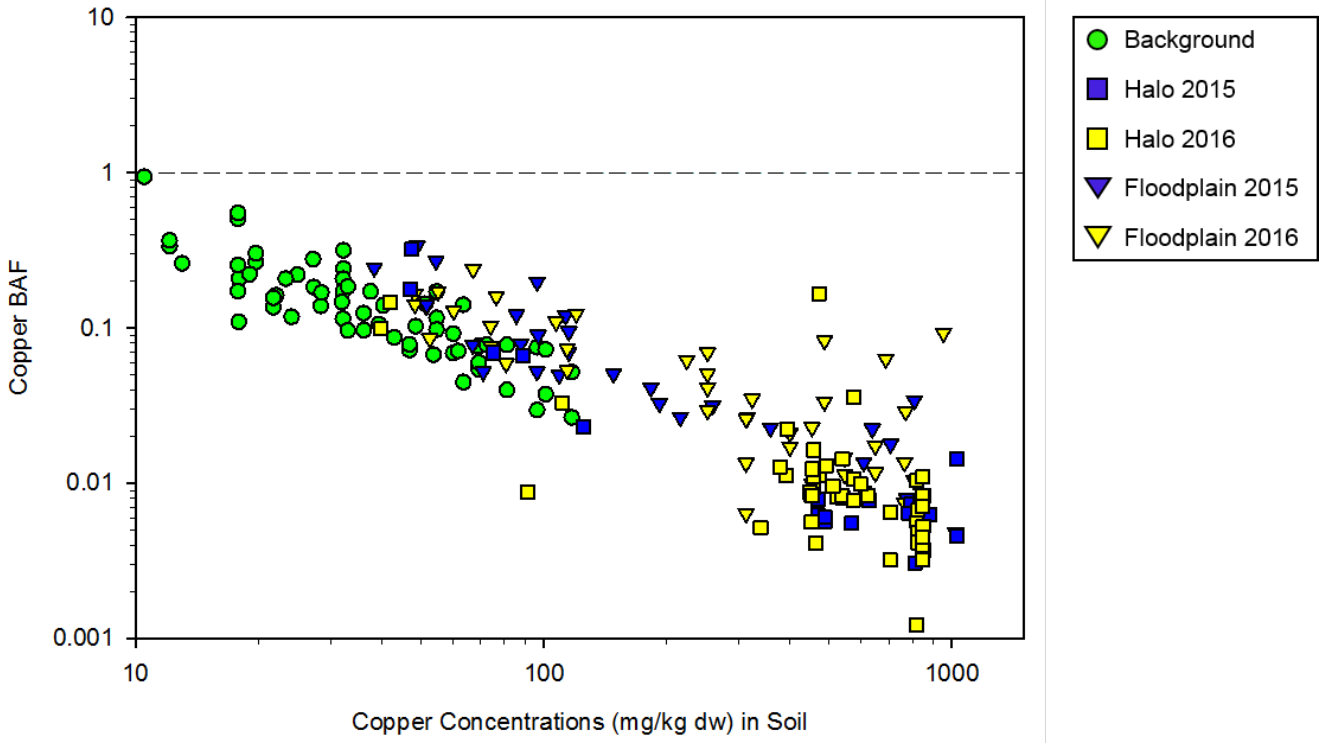

Figure 4: Copper Bioaccumulation Factors versus Soil Concentrations in Plants within the Halo, Floodplain, and Background Areas

3.2 Selenium

Statistical comparisons of selenium concentrations in plant tissues are presented in Table 4. Summary statistics of selenium concentrations in plant tissue collected from the different areas are presented in Attachment B. Box-plots for the various tissue types are presented below. Selenium concentrations in plant tissue samples collected in 2015 and 2016 ranged from <0.05 to 3.8 mg/kg dw with a median concentration of 0.1 mg/kg dw (Table B-3; Figure 5). A review of published literature did not identify limits for adequate or toxic concentration ranges for selenium in plants. In soil, selenium concentrations ranged from 0.2 to 3.7 mg/kg (Table C-2, Attachment C). Selenium results are discussed below for the halo and floodplain.

Table 4: Results of Non-Parametric, Two-Sample Wilcoxon Test for Difference in Selenium Concentrations in Plant Tissue

Area	Tissue	P-value (vs Background)	P-value (vs Baseline)
Floodplain	Grass	**<0.001**	-
	Shrub	**<0.001**	**<0.001**
Halo	Conifer	1[a]	0.99[a]
	Berry	0.328	-

Note: The values shown are the p-value from one-tailed two-sample Wilcoxon tests assuming that background or baseline < halo or floodplain tissue concentrations.

Bold = Statistical difference; significance level set at 0.05.

a) No detected values for Halo or Background.

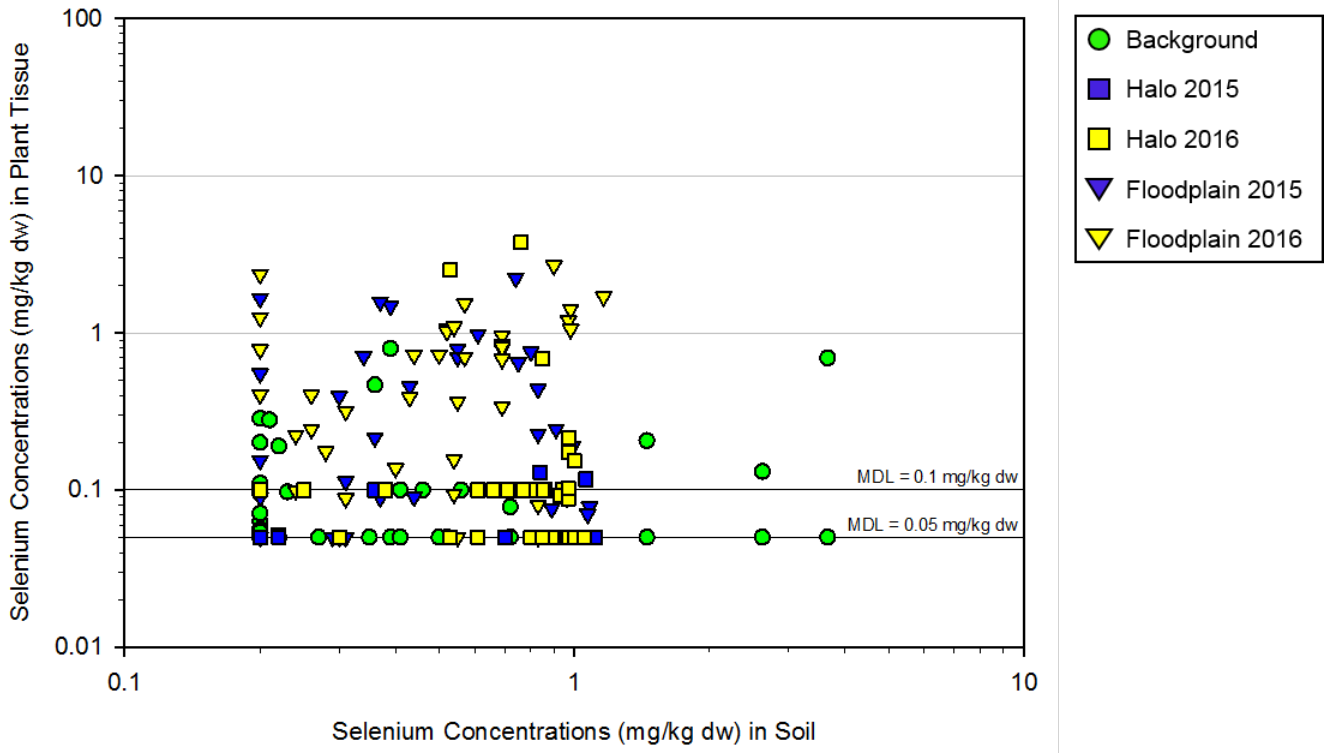

Figure 5: Selenium Concentrations in Plant Tissue versus Soil

Floodplain

Grass and shrub samples were collected from the floodplain. Selenium concentrations in floodplain grass samples ranged from <0.05 to 2.4 mg/kg dw with a median value of 0.29 mg/kg dw (Table B-3, Figure 6a). Selenium concentrations in grass samples from the floodplain were statistically higher than background samples (Table 4). Only one background sample had detectable concentrations of selenium as compared to 27 of 30 samples having detectable concentrations of selenium in floodplain grasses. Selenium concentrations in floodplain grasses appear to be similar to baseline grasses as the first quartile and median were very close between the two data populations (Figure 6). No statistical comparison of floodplain grass to baseline grass (n=5) was conducted as the baseline sample size was considered too small to identify differences with sufficient power.

Selenium concentrations in floodplain shrub samples ranged from <0.05 to 2.7 mg/kg dw with a median concentration of 0.55 mg/kg dw (Table B-3, Figure 6b). Selenium concentrations in shrubs from the floodplain were statistically higher than background and baseline samples.

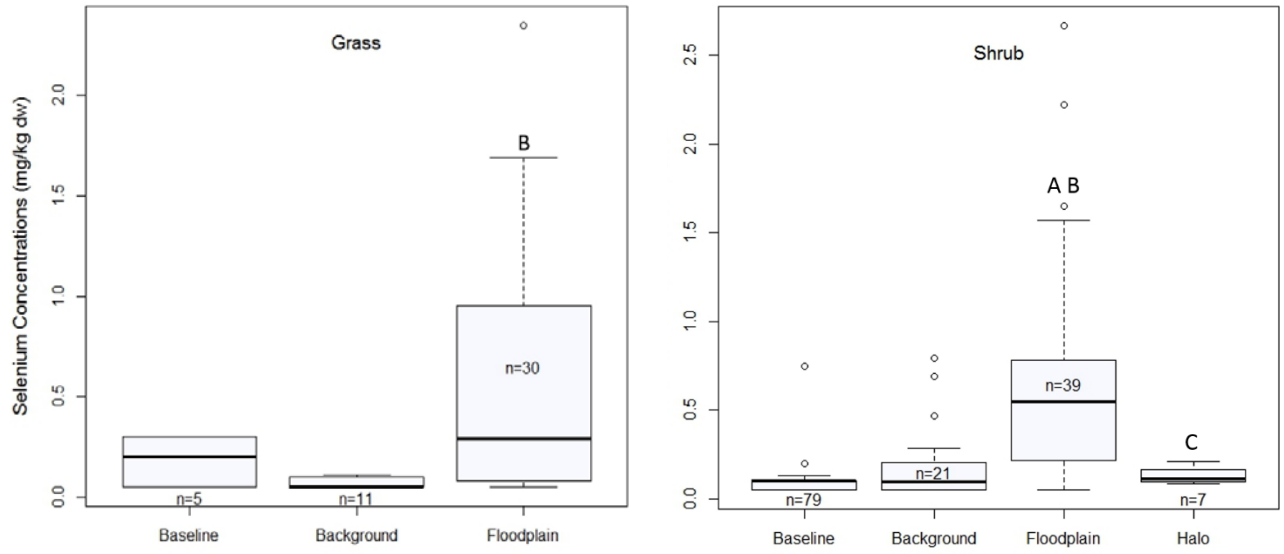

Figure 6: Selenium Concentrations in a) Grass and b) Shrub Samples Collected in 2015 and 2016 (Floodplain, Halo and Background) and Prior to Mine Development (Baseline)

A) Statistically Higher than Baseline.

B) Statistically Higher than Background.

C) Insufficient Data for Statistical Comparison to Background or Baseline.

Halo

Conifer, berry and shrub samples were collected from the halo area. Selenium concentrations in conifer samples were below MDL for all samples collected from the halo and background areas (Table 4); therefore no statistical comparison was possible. In 2 of 9 baseline conifer samples there were detectable amounts of selenium (Table 4). Boxplots showing selenium concentrations are not provided as there were no detectable levels of selenium in impacted areas.

Selenium concentrations in berry samples from the halo ranged from <0.05 to 3.75 mg/kg dw with a median concentration of <0.1 mg/kg dw (Table B-3). Concentrations of selenium in berry samples from the halo area were not statistically higher than in background samples. No baseline data were available for berries. Concentrations of selenium were detected in 3 of 32 berry samples and in none of the background berry samples. Boxplots showing selenium concentrations are not provided as there were no detectable concentrations of selenium in background areas.

Selenium concentrations in shrub samples from the halo ranged from 0.088 to 0.21 mg/kg dw with a median concentration of 0.12 mg/kg dw (Table B-3; Figure 6b). Selenium concentrations in halo shrub samples were within the range of concentrations measured in background and baseline samples (Table B-3; Figure 6b). No statistical comparison of halo shrubs (n=7) to background or baseline shrubs was conducted as the sample size was considered too small to identify differences with sufficient power.

Selenium bioaccumulation factors for all data populations (including background) were above one in a portion of the plant tissue samples (Figure 7). The data indicate that there is a nonlinear relationship between selenium concentrations in soil and plants; although there are samples with a BAF of >1 there does not appear to be a trend relating soil concentration with increased BAFs (Figure 7).

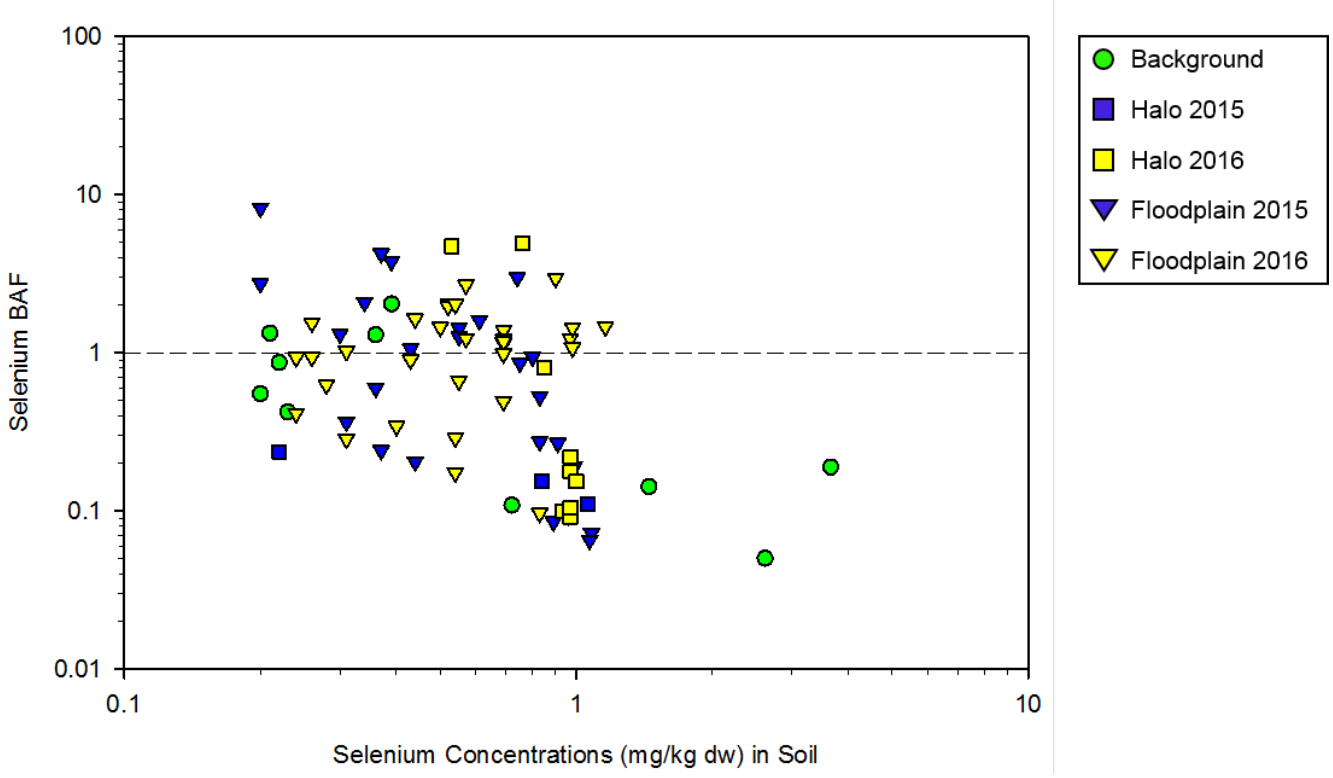

Figure 7: Bioaccumulation Factors versus Selenium Concentrations in Soil within the Halo, Floodplain, and Background Areas

3.3 Vanadium

Statistical comparison of vanadium concentrations are presented in Table 5. Summary statistics of vanadium concentrations in plant tissue collected from the different areas are presented in Attachment B. Box-plots for the various tissue types are presented below. Vanadium concentrations in plant tissue samples collected in 2015 and 2016 ranged from <0.1 to 12 mg/kg dw with a median concentration of 0.2 mg/kg dw (Table B-3, Figure 8). In soil, vanadium concentrations ranged from 9.3 to 257 mg/kg (Table C-2, Attachment C). Baseline samples were not analyzed for vanadium and thus no comparison to baseline could be completed. There is no standard for vanadium concentrations in plants and a review of the published literature returned no such data. Vanadium results are discussed below for the floodplain and halo.

Table 5: Results of Non-Parametric, Two-Sample Wilcoxon Test for Difference in Vanadium Concentrations in Plant Tissue

Area	Tissue	P-value (VS Background)
Floodplain	Grass	**0.014**
	Shrub	**<0.001**
Halo	Conifer	**0.003**
	Berry	**0.004**

Note: The values shown are the p-value from one-tailed two-sample Wilcoxon tests assuming that background or baseline < halo or floodplain tissue concentrations.

Bold = Statistical difference; significance level set at 0.05.

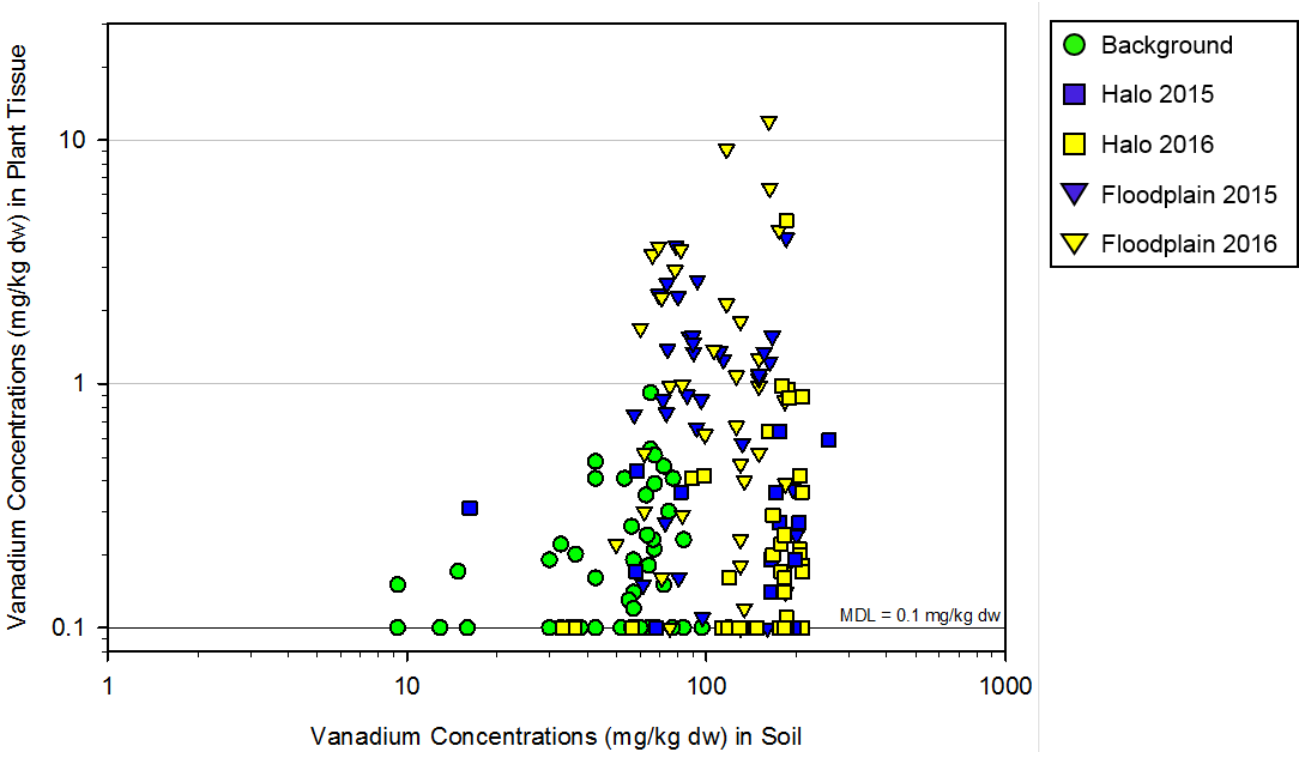

Figure 8: Vanadium Concentrations in Plant Tissue versus Soil

Floodplain

Grass and shrub samples were collected from the floodplain.

- Grass: Vanadium concentrations in grass from the floodplain ranged from <0.1 to 12 mg/kg dw with a median value of 0.34 mg/kg dw (Table B-4; Figure 9a). Vanadium concentrations in grass from the floodplain were statistically higher than background samples. The median vanadium concentration in floodplain grass was 2.6x higher than the median background concentration.
- Shrubs: Vanadium concentrations in shrubs from the floodplain ranged from 0.16 to 4.3 mg/kg dw with a median concentration of 1.36 mg/kg dw (Table B-4; Figure 9b). Vanadium concentrations in shrubs from the floodplain were statistically higher than background samples. The median vanadium concentration in floodplain shrubs was 6.2x higher than the median background concentration.

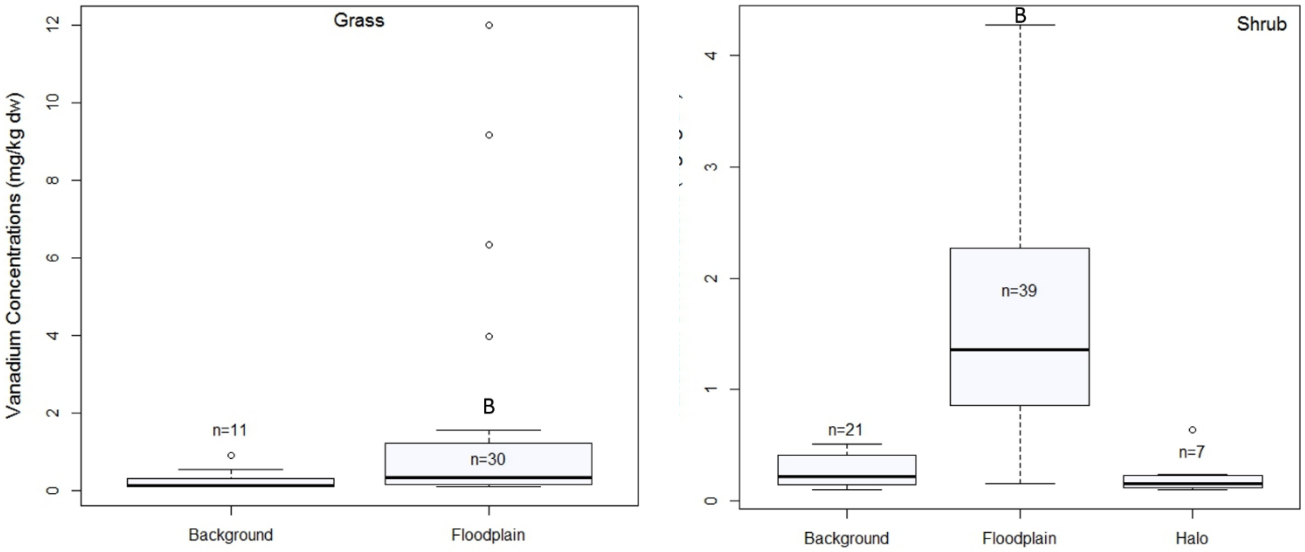

Figure 9: Vanadium Concentrations in a) Grass and b) Shrub Samples Collected in 2015 and 2016 (Floodplain, Halo and Background)

B) Statistically Higher than Background.

Halo

Conifer, berry and shrub samples were collected in the halo area.

- Conifers: Vanadium concentrations in conifers from the halo ranged from <0.1 to 0.98 mg/kg dw with a median concentration of 0.20 mg/kg dw (Table B-4; Figure 10a). Vanadium concentrations in conifers from the halo area were statistically higher than background samples (Table 5).
- Berries; Vanadium concentrations in berries from the halo ranged from <0.1 to 4.7 mg/kg dw with a median concentration of <0.1 mg/kg dw (Table B-4; Figure 10b). Detectable concentrations of vanadium were measured in 14 of 32 halo samples and in 1 of 16 background samples. Vanadium concentrations in berries from the halo were statistically higher than background samples; however median concentrations for both were <MDL (Table 5; Table B-4). No baseline data were available for berries.
- Shrubs: Vanadium concentrations in shrubs from the halo ranged from <0.1 to 0.64 mg/kg dw with a median concentration of 0.16 mg/kg dw (Table B-4, Figure 9b). Concentrations of vanadium in halo shrubs were, with the exception of one outlier, generally lower and within the range of background samples (Figure 9b). No statistical comparison of halo shrubs (n=7) to background shrubs was conducted as the sample size was considered too small to identify differences with sufficient power.

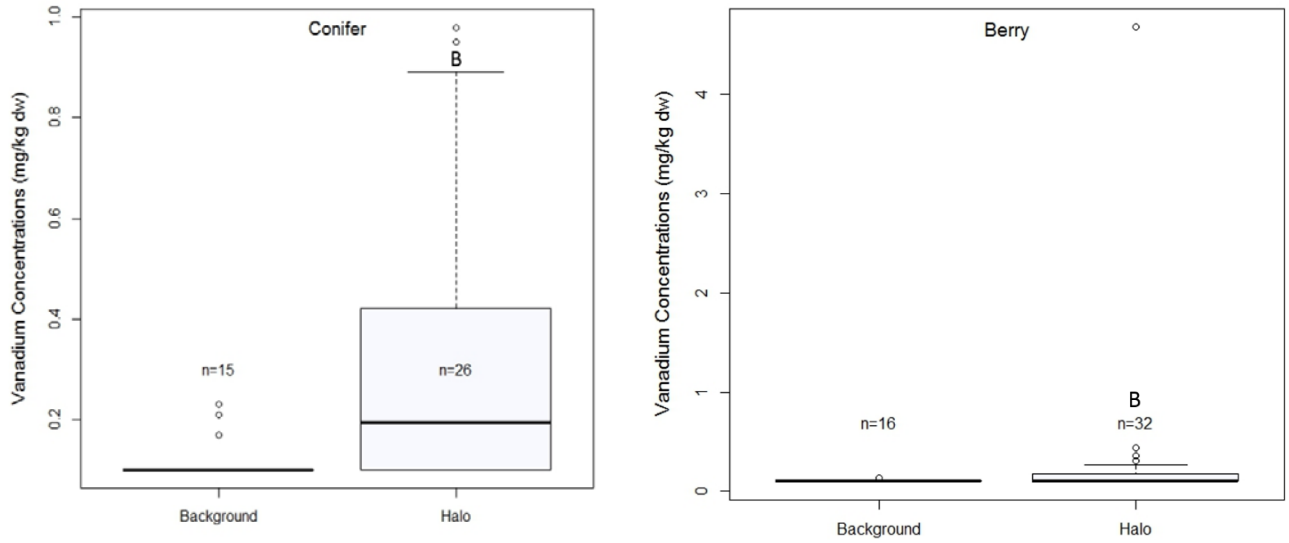

Figure 10: Copper Concentrations in a) Conifer and b) Berry Samples Collected in 2015 and 2016 (Halo and Background) and Prior to Mine Development (Baseline)

B) Statistically Higher than Background.

Vanadium bioaccumulation factors were well below one for all plant samples (Figure 1) and show a decreasing trend with higher soil concentrations. The data indicate that there is a non-linear relationship between vanadium concentrations in soil and plants.

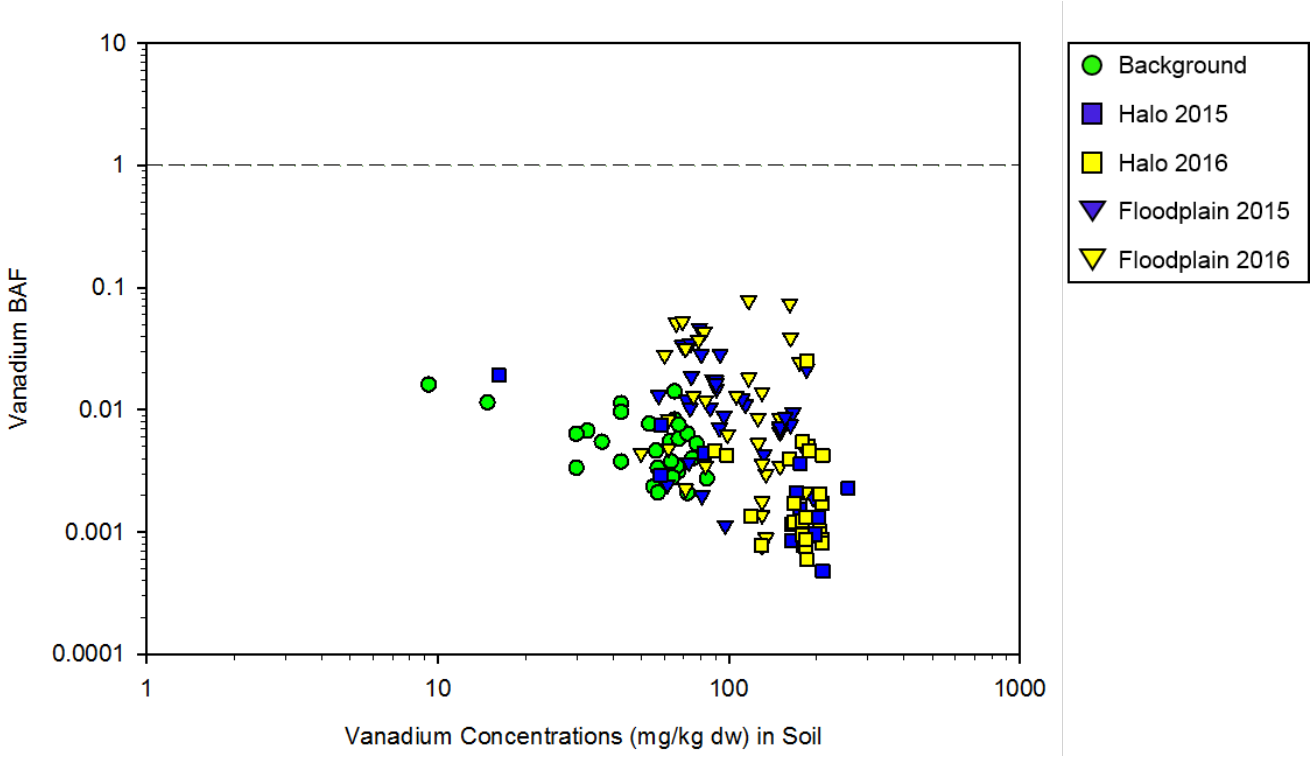

Figure 11: Bioaccumulation Factors versus Vanadium Concentrations in Soil within the Halo, Floodplain, and Background Areas

3.4 Quality Assurance/Quality Control

3.4.1 Field

Results of analyses for field duplicates are provided in Attachment D, Table D-1 (tissue) and Table D-2 (soil). In plant tissue, the RPD was greater than 50% in one or more sets of duplicate samples for the following:

- Shrub samples: aluminum, chromium, iron, and vanadium (one sample)
- Grass samples: aluminum, barium, and boron
- Conifer samples: cadmium

RPDs greater than 50% were observed in both impacted and background areas. In one shrub sample an RPD of 80% for vanadium was observed. The concentration of one of the samples used to calculate this vanadium RPD was only 3.4x the MDL, although the RPD was still calculated as the mean concentration of the sample and its duplicate were above 5x the MDL. Higher variability is expected in samples with concentrations near the MDL so this elevated RPD is unlikely to be representative of shrub samples as a whole. The RPDs calculated for copper, vanadium and selenium all met the data quality objective of <50% with the exception of the one sample noted above; therefore, the data were considered reliable for the purposes of this memorandum. Overall, conifer samples had the least variability in metal concentrations amongst the tissue types.

In soil, RPDs were greater than 35% for the following parameters: copper, chromium, molybdenum, total carbon, total organic carbon, and potassium. Elevated RPDs were observed in two of the seven duplicate samples, both of which were collected in floodplain area. The majority of the observed variability is likely attributed to the higher heterogeneity of floodplain soils. Although this variability could affect the precision of the individual results, selection of the duplicate samples was random, meaning that there would be no systematic bias in results due to the variability.

3.4.2 Laboratory

Laboratory data reports for samples collected during field sampling are provided in Attachment E. The following data quality issues were identified in the ALS laboratory report for tissue samples:

- Hold-times were met for all tissue samples.
- Detection limits were adjusted for several parameters because of matrix interferences, low sample volume, or a required dilution.
- Method Blank for magnesium exceeded ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level.
- The duplicates results were outside the ALS DQOs in at least one sample for total beryllium, total cobalt, total lead, total thallium, total titanium, total tin, and total uranium due to sample heterogeneity.
- Reference Material recovery was above ALS DQO for total zinc and total sodium in some samples in lab report L1826505. Non-detected sample results are considered reliable. Other results, if reported, have been qualified.

The following data quality issues were identified in the ALS laboratory reports for soil:

- Recommended hold times were exceeded prior to analysis of organic carbon, inorganic carbon, available nitrate, pH, and mercury in some samples.
- Detection limits for several nutrients were adjusted in some samples due to high concentrations of test analytes, sample matrix effects, limited sample amount, or high percent moisture.

The DQO were met for copper, selenium, and vanadium in all samples and were met for the majority of samples for other parameters; therefore, the data were considered reliable for the purposes of this memorandum.

4.0 UNCERTAINTY AND DATA GAPS

The uncertainty within the studied area was mostly due to other factors that can affect metal uptake within these plants, such as plant growth, species diversity, plant age, growth stage (e.g., planted vs established), season, microsite variability, rooting depth, and soil type. Soil conditions could vary with respect to concentrations of nutrients, organic carbon, soil structure, and the soil food web community, including the soil microbial community. The substrates in the floodplain are composed of tailings and till, had negligible soil development, and were largely absent of organic matter, unlike the halo or background areas. As such, the variation in metal concentrations in tissues may reflect the wider range of chemical, physical, and biological conditions in the substrates among areas rather than only the metal concentration in the substrates.

Within the floodplain area, the deposition of tailings and scoured native till varied along Hazeltine Channel as did the soil treatments in areas rehabilitated by MPMC. Rehabilitation work in the floodplain is ongoing, with a number of different treatments having been and currently being utilized along the Hazeltine Channel. Further studies of tissue concentrations in plants along the floodplain area should take into account the various soil treatments to reduce the uncertainty associated with tissue chemistry results in this area.

5.0 SUMMARY OF FINDINGS

In general, concentrations of copper in all types of tissues in all areas fell within the range of adequate levels and below values considered toxic to plants according to the published literature. Evaluation of selenium or vanadium toxicity was hampered by the lack of toxicity threshold values reported in the literature. However, none of the samples had symptoms of toxicity, and BAF values were lower than one for copper and vanadium, and either below 1 or close to background levels for selenium.

With the understanding that toxicity thresholds were not exceeded for copper, and unlikely to have been exceeded for selenium or vanadium based on lack of visible symptoms or excessive BAFs, there were some statistical differences in metal concentrations among floodplain, halo, background, and baseline levels.

The key differences among substrates are:

- Plant tissue concentrations were not statistically different between 2015 and 2016 for all areas and tissue types with the exception of selenium concentrations in floodplain grasses. This finding indicates that concentrations of metals in plants are not increasing over time.

- Tissue concentrations of copper were lower in the halo than in the floodplain. Tissue concentrations of copper, selenium and vanadium in berries and conifers were neither statistically higher in the halo than background nor baseline with one exception: copper in halo conifers was higher than background.
- Shrubs in the halo zone had lower copper, selenium, and vanadium tissue concentrations than in the floodplain and were within the range of background and baseline concentrations.
- Berry and conifer samples collected in the halo had statistically higher vanadium concentrations than background samples.
- Plant tissue samples collected in the floodplain areas (shrubs and grass) had statistically higher concentrations of copper, selenium and vanadium than background samples.

The key findings by plant functional group were:

- Grasses in the floodplain had statistically higher concentrations of copper, but not selenium, than baseline. Concentrations of copper, selenium, and vanadium in floodplain grasses were statistically higher than background. Vanadium was not analyzed in baseline samples.
- Shrubs collected in halo area had tissue concentrations of copper, selenium, and vanadium within the range of background and baseline samples. Copper, selenium, and vanadium concentrations in floodplain shrubs were statistically higher than background and baseline samples. Vanadium was not analyzed in baseline samples.
- Conifers in the halo area did not have statistically higher concentrations of selenium than background or baseline. Conifers from the halo area were statistically higher than background samples for copper and vanadium but were within the range of baseline for copper. Vanadium was not analyzed in baseline samples. The magnitude of these differences were smaller than that of shrubs or grasses.
- Berries in the halo area did not have statistically higher concentrations of copper or selenium than background samples. Concentrations of vanadium in halo berries were statistically higher than background, but the majority of vanadium concentrations in berries were less than detection limits for both halo and background samples.

These findings indicate that there are higher concentrations of metals in all plant functional groups collected from the floodplain than background and/or baseline samples, even though copper concentrations were generally within the range of normal and below levels considered toxic to plants. In the halo, certain plant functional groups were greater than background and/or baseline but, with the exception of vanadium, the values generally fell within the range of background or baseline levels. The generally greater concentrations observed in floodplain than halo plants may be attributed to their younger age, the lower organic matter of the substrate they were planted into, and the greater amount of residual tailings. The BAF data showed a decreasing rate of uptake with increasing soil concentrations confirming that these plants are able to regulate uptake of the metals. Given that the concentrations of copper in plants were generally within the range of normal and below thresholds for toxicity, the risks to plants is likely to be low. Further assessment of potential risks associated with this increased uptake will be addressed as part of the up-coming ecological risk assessment.

6.0 CLOSURE

The reader is referred to the Study Limitations, which follows the text and forms an integral part of this memorandum.

We trust the above meets your present requirements. If you have any questions or requirements, please contact the undersigned.

Berry			
Copper Halo 2015 v 2016	two-tailed	Copper Halo 2015 = 2016	0.42
Selenium Halo 2015 v 2016	two-tailed	Selenium Halo 2015 = 2016	0.71
Vanadium Halo 2015 v 2016	two-tailed	Vanadium Halo 2015 = 2016	0.096

Notes:

* There are no detected concentrations of selenium in conifers in either 2015 or 2016. The two populations are equal.

Table B-2: Summary Statistics of Copper Concentrations (mg/kg dw) in Tissue Samples Along Hazeltine Creek

Notes:
QA/QC = quality assurance/quality control; FDA = field duplicate available; FD = field duplicate
NA = not applicable; NC = not calculated; Mean = average of two values
Relative percent difference (RPD) = the difference between two values divided by the mean of the two values. RPD is calculated when the concentration is greater than five times the detection limit.

Golders' acceptable RPD for tissue is less than or equal to 50%.
Bold values indicate an exceedance of the acceptable RPD.

Table D-2: Results of Tissue QA/QC Analyses - Plant Samples
Detailed Site Investigation
Mount Polley Mining Corporation

Notes:
QA/QC = quality assurance/quality control; FDA = field duplicate available; FD = field duplicate

NA = not applicable; NC = not calculated; Mean = average of two values

Relative percent difference (RPD) = the difference between two values divided by the mean of the two values. RPD is calculated when the concentration is greater than five times the detection limit.

Golders' acceptable RPD for tissue is less than or equal to 50%.
Bold values indicate an exceedance of the acceptable RPD.

Notes:
QA/QC = quality assurance/quality control; FDA = field duplicate available; FD = field duplicate
NA = not applicable; NC = not calculated; Mean = average of two values
Relative percent difference (RPD) = the difference between two values divided by the mean of the two values. RPD is calculated when the concentration is greater than five times the detection limit.
Golders' acceptable RPD for soil is less than or equal to 35%.
Difference factor (DF) = absolute difference between two values divided by the method detection limit. The DF is calculated when the concentration is less than five times the detection limit.
Golders' acceptable DF is less than or equal to 2.0.
Bold values indicate an exceedance of the acceptable RPD or DF.

Notes:
QA/QC = quality assurance/quality control; FDA = field duplicate available; FD = field duplicate
NA = not applicable; NC = not calculated; Mean = average of two values
Relative percent difference (RPD) = the difference between two values divided by the mean of the two values. RPD is calculated when the concentration is greater than five times the detection limit.
Golders' acceptable RPD for soil is less than or equal to 35%.
Difference factor (DF) = absolute difference between two values divided by the method detection limit. The DF is calculated when the concentration is less than five times the detection limit.
Golders' acceptable DF is less than or equal to 2.0.
Bold values indicate an exceedance of the acceptable RPD or DF.

Notes:
QA/QC = quality assurance/quality control; FDA = field duplicate available; FD = field duplicate
NA = not applicable; NC = not calculated; Mean = average of two values
Relative percent difference (RPD) = the difference between two values divided by the mean of the two values. RPD is calculated when the concentration is greater than five times the detection limit.

Golders' acceptable RPD for soil is less than or equal to 35%.
Difference factor (DF) = absolute difference between two values divided by the method detection limit. The DF is calculated when the concentration is less than five times the detection limit.

Golders' acceptable DF is less than or equal to 2.0.
Bold values indicate an exceedance of the acceptable RPD or DF.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Certified Reference Material	Zinc (Zn)-Total	RM-H	L1826505-10, -19, -20, -21, -22, -23, -24, -25, -26, -27, -28, -29, -30, -31, -32, -33, -34, -37, -38, -5
Certified Reference Material	Sodium (Na)-Total	RM-H	L1826505-15, -6, -7
Certified Reference Material	Zinc (Zn)-Total	RM-H	L1826505-10, -19, -20, -21, -22, -23, -24, -25, -26, -27, -28, -29, -30, -31, -32, -33, -34, -37, -38, -5
Certified Reference Material	Sodium (Na)-Total	RM-H	L1826505-15, -6, -7

Qualifiers for Individual Parameters Listed:

Qualifier	Description
RM-H	Reference Material recovery was above ALS DQO. Non-detected sample results are considered reliable. Other results, if reported, have been qualified.
RRR	Refer to Report Remarks for issues regarding this analysis

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
HG-DRY-CVAFS-N-VA	Tissue	Mercury in Tissue by CVAFS (DRY)	EPA 200.3, EPA 245.7

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

HG-DRY-MICR-CVAF-VA	Tissue	Mercury in Tissue by CVAFS Micro (DRY)	EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

HG-WET-CVAFS-N-VA	Tissue	Mercury in Tissue by CVAFS (WET)	EPA 200.3, EPA 245.7

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

HG-WET-MICR-CVAF-VA	Tissue	Mercury in Tissue by CVAFS Micro (WET)	EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

MET-DRY-CCMS-N-VA	Tissue	Metals in Tissue by CRC ICPMS (DRY)	EPA 200.3/6020A

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-DRY-MICR-HRMS-VA	Tissue	Metals in Tissue by HR-ICPMS Micro (DRY)	EPA 200.3/200.8

Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on dry weight basis.

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-WET-CCMS-N-VA	Tissue	Metals in Tissue by CRC ICPMS (WET)	EPA 200.3/6020A

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-WET-MICR-HRMS-VA	Tissue	Metals in Tissue by HR-ICPMS Micro (WET)	EPA 200.3/200.8

Reference Information

Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on wet weight basis.

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MOISTURE-TISS-VA Tissue % Moisture in Tissues ASTM D2974-00 Method A

This analysis is carried out gravimetrically by drying the sample at 105 C for a minimum of six hours.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

G0147	G0149	G0150	G0152	G0156
G0157	G0165	G0166	G0167	G0168
G0169	G0170	G0171		

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Duplicate	Tin (Sn)-Total	DUP-H	L1826566-12, -17, -19, -80, -9

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLIS	Detection Limit Adjusted: Insufficient Sample
DUP-H	Duplicate results outside ALS DQO, due to sample heterogeneity.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
HG-DRY-CVAFS-N-VA	Tissue	Mercury in Tissue by CVAFS (DRY)	EPA 200.3, EPA 245.7

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

HG-DRY-MICR-CVAF-VA Tissue Mercury in Tissue by CVAFS Micro (DRY) EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

HG-WET-CVAFS-N-VA Tissue Mercury in Tissue by CVAFS (WET) EPA 200.3, EPA 245.7

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

HG-WET-MICR-CVAF-VA Tissue Mercury in Tissue by CVAFS Micro (WET) EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

MET-DRY-CCMS-N-VA Tissue Metals in Tissue by CRC ICPMS (DRY) EPA 200.3/6020A

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-DRY-MICR-HRMS-VA Tissue Metals in Tissue by HR-ICPMS Micro (DRY) EPA 200.3/200.8

Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on dry weight basis.

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-WET-CCMS-N-VA Tissue Metals in Tissue by CRC ICPMS (WET) EPA 200.3/6020A

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

Reference Information

MET-WET-MICR-HRMS-VA Tissue Metals in Tissue by HR-ICPMS Micro (WET) EPA 200.3/200.8

Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on wet weight basis.

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MOISTURE-TISS-VA Tissue % Moisture in Tissues ASTM D2974-00 Method A

This analysis is carried out gravimetrically by drying the sample at 105 C for a minimum of six hours.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

G0147	G0149	G0150	G0152	G0156
G0157	G0165	G0166	G0167	G0168
G0169	G0170	G0171		

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

- all 'Group A' & 'Group B' tissues:
  - moisture
  - routine prep
  - CCMS metals (wet + dry)
  - routine Hg (wet & dry)

tissues not in A or B list = Keep on hold.

TAT:

Group A: 5' codes) Sept 16

Group B: routine.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Method Blank	Magnesium (Mg)-Total	MB-LOR	L1826684-15, -16
Method Blank	Magnesium (Mg)-Total	MB-LOR	L1826684-15, -16

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
MB-LOR	Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
MET-DRY-CCMS-N-VA	Tissue	Metals in Tissue by CRC ICPMS (DRY)	EPA 200.3/6020A

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-DRY-MICR-HRMS-VA	Tissue	Metals in Tissue by HR-ICPMS Micro (DRY)	EPA 200.3/200.8

Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on dry weight basis.

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-WET-CCMS-N-VA	Tissue	Metals in Tissue by CRC ICPMS (WET)	EPA 200.3/6020A

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-WET-MICR-HRMS-VA	Tissue	Metals in Tissue by HR-ICPMS Micro (WET)	EPA 200.3/200.8

Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on wet weight basis.

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MOISTURE-TISS-VA	Tissue	% Moisture in Tissues	ASTM D2974-00 Method A

This analysis is carried out gravimetrically by drying the sample at 105 C for a minimum of six hours.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

F0205

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLR	Detection Limit Raised due to required dilution, limited sample amount, and/or high moisture content (soil samples)

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
C-TIC-PCT-SK	Soil	Total Inorganic Carbon in Soil	CSSS (2008) P216-217

A known quantity of acetic acid is consumed by reaction with carbonates in the soil. The pH of the resulting solution is measured and compared against a standard curve relating pH to weight of carbonate.

C-TOC-CALC-SK	Soil	Total Organic Carbon Calculation	CSSS (2008) 21.2

Total Organic Carbon (TOC) is calculated by the difference between total carbon (TC) and total inorganic carbon. (TIC)

C-TOT-LECO-SK	Soil	Total Carbon by combustion method	SSSA (1996) P. 973-974

The sample is ignited in a combustion analyzer where carbon in the reduced CO2 gas is determined using a thermal conductivity detector.

HG-200.2-CVAF-VA	Soil	Mercury in Soil by CVAFS	EPA 200.2/1631E (mod)

Soil samples are digested with nitric and hydrochloric acids, followed by analysis by CVAFS.

IC-CACO3-CALC-SK	Soil	Inorganic Carbon as CaCO3 Equivalent	Calculation
MET-200.2-CCMS-VA	Soil	Metals in Soil by CRC ICPMS	EPA 200.2/6020A (mod)

Soil samples are digested with nitric and hydrochloric acids, followed by analysis by CRC ICPMS.

Method Limitation: This method is not a total digestion technique. It is a very strong acid digestion that is intended to dissolve those metals that may be environmentally available. This method does not dissolve all silicate materials and may result in a partial extraction. depending on the sample matrix, for some metals, including, but not limited to Al, Ba, Be, Cr, Sr, Ti, Tl, and V.

NO3-AVAIL-SK	Soil	Available Nitrate-N	Method = Alberta Ag (1988)

Available Nitrate and Nitrite are extracted from the soil using a dilute calcium chloride solution. Nitrate is quantitatively reduced to nitrite by passage of the sample through a copperized cadmium column. The nitrite (reduced nitrate plus original nitrite) is then determined by diazotizing with sulfanilamide followed by coupling with N-(1-naphthyl) ethylenediamine dihydrochloride. The resulting water soluble dye has a magenta color which is measured at colorimetrically at 520nm.

Reference:
Recommended Methods of Soil Analysis for Canadian Prairie Agricultural Soils. Alberta Agriculture (1988) p. 19 and 28

PH-1:2-VA	Soil	pH in Soil (1:2 Soil:Water Extraction)	BC WLAP METHOD: PH, ELECTROMETRIC, SOIL

This analysis is carried out in accordance with procedures described in the pH, Electrometric in Soil and Sediment method - Section B Physical/Inorganic and Misc. Constituents, BC Environmental Laboratory Manual 2007. The procedure involves mixing the dried (at <60°C) and sieved (No. 10 / 2mm) sample with deionized/distilled water at a 1:2 ratio of sediment to water. The pH of the solution is then measured using a standard pH probe.

PO4/K-AVAIL-SK	Soil	Plant Available Phosphorus and Potassium	Comm. Soil Sci. Plant Anal, 25 (5&6)

Plant available phosphorus and potassium are extracted from the soil usng Modified Kelowna solution. Phosphorous in the soil extract is determined colorimetrically at 880 nm, while potassiumis determined by flame emission at 770 nm.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
SK	ALS ENVIRONMENTAL - SASKATOON, SASKATCHEWAN, CANADA
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

F0205

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Duplicate	Titanium (Ti)	DUP-H	L1826516-18

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLHC	Detection Limit Raised: Dilution required due to high concentration of test analyte(s).
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
DLR	Detection Limit Raised due to required dilution, limited sample amount, and/or high moisture content (soil samples)
DUP-H	Duplicate results outside ALS DQO, due to sample heterogeneity.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
C-TIC-PCT-SK	Soil	Total Inorganic Carbon in Soil	CSSS (2008) P216-217

A known quantity of acetic acid is consumed by reaction with carbonates in the soil. The pH of the resulting solution is measured and compared against a standard curve relating pH to weight of carbonate.

C-TOC-CALC-SK	Soil	Total Organic Carbon Calculation	CSSS (2008) 21.2

Total Organic Carbon (TOC) is calculated by the difference between total carbon (TC) and total inorganic carbon. (TIC)

C-TOT-LECO-SK	Soil	Total Carbon by combustion method	SSSA (1996) P. 973-974

The sample is ignited in a combustion analyzer where carbon in the reduced CO2 gas is determined using a thermal conductivity detector.

HG-200.2-CVAF-VA	Soil	Mercury in Soil by CVAFS	EPA 200.2/1631E (mod)

Soil samples are digested with nitric and hydrochloric acids, followed by analysis by CVAFS.

IC-CACO3-CALC-SK	Soil	Inorganic Carbon as CaCO3 Equivalent	Calculation
MET-200.2-CCMS-VA	Soil	Metals in Soil by CRC ICPMS	EPA 200.2/6020A (mod)

Soil samples are digested with nitric and hydrochloric acids, followed by analysis by CRC ICPMS.

Method Limitation: This method is not a total digestion technique. It is a very strong acid digestion that is intended to dissolve those metals that may be environmentally available. This method does not dissolve all silicate materials and may result in a partial extraction. depending on the sample matrix, for some metals, including, but not limited to Al, Ba, Be, Cr, Sr, Ti, Tl, and V.

NO3-AVAIL-SK	Soil	Available Nitrate-N	Method = Alberta Ag (1988)

Available Nitrate and Nitrite are extracted from the soil using a dilute calcium chloride solution. Nitrate is quantitatively reduced to nitrite by passage of the sample through a copperized cadmium column. The nitrite (reduced nitrate plus original nitrite) is then determined by diazotizing with sulfanilamide followed by coupling with N-(1-naphthyl) ethylenediamine dihydrochloride. The resulting water soluble dye has a magenta color which is measured at colorimetrically at 520nm.

Reference:
Recommended Methods of Soil Analysis for Canadian Prairie Agricultural Soils. Alberta Agriculture (1988) p. 19 and 28

PH-1:2-VA	Soil	pH in Soil (1:2 Soil:Water Extraction)	BC WLAP METHOD: PH, ELECTROMETRIC, SOIL

This analysis is carried out in accordance with procedures described in the pH, Electrometric in Soil and Sediment method - Section B Physical/Inorganic and Misc. Constituents, BC Environmental Laboratory Manual 2007. The procedure involves mixing the dried (at <60°C) and sieved (No. 10 / 2mm) sample with deionized/distilled water at a 1:2 ratio of sediment to water. The pH of the solution is then measured using a standard pH probe.

PO4/K-AVAIL-SK	Soil	Plant Available Phosphorus and Potassium	Comm. Soil Sci. Plant Anal, 25 (5&6)

Plant available phosphorus and potassium are extracted from the soil usng Modified Kelowna solution. Phosphorous in the soil extract is determined colorimetrically at 880 nm, while potassiumis determined by flame emission at 770 nm.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
SK	ALS ENVIRONMENTAL - SASKATOON, SASKATCHEWAN, CANADA
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

RUSH

Priority processing

please log all highlighted soils for:

- CSR + Full Metals
- TOC/TIC
- Avail N, P, K

"Group A" soils are due Sept 15 with 'P' codes

"Group B" soils are due Sept 21, no priority code

SK sublets should go out Monday.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Duplicate	Lithium (Li)	DUP-H,J	L1826551-21, -22, -23, -24, -25, -26, -27, -28, -29, -30, -31

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLHC	Detection Limit Raised: Dilution required due to high concentration of test analyte(s).
DLR	Detection Limit Raised due to required dilution, limited sample amount, and/or high moisture content (soil samples)
DUP-H,J	Duplicate results outside ALS DQO, due to sample heterogeneity. Duplicate results and limits are expressed in terms of absolute difference.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
C-TIC-PCT-SK	Soil	Total Inorganic Carbon in Soil	CSSS (2008) P216-217

A known quantity of acetic acid is consumed by reaction with carbonates in the soil. The pH of the resulting solution is measured and compared against a standard curve relating pH to weight of carbonate.

C-TOC-CALC-SK	Soil	Total Organic Carbon Calculation	CSSS (2008) 21.2

Total Organic Carbon (TOC) is calculated by the difference between total carbon (TC) and total inorganic carbon. (TIC)

C-TOT-LECO-SK	Soil	Total Carbon by combustion method	SSSA (1996) P. 973-974

The sample is ignited in a combustion analyzer where carbon in the reduced CO2 gas is determined using a thermal conductivity detector.

HG-200.2-CVAF-VA	Soil	Mercury in Soil by CVAFS	EPA 200.2/1631E (mod)

Soil samples are digested with nitric and hydrochloric acids, followed by analysis by CVAFS.

MET-200.2-CCMS-VA	Soil	Metals in Soil by CRC ICPMS	EPA 200.2/6020A (mod)

Soil samples are digested with nitric and hydrochloric acids, followed by analysis by CRC ICPMS.

Method Limitation: This method is not a total digestion technique. It is a very strong acid digestion that is intended to dissolve those metals that may be environmentally available. This method does not dissolve all silicate materials and may result in a partial extraction. depending on the sample matrix, for some metals, including, but not limited to Al, Ba, Be, Cr, Sr, Ti, Tl, and V.

NO3-AVAIL-SK	Soil	Available Nitrate-N	Method = Alberta Ag (1988)

Available Nitrate and Nitrite are extracted from the soil using a dilute calcium chloride solution. Nitrate is quantitatively reduced to nitrite by passage of the sample through a copperized cadmium column. The nitrite (reduced nitrate plus original nitrite) is then determined by diazotizing with sulfanilamide followed by coupling with N-(1-naphthyl) ethylenediamine dihydrochloride. The resulting water soluble dye has a magenta color which is measured at colorimetrically at 520nm.

Reference:
Recommended Methods of Soil Analysis for Canadian Prairie Agricultural Soils. Alberta Agriculture (1988) p. 19 and 28

PH-1:2-VA	Soil	pH in Soil (1:2 Soil:Water Extraction)	BC WLAP METHOD: PH, ELECTROMETRIC, SOIL

This analysis is carried out in accordance with procedures described in the pH, Electrometric in Soil and Sediment method - Section B Physical/Inorganic and Misc. Constituents, BC Environmental Laboratory Manual 2007. The procedure involves mixing the dried (at <60°C) and sieved (No. 10 / 2mm) sample with deionized/distilled water at a 1:2 ratio of sediment to water. The pH of the solution is then measured using a standard pH probe.

PO4/K-AVAIL-SK	Soil	Plant Available Phosphorus and Potassium	Comm. Soil Sci. Plant Anal, 25 (5&6)

Plant available phosphorus and potassium are extracted from the soil usng Modified Kelowna solution. Phosphorous in the soil extract is determined colorimetrically at 880 nm, while potassiumis determined by flame emission at 770 nm.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
SK	ALS ENVIRONMENTAL - SASKATOON, SASKATCHEWAN, CANADA
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

G0148

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

RUSH

Priority processing

Please log all highlighted soils for:

- CSR + Full Metals
- TOC/TIC
- Avail N, P, K

"Group A" soils are due Sept 16 with 'P' codes

"Group B" soils are due Sept 21, no priority code.

SK sublets should go out Monday.

APPENDIX E-1.2

Addendum to Tissue Data Report for Plants Collected Along Hazeltine Channel

11 May 2017
Reference No. 1662612-086-R-Rev0-22392

Golder Associates

TECHNICAL MEMORANDUM

DATE 19 May 2017 **REFERENCE No.** 1662612-152-TM-Rev0-22343

TO 'Lyn Anglin, Ph.D., P.Geo.
Imperial Metals Corporation

CC Don Parsons (MPMC)

FROM Arainn Atkinson and Lee Nikl **EMAIL** Arainn_Atkinson@golder.com; Lee_Nikl@golder.com

ALUMINUM CONCENTRATIONS IN PLANTS COLLECTED ALONG HAZELTINE CHANNEL CORRIDOR – MOUNT POLLEY MINE

Golder Associates Ltd. (Golder) is pleased to provide Mount Polley Mining Corporation (MPMC) with the following addendum to the 2016 Plant Tissue Data Report (Golder 2017) that summarized the tissue chemistry results of plant samples collected from the Hazeltine Channel floodplain and halo (herein referred to as the "Hazeltine corridor") in 2015 and 2016. This addendum is intended to provide presentation of aluminum concentrations in plant tissue and some context for the tissue concentrations measured. Aluminum concentrations in tailings were less than in some of the natural soils collected from background areas; however, an evaluation of aluminum in plants was requested by project reviewers.

This addendum should be read in conjunction with the 2016 Plant Tissue Data Report (Golder 2017). Details of sampling methods are not provided in this addendum.

1.0 BACKGROUND

Samples of plants considered edible for human and/or ecological receptors (berries, spruce, willow, and rye/barley grass) were collected in summer 2015 and summer 2016 from the terrestrial area (i.e., Hazeltine corridor) impacted by the flood of debris resulting from the 2014 Tailings Storage Facility (TSF) embankment foundational failure (herein referred to as the 'TSF embankment breach') to evaluate whether concentrations of contaminants of concern in plant tissue have changed as a result of tailings deposition. Two areas within the Hazeltine corridor have been identified. The 'floodplain' area is where the forest and portions of native soils were removed by the flood of debris from the TSF embankment breach. The area along the Hazeltine corridor where tailings were deposited on top of the native organic soil is referred to as the 'halo' area (Figures A-1 through A-14 in Attachment A of Golder 2017). There were no signs of toxicity in plant samples collected from either the floodplain, halo, or background areas (Golder 2017). This memorandum refers to 'tailings deposited' along the Hazeltine corridor; however, in reality, the deposited material is a heterogeneous mixture of tailings, scoured native till, and TSF embankment construction materials.

Aluminum is the most abundant metal in the Earth's crust (Delhaize and Ryan 1995). Despite its prevalence in the environment, aluminium has no known biological function (Poschenrieder et al. 2008). Aluminium is considered to be well tolerated by plants and animals and to have extremely low acute toxicity. Aluminum bioavailability and toxicity is largely restricted to acidic soil conditions (Delhaize and Ryan 1995, Poschenrieder et al. 2008). High aluminum resistance is also a trait of many forest tree species that are well adapted to the acidification processes in their habitats (Poschenrieder et al. 2008).

2.0 SAMPLE COLLECTION

Detailed sample collection methods are provided in the 2016 Plant Tissue Data Report (Golder 2017). The locations of tissue and co-located soil samples can be found in Figures A-1 through A-14 in Attachment A of the 2016 Plant Tissue Data Report (Golder 2017).

3.0 ANALYSES

Consistent with the data analysis in the 2016 Plant Tissue Data Report (Golder 2017), tissue data were separated for analysis based on tissue type by plant functional group (i.e., berries from berry-producing shrubs, leaves from other shrubs, conifers, grasses) and sample area (i.e., background, halo, floodplain). Table 1 provides a summary of the samples available for each parameter.

Table 1: Number of Each Type of Plant Tissue Sample Collected along Hazeltine Channel Corridor

Tissue	Halo	Floodplain	Background
Berry	32	-	16
Shrub	7	39	21
Conifer	26	-	15
Grass	2	30	11

A baseline study of plant tissue sampling at the Mount Polley Mine (the "Mine") property was conducted by Hallam Knight Piésold to document pre-Mine concentrations of metals in plants on or near the Mine site; however, aluminum was not measured in the historic plant samples. Thus, comparison to baseline was not conducted for aluminum.

Summary statistics (minimum, maximum, mean, median, number of samples, and number of detected samples) were reported for each plant tissue type separated by area. Mean and median values were calculated using the full detection limit for samples with non-detects. Using the full detection limit is conservative because in reality the true concentration is less than the detection limit. Statistical testing of the aluminum plant tissue data was not conducted for this memorandum.

Individual plant samples collected from the floodplain and halo areas were plotted for comparison to background samples. Boxplots were created for each plant tissue type to compare concentrations across areas (i.e., halo, floodplain, background). Boxplots indicate median, 5th percentile, 25th percentile, 75th percentile, and 95th percentile values, and outliers.

Metal concentrations in plant tissue were also compared to the co-located soil samples to determine tissue:soil ratios (i.e., bioaccumulation factors [BAFs]). Individual plant tissue concentrations were plotted against co-located soil concentrations to visualize the relationship. BAFs were plotted against soil concentrations to examine if there was a soil concentration-dependence of metal accumulation in plants.

4.0 RESULTS

Raw plant tissue and soil chemistry data are provided in Attachment C of the 2016 Plant Tissue Data Report (Golder 2017) and are plotted in Figure 1. Summary statistics of aluminum concentrations in the various plant tissue types from the halo, floodplain, and background are presented in Table 2. Boxplots for the various plant tissue types are presented below in Figure 2.

In co-located soil from the halo and floodplain, aluminum concentrations ranged from 3,720 to 26,000 milligrams per kilogram dry weight (mg/kg dw), and in background soil, aluminum concentrations ranged from 3,410 to 44,300 mg/kg dw (Table C-2 in Attachment C of Golder 2017). Aluminum concentrations in plant tissue samples collected from the halo and floodplain ranged from 3.2 to 1,650 mg/kg dw with a median concentration of 51 mg/kg dw (Table 2; Figure 1). Aluminum concentrations in background plant tissue samples ranged from 3.6 to 193 mg/kg dw with a median concentration of 21 mg/kg dw (Table 2; Figure 1).

Plant tissue aluminum concentrations varied within a narrow range of soil concentrations. Plant samples from the halo appeared to have similar aluminum concentrations as plant samples from the background forest. However, even though soil concentrations in the floodplain were similar to background, plant samples from the floodplain area tended to have higher aluminum concentrations than background (Figure 1). The soil samples from the floodplain were composed of tailings and till, had negligible soil development, and were largely absent of organic matter, unlike the halo and background areas. The variation in aluminum in plant tissues may reflect the wider range of chemical, physical, and biological conditions in the substrates among areas rather than aluminum in the soil alone.

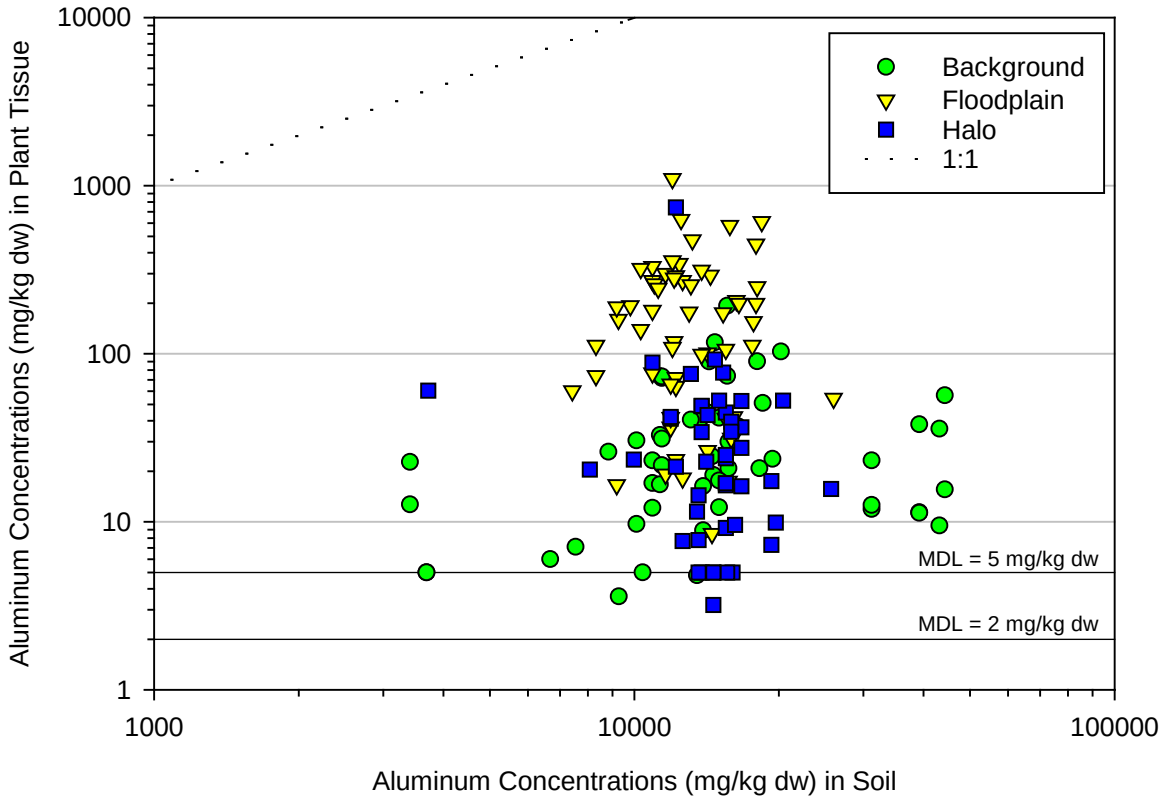

Figure 1: Aluminum Concentrations in Plant Tissue versus Soil

Note: MDL = method detection limit. The standard MDL for aluminum analysis is 2 mg/kg dw. The MDL was raised for some samples from 2 to 5 mg/kg dw. For some of those samples a concentration greater than 5 was not detected so the result was reported as <5 mg/kg dw. The solid lines indicate the MDLs of <2 and <5 mg/kg dw.

Grass and shrub samples were primarily collected from the floodplain, and berry and conifer samples were primarily collected from the halo. Comparison of median aluminum concentrations between specific plant types from the halo or floodplain versus background (Table 2; Figure 2) indicated:

- Berries and conifers generally had higher aluminum concentrations in samples from the halo than from the background forest.
- Leaves from shrubs in the halo generally had lower aluminum concentrations than leaves from the background forest, whereas leaves from shrubs in the floodplain generally had higher aluminum concentrations than leaves from the background forest.
- Grass generally had higher aluminum concentrations in samples from the halo and floodplain than from the background forest.

Table 2: Summary Statistics of Aluminum Concentrations in Plant Tissue

Tissue		Halo	Floodplain	Background
Berries	N	32	-	16
	N detect	24	-	13
	Min	5.0	-	3.6
	Max	744	-	33
	Mean	41	-	9.7
	Median	13	-	6.0
Shrubs	N	7	39	21
	N detect	7	39	21
	Min	17	42	16
	Max	72	962	117
	Mean	34	287	49
	Median	25	260	38
Conifers	N	26	-	15
	N detect	26	-	15
	Min	3.2	-	8.9
	Max	93	-	73
	Mean	38	-	20
	Median	34	-	17
Grasses	N	2	30	11
	N detect	2	30	11
	Min	49	8.5	7.1
	Max	89	1,650	193
	Mean	69	208	45
	Median	69	68	25

Notes: Plant tissue concentrations are in milligrams per kilogram dry weight (mg/kg dw). N = number of samples; N detect = number of samples with detected concentrations of aluminum; Min = minimum; Max = maximum.

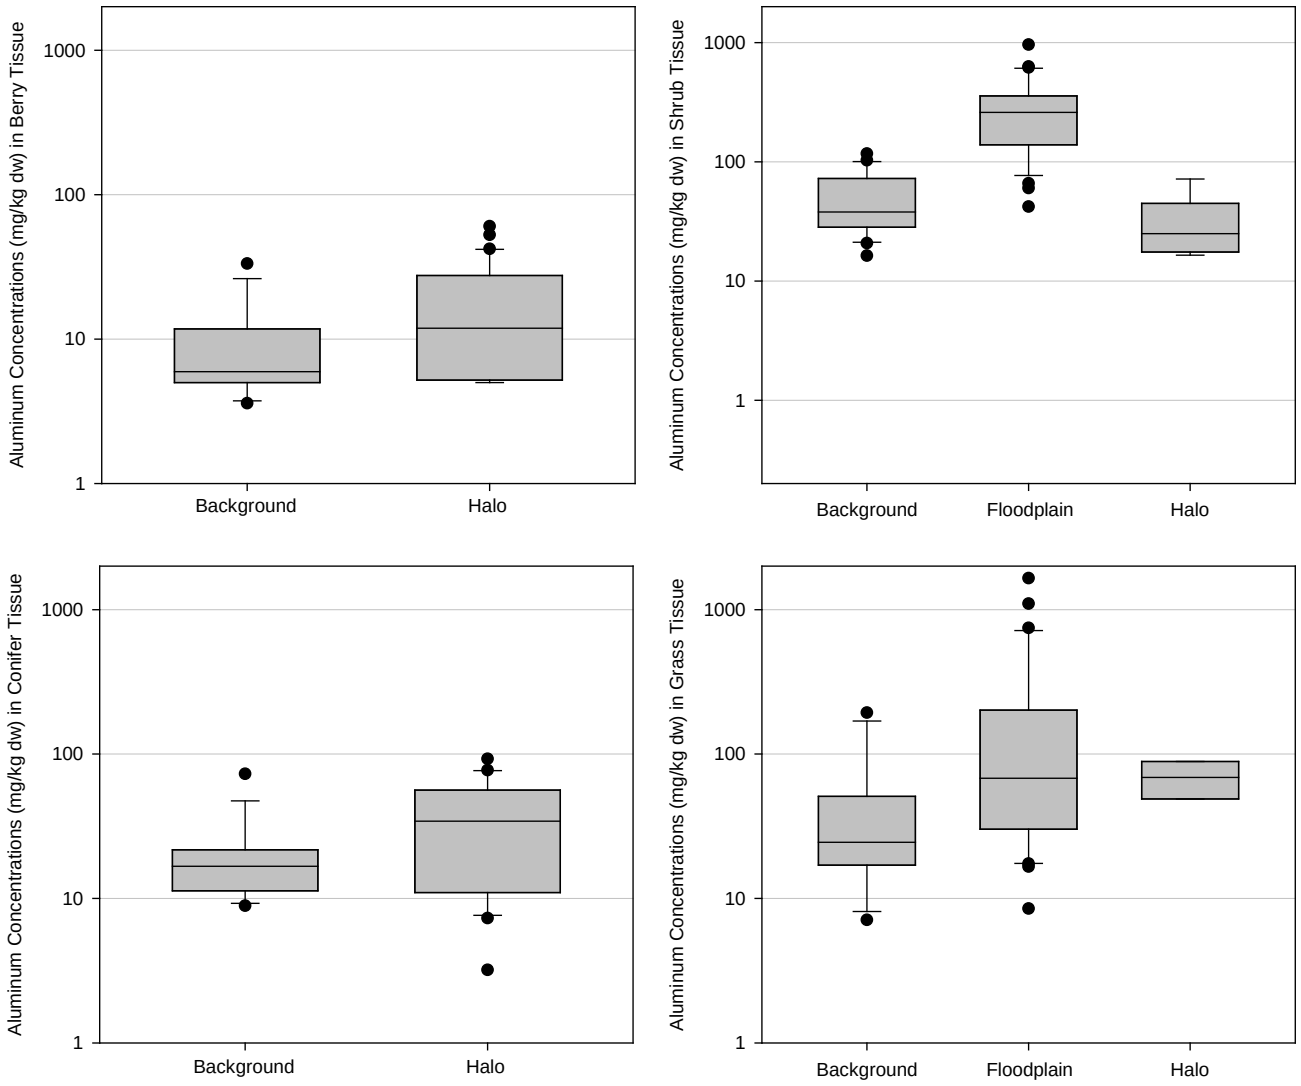

Figure 2: Aluminum Concentrations in Berry, Shrub, Conifer, and Grass Tissue Samples from the Halo or Floodplain Compared to Background

Notes: The number of samples of each plant type are provided in Table 2.

Aluminum BAFs for all plant samples were below 1.0 (Figure 3). Background data may indicate a slight linear decrease in the BAF with increasing soil aluminum concentrations, and do indicate that under background conditions aluminum is regulated by the plants. However, the observed variability in the aluminum concentration in plant tissue suggests that factors in addition to aluminum concentration in soil have a role in aluminum concentrations in plants.

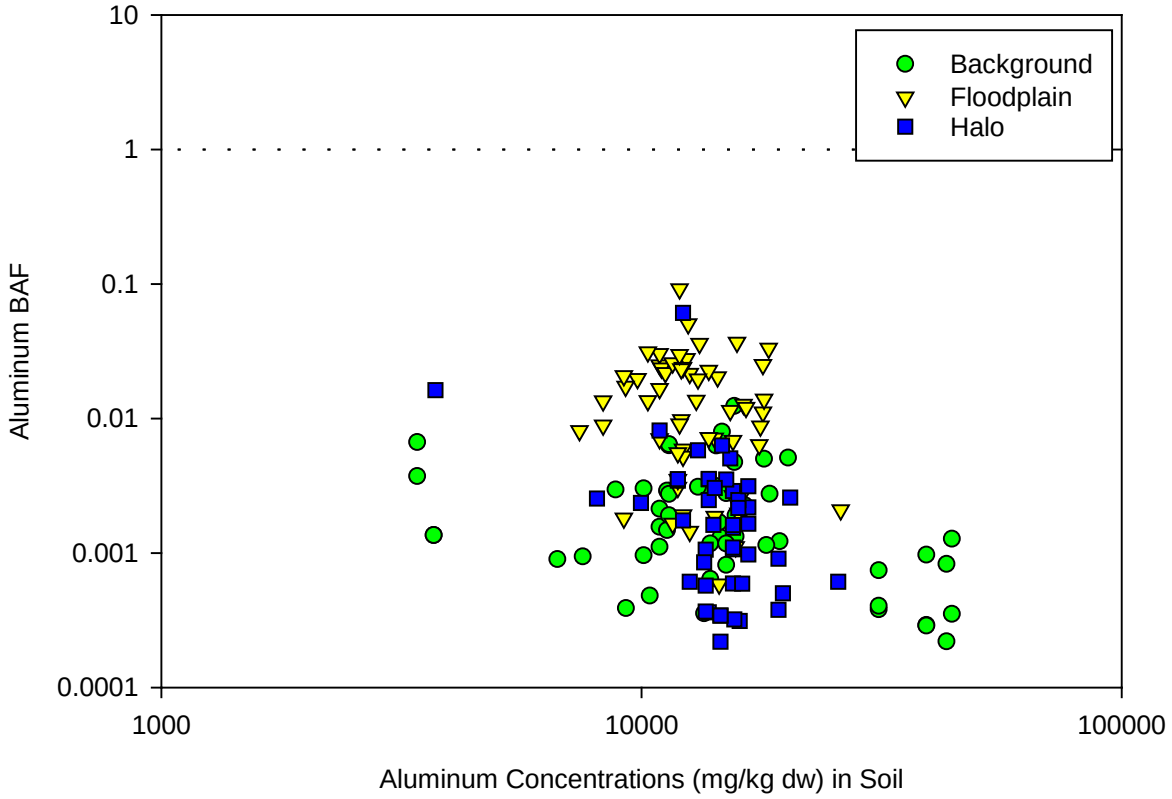

Figure 3: Aluminum Bioaccumulation Factors versus Soil Concentrations in Plants from the Halo, Floodplain, and Background Areas

5.0 SUMMARY OF FINDINGS

None of the samples had symptoms of toxicity and BAF values were lower than 1.0. There were some differences in aluminum concentrations among floodplain, halo, and background plant samples. In general, plant tissue concentrations of aluminum were highest in the floodplain, and were higher in the halo than the background forest. However, the range of aluminum concentrations in plants from the halo and background area overlapped. The generally greater concentrations observed in floodplain than halo plants may be attributed to soil conditions in the floodplain. The soil samples from the floodplain were composed of tailings and till, had negligible soil development, and were largely absent of organic matter, unlike the halo and background areas.

Uncertainty with the data analysis is mostly due to other factors that can affect metal uptake within plants, such as plant growth, species diversity, plant age, growth stage (e.g., planted vs established), season, microsite variability, rooting depth, and soil type. Soil conditions vary with respect to concentrations of nutrients, organic carbon, soil structure, and the soil food web community, including the soil microbial community. The variation in aluminum concentrations in tissues may reflect the wider range of chemical, physical, and biological conditions in the soil among areas rather than aluminum concentration in the soil alone.

6.0 CLOSURE

The reader is referred to the Study Limitations, which follows the text and forms an integral part of this memorandum.

We trust the above meets your present requirements. If you have any questions or requirements, please contact the undersigned.

2016 TISSUE DATA REPORT FOR SOIL INVERTEBRATES COLLECTED ALONG HAZELTINE CHANNEL – MOUNT POLLEY MINE

Golder Associates Ltd. (Golder) is pleased to provide Mount Polley Mining Corporation (MPMC) with this technical memorandum that summarizes the tissue chemistry results of soil invertebrate samples collected from the Hazeltine Channel in 2015 and 2016. This memorandum updates the findings of the *Terrestrial Invertebrate Data Report* (dated 25 May 2016) included as Appendix J of the Post-event Environmental Impact Assessment Report (PEEIAR), update report dated 3 June 2016 (Golder 2016). This memorandum is intended as a data report and presents the data collected in 2015 and 2016. The upcoming ecological risk assessment will evaluate potential risks associated with metal concentrations in soil invertebrate tissue.

1.0 BACKGROUND

Samples of soil invertebrates (ants, beetles, worms, and slugs) were collected in summer 2015 from the terrestrial area impacted by the tailings storage facility (TSF) embankment breach (i.e., Hazeltine Channel), to evaluate whether concentrations of copper, selenium, and vanadium in soil invertebrate tissue have increased as a result of tailings deposition along Hazeltine Channel. Copper and vanadium were previously identified (MPMC 2015 Appendix D) to be of concern because concentrations in tailings exceeded the BC Contaminated Sites Regulation (CSR) soil standard for copper that is protective of toxicity to soil invertebrates and plants and the generic parkland soil standard for vanadium (BC MoE 2014). Selenium was included in the analysis on request from project reviewers although tailings concentrations were below the CSR standard and are similar to or below concentrations in native glacial sediments from Hazeltine Creek collected prior to the Tailings Storage Facility embankment breach (MPMC 2015 Appendix C). The area along Hazeltine Channel where tailings had deposited on top of the native soil is referred to as the ‘halo’ area. The ‘floodplain’ area is where the forest and portions of native soils were removed by the flood of debris from the TSF embankment breach.

The preliminary survey of soil invertebrate tissue conducted in 2015 indicated that concentrations of copper, selenium, and vanadium in soil invertebrates from the halo and floodplain were similar to local background concentrations, based on visual comparison of results as data were insufficient for statistical comparison. Additional sampling of invertebrates along Hazeltine Channel was recommended to increase the data set and reduce uncertainty in the 2015 findings.

2.0 METHODS

2.1 Sample Collection

Consistent with the methods used in 2015, samples of terrestrial invertebrates (ants, beetles, spiders, and worms) were collected between 19 August and 5 September 2016 by Golder field staff from the Hazeltine Channel and background areas. Background locations were at least 20 metres outside of the area of visual impact of the tailings material. Sample locations are shown on Figures 1-1 to 1-7. Invertebrate samples were collected by hand and transferred to clean, laboratory supplied glass jars as per the *BC Field Sampling Manual* (BC MoE 2013). Invertebrates of the same type from a given location were composited with the exception of worms, which were sampled separately. Additional effort to remove particulate matter from samples was included in the 2016 sampling program. Ant, beetle and spider samples were rinsed with distilled water twice. After each rinsing individual invertebrates were blotted dry with kimwipes. Worm samples were left in ambient temperature overnight to allow depuration. Worm samples were rinsed and blotted dry with kimwipes before being transferred to a clean jar. Samples were frozen and kept on ice until submitted to the laboratory.

Co-located soil samples were collected at the same time and location as each invertebrate sample. Surface soil within the top 0.2 m was collected using a hand shovel. From background areas, the humus layer was removed and not included in the sample. Soil was homogenized in a stainless steel bowl prior to transfer to clean, laboratory supplied glass jars with Teflon™ lined lids.

Tissue samples were submitted to ALS Environmental (Burnaby, BC; ALS) for analysis of metals and moisture content. Soil samples were submitted to ALS for analysis of metals, nutrients, Total Organic Carbon (TOC), and pH. For quality assurance and quality control (QA/QC), field duplicate samples were collected from at least 10% of locations.

2.2 Data Analyses

Copper, selenium, and vanadium concentrations in soil invertebrates collected from the floodplain and halo areas in 2016 were compared to samples from those areas in 2015 and from background areas in both years. Table 1 provides a summary of the samples available for each dataset.

Table 1: Number of Each Type of Tissue Sample along Hazeltine Channel (2015 and 2016)

Tissue	Floodplain		Halo		Background	
Year Collected	**2015**	**2016**	**2015**	**2016**	**2015**	**2016**
Worms & Slug	0	3	3	2	2	2
Spiders	0	1	0	3	0	2
Beetles & Ants	0	3	8	4	0	3

Summary statistics, including number of samples, minimum, maximum, and mean concentrations were calculated for each tissue type separated by area. Where concentrations were reported below the detection limit, values were set to the detection limit to calculate summary statistics. Within the copper, selenium, and vanadium datasets for soil invertebrates and soil, five values were reported below the detection limit. Further statistical analysis was not conducted because the data sets are not of sufficient size to perform meaningful non-parametric tests.

For visual comparison, individual soil invertebrate samples were plotted by invertebrate type and sampled area. Plots included the minimum and maximum of background tissue samples (all types combined due to limited number of data points). Individual soil invertebrate tissue concentrations were also plotted against co-located soil concentrations (normalized to bulk density) to visualize the uptake relationship. The soil invertebrate and soil chemistry data were normalized to bulk density so that the ratio of metal concentration in invertebrate to that in soil could be calculated (i.e., bioaccumulation factor [BAF]). For soil invertebrates, a worm bulk density of 1 gram per centimetre (g/cm^3) was used (Armitage 2004, Hughes et al. 2005). The bulk density of mineral soil is between 1 to 2 g/cm^3, with the value dependent on organic carbon content of the soil. For soils with very low organic carbon content, like the tailings, 1.5 g/cm^3 was selected as a reasonable estimate based on the equations given in Hossain et al. (2015) and Alexander (1989).

2.3 Quality Assurance / Quality Control

2.3.1 Field Quality Assurance / Quality Control

Soil invertebrate samples were hand collected by field staff wearing nitrile gloves. Re-usable equipment (e.g., bowls and trowels) was decontaminated between samples. Care was taken to minimize the introduction of foreign material into the samples or loss of material of interest from the samples prior to analysis. As per the *BC Field Sampling Manual* (BC MoE 2013), field notes were maintained to document the field sampling program. Each sample was labelled with a unique identifier and the date sampled. Chain-of-custody forms were updated as samples were collected, and were checked to verify the information recorded before samples were submitted.

Three duplicate soil invertebrate samples and seven duplicate soil samples were collected. Soil invertebrate duplicate samples were separate composites of ants from the same areas. Because the duplicate samples consisted of separate living and mobile organisms, they should not be used to determine sampler variability or laboratory variability; instead, the duplicate samples provide a measure of the environmental variability. Duplicate samples of soil were collected from the same sample location, but were homogenized separately in a metal bowl before being placed in sample containers. Soil duplicates were collected to provide an indication of sample variation and the reproducibility of the laboratory test methods.

The relative percent difference (RPD) was used to evaluate variability between duplicate samples. An RPD value of >50% was used to identify notable differences between original and duplicate tissue samples, when values were greater than or equal to five times the method detection limit (MDL). An RPD value of >35% was used for soil samples. The RPD value used for tissue is relatively high because a higher degree of natural variability is expected for this biological matrix. For values less than five times the MDL, a difference factor (DF) was calculated. In general, samples should have a difference factor of less than 2.0.

2.3.2 Laboratory Quality Assurance / Quality Control

ALS Laboratory (ALS) is an accredited laboratory (locally, Canadian Association for Laboratory Accreditation Inc. and Standard Council of Canada) and methods are based on International Organization for Standards / International Electrotechnical Commission (ISO/IEC) 17025:2005. ALS analytical methods are based on well established, internationally-recognized procedures such as those published by the United States Environmental Protection Agency and the American Public Health Association, as well as local country standards. All approved methods included quality control and performance criteria that must be achieved prior to releasing the data.

Laboratory quality control for chemistry samples included analysis of method blanks, laboratory duplicates, spiked samples, and control samples using certified reference materials to assess precision and accuracy of chemical analyses. Laboratory data quality control reports were reviewed upon receipt to confirm that the laboratory data quality objectives (DQOs) had been met and that the appropriate quality control information had been reported.

3.0 RESULTS

3.1 Copper

Analytical results are provided in Attachment A. Summary statistics of soil invertebrate copper concentrations are provided in Table 2. Copper concentrations in individual soil invertebrate samples are plotted in Figure 2. Soil invertebrate copper concentrations are plotted relative to soil copper concentrations in Figure 3. The following observations were made:

- Copper concentrations of the three invertebrate groups overlapped, but were generally highest in spiders, followed by worms/slug and beetles/ants (Figure 2; Table 2). The range of concentrations in samples from the halo overlapped with samples from the floodplain.
- In 2016, copper concentrations in beetles/ants and worms/slug collected from the floodplain and halo areas were generally higher relative to copper concentrations in the background area. In spiders, the highest copper concentration observed in 2016 was collected from the background area; concentrations in floodplain and halo area samples were within the range of samples from background areas (Figure 2; Table 2).
- In beetles/ants and worms/slug collected from the halo area, copper concentrations were lower in 2016 relative to 2015, except for one worm sample collected in 2015 that had the lowest copper concentration (Figure 2).
- Overall, copper concentrations measured in soil invertebrates from the floodplain and halo were within the range of copper concentrations measured in soil invertebrates from the background area (Figure 2; Table 2).
- Copper concentrations (normalized to bulk density) in co-located soil samples from the floodplain and halo exceeded the BC CSR soil standard for copper that is protective of toxicity to soil invertebrates and plants (150 mg/kg; Figure 2).
- When normalized to bulk density, ratios of soil invertebrate to soil concentration were less than one, except for one pair collected from the background area in 2016 (Figure 3). The general trend (i.e., ratio less than one) indicates that there is not a linear relationship between soil and soil invertebrate concentrations of copper, and indicates regulation of copper is occurring. Copper is known to be physiologically regulated as an essential micronutrient (Wood et al. 2011), and is stored in metal binding proteins for use at times of low concentration in the environment. Copper is continuously excreted and stimulated excretion occurs when environmental concentrations are high (Wood et al. 2011).

Table 2: Summary Statistics of Tissue Copper Concentrations (mg/kg) from 2015 and 2016

Tissue		Floodplain	Halo	Background
Worms & Slug	N	3	5	4
	Min	25	6.8	8
	Max	99	237	91
	Mean	54	126	31
Beetles & Ants	N	3	12	3
	Min	16	14	8.0
	Max	53	62	11
	Mean	37	34	9.1
Spiders	N	1	3	2
	Min	-	71	83
	Max	307	180	508
	Mean	-	135	296

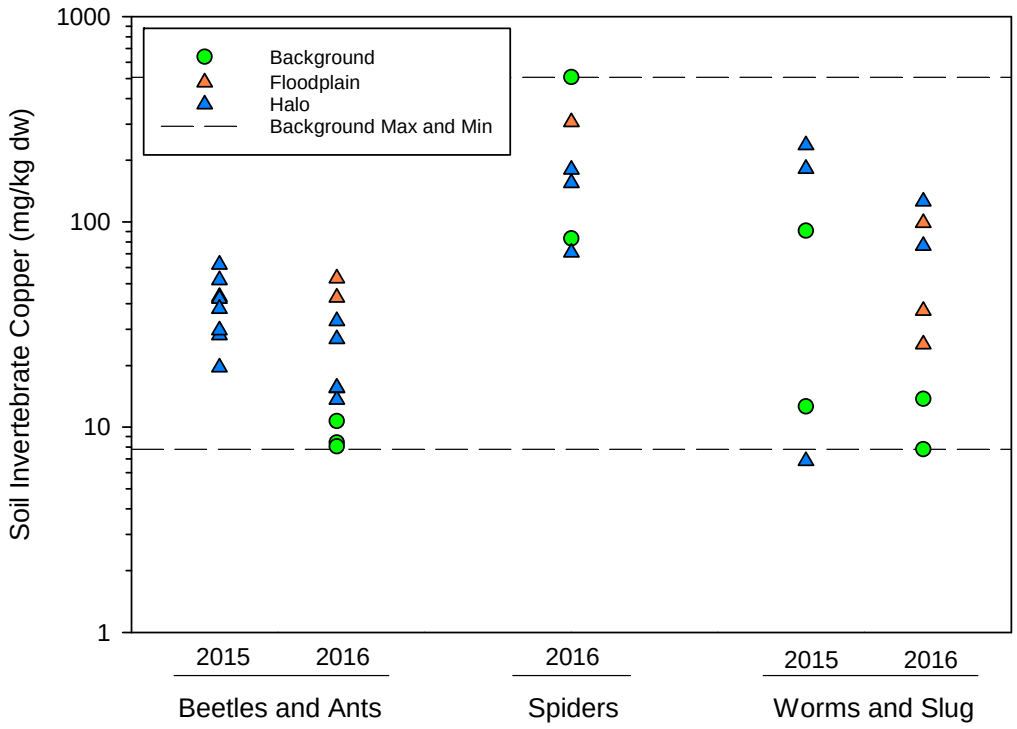

Figure 1: Copper Concentrations in Soil Invertebrates Collected in 2015 and 2016. The copper concentrations appeared to be higher for some invertebrates but the range of concentrations found for floodplain and halo soil invertebrate samples fell within the range of concentrations measured in background.

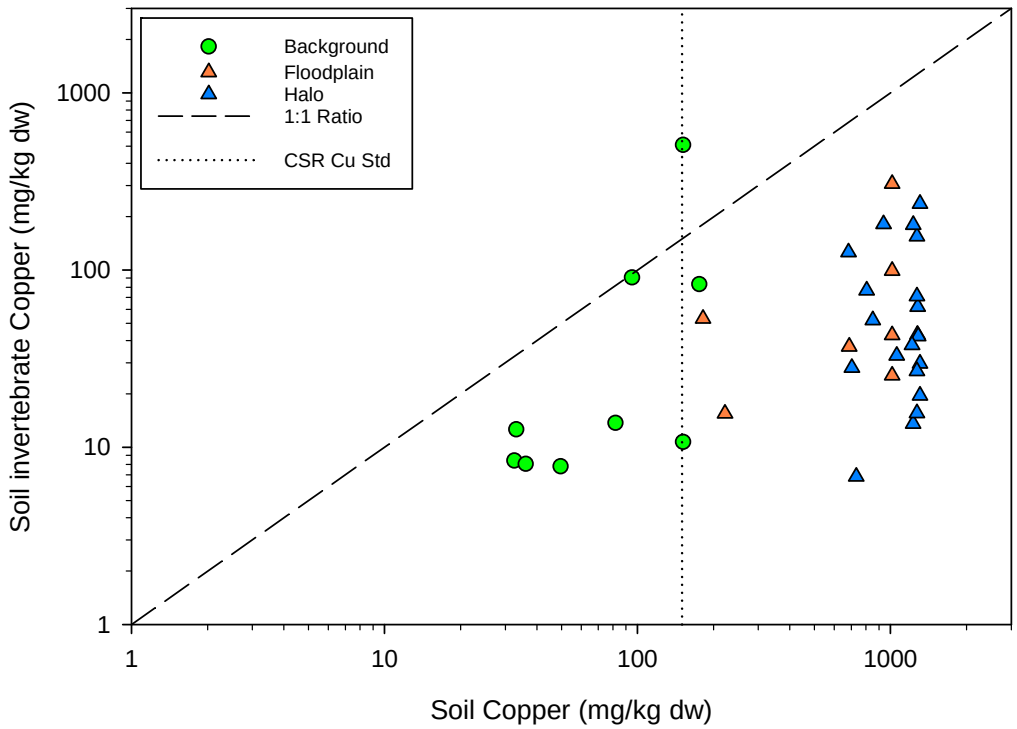

Figure 2: Copper Concentrations in Soil Invertebrates Versus Soil Collected in 2015 and 2016. The general trend (i.e., ratio less than one) indicates there is not a linear relationship between soil and soil invertebrate concentrations of copper, and indicates regulation of copper is occurring. Applicable CSR Schedule 5 Standard for copper is 150 mg/kg for the protection of soil invertebrates and plants.

3.2 Selenium

Analytical results are provided in Attachment A. Summary statistics of soil invertebrate selenium concentrations are provided in Table 3. Selenium concentrations in individual soil invertebrate samples are plotted in Figure 4. Soil invertebrate selenium concentrations and BAFs are plotted relative to soil selenium concentrations in Figure 5. The following observations were made:

- Selenium concentrations of the three invertebrate groups overlapped, but were generally highest in worms/slug, followed by spiders and beetles/ants (Figure 4; Table 3). The range of concentrations in samples from the halo overlapped with samples from the floodplain.
- Selenium concentrations in beetles/ants and worms/slug collected from the floodplain and halo areas were generally higher relative to copper concentrations in the background area. In spiders, selenium concentrations in floodplain and halo area samples were within the range of samples from background areas (Figure 4; Table 3).
- With two exceptions, selenium concentrations measured in soil invertebrates from the floodplain and halo were within or less than the range of selenium concentrations measured in soil invertebrates from the background area (Figure 4; Table 3).

- Selenium concentrations (normalized to bulk density) in most co-located soil samples from the floodplain and halo were less than the BC CSR generic agriculture soil standard for selenium (2 mg/kg; Figure 4). When normalized to bulk density, ratios of soil invertebrate to soil concentration were greater than one in approximately half of pairs, including five of nine pairs from the background area (Figure 5). In general, the ratios of soil to soil invertebrate selenium for samples from the floodplain and halo fell within the range of ratios for background samples. The range of selenium concentrations in soil was relatively small in comparison to the corresponding range of selenium concentrations in soil invertebrates. In addition, the range of selenium concentrations in soil from the floodplain and halo was relatively narrow and fell within the more broad range of selenium concentrations measured in soil from background areas. Selenium is known to be physiologically regulated as an essential micronutrient (Wood et al. 2011) and at low environmental concentrations uptake tends to be relatively large compared to uptake at higher environmental concentrations (e.g., de Bruyn et al. 2013; Presser and Luoma 2010). The ratio-based approach has limitations to predicting accumulation because uptake and transfer of selenium may not be linear.

Table 3: Summary Statistics of Tissue Selenium Concentrations (mg/kg) from 2015 and 2016

Tissue		Floodplain	Halo	Background
Worms & Slug	N	3	5	4
	Min	1.8	4.4	0.72
	Max	8.0	19	4.0
	Mean	4.3	7.9	1.9
Beetles & Ants	N	3	12	3
	Min	<0.1	0.17	0.29
	Max	2.7	1.9	0.49
	Mean	1.1	0.63	0.42
Spiders	N	1	3	2
	Min	-	2.0	1.3
	Max	2.3	2.8	6.5
	Mean	-	2.5	3.9

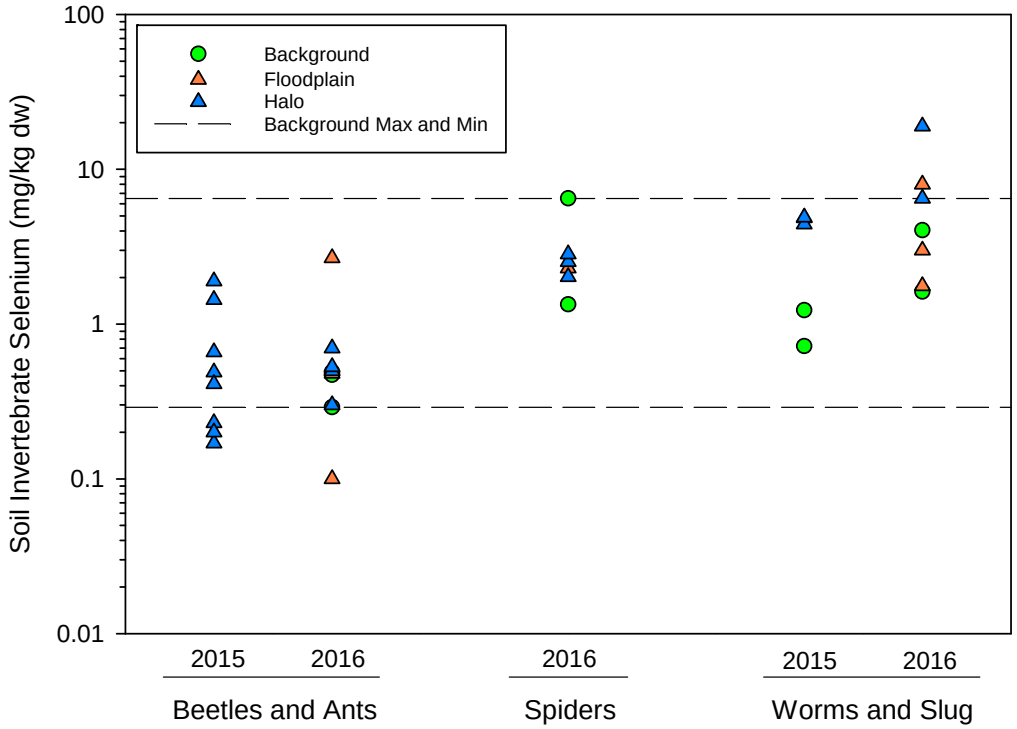

Figure 3: Selenium Concentrations in Soil Invertebrates Collected in 2015 and 2016. In general, selenium concentrations in soil invertebrate samples from the floodplain and halo were within or less than the range of concentrations measured in background.

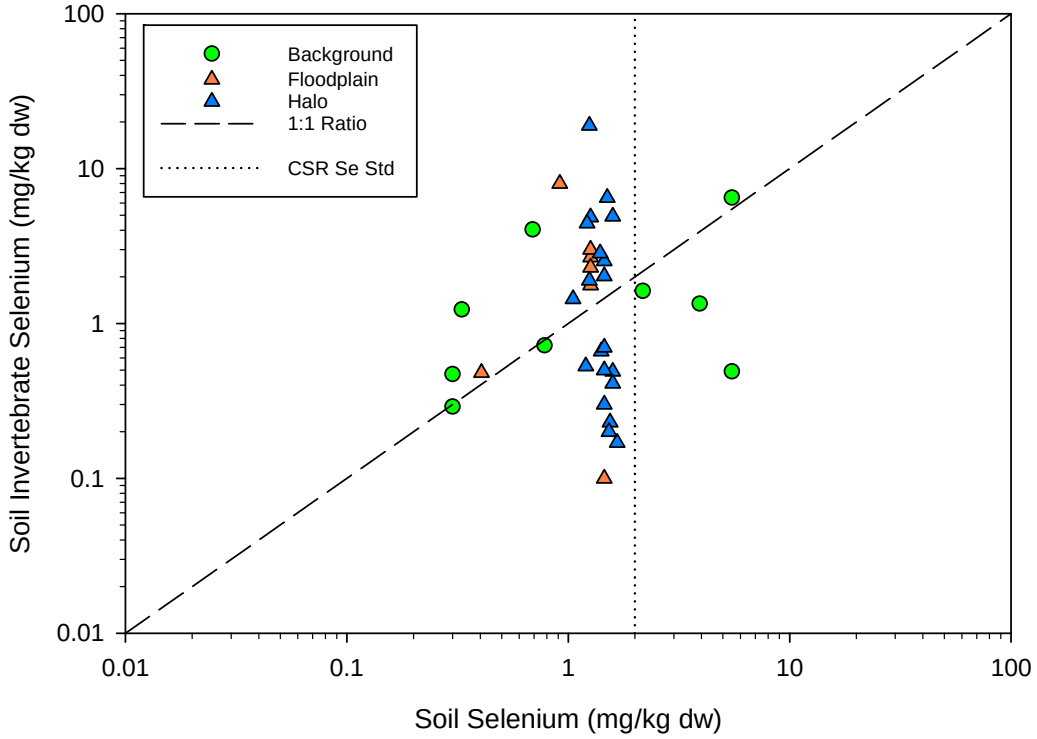

Figure 4: Selenium Concentrations in Soil Invertebrates versus Soil Collected in 2015 and 2016. The range of selenium concentrations in soil from the floodplain and halo fell within the more broad range of selenium concentrations measured in soil from background areas. The ratios of soil to soil invertebrate selenium also fell within the range of background. Applicable CSR Schedule 4 Standard for selenium is 2 mg/kg.

3.3 Vanadium

Analytical results are provided in Attachment A. Summary statistics of soil invertebrate vanadium concentrations are provided in Table 4. Vanadium concentrations in individual soil invertebrate samples are plotted in Figure 6. Soil invertebrate vanadium concentrations and BAFs are plotted relative to soil vanadium concentrations in Figure 7. The following observations were made:

- Vanadium concentrations of the three invertebrate groups overlapped, but were generally highest in worms/slug, followed by spiders and beetles/ants (Figure 6; Table 4). The range of concentrations in samples from the halo overlapped with samples from the floodplain.
- In 2016, vanadium concentrations in the three soil invertebrate groups collected from the floodplain and halo areas were generally higher relative to vanadium concentrations in the background area (Figure 6; Table 4).
- Twenty of 27 soil invertebrates samples from the floodplain and halo, had vanadium concentrations measured within the range of vanadium concentrations measured in soil invertebrates from the background area (Figure 6; Table 4).
- Vanadium concentrations (normalized to bulk density) in most co-located soil samples from the floodplain and halo exceeded the BC CSR generic parkland soil standard for vanadium (200 mg/kg; Figure 6).
- When normalized to bulk density, ratios of soil invertebrate to soil concentration were less than one for all pairs collected from the floodplain, halo and background areas (Figure 7). The general trend (i.e., ratio less than one) indicates that there is not a linear relationship between soil and soil invertebrate concentrations of vanadium, and indicates regulation of vanadium is occurring.

Table 4: Summary Statistics of Tissue Vanadium Concentrations (mg/kg) from 2015 and 2016

Tissue		Floodplain	Halo	Background
Worms & Slug	N	3	5	4
	Min	0.67	1.7	0.39
	Max	25	34	7.6
	Mean	12	18	2.4
Beetles & Ants	N	3	12	3
	Min	0.48	0.14	<0.1
	Max	1.3	5.2	0.31
	Mean	0.8	2.2	0.22
Spiders	N	1	3	2
	Min	-	0.67	0.21
	Max	2.4	18	<0.4
	Mean	-	10	0.31

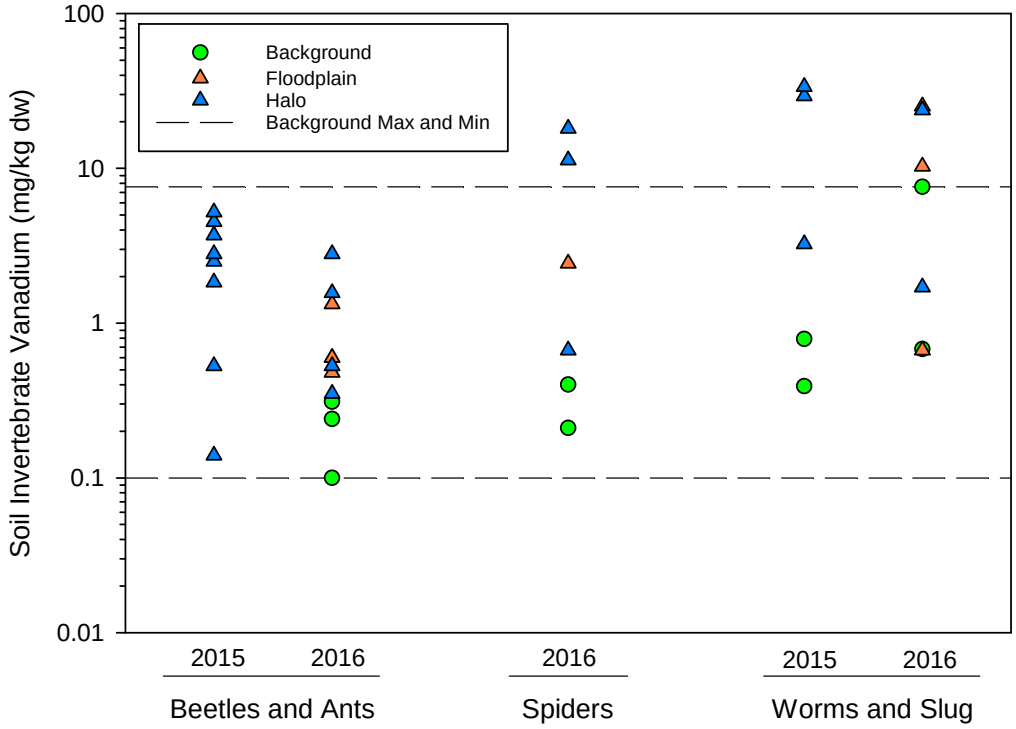

Figure 5: Vanadium Concentrations in Soil Invertebrates Collected in 2015 and 2016. The concentrations of vanadium measured in soil invertebrates tended to be highest in the halo samples.

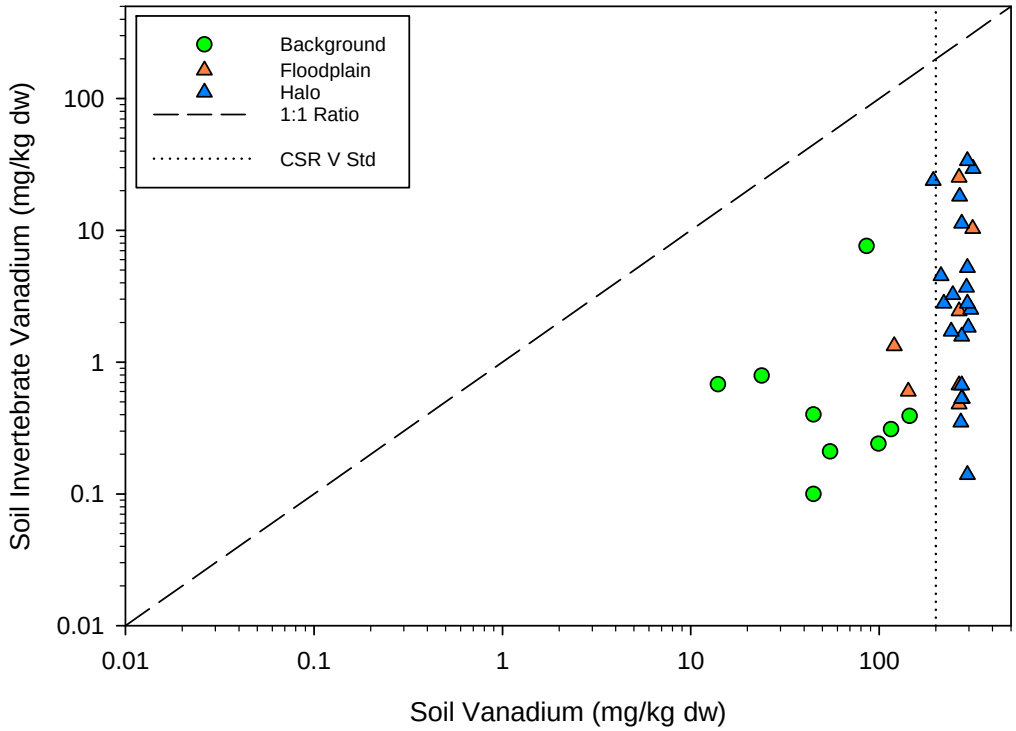

Figure 6: Vanadium Concentrations in Soil Invertebrates versus Soil Collected in 2015 and 2016. The general trend (i.e., ratio less than one) indicates that there is not a linear relationship between soil and soil invertebrate concentrations of vanadium, and indicates regulation of vanadium is occurring. Applicable CSR Schedule 4 Standard for vanadium is 200 mg/kg.

3.4 Quality Assurance/Quality Control

3.4.1 Field

The duplicate analyses for are provided in Attachment B, Tables B-1 (soil invertebrates) and B-2 (soil).

The RPD in soil invertebrate tissue duplicates exceeded the 50% RPD criteria or DF of 2 criteria in one or more duplicate samples for the following parameters: aluminum, antimony, arsenic, barium, boron, cadmium, calcium, cesium, chromium, cobalt, copper, iron, lead, manganese, mercury, molybdenum, nickel, phosphorus, potassium, selenium, sodium, strontium, tin, uranium, vanadium, and zinc. Because the duplicate samples consisted of separate living and mobile organisms, they should not be used to determine sampler variability or laboratory variability; instead, the duplicate samples provide a measure of the environmental variability. Overall, the differences between duplicate samples are not considered to have affected the reliability of these datasets.

In soil, RPDs were greater than the 35% for the following parameters: copper, chromium, molybdenum, total carbon, total organic carbon and potassium. Elevated RPDs were observed in two of the seven duplicate samples, both of which were collected in floodplain area. The majority of the observed duplicate variability is likely attributed to the higher heterogeneity of floodplain soils. Although this variability could affect the precision of the individual results, selection of the duplicate samples was random, meaning that there would be no systematic bias in results due to the variability.

3.4.2 Laboratory

Laboratory data reports for samples collected during field sampling are provided in Attachment C. The following data quality issues were identified in the ALS laboratory reports for soil:

- Recommended hold times were exceeded prior to analysis of organic carbon, inorganic carbon, available nitrate, pH, and mercury in some samples.
- Detection limits for several nutrients were adjusted in some samples due to high concentrations of test analytes, sample matrix effects, limited sample amount, or high percent moisture.

The following data quality issues were identified in the ALS laboratory reports for invertebrate tissue:

- Detection limits for several metals were adjusted in some samples due to insufficient sample volume or because the analyte was detected at a comparable level in the method blank.
- Duplicate results were outside of the ALS DQOs for beryllium, cobalt, and uranium due to sample heterogeneity.
- Certified reference material recovery for sodium and zinc was outside of the ALS DQO for sodium and zinc. The recoveries of these two analytes were above the limits established, indicating a possible high bias for these analytes.

The DQO were met for copper, selenium and vanadium in all samples and were met for the majority of samples for other parameters; therefore, the data were considered reliable for the purposes of this memorandum.

4.0 CLOSURE

The reader is referred to the Study Limitations, which follows the text and forms an integral part of this memorandum.

We trust the information provided in this technical memorandum meets your present requirements. If you have any questions, please contact the undersigned.

Notes:
QA/QC = quality assurance/quality control; FDA = field duplicate available; FD = field duplicate
NA = not applicable; NC = not calculated; Mean = average of two values
Relative percent difference (RPD) = the difference between two values divided by the mean of the two values. RPD is calculated when the concentration is greater than five times the detection limit.
Golders' acceptable RPD for tissue is less than or equal to 50%.
Difference factor (DF) = absolute difference between two values divided by the method detection limit. The DF is calculated when the concentration is less than five times the detection limit.
Golders' acceptable DF is less than or equal to 2.0.
Bold values indicate an exceedance of the acceptable RPD or DF.

Relative percent difference (RPD) = the difference between two values divided by the mean of the two values. RPD is calculated when the concentration is greater than five times the detection limit.						17.04%	0.50					26.05%	0.40

Notes:
QA/QC = quality assurance/quality control; FDA = field duplicate available; FD = field duplicate
NA = not applicable; NC = not calculated; Mean = average of two values
Golders' acceptable RPD for soil is less than or equal to 35%.
Difference factor (DF) = absolute difference between two values divided by the method detection limit. The DF is calculated when the concentration is less than five times the detection limit.
Golders' acceptable DF is less than or equal to 2.0.
Bold values indicate an exceedance of the acceptable RPD or DF.

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLIS	Detection Limit Adjusted: Insufficient Sample
DUP-H	Duplicate results outside ALS DQO, due to sample heterogeneity.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
HG-DRY-CVAFS-N-VA	Tissue	Mercury in Tissue by CVAFS (DRY)	EPA 200.3, EPA 245.7

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

HG-DRY-MICR-CVAF-VA Tissue Mercury in Tissue by CVAFS Micro (DRY) EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

HG-WET-CVAFS-N-VA Tissue Mercury in Tissue by CVAFS (WET) EPA 200.3, EPA 245.7

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

HG-WET-MICR-CVAF-VA Tissue Mercury in Tissue by CVAFS Micro (WET) EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

MET-DRY-CCMS-N-VA Tissue Metals in Tissue by CRC ICPMS (DRY) EPA 200.3/6020A

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-DRY-MICR-HRMS-VA Tissue Metals in Tissue by HR-ICPMS Micro (DRY) EPA 200.3/200.8

Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on dry weight basis.

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-WET-CCMS-N-VA Tissue Metals in Tissue by CRC ICPMS (WET) EPA 200.3/6020A

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

Reference Information

MET-WET-MICR-HRMS-VA Tissue Metals in Tissue by HR-ICPMS Micro (WET) EPA 200.3/200.8

Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on wet weight basis.

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MOISTURE-TISS-VA Tissue % Moisture in Tissues ASTM D2974-00 Method A

This analysis is carried out gravimetrically by drying the sample at 105 C for a minimum of six hours.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

G0147	G0149	G0150	G0152	G0156
G0157	G0165	G0166	G0167	G0168
G0169	G0170	G0171		

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Duplicate	Beryllium (Be)-Total	DUP-H	L1826505-2, -35, -36, -39, -42, -43, -44, -54, -55, -56, -59, -60, -62, -63, -66, -8, -9
Duplicate	Cobalt (Co)-Total	DUP-H	L1826505-2, -35, -36, -39, -42, -43, -44, -54, -55, -56, -59, -60, -62, -63, -66, -8, -9
Duplicate	Uranium (U)-Total	DUP-H	L1826505-2, -35, -36, -39, -42, -43, -44, -54, -55, -56, -59, -60, -62, -63, -66, -8, -9
Duplicate	Beryllium (Be)-Total	DUP-H	L1826505-2, -35, -36, -39, -42, -43, -44, -54, -55, -56, -59, -60, -62, -63, -66, -8, -9
Duplicate	Cobalt (Co)-Total	DUP-H	L1826505-2, -35, -36, -39, -42, -43, -44, -54, -55, -56, -59, -60, -62, -63, -66, -8, -9
Duplicate	Uranium (U)-Total	DUP-H	L1826505-2, -35, -36, -39, -42, -43, -44, -54, -55, -56, -59, -60, -62, -63, -66, -8, -9

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLB	Detection Limit Raised. Analyte detected at comparable level in Method Blank.
DLIS	Detection Limit Adjusted: Insufficient Sample
DUP-H	Duplicate results outside ALS DQO, due to sample heterogeneity.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
HG-DRY-CVAFS-N-VA	Tissue	Mercury in Tissue by CVAFS (DRY)	EPA 200.3, EPA 245.7

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

HG-DRY-MICR-CVAF-VA	Tissue	Mercury in Tissue by CVAFS Micro (DRY)	EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

HG-WET-CVAFS-N-VA	Tissue	Mercury in Tissue by CVAFS (WET)	EPA 200.3, EPA 245.7

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

HG-WET-MICR-CVAF-VA	Tissue	Mercury in Tissue by CVAFS Micro (WET)	EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

MET-DRY-CCMS-N-VA	Tissue	Metals in Tissue by CRC ICPMS (DRY)	EPA 200.3/6020A

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-DRY-MICR-HRMS-VA	Tissue	Metals in Tissue by HR-ICPMS Micro (DRY)	EPA 200.3/200.8

Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on dry weight basis.

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-WET-CCMS-N-VA	Tissue	Metals in Tissue by CRC ICPMS (WET)	EPA 200.3/6020A

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Reference Information

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-WET-MICR-HRMS-VA Tissue Metals in Tissue by HR-ICPMS Micro (WET) EPA 200.3/200.8

Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on wet weight basis.

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MOISTURE-TISS-VA Tissue % Moisture in Tissues ASTM D2974-00 Method A

This analysis is carried out gravimetrically by drying the sample at 105 C for a minimum of six hours.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

G0147	G0149	G0150	G0152	G0156
G0157	G0165	G0166	G0167	G0168
G0169	G0170	G0171		

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLR	Detection Limit Raised due to required dilution, limited sample amount, and/or high moisture content (soil samples)

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
C-TIC-PCT-SK	Soil	Total Inorganic Carbon in Soil	CSSS (2008) P216-217

A known quantity of acetic acid is consumed by reaction with carbonates in the soil. The pH of the resulting solution is measured and compared against a standard curve relating pH to weight of carbonate.

C-TOC-CALC-SK	Soil	Total Organic Carbon Calculation	CSSS (2008) 21.2

Total Organic Carbon (TOC) is calculated by the difference between total carbon (TC) and total inorganic carbon. (TIC)

C-TOT-LECO-SK	Soil	Total Carbon by combustion method	SSSA (1996) P. 973-974

The sample is ignited in a combustion analyzer where carbon in the reduced CO2 gas is determined using a thermal conductivity detector.

HG-200.2-CVAF-VA	Soil	Mercury in Soil by CVAFS	EPA 200.2/1631E (mod)

Soil samples are digested with nitric and hydrochloric acids, followed by analysis by CVAFS.

IC-CACO3-CALC-SK	Soil	Inorganic Carbon as CaCO3 Equivalent	Calculation
MET-200.2-CCMS-VA	Soil	Metals in Soil by CRC ICPMS	EPA 200.2/6020A (mod)

Soil samples are digested with nitric and hydrochloric acids, followed by analysis by CRC ICPMS.

Method Limitation: This method is not a total digestion technique. It is a very strong acid digestion that is intended to dissolve those metals that may be environmentally available. This method does not dissolve all silicate materials and may result in a partial extraction. depending on the sample matrix, for some metals, including, but not limited to Al, Ba, Be, Cr, Sr, Ti, Tl, and V.

NO3-AVAIL-SK	Soil	Available Nitrate-N	Method = Alberta Ag (1988)

Available Nitrate and Nitrite are extracted from the soil using a dilute calcium chloride solution. Nitrate is quantitatively reduced to nitrite by passage of the sample through a copperized cadmium column. The nitrite (reduced nitrate plus original nitrite) is then determined by diazotizing with sulfanilamide followed by coupling with N-(1-naphthyl) ethylenediamine dihydrochloride. The resulting water soluble dye has a magenta color which is measured at colorimetrically at 520nm.

Reference:
Recommended Methods of Soil Analysis for Canadian Prairie Agricultural Soils. Alberta Agriculture (1988) p. 19 and 28

PH-1:2-VA	Soil	pH in Soil (1:2 Soil:Water Extraction)	BC WLAP METHOD: PH, ELECTROMETRIC, SOIL

This analysis is carried out in accordance with procedures described in the pH, Electrometric in Soil and Sediment method - Section B Physical/Inorganic and Misc. Constituents, BC Environmental Laboratory Manual 2007. The procedure involves mixing the dried (at <60°C) and sieved (No. 10 / 2mm) sample with deionized/distilled water at a 1:2 ratio of sediment to water. The pH of the solution is then measured using a standard pH probe.

PO4/K-AVAIL-SK	Soil	Plant Available Phosphorus and Potassium	Comm. Soil Sci. Plant Anal, 25 (5&6)

Plant available phosphorus and potassium are extracted from the soil usng Modified Kelowna solution. Phosphorous in the soil extract is determined colorimetrically at 880 nm, while potassiumis determined by flame emission at 770 nm.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
SK	ALS ENVIRONMENTAL - SASKATOON, SASKATCHEWAN, CANADA
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

G0148

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

RUSH

Priority processing

please log all highlighted soils for:

- CSR + Full Metals
- TOC/TIC
- Avail N, P, K

"Group A" soils are due Sept 15 with 'P' codes

"Group B" soils are due Sept 21, no priority code

SK sublets should go out Monday.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Duplicate	Lithium (Li)	DUP-H,J	L1826551-24, -25, -26, -28, -29

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLHC	Detection Limit Raised: Dilution required due to high concentration of test analyte(s).
DLR	Detection Limit Raised due to required dilution, limited sample amount, and/or high moisture content (soil samples)
DUP-H,J	Duplicate results outside ALS DQO, due to sample heterogeneity. Duplicate results and limits are expressed in terms of absolute difference.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
C-TIC-PCT-SK	Soil	Total Inorganic Carbon in Soil	CSSS (2008) P216-217

A known quantity of acetic acid is consumed by reaction with carbonates in the soil. The pH of the resulting solution is measured and compared against a standard curve relating pH to weight of carbonate.

C-TOC-CALC-SK	Soil	Total Organic Carbon Calculation	CSSS (2008) 21.2

Total Organic Carbon (TOC) is calculated by the difference between total carbon (TC) and total inorganic carbon. (TIC)

C-TOT-LECO-SK	Soil	Total Carbon by combustion method	SSSA (1996) P. 973-974

The sample is ignited in a combustion analyzer where carbon in the reduced CO2 gas is determined using a thermal conductivity detector.

HG-200.2-CVAF-VA	Soil	Mercury in Soil by CVAFS	EPA 200.2/1631E (mod)

Soil samples are digested with nitric and hydrochloric acids, followed by analysis by CVAFS.

MET-200.2-CCMS-VA	Soil	Metals in Soil by CRC ICPMS	EPA 200.2/6020A (mod)

Soil samples are digested with nitric and hydrochloric acids, followed by analysis by CRC ICPMS.

Method Limitation: This method is not a total digestion technique. It is a very strong acid digestion that is intended to dissolve those metals that may be environmentally available. This method does not dissolve all silicate materials and may result in a partial extraction. depending on the sample matrix, for some metals, including, but not limited to Al, Ba, Be, Cr, Sr, Ti, Tl, and V.

NO3-AVAIL-SK	Soil	Available Nitrate-N	Method = Alberta Ag (1988)

Available Nitrate and Nitrite are extracted from the soil using a dilute calcium chloride solution. Nitrate is quantitatively reduced to nitrite by passage of the sample through a copperized cadmium column. The nitrite (reduced nitrate plus original nitrite) is then determined by diazotizing with sulfanilamide followed by coupling with N-(1-naphthyl) ethylenediamine dihydrochloride. The resulting water soluble dye has a magenta color which is measured at colorimetrically at 520nm.

Reference:
Recommended Methods of Soil Analysis for Canadian Prairie Agricultural Soils. Alberta Agriculture (1988) p. 19 and 28

PH-1:2-VA	Soil	pH in Soil (1:2 Soil:Water Extraction)	BC WLAP METHOD: PH, ELECTROMETRIC, SOIL

This analysis is carried out in accordance with procedures described in the pH, Electrometric in Soil and Sediment method - Section B Physical/Inorganic and Misc. Constituents, BC Environmental Laboratory Manual 2007. The procedure involves mixing the dried (at <60°C) and sieved (No. 10 / 2mm) sample with deionized/distilled water at a 1:2 ratio of sediment to water. The pH of the solution is then measured using a standard pH probe.

PO4/K-AVAIL-SK	Soil	Plant Available Phosphorus and Potassium	Comm. Soil Sci. Plant Anal, 25 (5&6)

Plant available phosphorus and potassium are extracted from the soil usng Modified Kelowna solution. Phosphorous in the soil extract is determined colorimetrically at 880 nm, while potassiumis determined by flame emission at 770 nm.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
SK	ALS ENVIRONMENTAL - SASKATOON, SASKATCHEWAN, CANADA
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

G0148

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

RUSH

Priority processing

Please log all highlighted soils for:

- CSR + Full Metals
- TOC/TIC
- Avail N, P, K

"Group A" soils are due Sept 16 with 'P' codes

"Group B" soils are due Sept 21, no priority code.

SK sublets should go out Monday.
